

# RECLAMATION

*Managing Water in the West*

## **Coordinated Long-Term Operation of the Central Valley Project and State Water Project**

**Mid-Pacific Region  
Bay-Delta Office**

### **Final Environmental Impact Statement**

## **Mission Statements**

The mission of the Department of the Interior is to protect and provide access to our Nation's natural and cultural heritage and honor our trust responsibilities to Indian Tribes and our commitments to island communities.

The mission of the Bureau of Reclamation is to manage, develop, and protect water and related resources in an environmentally and economically sound manner in the interest of the American public.

# 1 **Executive Summary**

## 2 **ES.1 Introduction**

3 This Environmental Impact Statement (EIS) for the Coordinated Long-Term  
4 Operation of the Central Valley Project (CVP) and State Water Project (SWP) has  
5 been prepared by the Department of the Interior, Bureau of Reclamation  
6 (Reclamation). Reclamation is the Federal lead agency for compliance with the  
7 National Environmental Policy Act (NEPA) and is completing the EIS as ordered  
8 by the United States District Court for the Eastern District of California (District  
9 Court). In 2008 and 2009, following litigation on previous Biological Opinion  
10 (BOs), Reclamation provisionally accepted and began implementing the BOs on  
11 continued long-term operation of the CVP, in coordination with the operation of  
12 the SWP issued by the U.S. Fish and Wildlife Service (USFWS) and the National  
13 Marine Fisheries Service (NMFS), respectively, pursuant to the Federal  
14 Endangered Species Act of 1973 (ESA) as amended (United States Code [U.S.C.]  
15 1531 et. seq.). In 2014, the Ninth Circuit upheld the District Court's ruling that  
16 Reclamation's provisional acceptance and implementation of the BOs required  
17 Reclamation to comply with NEPA. The District Court remanded Reclamation's  
18 decision back to the agency to comply with the court's ruling.

19 The EIS evaluates potential long-term direct, indirect, and cumulative impacts on  
20 the environment that could result from implementation of modifications to the  
21 continued long-term operation of the CVP and SWP.

## 22 **ES.2 Background**

### 23 **ES.2.1 Central Valley Project**

24 The first Federal action authorizing the CVP was by the Rivers and Harbors Act  
25 of August 30, 1935. The CVP was reauthorized for construction, operation, and  
26 maintenance by the Secretary of the Department of the Interior (Secretary),  
27 pursuant to the Reclamation Act of 1902, as amended and supplemented (the  
28 Federal Reclamation laws), and by the Rivers and Harbors Act of  
29 August 26, 1937. In 1992, the Central Valley Project Authorization Act of  
30 August 26, 1937 was amended by Section 3406(a) of the Central Valley Project  
31 Improvement Act (CVPIA), Public Law 102-575.  
32 (<http://www.usbr.gov/history/cvpintro.html>)

1 The CVP is composed of 20 reservoirs with a combined storage capacity of more  
2 than 11 million acre-feet, over 10 hydroelectric powerplants, and more than  
3 500 miles of major canals and aqueducts. The major CVP facilities are located in  
4 the Sacramento-San Joaquin Rivers Delta Estuary (Delta) watershed including:

- 5 • **Major Reservoirs:** Trinity Lake (Trinity River), Whiskeytown Lake (Clear  
6 Creek); Shasta Lake (Sacramento River), Folsom Lake (American River),  
7 New Melones Reservoir (Stanislaus River), portions of the San Luis Reservoir  
8 complex (local drainages), and Millerton Lake (San Joaquin River).
- 9 • **Major Pumping Plants and Conveyance Facilities:** Red Bluff Pumping  
10 Plant (diverts water from Sacramento River into CVP Tehama-Colusa Canal),  
11 Folsom South Canal (diverts water from Folsom Lake to portions of  
12 Sacramento County), Contra Costa Canal Pumping Plant (diverts water from  
13 the Delta into CVP Contra Costa Canal), C.W. “Bill” Jones Pumping Plant  
14 (diverts water from the Delta into CVP Delta-Mendota Canal), Clear Creek  
15 Tunnel (conveys water from Trinity Lake to Whiskeytown Lake), Pacheco  
16 Tunnel and Conduit (conveys water from San Luis Reservoir to Santa Clara  
17 and San Benito counties), and Friant Kern and Madera canals (convey water  
18 from Millerton Lake to the eastern San Joaquin Valley).

19 These facilities are operated as an integrated project, although they are authorized  
20 and categorized in distinct units or divisions.

## 21 **ES.2.2 State Water Project**

22 The State Legislature appropriated funds to the California Department of Water  
23 Resources (DWR) to construct the SWP under the State Central Valley Project  
24 Act (Water Code section 11100 et seq.), Burns-Porter Act (California Water  
25 Resources Development Bond Act), State Contract Act (Public Contract Code  
26 section 10100 et seq.), Davis-Dolwig Act (Water Code sections 11900 - 11925),  
27 and other acts of the State Legislature.

28 Major SWP facilities include:

- 29 • **Reservoirs:** Lake Oroville and the Thermalito Complex (Feather River);  
30 Antelope Lake, Lake Davis, and Frenchman Lake (upper Feather River  
31 upstream of Lake Oroville); portions of the San Luis Reservoir complex (local  
32 drainages); reservoirs located downstream of San Luis Reservoir along the  
33 California Aqueduct and other SWP conveyance facilities (Quail Lake,  
34 Pyramid Lake, Castaic Lake, Silverwood Lake, Crafton Hills Reservoir, and  
35 Lake Perris).
- 36 • **Major Pumping Plants and Conveyance Facilities:** Barker Slough Pumping  
37 Plant (diverts water into SWP North Bay Aqueduct); Clifton Court Forebay  
38 and Harvey O. Banks Pumping Plant (diverts water from the Delta into SWP  
39 South Bay Aqueduct and the SWP California Aqueduct); California Aqueduct  
40 and associated pumping plants (convey water to the San Joaquin Valley,  
41 San Luis Obispo and Santa Barbara counties along the central coast, and  
42 southern California); Coastal Branch of the California Aqueduct (conveys

1 water to San Luis Obispo and Santa Barbara counties); and East Branch and  
2 West Branch (convey water to Southern California).

### 3 **ES.2.3 Coordinated Operation of the CVP and SWP**

4 The CVP and SWP are operated in a coordinated manner in accordance with  
5 Public Law 99-546 (October 27, 1986), directing the Secretary to execute the  
6 Coordinated Operation Agreement (COA). The CVP and SWP are also operated  
7 under State Water Resources Control Board (SWRCB) decisions and water right  
8 orders related to the CVP's and SWP's water right permits and licenses to  
9 appropriate water by diverting to storage, by directly diverting to use, or by  
10 re-diverting releases from storage later in the year or in subsequent years.

11 The CVP and SWP are permitted by SWRCB to store water, divert water and re-  
12 divert CVP and SWP water that has been stored in upstream reservoirs. The CVP  
13 and SWP have built water storage and water delivery facilities in the Central  
14 Valley to deliver water supplies to CVP and SWP contractors, including senior  
15 water users. The CVP's and SWP's water rights are conditioned by the SWRCB  
16 to protect the beneficial uses of water within the watersheds.

17 As conditions of the water right permits and licenses, SWRCB requires the CVP  
18 and SWP to meet specific water quality objectives within the Delta. Reclamation  
19 and DWR coordinate operation of the CVP and SWP, pursuant to the COA, to  
20 meet these and other operating requirements. The COA is an agreement between  
21 the Federal government and the State of California for the coordinated operation  
22 of the CVP and SWP.

23 Implementation of the COA has evolved continually since 1986 as CVP and SWP  
24 facilities, operational criteria, and physical and regulatory environment have  
25 changed. For example, adoption of the CVPIA in 1992 changed the purposes and  
26 operations of the CVP, and ESA responsibilities have affected operation of the  
27 CVP and SWP. DWR and Reclamation have operational arrangements to  
28 accommodate new facilities, water quality objectives, the CVPIA, other SWRCB  
29 criteria, and the ESA, but the COA has not been formally modified to address  
30 these newer operating conditions.

### 31 **ES.2.4 Federal Endangered Species Consultation**

32 The following species and their critical habitat listing rules were considered in  
33 recent ESA consultations with the USFWS and NMFS for the coordinated long-  
34 term operation of the CVP and SWP and in the analyses in this EIS.

- 35 • The Sacramento River winter-run Chinook Salmon (*Oncorhynchus*  
36 *tshawytscha*) evolutionarily significant unit (ESU) was originally listed as  
37 threatened in August 1989, under emergency provisions of the ESA, and  
38 formally listed as threatened in November 1990 (55 Federal Register (FR)  
39 46515). They were re-classified as an endangered species on January 4, 1994  
40 (59 FR 440).
- 41 • Central Valley spring-run Chinook Salmon (*O. tshawytscha*) ESU was listed  
42 as threatened on June 18, 2005 (70 FR 37160).

- 1 • The Central Valley Steelhead (*O. mykiss*) distinct population segment (DPS)  
2 was listed as threatened on January 5, 2006 (71 FR 834).
- 3 • Southern Oregon/Northern California Coast Coho Salmon (*O. kisutch*) ESU  
4 was listed as threatened on June 18, 2005 (70 FR 37160).
- 5 • Southern DPS of the North American Green Sturgeon (*Acipenser medirostris*)  
6 was listed as threatened on June 6, 2006 (71 FR 17757).
- 7 • The Southern Resident DPS of Killer Whales (*Orcinus orca*) was listed as  
8 endangered on November 18, 2005 (NMFS 2005).
- 9 • The Delta Smelt (*Hypomesus transpacificus*) was listed as threatened on  
10 March 5, 1993 (58 FR 12854). The species was recently proposed for re-  
11 listing as endangered under the ESA.

12 Fall and late-fall runs of Chinook Salmon are currently Federal Species of  
13 Concern, but have not been formally listed.

14 The Central California Coast Steelhead (*O. mykiss*) DPS was listed as threatened  
15 on January 5, 2006 (71 FR 834). The 2009 NMFS BO determined that the long-  
16 term operation of the CVP and SWP would not likely adversely affect Central  
17 California Coast Steelhead DPS and its critical habitat. Therefore, no further  
18 analysis of this DPS was performed and addressed in this EIS.

#### 19 **ES.2.4.1 Recent ESA Consultation Activities and Court Rulings**

20 In August 2008, Reclamation submitted a biological assessment (BA) to the  
21 USFWS and NMFS to initiate formal consultation. BO's were issued by the  
22 USFWS (December 15, 2008) and NMFS (June 4, 2009) with separate  
23 Reasonable and Prudent Alternative (RPA) actions to allow CVP and SWP to  
24 continue operating without causing jeopardy to listed species or adverse  
25 modification to designated critical habitat. Reclamation provisionally accepted  
26 and began implementing the two BOs with the RPAs.

27 Several lawsuits were filed in the District Court challenging aspects of the 2008  
28 USFWS BO and the 2009 NMFS BO and Reclamation's acceptance and  
29 implementation of the associated RPAs. Many of the lawsuits consolidated into  
30 two proceedings focused on each BO. The outcomes of the *Consolidated Delta*  
31 *Smelt Cases* and the *Consolidated Salmonid Cases* are summarized below.

- 32 • *Consolidated Delta Smelt Cases*
  - 33 – On November 16, 2009, the District Court ruled that Reclamation violated  
34 NEPA by failing to conduct a NEPA review of the potential impacts to the  
35 human environment before provisionally accepting and implementing the  
36 2008 USFWS BO, including the RPA.
  - 37 – On December 14, 2010, the District Court found certain portions of the  
38 2008 USFWS BO to be arbitrary and capricious in several respects, and  
39 remanded those portions of the BO to the USFWS without vacatur for  
40 further consideration. The District Court ordered Reclamation to review

- 1 its decision to provisionally accept and implement the BO and RPA in  
2 accordance with NEPA.
- 3 – The decision of the District Court related to the USFWS BO was appealed  
4 to the United States Court of Appeals for the Ninth Circuit (Appellate  
5 Court). On March 13, 2014, the Appellate Court reversed the District  
6 Court decision and upheld the BO. However, the Appellate Court  
7 affirmed the judgment of the District Court with respect to the NEPA  
8 claims.
- 9 – The District Court amended the Judgment on September 30, 2014  
10 consistent with the Appellate Court’s decision. Petitions for Writ of  
11 Certiorari were submitted to the U.S. Supreme Court; however, the U.S.  
12 Supreme Court decided to not hear the cases.
- 13 • *Consolidated Salmonid Cases*
- 14 – On March 5, 2010, the District Court ruled that Reclamation violated  
15 NEPA by failing to undertake a NEPA analysis of potential impacts to the  
16 human environment before provisionally accepting and implementing the  
17 2009 NMFS BO and RPA.
- 18 – On September 20, 2011, the District Court found the 2009 NMFS BO was  
19 arbitrary and capricious in several respects, and remanded the 2009 NMFS  
20 BO without vacatur for further consideration.
- 21 – The decisions of the District Court related to the 2009 NMFS BO were  
22 appealed to the Appellate Court. On December 22, 2014, the Appellate  
23 Court reversed the District Court decision and upheld the BO.
- 24 – The District Court issued the Final Order on May 5, 2015 consistent with  
25 the Appellate Court’s Decision.

### 26 **ES.3 Need to Prepare this Environmental Impact** 27 **Statement**

28 To comply with the District Court’s 2010 orders regarding NEPA for the  
29 coordinated long-term operation of the CVP and SWP, Reclamation initiated  
30 preparation of this EIS in 2011. This EIS documents Reclamation’s analysis of  
31 the effects of modifications to the coordinated long-term operation of the CVP  
32 and SWP that are likely to avoid jeopardy to listed species and destruction or  
33 adverse modification of designated critical habitat.

34 In accordance with the October 1, 2014, District Court’s order in the *Consolidated*  
35 *Delta Smelt Cases*, the Final EIS and Record of Decision are to be completed on  
36 or before December 1, 2015. By order dated October 8, 2015, this date has been  
37 extended to January 12, 2016.

38 Many of the provisions of the RPAs, as set forth in the 2008 USFWS BO and the  
39 2009 NMFS BO, require further study, monitoring, consultation, implementation

1 of adaptive management programs, and subsequent environmental documentation  
2 for future facilities to be constructed or modified. Specific actions related to these  
3 provisions are not known at this time. Therefore, this EIS assumes the  
4 completion of future actions, including provisions of the RPAs, in a manner that  
5 would be consistent with ESA and does not address impacts during construction  
6 or start-up phases of these actions.

## 7 **ES.4 Use of the Environmental Impact Statement**

8 This EIS may be used by Reclamation or cooperating agencies that are  
9 participating in the preparation of this EIS to inform future decisions related to  
10 operation of the CVP and SWP, and implementation of the RPAs in the 2008  
11 USFWS BO and 2009 NMFS BO.

## 12 **ES.5 Purpose and Need**

13 NEPA regulations require a statement regarding “the underlying purpose and need  
14 to which the agency is responding in proposing the alternatives, including the  
15 proposed action” (40 Code of Federal Regulations (CFR) 1502.13).

### 16 **ES.5.1 Purpose of the Action**

17 The purpose of the action considered in this EIS is to continue the operation of the  
18 CVP in coordination with operation of the SWP, for its authorized purposes, in a  
19 manner that:

- 20 • Is similar to historic operational parameters with certain modifications;
- 21 • Is consistent with Federal Reclamation law; other Federal laws and  
22 regulations; Federal permits and licenses; State of California water rights,  
23 permits, and licenses; and
- 24 • Enables Reclamation and DWR to satisfy their contractual obligations to the  
25 fullest extent possible.

### 26 **ES.5.2 Need for the Action**

27 Continued operation of the CVP is needed to provide river regulation, navigation;  
28 flood control; water supply for irrigation and domestic uses; fish and wildlife  
29 mitigation, protection, and restoration; fish and wildlife enhancement; and power  
30 generation. The CVP and the SWP facilities are also operated to provide  
31 recreation benefits and in accordance with the water rights and water quality  
32 requirements adopted by the SWRCB.

33 The USFWS and NMFS concluded in their 2008 and 2009 BOs, respectively, that  
34 the coordinated long-term operation of the CVP and SWP, as described in the  
35 2008 Reclamation BA, jeopardized the continued existence of listed species and  
36 adversely modified critical habitat. To remedy this, the USFWS and NMFS  
37 provided RPAs in their respective BOs.

1 The Appellate Court confirmed the District Court ruling that Reclamation must  
2 conduct a NEPA review to determine whether the provisional acceptance and  
3 implementation of the RPA actions cause a significant effect to the human  
4 environment.

## 5 **ES.6 Project Area**

6 The project area boundaries are defined by the locations of most of the CVP  
7 facilities and their service areas; and all of the SWP facilities and the SWP service  
8 areas. The CVP facilities associated with Millerton Lake, including the Madera  
9 and Friant-Kern canals and their service areas, and the San Joaquin River  
10 Restoration Program are not part of the project area for this EIS because the  
11 operations of these facilities were not addressed in either the 2008 USFWS BO or  
12 2009 NMFS BO.

## 13 **ES.7 Study Period**

14 The coordinated long-term operation of the CVP and SWP, as described in this  
15 EIS, would continue to at least 2030 before CVP and SWP operations would  
16 change. These changes could include projects considered as part of the  
17 cumulative effects analyses. Therefore, the EIS analyzes future conditions  
18 projected for the Year 2030. It is recognized that many changes between existing  
19 conditions and 2030 would occur without changes to CVP and SWP operations,  
20 including local land use decisions, implementation of new water management  
21 facilities, and climate change.

22 As the changing conditions described above and other future changes occur,  
23 changes in long-term operation of the CVP and SWP may be required. This may  
24 require the re-initiation of consultation on the 2008 USFWS BO and 2009 NMFS  
25 BO. Therefore, because the above-described changes in conditions are likely to  
26 occur by 2030 and because new BOs would be required, this EIS considers a  
27 study period that concludes in 2030.

## 28 **ES.8 Proposed Action and Preferred Alternative**

29 The Notice of Intent to prepare this EIS was published in March 2012 identified  
30 an “initial Proposed Action” that included the operational actions of the 2008  
31 USFWS BO and 2009 NMFS BO, without structural changes included in the RPA  
32 actions that would require future studies and environmental documentation to  
33 define recommended actions, including fish passage around the CVP dams. The  
34 initial Proposed Action is included in this EIS as Alternative 2.

35 Based upon the analysis in this EIS of aquatic resources by 2030, climate change  
36 may result in substantially higher air temperatures than during recent conditions.  
37 Higher air temperatures would likely increase water temperatures in both the CVP

1 reservoirs and in the rivers downstream of the CVP dams. Under these  
2 conditions, Reclamation may not be able to operate the reservoirs under the initial  
3 Proposed Action without fish passage in a manner that would meet water  
4 temperature objectives; and it may not be possible to avoid jeopardizing the  
5 continued existence of listed species and/or resulting in an adverse modification  
6 of critical habitat.

7 Based upon the results of the impact analyses presented in this EIS, the Preferred  
8 Alternative is the No Action Alternative. The No Action Alternative contains all  
9 of the RPA actions in the 2008 USFWS BO and 2009 NMFS BO, as amended,  
10 including the RPA actions to evaluate fish passage to upstream habitats that  
11 exhibit lower water temperatures. Further discussion of the selection of the  
12 Preferred Alternative will be included in the Record of Decision.

13 The Environmentally Preferred Alternative also will be identified and disclosed in  
14 the Record of Decision, as required by the Council of Environmental Quality  
15 regulations.

## 16 **ES.9 Summary Description of Alternatives**

17 Identification of the No Action Alternative and the range of alternatives for this  
18 EIS were developed to respond to the purpose and need for the action and to  
19 comments received during the scoping process and preparation of the EIS.

20 Twenty-three alternative concepts were identified during the scoping process and  
21 through meetings with stakeholders and agencies during preparation of this EIS.  
22 The alternative concepts were compared to screening criteria that were developed  
23 based on the purpose of the action. The alternative concepts were also reviewed  
24 to determine if they addressed substantial issues. Based upon the comparison of  
25 screening criteria to the alternative concepts, 17 of the 23 alternative concepts  
26 were identified to be included in one or more of the alternatives evaluated in this  
27 EIS. The alternative concepts were combined into five specific alternatives that  
28 were consistent with assumptions for the year 2030. Further development of the  
29 alternatives was informed by subsequent comments received during preparation  
30 of the EIS.

31 All of the alternatives, including the No Action Alternative, include the same  
32 assumptions related to (1) climate change and sea level rise in Year 2030, and  
33 (2) development throughout California in accordance with existing general plans,  
34 existing contracts, and implementation of reasonable and foreseeable water  
35 resources management projects.

### 36 **ES.9.1 Inclusion of the Second Basis of Comparison**

37 The No Action Alternative is defined as the projections of current conditions and  
38 trends into the future without implementation of the alternatives. These projected  
39 conditions are defined in Question 3 of the Council on Environmental Quality  
40 (CEQ) Forty Most Asked Questions as “no change’ from current management  
41 direction or level of management intensity.” The No Action Alternative also can

1 be defined as “no project” in cases where a new project is proposed for  
2 implementation. However, all of the alternatives evaluated in this EIS are to  
3 continue the coordinated long-term operation of the CVP and SWP. Therefore,  
4 the definition of the No Action Alternative used for this EIS is continuation of the  
5 current management direction and level of intensity.

6 For this EIS, the No Action Alternative is based upon the continued operation of  
7 the CVP and SWP in the same manner as was occurring at the time of the  
8 publication of the Notice of Intent in March 2012. Thus, the No Action  
9 Alternative consists of the coordinated long-term operation of the CVP and SWP,  
10 including full implementation of the RPAs in the 2008 USFWS BO and 2009  
11 NMFS BO, because Reclamation provisionally accepted the BOs in 2008 and  
12 2009, respectively, began implementing the RPAs, and continues to implement  
13 the RPAs to date. The No Action Alternative also includes changes not related to  
14 the long-term operation of the CVP and SWP or implementation of the RPAs in  
15 the 2008 USFWS BO and 2009 NMFS BO.

16 Numerous scoping comments requested that the No Action Alternative not  
17 include the RPAs in the 2008 USFWS BO and 2009 NMFS BO because, at that  
18 time, the District Court had remanded the BOs back to USFWS and NMFS. The  
19 comments indicated that the EIS should include a “basis of comparison” for the  
20 alternatives that was similar to conditions prior to implementation of the RPAs.  
21 Scoping comments also indicated that a “No Action Alternative scenario” without  
22 implementation of the RPAs in the 2008 USFWS BO and 2009 NMFS BO could  
23 be used to analyze the effects of implementing the RPAs.

24 Determining an appropriate baseline without the 2008 USFWS BO and 2009  
25 NMFS BO actions and yet continuing to meet all of Reclamation’s statutory and  
26 regulatory requirements is a difficult task. Simply analyzing a No Action  
27 Alternative that is similar to the project description described in either the 2004  
28 Biological Assessment or 2008 Biological Assessment is insufficient, as each was  
29 found to jeopardize listed species, the 2004 Biological Assessment by the District  
30 Court in 2007, and the 2008 Biological Assessment by USFWS and NMFS.  
31 Either of these operations would be inconsistent with Reclamation’s existing  
32 policy and management direction.

33 Because the RPAs were provisionally accepted and the No Action Alternative  
34 represents a continuation of existing policy and management direction, the No  
35 Action Alternative includes the RPAs. However, in response to scoping  
36 comments and subsequent comments from stakeholders and interest groups, and  
37 to provide a basis for comparison of the effects of implementation of the RPAs  
38 (per the District Court’s mandate), this EIS includes a “Second Basis of  
39 Comparison” that represents a condition in 2030 without implementation of the  
40 2008 USFWS BO and 2009 NMFS BO. All of the alternatives are compared to  
41 the No Action Alternative and to the Second Basis of Comparison to describe the  
42 effects that could occur in 2030 under both bases of comparison.

43 Several of the 2008 USFWS BO RPA and 2009 NMFS BO RPA actions had been  
44 initiated prior to issuance of the 2009 NMFS BO; those actions are included in the

1 Second Basis of Comparison. Reasonably foreseeable actions included in the No  
2 Action Alternative that are not related to the 2008 USFWS BO or 2009 NMFS  
3 BO are also included in the Second Basis of Comparison.

4 **ES.9.2 No Action Alternative**

5 The definition of the No Action Alternative is based upon the following  
6 assumptions.

- 7 • Continued long-term operation of the CVP and SWP in accordance with  
8 ongoing management policies, criteria, and regulations, including water right  
9 permits and licenses issued by the SWRCB; and operational requirements of  
10 the 2008 USFWS BO and the 2009 NMFS BO.
- 11 • Implementation of existing and future actions described in the 2008 USFWS  
12 BO and 2009 NMFS BO that would occur by 2030 without implementation of  
13 the BOs, including:
  - 14 – 2008 USFWS BO RPA Component 4, Habitat Restoration and 2009  
15 NMFS BO RPA Action I.6.1, Restoration of Floodplain Habitat; and  
16 Action I.6.2, Near-Term Actions at Liberty Island/Lower Cache Slough  
17 and Lower Yolo Bypass; Action I.6.3, Lower Putah Creek Enhancements;  
18 Action I.6.4, Improvements to Lisbon Weir; and Action I.7, Reduce  
19 Migratory Delays and Loss of Salmon, Steelhead, and Sturgeon at  
20 Fremont Weir and Other Structures in the Yolo Bypass - Restoration of  
21 more than 10,000 acres of intertidal and associated subtidal wetlands in  
22 Suisun Marsh and Cache Slough; and at least 17,000 to 20,000 acres of  
23 seasonal floodplain restoration in Yolo Bypass.
  - 24 – 2009 NMFS BO RPA Action I.1.3, Clear Creek Spawning Gravel  
25 Augmentation - Gravel augmentation in Clear Creek in addition to several  
26 gravel augmentation programs in the Sacramento Valley watershed being  
27 implemented in accordance with CVPIA.
  - 28 – 2009 NMFS BO RPA Action I.1.4, Spring Creek Temperature Control  
29 Curtain Replacement - Replacement of the Spring Creek Temperature  
30 Control Curtain.
  - 31 – 2009 NMFS BO RPA Action I.2.6, Restore Battle Creek for Winter-Run,  
32 Spring-Run, and Central Valley Steelhead - Habitat restoration of Battle  
33 Creek.
  - 34 – 2009 NMFS BO RPA Action I.3.1, Operate Red Bluff Diversion Dam  
35 with Gates Out - Implementation of Red Bluff Pumping Plant.
  - 36 – 2009 NMFS BO RPA Action I.5, Funding for CVPIA Anadromous Fish  
37 Screen Program - Implementation of the CVPIA Anadromous Fish Screen  
38 Program.
  - 39 – 2009 NMFS BO RPA Action II.1, Lower American River Flow  
40 Management - Implementation of the American River Flow Management  
41 Standard.

- 1 • Implementation of existing and future actions not described in the 2009
- 2 NMFS BO that would occur by 2030 without implementation of any
- 3 alternatives considered in this EIS, including:
- 4 – Trinity River Restoration Program.
- 5 – Clear Creek Mercury Abatement and Fisheries Restoration Project.
- 6 – Iron Mountain Mine Superfund Site cleanup.
- 7 – Mainstem Sacramento River and American River Gravel Augmentation
- 8 Programs.
- 9 – Nimbus Fish Hatchery Fish Passage Project.
- 10 – Folsom Dam Water Control Manual Update.
- 11 – FERC Relicensing for Middle Fork of the American River Project.
- 12 – Lower Mokelumne River Spawning Habitat Improvement Project.
- 13 – Dutch Slough Tidal Marsh Restoration.
- 14 – Suisun Marsh Habitat Management, Preservation, and Restoration Plan
- 15 Implementation.
- 16 – Tidal Wetland Restoration in the Delta and Suisun Marsh.
- 17 – San Joaquin River Restoration Program.
- 18 – Stockton Deep Water Ship Channel Demonstration Dissolved Oxygen
- 19 Project.
- 20 – Grasslands Bypass Project.
- 21 – Central Valley Salinity Alternatives for Long-Term Sustainability
- 22 (CV-SALTS).
- 23 – Municipal Water Supply Projects identified in Urban Water Management
- 24 Plans that have undergone environmental review and are reasonably
- 25 foreseeable.
- 26 – Water Transfer Projects.

### 27 **ES.9.3 Second Basis of Comparison**

28 The definition of the Second Basis of Comparison is based upon the following  
29 assumptions.

- 30 • Continued long-term operation of the CVP and SWP in accordance with
- 31 ongoing management policies, criteria, and regulations, including water right
- 32 permits and licenses issued by the SWRCB without implementation of the
- 33 2008 USFWS BO and the 2009 NMFS BO.
- 34 • Implementation of existing and future actions that would occur by 2030
- 35 without implementation of the BOs, including actions that have already been
- 36 constructed or have substantial progress:

## Executive Summary

- 1       – Restoration of more than 10,000 acres of intertidal and associated subtidal  
2       wetlands in Suisun Marsh and Cache Slough; and at least 17,000 to  
3       20,000 acres of seasonal floodplain restoration in Yolo Bypass (as being  
4       implemented under a separate program adopted in 2014, Suisun Marsh  
5       Habitat Management, Preservation, and Restoration Plan, and referenced  
6       in 2008 USFWS BO RPA Component 4, Habitat Restoration; and as being  
7       developed under Yolo Bypass Salmonid Habitat Restoration and Fish  
8       Passage Implementation Plan and referenced in 2009 NMFS BO RPA  
9       Action I.6.1, Restoration of Floodplain Habitat; and Action I.6.2, Near-  
10      Term Actions at Liberty Island/Lower Cache Slough and Lower Yolo  
11      Bypass; Action I.6.3, Lower Putah Creek Enhancements; Action I.6.4,  
12      Improvements to Lisbon Weir; and Action I.7, Reduce Migratory Delays  
13      and Loss of Salmon, Steelhead, and Sturgeon at Fremont Weir and Other  
14      Structures in the Yolo Bypass).
- 15      – Gravel augmentation in the Sacramento Valley and Stanislaus River  
16      watershed (as being implemented under a separate program and including  
17      program under CVPIA and referenced in 2009 NMFS BO RPA  
18      Action I.1.3, Clear Creek Spawning Gravel Augmentation).
- 19      – Replacement of the Spring Creek Temperature Control Curtain (as was  
20      constructed and placed into operation in 2011 and referenced in 2009  
21      NMFS BO RPA Action I.1.4, Spring Creek Temperature Control Curtain  
22      Replacement).
- 23      – Habitat restoration of Battle Creek (as being implemented under a separate  
24      program and referenced in 2009 NMFS BO RPA Action I.2.6, Restore  
25      Battle Creek for Winter-Run, Spring-Run, and Central Valley Steelhead).
- 26      – Implementation of Red Bluff Pumping Plant (as was constructed and  
27      placed into operation in 2012 and referenced in 2009 NMFS BO RPA  
28      Action I.3.1, Operate Red Bluff Diversion Dam with Gates Out).
- 29      – Implementation of the CVPIA Anadromous Fish Screen Program (as was  
30      initiated in the 1990s and referenced in 2009 NMFS BO RPA Action I.5,  
31      Funding for CVPIA Anadromous Fish Screen Program).
- 32      – Implementation of the American River Flow Management Standard (as  
33      was initiated in 2006 and referenced in 2009 NMFS BO RPA Action II.1,  
34      Lower American River Flow Management).
- 35      – Trinity River Restoration Program.
- 36      – Clear Creek Mercury Abatement and Fisheries Restoration Project.
- 37      – Iron Mountain Mine Superfund Site cleanup.
- 38      – Mainstem Sacramento River and American River Gravel Augmentation  
39      Programs.
- 40      – Nimbus Fish Hatchery Fish Passage Project.
- 41      – FERC Relicensing for Middle Fork of the American River Project.

- 1       – Lower Mokelumne River Spawning Habitat Improvement Project.
- 2       – Dutch Slough Tidal Marsh Restoration.
- 3       – Tidal Wetland Restoration in the Delta and Suisun Marsh.
- 4       – San Joaquin River Restoration Program.
- 5       – Stockton Deep Water Ship Channel Demonstration Dissolved Oxygen
- 6       Project.
- 7       – Grasslands Bypass Project.
- 8       – Municipal Water Supply Projects identified in Urban Water Management
- 9       Plans that have undergone environmental review and are reasonably
- 10      foreseeable.
- 11      – Water Transfer Projects.

12      **ES.9.4    Alternative 1**

13      Alternative 1 was created because many comments requested an alternative that  
 14      reflected conditions without implementation of the 2008 USFWS BO and the  
 15      2009 NMFS BO RPAs. Since the Second Basis of Comparison is not a true  
 16      alternative, in accordance with NEPA guidelines, Reclamation could not select  
 17      the Second Basis of Comparison as a preferred alternative. Therefore,  
 18      Alternative 1 is identical to the Second Basis of Comparison.

19      **ES.9.5    Alternative 2**

20      Alternative 2 was first included in the Notice of Intent and identified as an initial  
 21      proposed action that included the operational actions of the 2008 USFWS BO and  
 22      2009 NMFS BO. Alternative 2 does not include RPA actions that would require  
 23      future studies and environmental documentation to define recommended actions  
 24      (generally, structural actions). Therefore, Alternative 2 includes the assumptions  
 25      in the No Action Alternative except:

- 26      • 2009 NMFS BO RPA Action I.2.5, Winter-Run Passage and Re-Introduction
- 27      Program at Shasta Dam.
- 28      • 2009 NMFS BO RPA Action II.3, Structural Improvements for Temperature
- 29      Management on the American River.
- 30      • 2009 NMFS BO RPA Action II.5, Fish Passage at Nimbus and Folsom Dams.
- 31      • 2009 NMFS BO RPA Action II.6, Implement Actions to Reduce Genetic
- 32      Effects of Nimbus and Trinity River Fish Hatchery Operations.
- 33      • 2009 NMFS BO RPA Action III.2.1, Increase and Improve Quality of
- 34      Spawning Habitat with Addition of Gravel.
- 35      • 2009 NMFS BO RPA Action III.2.2, Conduct Floodplain Restoration and
- 36      Inundation Flows in Winter or Spring to Inundate Steelhead Juvenile Rearing
- 37      Habitat on Stanislaus River.

- 1 • 2009 NMFS BO RPA Action III.2.3, Restore Freshwater Migratory Habitat  
2 for Juvenile Steelhead on Stanislaus River.
- 3 • 2009 NMFS BO RPA Action III.2.4, Fish Passage at New Melones, Tulloch,  
4 and Goodwin Dams.
- 5 • 2009 NMFS BO RPA Action IV.4, Tracy Fish Collection Facility  
6 Improvements to Reduce Pre-Screen Loss and Improve Screening Efficiency.
- 7 • 2009 NMFS BO RPA Action IV.4.2 Skinner Fish Collection Facility  
8 Improvements to Reduce Pre-Screen Loss and Improve Screening Efficiency.
- 9 • 2009 NMFS BO RPA Action IV.4.3 Tracy Fish Collection Facility and the  
10 Skinner Fish Collection Facility Actions to Improve Salvage Monitoring,  
11 Reporting and Release Survival Rates.
- 12 • 2009 NMFS BO RPA Action V Fish Passage.

### 13 **ES.9.6 Alternative 3**

14 Alternative 3 was developed based upon a scoping comment from the Coalition  
15 for a Sustainable Delta, including actions related to their “RPA Alternative 1,”  
16 and a scoping comment received from Oakdale Irrigation District (OID) and  
17 South San Joaquin Irrigation District (SSJID). The definition of Alternative 3 is  
18 based upon the following assumptions.

- 19 • Continued long-term operation of the CVP and SWP in accordance with  
20 ongoing management policies, criteria, and regulations, including water right  
21 permits and licenses issued by the SWRCB; without the operational  
22 requirements of the 2008 USFWS BO and the 2009 NMFS BO RPAs.
- 23 • Implementation of the 2012 operations plan for New Melones Reservoir  
24 proposed by OID and SSJID.
- 25 • Additional demands for American River water supplies for up to 17,000 acre-  
26 feet/year under a Warren Act contract for El Dorado Irrigation District and  
27 15,000 acre-feet/year under a water service contract for El Dorado County  
28 Water Agency.
- 29 • Implementation of actions described in the scoping comments letter from the  
30 Coalition for a Sustainable Delta related to their “RPA Alternative 1.”
  - 31 – The Old and Middle River (OMR) flow criteria under Alternative 3 are  
32 based on concepts addressed in the 2008 USFWS BO and 2009 NMFS BO  
33 related to adaptive restrictions for temperature, turbidity, salinity, and  
34 presence of Delta Smelt.
  - 35 – Flood control operations for the New Melones Reservoir would be the  
36 same as under the No Action Alternative. However, New Melones  
37 Reservoir would be operated for different fishery flows, water quality  
38 flows, and San Joaquin River base flows and pulse flows at Vernalis.

- 1       – Implement predator control programs for Black Bass, Striped Bass, and  
2       Pikeminnow to protect salmonids and Delta Smelt, including  
3       establishment of new catch limits.
- 4       – Restore or create at least 10,000 acres of tidally influenced seasonal or  
5       perennial wetlands (these conditions are the same as under the No Action  
6       Alternative and Second Basis of Comparison).
- 7       – Establish a trap and haul program for juvenile salmonids entering the  
8       Delta from the San Joaquin River upstream of the Head of Old River in  
9       March through June with a release site near Chipps Island.
- 10      – Modify ocean harvest limits for consistency with Viable Salmonid  
11      Population Standards; including harvest management plan to show that  
12      abundance, productivity, and diversity (age-composition) are not  
13      appreciably reduced.
- 14      • Implementation of future actions that would occur by 2030 without  
15      implementation of any alternatives considered in this EIS, as described above  
16      for the Second Basis of Comparison.

#### 17   **ES.9.7   Alternative 4**

18   Alternative 4 was developed based upon a scoping comment from the Coalition  
19   for a Sustainable Delta, including actions related to their “RPA Alternative 2.”  
20   The definition of Alternative 4 is based upon the following assumptions.

- 21      • Continued long-term operation of the CVP and SWP in accordance with  
22      ongoing management policies, criteria, and regulations, including water right  
23      permits and licenses issued by the SWRCB; without the operational  
24      requirements of the 2008 USFWS BO and the 2009 NMFS BO, as described  
25      under Second Basis of Comparison.
- 26      • Implementation of actions described in the scoping comments letter from the  
27      Coalition for a Sustainable Delta related to their “RPA Alternative 2.”
  - 28         – Limit floodplain development to protect salmonids and Delta Smelt by  
29         incorporating guidance into flood hazard mapping to comply with ESA;  
30         prioritizing consideration of ESA listed species and critical habitats in  
31         flood insurance studies; refine community rating system to provide credits  
32         for natural and beneficial functions; prohibit new development and  
33         substantial improvements to existing development within any designated  
34         floodway or within 170 feet of the ordinary high water line of any  
35         floodway.
  - 36         – Modify the requirements of the U.S. Army Corps of Engineers related to  
37         removal of vegetation on levees to allow for the planting of trees and  
38         shrubs along the levees; and installation of vegetation, woody material,  
39         and root re-enforcement material on the levees instead of riprap for  
40         erosion protection.

- 1       – Implement predator control programs for Black Bass, Striped Bass, and  
2       Pikeminnow to protect salmonids and Delta Smelt, including  
3       establishment of new catch limits.
- 4       – Restore or create at least 10,000 acres of tidally influenced seasonal or  
5       perennial wetlands (these conditions are the same as under the No Action  
6       Alternative and Second Basis of Comparison).
- 7       – Establish a trap and haul program for juvenile salmonids entering the  
8       Delta from the San Joaquin River upstream of the Head of Old River in  
9       March through June with a release site near Chipps Island.
- 10      – Modify ocean harvest limits to reduce by-catch of winter-run and spring-  
11      run Chinook Salmon to less than 10 percent of age-3 cohort in all years.
- 12      • Implementation of future actions that would occur by 2030 without  
13      implementation of any alternatives considered in this EIS, as described above  
14      for the Second Basis of Comparison.

15      **ES.9.8    Alternative 5**

16      Alternative 5 was developed considering comments from environmental interest  
17      groups during the scoping process. Alternative 5 is similar to the No Action  
18      Alternative with reduced potential for reverse flows in April and May and with  
19      associated increased Delta outflow; and use of the SWRCB D-1641 pulse flow at  
20      Vernalis. The definition of Alternative 5 is based upon the following  
21      assumptions.

- 22      • Continued long-term operation of the CVP and SWP in accordance with  
23      ongoing management policies, criteria, and regulations, including water right  
24      permits and licenses issued by the SWRCB; including the requirements of the  
25      2008 USFWS BO and the 2009 NMFS BO.
- 26      • The OMR flow criteria similar to the RPA criteria in the 2008 USFWS BO  
27      and 2009 NMFS BO plus a requirement for positive OMR (no reverse flows)  
28      in April and May of all water year types.
- 29      • New Melones Reservoir operations are similar to assumptions under the No  
30      Action Alternative except additional requirements were added to meet the  
31      SWRCB D-1641 April and May pulse flows at Vernalis on the San Joaquin  
32      River.
- 33      • Additional demands for American River water supplies for up to 17,000 acre-  
34      feet/year under a Warren Act Contract for El Dorado Irrigation District and  
35      15,000 acre-feet/year under a water service contract for El Dorado County  
36      Water Agency.
- 37      • Implementation of future actions that would occur by 2030 without  
38      implementation of any alternatives considered in this EIS, as described above  
39      for the No Action Alternative.

## 1 **ES.10 Impact Analysis**

2 An EIS must evaluate the effects of implementation of the alternatives on the  
3 environment; and identify any adverse environmental effects which cannot be  
4 avoided, the relationship between short-term uses of the human environment and  
5 long-term productivity; and any irreversible or irretrievable commitments of  
6 resources if the alternatives are implemented. The impact analyses section of  
7 each resource chapter (Chapters 5 through 21 of the EIS) address direct, indirect,  
8 and cumulative effects of the alternatives as compared to the No Action  
9 Alternative and the Second Basis of Comparison in the following manner:

- 10 • Alternatives 1 through 5 are compared to the No Action Alternative.
- 11 • Alternatives 1 through 5 and the No Action Alternative are compared to the  
12 Second Basis of Comparison.

13 Potential mitigation measures are presented to the extent possible for each  
14 resource to avoid, minimize, rectify, reduce, eliminate, or compensate for adverse  
15 environmental effects of Alternatives 1 through 5 as compared to the No Action  
16 Alternative. Mitigation measures were not included to address adverse impacts  
17 under the alternatives as compared to the Second Basis of Comparison because  
18 this analysis was included in this EIS for information purposes only.

19 Tables ES.1 and ES.2 present summaries of the environmental changes of  
20 Alternatives 1 through 5 as compared to the No Action Alternative and the  
21 Second Basis of Comparison, respectively. These tables are located at the end of  
22 this Executive Summary.

23 These tables summarize the results of both the quantitative and qualitative impact  
24 analyses. The tables include relative quantitative differences for adverse impacts  
25 to provide a basis for consideration of mitigation measures. Differences in the  
26 quantitative analyses of 5 percent or less are considered to be “similar” because  
27 the modeling analyses are based on CalSim II model output which operates with  
28 monthly time steps. Therefore, it was determined that changes in the model of  
29 5 percent or less were related to the uncertainties in the model processing.

30 Changes in surface water conditions are provided as a basis for identifying the  
31 impacts as described in Aquatic, Terrestrial, and Recreation resources. Therefore,  
32 no mitigation measures are presented for Surface Water Resources.

## 33 **ES.11 Public Involvement and Next Steps**

34 Public involvement was initiated with the scoping process on March 28, 2012,  
35 with the publication of the Notice of Intent in the Federal Register (FR) and  
36 continued through June 28, 2012. Initially, the public scoping process was to be  
37 completed on May 29, 2012. During the public scoping process, other agencies  
38 and interested persons requested an extension of the public scoping period to  
39 allow additional opportunities to provide scoping comments. In response to these  
40 requests, Reclamation published a notice on May 25, 2012, extending the public

## Executive Summary

1 scoping period through June 28, 2012. Reclamation held five scoping meetings  
2 which were attended by 256 individuals. Scoping comments were used in the  
3 development of a reasonable range of alternatives and identification of key issues.

4 Reclamation also posted on its website an initial range of alternatives discussed at  
5 a stakeholders meeting on October 19, 2012. Several project status meetings were  
6 held with cooperating agencies and other stakeholders during preparation of the  
7 Draft EIS. Comments received during these processes were used to refine the  
8 description of the alternatives.

9 The Draft EIS was issued for public review in July 2015. Reclamation posted  
10 notification of the availability of the Public Draft EIS and the location and timing  
11 of four public meetings on its website, in the Federal Register, and through press  
12 releases. Approximately 860 written and verbal comments were received on the  
13 Draft EIS. All of the comments received on the Draft EIS were considered in  
14 preparation of the Final EIS. Written responses to all substantive comments  
15 received are included in Appendices 1A through 1E of the Final EIS.

16 Reclamation will make the Final EIS available for 30 days before finalizing the  
17 Record of Decision (ROD). In the ROD, which is the final step in the NEPA  
18 process, Reclamation will document its decision on which actions, if any, to take  
19 to address the primary objectives. Reclamation will also identify the  
20 Environmentally Preferred Alternative, describe other risk reduction plans it  
21 considered, identify any mitigation plans, and describe factors and comments  
22 taken into consideration when making its decision.

1 **Table ES.1 Comparison of Alternatives 1 through 5 to the No Action Alternative**

	<b>Alternative 1 Compared to the No Action Alternative</b>	<b>Alternative 2 Compared to the No Action Alternative</b>	<b>Alternative 3 Compared to the No Action Alternative</b>	<b>Alternative 4 Compared to the No Action Alternative</b>	<b>Alternative 5 Compared to the No Action Alternative</b>
<b>Surface Water</b>					
Trinity Lake	Water surface elevations similar. Storage similar or increased.	No change.	Water surface elevations similar. Storage similar or increased.	Water surface elevations similar. Storage similar or increased.	Water surface elevations similar. Storage similar or increased.
Trinity River at Lewiston Dam	Flows similar or increased.	No change.	Flows similar or increased.	Flows similar or increased.	Water surface elevations similar. Storage similar.
Shasta Lake	Water surface elevations similar. Storage similar or increased.	No change.	Water surface elevations similar. Storage similar or increased.	Water surface elevations similar. Storage similar or increased.	Water surface elevations similar. Storage similar.
Sacramento River at Keswick Dam	Flows similar or increased except reduced in September and November (up to 44%).	No change.	Flows similar or increased except reduced in September and November (up to 42%).	Flows similar or increased except reduced in September and November (up to 44%).	Flows similar.
Sacramento River at Freeport	Flows similar or increased except reduced in September and November (up to 47%).	No change.	Flows similar or increased except reduced in September and November (up to 48%).	Flows similar or increased except reduced in September and November (up to 47%).	Flows similar.
Clear Creek near Igo	Flows same except reduced in May (41%).	No change.	Flows same except reduced in May (29%).	Flows same except reduced in May (41%).	No change.
Lake Oroville	Water surface elevations similar. Storage reduced except in June (up to 22%).	No change.	Water surface elevations similar. Storage similar or increased.	Water surface elevations similar. Storage reduced except in June (up to 22%).	Water surface elevations similar. Storage similar.

Executive Summary

	<b>Alternative 1 Compared to the No Action Alternative</b>	<b>Alternative 2 Compared to the No Action Alternative</b>	<b>Alternative 3 Compared to the No Action Alternative</b>	<b>Alternative 4 Compared to the No Action Alternative</b>	<b>Alternative 5 Compared to the No Action Alternative</b>
Feather River downstream of Themalito Complex	Flows similar or increased except reduced in July-September and November-December (up to 65%).	No change.	Flows similar or increased except reduced in July-September and October-January (up to 70%).	Flows similar or increased except reduced in July-September and November-December (up to 65%).	Flows similar or increased except reduced in April-May (up to 27%).
Folsom Lake	Water surface elevations similar Storage similar or increased except reduced in June-August in above normal and below normal years (up to 15%).	No change.	Water surface elevations similar Storage similar or increased except reduced in July-August in above normal and August-September in below normal years (up to 10%).	Water surface elevations similar Storage similar or increased except in reduced June-August in above normal and below normal years (up to 15%).	Water surface elevations similar. Storage similar.
American River at Nimbus Dam	Flows similar or increased except reduced in September-November and June-July (up to 48%).	No change.	Flows similar or increased except reduced in August-November and June (up to 46%).	Flows similar or increased except reduced in September-November and June-July (up to 48%).	Flows similar or increased except reduced in September and April-May (up to 14%).
New Melones Reservoir	Water surface elevations similar Storage similar or increased.	No change.	Water surface elevations similar Storage similar or increased.	Water surface elevations similar Storage similar or increased.	Water surface elevations similar. Storage reduced in July-September in above normal years (up to 6%); and all months in below normal, dry, and critical dry years (up to 19 percent).
Stanislaus River at Goodwin Dam	Flows similar or increased except reduced in July-August, December, and March (up to 18%).	No change.	Flows similar or increased except reduced in October and February-July (up to 73%).	Flows similar or increased except reduced in July-August, December, and March (up to 18%).	Flows similar or increased except reduced in June-August (up to 18%).

	<b>Alternative 1 Compared to the No Action Alternative</b>	<b>Alternative 2 Compared to the No Action Alternative</b>	<b>Alternative 3 Compared to the No Action Alternative</b>	<b>Alternative 4 Compared to the No Action Alternative</b>	<b>Alternative 5 Compared to the No Action Alternative</b>
San Joaquin River at Vernalis	Flows similar or increased except reduced in October and April (up to 19%).	No change.	Flows similar or increased except reduced in October and May-June (up to 21%).	Flows similar or increased except reduced in October and April (up to 19%).	Flows similar or increased.
San Luis Reservoir	Water surface elevations similar Storage similar or increased.	No change.	Water surface elevations similar Storage similar or increased.	Water surface elevations similar Storage similar or increased.	Water surface elevations similar Storage similar or increased except in below normal years in June-July (up to 9%); in dry years in April-September (up to 17%); and in critical dry years in April-January (up to 18%).
Flows into Yolo Bypass	Flows similar or increased except in October in wet years (20%).	No change.	Flows similar or increased except in October in wet years (25%).	Flows similar or increased except in October in wet years (20%).	Flows similar.
Delta Outflow	Reduced flows in many months. Increased flows in some months, including in December, February-March, and June in wet years (up to 1,492 cfs); and similar or increased flows in June and September in dry years (up to 385 cfs).	No change.	Reduced flows in many months. Increased flows in some months, including in December-March, in wet years (up to 3,307cfs); and increased flows in January-February and June-July in dry years (up to 277 cfs).	Reduced flows in many months. Increased flows in some months, including in December, February-March, and June in wet years (up to 1,492 cfs); and similar or increased flows in June and September in dry years (up to 385 cfs).	Flows would be similar or increased.
Reverse Flows in Old and Middle Rivers	Increased negative flows except in July-September.	No change.	Increased negative flows except in July-September.	Increased negative flows except in July-September.	Increased positive flows except in July-August.

Executive Summary

<b>Surface Water Quality</b>					
Salinity in Northern Delta (near Emmaton)	Salinity increased in fall and winter months (up to 377%). Reduced in June in wet to dry years (up to 30%). Potential Mitigation Measures: Continued coordination of CVP and SWP operations to reduce salinity to the extent possible. Other mitigation measures have not been identified at this time.	No change. No mitigation needed.	Salinity increased in fall and winter months in wet and above normal years (up to 378%). Reduced in June of above normal years and September of below normal years (up to 8%). Potential Mitigation Measures: Continued coordination of CVP and SWP operations to reduce salinity to the extent possible. Other mitigation measures have not been identified at this time.	Salinity increased in the western Delta in fall and winter months (up to 377%). Potential Mitigation Measures: Continued coordination of CVP and SWP operations to reduce salinity to the extent possible. Other mitigation measures have not been identified at this time.	Salinity increased in January-February in all years (up to 8%). Reduced in April-June in critical dry years (up to 15%). Potential Mitigation Measures: Continued coordination of CVP and SWP operations to reduce salinity to the extent possible. Other mitigation measures have not been identified at this time.
Salinity in Western Delta (near Port Chicago)	Salinity increased in Oct-March in below normal, dry, and critical dry years, and September wet and above normal years (up to 96%). Potential Mitigation Measures: Continued coordination of CVP and SWP operations to reduce salinity to the extent possible. Other mitigation measures have not been identified at this time.	No change. No mitigation needed.	Salinity increased in October-January, April-May, June, and September in wet and above normal years (up to 95%). Potential Mitigation Measures: Continued coordination of CVP and SWP operations to reduce salinity to the extent possible. Other mitigation measures have not been identified at this time.	Salinity increased in Oct-March in below normal, dry, and critical dry years, and September wet and above normal years (up to 96%). Potential Mitigation Measures: Continued coordination of CVP and SWP operations to reduce salinity to the extent possible. Other mitigation measures have not been identified at this time.	Salinity similar in most months except reduced in April-May in dry and critical dry years (up to 8%). No mitigation needed.

Executive Summary

	<b>Alternative 1 Compared to the No Action Alternative</b>	<b>Alternative 2 Compared to the No Action Alternative</b>	<b>Alternative 3 Compared to the No Action Alternative</b>	<b>Alternative 4 Compared to the No Action Alternative</b>	<b>Alternative 5 Compared to the No Action Alternative</b>
Salinity in Western Central Delta (near Antioch)	Salinity increased in fall and winter months (up to 265%). Reduced in June in wet to below normal years (up to 14%). Potential Mitigation Measures: Continued coordination of CVP and SWP operations to reduce salinity to the extent possible. Other mitigation measures have not been identified at this time.	No change. No mitigation needed.	Salinity increased in fall and winter months (up to 262%). Potential Mitigation Measures: Continued coordination of CVP and SWP operations to reduce salinity to the extent possible. Other mitigation measures have not been identified at this time.	Salinity increased in fall and winter months (up to 265%). Reduced in June in wet to below normal years (up to 14%). Potential Mitigation Measures: Continued coordination of CVP and SWP operations to reduce salinity to the extent possible. Other mitigation measures have not been identified at this time.	Salinity increased in February in critical dry years (7%). Reduced in April-May in below normal to critical dry years, and in June in critical dry years (up to 20%). Potential Mitigation Measures: Continued coordination of CVP and SWP operations to reduce salinity to the extent possible. Other mitigation measures have not been identified at this time.
Salinity in Western Central Delta (near Contra Costa Water District Intakes)	Salinity increased in October-January and September in wet and above normal years (up to 65%). Reduced in March-June in wet to below normal years (up to 32%). Potential Mitigation Measures: Continued coordination of CVP and SWP operations to reduce salinity to the extent possible. Other mitigation measures have not been identified at this time.	No change. No mitigation needed.	Salinity increased in October-December in all year types, and January in above normal to dry years, and in September in wet and above normal years (up to 76%). Reduced in April-June (up to 34%). Potential Mitigation Measures: Continued coordination of CVP and SWP operations to reduce salinity to the extent possible. Other mitigation measures have not been identified at this time.	Salinity increased in October-January and September in wet and above normal years (up to 65%). Reduced in March-June in wet to below normal years (up to 32%). Potential Mitigation Measures: Continued coordination of CVP and SWP operations to reduce salinity to the extent possible. Other mitigation measures have not been identified at this time.	Salinity increased in April-June in below normal to critical dry years (up to 40%). Potential Mitigation Measures: Continued coordination of CVP and SWP operations to reduce salinity to the extent possible. Other mitigation measures have not been identified at this time.

Recreational Economics Related to Striped Bass Fishing in Delta	Similar conditions. No mitigation needed.	No change. No mitigation needed.	Reduced recreational opportunities and associated economics. No mitigation identified at this time.	Reduced recreational opportunities and associated economics. No mitigation identified at this time.	Similar conditions. No mitigation needed.
Commercial and Sport Ocean Salmon Fishing	Similar conditions. No mitigation needed.	No change. No mitigation needed.	Reduced commercial and sport ocean salmon fishing and associated economics. No mitigation identified at this time.	Reduced commercial and sport ocean salmon fishing and associated economics. No mitigation identified at this time.	Similar conditions. No mitigation needed.
<b>Indian Trust Assets</b>					
Potential for Disturbance of Indian Trust Assets	No change. No mitigation needed.	No change. No mitigation needed.	No change. No mitigation needed.	No change. No mitigation needed.	No change. No mitigation needed.
<b>Environmental Justice</b>					
Emissions of Criteria Air Pollutants and Precursors and/or Exposure of Sensitive Receptors to Substantial Concentrations of Air Contaminants from Diesel Engines at Groundwater Wells	Improved air quality conditions. No mitigation needed.	No change. No mitigation needed.	Reduced air quality conditions. No mitigation needed.	Improved air quality conditions. No mitigation needed.	Similar air quality conditions. No mitigation needed.
Potential Exposure to Mercury in Fish in Delta	Similar or reduced concentrations. No mitigation needed.	No change. No mitigation needed.	Similar or reduced concentrations. No mitigation needed.	Similar or reduced concentrations. No mitigation needed.	Similar concentrations. No mitigation needed.

Executive Summary

1 **Table ES.2 Comparison of Alternatives 1 through 5 and the No Action Alternative to the Second Basis of Comparison**

	No Action Alternative Compared to Second Basis of Comparison	Alternative 1 Compared to the Second Basis of Comparison	Alternative 2 Compared to the Second Basis of Comparison	Alternative 3 Compared to the Second Basis of Comparison	Alternative 4 Compared to the Second Basis of Comparison	Alternative 5 Compared to the Second Basis of Comparison
<b>Surface Water Conditions</b>						
Trinity Lake	Water surface elevations similar Storage would be similar in most months, except reduced in November-December in above normal years (up to 6%) and all months in critical dry years (up to 10%).	No change.	Water surface elevations similar Storage would be similar in most months, except reduced in November-December in above normal years (up to 6%) and all months in critical dry years (up to 10%).	Water surface elevations similar Storage similar or increased.	No change.	Water surface elevations similar Storage would be similar in most months, except reduced in all months in critical dry years (up to 10%).
Trinity River at Lewiston Dam	Flows similar or increased except reduced in December-February in wet to below normal years (up to 30%).	No change.	Flows similar or increased except reduced in December-February in wet to below normal years (up to 30%).	Flows similar or increased.	No change.	Flows similar or increased except reduced in December-February in wet to below normal years (up to 21%).
Shasta Lake	Water surface elevations similar Storage reduced in September-February in wet to dry years (up to 11%) and in all months in critical dry years (up to 14%).	No change.	Water surface elevations similar Storage reduced in September-February in wet to dry years (up to 11%) and in all months in critical dry years (up to 14%).	Water surface elevations similar Storage similar or increased.	No change.	Water surface elevations similar Storage reduced in September-February in most months of wet to dry years (up to 10%), and in all months in critical dry years (up to 17%).

	<b>No Action Alternative Compared to Second Basis of Comparison</b>	<b>Alternative 1 Compared to the Second Basis of Comparison</b>	<b>Alternative 2 Compared to the Second Basis of Comparison</b>	<b>Alternative 3 Compared to the Second Basis of Comparison</b>	<b>Alternative 4 Compared to the Second Basis of Comparison</b>	<b>Alternative 5 Compared to the Second Basis of Comparison</b>
Sacramento River at Keswick Dam	Flows reduced (up to 21%) except September and November.	No change.	Flows reduced (up to 21%) except September and November.	Flows similar or increased except reduced in August in below normal years (up to 6%).	No change.	Flows reduced (up to 16%) except September and November.
Sacramento River at Freeport	Flows similar or increased except reduced in May and June (up to 27%).	No change.	Flows similar or increased except reduced in May and June (up to 27%).	Flows similar or increased except reduced in June in below normal years (up to 13%).	No change.	Flows similar or increased except reduced in May and June (up to 28%).
Clear Creek near Igo	Flows similar or increased.	No change.	Flows similar or increased.	No change.	No change.	Flows similar or increased.
Lake Oroville	Water surface elevations similar. Similar in most months May-July in wet to dry years and in all months in critical dry years. Reduced in many months from September-February in all year types (up to 18%).	No change.	Water surface elevations similar. Similar in most months May-July in wet to dry years and in all months in critical dry years. Reduced in many months from September-February in all year types (up to 18%).	Water surface elevations similar. Storage similar.	No change.	Water surface elevations similar. Similar in most months May-July in wet to dry years and in all months in critical dry years. Reduced in many months from September-February in all year types (up to 18%).
Feather River downstream of Thermalito Complex	Flows similar or increased except reduced in August-June (up to 52%).	No change.	Flows similar or increased except reduced in August-June (up to 52%).	Flows similar or increased except reduced in August-June (up to 28%).	No change.	Flows similar or increased except reduced in August-June (up to 58%).

Executive Summary

	<b>No Action Alternative Compared to Second Basis of Comparison</b>	<b>Alternative 1 Compared to the Second Basis of Comparison</b>	<b>Alternative 2 Compared to the Second Basis of Comparison</b>	<b>Alternative 3 Compared to the Second Basis of Comparison</b>	<b>Alternative 4 Compared to the Second Basis of Comparison</b>	<b>Alternative 5 Compared to the Second Basis of Comparison</b>
Folsom Lake	Water surface elevations similar Storage similar in many months except reduced flows in September-January (up to 12%) in wet to below normal years and July-September in critical dry years (up to 11%).	No change.	Water surface elevations similar Storage similar in many months except reduced flows in September-January (up to 12%) in wet to below normal years and July-September in critical dry years (up to 11%).	Water surface elevations similar Storage similar.	No change.	Water surface elevations similar Storage similar in many months except reduced flows in August-January (up to 13%) in wet to below normal years and July in critical dry years (8%).
American River at Nimbus Dam	Flows similar or increased except reduced in June-August, December, February, and April (up to 25%).	No change.	Flows similar or increased except reduced in June-August, December, February, and April (up to 25%).	Flows similar or increased except reduced flows in June-August and April (up to 17%).	No change.	Flows similar or increased except reduced in December-February, April, June, and August (up to 25%).
New Melones Reservoir	Water surface elevations similar Storage similar in wet, below normal, and dry years, and in most months in above normal and critical dry years. Storage reduced in October in above normal water years (6%) and in October-January and April-June in critical dry years (up to 7%).	No change.	Water surface elevations similar Storage similar in wet, below normal, and dry years, and in most months in above normal and critical dry years. Storage reduced in October in above normal water years (6%) and in October-January and April-June in critical dry years (up to 7%).	Water surface elevations similar Storage similar or increased.	No change.	Water surface elevations similar Storage reduced in all months in all water year types (up to 23%).

	<b>No Action Alternative Compared to Second Basis of Comparison</b>	<b>Alternative 1 Compared to the Second Basis of Comparison</b>	<b>Alternative 2 Compared to the Second Basis of Comparison</b>	<b>Alternative 3 Compared to the Second Basis of Comparison</b>	<b>Alternative 4 Compared to the Second Basis of Comparison</b>	<b>Alternative 5 Compared to the Second Basis of Comparison</b>
Stanislaus River at Goodwin Dam	Flows similar or increased except reduced in November-March and May-June (up to 25%).	No change.	Flows similar or increased except reduced in November-March and May-June (up to 25%).	Flows reduced in all months (up to 79%) except April and August.	No change.	Flows reduced in all months (up to 25%) except October, April, and May.
San Joaquin River at Vernalis	Flows similar or increased except reduced in November and May-June (up to 9%).	No change.	Flows similar or increased except reduced in November and May-June (up to 9%).	Flows similar or increased except reduced in May-June (up to 27%).	No change.	Flows similar or increased except reduced in November and June (up to 10%).

Executive Summary

	<b>No Action Alternative Compared to Second Basis of Comparison</b>	<b>Alternative 1 Compared to the Second Basis of Comparison</b>	<b>Alternative 2 Compared to the Second Basis of Comparison</b>	<b>Alternative 3 Compared to the Second Basis of Comparison</b>	<b>Alternative 4 Compared to the Second Basis of Comparison</b>	<b>Alternative 5 Compared to the Second Basis of Comparison</b>
San Luis Reservoir	Water surface elevations reduced in all months in wet to below normal water years and in February-September in dry and critical dry years (up to 16%). Storage reduced in October-June in most water years (up to 71%).	No change.	Water surface elevations reduced in all months in wet to below normal water years and in February-September in dry and critical dry years (up to 16%). Storage reduced in October-June in most water years (up to 71%).	Water surface elevations similar except reduced in January-February in above normal years (up to 6%) and February-August in critical dry years (up to 7%). Storage similar or increased in some months except in December-February and June in wet years (up to 16%), October-July in above normal and below normal years (up to 40%), January-September in dry years (up to 19%), and October-August in critical dry years (up to 29%).	No change.	Water surface elevations reduced in all months in all year types (up to 70%). Storage would be reduced in October-August in wet to below normal years (up to 17%), in January-September in dry years (up to 14%), and in all months in critical dry years (up to 14%).

Flows into Yolo Bypass	Flows similar or increased except reduced in November-December in wet years (up to 15%), January-March in above normal years (14%), December-March in below normal years (up to 25%), and December in dry years (6%).	No change.	Flows similar or increased except reduced in November-December in wet years (up to 15%), January-March in above normal years (14%), December-March in below normal years (up to 25%), and December in dry years (6%).	Flows similar except reduced in October of wet years (6%).	No change.	Flows similar or increased except reduced in November-January in wet years (up to 15%), January-March in above normal years (15%), December-March in below normal years (up to 24%), and December in dry years (7%).
Delta Outflow	Flows similar or increased in many months. Reduced flows in some months, including in December, February-March, and June in wet years (up to 1,590 cfs).	No change.	Flows similar or increased in many months. Reduced flows in some months, including in December, February-March, and June in wet years (up to 1,590 cfs).	Flows would increase in many months. Reduced flows in some months, including October and March-June in wet years (up to 1,127 cfs), and October and May-June in dry years (up to 373 cfs).	No change.	Flows similar or increased in many months. Reduced flows in some months, including in December, February-March, and June in wet years (up to 1,713 cfs), and June in dry years (526 cfs).
Reverse Flows in Old and Middle Rivers	Increased positive flows except in June-August in most years and March in wet years.	No change.	Increased positive flows except in June-August in most years and March in wet years.	Increased negative flows in June-August in most years and March in wet years.	No change.	Increased negative flows in July-August in most years and March and June in wet years.

Executive Summary

North of Delta: SWP Water Deliveries under Table A without Article 21 water	Deliveries reduced up to 18% over the long-term to 22% in critical dry years.	No change.	Deliveries reduced up to 18% over the long-term to 22% in critical dry years.	Deliveries similar over the long-term and in dry years. Reduced by 11% in critical dry years.	No change.	Deliveries reduced up to 19% over the long-term to 23% in critical dry years.
<b>Surface Water Quality</b>						
Salinity in Northern Delta (near Emmaton)	Salinity increased in June in wet to dry years (up to 21%). Reduced in fall and winter months in wet and above normal years (up to 79%).	No change.	Salinity increased in June in wet to dry years (up to 21%). Reduced in fall and winter months in wet and above normal years (up to 79%).	Salinity increased in June in wet to dry years (up to 35%). Reduced in fall and winter months in wet and above normal years (up to 24%).	No change.	Salinity increased in June in wet to dry years (up to 21%). Reduced in fall and winter months in wet and above normal years (up to 79%).
Salinity in Western Delta (near Port Chicago)	Salinity reduced in September-May (up to 49%).	No change.	Salinity reduced in September-May (up to 49%).	Salinity increased in June in wet to below normal years (up to 9%). Reduced in January-March (up to 25%).	No change.	Salinity reduced in September-May (up to 49%).
Salinity in Western Central Delta (near Antioch)	Salinity increased in June in wet to below normal years (up to 16%). Reduced in fall and winter months (up to 73%).	No change.	Salinity increased in June in wet to below normal years (up to 16%). Reduced in fall and winter months (up to 73%).	Salinity increased in May in wet years and June in wet to dry years (up to 20%). Reduced in January-April (up to 40%).	No change.	Salinity increased in June in wet to below normal years (up to 14%). Reduced in fall and winter months (up to 73%).

Executive Summary

	<b>No Action Alternative Compared to Second Basis of Comparison</b>	<b>Alternative 1 Compared to the Second Basis of Comparison</b>	<b>Alternative 2 Compared to the Second Basis of Comparison</b>	<b>Alternative 3 Compared to the Second Basis of Comparison</b>	<b>Alternative 4 Compared to the Second Basis of Comparison</b>	<b>Alternative 5 Compared to the Second Basis of Comparison</b>
Salinity in Western Central Delta (near Contra Costa Water District Intakes)	Salinity increased in March-June (up to 47%). Reduced in October-January and September (up to 42%).	No change.	Salinity increased in March-June (up to 47%). Reduced in October-January and September (up to 42%).	Salinity increased in March-April in dry and critical dry years (up to 16%). Reduced in December-February in dry and critical dry years (up to 23%).	No change.	Salinity increased in March-June (up to 63%). Reduced in October-January and September (up to 41%).
Salinity in Southern Delta (near CVP and SWP intakes)	Salinity increased in February-June (up to 23%). Reduced in October-January (up to 28%).	No change.	Salinity increased in February-June (up to 23%). Reduced in October-January (up to 28%).	Salinity increased in February-May in dry and critical dry years (up to 23%).	No change.	Salinity increased in February-June (up to 26%). Reduced in October-January (up to 28%).
Mercury in Delta Fish	Mercury concentrations increased near Rock Slough, San Joaquin River at Antioch, and Montezuma Slough (up to 7%).	No change.	Mercury concentrations increased near Rock Slough, San Joaquin River at Antioch, and Montezuma Slough (up to 7%).	Similar conditions.	No change.	Mercury concentrations increased near Rock Slough, San Joaquin River at Antioch, and Montezuma Slough (up to 7%).
Selenium in Delta and Delta Fish	Selenium concentrations similar concentrations.	No change.	Selenium concentrations similar concentrations.	Selenium concentrations similar concentrations.	No change.	Selenium concentrations similar concentrations.
<b>Groundwater Resources</b>						
Trinity River Region	Similar groundwater conditions.	No change.	Similar groundwater conditions.	Similar groundwater conditions.	No change.	Similar groundwater conditions.
Central Valley Region: Sacramento Valley	Similar groundwater conditions.	No change.	Similar groundwater conditions.	Similar groundwater conditions.	No change.	Similar groundwater conditions.

	<b>No Action Alternative Compared to Second Basis of Comparison</b>	<b>Alternative 1 Compared to the Second Basis of Comparison</b>	<b>Alternative 2 Compared to the Second Basis of Comparison</b>	<b>Alternative 3 Compared to the Second Basis of Comparison</b>	<b>Alternative 4 Compared to the Second Basis of Comparison</b>	<b>Alternative 5 Compared to the Second Basis of Comparison</b>
Central Valley Region: San Joaquin Valley	Increased groundwater pumping (8%); and lower groundwater elevations (2-200 feet). Potentially reduced groundwater quality. Increased subsidence potential.	No change.	Increased groundwater pumping (8%); and lower groundwater elevations (2-200 feet). Potentially reduced groundwater quality. Increased subsidence potential.	Similar groundwater pumping; and similar to lower groundwater elevations (2-25 feet). Similar groundwater quality. Similar subsidence potential.	No change.	Increased groundwater pumping (8%); and lower groundwater elevations (2-200 feet). Potentially reduced groundwater quality. Increased subsidence potential.
San Francisco Bay Area, Central Coast, and Southern California Region	Potentially increased groundwater pumping; and potentially lower groundwater elevations. Potentially reduced groundwater quality. Increased subsidence potential.	No change.	Potentially increased groundwater pumping; and potentially lower groundwater elevations. Potentially reduced groundwater quality. Increased subsidence potential.	Potentially increased groundwater pumping; and potentially lower groundwater elevations. Potentially reduced groundwater quality. Increased subsidence potential.	No change.	Potentially increased groundwater pumping; and potentially lower groundwater elevations. Potentially reduced groundwater quality. Increased subsidence potential.
<b>CVP and SWP Energy Resources</b>						
Energy Generated and Used by CVP and SWP Water Users	Similar CVP net generation. Increased net generation over the long-term (29%). Potentially increased energy use by CVP and SWP water users.	No change.	Similar CVP net generation. Increased net generation over the long-term (29%). Potentially increased energy use by CVP and SWP water users.	Similar CVP net generation. Increased net generation over the long-term (10%). Potentially increased energy use by CVP and SWP water users.	No change.	Similar CVP net generation. Increased net generation over the long-term (30%). Potentially increased energy use by CVP and SWP water users.

<b>Aquatic Resources</b>						
Trinity River: Coho Salmon	Similar conditions.	No change.	Similar conditions.	Similar conditions.	No change.	Similar conditions.
Trinity River: Spring-run Chinook Salmon	Similar conditions.	No change.	Similar conditions.	Similar conditions.	No change.	Similar conditions.
Trinity River: Fall-run Chinook Salmon	Similar conditions.	No change.	Similar conditions.	Similar conditions.	No change.	Similar conditions.
Trinity River: Steelhead	Similar conditions.	No change.	Similar conditions.	Similar conditions.	No change.	Similar conditions.
Trinity River: Green Sturgeon	Similar conditions.	No change.	Similar conditions.	Similar conditions.	No change.	Similar conditions.
Trinity Lake and Lewiston Reservoir: Reservoir Fish	Similar conditions.	No change.	Similar conditions.	Similar conditions.	No change.	Similar conditions.
Trinity River: Pacific Lamprey	Similar conditions.	No change.	Similar conditions.	Similar conditions.	No change.	Similar conditions.
Trinity River: Eulachon	Similar conditions.	No change.	Similar conditions.	Similar conditions.	No change.	Similar conditions.
Sacramento River System: Winter-run Chinook Salmon	Improved habitat conditions due to fish passage at dams and other actions to address high water temperatures caused by climate change by 2030.	No change.	Similar conditions.	Improved habitat conditions due to improved escapement potential and predator controls.	Similar conditions.	Improved habitat conditions due to fish passage at dams and other actions to address high water temperatures caused by climate change by 2030.

	<b>No Action Alternative Compared to Second Basis of Comparison</b>	<b>Alternative 1 Compared to the Second Basis of Comparison</b>	<b>Alternative 2 Compared to the Second Basis of Comparison</b>	<b>Alternative 3 Compared to the Second Basis of Comparison</b>	<b>Alternative 4 Compared to the Second Basis of Comparison</b>	<b>Alternative 5 Compared to the Second Basis of Comparison</b>
Sacramento River System: Spring-run Chinook Salmon	Improved habitat conditions due to fish passage at dams and other actions to address high water temperatures caused by climate change by 2030.	No change.	Similar conditions.	Improved habitat conditions due to harvest limitations and predator controls.	Similar conditions.	Improved habitat conditions due to fish passage at dams and other actions to address high water temperatures caused by climate change by 2030.
Sacramento River System: Fall-run Chinook Salmon	Similar conditions.	No change.	Similar conditions.	Similar conditions.	Similar conditions.	Similar conditions.
Sacramento River System: Late Fall-run Chinook Salmon	Improved habitat conditions due to measures to increase efficiency of fish handling facilities at Banks and Jones pumping plants.	No change.	Similar conditions.	Similar conditions.	Similar conditions.	Improved habitat conditions due to measures to increase efficiency of fish handling facilities at Banks and Jones pumping plants.

Executive Summary

	<b>No Action Alternative Compared to Second Basis of Comparison</b>	<b>Alternative 1 Compared to the Second Basis of Comparison</b>	<b>Alternative 2 Compared to the Second Basis of Comparison</b>	<b>Alternative 3 Compared to the Second Basis of Comparison</b>	<b>Alternative 4 Compared to the Second Basis of Comparison</b>	<b>Alternative 5 Compared to the Second Basis of Comparison</b>
Sacramento River System: Steelhead	Improved habitat conditions due to fish passage programs to address high water temperatures caused by climate change by 2030; and measures to increase efficiency of fish handling facilities at Banks and Jones pumping plants.	No change.	Similar conditions.	Similar conditions.	Similar conditions.	Improved habitat conditions due to fish passage programs to address high water temperatures caused by climate change by 2030; and measures to increase efficiency of fish handling facilities at Banks and Jones pumping plants.
Sacramento River System: Green Sturgeon and White Sturgeon	Reduced habitat conditions due to lack of measures to address high water temperatures caused by climate change by 2030 that are not improved by other actions.	No change.	Similar conditions.	Improved habitat conditions due to lower water temperatures.	No change.	Reduced habitat conditions due to lack of measures to address high water temperatures caused by climate change by 2030 that are not improved by other actions.
Delta: Delta Smelt	Improved habitat conditions due to reduced potential for entrainment during larval and juvenile stages, and reduced salinity in the fall in the western Delta.	No change.	Similar conditions.	Similar conditions.	No change.	Improved habitat conditions due to reduced potential for entrainment during larval and juvenile stages, and reduced salinity in the fall in the western Delta.

Terrestrial Resources along Rivers Downstream of CVP and SWP Reservoirs	Similar or improved conditions along Trinity, Sacramento, American, and Stanislaus rivers. Reduced conditions along Feather River. No mitigation measures identified at this time for changes along Feather River.	No change.	Similar or improved conditions along Trinity, Sacramento, American, and Stanislaus rivers. Reduced conditions along Feather River. No mitigation measures identified at this time for changes along Feather River.	Similar or improved conditions along Trinity, Sacramento, Feather, and American rivers. Reduced conditions along Stanislaus River. No mitigation measures identified at this time for changes along Stanislaus River.	No change.	Similar or improved conditions along Trinity, American, and Stanislaus rivers. Reduced conditions along Feather and Sacramento rivers. No mitigation measures identified at this time for changes along Feather and Sacramento rivers.
Terrestrial Resources in Yolo Bypass	Similar conditions in Yolo Bypass.	No change.	Similar conditions in Yolo Bypass.	Similar conditions in Yolo Bypass.	No change.	Similar or reduced conditions in Yolo Bypass.

Executive Summary

	<b>No Action Alternative Compared to Second Basis of Comparison</b>	<b>Alternative 1 Compared to the Second Basis of Comparison</b>	<b>Alternative 2 Compared to the Second Basis of Comparison</b>	<b>Alternative 3 Compared to the Second Basis of Comparison</b>	<b>Alternative 4 Compared to the Second Basis of Comparison</b>	<b>Alternative 5 Compared to the Second Basis of Comparison</b>
Terrestrial Resources in Western Delta	Increased extent of freshwater habitat in western Delta.	No change.	Increased extent of freshwater habitat in western Delta.	Similar conditions.	No change.	Increased extent of freshwater habitat in western Delta.
<b>Geology and Soils Resources</b>						
Geology and Soils Resources	Similar conditions.	No change.	Similar conditions.	Similar conditions.	No change.	Similar conditions.
<b>Agricultural Resources</b>						
Agricultural Production and Employment	Similar conditions.	No change.	Similar conditions.	Similar conditions.	No change.	Similar conditions.
<b>Land Use</b>						
Municipal and Industrial Land Use	Similar conditions.	No change.	Similar conditions.	Similar conditions.	No change.	Similar conditions.
<b>Visual Resources</b>						
Visual Resources of Land Irrigated with CVP and SWP Water	Similar conditions.	No change.	Similar conditions.	Similar conditions.	No change.	Similar conditions.

	<b>No Action Alternative Compared to Second Basis of Comparison</b>	<b>Alternative 1 Compared to the Second Basis of Comparison</b>	<b>Alternative 2 Compared to the Second Basis of Comparison</b>	<b>Alternative 3 Compared to the Second Basis of Comparison</b>	<b>Alternative 4 Compared to the Second Basis of Comparison</b>	<b>Alternative 5 Compared to the Second Basis of Comparison</b>
Visual Resources at Reservoirs that Store CVP and SWP Water	<p>Similar conditions at Trinity Lake, Shasta Lake, Lake Oroville, and New Melones Reservoir.</p> <p>Similar conditions at San Luis Reservoir in above normal to dry years.</p> <p>Reduced conditions at San Luis Reservoir in wet and critical dry years (up to 6%).</p> <p>Potentially reduced conditions in the San Francisco Bay Area, Central Coast, and Southern California regions (up to 18%).</p>	No change.	<p>Similar conditions at Trinity Lake, Shasta Lake, Lake Oroville, and New Melones Reservoir.</p> <p>Similar conditions at San Luis Reservoir in above normal to dry years.</p> <p>Reduced conditions at San Luis Reservoir in wet and critical dry years (up to 6%).</p> <p>Potentially reduced conditions in the San Francisco Bay Area, Central Coast, and Southern California regions (up to 18%).</p>	Similar conditions.	No change.	<p>Similar conditions at Trinity Lake, Shasta Lake, Lake Oroville, and New Melones Reservoir.</p> <p>Similar conditions at San Luis Reservoir in above normal to dry years.</p> <p>Reduced conditions at San Luis Reservoir in wet and critical dry years (up to 9%).</p> <p>Potentially reduced conditions in the San Francisco Bay Area, Central Coast, and Southern California regions (up to 18%).</p>

Executive Summary

Recreation Resources in Rivers downstream of CVP and SWP Reservoirs	Similar or improved conditions; except reduced conditions in June and August along the Feather and American rivers, and in May along the Feather River and Sacramento River near Freeport.	No change.	Similar or improved conditions; except reduced conditions in June and August along the Feather and American rivers, and in May along the Feather River and Sacramento River near Freeport.	Similar or improved conditions along rivers. Reduced opportunities for Striped Bass and sport ocean salmon fishing.	No change along rivers. Reduced opportunities for Striped Bass and sport ocean salmon fishing.	Similar or improved conditions; except reduced conditions in May and June and August along the Sacramento and Feather rivers, in August along the American River; and in June-August along Stanislaus River.
<b>Air Quality and Greenhouse Gas Emissions</b>						
Emissions of Criteria Air Pollutants and Precursors and/or Exposure of Sensitive Receptors to Substantial Concentrations of Air Contaminants from Diesel Engines at Groundwater Wells	Similar air quality conditions in the Trinity River Region and Sacramento Valley. Potential increase in emissions (up to 18%) in the San Joaquin Valley and the San Francisco Bay Area, Central Coast, and Southern California regions.	No change.	Similar air quality conditions in the Trinity River Region and Sacramento Valley. Potential increase in emissions (up to 18%) in the San Joaquin Valley and the San Francisco Bay Area, Central Coast, and Southern California regions.	Similar conditions.	No change.	Similar air quality conditions in the Trinity River Region and Sacramento Valley. Potential increase in emissions (up to 18%) in the San Joaquin Valley and the San Francisco Bay Area, Central Coast, and Southern California regions.

Executive Summary

	<b>No Action Alternative Compared to Second Basis of Comparison</b>	<b>Alternative 1 Compared to the Second Basis of Comparison</b>	<b>Alternative 2 Compared to the Second Basis of Comparison</b>	<b>Alternative 3 Compared to the Second Basis of Comparison</b>	<b>Alternative 4 Compared to the Second Basis of Comparison</b>	<b>Alternative 5 Compared to the Second Basis of Comparison</b>
Increased Greenhouse Gas Emissions due to Changes in Energy Resources Related to CVP and SWP Water Use	Overall changes are not known at this time due to complexity of energy demands associated with alternative water supplies. However, GHG emissions could be reduced in the San Francisco Bay Area, Central Coast, and Southern California regions.	No change.	Overall changes are not known at this time due to complexity of energy demands associated with alternative water supplies. However, GHG emissions could be reduced in the San Francisco Bay Area, Central Coast, and Southern California regions.	Overall changes are not known at this time due to complexity of energy demands associated with alternative water supplies. However, GHG emissions could be reduced in the San Francisco Bay Area, Central Coast, and Southern California regions.	No change.	Overall changes are not known at this time due to complexity of energy demands associated with alternative water supplies. However, GHG emissions could be reduced in the San Francisco Bay Area, Central Coast, and Southern California regions.
<b>Cultural Resources</b>						
Potential for Disturbance of Cultural Resources	Similar conditions.	No change.	Similar conditions.	Similar conditions.	No change.	Similar conditions.
<b>Public Health</b>						
Water Supply Availability for Wildland Firefighting	Similar conditions at Trinity Lake, Shasta Lake, Lake Oroville, Folsom Lake, and New Melones Reservoir. Reduced potential at San Luis Reservoir (6%).	No change.	Similar conditions at Trinity Lake, Shasta Lake, Lake Oroville, Folsom Lake, and New Melones Reservoir. Reduced potential at San Luis Reservoir (6%).	Similar conditions.	No change.	Similar conditions at Trinity Lake, Shasta Lake, Lake Oroville, Folsom Lake, and New Melones Reservoir. Reduced potential at San Luis Reservoir (9%).
Potential Exposure to Mercury in Fish in Delta	Increased near Rock Slough, San Joaquin River at Antioch, and Montezuma Slough (up to 7%).	No change.	Increased near Rock Slough, San Joaquin River at Antioch, and Montezuma Slough (up to 7%).	Similar conditions.	No change.	Increased near Rock Slough, San Joaquin River at Antioch, and Montezuma Slough (up to 7%).

1 **Tables**

2 ES.1 Comparison of Alternatives 1 through 5 to the No Action Alternative.. ES-19

3 ES.2 Comparison of Alternatives 1 through 5 and the No Action

4 Alternative to the Second Basis of Comparison ..... ES-40

5 3.1 Application of Screening Criteria to Alternative Concepts

6 Identified for Consideration in the EIS ..... 3-27

7 3.2 Annual Fishery Flow Allocation in New Melones ..... 3-41

8 3.3 Monthly “Base” Flows for Fisheries Purposes Based on the

9 Annual Fishery Volume ..... 3-41

10 3.4 April 1 through May 31 “Pulse” Flows for Fisheries Purposes

11 Based on the Annual Fishery Volume ..... 3-41

12 3.5 Bay-Delta Vernalis Flow Objectives (average monthly cfs) ..... 3-47

13 3.6 Comparison of Alternatives 1 through 5 to No Action Alternative..... 3-66

14 3.7 Comparison of No Action Alternative and Alternatives 1

15 through 5 to Second Basis of Comparison..... 3-86

16 4.1 Geographic Range of the EIS Analysis ..... 4-4

17 5.1 Major Central Valley Project and Orland Project Reservoirs..... 5-7

18 5.2 State Water Project Reservoirs ..... 5-9

19 5.3 Major Non-Central Valley Project and Non-State Water

20 Project Reservoirs in the Sacramento Valley Watershed

21 Considered in this EIS ..... 5-10

22 5.4 Major Non-Central Valley Project and Non-State Water

23 Project Reservoirs in the San Joaquin Valley Watersheds

24 Considered in this EIS ..... 5-11

25 5.5 Major Non-Central Valley Project and Non-State Water

26 Project Reservoirs in the San Francisco Bay Area Region

27 Used to Store Central Valley Project and/or State Water

28 Project Water ..... 5-12

29 5.6 Major Non-Central Valley Project and Non-State Water

30 Project Reservoirs in the Central Coast Region Used to

31 Store State Water Project Water ..... 5-12

32 5.7 Major Non-Central Valley Project and Non-State Water

33 Project Reservoirs in the Southern California Region Used

34 to Store State Water Project Water ..... 5-13

35 5.8 Old and Middle River Criteria under the 2009 NMFS BO..... 5-51

36 5.9 Inflow:Export Ratios under the 2009 NMFS BO ..... 5-52

37 5.10 Future Long-Term Average Municipal Water Supply

38 Assumptions for CVP and SWP Water Users ..... 5-73

39 5.11 Changes in Trinity Lake Storage under the No Action

40 Alternative as Compared to the Second Basis of Comparison ..... 5-78

1 5.12 Changes in Trinity Lake Elevation under the No Action  
 2 Alternative as Compared to the Second Basis of Comparison ..... 5-79  
 3 5.13 Changes in Shasta Lake Storage under the No Action  
 4 Alternative as Compared to the Second Basis of Comparison ..... 5-81  
 5 5.14 Changes in Shasta Lake Elevation under the No Action  
 6 Alternative as Compared to the Second Basis of Comparison ..... 5-82  
 7 5.15 Changes in Lake Oroville Storage under the No Action  
 8 Alternative as Compared to the Second Basis of Comparison ..... 5-84  
 9 5.16 Changes in Lake Oroville Elevation under the No Action  
 10 Alternative as Compared to the Second Basis of Comparison ..... 5-85  
 11 5.17 Changes in Folsom Lake Storage under the No Action  
 12 Alternative as Compared to the Second Basis of Comparison ..... 5-87  
 13 5.18 Changes in Folsom Lake Elevation under the No Action  
 14 Alternative as Compared to the Second Basis of Comparison ..... 5-88  
 15 5.19 Changes in Clear Creek Flows below Whiskeytown Dam  
 16 under the No Action Alternative as Compared to the  
 17 Second Basis of Comparison ..... 5-90  
 18 5.20 Changes in New Melones Reservoir Storage under the No Action  
 19 Alternative as Compared to the Second Basis of Comparison ..... 5-91  
 20 5.21 Changes in New Melones Reservoir Elevation under the No Action  
 21 Alternative as Compared to the Second Basis of Comparison ..... 5-92  
 22 5.22 Changes in San Luis Reservoir Storage under the No Action  
 23 Alternative as Compared to the Second Basis of Comparison ..... 5-94  
 24 5.23 Changes in San Luis Reservoir Elevation under the No Action  
 25 Alternative as Compared to the Second Basis of Comparison ..... 5-95  
 26 5.24 Changes in Flows into the Yolo Bypass at Fremont Weir  
 27 under the No Action Alternative as Compared to the Second  
 28 Basis of Comparison ..... 5-97  
 29 5.25 Changes in Exports at Jones and Banks Pumping Plants  
 30 under the No Action Alternative as Compared to the  
 31 Second Basis of Comparison ..... 5-99  
 32 5.26 Changes in CVP Water Deliveries under the No Action  
 33 Alternative as Compared to the Second Basis of Comparison ..... 5-100  
 34 5.27 Changes in SWP Water Deliveries under the No Action  
 35 Alternative as Compared to the Second Basis of Comparison ..... 5-103  
 36 5.28 Changes in Trinity Lake Storage under Alternative 1 as  
 37 Compared to the No Action Alternative ..... 5-107  
 38 5.29 Changes in Trinity Lake Elevation under Alternative 1 as  
 39 Compared to the No Action Alternative ..... 5-108  
 40 5.30 Changes in Shasta Lake Storage under Alternative 1 as  
 41 Compared to the No Action Alternative ..... 5-110

Contents

1 5.31 Changes in Shasta Lake Elevation under Alternative 1 as  
2 Compared to the No Action Alternative ..... 5-111

34 Compared to the No Action Alternative ..... 5-139

35 5.48 Changes in Shasta Lake Elevation under Alternative 3 as  
36 Compared to the No Action Alternative ..... 5-140

37 5.49 Changes in Lake Oroville Storage under Alternative 3 as  
38 Compared to the No Action Alternative ..... 5-142

39 5.50 Changes in Lake Oroville Elevation under Alternative 3 as  
40 Compared to the No Action Alternative ..... 5-143

41 5.51 Changes in Folsom Lake Storage under Alternative 3 as  
42 Compared to the No Action Alternative ..... 5-145

1 5.52 Changes in Folsom Lake Elevation under Alternative 3 as  
2 Compared to the No Action Alternative ..... 5-146

3 5.53 Changes in Clear Creek Flows below Whiskeytown Dam under  
4 Alternative 3 as Compared to the No Action Alternative..... 5-148

5 5.54 Changes in New Melones Reservoir Storage under Alternative 3 as  
6 Compared to the No Action Alternative ..... 5-149

7 5.55 Changes in New Melones Reservoir Elevation under Alternative 3 as  
8 Compared to the No Action Alternative ..... 5-150

9 5.56 Changes in San Luis Reservoir Storage under Alternative 3  
10 as Compared to the No Action Alternative..... 5-152

11 5.57 Changes in San Luis Reservoir Elevation under Alternative 3  
12 as Compared to the No Action Alternative..... 5-153

13 5.58 Changes in Flows into the Yolo Bypass at Fremont Weir under  
14 Alternative 3 as Compared to the No Action Alternative..... 5-155

15 5.59 Changes in Exports at Jones and Banks Pumping Plants under  
16 Alternative 3 as Compared to the No Action Alternative..... 5-157

17 5.60 Changes CVP Water Deliveries under Alternative 3  
18 as Compared to the No Action Alternative..... 5-159

19 5.61 Changes SWP Water Deliveries under Alternative 3  
20 as Compared to the No Action Alternative..... 5-161

21 5.62 Changes in Trinity Lake Storage under Alternative 3  
22 as Compared to the Second Basis of Comparison ..... 5-165

23 5.63 Changes in Trinity Lake Elevation under Alternative 3 as  
24 Compared to the Second Basis of Comparison..... 5-166

25 5.64 Changes in Shasta Lake Storage under Alternative 3 as  
26 Compared to the Second Basis of Comparison..... 5-167

27 5.65 Changes in Shasta Lake Elevation under Alternative 3 as  
28 Compared to the Second Basis of Comparison..... 5-168

29 5.66 Changes in Lake Oroville Storage under Alternative 3 as  
30 Compared to the Second Basis of Comparison..... 5-169

31 5.67 Changes in Lake Oroville Elevation under Alternative 3 as  
32 Compared to the Second Basis of Comparison..... 5-170

33 5.68 Changes in Folsom Lake Storage under Alternative 3 as  
34 Compared to the Second Basis of Comparison..... 5-172

35 5.69 Changes in Folsom Lake Elevation under Alternative 3 as  
36 Compared to the Second Basis of Comparison..... 5-173

37 5.70 Changes in Clear Creek Flows below Whiskeytown Dam under  
38 Alternative 3 as Compared to the Second Basis of Comparison ..... 5-174

39 5.71 Changes in New Melones Reservoir Storage under  
40 Alternative 3 as Compared to the Second Basis of Comparison ..... 5-175

41 5.72 Changes in New Melones Reservoir Elevation under  
42 Alternative 3 as Compared to the Second Basis of Comparison ..... 5-176

Contents

1 5.73 Changes in San Luis Reservoir Storage under Alternative 3  
2 as Compared to the Second Basis of Comparison ..... 5-178  
3 5.74 Changes in San Luis Reservoir Elevation under Alternative 3  
4 as Compared to the Second Basis of Comparison ..... 5-179  
5 5.75 Changes in Flows into the Yolo Bypass at Fremont Weir under  
6 Alternative 3 as Compared to the Second Basis of Comparison ..... 5-181  
7 5.76 Changes in Exports at Jones and Banks Pumping Plants under  
8 Alternative 3 as Compared to the Second Basis of Comparison ..... 5-183  
9 5.77 Changes CVP Water Deliveries under Alternative 3  
10 as Compared to the Second Basis of Comparison ..... 5-184  
11 5.78 Changes SWP Water Deliveries under Alternative 3  
12 as Compared to the Second Basis of Comparison ..... 5-187  
13 5.79 Changes in Trinity Lake Storage under Alternative 5  
14 as Compared to the No Action Alternative..... 5-192  
15 5.80 Changes in Trinity Lake Elevation under Alternative 5  
16 as Compared to the No Action Alternative..... 5-193  
17 5.81 Changes in Shasta Lake Storage under Alternative 5  
18 as Compared to the No Action Alternative..... 5-194  
19 5.82 Changes in Shasta Lake Elevation under Alternative 5  
20 as Compared to the No Action Alternative..... 5-195  
21 5.83 Changes in Lake Oroville Storage under Alternative 5  
22 as Compared to the No Action Alternative..... 5-197  
23 5.84 Changes in Lake Oroville Elevation under Alternative 5  
24 as Compared to the No Action Alternative..... 5-198  
25 5.85 Changes in Folsom Lake Storage under Alternative 5  
26 as Compared to the No Action Alternative..... 5-200  
27 5.86 Changes in Folsom Lake Elevation under Alternative 5  
28 as Compared to the No Action Alternative..... 5-201  
29 5.87 Changes in Clear Creek Flows below Whiskeytown Dam  
30 under Alternative 5 as Compared to the No Action Alternative..... 5-202  
31 5.88 Changes in New Melones Reservoir Storage under  
32 Alternative 5 as Compared to the No Action Alternative..... 5-203  
33 5.89 Changes in New Melones Reservoir Elevation under  
34 Alternative 5 as Compared to the No Action Alternative..... 5-204  
35 5.90 Changes in San Luis Reservoir Storage under Alternative 5  
36 as Compared to the No Action Alternative..... 5-206  
37 5.91 Changes in San Luis Reservoir Elevation under Alternative 5  
38 as Compared to the No Action Alternative..... 5-207  
39 5.92 Changes in Flows into the Yolo Bypass at Fremont Weir  
40 under Alternative 5 as Compared to the No Action Alternative..... 5-209  
41 5.93 Changes in Exports at Jones and Banks Pumping Plants  
42 under Alternative 5 as Compared to the No Action Alternative..... 5-211

1 5.94 Changes CVP Water Deliveries under Alternative 5 as  
2 Compared to the No Action Alternative ..... 5-212

3 5.95 Changes SWP Water Deliveries under the Alternative 5 as  
4 Compared to the No Action Alternative ..... 5-215

5 5.96 Changes in Trinity Lake Storage under Alternative 5 as  
6 Compared to the Second Basis of Comparison..... 5-219

7 5.97 Changes in Trinity Lake Elevation under Alternative 5 as  
8 Compared to the Second Basis of Comparison..... 5-220

9 5.98 Changes in Shasta Lake Storage under Alternative 5 as  
10 Compared to the Second Basis of Comparison..... 5-222

11 5.99 Changes in Shasta Lake Elevation under Alternative 5 as  
12 Compared to the Second Basis of Comparison..... 5-223

13 5.100 Changes in Lake Oroville Storage under Alternative 5 as  
14 Compared to the Second Basis of Comparison..... 5-225

15 5.101 Changes in Lake Oroville Elevation under Alternative 5 as  
16 Compared to the Second Basis of Comparison..... 5-226

17 5.102 Changes in Folsom Lake Storage under Alternative 5 as  
18 Compared to the Second Basis of Comparison..... 5-228

19 5.103 Changes in Folsom Lake Elevation under Alternative 5 as  
20 Compared to the Second Basis of Comparison..... 5-229

21 5.104 Changes in Clear Creek Flows below Whiskeytown Dam under  
22 Alternative 5 as Compared to the Second Basis of Comparison ..... 5-231

23 5.105 Changes in New Melones Reservoir Storage under Alternative 5  
24 as Compared to the Second Basis of Comparison ..... 5-232

25 5.106 Changes in New Melones Reservoir Elevation under Alternative 5  
26 as Compared to the Second Basis of Comparison ..... 5-233

27 5.107 Changes in San Luis Reservoir Storage under Alternative 5  
28 as Compared to the Second Basis of Comparison ..... 5-235

29 5.108 Changes in San Luis Elevation Storage under Alternative 5  
30 as Compared to the Second Basis of Comparison ..... 5-236

31 5.109 Changes in Flows into the Yolo Bypass at Fremont Weir under  
32 Alternative 5 as Compared to the Second Basis of Comparison ..... 5-238

33 5.110 Changes in Exports at Jones and Banks Pumping Plants under  
34 Alternative 5 as Compared to the Second Basis of Comparison ..... 5-240

35 5.111 Changes CVP Water Deliveries under Alternative 5 as  
36 Compared to the Second Basis of Comparison..... 5-242

37 5.112 Changes SWP Water Deliveries under Alternative 5 as  
38 Compared to the Second Basis of Comparison..... 5-245

39 5.113 Comparison of Surface Water Conditions under Alternatives 1  
40 through 5 to the No Action Alternative ..... 5-248

41 5.114 Comparison of CVP and SWP Water Supply Deliveries  
42 under Alternatives 1 through 5 to the No Action Alternative..... 5-261

Contents

1 5.115 Comparison of Surface Water Conditions under the  
2 No Action Alternative and Alternatives 1 through 5 to the  
3 Second Basis of Comparison ..... 5-263  
4 5.116 Comparison of CVP and SWP Water Supply Deliveries  
5 under the No Action Alternative and Alternatives 1 through 5  
6 to the Second Basis of Comparison ..... 5-273  
7 5.117 Summary of Cumulative Effects on Water Supply Deliveries  
8 under Alternatives 1 through 5 as Compared to the  
9 No Action Alternative ..... 5-276  
10 6.1 Constituents of Concern per the 303(d) list within the Study Area ..... 6-2  
11 6.2 Designated Beneficial Uses within Project Study Area ..... 6-13  
12 6.3 Water Quality Criteria for Mercury and Methylmercury  
13 (as Total Mercury) ..... 6-21  
14 6.4 Draft Water Quality Criteria for Selenium ..... 6-24  
15 6.5 Water Quality Objectives for Temperature in the Trinity River ..... 6-30  
16 6.6 Trinity River Temperature Criteria for the Hoopa Valley Indian  
17 Reservation ..... 6-31  
18 6.7 Tributary Temperature Criteria for the Hoopa Valley  
19 Indian Reservation ..... 6-32  
20 6.8 Monthly Average of Water Temperatures Recorded at Trinity River  
21 Compliance Locations ..... 6-33  
22 6.9 Specific Use Water Quality Criteria for Waters of the Hoopa Valley  
23 Indian Reservation ..... 6-35  
24 6.10 Water Quality Objectives for Dissolved Oxygen in Trinity  
25 and Lower Klamath ..... 6-37  
26 6.11 Specific Use Water Quality Criteria for Waters of the Hoopa Valley  
27 Indian Reservation ..... 6-38  
28 6.12 Site Specific Objectives for Dissolved Oxygen in the Klamath River .. 6-38  
29 6.13 Water Quality Objectives for Dissolved Oxygen for Specified  
30 Beneficial Uses ..... 6-39  
31 6.14 Water Quality Objectives for Temperature in the Sacramento River .... 6-43  
32 6.15a Monthly Average of Water Temperatures Recorded at  
33 Sacramento River Compliance Locations in °F ..... 6-43  
34 6.15b Streambed Sediment Concentrations of Mercury in the  
35 Sacramento River and Delta Regions ..... 6-49  
36 6.16 San Joaquin River Maximum Temperature Criteria and  
37 Recommended Uses for Summer ..... 6-60  
38 6.17 Water Quality Objectives for Selenium in the San Joaquin River  
39 Region, mg/l ..... 6-61  
40 6.18 SWRCB Water quality objectives for electrical conductivity  
41 in the San Joaquin River (Airport Way Bridge, Vernalis) ..... 6-63

1 6.19 Fish and Waterborne Methylmercury (as Total Mercury)  
2 Concentrations by Delta Subarea..... 6-69

3 6.20 Historical Methylmercury Concentrations in the Five Delta  
4 Source Waters for the Period 2000-2008..... 6-70

5 6.21 Water Quality Objectives for Total Mercury in the Delta  
6 within the San Francisco Bay Region..... 6-72

7 6.22 Water Quality Objectives for total mercury in the Delta  
8 within the Central Valley ..... 6-72

9 6.23 Selenium Concentrations in Largemouth Bass ..... 6-74

10 6.24 Selenium Concentrations in Water at Inflow Sources to the Delta ..... 6-76

11 6.25 Water Quality Objectives for Total Mercury in Suisun Marsh..... 6-81

12 6.26 Percentage of Observations Exceeding Water Quality Objectives for  
13 Dissolved Oxygen..... 6-83

14 6.27 List of Surface Water Quality Constituents Considered for  
15 this Analysis..... 6-94

16 6.28 Changes in Mercury Concentrations 350-millimeter Largemouth  
17 Bass over the Long-term Average Conditions under the No Action  
18 Alternative as Compared to the Second Basis of Comparison ..... 6-103

19 6.29 Changes in Mercury Concentrations 350-millimeter Largemouth  
20 Bass in Dry and Critical Dry Years under the No Action  
21 Alternative as Compared to the Second Basis of Comparison ..... 6-104

22 6.30 Changes in Mercury Concentrations 350-millimeter Largemouth  
23 Bass over the Long-term Average Conditions under Alternative 1  
24 as Compared to the No Action Alternative..... 6-108

25 6.31 Changes in Mercury Concentrations 350-millimeter Largemouth  
26 Bass in Dry and Critical Dry Years under the Alternative 1  
27 as Compared to the No Action Alternative..... 6-109

28 6.32 Changes in Mercury Concentrations 350-millimeter Largemouth  
29 Bass over the Long-term Average Conditions under  
30 Alternative 3 as Compared to the No Action Alternative..... 6-113

31 6.33 Changes in Mercury Concentrations 350-millimeter Largemouth  
32 Bass in Dry and Critical Dry Years under the Alternative 3  
33 as Compared to the No Action Alternative..... 6-114

34 6.34 Changes in Mercury Concentrations 350-millimeter Largemouth  
35 Bass over the Long-term Average Conditions under  
36 Alternative 3 as Compared to the Second Basis of Comparison ..... 6-118

37 6.35 Changes in Mercury Concentrations 350-millimeter Largemouth  
38 Bass in Dry and Critical Dry Years under Alternative 3  
39 as Compared to the Second Basis of Comparison ..... 6-119

40 6.36 Changes in Mercury Concentrations 350-millimeter Largemouth  
41 Bass over the Long-term Average Conditions under  
42 Alternative 5 as Compared to the No Action Alternative..... 6-123

Contents

1 6.37 Changes in Mercury Concentrations 350-millimeter Largemouth  
2 Bass in Dry and Critical Dry Years under the Alternative 5  
3 as Compared to the No Action Alternative..... 6-124  
4 6.38 Changes in Mercury Concentrations 350-millimeter Largemouth  
5 Bass over the Long-term Average Conditions under Alternative 5  
6 as Compared to the Second Basis of Comparison ..... 6-128  
7 6.39 Changes in Mercury Concentrations 350-millimeter Largemouth  
8 Bass in Dry and Critical Dry Years under Alternative 5  
9 as Compared to the Second Basis of Comparison ..... 6-129  
10 6.40 Comparison of Alternatives 1 through 5 to No Action Alternative..... 6-132  
11 6.41 Comparison of No Action Alternative and Alternatives 1 through 5  
12 to Second Basis of Comparison ..... 6-135  
13 6.42 Summary of Cumulative Effects on Water Quality of Alternatives 1  
14 through 5 as Compared to the No Action Alternative ..... 6-139  
15 7.1 Adjudicated Groundwater Basins in the Study Area ..... 7-2  
16 7.2 County Groundwater Ordinances in the Study Area with a Summary  
17 of Regulations ..... 7-5  
18 7.3 Comparison of Alternatives 1 through 5 to No Action Alternative..... 7-141  
19 7.4 Comparison of No Action Alternative and Alternatives 1 through 5  
20 to Second Basis of Comparison ..... 7-143  
21 7.5 Summary of Cumulative Effects on Groundwater Resources of  
22 Alternatives 1 through 5 as Compared to the No Action Alternative.. 7-145  
23 8.1 Central Valley Project Hydroelectric Powerplants ..... 8-3  
24 8.2 State Water Project Hydroelectric Powerplants..... 8-5  
25 8.3 Hydropower Generation and Energy Use by the CVP ..... 8-8  
26 8.4 Hydropower Generation and Energy Use by the State Water Project ..... 8-9  
27 8.5 Energy Generation, Energy Use, and Net Generation under  
28 the No Action Alternative as Compared to the Second Basis  
29 of Comparison..... 8-15  
30 8.6 Energy Generation, Energy Use, and Net Generation under  
31 Alternative 1 as Compared to the No Action Alternative..... 8-17  
32 8.7 Energy Generation, Energy Use, and Net Generation under  
33 Alternative 3 as Compared to the No Action Alternative..... 8-19  
34 8.8 Energy Generation, Energy Use, and Net Generation under  
35 Alternative 3 as Compared to the Second Basis of Comparison ..... 8-21  
36 8.9 Energy Generation, Energy Use, and Net Generation under  
37 Alternative 5 as Compared to the No Action Alternative..... 8-23  
38 8.10 Energy Generation, Energy Use, and Net Generation under  
39 Alternative 5 as Compared to the Second Basis of Comparison ..... 8-24  
40 8.11 Comparison of Alternatives 1 through 5 to No Action Alternative..... 8-26  
41 8.12 Comparison of No Action Alternative and Alternatives 1  
42 through 5 to Second Basis of Comparison..... 8-27

1 8.13 Summary of Cumulative Effects on Energy Resources of  
2 Alternatives 1 through 5 as Compared to the No Action Alternative.... 8-28

3 9.1 Focal Fish Species by Region of Occurrence ..... 9-2

4 9.2 Total Production (Number of Individuals) of Central Valley  
5 Fall-run Chinook Salmon in the Pacific Ocean  
6 and Ocean Harvest 1992-2011 ..... 9-104

7 9.3 Water Temperature Objectives ..... 9-117

8 9.4 Comparison of Alternatives 1 through 5 to No Action Alternative..... 9-409

9 9.5 Comparison of No Action Alternative and Alternatives 1  
10 through 5 to Second Basis of Comparison..... 9-423

11 9.6 Summary of Cumulative Effects on Fish and Aquatic  
12 Resources of Alternatives 1 through 5 as Compared to the  
13 No Action Alternative..... 9-439

14 10.1 Terrestrial Species with Designated Critical Habitat in Portions  
15 of the Study Area that Could Be Affected by Changes in CVP  
16 and SWP Operations ..... 10-4

17 10.2 Comparison of Alternatives 1 through 5 to No Action Alternative..... 10-85

18 10.3 Comparison of No Action Alternative and Alternatives 1 through 5  
19 to Second Basis of Comparison ..... 10-86

20 10.4 Summary of Cumulative Effects on Terrestrial Resources of  
21 Alternatives 1 through 5 as Compared to the No Action Alternative.. 10-88

22 11.1 Comparison of Alternatives 1 through 5 to No Action Alternative..... 11-30

23 11.2 Comparison of No Action Alternative and Alternatives 1 through 5  
24 to Second Basis of Comparison ..... 11-31

25 11.3 Summary of Cumulative Effects on Geology and Soils Resources  
26 with Implementation of Alternatives 1 through 5 as Compared  
27 to the No Action Alternative..... 11-31

28 12.1 Salinity Tolerance of Selected Crops (as percent of maximum yield) .. 12-6

29 12.2 Typical Establishment Costs for Some Perennial Crops  
30 in the Central Valley ..... 12-11

31 12.3 Land Rent, Labor Hours, and Custom Services for Example  
32 Crops in the Central Valley..... 12-11

33 12.4 Irrigation Methods Used in Westlands Water District, as a  
34 Percentage of Total Irrigation Methods ..... 12-14

35 12.5 Average Annual Agricultural Acreage and Value of Production  
36 in Trinity, Humboldt, and Del Norte Counties from 2007  
37 through 2012 ..... 12-16

38 12.6 Sacramento Valley Average Annual Agricultural Acreage and  
39 Value of Production from 2007 through 2012 ..... 12-17

40 12.7 Farmland Mapping and Monitoring Program Acreages in the  
41 Sacramento Valley in 2000 and 2010 ..... 12-17

Contents

1 12.8 San Joaquin Valley Average Annual Agricultural Acreage and  
2 Value of Production from 2007 through 2012..... 12-19

3 12.9 Farmland Mapping and Monitoring Program Acreages in the  
4 San Joaquin Valley in 2000 and 2010..... 12-19

5 12.10 San Francisco Bay Area Average Annual Agricultural Acreage  
6 and Value from 2007 through 2012 ..... 12-20

7 12.11 Farmland Mapping and Monitoring Program Acreages in the  
8 San Francisco Bay Area Region in 2000 and 2010 ..... 12-20

9 12.12 Central Coast Region Average Annual Agricultural Acreage  
10 and Value from 2007 through 2012 ..... 12-21

11 12.13 Farmland Mapping and Monitoring Program Acreages in the  
12 Central Coast and Southern California Regions in 2000 and 2010 ..... 12-21

13 12.14 Southern California Average Annual Agricultural Acreage and  
14 Value from 2007 through 2012..... 12-22

15 12.15 Farmland Mapping and Monitoring Program Acreages in the  
16 Southern California Region in 2000 and 2010 ..... 12-22

17 12.16 Changes in Sacramento Valley Irrigated Acreage over the  
18 Long-term Average Conditions under the No Action  
19 Alternative as Compared to the Second Basis of Comparison ..... 12-27

20 12.17 Changes in Sacramento Valley Irrigated Acreage in Dry and  
21 Critical Dry Years under the No Action Alternative as Compared  
22 to the Second Basis of Comparison ..... 12-27

23 12.18 Changes in Sacramento Valley Agricultural Production  
24 over the Long-term Average Conditions under the No Action  
25 Alternative as Compared to the Second Basis of Comparison ..... 12-28

26 12.19 Changes in Sacramento Valley Agricultural Production in Dry  
27 and Critical Dry Years under the No Action Alternative as  
28 Compared to the Second Basis of Comparison..... 12-28

29 12.20 Changes in San Joaquin Valley Irrigated Acreage over the  
30 Long-term Average Conditions under the No Action Alternative  
31 as Compared to the Second Basis of Comparison ..... 12-29

32 12.21 Changes in San Joaquin Valley Irrigated Acreage in Dry and  
33 Critical Dry Years under the No Action Alternative as Compared  
34 to the Second Basis of Comparison ..... 12-30

35 12.22 Changes in San Joaquin Valley Agricultural Production over the  
36 Long-term Average Conditions under the No Action Alternative as  
37 Compared to the Second Basis of Comparison..... 12-30

38 12.23 Changes in San Joaquin Valley Agricultural Production in Dry and  
39 Critical Dry Years under the No Action Alternative as Compared  
40 to the Second Basis of Comparison ..... 12-31

41 12.24 Changes in Sacramento Valley Irrigated Acreage over the  
42 Long-term Average Conditions under Alternative 1 as Compared  
43 to the No Action Alternative..... 12-32

1 12.25 Changes in Sacramento Valley Irrigated Acreage in Dry and  
2 Critical Dry Years under Alternative 1 as Compared to the  
3 No Action Alternative..... 12-33

4 12.26 Changes in Sacramento Valley Agricultural Production over the  
5 Long-term Average Conditions under Alternative 1 as Compared  
6 to the No Action Alternative..... 12-33

7 12.27 Changes in Sacramento Valley Agricultural Production in Dry  
8 and Critical Dry Years under Alternative 1 as Compared to the  
9 No Action Alternative..... 12-34

10 12.28 Changes in San Joaquin Valley Irrigated Acreage over the  
11 Long-term Average Conditions under Alternative 1 as Compared  
12 to the No Action Alternative..... 12-34

13 12.29 Changes in San Joaquin Valley Irrigated Acreage in Dry and  
14 Critical Dry Years under Alternative 1 as Compared to the  
15 No Action Alternative..... 12-35

16 12.30 Changes in San Joaquin Valley Agricultural Production over the  
17 Long-term Average Conditions under Alternative 1 as  
18 Compared to the No Action Alternative ..... 12-35

19 12.31 Changes in San Joaquin Valley Agricultural Production in Dry  
20 and Critical Dry Years under Alternative 1 as Compared to  
21 the No Action Alternative..... 12-36

22 12.32 Changes in Sacramento Valley Irrigated Acreage over the  
23 Long-term Average Conditions under Alternative 3 as  
24 Compared to the No Action Alternative ..... 12-37

25 12.33 Changes in Sacramento Valley Irrigated Acreage in Dry  
26 and Critical Dry Years under Alternative 3 as Compared to the  
27 No Action Alternative..... 12-38

28 12.34 Changes in Sacramento Valley Agricultural Production  
29 over the Long-term Average Conditions under Alternative 3  
30 as Compared to the No Action Alternative..... 12-38

31 12.35 Changes in Sacramento Valley Agricultural Production in Dry  
32 and Critical Dry Years under Alternative 3 as Compared to  
33 the No Action Alternative..... 12-39

34 12.36 Changes in San Joaquin Valley Irrigated Acreage over the  
35 Long-term Average Conditions under Alternative 3 as Compared  
36 to the No Action Alternative..... 12-40

37 12.37 Changes in San Joaquin Valley Irrigated Acreage in Dry and  
38 Critical Dry Years under Alternative 3 as Compared to the  
39 No Action Alternative..... 12-40

40 12.38 Changes in San Joaquin Valley Agricultural Production  
41 over the Long-term Average Conditions under Alternative 3  
42 as Compared to the No Action Alternative..... 12-41

Contents

1 12.39 Changes in San Joaquin Valley Agricultural Production in Dry  
2 and Critical Dry Years under Alternative 3 as Compared to  
3 the No Action Alternative..... 12-41

4 12.40 Changes in Sacramento Valley Irrigated Acreage over the  
5 Long-term Average Conditions under Alternative 3 as Compared  
6 to the Second Basis of Comparison ..... 12-43

7 12.41 Changes in Sacramento Valley Irrigated Acreage in Dry and  
8 Critical Dry Years under Alternative 3 as Compared to the  
9 Second Basis of Comparison ..... 12-43

10 12.42 Changes in Sacramento Valley Agricultural Production over  
11 the Long-term Average Conditions under Alternative 3 as  
12 Compared to the Second Basis of Comparison..... 12-44

13 12.43 Changes in Sacramento Valley Agricultural Production in Dry  
14 and Critical Dry Years under Alternative 3 as Compared to the  
15 Second Basis of Comparison ..... 12-44

16 12.44 Changes in San Joaquin Valley Irrigated Acreage over the  
17 Long-term Average Conditions under Alternative 3 as Compared  
18 to the Second Basis of Comparison ..... 12-45

19 12.45 Changes in San Joaquin Valley Irrigated Acreage in Dry and  
20 Critical Dry Years under Alternative 3 as Compared to the  
21 Second Basis of Comparison ..... 12-45

22 12.46 Changes in San Joaquin Valley Agricultural Production over the  
23 Long-term Average Conditions under Alternative 3 as Compared  
24 to the Second Basis of Comparison ..... 12-46

25 12.47 Changes in San Joaquin Valley Agricultural Production in Dry  
26 and Critical Dry Years under Alternative 3 as Compared to the  
27 Second Basis of Comparison ..... 12-46

28 12.48 Changes in Sacramento Valley Irrigated Acreage over the  
29 Long-term Average Conditions under Alternative 5 as Compared  
30 to the No Action Alternative..... 12-48

31 12.49 Changes in Sacramento Valley Irrigated Acreage in Dry and  
32 Critical Dry Years under Alternative 5 as Compared to the  
33 No Action Alternative..... 12-48

34 12.50 Changes in Sacramento Valley Agricultural Production over  
35 the Long-term Average Conditions under Alternative 5 as  
36 Compared to the No Action Alternative ..... 12-49

37 12.51 Changes in Sacramento Valley Agricultural Production in Dry  
38 and Critical Dry Years under Alternative 5 as Compared to the  
39 No Action Alternative..... 12-50

40 12.52 Changes in San Joaquin Valley Irrigated Acreage over the  
41 Long-term Average Conditions under Alternative 5 as Compared  
42 to the No Action Alternative..... 12-50

1 12.53 Changes in San Joaquin Valley Irrigated Acreage in Dry and  
2 Critical Dry Years under Alternative 5 as Compared to the  
3 No Action Alternative..... 12-51  
4 12.54 Changes in San Joaquin Valley Agricultural Production over  
5 the Long-term Average Conditions under Alternative 5 as  
6 Compared to the No Action Alternative ..... 12-51  
7 12.55 Changes in San Joaquin Valley Agricultural Production in Dry  
8 and Critical Dry Years under Alternative 5 as Compared to the  
9 No Action Alternative..... 12-52  
10 12.56 Changes in Sacramento Valley Irrigated Acreage over the  
11 Long-term Average Conditions under Alternative 5 as Compared  
12 to the Second Basis of Comparison ..... 12-53  
13 12.57 Changes in Sacramento Valley Irrigated Acreage in Dry and  
14 Critical Dry Years under Alternative 5 as Compared to the  
15 Second Basis of Comparison ..... 12-53  
16 12.58 Changes in Sacramento Valley Agricultural Production over the  
17 Long-term Average Conditions under Alternative 5 as Compared  
18 to the Second Basis of Comparison ..... 12-54  
19 12.59 Changes in Sacramento Valley Agricultural Production in Dry and  
20 Critical Dry Years under Alternative 5 as Compared to the Second  
21 Basis of Comparison ..... 12-55  
22 12.60 Changes in San Joaquin Valley Irrigated Acreage over the  
23 Long-term Average Conditions under Alternative 5 as Compared  
24 to the Second Basis of Comparison ..... 12-55  
25 12.61 Changes in San Joaquin Valley Irrigated Acreage in Dry and  
26 Critical Dry Years under Alternative 5 as compared to the  
27 Second Basis of Comparison ..... 12-56  
28 12.62 Changes in San Joaquin Valley Agricultural Production over the  
29 Long-term Average Conditions under Alternative 5 as Compared  
30 to the Second Basis of Comparison ..... 12-56  
31 12.63 Changes in San Joaquin Valley Agricultural Production in Dry and  
32 Critical Dry Years under Alternative 5 as Compared to the Second  
33 Basis of Comparison ..... 12-57  
34 12.64 Comparison of Alternatives 1 through 5 to No Action Alternative..... 12-58  
35 12.65 Comparison of No Action Alternative and Alternatives 1 through 5  
36 to Second Basis of Comparison ..... 12-58  
37 12.66 Summary of Cumulative Effects on Agricultural Resources of  
38 Alternatives 1 through 5 as Compared to the No Action Alternative.. 12-59  
39 13.1 Comparison of Alternatives 1 through 5 to No Action Alternative..... 13-37  
40 13.2 Comparison of No Action Alternative and Alternatives 1 through 5  
41 to Second Basis of Comparison ..... 13-37

Contents

7 as Compared to the Second Basis of Comparison in Dry and  
8 Critical Dry Years ..... 19-104

9 19.121 Changes in Agricultural-Related Employment and Regional  
10 Economic Output for the San Joaquin Valley under Alternative 5  
11 as Compared to the Second Basis of Comparison in Dry and  
12 Critical Dry Years ..... 19-104

13 19.122 Changes in Municipal and Industrial Water Supply Costs for  
14 the Sacramento Valley under Alternative 5 as Compared to the  
15 Second Basis of Comparison ..... 19-105

16 19.123 Changes in Municipal and Industrial Water Supply Costs for the  
17 San Joaquin Valley under Alternative 5 as Compared to the  
18 Second Basis of Comparison ..... 19-106

19 19.124 Changes in Municipal and Industrial Water Supply Related  
20 Employment and Regional Economic Output for the Sacramento  
21 Valley under Alternative 5 as Compared to the Second Basis  
22 of Comparison..... 19-106

23 19.125 Changes in Municipal and Industrial Water Supply Related  
24 Employment and Regional Economic Output for the San Joaquin  
25 Valley under Alternative 5 as Compared to the Second Basis  
26 of Comparison..... 19-107

27 19.126 Changes in Municipal and Industrial Water Supply Costs for  
28 the San Francisco Bay Area Region under Alternative 5 as  
29 Compared to the Second Basis of Comparison..... 19-108

30 19.127 Changes in Municipal and Industrial Water Supply Related  
31 Employment and Regional Economic Output for the San Francisco  
32 Bay Area Region under Alternative 5 as Compared to the  
33 Second Basis of Comparison ..... 19-109

34 19.128 Changes in Municipal and Industrial Water Supply Costs  
35 for the Central Coast Region under Alternative 5 as Compared  
36 to the Second Basis of Comparison ..... 19-110

37 19.129 Changes in Municipal and Industrial Water Supply Related  
38 Employment and Regional Economic Output for the Central  
39 Coast Region under Alternative 5 as Compared to the Second  
40 Basis of Comparison ..... 19-111

41 19.130 Changes in Municipal and Industrial Water Supply Costs for  
42 the Southern California Region under Alternative 5 as Compared  
43 to the Second Basis of Comparison ..... 19-112

Contents

1 19.131 Changes in Municipal and Industrial Water Supply Related

## Chapter 1

# 1 Introduction

## 2 1.1 Introduction

3 This Environmental Impact Statement (EIS) on the Coordinated Long-Term  
4 Operation of the Central Valley Project (CVP) and State Water Project (SWP) has  
5 been prepared by the U.S. Department of the Interior, Bureau of Reclamation  
6 (Reclamation). Reclamation is the Federal lead agency for compliance with the  
7 National Environmental Policy Act (NEPA) as ordered by the United States  
8 District Court for the Eastern District of California (District Court). In 2008 and  
9 2009, following litigation on previous Biological Opinion (BOs), Reclamation  
10 provisionally accepted and began implementing the BOs on continued long-term  
11 operation of the CVP, in coordination with the operation of the SWP issued by the  
12 U.S. Fish and Wildlife Service (USFWS) and the National Marine Fisheries  
13 Service (NMFS), respectively, pursuant to the Federal Endangered Species Act of  
14 1973 (ESA) as amended (United States Code [U.S.C.] 1531 et. seq.). In 2014, the  
15 Ninth Circuit upheld the District Court's ruling that Reclamation's provisional  
16 acceptance and implementation of the BOs required Reclamation to comply with  
17 NEPA. The District Court remanded Reclamation's decision back to the agency  
18 to comply with the court's ruling.

19 This EIS evaluates potential long-term direct, indirect, and cumulative impacts on  
20 the environment that could result from implementation of modifications to the  
21 continued long-term operation of the CVP and SWP. This EIS does not evaluate  
22 impacts related to implementing project-specific actions, such as impacts during  
23 construction and startup periods for actions that are not fully defined at this time  
24 and that may be implemented by Reclamation or other agencies as part of the  
25 long-term operation of the CVP and SWP.

## 26 1.2 Background

27 This chapter presents an overview of the CVP and SWP, the coordinated  
28 operation of the CVP and SWP, and endangered species consultations related to  
29 the long-term operation of the CVP and SWP. The long-term operation of the  
30 CVP and SWP is described in more detail in Chapter 3, Description of  
31 Alternatives; Chapter 5, Surface Water Resources and Water Supplies; and  
32 Appendix 3A, No Action Alternative: Central Valley Project and State Water  
33 Project Operations.

### 34 1.2.1 Overview of the Central Valley Project

35 California initiated a comprehensive water plan for the state more than 100 years  
36 ago to provide water conservation, flood control, water storage, and water  
37 distribution. In 1933, the state legislature, governor, and the electorate approved

1 construction of the CVP. Because of difficulty in marketing bonds to finance  
2 construction, the project could not be constructed by the state, and the Federal  
3 government was requested to construct the CVP.

4 The first Federal authorization of the CVP was by the Rivers and Harbors Act of  
5 August 30, 1935. The CVP was reauthorized for construction, operation, and  
6 maintenance by the Secretary of the Department of the Interior (Secretary),  
7 pursuant to the Reclamation Act of 1902, as amended and supplemented by the  
8 Rivers and Harbors Act of August 26, 1937. The 1937 act also provided that the  
9 dams and reservoirs of the CVP "... be used, first, for river regulation,  
10 improvement of navigation, and flood control; second, for irrigation and domestic  
11 uses; and, third, for power."

12 In 1992, the Central Valley Project Authorization Act of August 26, 1937, was  
13 amended by Section 3406(a) of the Central Valley Project Improvement Act  
14 (CVPIA), Public Law 102-575. The CVPIA modified the 1937 act and specified  
15 that the dams and reservoirs of the CVP be used "first, for river regulation,  
16 improvement of navigation, and flood control; second for irrigation and domestic  
17 uses and fish and wildlife mitigation, protection and restoration purposes; and  
18 third for power and fish and wildlife enhancement."

19 The CVP is composed of more than 18 reservoirs with a combined storage  
20 capacity of more than 11 million acre-feet, more than 10 hydroelectric power  
21 plants, and more than 500 miles of major canals and aqueducts (Figure 1.1 at the  
22 end of this chapter). The major CVP reservoirs are in the Sacramento-San  
23 Joaquin Rivers Delta Estuary (Delta) watershed, including Shasta Lake on the  
24 Sacramento River, Folsom Lake on the American River, New Melones Reservoir  
25 on the Stanislaus River, and Millerton Lake on the San Joaquin River. The CVP  
26 also diverts water from Trinity Lake (on the Trinity River) to the Sacramento  
27 River system. CVP pumping plants and canals include the Red Bluff Pumping  
28 Plant, which diverts water from the Sacramento River into the CVP Tehama-  
29 Colusa Canal; Folsom South Canal, which conveys water from Folsom Lake to  
30 southeastern Sacramento County; Contra Costa Canal Pumping Plant, which  
31 diverts water from Rock Slough in the Delta into the CVP Contra Costa Canal;  
32 and Jones Pumping Plant, which diverts water from the south Delta into the CVP  
33 Delta-Mendota Canal (DMC).

34 These facilities are generally operated as an integrated project, although they are  
35 authorized and categorized in more distinct units or divisions. However, not all  
36 facilities are operated to meet each of the above-identified project purposes. For  
37 example, flood control is not an authorized purpose of the CVP Trinity River  
38 Division.

39 The facilities, operational criteria and constraints, and authorizations of the CVP  
40 are described in Chapter 5, Surface Water Resources and Water Supplies.

### 41 **1.2.2 Overview of the State Water Project**

42 After World War II, California's population almost doubled, and more water was  
43 needed. In addition, devastating floods occurred in northern and central

1 California in the 1950s. To provide more reliable water supplies and reduce the  
 2 flood risk in the Sacramento Valley, the state legislature appropriated funds to the  
 3 California Department of Water Resources (DWR) to construct the SWP under  
 4 the State Central Valley Project Act (Water Code Section 11100 et seq.), Burns-  
 5 Porter Act (California Water Resources Development Bond Act), State Contract  
 6 Act (Public Contract Code Section 10100 et seq.), Davis-Dolwig Act (Water  
 7 Code Sections 11900 through 11925), and other acts of the state legislature. The  
 8 plans for the SWP included a reservoir on the Feather River near Oroville (Lake  
 9 Oroville), a Delta cross channel, an electric power transmission system, an  
 10 aqueduct to convey water from the Delta to Solano and Napa counties (North Bay  
 11 Aqueduct), an aqueduct to convey water from the Delta to the San Francisco Bay  
 12 Area (South Bay Aqueduct and a reservoir in Alameda County), an aqueduct  
 13 (California Aqueduct) with the San Luis Dam to convey water from the Delta to  
 14 the San Joaquin Valley and southern California, and several reservoirs in southern  
 15 California.

16 DWR is required to plan for recreational and fish and wildlife uses of water in  
 17 connection with the SWP and other state-constructed water projects (Water Code  
 18 Sections 233, 345, 346, 12582). The Davis-Dolwig Act (Water Code  
 19 Sections 11900 through 11925) established the policy that preservation of fish and  
 20 wildlife is part of state costs to be paid by SWP water supply contractors, and  
 21 recreation and enhancement of fish and wildlife are to be provided by  
 22 appropriations from the General Fund.

### 23 **1.2.3 Coordinated Operation of the CVP and SWP**

24 The CVP and SWP are operated in a coordinated manner in accordance with  
 25 Public Law 99-546 (October 27, 1986), directing the Secretary to execute the  
 26 Coordinated Operation Agreement (COA). The CVP and SWP are also operated  
 27 under State Water Resources Control Board (SWRCB) decisions and water right  
 28 orders related to the CVP's and SWP's water right permits and licenses to  
 29 appropriate water by diverting to storage, by directly diverting to use, or by  
 30 re-diverting releases from storage later in the year or in subsequent years.

31 The CVP and SWP are permitted by SWRCB to store water, divert water and  
 32 re-divert CVP and SWP water that has been stored in upstream reservoirs. The  
 33 CVP and SWP have built water storage and water delivery facilities in the Central  
 34 Valley to deliver water supplies to CVP and SWP contractors, including senior  
 35 water users. The CVP's and SWP's water rights are conditioned by the SWRCB  
 36 to protect the beneficial uses of water within the watersheds.

37 As conditions of the water right permits and licenses, SWRCB requires the CVP  
 38 and SWP to meet specific water quality objectives within the Delta. Reclamation  
 39 and DWR coordinate operation of the CVP and SWP, pursuant to the COA, to  
 40 meet these and other operating requirements. The COA is an agreement between  
 41 the Federal government and the State of California for the coordinated operation  
 42 of the CVP and SWP. The agreement suspended a 1960 agreement and  
 43 superseded annual coordination agreements that had been implemented following  
 44 construction of the SWP.

1 The COA established the operating framework for the CVP and SWP based upon  
2 conditions in the 1980s, by setting forth: (1) definitions of the CVP and SWP  
3 facilities and their water supplies, (2) procedures for coordination of operations,  
4 (3) formulas for sharing joint responsibilities for meeting Delta standards and  
5 ensuring no injury to other legal uses of water, (4) criteria for sharing unstored  
6 flow in the Delta, (5) a framework for exchange of water and services between the  
7 SWP and CVP, and (6) provisions for periodic reviews. Coordinated operation by  
8 agreed-on criteria can increase the efficiency of both the CVP and the SWP.

9 Implementation of the COA has evolved continually since 1986 as CVP and SWP  
10 facilities, operational criteria, and physical and regulatory environment have  
11 changed. For example, adoption of the CVPIA in 1992 changed purposes and  
12 operations of the CVP, and ESA responsibilities have affected operation of the  
13 CVP and SWP. Since 1986, facilities operations have been modified in response  
14 to statutory and regulatory requirements that were not part of the original COA  
15 assumptions or requirements. In addition, water quality objectives have been  
16 revised by the SWRCB since 1986 in the 1995 and 2006 Water Quality Control  
17 Plans and implemented through SWRCB Decision 1641. DWR and Reclamation  
18 have operational arrangements to accommodate new facilities, water quality  
19 objectives, the CVPIA, other SWRCB criteria, and the ESA, but the COA has not  
20 been formally modified to address these newer operating conditions.

#### 21 **1.2.4 Federal Endangered Species Consultation**

22 In addition to the conditions and limitations imposed by the SWRCB on the water  
23 rights permits and licenses for the CVP and SWP, Federal agencies have an  
24 obligation pursuant to Section (7a)(2) of the ESA to determine that any  
25 discretionary action authorized, funded, or carried out by the agency is not likely  
26 to jeopardize the continued existence of endangered or threatened species or result  
27 in the destruction or adverse modification of their critical habitat [16 U.S.C. 1536  
28 (a)(2)]. A discretionary agency action jeopardizes the continued existence of a  
29 listed species if the action is reasonably expected to directly or indirectly  
30 appreciably reduce the likelihood of both the survival and recovery of a listed  
31 species in the wild by reducing the reproduction, numbers, or distribution of the  
32 listed species (50 Code of Federal Regulations [CFR] 402.02).

33 In carrying out its obligations, Reclamation must consult with the appropriate  
34 regulatory agency or agencies (e.g., USFWS and NMFS) when an action may  
35 affect listed species. After the formal consultation process, those agencies render  
36 written statements (Biological Opinions or BOs) setting forth their opinion as to  
37 effects of the agency action on listed species and its designated critical habitat. If  
38 these agencies conclude that the action will jeopardize the continued existence of  
39 a listed species or result in the destruction or adverse modification of their  
40 designated critical habitat, they must suggest a Reasonable and Prudent  
41 Alternative (or RPA) to the agency action if one exists. As defined in the ESA,  
42 RPAs “refer to alternative actions identified during formal consultation that can  
43 be implemented in a manner consistent with the intended purpose of the action,  
44 that can be implemented consistent with the scope of the Federal agency’s legal  
45 authority and jurisdiction, that is economically and technologically feasible, and

1 that the Director believes would avoid the likelihood of jeopardizing the  
 2 continued existence of listed species or resulting in the destruction or adverse  
 3 modification of critical habitat” (40 CFR 402.02).

4 If the SWP seeks to avail itself of the incidental take exemption provided by the  
 5 BOs, the coordinated long-term operation of the SWP would be subject to the  
 6 BOs, including any reasonable and prudent measures, terms and conditions, or  
 7 RPAs required by the BOs.

8 **1.2.4.1 Threatened and Endangered Species Considered in ESA**  
 9 **Consultation for Coordinated Long-Term Operation of the CVP**  
 10 **and SWP**

11 The following species, and their associated ESA and critical habitat listing rules,  
 12 were considered in recent ESA consultations with USFWS and NMFS for the  
 13 coordinated long-term operation of the CVP and SWP analysis in this document:

- 14 • Sacramento River winter-run Chinook Salmon (*Oncorhynchus tshawytscha*)  
 15 Evolutionarily Significant Unit (ESU) was originally listed as threatened in  
 16 August 1989, under emergency provisions of the ESA, and formally listed as  
 17 threatened in November 1990 (55 FR 46515). They were re-classified as an  
 18 endangered species on January 4, 1994 (59 FR 440).
- 19 • Central Valley spring-run Chinook Salmon (*O. tshawytscha*) ESU was listed  
 20 as threatened on June 18, 2005 (70 FR 37160).
- 21 • Central Valley Steelhead (*O. mykiss*) Distinct Population Segment (DPS) was  
 22 listed as threatened on January 5, 2006 (71 FR 834).
- 23 • Southern Oregon/Northern California Coast Coho Salmon (*O. kisutch*) ESU  
 24 was reaffirmed as threatened on June 18, 2005 (70 FR 37160).
- 25 • Southern DPS of the North American Green Sturgeon (*Acipenser medirostris*)  
 26 was listed as threatened on June 6, 2006 (71 FR 17757).
- 27 • Southern Resident DPS of Killer Whales (*Orcinus orca*) was listed as  
 28 endangered on November 18, 2005 (70 FR 69903-69912).
- 29 • Delta Smelt (*Hypomesus transpacificus*) was listed as threatened on  
 30 March 5, 1993 (58 FR 12854). The species was recently proposed for  
 31 re-listing as endangered under the ESA.

32 Fall and late-fall runs of Chinook Salmon are currently Federal Species of  
 33 Concern, but have not been formally listed.

34 Central California Coast Steelhead (*O. mykiss*) DPS was listed as threatened on  
 35 January 5, 2006 (71 FR 834). The 2009 NMFS BO determined that the long-term  
 36 operation of the CVP and SWP would not likely adversely affect Central  
 37 California Coast Steelhead DPS and its critical habitat. Therefore, no further  
 38 analysis of this DPS was performed for this EIS.

1     **1.2.4.2     Recent ESA Consultation Activities and Court Rulings**

2     Reclamation submitted a biological assessment to USFWS and NMFS for  
3     consultation on the long-term operation of the CVP and SWP in June 2004.  
4     Because SWP operations are coordinated with CVP operations, SWP operations  
5     are included in Reclamation’s action. NMFS has responsibility for anadromous  
6     fish and marine mammals, and USFWS has jurisdiction over all other ESA listed  
7     species.

8     In July 2004, USFWS issued its BO “Formal and Early Section 7 Endangered  
9     Species Consultation on the Coordinated Operations of the Central Valley Project  
10    and State Water Project and the Operations Criteria and Plan to Address Potential  
11    Critical Habitat Issues.” In February 2005, USFWS issued the “Re-Initiation of  
12    Formal and Early Section 7 Endangered Species Consultation on the Coordinated  
13    Operations of the Central Valley Project and State Water Project and the  
14    Operational Criteria and Plan to Address Potential Critical Habitat Issues.”

15    On October 22, 2004, NMFS issued its “Biological Opinion and Conference  
16    Opinion on the Long-Term Operations of the Central Valley Project and State  
17    Water Project.”

18    On April 26, 2006, Reclamation requested that the NMFS consultation be  
19    re-initiated based on the new listing of the Southern DPS of the North American  
20    Green Sturgeon. On May 19, 2006, Reclamation requested that the USFWS  
21    consultation be re-initiated because of the potential for the re-initiation of the  
22    NMFS consultation to affect the Delta Smelt and because of recently compiled  
23    data related to the pelagic organism decline.

24    Following the issuance of the 2004 and 2005 BOs, litigation was filed against the  
25    Department of the Interior and the Department of Commerce challenging the  
26    validity of these BOs. Following a finding that the CVP/SWP operation analyzed  
27    in the 2005 BO jeopardized the continued existence of Delta Smelt, on  
28    December 14, 2007, the District Court issued an Interim Remedial Order in  
29    *Natural Resources Defense Council, et al. v. Kempthorne*, 1:05-cv-1207 OWW  
30    GSA (E.D. Cal. 2007), to provide additional protection for Delta Smelt pending  
31    completion of a new USFWS BO for the continued long-term operation of the  
32    CVP and SWP. The Interim Remedial Order remained in effect until USFWS  
33    issued a new BO for the continued long-term operation of the CVP and SWP on  
34    December 15, 2008.

35    On April 16, 2008, the District Court issued a Memorandum Decision and Order  
36    on the Cross-Motions for Summary Judgment filed in *Pacific Coast Federation of*  
37    *Fishermen’s Associations, et al. v. Gutierrez*, 1:06-cv-245-OWW-GSA (E.D.  
38    Cal. 2008). The District Court found that the BO issued by NMFS in 2004 was  
39    invalid. An evidentiary hearing followed, resulting in a Remedies Ruling on  
40    July 18, 2008. The ruling concluded that the District Court needed further  
41    evidence to consider the Plaintiffs’ proposed restrictions on the long-term  
42    coordinated CVP and SWP operation.

43    In August 2008, Reclamation submitted a biological assessment to USFWS and  
44    NMFS for consultation.

1 On December 15, 2008, USFWS issued a BO analyzing the effects of the  
 2 coordinated long-term operation of the CVP and SWP on Delta Smelt and its  
 3 designated critical habitat. The 2008 USFWS BO concluded that “the  
 4 coordinated operation of the CVP and SWP, as proposed, [was] likely to  
 5 jeopardize the continued existence of the Delta Smelt” and “adversely modify  
 6 Delta Smelt critical habitat.” The BO included an RPA for long-term operation  
 7 of the CVP and SWP designed to allow the projects to continue operating without  
 8 causing jeopardy to Delta Smelt or adverse modification of designated critical  
 9 habitat.

10 On December 15, 2008, Reclamation provisionally accepted and began  
 11 implementing the USFWS RPA.

12 On June 4, 2009, NMFS issued a BO analyzing the effects of the coordinated  
 13 long-term operation of the CVP and SWP on listed salmonids, Green Sturgeon,  
 14 and southern resident Killer Whale and their designated critical habitats. The  
 15 NMFS BO concluded that the long-term operation of the CVP and SWP, as  
 16 proposed, was likely to jeopardize the continued existence of Sacramento River  
 17 winter-run Chinook Salmon, Central Valley spring-run Chinook Salmon, Central  
 18 Valley Steelhead, Southern DPS of North American Green Sturgeon, and  
 19 Southern Resident Killer Whales. Further, the BO concluded that the proposed  
 20 action would destroy or adversely modify critical habitat for Sacramento River  
 21 winter-run Chinook Salmon, Central Valley spring-run Chinook Salmon, Central  
 22 Valley Steelhead, and Southern DPS of North American Green Sturgeon.

23 The 2009 NMFS BO included an RPA designed to allow the CVP and SWP to  
 24 continue operating without causing jeopardy to the analyzed species or adverse  
 25 modification of their designated critical habitat. On June 4, 2009, Reclamation  
 26 provisionally accepted and began implementing the NMFS RPA.

27 Several lawsuits were filed in the District Court challenging aspects of the 2008  
 28 USFWS BO and the 2009 NMFS BO and Reclamation’s acceptance and  
 29 implementation of the associated RPAs. Many of the lawsuits were consolidated  
 30 into two proceedings focused on each BO. The outcomes of the *Consolidated*  
 31 *Delta Smelt Cases* and the *Consolidated Salmonid Cases* are summarized below.

32 • *Consolidated Delta Smelt Cases*

33 – On November 16, 2009, the District Court ruled that Reclamation violated  
 34 NEPA by failing to conduct a NEPA review of the potential impacts on  
 35 the human environment before provisionally accepting and implementing  
 36 the 2008 USFWS BO, including the RPA.

37 – On December 14, 2010, the District Court found certain portions of the  
 38 2008 USFWS BO to be arbitrary and capricious in several respects and  
 39 remanded those portions of the BO to USFWS without vacatur for further  
 40 consideration. The District Court ordered Reclamation to review its  
 41 decision to provisionally accept and implement the BO and RPA in  
 42 accordance with NEPA.

- 1       – The decision of the District Court related to the USFWS BO was appealed  
2       to the United States Court of Appeals for the Ninth Circuit (Appellate  
3       Court). On March 13, 2014, the Appellate Court reversed the District  
4       Court and upheld the BO. However, the Appellate Court affirmed the  
5       judgment of the District Court with respect to the NEPA claims.
- 6       – The District Court amended the Judgment on September 30, 2014  
7       consistent with the Appellate Court’s decision. Petitions for Writ of  
8       Certiorari were submitted to the U.S. Supreme Court; however, the U.S.  
9       Supreme Court decided to not hear the cases.
- 10      • *Consolidated Salmonid Cases*
- 11      – On March 5, 2010, the District Court ruled that Reclamation violated  
12      NEPA by failing to undertake a NEPA analysis of potential impacts on the  
13      human environment before provisionally accepting and implementing the  
14      2009 NMFS BO and RPA.
- 15      – On September 20, 2011, the District Court found the NMFS BO was  
16      arbitrary and capricious in several respects and remanded the 2009 NMFS  
17      BO to NMFS without vacatur for further consideration.
- 18      – The decisions of the District Court related to the 2009 NMFS BO were  
19      appealed to the Appellate Court. On December 22, 2014, the Appellate  
20      Court reversed the District Court and upheld the BO.
- 21      – The District Court issued the Final Order on May 5, 2015 consistent with  
22      the Appellate Court’s Decision.

### 23      **1.3        Need to Prepare this Environmental Impact** 24      **Statement**

25      Compliance with NEPA is a Federal responsibility and involves the participation  
26      of Federal, state, tribal, and local agencies, as well as concerned and affected  
27      members of the public in the planning process. NEPA requires that Federal  
28      agencies analyze and disclose the potential environmental impacts and possible  
29      mitigation for Federal actions and a reasonable range of alternatives to the  
30      proposed action. NEPA is required when a discretionary Federal action is  
31      proposed. The regulations [40 CFR 1508.18(a)] define a Federal action as  
32      including new and continuing activities, actions partly or entirely financed by  
33      Federal agencies (where some control and responsibility over the action remain  
34      with the Federal agency [43 CFR 46.100]), actions conducted by Federal  
35      agencies, actions approved by Federal agencies, new or revised agency rules or  
36      regulations, and proposals for legislation.

37      Section 102 of NEPA (42 U.S.C. 4332) indicates that a detailed analysis, such as  
38      an EIS, should be completed with proposals for Federal actions that substantially  
39      affect the quality of the human environment, including the natural and physical

1 environment and the relationship of people with that environment (40 CFR  
2 1508.14).

3 To comply with the District Court’s 2010 orders regarding NEPA, Reclamation  
4 initiated preparation of this EIS in 2011. This EIS documents Reclamation’s  
5 analysis of the effects of modifications to the coordinated long-term operation of  
6 the CVP and SWP that are likely to avoid jeopardy to listed species and  
7 destruction or adverse modification of designated critical habitat.

8 In accordance with the District Court’s order in the *Consolidated Delta Smelt*  
9 *Cases*, the Final EIS and Record of Decision are to be completed on or before  
10 December 1, 2015. By order dated October 8, 2015, this date has been extended  
11 to January 12, 2016.

12 As described in Chapter 3, Description of Alternatives, many of the provisions of  
13 the RPAs, as set forth in the 2008 USFWS BO and the 2009 NMFS BO, require  
14 further study, monitoring, further consultation, implementation of adaptive  
15 management programs, and subsequent environmental documentation for future  
16 facilities to be constructed or modified. Specific actions related to these  
17 provisions are not known at this time. Therefore, this EIS assumes the  
18 completion of future actions, including provisions of the RPAs, in a manner that  
19 would be consistent with the ESA and does not address impacts during  
20 construction and startup phases of these actions.

## 21 **1.4 Use of the Environmental Impact Statement**

22 This EIS may be used by Reclamation or cooperating agencies that are  
23 participating in the preparation of this EIS to inform future decisions related to the  
24 ESA consultation and implementation of the RPAs in the 2008 USFWS BO and  
25 2009 NMFS BO. A cooperating agency is defined as any Federal agency, except  
26 the NEPA lead agency, that has jurisdiction by law or has special expertise with  
27 respect to any environmental issue that should be addressed in the EIS  
28 (40 CFR 1501.6). A cooperating agency also can include a governmental entity  
29 (state, tribal, or local) that has jurisdiction by law or special expertise with respect  
30 to any environmental impact associated with the action being considered. The  
31 cooperating agencies for this EIS are listed in Section 1.6.

## 32 **1.5 Proposed Action and Preferred Alternative**

33 The Notice of Intent identified an “initial Proposed Action” that included the  
34 operational actions of the 2008 USFWS BO and 2009 NMFS BO, without  
35 structural changes included in the RPA actions that would require future studies  
36 and environmental documentation to define recommended actions, including fish  
37 passage around the CVP dams. The initial Proposed Action is included in this  
38 EIS as Alternative 2.

1 Based upon the analysis of aquatic resources (see Chapter 9, Fish and Aquatic  
2 Resources), by 2030, climate change may result in substantially higher air  
3 temperatures than during recent conditions. Higher air temperatures would likely  
4 increase water temperatures in both the CVP reservoirs and in the rivers  
5 downstream of the CVP dams. Under these conditions, Reclamation may not be  
6 able to operate the reservoirs under the initial Proposed Action without fish  
7 passage in a manner that would meet water temperature objectives; and it may not  
8 be possible to avoid jeopardizing the continued existence of listed species and/or  
9 resulting in an adverse modification of critical habitat.

10 Based upon the results of the impact analyses presented in Chapters 5 through 21  
11 of this EIS, the Preferred Alternative is the No Action Alternative. The No  
12 Action Alternative contains all of the RPA actions in the 2008 USFWS BO and  
13 2009 NMFS BO, as amended, including the RPA actions to evaluate fish passage  
14 to upstream habitats that exhibit lower water temperatures. Further discussion of  
15 the selection of the Preferred Alternative will be included in the Record of  
16 Decision.

17 The Environmentally Preferred Alternative also will be identified and disclosed in  
18 the Record of Decision, as required by the Council of Environmental Quality  
19 regulations.

## 20 **1.6 Project Area**

21 The project area boundaries are defined by the locations of most of the CVP  
22 facilities and their service areas and all of the SWP facilities and the SWP service  
23 areas, as shown on Figure 1.1. The CVP facilities associated with Millerton Lake,  
24 including the Madera and Friant-Kern canals and their service areas, and the San  
25 Joaquin River Restoration Program are not part of the project area for this EIS  
26 because the operations of these facilities were not addressed in the 2008 USFWS  
27 BO and 2009 NMFS BO.

### 28 **1.6.1 CVP Facilities**

29 The CVP facilities evaluated in this EIS include reservoirs on the Trinity,  
30 Sacramento, American, and Stanislaus rivers; Mendota Pool on the San Joaquin  
31 River; rivers, streams, canals, and aqueducts used to convey CVP water; and the  
32 CVP service area that relies upon water from the following reservoirs (as  
33 described in Chapter 5, Surface Water Resources and Water Supplies, and  
34 Appendix 3A, No Action Alternative: Central Valley Project and State Water  
35 Project Operations).

- 36 • A portion of the water from Trinity River is stored and re-regulated in Trinity  
37 Lake, Lewiston Lake, and Whiskeytown Reservoir and diverted through  
38 tunnels and power plants into the Sacramento River. Water is also stored and  
39 re-regulated in Shasta Lake and Folsom Lake. Water from these reservoirs  
40 and other reservoirs owned or operated by the CVP flows into the Sacramento  
41 River. The Red Bluff Pumping Plant on the Sacramento River lifts water into

1 the Tehama Colusa Canal for delivery to CVP contractors. Water also is  
 2 delivered from the Sacramento River, American River, and the Folsom South  
 3 Canal to CVP contractors, water rights holders, and settlement contractors.

- 4 • The Sacramento River conveys water to the Delta for delivery through the  
 5 Contra Costa Canal and Jones Pumping Plant. The Contra Costa Canal  
 6 originates at Rock Slough near Oakley and extends to the Martinez Reservoir.  
 7 Water from the Contra Costa Canal is delivered to the Contra Costa Water  
 8 District. The Jones Pumping Plant at the southern end of the Delta lifts the  
 9 water into the DMC. This canal delivers water to CVP contractors, who  
 10 divert water directly from the DMC, and to San Joaquin River exchange  
 11 contractors, who divert directly from the San Joaquin River and the Mendota  
 12 Pool. CVP water is also conveyed to the San Luis Reservoir for deliveries to  
 13 CVP contractors through the San Luis Canal. Water from the San Luis  
 14 Reservoir is also conveyed through the Pacheco Tunnel to CVP contractors in  
 15 Santa Clara and San Benito counties.
- 16 • The CVP provides water stored in New Melones Reservoir for water rights  
 17 holders in the Stanislaus River watershed and CVP contractors in the northern  
 18 San Joaquin Valley and to meet existing water right permit conditions to  
 19 support fish and wildlife and water quality beneficial uses.

20 The project area includes portions of the watersheds upstream of the CVP  
 21 reservoirs that support anadromous fish species, as addressed in the NMFS BO,  
 22 and the service areas of CVP water users in the Trinity River Region, Sacramento  
 23 and San Joaquin valleys in the Central Valley Region, and the San Francisco-Bay  
 24 Area Region.

### 25 **1.6.2 SWP Facilities**

26 The SWP facilities evaluated in this EIS include Lake Oroville on the Feather  
 27 River; rivers, streams, canals, and aqueducts used to convey SWP water; and the  
 28 SWP service area that relies upon water from these reservoirs including:

- 29 • SWP water is stored and re-regulated in Lake Oroville and released into the  
 30 Feather River, which flows into the Sacramento River. Water also is  
 31 delivered from the Feather River to SWP contractors, water rights holders,  
 32 and settlement contractors.
- 33 • SWP water flows in the Sacramento River to the Delta and is exported from  
 34 the Delta at the Banks Pumping Plant. The Banks Pumping Plant pumps the  
 35 water into the California Aqueduct, which delivers water to the SWP  
 36 contractors and conveys water to the San Luis Reservoir for continued  
 37 delivery in the California Aqueduct to the San Joaquin Valley, Central Coast  
 38 Region, and southern California.
- 39 • The SWP provides water from the Delta to Solano and Napa counties through  
 40 the North Bay Aqueduct and to Alameda and Santa Clara counties through the  
 41 South Bay Aqueduct (including Lake Del Valle).

- 1 • The SWP provides water from the Delta to the Central Coast Region through  
2 the Coastal Branch Aqueduct.
  - 3 • The SWP provides water from the Delta to southern California through the  
4 California Aqueduct (including Quail, Pyramid, Castaic, Silverwood, and  
5 Perris lakes).
  - 6 • The SWP delivers water to the Cross-Valley Canal, when the systems have  
7 capacity, for CVP contractors.
- 8 The project area includes the service areas in the Sacramento and San Joaquin  
9 valleys in the Central Valley Region as well as the San Francisco-Bay Area,  
10 Central Coast, and Southern California regions.

## 11 **1.7 Study Period**

12 The coordinated long-term operation of the CVP and SWP, as described in this  
13 EIS, is assumed to continue to at least 2030 before CVP and SWP operations  
14 would change. These changes could include projects considered as part of the  
15 cumulative effects analyses, as described in Chapter 3, Description of  
16 Alternatives. Therefore, this EIS analyzes future conditions projected for 2030.  
17 It is recognized that many changes between existing conditions and 2030  
18 conditions would occur without changes to CVP and SWP operations, including:

- 19 • Land use changes will occur in the Delta watershed as growth occurs as  
20 projected in local agency general plans. Much of this growth is expected in  
21 the service areas of water users with water rights that may be senior to the  
22 CVP and SWP or within the Sacramento Valley, and municipal and industrial  
23 CVP contractors will increase water demands for population growth as  
24 described in the general plans. These actions could reduce the available water  
25 supplies for use by the CVP and SWP. This EIS assumes that this growth will  
26 occur by 2030. Therefore, the effects of land use changes by 2030 will be  
27 similar in the comparison of all alternatives.
- 28 • Climate change could change CVP and SWP water supplies if the amount of  
29 snow decreases and the amount of rain either decreases or occurs within a  
30 shorter period and limits the amount of water captured in reservoirs. Sea-level  
31 rise would increase salinity in the western, central, and southern Delta, which  
32 could limit the time when CVP and SWP divert water. These actions could  
33 reduce the available water supplies for use by the CVP and SWP. Federal and  
34 state agencies have completed numerous studies that project future climate  
35 change and sea-level rise scenarios. The specific characteristics of climate  
36 change and sea-level rise are not defined at this time because this EIS includes  
37 only qualitative analyses. All of the alternatives, including the No Action  
38 Alternative, evaluated in this EIS include the same assumptions for climate  
39 change and sea-level rise. Therefore, the effects of climate change and  
40 sea-level rise will be similar in the comparison of all alternatives.

1 • Numerous studies are being prepared by Federal, state, and local agencies to  
 2 evaluate implementation of storage projects in the Delta watershed, Delta  
 3 conveyance, Delta ecosystem restoration, Delta water quality improvement  
 4 through construction of treatment facilities for discharges into the Delta, and  
 5 changes to the SWRCB Water Quality Control Plan. As described in Chapter  
 6 3, Description of Alternatives, most of those studies have not been completed.  
 7 However, many of the facilities recommended by those studies are expected to  
 8 be constructed and operational by 2030. Therefore, the effects of  
 9 implementation of those facilities will be similar in the comparison of all  
 10 alternatives.

11 As the changing conditions described above and other future changes occur,  
 12 changes in long-term operation of the CVP and SWP may be required. This may  
 13 require the re-initiation of consultation on the 2008 USFWS BO and 2009 NMFS  
 14 BO. Therefore, because the above-described changes in conditions are likely to  
 15 occur by 2030 and because new BOs would be required, this EIS considers a  
 16 study period that concludes in 2030.

## 17 **1.8 Participants in Preparation of the EIS**

18 For this EIS, Reclamation is the Federal lead agency. The Federal cooperating  
 19 agencies include USFWS, NMFS, U.S. Environmental Protection Agency, U.S.  
 20 Army Corps of Engineers, and Bureau of Indian Affairs.

21 Reclamation also provided non-federal agencies with the opportunity to  
 22 participate in the NEPA process if they qualified under NEPA (as described  
 23 above) as a cooperating agency. In August 2012, Reclamation invited  
 24 747 non-federal entities to be cooperating agencies for this EIS, including:

- 25 • DWR
- 26 • SWRCB
- 27 • California Department of Fish and Wildlife
- 28 • Agencies that have contracts with the CVP or SWP for water delivery, water  
 29 service repayment, exchange or settlement, or use of CVP or SWP facilities  
 30 for conveyance
- 31 • State and Federal Contractors Water Agency
- 32 • Cities and counties within the CVP and SWP service areas
- 33 • Federally recognized tribes within the CVP and SWP service areas or areas  
 34 affected by long-term operation of the CVP and SWP

35 Non-federal entities that meet the specified criteria for cooperating agencies are  
 36 required to enter into a Memorandum of Understanding (MOU) [43 CFR  
 37 46.225(d)] with Reclamation. The MOU provides a framework for cooperating  
 38 agencies to agree to their respective roles, responsibilities, and limitations,  
 39 including, as appropriate, target schedules.

1 Reclamation has signed cooperating agency MOUs with the following entities:

- 2 • Anderson-Cottonwood Irrigation District
- 3 • California Department of Water Resources
- 4 • California Valley Miwok Tribe
- 5 • City of Hesperia
- 6 • Contra Costa Water District
- 7 • East Bay Municipal Utility District
- 8 • Friant Water Authority
- 9 • Glenn-Colusa Irrigation District
- 10 • Metropolitan Water District of Southern California
- 11 • Oakdale Irrigation District
- 12 • Reclamation District 108
- 13 • San Diego County Water Authority
- 14 • San Juan Water District
- 15 • San Luis & Delta-Mendota Water Authority
- 16 • Santa Clara Valley Water District
- 17 • Tehama Colusa Canal Authority
- 18 • Stockton East Water District
- 19 • Sutter Mutual Water District
- 20 • Zone 7 Water Agency

21 Reclamation also received a request from an interested party to include the  
22 Federal Emergency Management Agency (FEMA) as a cooperating agency.  
23 However, Reclamation concluded that FEMA does not meet the requirements for  
24 being a cooperative agency in accordance with Section 1501.6 of NEPA for a  
25 “Federal agency which has special expertise related to environmental issues,  
26 which should be addressed in the statement” and beyond that which could not be  
27 addressed by other cooperating Federal agencies.

### 28 **1.8.1 Stakeholder and Public Involvement during Preparation of** 29 **the EIS**

30 The scoping process was initiated on March 28, 2012, with the publication of the  
31 Notice of Intent in the Federal Register (FR) and continued through  
32 June 28, 2012. Initially, the public scoping process was to be completed on  
33 May 29, 2012. During the public scoping process, other agencies and interested  
34 persons requested an extension of the public scoping process to allow additional  
35 opportunities to provide scoping comments. In response to these requests,  
36 Reclamation published a notice on May 25, 2012, extending the public scoping  
37 period through June 28, 2012.

38 Scoping meetings were held to inform the public and interested stakeholders  
39 about the project and to solicit comments and input on the EIS. The scoping  
40 meetings were held in the following locations and resulted in the following level  
41 of public participation:

- 42 • Madera on April 25, 2012 (6 participants)

- 1 • Diamond Bar on April 26, 2012 (3 participants)
- 2 • Sacramento on May 2, 2012 (15 participants)
- 3 • Marysville on May 3, 2012 (2 participants)
- 4 • Los Banos on May 22, 2012 (230 participants)

5 Reclamation posted the scoping notices in the FR, on its website, and in  
6 newspapers that served areas where the scoping meetings were held. Reclamation  
7 also published press releases to news organizations and others that have requested  
8 notifications for all press releases.

9 Scoping comments were used in the development of a reasonable range of  
10 alternatives and identification of key issues that would require analysis in the  
11 Environmental Consequences sections of this EIS, as described in Chapter 3,  
12 Description of Alternatives, and Chapter 23, Consultation, Coordination, and  
13 Cooperation.

14 Reclamation also posted on its website an initial range of alternatives discussed at  
15 a stakeholders meeting on October 19, 2012. As described in Chapter 3,  
16 Description of Alternatives, comments received during that process were used to  
17 refine the description of the alternatives.

18 Project status meetings were held with cooperating agencies and other  
19 stakeholders during preparation of the Draft EIS, including meetings in  
20 Sacramento on January 16, May 29, and November 5, 2014; and February 20 and  
21 June 24, 2015.

## 22 **1.8.2 Stakeholder and Public Involvement during Preparation of** 23 **the Final EIS**

24 The Draft EIS was published for public review in July 2015. The distribution list  
25 for the Public Draft EIS is included in Chapter 24. Reclamation posted  
26 notification of the availability of the Public Draft EIS and the location and timing  
27 of public hearing(s) on its website, in the FR, and through press releases.

28 Four public meetings were held during the public review period for the Draft EIS  
29 in the following locations, with the following level of participation:

- 30 • Sacramento on September 9, 2015 (9 participants)
- 31 • Red Bluff on September 10, 2015 (9 participants)
- 32 • Los Banos on Tuesday, September 15, 2015 (9 participants)
- 33 • Irvine on September 17, 2015 (2 participants)

34 Approximately 860 written and verbal comments were received on the Draft EIS.  
35 All of the comments received on the Draft EIS were considered in preparation of  
36 the Final EIS. Written responses to all substantive comments received are  
37 included in Appendices 1A through 1E of the Final EIS.

## 1 **1.9 Related Projects and Activities**

2 Because the EIS study area is large, many activities and studies that are currently  
3 ongoing or planned for the near future could be affected by the findings of the EIS  
4 or are related actions of long-term operation of the CVP and SWP. Preliminary  
5 information from these studies and projects has been used to describe the No  
6 Action Alternative or to assess cumulative impacts of implementing alternatives  
7 evaluated in this EIS. Some of these projects are adjacent to, but not specifically  
8 part of the Study Area (e.g., San Joaquin River Restoration Program). However,  
9 these projects have been included in the cumulative effects analysis because of  
10 indirect effects on the Study Area. The following studies and projects are  
11 summarized in Chapter 3, Description of Alternatives, as either part of the No  
12 Action Alternative or the cumulative effects analyses:

- 13 • Trinity River Restoration Program
- 14 • Continued Implementation of the Central Valley Project Improvement Act  
15 Provisions
- 16 • Clear Creek Mercury Abatement and Fisheries Restoration Project
- 17 • Iron Mountain Mine Superfund Site
- 18 • Mainstem Sacramento River, American River, and Stanislaus River Gravel  
19 Augmentation Program
- 20 • Nimbus Fish Hatchery Fish Passage Project
- 21 • Folsom Dam Water Control Manual Update
- 22 • FERC Relicensing for Middle Fork of the American River Project
- 23 • Lower Mokelumne River Spawning Habitat Improvement Project
- 24 • Dutch Slough Tidal Marsh Restoration
- 25 • Suisun Marsh Habitat Management, Preservation, and Restoration Plan  
26 Implementation
- 27 • Tidal Wetland Restoration in the Delta and Suisun Marsh
- 28 • San Joaquin River Restoration Program
- 29 • Stockton Deep Water Ship Channel Dissolved Oxygen Project
- 30 • Grassland Bypass Project
- 31 • Central Valley Salinity Alternatives for Long-term Sustainability (CV-Salts)
- 32 • Long-term Water Transfers
- 33 • Municipal Water Supply Projects that are being implemented (including City  
34 of Stockton Delta Water Supply Project, Woodland-Davis Water Supply  
35 Project, water recycling programs, San Diego County Water Authority

- 1 Carlsbad Seawater Desalination Facility, groundwater bank and wellfield
- 2 expansions)
- 3 • Yolo Bypass Salmonid Habitat Restoration and Fish Passage Implementation
- 4 Plan
- 5 • Bay-Delta Water Quality Control Plan Update
- 6 • California WaterFix (Bay Delta Conservation Plan)
- 7 • California EcoRestore
- 8 • Shasta Lake Water Resources Investigation
- 9 • North of Delta Offstream Storage Investigation
- 10 • Federal Energy Regulatory Commission (FERC) License Renewal Projects
- 11 (including SWP Oroville Project, Yuba-Bear and Drum Spaulding Projects,
- 12 Turlock Irrigation District and Modesto Irrigation District Don Pedro Project,
- 13 and Merced Irrigation District Merced River Hydroelectric Project)
- 14 • El Dorado Water and Power Authority Supplemental Water Rights Project
- 15 • Northeastern San Joaquin County Groundwater Banking Authority
- 16 • Semitropic Water Storage District Delta Wetlands
- 17 • North Bay Aqueduct Alternative Intake
- 18 • Los Vaqueros Reservoir Expansion Phase 2
- 19 • Upper San Joaquin River Basin Storage Investigation
- 20 • Central Valley Regional Water Quality Control Board Irrigated Lands
- 21 Regulatory Program
- 22 • San Luis Reservoir Low Point Improvement Project
- 23 • Future Water Supply Projects (including groundwater storage and recovery
- 24 projects; major conveyance projects, including Sacramento River Water
- 25 Reliability Project, water recycling, and desalination projects)
- 26 • Contra Loma Reservoir and Recreation Resource Management Plan
- 27 • San Luis Reservoir State Recreation Area Resource Management
- 28 Plan/General Plan
- 29 • *Westlands Water District v. United States Settlement*
- 30 • Mill Creek Riparian Assessment
- 31 • Yolo County Habitat/Natural Community Conservation Plan
- 32 • North Delta Flood Control and Ecosystem Restoration Project
- 33 • Franks Tract Project
- 34 • Future Water Supply Projects (including groundwater storage and recovery,
- 35 conveyance, water recycling, desalination, and water transfers).

## 1.10 Organization of the Environmental Impact Statement

The Final EIS was prepared by incorporating changes identified during the public review of the Draft EIS. Chapters 1 through 25 and the Executive Summary have been revised and included in the Final EIS in response to comments received on the Draft EIS. Changes to the Appendices 3A through 19B have been included in the Final EIS as Errata sheets placed in front of each appendix. Appendices 1A through 1E include the comments on the Draft EIS and their corresponding responses. Three additional appendices have been added to the Final EIS to provide more detailed information requested by several commenters (Appendices 5E, 9O, and 9P).

This EIS is organized as follows:

- The **Executive Summary** presents the purpose and intended uses of this EIS and summarizes the project background, need to prepare this EIS, project area and study period, an overview of the alternatives, and major conclusions of the environmental analysis. A table summarizing the environmental consequences, mitigation measures, and significant impacts for the alternatives is included.
- **Chapter 1, Introduction**, summarizes the project background, need to prepare this EIS, use of this EIS, project area and study period, stakeholder and public involvement in the preparation of the EIS, and related projects and activities.
- **Chapter 2, Purpose and Need for the Action**, summarizes the underlying purpose and need to which Reclamation is responding in proposing the alternatives for the action.
- **Chapter 3, Description of Alternatives**, summarizes the methods used for developing the alternatives considered in the EIS, describes the alternatives, and discusses the alternatives considered but eliminated from detailed analysis.
- **Chapter 4, Approach to Environmental Analyses**, describes the approach and terms used in the description of the regulatory setting, affected environment, environmental consequences, cumulative effects, and mitigation measures, if appropriate, for the resource topics identified in Chapters 5 through 21.
- **Chapters 5 through 21** include the regulatory setting, affected environment, and environmental consequences for 17 resource topics and discuss methods of analysis, environmental impacts, and mitigation measures for potential direct and indirect impacts. References for each resource are included within each of these chapters, as follows:
  - Chapter 5 – Surface Water Resources and Water Supplies
  - Chapter 6 – Surface Water Quality

- 1 – Chapter 7 – Groundwater Resources and Groundwater Quality
- 2 – Chapter 8 – Energy
- 3 – Chapter 9 – Fisheries and Aquatic Resources
- 4 – Chapter 10 – Terrestrial Biological Resources
- 5 – Chapter 11 – Geology and Soils
- 6 – Chapter 12 – Agricultural Resources
- 7 – Chapter 13 – Land Use
- 8 – Chapter 14 – Visual Resources
- 9 – Chapter 15 – Recreation Resources
- 10 – Chapter 16 – Air Quality and Greenhouse Gas Emissions
- 11 – Chapter 17 – Cultural Resources
- 12 – Chapter 18 – Public Health
- 13 – Chapter 19 – Socioeconomics
- 14 – Chapter 20 – Indian Trust Assets
- 15 – Chapter 21 – Environmental Justice
- 16 • **Chapter 22, Other NEPA Considerations**, summarizes the environmental  
17 effects of implementation of the alternatives related to growth-inducing  
18 indirect impacts, the relationship between short-term and long-term  
19 productivity, irreversible and irretrievable commitments of resources, and  
20 impacts on other Federal and non-federal projects and plans.
- 21 • **Chapter 23, Consultation, Coordination, and Cooperation**, summarizes  
22 public and stakeholder involvement activities under NEPA; Native American  
23 consultation; consultation with other Federal, state, regional, and local  
24 agencies; consultation with other entities and organizations; and  
25 unresolved issues.
- 26 • **Chapter 24, Distribution List for Draft EIS and Final EIS**, provides  
27 locations where the Draft EIS was available for review and provides an  
28 overview of governmental entities, organizations, and interested parties that  
29 received a copy of the Draft EIS. The Final EIS was distributed to the same  
30 distribution list.
- 31 • **Chapter 25, List of Preparers**, provides a list of individuals who participated  
32 in the preparation of the EIS.
- 33 • **Chapter 26, Index**, provides an index of key topics in Chapters 1 through 23.
- 34 • **Appendices** contain background information including modeling  
35 methodologies, assumptions, and results; and lists and statuses of species  
36 federally listed as threatened and endangered evaluated in this EIS.

1

2 **Figure 1.1 Study Area**

**Chapter 2**

1 **Purpose and Need for the Action**

2 **2.1 Introduction**

3 National Environmental Policy Act (NEPA) regulations require a statement of  
4 “the underlying purpose and need to which the agency is responding in  
5 proposing the alternatives, including the proposed action” (40 Code of Federal  
6 Regulations 1502.13).

7 **2.2 Purpose of the Action**

8 The purpose of the action considered in this Environmental Impact Statement  
9 (EIS) is to continue the operation of the Central Valley Project (CVP), in  
10 coordination with operation of the State Water Project (SWP), for the authorized  
11 purposes, in a manner that:

- 12 • Is similar to historical operational parameters with certain modifications
- 13 • Is consistent with Federal Reclamation law; other Federal laws and  
14 regulations; Federal permits and licenses; and State of California water rights,  
15 permits, and licenses
- 16 • Enables the Bureau of Reclamation (Reclamation) and the California  
17 Department of Water Resources (DWR) to satisfy their contractual obligations  
18 to the fullest extent possible

19 **2.3 Need for the Action**

20 Continued operation of the CVP is needed to provide river regulation;  
21 improvement of navigation; flood control; water supply for irrigation and  
22 domestic uses; fish and wildlife mitigation, protection, and restoration; fish and  
23 wildlife enhancement; and power generation. The CVP and the SWP facilities  
24 also are operated to provide recreation benefits and in accordance with the water  
25 rights and water quality requirements adopted by the State Water Resources  
26 Control Board.

27 As described in Chapter 1, Introduction, the U.S. Fish and Wildlife Service  
28 (USFWS) and the National Marine Fisheries Service (NMFS) concluded in their  
29 2008 and 2009 Biological Opinions (BOs), respectively, that coordinated long-  
30 term operation of the CVP and SWP, as described in the 2008 Reclamation  
31 Biological Assessment, jeopardizes the continued existences of listed species and  
32 adversely modifies critical habitat. To remedy this, USFWS and NMFS provided  
33 Reasonable and Prudent Alternatives (RPAs) in their BOs.

## Chapter 2: Purpose and Need for the Action

1 The U.S. Court of Appeals for the Ninth Circuit confirmed the U.S. District Court  
2 for the Eastern District of California ruling that Reclamation must conduct a  
3 NEPA review to determine whether the RPA actions cause a significant impact on  
4 the human environment. Potential modifications to the coordinated operation of  
5 the CVP and SWP analyzed in the EIS process should be consistent with the  
6 intended purpose of the action, be within the scope of Reclamation's legal  
7 authority and jurisdiction, be economically and technologically feasible, and  
8 avoid the likelihood of jeopardizing listed species or resulting in the destruction or  
9 adverse modification of critical habitat in compliance with the requirements of  
10 Section 7(a)(2) of the Endangered Species Act.

## Chapter 3

# 1 Description of Alternatives

## 2 3.1 Introduction

3 This chapter describes the methodology used for development of all potential  
4 alternatives and the basis for selecting the reasonable range of alternatives which  
5 are evaluated in detail in this Environmental Impact Statement (EIS).

## 6 3.2 Approach to Identify Potential Alternatives

7 This EIS evaluates a range of alternatives to the No Action Alternative for the  
8 coordinated long-term operation of the Central Valley Project (CVP) and the State  
9 Water Project (SWP) in the Year 2030. The No-Action Alternative includes full  
10 implementation of the 2008 USFWS Biological Opinion (2008 USFWS BO) and  
11 the 2009 National Marine Fisheries Service (NMFS) Biological Opinion (2009  
12 NMFS BO) Reasonable and Prudent Alternatives (RPAs), in addition to other  
13 ongoing and future programs that are reasonably foreseeable to occur by 2030.

14 Identification of the No Action Alternative and the range of action alternatives for  
15 this EIS were developed in response to the purpose and need for the action as well  
16 as comments received during the scoping process and during preparation of the  
17 Draft EIS, as summarized below.

### 18 3.2.1 Scoping Process

19 The scoping process was initiated on March 28, 2012, with the publication of the  
20 Notice of Intent in the Federal Register (FR) and continued through June 28,  
21 2012. Five scoping meetings were held to inform the public and interested  
22 stakeholders about the project, and to solicit comments and input on the EIS. The  
23 scoping meetings were held in Madera, Diamond Bar, Sacramento, Marysville,  
24 and Los Banos, California, in April and May 2012. Many scoping comments  
25 addressed the definition and range of alternatives, as summarized below and in  
26 the Scoping Report (included as Appendix 23A of this EIS).

- 27 • Alternative South Delta operation criteria, including:
  - 28 – Changes to Old and Middle River (OMR) flow criteria from what was
  - 29 described in the 2008 USFWS BO and 2009 NMFS BO
  - 30 – Changes to operational criteria of CVP and SWP south Delta intakes
  - 31 relative to the ratio of San Joaquin River inflows to south Delta exports;
  - 32 – Changes to measurement methods for OMR flow criteria related to
  - 33 locations of measurements and inclusion of Contra Costa Water District
  - 34 intakes within the calculations of OMR flows.

- 1 • Measures to benefit the survival and recovery of listed aquatic species that do  
2 not involve modifications of long-term operation of the CVP and SWP, such  
3 as improved water quality, reduction of populations of predators of listed  
4 aquatic species in the Delta, regulation of small unscreened water diversions,  
5 restoration of floodplain habitat, and provisions for levee vegetation  
6 approaches.
- 7 • Measures to improve primary productivity and food supply for salmonids and  
8 smelts Smelt (both Delta Smelt and Longfin Smelt), including through  
9 increased spring outflow, reduced Delta diversions, and changes in Delta flow  
10 patterns resulting from channel modifications or changes in Delta exports that  
11 change Delta residence times for aquatic species.
- 12 • Measures to support federal and state fish population doubling mandates and  
13 goals.
- 14 • Measures to increase opportunities for transfer of water through the Delta.
- 15 • Measures to increase water supply availability from the CVP and SWP south  
16 Delta intakes.
- 17 • Measures to reduce reliance on Delta water supplies by reducing water supply  
18 availability from the CVP and SWP south Delta intakes.
- 19 • Complete cessation of long-term operation of the CVP and SWP, including  
20 benefits related to the operation of the CVP and SWP reservoirs, such as flood  
21 management and recreational benefits.
- 22 • Measures to prioritize CVP operations of the Trinity, Sacramento, American,  
23 and Stanislaus rivers to meet in-watershed water demands, not only in  
24 accordance with existing water rights and agreements, but also for CVP water  
25 contractors specifically located within the American and Stanislaus river  
26 watersheds.
- 27 • Measures to prioritize use of Central Valley Project Improvement Act  
28 (CVPIA) restoration funds within geographic locations collected from CVP  
29 water users in those locations.

### 30 **3.2.2 Concepts Identified during Preparation of the Draft EIS**

31 As described in Chapter 23, Consultation and Coordination, status meetings were  
32 held throughout preparation of the Draft EIS with stakeholders and interested  
33 parties between 2012 and 2015. Following the scoping process, the discussions  
34 were initially focused on identification of the No Action Alternative, other bases  
35 of comparisons, and alternative concepts to the RPAs. Based upon these  
36 discussions, the development of alternatives process initially focused on  
37 identification of the No Action Alternative, and subsequently, upon development  
38 of the range of alternatives to the No Action Alternative.

### 3.3 Identification of the Bases of Comparison

Council on Environmental Quality (CEQ) regulations require an EIS to include evaluation of a No Action Alternative (40 CFR 1502.14). The No Action Alternative is defined as the projections of current conditions and trends into the future without implementation of alternatives. These projected conditions are defined by CEQ as “no change” from current management direction or level of management intensity.” The No Action Alternative also can be defined as “no project” in cases where a new project is proposed for implementation. However, all of the alternatives evaluated in this EIS are to continue the coordinated long-term operation of the CVP and SWP. Therefore, the definition of the No Action Alternative used for this EIS is continuation of the current management direction and level of intensity.

For this EIS, the No Action Alternative is based upon the continued operation of the CVP and SWP in the same manner as was occurring at the time of the publication of the Notice of Intent in March 2012. Thus, the No Action Alternative consists of the coordinated long-term operation of the CVP and SWP, including full implementation of the RPAs in the 2008 USFWS BO and 2009 NMFS BO, because Reclamation provisionally accepted the BOs in 2008 and 2009, respectively, began implementing the RPAs, and continues to implement the RPAs to date. The No Action Alternative also includes changes not related to the long-term operation of the CVP and SWP or implementation of the RPAs in the 2008 USFWS BO and 2009 NMFS BO, as described in subsequent sections of this chapter.

Numerous scoping comments requested that the No Action Alternative not include the RPAs in the 2008 USFWS BO and 2009 NMFS BO because, at that time, the District Court had remanded the biological opinions (BOs) back to USFWS and NMFS. The comments indicated that the EIS should include a “basis of comparison” for the alternatives that was similar to conditions prior to implementation of the RPAs. Scoping comments also indicated that a “No Action Alternative scenario” without implementation of the RPAs in the 2008 USFWS BO and 2009 NMFS BO could be used to analyze the effects of implementing the RPAs.

Determining an appropriate baseline without the 2008 USFWS BO and 2009 NMFS BO actions and yet continuing to meet all of Reclamation’s statutory and regulatory requirements is a difficult task. Simply analyzing a No Action Alternative that is similar to the project description described in either the 2004 Biological Assessment or 2008 Biological Assessment is insufficient, as each was found to jeopardize listed species, the 2004 Biological Assessment by the District Court in 2007, and the 2008 Biological Assessment by USFWS and NMFS. Either of these operations would be inconsistent with Reclamation’s existing policy and management direction.

Because the RPAs were provisionally accepted and the No Action Alternative, represents a continuation of existing policy and management direction, the No Action Alternative includes the RPAs. However, in response to scoping

1 comments and subsequent comments from stakeholders and interest groups; and  
2 to provide a basis for comparison of the effects of implementation of the RPAs  
3 (per the District Court’s mandate), this EIS includes a “Second Basis of  
4 Comparison” that represents a condition in 2030 without implementation of the  
5 2008 USFWS BO and 2009 NMFS BO. All of the alternatives are compared to  
6 the No Action Alternative and to the Second Basis of Comparison to describe the  
7 effects that could occur by 2030 under both bases of comparison.

8 Several of the 2009 NMFS BO RPA actions had been initiated prior to issuance of  
9 the 2009 NMFS BO; and therefore, those actions are included in the Second Basis  
10 of Comparison, as described below. Reasonably foreseeable actions included in  
11 the No Action Alternative that are not related to the 2008 USFWS BO or 2009  
12 NMFS BO are also included in the Second Basis of Comparison.

### 13 **3.3.1 Conditions in Year 2030 without Implementation of** 14 **Alternatives 1 through 5**

15 Changes that would occur over the next 15 years without implementation of the  
16 alternatives are not analyzed in this EIS. However, the changes to environmental  
17 justice factors that are assumed to occur by 2030 under the No Action Alternative  
18 and the Second Basis of Comparison are summarized in this section, including:

- 19 • Continued long-term operation of the CVP and SWP in accordance with  
20 ongoing management policies, criteria, and regulations, including water right  
21 permits and licenses issued by the State Water Resources Control Board  
22 (SWRCB); and operational requirements of the 2008 USFWS BO and the  
23 2009 NMFS BO.
- 24 • Implementation of existing and future actions described in the 2008 USFWS  
25 BO and 2009 NMFS BO that would occur by 2030 without implementation of  
26 the BOs.
- 27 • Implementation of existing and future actions not described in the 2009  
28 NMFS BO that would occur by 2030 without implementation of any  
29 alternatives considered in this EIS.

#### 30 **3.3.1.1 Continued Long-Term Operation of the CVP and SWP Facilities**

31 The CVP and SWP are operated in a coordinated manner in accordance with  
32 Public Law 99-546 (October 27, 1986), directing the Secretary to execute the  
33 Coordinated Operation Agreement (COA). The CVP and SWP are also operated  
34 under State Water Resources Control Board (SWRCB) decisions and water right  
35 orders related to the CVP’s and SWP’s water right permits and licenses to  
36 appropriate water by diverting to storage, by directly diverting to use, or by re-  
37 diverting releases from storage later in the year or in subsequent years.

38 The CVP and SWP are permitted by SWRCB to store water, divert water and re-  
39 divert CVP and SWP water that has been stored in upstream reservoirs. The CVP  
40 and SWP have built water storage and water delivery facilities in the Central  
41 Valley to deliver water supplies to CVP and SWP contractors, including senior

1 water users. The CVP's and SWP's water rights are conditioned by the SWRCB  
2 to protect the beneficial uses of water within the watersheds.

3 As conditions of the water right permits and licenses, SWRCB requires the CVP  
4 and SWP to meet specific water quality objectives within the Delta. Reclamation  
5 and DWR coordinate operation of the CVP and SWP, pursuant to the COA, to  
6 meet these and other operating requirements. The COA is an agreement between  
7 the Federal government and the State of California for the coordinated operation  
8 of the CVP and SWP. The agreement suspended a 1960 agreement and  
9 superseded annual coordination agreements that had been implemented following  
10 construction of the SWP.

11 The COA established the operating framework for the CVP and SWP based upon  
12 conditions in the 1980s, by setting forth: (1) definitions of the CVP and SWP  
13 facilities and their water supplies, (2) procedures for coordination of operations,  
14 (3) formulas for sharing joint responsibilities for meeting Delta standards and  
15 ensuring no injury to other legal uses of water, (4) criteria for sharing unstored  
16 flow in the Delta, (5) a framework for exchange of water and services between the  
17 SWP and CVP, and (6) provisions for periodic reviews. Coordinated operation by  
18 agreed-on criteria can increase the efficiency of both the CVP and the SWP.

19 Implementation of the COA has evolved continually since 1986 as CVP and SWP  
20 facilities, operational criteria, and physical and regulatory environment have  
21 changed. For example, adoption of the CVPIA in 1992 changed purposes and  
22 operations of the CVP, and ESA responsibilities have affected operation of the  
23 CVP and SWP. Since 1986, facilities operations have been modified in response  
24 to statutory and regulatory requirements that were not part of the original COA  
25 assumptions or requirements. In addition, water quality objectives have been  
26 revised by the SWRCB since 1986 in the 1995 and 2006 Water Quality Control  
27 Plans and implemented through SWRCB Decision 1641. DWR and Reclamation  
28 have operational arrangements to accommodate new facilities, water quality  
29 objectives, the CVPIA, other SWRCB criteria, and the ESA, but the COA has not  
30 been formally modified to address these newer operating conditions.

31 The ongoing operational management policies of the CVP and SWP are  
32 anticipated to continue under the No Action Alternative and Second Basis of  
33 Comparison. These operational assumptions are described in Appendix 3A, No  
34 Action Alternative: Central Valley Project and State Water Project Operations,  
35 and summarized in Chapter 5, Surface Water Resources and Water Supplies.

36 **3.3.1.2 Actions included in the 2008 USFWS BO and 2009 NMFS BO that**  
37 **Would Have Occurred without Implementation of the Biological**  
38 **Opinions**

39 Several actions included in the 2008 USFWS BO RPA and 2009 NMFS BO RPA  
40 are ongoing and others have been completed, including the following actions.

- 41 • 2008 USFWS BO RPA Component 4, Habitat Restoration. In 2014,  
42 Reclamation, California Department of Fish and Wildlife (CDFW), and  
43 USFWS adopted and initiated implementation of the Suisun Marsh Habitat  
44 Management, Preservation, and Restoration Plan (Suisun Marsh Management

- 1 Plan). The No Action Alternative assumes that the Suisun Marsh  
2 Management Plan will provide up to 7,000 acres of intertidal and associated  
3 subtidal habitat in the Delta and Suisun Marsh with or without implementation  
4 of the 2000 USFWS BO. This would represent up to 87 percent (7,000 of  
5 8,000 acres of this habitat type referenced in the 2008 USFWS BO.
- 6 • 2009 NMFS BO RPA Action I.1.3, Clear Creek Spawning Gravel  
7 Augmentation. This effort was initiated in 1996 under the CVPIA Section  
8 3406(b)(12), and is assumed to continue under the No Action Alternative and  
9 Second Basis of Comparison. The Clear Creek fisheries habitat restoration  
10 program is being implemented by USFWS and Reclamation in accordance  
11 with CVPIA (Reclamation 2011a). By the year 2020 the overall goal is to  
12 provide 347,288 square feet of usable spawning habitat from Whiskeytown  
13 Dam downstream to the former McCormick-Saeltzer Dam, which is the  
14 amount that existed before construction of Whiskeytown Dam. Between 1996  
15 and 2009, a total of approximately 130,925 tons of spawning gravel was  
16 added to the creek. The interim annual spawning gravel addition target is  
17 25,000 tons per year, but due to a lack of funding, only an average of  
18 9,358 tons has been placed annually since 1996 (Reclamation 2013a). In  
19 2010, the first annual evaluation of spawning gravel implementation and  
20 monitoring was submitted to NMFS as required by the NMFS BO. In 2012,  
21 Reclamation placed 10,000 tons of spawning gravel at four locations:  
22 Guardian Rock/Below N.E.E.D. Camp, Placer Bridge, Clear Creek  
23 Crossing/Bridge, and Tule Backwater.
  - 24 • 2009 NMFS BO RPA Action I.1.4, Spring Creek Temperature Control  
25 Curtain Replacement. This action was completed when the temperature  
26 control curtain was replaced in 2011, as described in Appendix 3A, No Action  
27 Alternative: Central Valley Project and State Water Project Operations.
  - 28 • 2009 NMFS BO RPA Action I.2.6, Restore Battle Creek for Winter-Run,  
29 Spring-Run, and Central Valley Steelhead. The Battle Creek Salmon and  
30 Steelhead Restoration Projects under construction to reestablish  
31 approximately 42 miles of salmon and steelhead habitat on Battle Creek and  
32 an additional 6 miles of habitat on tributaries. The Project is a collaborative  
33 effort between Reclamation, USFWS, NMFS, CDFW, Pacific Gas & Electric  
34 Company (PG&E), and other groups. Prior to 2030, elements of the project  
35 will be completed including removal of five dams, installation of new fish  
36 screens and fish ladders, provisions for increased instream flows in Battle  
37 Creek, improved access roads and trails, and decommissioned power plant  
38 canals that conveyed water between tributaries. The No Action Alternative  
39 assumes implementation of this project with or without implementation of the  
40 2009 NMFS BO.
  - 41 • 2009 NMFS BO RPA Action I.3.1, Operate Red Bluff Diversion Dam with  
42 Gates Out. This action was completed when the new Red Bluff Pumping  
43 Plant began operation in 2012, and the gates no longer block the flow of water

- 1 in the Sacramento River, as described in Appendix 3A, No Action  
 2 Alternative: Central Valley Project and State Water Project Operations.
- 3 • 2009 NMFS BO RPA Action I.5, Funding for CVPIA Anadromous Fish  
 4 Screen Program. This effort was initiated over 20 years ago under the CVPIA  
 5 Section 3406(b)(21), and is assumed to continue under the No Action  
 6 Alternative with or without implementation of the 2009 NMFS BO. The No  
 7 Action Alternative assumes continued implementation of the program to meet  
 8 the program objectives by 2030.
  - 9 • 2009 NMFS BO RPA Action I.6.1, Restoration of Floodplain Habitat; and  
 10 Action I.6.2, Near-Term Actions at Liberty Island/Lower Cache Slough and  
 11 Lower Yolo Bypass; Action I.6.3, Lower Putah Creek Enhancements;  
 12 Action I.6.4, Improvements to Lisbon Weir; and Action I.7, Reduce Migratory  
 13 Delays and Loss of Salmon, Steelhead, and Sturgeon at Fremont Weir and  
 14 Other Structures in the Yolo Bypass. These actions are addressed in the  
 15 ongoing Yolo Bypass Salmonid Habitat Restoration and Fish Passage  
 16 Implementation Plan (Implementation Plan) that has been initiated by  
 17 Reclamation and DWR. The No Action Alternative and Second Basis of  
 18 Comparison assume completion of this Implementation Plan by 2030 with or  
 19 without implementation of the 2009 NMFS BO. The Implementation Plan  
 20 includes an operable gate at or near the Fremont Weir and modification of the  
 21 Sacramento Weir to increase the frequency and extent of floodplain  
 22 inundation in the Yolo Bypass; restoration of at least 20,000 acres of  
 23 floodplain rearing habitat (excluding tidally-influenced areas); and habitat  
 24 enhancements in the Yolo Bypass, including measures to avoid stranding or  
 25 barriers to migration. The No Action Alternative and Second Basis of  
 26 Comparison assume that an operable gate would be installed in or near the  
 27 Fremont Weir that would allow for controlled flows from the Sacramento  
 28 River into the Yolo Bypass when Sacramento River water elevations exceed  
 29 approximately 17.5 feet (NAVD88). Other portions of Fremont Weir would  
 30 continue to block flows into the Yolo Bypass until the Sacramento River  
 31 water elevations exceed 32.8 feet (NAVD88).
  - 32 • 2009 NMFS BO RPA Action II.1, Lower American River Flow Management.  
 33 This effort was initiated in 2006 when Reclamation began operating in  
 34 accordance with the American River Flow Management Standard (FMS), as  
 35 described in Appendix 3A, No Action Alternative: Central Valley Project and  
 36 State Water Project Operations. The No Action Alternative and Second Basis  
 37 of Comparison assume continued operations under the FMS.

38 **3.3.1.3 Future Actions not included in the 2008 USFWS BO and 2009**  
 39 **NMFS BO that Would Have Occurred without Implementation of**  
 40 **the Biological Opinions**

41 The No Action Alternative and the Second Basis of Comparison include  
 42 assumptions unrelated to implementation of the 2008 USFWS BO RPA actions  
 43 and 2009 NMFS BO RPA actions, including: climate change and sea level rise;  
 44 continued implementation of ongoing federal, state, and local regulations and

1 policies; development of lands in accordance with general plans in areas served  
2 by CVP and SWP water supplies; and reasonable and foreseeable projects that  
3 have been approved and are anticipated to be implemented by 2030. The 2008  
4 USFWS BO and the 2009 NMFS BO included assumptions for climate change  
5 and sea level rise; continued implementation of ongoing federal, state, and local  
6 regulations and policies; development of lands in accordance with general plans  
7 in areas served by CVP and SWP water supplies; and reasonable and foreseeable  
8 projects. Subsequent to the publication of the BOs, the assumptions for these  
9 items have been updated and are included in the No Action Alternative and the  
10 Second Basis of Comparison. The assumptions used in this EIS for these items  
11 are discussed below.

### 12 **3.3.1.3.1 Climate Change and Sea Level Rise**

13 Under Section 9503 of the SECURE Water Act (Public Law 111-11, Subtitle F),  
14 Reclamation conducted a comprehensive assessment of current information on  
15 potential future climate change impacts and implications for long-term water  
16 management in the West, as described in Appendix 5A, Modeling Methodology.  
17 Projections of future climate in the Sacramento and San Joaquin River basins are  
18 summarized, with regard to temperature, precipitation, snowpack, and runoff.  
19 Results indicate that temperatures across both river basins may increase steadily,  
20 with the basin-average mean annual temperature projected to increase by roughly  
21 5° to 6° Fahrenheit (F) during the 21st century. Annual precipitation in the basins  
22 should remain geographically variable over the next century, with current  
23 projections suggesting that annual basin-wide precipitation may initially stay  
24 steady to slightly increasing, to an eventual slight decrease over the region. With  
25 regard to snowpack, increased warming is expected to diminish snow  
26 accumulation during the cool season and reduce the availability of snowmelt to  
27 sustain runoff during the warm season. Reductions in annual runoff are predicted  
28 to occur by the latter half of the century. Changes in runoff seasonality are  
29 generally projected, with warming leading to more rainfall and runoff in the cool  
30 season and less runoff during the spring, affecting seasonal water supplies. One  
31 difficulty that arises in taking climate change into account in long-term water  
32 resources planning is that the natural variability is often greater than the  
33 magnitude of change expected over several decades.

34 Global and regional sea levels have been increasing steadily over the past century  
35 and are expected to continue to increase throughout this century (BCDC 2011).  
36 The National Research Council recently released a study of sea level rise on the  
37 west coast. Key results indicate that global sea level has risen about 7 inches in  
38 the 20th century and the rate of sea level rise is accelerating (NRC 2012).  
39 Relative to year 2000 levels, global sea level is projected to rise 3 to 9 inches by  
40 2030, 7 to 19 inches by 2050, and 20 to 55 inches by 2100. Sea level rise along  
41 the California coast south of Cape Mendocino are projected to show even greater  
42 ranges of potential change. As a result, sea level rise associated with climate  
43 change will continue to threaten coastal lands and infrastructure, increase flooding  
44 at the mouths of rivers, place additional stress on levees and water resources in  
45 the Delta.

1 Additional information related to development of climate change and sea level  
 2 rise projections by 2030 are presented in Section 5A.A.5 of Appendix 5A,  
 3 Section A, CalSim II and DSM2 Modeling.

4 **3.3.1.3.2 Continued Implementation of Ongoing Federal, State, and Local**  
 5 **Water Resources Policies**

6 The No Action Alternative and Second Basis of Comparison assume continued  
 7 implementation of ongoing water resources policies and programs that are not  
 8 addressed in the 2008 USFWS BO and 2009 NMFS BO, including the following  
 9 programs.

- 10 • Federal Clean Water Act, including completion of Total Maximum Daily  
 11 Load programs, National Pollutant Discharge Elimination System permits,  
 12 and Waste Discharge Permits, as described in Chapter 6, Surface Water  
 13 Quality.
- 14 • SWRCB water rights and water quality policies and programs, as described in  
 15 Chapter 5, Surface Water Resources and Water Supplies.
- 16 • Federal Safe Drinking Water Act and California Safe Drinking Water Act  
 17 policies and programs related to drinking water treatment requirements, as  
 18 described in Chapter 6, Surface Water Quality.
- 19 • Federal Clean Air Act and California Clean Air Act, including completion of  
 20 the compliance programs in accordance with the State Implementation Plans,  
 21 as described in Chapter 16, Air Quality and Greenhouse Gas Emissions.
- 22 • Flood management policies and programs established by the U.S. Army Corps  
 23 of Engineers (USACE) except for removal of substantial vegetation from  
 24 levees per recent USACE requirements (USACE 2009, 2010), Federal  
 25 Emergency Management Agency, DWR, Central Valley Flood Protection  
 26 Board, and local flood management agencies, as described in Chapter 5,  
 27 Surface Water Resources and Water Supplies.

28 **3.3.1.3.3 General Plan Development in CVP and SWP Service Areas**

29 Counties and cities throughout California have adopted general plans which  
 30 identify land use classifications including those for municipal and industrial uses  
 31 and those for agricultural uses. Preparation of general plans includes an  
 32 environmental evaluation under the California Environmental Quality Act to  
 33 identify adverse impacts to the physical environment and to provide mitigation  
 34 measures to reduce those impacts to a level of less than significance. Most of the  
 35 counties where CVP and SWP water supplies are delivered have adopted general  
 36 plans following the environmental review of the plans and appropriate  
 37 alternatives. Population projections from those general plan evaluations are  
 38 provided to the State Department of Finance and are used to project future water  
 39 needs and the potential for conversion of existing undeveloped lands and  
 40 agricultural lands. Many of the existing general plans for counties with municipal  
 41 areas recently have been modified to include land use and population projections  
 42 through 2030. The No Action Alternative and Second Basis of Comparison

1 assume that land uses, as described in Chapter 13, Land Use, will develop through  
2 2030 in accordance with existing general plans.

3 **3.3.1.3.4 Other Reasonable and Foreseeable Projects and Programs**

4 The No Action Alternative and Second Basis of Comparison assume continued  
5 implementation of existing projects and facilities, including water supply and  
6 wastewater management facilities, flood management facilities, and recreational  
7 facilities.

8 In addition, the No Action Alternative assumes implementation of the following  
9 ongoing projects by 2030. These project descriptions are organized  
10 geographically from north to south in the State of California.

11 *Trinity River Restoration Program*

12 The Trinity River Restoration Program is a conducted by eight partners that form  
13 the Trinity Management Council, including Reclamation, USFWS, NMFS, U.S.  
14 Forest Service, Hoopa Valley Tribe, Yurok Tribe, California Resources Agency,  
15 and Trinity County. The Trinity River Flow Evaluation Final Report was adopted  
16 in 1999 and the Trinity River Record of Decision (ROD) was signed in 2000 to  
17 implement restoration of the physical processes and rehabilitate the Trinity River  
18 as foundation for fisheries recovery. The ROD described four restoration  
19 methods (flow management through releases from Lewiston Dam, construction of  
20 channel rehabilitation sites, augmentation of gravels, and control of fine  
21 sediments); infrastructure improvements to accommodate high flow releases from  
22 Lewiston Dam; environmental compliance with improvements to riparian  
23 vegetation and wetlands, reduced turbidity, and improved water temperatures; and  
24 science-based adaptive management. The Trinity River Restoration Program  
25 2011 Annual Report indicated that about half of the projects described in the Flow  
26 Evaluation Study had been completed and intensive assessments of the physical  
27 responses of the Trinity River and geomorphic assessments of the 40-mile  
28 restoration reach had been initiated (TRRP 2012). This project will improve  
29 conditions for aquatic species in the Trinity River.

30 *Continued Implementation of the Central Valley Project Improvement Act*  
31 *Provisions*

32 In 1992, the CVPIA (Title 34 of Public Law 102-575) was adopted to include fish  
33 and wildlife protection, restoration, enhancement, and mitigation as purposes of  
34 the CVP having equal priority with irrigation and domestic water supply uses, and  
35 power generation. The purpose of the CVPIA is expressed in six broad  
36 statements found in Section 3402 of the Act:

- 37 • To protect, restore, and enhance fish, wildlife, and associated habitats in the  
38 Central Valley and Trinity River basins of California;
- 39 • To address impacts of the CVP on fish, wildlife, and associated habitats;
- 40 • To improve the CVP's operational flexibility;
- 41 • To increase water-related benefits provided by the CVP to the state through  
42 expanded use of voluntary water transfers and improved water conservation;

- 1 • To contribute to the state’s interim and long-term efforts to protect the San  
2 Francisco Bay/Sacramento-San Joaquin Delta Estuary;
- 3 • To achieve a reasonable balance among competing demands for use of CVP  
4 water, including the requirements of fish and wildlife, agricultural, municipal  
5 and industrial, and power contractors.

6 The Secretary of the Department of the Interior (DOI) assigned primary  
7 responsibility for implementing CVPIA’s many provisions to Reclamation and  
8 USFWS. Reclamation and USFWS coordinate with other federal agencies, tribes,  
9 the State of California, and numerous partners and stakeholders during each fiscal  
10 year to plan and implement activities.

11 The current focus of the CVPIA Program is on fish and wildlife restoration, water  
12 management, and conservation activities, authorized in Sections 3406 and 3408 of  
13 the Act. These goals fit within four broad resource areas: Fisheries, Water  
14 Operations, Refuges and Other Resources (Reclamation 2013c).

15 The Fisheries Resource Area includes actions to implement the CVPIA “fish-  
16 doubling goal” for Chinook Salmon, Rainbow Trout (steelhead), Striped Bass,  
17 American Shad, White Sturgeon and Green Sturgeon. The 2001 Final Restoration  
18 Plan to implement the CVPIA included 289 actions and evaluations that were  
19 determined to be reasonable given numerous technical, legal and implementation  
20 considerations. Reclamation and USFWS are implementing these and related  
21 actions (Reclamation 2013c). In 2008, the CVPIA Program conducted an  
22 independent review of the status of actions to achieve the fish-doubling goal.  
23 Following the review, a revised plan was developed to emphasize managing all of  
24 the fisheries programs as one program instead of individual actions; utilize a  
25 science-based management framework to address problems at a system level;  
26 report accomplishments by watershed; and improve transparency by  
27 communicating the coordination and decision-making that occurs within the  
28 program. The No Action Alternative assumes that the CVPIA Program will  
29 continue to be implemented in 2030.

30 The Water Operations Resource Area includes provisions to supply CVP water to  
31 resource locations in flow, quantity, velocity, and timing patterns that would  
32 contribute to the biological resources in accordance with Section 3406(b) of  
33 CVPIA (Reclamation 2013c). The No Action Alternative assumes that water  
34 operations will continue to include measures identified in Section 3406(b).

35 The Refuges Resources Area includes actions to contribute to the maintenance,  
36 restoration and enhancements of wetlands and waterfowl habitat either directly or  
37 through contractual agreements with other appropriate parties, firm water supplies  
38 of suitable quality to maintain and improve wetland habitat areas on 19 federal,  
39 state and private lands. The CVPIA requires Reclamation to provide CVP water  
40 to meet “Level 2” water demands and to obtain water supplies to meet “Level 4”  
41 water demands (Reclamation 2013c). In 2009, the CVPIA Program conducted an  
42 independent review of the refuge water supply program. The report indicated that  
43 Level 2 water supplies had become more reliable under CVPIA; however, Level 4  
44 water supplies were not fully obtained. In response, Reclamation entered into an

1 agreement with USFWS and the National Fish and Wildlife Foundation to explore  
2 avenues to improve the effectiveness of the water acquisitions, including those for  
3 Incremental Level 4; assessed ways to increase the priority for pumping,  
4 conveyance and storage of Incremental Level 4 water supplies in CVP facilities;  
5 and continued planning for external storage and conveyance facilities to meet  
6 refuge water supply needs. The No Action Alternative assumes that refuge water  
7 supplies will continue to be provided in 2030.

8 The Other Resource Area actions are related to terrestrial habitat and species; and  
9 water quality and conservation. One of the programs implemented in this  
10 resource area includes the Section 3406(b)(1) “other” Habitat Restoration  
11 Program, which focuses on protecting native habitats that have been directly and  
12 indirectly affected by the CVP’s construction and operation (Reclamation 2013c).  
13 This is accomplished through the purchase of fee title or conservation easements  
14 on lands where threats are significant and restoring lands to native habitat.  
15 Another program is the Land Retirement Program, Section 3408 (h), to purchase  
16 and retire land from agricultural production to improve water quality and provide  
17 for terrestrial habitat restoration. The No Action Alternative assumes that these  
18 actions will continue in a manner similar to ongoing operations.

19 The DOI is continuing to implement CVPIA using an improved science-based  
20 decision making process using a scientific framework that connects restoration  
21 actions to environmental and population responses across watersheds  
22 (Reclamation 2013c). A system-wide science-based approach with performance  
23 indices, monitoring, and scientific review of results is used to provide direction as  
24 the CVPIA adapts to changing conditions.

#### 25 *Clear Creek Mercury Abatement and Fisheries Restoration Project*

26 The Lower Clear Creek Aquatic Habitat and Waste Discharge Improvement  
27 Project was initiated to remove the long-term impacts of mercury contamination  
28 in Lower Clear Creek and to create over 5 acres of new wetlands. The mercury  
29 sources are dredge-mined tailings from more than 200 historic gold and gravel  
30 mines in the watershed. The tailings are located on the properties adjacent to  
31 Clear Creek and in gravels historically used for spawning gravel supplementation.  
32 This is being completed in accordance with CVPIA actions (WSRCD 2011). This  
33 project will improve conditions for aquatic species in Clear Creek and the upper  
34 Sacramento River.

#### 35 *Iron Mountain Mine Superfund Site*

36 The Iron Mountain Mine Superfund Site on Spring Creek had discharged acid  
37 mine drainage into several creeks that are tributary to Keswick Reservoir and the  
38 Sacramento River since the late 1890s. The interim remedies include source  
39 control, acid mine drainage collection and treatment, and water management,  
40 including water diversions and coordinated releases of contaminated surface  
41 water from Spring Creek Debris Dam with dilution flows released from the  
42 Spring Creek power plant and Shasta Lake. In 2008, the U.S. Environmental  
43 Protection Agency indicated that the interim remedies were operational and had  
44 reduced metal loading discharges by 95 percent as compared to pre-project

1 conditions. A final restoration plan for natural resources injured by Iron  
 2 Mountain Mine operation was adopted in 2002 by USFWS, CDFW, National  
 3 Oceanic and Atmospheric Administration, Bureau of Land Management, and  
 4 Reclamation and those programs are being implemented (USEPA 2008). This  
 5 project will improve water quality and conditions for aquatic species in Spring  
 6 Creek and the upper Sacramento River.

7 *Mainstem Sacramento River, American River, and Stanislaus River Gravel*  
 8 *Augmentation Programs*

9 The Mainstem Sacramento Gravel Augmentation Program is an ongoing  
 10 Reclamation project that helps meet requirements of Section 3406 (b)(13) of the  
 11 CVPIA to restore and replenish spawning gravel and rearing habitat for salmonid  
 12 species. Reclamation began placing salmonid spawning gravel in the Sacramento  
 13 River approximately 0.25 miles downstream of Keswick Dam in 1997 and  
 14 subsequently in Salt Creek. The project will place approximately 5,000 tons of  
 15 gravel into the river and implement riffle supplementation/side-channel  
 16 excavation to help improve spawning habitat for Chinook Salmon and steelhead  
 17 (Reclamation and USFWS 2012). This project will improve conditions for  
 18 aquatic species in the upper Sacramento River.

19 The Lower American River Salmonid Spawning Gravel Augmentation and Side-  
 20 Channel Habitat Establishment Program to increase and improve salmon and  
 21 steelhead spawning and rearing habitat by replenishing spawning gravel and  
 22 establishing additional side-channel habitat at new restoration sites along the  
 23 lower American River between Nimbus Dam and Upper Sunrise Recreation Area  
 24 and at Arden Rapids. Gravel augmentation, side channel excavation, and  
 25 incorporation of woody material into the main channel to improve Chinook  
 26 Salmon and steelhead spawning and rearing habitat (Reclamation 2008, 2014e).

27 Gravel restoration also has been implemented on the lower Stanislaus River since  
 28 2004 (Reclamation 2011c).

29 *Nimbus Fish Hatchery Fish Passage Project*

30 A fish passageway from the Nimbus Fish Hatchery to the stilling basin  
 31 downstream of the Nimbus Dam will be constructed and the diversion weir will  
 32 be removed. This project will create and maintain a reliable system for collecting  
 33 adult fish to allow Reclamation to mitigate for loss of access to spawning areas  
 34 following construction of Nimbus Dam and adequately protect Chinook Salmon  
 35 and Central Valley steelhead. The project is scheduled to start in 2018 if adequate  
 36 funding is appropriated. This project will improve conditions for aquatic species  
 37 in the lower American River and lower Sacramento River.

38 *Folsom Dam Water Control Manual Update*

39 The USACE is developing and evaluating alternatives to change flood  
 40 management operations of Folsom Dam and Folsom Lake to reduce flood risk to  
 41 the Sacramento area. Currently, the USACE is completing construction of the  
 42 new auxiliary spillway at Folsom Dam and is completing an in-depth analysis of  
 43 recent hydrologic data for the American River watershed upstream of Folsom  
 44 Dam. The study will result in an updated Water Control Manual following

1 completion of an EIS and an engineering report (USACE et al. 2012). This  
2 project could change flow patterns in the American and Sacramento rivers and the  
3 Delta.

4 *Federal Energy Regulatory Commission Relicensing for Middle Fork of the*  
5 *American River Project*

6 The Federal Energy Regulatory Commission (FERC) completed a final EIS for  
7 the relicensing of the Placer County Water Agency existing 223,753 kilowatt  
8 Middle Fork American River Hydroelectric Project. The project is located on the  
9 Middle Fork of the American River, Rubicon River, and Duncan and North and  
10 South Fork Long Canyon creeks in Placer and El Dorado counties. The re-  
11 licensing will provide for continued operation of the project with increased pulse  
12 and minimum instream flow releases, defined ramping rates, whitewater boating  
13 flow releases, protection of sensitive species, maintenance and enhancement of  
14 recreation opportunities, erosion and sedimentation reduction measures,  
15 vegetation improvement plans, and recreation management plans (FERC 2012).  
16 This project will change flow patterns in the American River and improve  
17 conditions for aquatic species in portions of the American River watershed.

18 *Lower Mokelumne River Spawning Habitat Improvement Project*

19 The Mokelumne River is tributary to the Delta and supports five species of  
20 anadromous fish. The proposed project will initially include placement of  
21 4,000 to 5,000 cubic yards of suitably sized salmonid spawning gravel annually  
22 for a 3-year period at two specific sites, and then provide annual supplementation  
23 of 600 to 1,000 cubic yards thereafter. Fall-run Chinook Salmon and steelhead  
24 are the primary management focus in the river. Availability of spawning gravel in  
25 this section of the Mokelumne River has been determined to be deficient because  
26 historic gold and aggregate mining operations removed gravel annually and  
27 upstream dams have reduced gravel transport to the area. This area was chosen  
28 because it is known to have supported fall-run Chinook Salmon and steelhead  
29 spawning in the past and because the substrate is suitable for habitat improvement  
30 (USFWS 2009).

31 This project will improve conditions for aquatic species in the Mokelumne and  
32 San Joaquin rivers.

33 *Dutch Slough Tidal Marsh Restoration*

34 The Dutch Slough Tidal Marsh Restoration Project, located near Oakley in  
35 Eastern Contra Costa County, will restore wetland and uplands, and provide  
36 public access to the 1,200-acre Dutch Slough property. The property is composed  
37 of three parcels separated by narrow man-made sloughs. The project is a  
38 cooperative partnership between DWR, State Coastal Conservancy, CDFW, City  
39 of Oakley, Ironhouse Sanitary District, Reclamation Districts 2137 and 799,  
40 Natural Heritage Institute, and landowners. The project will provide ecosystem  
41 benefits, including habitat for sensitive species, including winter-run Chinook  
42 Salmon Sacramento splittail, and many waterfowl species. It also will be  
43 designed and implemented to maximize opportunities to assess the development  
44 of those habitats and measure ecosystem responses so that future Delta restoration

1 projects will be more successful. DWR approved the Final Environmental Impact  
 2 Report (EIR) for the project in March 2010 (NMFS 2013). This project will  
 3 improve conditions for aquatic and terrestrial species in the Delta through tidal  
 4 marsh restoration.

5 *Suisun Marsh Habitat Management, Preservation, and Restoration Plan*  
 6 *Implementation*

7 On March 2, 1987, the Suisun Marsh Preservation Agreement (SMPA) was  
 8 signed by DWR, CDFW, Reclamation, and the Suisun Resource Conservation  
 9 District. The purpose of the agreement was to establish mitigation for impacts on  
 10 salinity from the SWP, CVP, and other upstream diversions. The SMPA contains  
 11 provisions for Reclamation and DWR to mitigate the adverse effects on Suisun  
 12 Marsh channel water salinity from operation of the CVP and SWP and other  
 13 upstream diversions. The Suisun Marsh Habitat Management, Preservation and  
 14 Restoration Plan (SMP) was completed in 2014 under the direction of  
 15 Reclamation, USFWS, CDFW, NMFS, Suisun Resource Conservation District,  
 16 and CALFED Bay-Delta Program (the Principal Agencies). This group was  
 17 assisted by regulatory agencies such as the USACE, Bay Conservation and  
 18 Development Commission, SWRCB, and the San Francisco Bay Regional Water  
 19 Quality Control Board. The following actions will be implemented under the plan  
 20 (Reclamation 2014a).

- 21 • Restoration of up to 7,000 acres of tidal marsh and protection and  
 22 enhancement of up to 46,000 acres of managed wetlands through dredging,  
 23 erosion protection, and installation of fish screens.
- 24 • Increased frequency of currently implemented managed wetlands activities.
- 25 • Implementation of the Preservation Agreement Implementation Fund (PAI  
 26 Fund) to improve managed wetland flood and drain capabilities to  
 27 accommodate high salinity water while maintaining functions and values of  
 28 managed wetland habitats.

29 The plan includes environmental commitments and mitigation measures, an  
 30 adaptive management program, and reporting through annual reports over the  
 31 30-year time frame of the plan. This project will improve conditions for aquatic  
 32 and terrestrial species in the Delta and Suisun Marsh.

33 *Tidal Wetland Restoration in the Delta and Suisun Marsh*

34 In addition to tidal wetlands restoration that would occur in the Suisun Marsh,  
 35 several programs are being implemented in the Cache Slough portion of the Delta.  
 36 The 2008 USFWS BO RPA required a program to create or restore a minimum of  
 37 8,000 acres of intertidal and associated subtidal habitat in the Delta and Suisun  
 38 Marsh. As described above, up to 7,000 acres of tidal marsh restoration would  
 39 occur under the SMP. Other programs have been initiated to restore or expand  
 40 tidal wetlands, and could provide an additional 3,000 acres of tidal wetlands in the  
 41 Delta and Suisun Marsh. This additional 3,000 acres could be completed in  
 42 accordance with the 2008 USFWS BO requirements. The No Action Alternative  
 43 includes the following restoration programs.

- 1 • Yolo Ranch (initial phase), Northwest Field Network 4, and Flyway Farms –  
2 941 and 405 acres, respectively, of tidal influenced lands (SFWCA 2011,  
3 2013).
- 4 • Northern Liberty Island Fish Restoration Project – 737 acres (RD 2093 2011).
- 5 • Prospect Island Restoration Project – 1,170 acres (based on maps included in  
6 CDFW and DWR 2013).
- 7 • Calhoun Cut/Lindsey Slough Tidal Habitat Restoration Project – 87 acres  
8 (CDFW 2015).

9 *San Joaquin River Restoration Program*

10 The San Joaquin River Restoration Program is a comprehensive long-term effort  
11 to restore flows to the San Joaquin River from Friant Dam to the confluence of  
12 Merced River and restore a self-sustaining Chinook Salmon fishery in the river  
13 while reducing or avoiding adverse water supply impacts from restoration flows.  
14 The restoration program is the product of more than 18 years of litigation, which  
15 culminated in a Stipulation of Settlement on the lawsuit known as *NRDC, et al.,*  
16 *v. Kirk Rodgers, et al.* The settling parties reached agreement on the terms and  
17 conditions of the settlement, which was subsequently approved by the District  
18 Court on October 23, 2006. The settling parties include the Natural Resources  
19 Defense Council, Friant Water Users Authority, and the U.S. Departments of the  
20 Interior and of Commerce. The settlement's two primary goals are to:

- 21 • Restore and maintain fish populations in "good condition" in the main stem of  
22 the San Joaquin River below Friant Dam to the confluence of the Merced  
23 River, including naturally reproducing and self-sustaining populations of  
24 salmon and other fish, and
- 25 • Reduce or avoid adverse water supply impacts to all of the Friant Division  
26 long-term contractors that may result from the Interim Flows and Restoration  
27 Flows provided for in the settlement.

28 The settlement requires specific releases of water from Friant Dam to the  
29 confluence of the Merced River, which are designed primarily to meet the various  
30 life stage needs for spring- and fall-run Chinook Salmon. The release schedule  
31 assumes continuation of the current average Friant Dam release of 116,741 acre-  
32 feet, annually, with specific flow requirements depending on the year type. The  
33 project was authorized and funded with the passage of San Joaquin River  
34 Restoration Settlement Act, part of the Omnibus Public Land Management Act of  
35 2009 (Public Law 111-11). Interim flows began in October, 2009. There are  
36 many physical improvements within and near the San Joaquin River that will be  
37 undertaken to fully achieve the river restoration goal. The improvements will  
38 occur in two separate phases that will focus on a combination of water releases  
39 from Friant Dam, as well as structural and channel improvements (Reclamation  
40 2012). This project will improve conditions for aquatic and terrestrial species in  
41 the San Joaquin River and the Delta.

1 This EIS does not address the CVP facilities associated with Millerton Lake,  
2 including the Madera and Friant-Kern canals and their service areas, and the San  
3 Joaquin River Restoration Program because these facilities are not considered in  
4 the consultations related to the 2008 USFWS BO and 2009 NMFS BO.

5 *Stockton Deep Water Ship Channel Demonstration Dissolved Oxygen Project*

6 The Stockton Deep Water Ship Channel Demonstration Dissolved Oxygen  
7 Project is a multiple-year study of the effectiveness of elevating dissolved oxygen  
8 (DO) concentrations in the channel. The DO concentrations drop as low as 2 to  
9 3 milligrams per liter (mg/L) during warmer and lower water flow periods in the  
10 San Joaquin River. The low DO levels can adversely affect aquatic life including  
11 the health and migration behavior of anadromous fish (e.g., salmon). The  
12 objective of the study is to maintain DO levels above the minimum recommended  
13 levels specified in the 2006 Water Quality Control Plan (Basin Plan) for the  
14 Sacramento River and San Joaquin River basins, as described in Chapter 6,  
15 Surface Water Quality.

16 The project's full-scale aeration system includes two 200-foot-deep u-tube  
17 aeration tubes; two vertical turbine pumps capable of pumping over  
18 11,000 gallons of water each; a liquid-to-gas oxygen supply system; and  
19 numerous pieces of ancillary equipment and control systems. The system has  
20 been sized to deliver approximately 10,000 pounds of oxygen per day into the  
21 Deep Water Ship Channel. The aeration system is anticipated to be operated only  
22 when channel DO levels are below the Basin Plan DO water quality objectives  
23 (approximately 100 days per year). The project study includes an on-going  
24 assessment of DO levels in the channel and vicinity and a study of potential  
25 adverse effects of low DO on salmon (DWR 2010a). This project will improve  
26 water quality in the central and south Delta as compared to historical conditions.

27 *Grasslands Bypass Project*

28 Reclamation is actively engaged with the Grassland Area Farmers who discharge  
29 subsurface agricultural drainage waters through the Grassland Bypass Project,  
30 which is a significant source of selenium to the San Joaquin River and to the  
31 Delta. Reclamation and the Grassland Area Farmers are continuing to reduce the  
32 amount of agricultural drainage water produced in the Grassland Drainage Area,  
33 preventing the discharge of this water into local Grassland wetland water supply  
34 channels, and improving the quality of water in the San Joaquin River. The  
35 Grassland Bypass Project is based upon an agreement between Reclamation and  
36 the San Luis and Delta-Mendota Water Authority to use a 28-mile segment of the  
37 San Luis Drain to convey agricultural subsurface drainage water from the  
38 Grassland Drainage Area to Mud Slough (North), a tributary of the San Joaquin  
39 River. An extensive monitoring program by the San Francisco Estuary Institute  
40 (2013) continues to document the effectiveness of actions such as source control  
41 and other measures being taken by the Grassland Area Farmers. These actions by  
42 the Grassland Area Farmers are described in Chapter 2 of SFEI (2013). Briefly,  
43 these activities have included the Grassland Bypass Project and the San Joaquin  
44 River Improvement Project, formation of a regional drainage entity, newsletters  
45 and other communication with the farmers, a monitoring program, using State

1 Revolving Fund loans for improved irrigation systems, installing and using  
2 drainage recycling systems to mix subsurface drainage water with irrigation  
3 supplies under strict limits, tiered water pricing and a tradable loads programs.

4 The purposes and objectives of the Grasslands Bypass Project, 2010–2019, are to:  
5 1) extend the San Luis Drain Use Agreement in order to allow the Grassland  
6 Basin Drainers time to acquire funds and develop feasible drainwater treatment  
7 technology to meet revised Basin Plan objectives and Waste Discharge  
8 Requirements by December 31, 2019; 2) continue the separation of unusable  
9 agricultural drainage water discharged from the Grassland Drainage Area from  
10 wetland water supply conveyance channels for the period 2010–2019; and  
11 3) facilitate drainage management that maintains the viability of agriculture in the  
12 project area and promotes continuous improvement in water quality in the San  
13 Joaquin River. All discharges of drainage water from the Grassland Drainage  
14 Area into wetlands and refuges have been eliminated. The selenium load  
15 discharged from the Grassland Drainage Area has been reduced by 61 percent  
16 (from 9,600 pounds to 3,700pounds) and the salt load has been reduced by  
17 39 percent (from 187,300 tons to 113,600 tons). Prior to the project, the monthly  
18 mean concentration of selenium in Salt Slough was 16 parts per billion. Since  
19 implementation of this project, the concentration has been less than the water  
20 quality objective of 2 parts per billion. The drainage water is conveyed to Mud  
21 Slough. Grasslands Water District and others are currently evaluating alternative  
22 plans to comply with Central Valley Regional Water Quality Control Board water  
23 quality objectives for selenium and salinity in the San Joaquin River at the end of  
24 this project in 2019. One of the alternatives could be zero discharge with  
25 complete recycle of the drainwater to salinity-tolerant crops (Reclamation 2009).  
26 This project will improve water quality in the San Joaquin River and the central  
27 and south Delta.

28 *Central Valley Salinity Alternatives for Long-Term Sustainability (CV-SALTS)*

29 In 2006, the Central Valley Regional Water Quality Control Board, the SWRCB,  
30 and stakeholders began a joint effort to address salinity and nitrate problems in  
31 California's Central Valley and adopt long-term solutions that will lead to  
32 enhanced water quality and economic sustainability. This effort is referred to as  
33 the Central Valley Salinity Alternatives for Long-term Sustainability (CV-  
34 SALTS) Initiative. The goal of CV-SALTS is to develop a comprehensive  
35 region-wide Salt and Nitrate Management Plan (SNMP) describing a water  
36 quality protection strategy that will be implemented through a mix of voluntary  
37 and regulatory efforts. The SNMP may include recommendations for numeric  
38 water quality objectives, beneficial use designation refinements, and/or other  
39 refinements, enhancements, or basin plan revisions.

40 The SNMP and will serve as the basis for amendments to the three Basin Plans  
41 that cover the Central Valley Region (Sacramento River and San Joaquin River  
42 Basin Plan, the Tulare Lake Basin Plan and the Sacramento/San Joaquin Rivers  
43 Bay-Delta Plan). The basin plan "amendments" will likely establish a  
44 comprehensive implementation plan to achieve water quality objectives for  
45 salinity (including nitrate) in the Region's surface waters and groundwater. The

1 SNMP may include recommendations for numeric water quality objectives,  
 2 beneficial use designation refinements, and/or other refinements, enhancements,  
 3 or basin plan revisions (CVRWQCB 2015). This project could change water  
 4 quality and flow patterns in the San Joaquin River.

5 *Municipal Water Supply Projects*

6 Municipal water users in California are required to prepare Urban Water  
 7 Management Plans (UWMPs) in accordance with the California Urban Water  
 8 Management Planning Act of 1983. The State Water Conservation Act of 2009  
 9 (also known as SBx7-7) required the UWMPs to identify the water demands and  
 10 water supplies for their service area through the year 2030, and to provide a plan  
 11 to reduce statewide per capita water use by 20 percent by the year 2020. All of  
 12 the UWMPs identify conservation measures to reduce water demands by 2020.  
 13 Many of the UWMPs identify projects that are being planned or implemented to  
 14 meet water demands in 2030. Water resources projects that have been approved  
 15 and are being implemented are assumed to be complete by 2030 under the No  
 16 Action Alternative. There are numerous projects considered in the study area to  
 17 be included in the No Action Alternative, as described in Appendix 5D,  
 18 Municipal and Industrial Water Demands and Supplies, including the following  
 19 major water supply projects.

- 20 • Cambria Emergency Water Supply Project desalination project (CCSD 2014).
- 21 • Carlsbad Metropolitan Water District water recycling project (Carlsbad MWD  
 22 2012)
- 23 • Central Basin Municipal Water District Southeast Water Reliability Project  
 24 (CBMWD 2011).
- 25 • City of Los Angeles Department of Water and Power groundwater recharge  
 26 projects (City of Los Angeles 2011, 2013a).
- 27 • City of Oxnard GREAT Program Desalter (City of Oxnard 2013).
- 28 • Eastern Municipal Water District water recycling programs (EMWD 2014a,  
 29 2014b).
- 30 • Fresno Irrigation District groundwater recharge projects (FID 2015).
- 31 • Inland Empire Utilities Agency groundwater recharge projects (IEUA 2015).
- 32 • Kern County and Antelope Valley-East Kern Water Agency (AVEK 2011).
- 33 • Los Angeles County Sanitation Districts expansion of water recycling  
 34 programs (LACSD 2005).
- 35 • San Benito County Water District expansion of water treatment plant to treat  
 36 CVP water (SBCWD 2014).
- 37 • San Diego County Water Authority Carlsbad Seawater Desalination Facility  
 38 (SDCWA 2014).
- 39 • Santa Barbara desalination water treatment plant (KEYT 2015).

- 1 • Santa Clara Valley Water District wastewater recycling projects (SCVWD  
2 2012).
- 3 • City of Stockton Delta Water Supply Project (City of Stockton 2005).
- 4 • Victor Valley Wastewater Reclamation Authority water recycling programs  
5 (VVWRA 2015).
- 6 • Water Replenishment District Groundwater Reliability Improvement Program  
7 and water recycling programs (WRD 2012, 2015).
- 8 • West Basin Municipal Water District recycling water programs (WBMWD  
9 2011).
- 10 • Western Development and Storage Antelope Valley Water Bank (Reclamation  
11 2010).
- 12 • Western Municipal Water District Arlington Desalter Expansion to use saline  
13 groundwater (WMD 2015).
- 14 • Woodland-Davis Clean Water Agency water treatment plant (WDCWA  
15 2013).

16 *Water Transfer Projects*

17 Water transfer programs have been used historically throughout California,  
18 especially among CVP water users to meet both irrigation and municipal water  
19 demands either during drought or to replenish stored surface water or  
20 groundwater during wet periods (Reclamation 2013b).

21 Implementation of CVPIA in 1992 facilitated water transfers between CVP water  
22 users and between CVP water users and non-CVP water users. The water can be  
23 transferred through CVP facilities in a manner that does not harm the operation of  
24 the CVP for other users and beneficial uses. CVP facilities also can be used to  
25 convey non-CVP water under the Warren Act of 1911. In the first 10 years  
26 following adoption of CVPIA, more than 4.3 million acre-feet of water was  
27 transferred for agricultural and municipal water uses and more than 396,000 acre-  
28 feet was transferred to the DOI for Level 4 Refuge Water Supplies (Reclamation  
29 2004a). Water transfers also occur between the SWP water users and non-SWP  
30 water users. SWP facilities can be used to convey the transferred water, including  
31 non-SWP water, under DWR conveyance agreements.

32 Historically, water transfers primarily were in-basin transfers (e.g., Sacramento  
33 Valley water seller to Sacramento Valley water user) (Reclamation 2013b; DWR,  
34 Reclamation, USFWS and NMFS 2013). However, between 2001 and 2012,  
35 water transfers from the Sacramento Valley to the areas located south of the Delta  
36 of up to 298,806 acre-feet occurred (not including water transfers under the  
37 Environmental Water Account Program in the early 2000s) (DWR, Reclamation,  
38 USFWS and NMFS 2013). These transfers occurred in drier years. In 2012 and  
39 2013, the following types of water transfers occurred (DWR and SWRCB 2014).

- 1 • Water transfers involving CVP and SWP water:
  - 2 – 2012: 47,420 acre-feet of water transfers (43 percent were between
  - 3 agricultural water users, 36 percent were between municipal water users,
  - 4 and 21 percent were between agricultural and municipal water users).
  - 5 – 2013: 63,790 acre-feet of water transfers (28 percent were between
  - 6 agricultural water users, and 72 percent were between agricultural and
  - 7 municipal water users).
- 8 • Water transfers involving non-CVP and SWP water:
  - 9 – 2012: 188,074 acre-feet of water transfers (72 percent were between
  - 10 agricultural water users, 14 percent were from agricultural water users to
  - 11 wildlife refuges, and 14 percent were between agricultural and municipal
  - 12 water users).
  - 13 – 2013: 268,370 acre-feet of water transfers (72 percent were between
  - 14 agricultural water users, 1 percent were from agricultural water users to
  - 15 wildlife refuges, and 27 percent were between agricultural and municipal
  - 16 water users).

17 Until recently, most of the water transfers extended for one or two years. In 2008,  
 18 one of the first long-term water transfer agreements was approved by the SWRCB  
 19 for the Lower Yuba River Accord. The plan was designed to protect and enhance  
 20 fisheries resources in the Lower Yuba River, increase local water supply  
 21 reliability, provide DWR with increased operational flexibility for protection of  
 22 Delta fisheries resources, and provide added dry-year water supplies to CVP and  
 23 SWP water users, as described in Appendix 3A, No Action Alternative: Central  
 24 Valley Project and State Water Project Operations. In 2013, Reclamation  
 25 approved an overall program for a 25-year period (2014 to 2038) to transfer up to  
 26 150,000 acre-feet/year of water from the San Joaquin River Exchange Contractors  
 27 Water Authority to DOI for refuge water supplies or CVP and SWP water users  
 28 (Reclamation 2013b). Reclamation is currently evaluating a long-term water  
 29 transfer program (2015 to 2024) between water sellers in the Sacramento Valley  
 30 and water users located in the San Francisco Bay Area and south of the Delta  
 31 (Reclamation 2014b).

32 Transfer programs generally involve annual crop changes using temporary crop  
 33 idling or shifting, release of stored water in reservoirs on different patterns for the  
 34 purchasers' water demands, and/or groundwater substitution (DWR and  
 35 Reclamation 2014). The transfers must be approved by the CVP and/or SWP if  
 36 the transfer involves CVP or SWP water or utilizes CVP or SWP facilities.  
 37 Except for water transfers among CVP water users, water transfers also require  
 38 approval from the SWRCB. Environmental documentation is required for all  
 39 water transfers involving CVP and/or SWP water supplies or facilities. Under  
 40 State law, water transfers cannot result in injury to other legal users of water;  
 41 unreasonable impacts on fish and wildlife and instream uses; and unreasonable  
 42 economic or environmental impact on the county in which the transfer water  
 43 originates.

1 It is assumed that transfers would continue under the No Action Alternative in a  
2 similar manner as have occurred for the past 10 years. It is anticipated that the  
3 number of long-term transfer agreements could increase to facilitate annual  
4 decisions for water transfers. However, the conditions for each water transfer  
5 would be determined on a case-by-case basis.

### 6 **3.3.2 No Action Alternative**

7 In addition to the common conditions described above, the No Action Alternative  
8 also would include existing and future actions described in the 2008 USFWS BO  
9 and 2009 NMFS BO that would not occur by 2030 without implementation of the  
10 BOs and implementation of the USACE vegetation management operations along  
11 levees for flood management in accordance with policies issued by the USACE in  
12 2009 and 2010.

#### 13 **3.3.2.1 Continued Long-Term Operation of the CVP and SWP Facilities**

14 The actions related to the CVP and SWP operations are described in more detail  
15 in Appendix 3A, No Action Alternative: Central Valley Project and State Water  
16 Project Operations.

17 In addition to the operational actions, there are several actions that would not have  
18 been implemented by 2030 under the No Action Alternative without  
19 implementation of the 2008 USFWS BO and 2009 NMFS BO. These actions  
20 have not been fully defined at this time; and therefore, would require future  
21 engineering and environmental evaluation prior to implementation. These  
22 following actions are assumed to be completed under the No Action Alternative,  
23 and the objectives outlined in the 2008 USFWS BO and 2009 NMFS BO are  
24 assumed to be achieved by 2030.

- 25 • 2009 NMFS BO RPA Action I.2.5, Winter-Run Passage and Re-Introduction  
26 Program at Shasta Dam.
- 27 • 2009 NMFS BO RPA Action II.3, Structural Improvements for Temperature  
28 Management on the American River, including installation of a Folsom Dam  
29 temperature control device, methods to transport cold water through Lake  
30 Natoma, installation of a temperature control device on the El Dorado  
31 Irrigation District intake from Folsom Lake, and development of temperature  
32 management decision-support tools.
- 33 • 2009 NMFS BO RPA Action II.5, Fish Passage at Nimbus and Folsom Dams.
- 34 • 2009 NMFS BO RPA Action II.6, Implement Actions to Reduce Genetic  
35 Effects of Nimbus and Trinity River Fish Hatchery Operations.
- 36 • 2009 NMFS BO RPA Action III.2.1, Increase and Improve Quality of  
37 Spawning Habitat with Addition of 50,000 Cubic Yards of Gravel by 2014  
38 and with a Minimum Addition of 8,000 Cubic Yards per Year for the Duration  
39 of the Project Actions on Stanislaus River.

- 1 • 2009 NMFS BO RPA Action III.2.2, Conduct Floodplain Restoration and  
2 Inundation Flows in Winter or Spring to Inundate Steelhead Juvenile Rearing  
3 Habitat on One- to Three-Year Schedule on Stanislaus River.
- 4 • 2009 NMFS BO RPA Action III.2.3, Restore Freshwater Migratory Habitat  
5 for Juvenile Steelhead by Implementing Projects to Increase Floodplain  
6 Connectivity and to Reduce Predation Risk During Migration on Stanislaus  
7 River.
- 8 • 2009 NMFS BO RPA Action III.2.4, Fish Passage at New Melones, Tulloch,  
9 and Goodwin Dams.
- 10 • 2009 NMFS BO RPA Action IV.4, Tracy Fish Collection Facility  
11 Improvements to Reduce Pre-Screen Loss and Improve Screening Efficiency.
- 12 • 2009 NMFS BO RPA Action IV.4.2 Skinner Fish Collection Facility  
13 Improvements to Reduce Pre-Screen Loss and Improve Screening Efficiency.
- 14 • 2009 NMFS BO RPA Action IV.4.3 Tracy Fish Collection Facility and the  
15 Skinner Fish Collection Facility Actions to Improve Salvage Monitoring,  
16 Reporting and Release Survival Rates.

17 **3.3.2.2 Vegetation Management along Levees**

18 The No Action Alternative also would include vegetation management operations  
19 along levees for flood management in accordance with policies issued by the  
20 USACE in 2009 and 2010. Historically, the USACE has allowed brush and small  
21 trees to be located on the waterside of federal flood management project levees if  
22 the vegetation would preserve, protect, and/or enhance natural resources, and/or  
23 protect rights of Native Americans, while maintaining the safety, structural  
24 integrity, and functionality of the levee (DWR 2011b). After Hurricane Katrina in  
25 2005, the USACE issued a policy and draft policy guidance to remove substantial  
26 vegetation from these levees throughout the nation (USACE 2009). This policy  
27 requires federally authorized levee systems that have maintenance agreements  
28 with the USACE (including Delta levees along the Sacramento and San Joaquin  
29 rivers) and other levees that are eligible for the federal Rehabilitation and  
30 Inspection Program (Public Law 84-99) to remove vegetation in the following  
31 manner.

- 32 • Removal of all vegetation from the upper third of the waterside slope of the  
33 levee, the top of the levee, landside slope of the levee, or within 15 feet of the  
34 toe of the levee on the landside (“toe” is where the levee slope meets the  
35 ground surfaces).
- 36 • Removal of all vegetation over 2 inches in diameter on the lower two-thirds of  
37 the waterside slope of the levee and within 15 feet of the toe of the levee on  
38 the waterside along benches above the water surface.

39 In 2010, the USACE issued a draft policy guidance letter, *Draft Process for*  
40 *Requesting a Variance from Vegetation Standards for Levees and Floodwalls—*  
41 *75 Federal Register 6364-68* (USACE 2010) that included procedures for State  
42 and local agencies to request variances on a site-specific basis. DWR has been in

1 negotiations with USACE to remove vegetation on the upper third of the  
2 waterside slope, top, and landside of the levees, and continue to allow vegetation  
3 on the lower two-thirds of the waterside slope of the levee and along benches  
4 above the water surface (DSC 2011). By 2030, it is anticipated that much of the  
5 existing vegetation on the upper third of the waterside slopes, tops, landside  
6 slopes, and within 15 feet of the landside toe of the levees would be removed.

### 7 **3.3.3 Second Basis of Comparison**

8 Numerous comments received during the scoping process and subsequently  
9 during preparation of the Draft EIS requested that the No Action Alternative not  
10 include the 2008 USFWS BO RPA and 2009 NMFS BO RPA. The comments  
11 indicated that the EIS should include a “basis of comparison” for the alternatives  
12 that was similar to conditions prior to implementation of the RPAs. Scoping  
13 comments also indicated that a “No Action Alternative scenario” without  
14 implementation of the RPAs in the 2008 USFWS BO and 2009 NMFS BO could  
15 be used to analyze the effects of implementing the RPAs.

16 Determining an appropriate baseline without the 2008 USFWS BO and 2009  
17 NMFS BO actions and yet continuing to meet all of Reclamation’s statutory and  
18 regulatory requirements is a difficult task. Simply analyzing a No Action  
19 Alternative that is similar to the project description described in either the 2004  
20 Biological Assessment or 2008 Biological Assessment is insufficient, as each was  
21 found to jeopardize listed species (the 2004 Biological Assessment by the District  
22 Court in 2007, and the 2008 Biological Assessment by USFWS and NMFS).  
23 Either of these operations would be inconsistent with Reclamation’s existing  
24 policy and management direction.

25 Reclamation has provisionally accepted and implemented the 2008 USFWS BO  
26 and 2009 NMFS BO actions; therefore, the No Action Alternative, by definition,  
27 must include these actions because they represent a continuation of existing  
28 policy and management direction. In response to the comments and to provide a  
29 basis for comparison of the effects of implementation of the RPAs (per the  
30 District Court’s mandate), this EIS includes a “Second Basis of Comparison” that  
31 does not include implementation of the RPAs. The Second Basis of Comparison  
32 can be used as a basis of comparison for the alternatives that do not include the  
33 RPAs. In this way, the action alternatives can be compared against both the No  
34 Action Alternative and the Second Basis of Comparison.

#### 35 **3.3.3.1 Continued Long-Term Operation of the CVP and SWP Facilities**

36 The Second Basis of Comparison conditions assume that climate change  
37 conditions would have changed between 2015 and 2030. It is anticipated that by  
38 2030, there will be less snowfall over the long-term average conditions and higher  
39 mean sea level elevations.

40 The CVP and SWP operations would be in accordance with water rights permits  
41 and licenses issued by the SWRCB and biological opinions issued by the USFWS  
42 and NMFS in the early 2000s. The CVP and SWP operations would be closely  
43 coordinated through the COA. The ongoing operational management policies of

1 the CVP and SWP under the Second Basis of Comparison would be similar to the  
 2 operational assumptions described in Appendix 3A, No Action Alternative:  
 3 Central Valley Project and State Water Project Operations, except for the sections  
 4 identified as “Implementation of the 2008 USFWS BO [and/or 2009 NMFS BO]”  
 5 (see Section 3A.4.3.4.8) and New Melones Reservoir operations.

6 The Second Basis of Comparison includes implementation of existing and future  
 7 actions described in the 2008 USFWS BO and 2009 NMFS BO that would occur  
 8 by 2030 without implementation of the biological opinions (as described in  
 9 Section 3.3.1.2). The Second Basis of Comparison also includes implementation  
 10 of future actions not described in the 2009 NMFS BO that would occur by 2030  
 11 without implementation of any alternatives considered in this EIS (as described in  
 12 Section 3.3.1.3).

13 The Second Basis of Comparison would not include implementation of future  
 14 actions described in the 2008 USFWS BO and 2009 NMFS BO that would not  
 15 occur by 2030 without implementation of the biological opinions, as described  
 16 below, including operations RPA actions and the following actions.

- 17 • 2009 NMFS BO RPA Action I.2.5, Winter-Run Passage and Re-Introduction  
 18 Program at Shasta Dam.
- 19 • 2009 NMFS BO RPA Action II.3, Structural Improvements for Temperature  
 20 Management on the American River, including installation of a Folsom Dam  
 21 temperature control device, methods to transport cold water through Lake  
 22 Natoma, installation of a temperature control device on the El Dorado  
 23 Irrigation District intake from Folsom Lake, and development of temperature  
 24 management decision-support tools.
- 25 • 2009 NMFS BO RPA Action II.5, Fish Passage at Nimbus and Folsom Dams.
- 26 • 2009 NMFS BO RPA Action II.6, Implement Actions to Reduce Genetic  
 27 Effects of Nimbus and Trinity River Fish Hatchery Operations.
- 28 • 2009 NMFS BO RPA Action III.2.1, Increase and Improve Quality of  
 29 Spawning Habitat with Addition of 50,000 Cubic Yards of Gravel by 2014  
 30 and with a Minimum Addition of 8,000 Cubic Yards per Year for the Duration  
 31 of the Project Actions on Stanislaus River.
- 32 • 2009 NMFS BO RPA Action III.2.2, Conduct Floodplain Restoration and  
 33 Inundation Flows in Winter or Spring to Inundate Steelhead Juvenile Rearing  
 34 Habitat on One- to Three-Year Schedule on Stanislaus River.
- 35 • 2009 NMFS BO RPA Action III.2.3, Restore Freshwater Migratory Habitat  
 36 for Juvenile Steelhead by Implementing Projects to Increase Floodplain  
 37 Connectivity and to Reduce Predation Risk During Migration on Stanislaus  
 38 River.
- 39 • 2009 NMFS BO RPA Action III.2.4, Fish Passage at New Melones, Tulloch,  
 40 and Goodwin Dams.

- 1 • 2009 NMFS BO RPA Action IV.4, Tracy Fish Collection Facility  
2 Improvements to Reduce Pre-Screen Loss and Improve Screening Efficiency.
- 3 • 2009 NMFS BO RPA Action IV.4.2 Skinner Fish Collection Facility  
4 Improvements to Reduce Pre-Screen Loss and Improve Screening Efficiency.
- 5 • 2009 NMFS BO RPA Action IV.4.3 Tracy Fish Collection Facility and the  
6 Skinner Fish Collection Facility Actions to Improve Salvage Monitoring,  
7 Reporting and Release Survival Rates.

### 8 **3.3.3.2 Vegetation Management Along Levees**

9 The Second Basis of Comparison includes vegetation management operations  
10 along levees for flood management in accordance with policies issued by the  
11 USACE in 2009 and 2010.

### 12 **3.3.3.3 New Melones Reservoir Operations**

13 Under the Second Basis of Comparison, operations of New Melones Reservoir  
14 would be the same as under the No Action Alternative for flood management,  
15 water quality, San Joaquin River base flows and pulse flows at Vernalis, and  
16 water supply. Because the Second Basis of Comparison represents regulatory  
17 environment without the 2008 USFWS and 2009 NMFS BOs, fishery flows  
18 would be consistent with the 1997 New Melones Interim Plan of Operations (IPO)  
19 without implementation of the Vernalis Adaptive Management Program (VAMP),  
20 as described in Appendix 3A, No Action Alternative: Central Valley Project and  
21 State Water Project Operations.

## 22 **3.4 Development of Reasonable Alternatives**

23 The National Environmental Policy Act (NEPA) regulations and DOI NEPA  
24 regulations (43 CFR Section 46.415(b)) require an EIS to include a range of  
25 reasonable alternatives that meet the purpose and need of the proposed action, and  
26 address one or more significant issues related to the proposed action.

27 The DOI NEPA regulations also state that the lead agencies should include a  
28 consensus-based alternatives consistent with the purpose and need of the proposed  
29 project that are proposed by participating persons, organizations, or communities  
30 who may be interested in or affected by the proposed project when one exists. No  
31 alternatives or alternative concepts submitted to Reclamation during preparation  
32 of this EIS were identified as consensus-based.

33 The range of alternatives was developed for this EIS through the identification of  
34 screening criteria based upon the purpose of the action; comparison of alternative  
35 concepts identified by Reclamation, stakeholders, and agencies to the screening  
36 criteria; and review of the identified range of alternatives to determine if the range  
37 of alternatives addresses the significant issues.

**3.4.1 Application of Screening Criteria to the Range of Alternative Concepts**

The screening criteria developed for this EIS is based upon the purpose of the action, as described in Chapter 2, Purpose and Need for the Action. The purpose of the action is:

- To continue the operation of the CVP, in coordination with operation of the SWP, for the authorized purposes, in a manner that:
  - Is similar to historic operational parameters with certain modifications;
  - Is consistent with Federal Reclamation law; other Federal laws; Federal permits and licenses; State of California water rights, permits, and licenses; and
  - Enables Reclamation and DWR to satisfy their contractual obligations to the fullest extent possible.

A number of alternative concepts were identified during the scoping process and through meetings with stakeholders and agencies during preparation of this EIS. These concepts were compared to the purpose of the action, as summarized in Table 3.1. Most of the concepts were incorporated into alternatives to be evaluated in detail in this EIS. Further discussion of concepts not included in the alternatives evaluated in detail in this EIS is presented in Section 3.4.8, Alternatives Considered but Not Evaluated in Detail.

**Table 3.1 Application of Screening Criteria to Alternative Concepts Identified for Consideration in the EIS**

<b>Alternative Concept</b>	<b>Consistent with Purpose for the Action</b>	<b>Addresses One or More Significant Issues</b>	<b>Include in One or More of the Alternatives Evaluated in the Draft EIS</b>
<b>Concept 1.</b> CVP and SWP Operations without actions defined in the 2008 USFWS BO RPA and 2009 NMFS BO RPA	Possibly	Yes	Yes, included in Alternatives 1, 3, and 4
<b>Concept 2.</b> Modify actions defined in the 2008 USFWS BO RPA and 2009 NMFS BO RPA in a manner that would increase CVP and SWP deliveries	Possibly	Yes	Yes, included in Alternatives 1, 3, and 4
<b>Concept 3.</b> Modify actions defined in the 2008 USFWS BO RPA and 2009 NMFS BO RPA in a manner that would reduce reverse flows and increase Delta outflow in the spring.	Possibly	Yes	Yes, included in Alternative 5

Alternative Concept	Consistent with Purpose for the Action	Addresses One or More Significant Issues	Include in One or More of the Alternatives Evaluated in the Draft EIS
<p><b>Concept 4.</b> Modify actions defined in the 2008 USFWS BO RPA and 2009 NMFS BO RPA in a manner that would increase primary productivity and flood supply for aquatic resources</p>	Possibly	Yes	Yes, included in Alternatives 1, 3, 4, and 5
<p><b>Concept 5.</b> Modify actions defined in the 2008 USFWS BO RPA and 2009 NMFS BO RPA in a manner that would modify the triggers for OMR criteria to protect Delta Smelt as follows:</p> <p>a) Reduce OMR criteria to a level between -5,000 cfs and -3,500 cfs only when appropriate based on analysis of turbidity levels and normalized salvage data in the south Delta</p> <p>b) Reduce OMR to no more negative than -5,000 cfs when more than 25 percent of the Delta Smelt collected in the spring kodiak or 20 mm trawl are located in the south Delta or the adult cumulative salvage index immediately preceding spawning is high; lift this restriction if Qwest is &gt;12,000 cfs and/or secchi depth in the south Delta is &gt;85 cm</p> <p>Do not implement RPA actions in the 2008 USFWS BO or 2009 NMFS BO</p>	Possibly	Yes	Yes, included in Alternative 3

Alternative Concept	Consistent with Purpose for the Action	Addresses One or More Significant Issues	Include in One or More of the Alternatives Evaluated in the Draft EIS
<p><b>Concept 6.</b> Modify actions defined in the 2009 NMFS BO RPA related to the Interim Criteria for the San Joaquin River Inflow:Export ratio as follows for April 1 through May 30:</p> <p>Flows in San Joaquin River at Vernalis (7-day running average shall not be less than 7 percent of the target requirement) shall be based on the New Melones Index (as described in 2009 NMFS BO RPA Action IV.2.1) as follows for January 1 through June 15:</p> <p>a) If the Index is 999 TAF or less - no minimum flow requirement</p> <p>b) If the Index is 1000-1399 TAF - minimum flow is the greater of the SWRCB D-1641 requirement or 1500 cfs</p> <p>c) If the Index is 1400-1999 TAF - minimum flow is the greater of the SWRCB D-1641 requirement or 3000 cfs</p> <p>d) If the Index is 2000-2499 TAF - minimum flow is 4500 cfs</p> <p>e) If the Index is above 2499 TAF - minimum flow is 6000 cfs</p> <p>Do not implement RPA actions in the 2008 USFWS BO or 2009 NMFS BO</p>	<p>Possibly</p>	<p>Yes</p>	<p>No, this criteria is not implementable following the completion of the Vernalis Adaptive Management Program. Other flow criteria for the San Joaquin River at Vernalis are included in the range of alternatives, however this concept is informed the development of other alternative concepts evaluated in this EIS.</p>

Alternative Concept	Consistent with Purpose for the Action	Addresses One or More Significant Issues	Include in One or More of the Alternatives Evaluated in the Draft EIS
<p><b>Concept 7.</b> Implement predator control programs for Black Bass, Striped Bass, and Pikeminnow to protect salmonids and Delta Smelt as follows:</p> <p>a) Black Bass catch limit changed to allow catch of 12-inch fish with a bag limit of 10</p> <p>b) Striped Bass catch limit changed to allow catch of 12-inch fish with a bag limit of 5</p> <p>c) Establish a Pikeminnow sport-fishing reward program with a 8-inch limit at \$2/fish</p>	Yes	Yes	Yes, included in Alternatives 3 and 4
<p><b>Concept 8.</b> Restore or create at least 10,000 acres of tidally influenced seasonal or perennial wetlands.</p> <p>Do not implement other wetlands restoration RPA actions in the 2008 USFWS BO or 2009 NMFS BO</p>	Yes	Yes	Yes, included in Alternatives 3 and 4

Alternative Concept	Consistent with Purpose for the Action	Addresses One or More Significant Issues	Include in One or More of the Alternatives Evaluated in the Draft EIS
<p><b>Concept 9.</b> Establish a trap and haul program for juvenile salmonids entering the Delta from the San Joaquin River in March through June as follows:</p> <ul style="list-style-type: none"> <li>a) Begin operation of downstream migrant fish traps upstream of the Head of Old River on the San Joaquin River</li> <li>b) “Barge” all captured juvenile salmonids through the Delta, release at Chipps Island.</li> <li>c) Tag subset of fish in order to quantify effectiveness of the program</li> <li>d) Attempt to capture 10 percent to 20 percent of outmigrating juvenile salmonids</li> </ul>	<p>Yes</p>	<p>Yes</p>	<p>Yes, included in Alternatives 3 and 4</p>
<p><b>Concept 10.</b> Work with Pacific Fisheries Management Council, CDFW, and NMFS to minimize harvest mortality of natural origin Central Valley Chinook Salmon, including fall-run Chinook Salmon, by evaluating and modifying ocean harvest for consistency with Viable Salmonid Population Standards; including harvest management plan to show that abundance, productivity, and diversity (age-composition) are not appreciably reduced</p>	<p>Maybe</p>	<p>Yes</p>	<p>Yes, included in Alternative 3</p>

<b>Alternative Concept</b>	<b>Consistent with Purpose for the Action</b>	<b>Addresses One or More Significant Issues</b>	<b>Include in One or More of the Alternatives Evaluated in the Draft EIS</b>
<p><b>Concept 11.</b> Work with Pacific Fisheries Management Council, CDFW, and NMFS to impose salmon harvest restrictions to reduce by-catch of winter-run and spring-run Chinook Salmon to less than 10 percent of age-3 cohort in all years</p>	<p>Maybe</p>	<p>Yes</p>	<p>Yes, included in Alternative 4</p>
<p><b>Concept 12.</b> Limiting floodplain development to protect salmonids and Delta Smelt by implementing the following actions:</p> <ul style="list-style-type: none"> <li>a) Incorporate guidance into flood hazard mapping to help communities comply with the ESA</li> <li>b) Require communities to demonstrate ESA compliance for all flood plain map revisions</li> <li>c) Prioritize consideration of ESA listed species and critical habitat when selecting flood insurance studies</li> <li>d) Develop and implement floodplain management criteria</li> <li>e) Refine community rating system to provide credits for natural and beneficial functions</li> <li>f) Prohibit new development and substantial improvements to existing development within any designated floodway or within 170 feet of the ordinary high water line of any floodway</li> </ul>	<p>Possibly</p>	<p>Yes</p>	<p>Yes, included in Alternative 4</p>

Alternative Concept	Consistent with Purpose for the Action	Addresses One or More Significant Issues	Include in One or More of the Alternatives Evaluated in the Draft EIS
<p><b>Concept 13.</b> Do not implement USACE requirements for vegetation on levees, and instead bar removal of vegetation from levees, require planting of trees and shrubs on levees, and armor levees with vegetation, woody material, and root reinforcement material instead of riprap</p>	Possibly	Yes	Yes, included in Alternative 4
<p><b>Concept 14.</b> Advance the timing of upgrades at the Sacramento Regional Wastewater Treatment Plant to 2017; and implement advanced treatment technologies at the Fairfield-Suisun Sewer District treatment plant to reduce nutrients in the effluent</p>	Yes	Yes	No, these actions are under construction and will be complete by 2030, per the requirements of the SWRCB and the related Regional Water Quality Control Boards
<p><b>Concept 15.</b> Expand the current period of time for water transfers addressed in the operations consulted on in the 2008 USFWS BO and 2009 NMFS BO from July through September to year-round</p>	Possibly	Yes	Yes, included in Alternative 4
<p><b>Concept 16.</b> Include measures to support Federal and state fish-doubling goals, including the goals of CVPIA</p>	Yes	Yes	Yes, included in Alternatives 1, 2, 3, 4, and 5 as part of ongoing implementation of CVPIA
<p><b>Concept 17.</b> Operate the CVP and SWP to avoid “dead-pool” conditions in Shasta Lake, Folsom Lake, and Lake Oroville</p>	Possibly	Yes	Yes, included in Alternatives 1, 2, 3, 4, and 5 as part of overall CVP and SWP operations

Alternative Concept	Consistent with Purpose for the Action	Addresses One or More Significant Issues	Include in One or More of the Alternatives Evaluated in the Draft EIS
<b>Concept 18.</b> Change CVP water operations to meet all in-basin water demands for the Trinity, Sacramento, American, and Stanislaus rivers watersheds before meeting other CVP water demands	No	Yes	No, this concept would not be consistent with the purpose for the action
<b>Concept 19.</b> Implement operations of the New Melones Reservoir in accordance with the 2012 Oakdale Irrigation District and South San Joaquin Irrigation District Operations Plan	Possibly	Yes	Yes, included in Alternative 3
<b>Concept 20.</b> Reduce reliance of the CVP and SWP water users on water exported from the Delta through development of regional and local water supplies	Possibly	Yes	Yes, included in Alternatives 1, 2, 3, 4, and 5 as part of overall statewide water operations
<b>Concept 21.</b> Changes to methods used to monitor and predict OMR flow criteria, including exclusion of Contra Costa Water District diversions from the calculations	Possibly	Maybe	No, this EIS analyzes overall operational concepts for the CVP and SWP. Specific methods to monitor and predict operations will be developed under separate efforts by Reclamation
<b>Concept 22.</b> Prioritize use of CVPIA restoration funds within watersheds in accordance with the amount of restoration funds collected in each watershed (e.g., the most funds would be highest in the watershed that generates the highest CVPIA restoration fund based upon water sales)	No	No	No, would not be consistent with CVPIA

Alternative Concept	Consistent with Purpose for the Action	Addresses One or More Significant Issues	Include in One or More of the Alternatives Evaluated in the Draft EIS
<b>Concept 23.</b> Completely cease operations of the CVP and SWP facilities	No	No	No, this concept would not be consistent with the purpose for the action

1 Note:  
 2 Concepts identified as “possibly consistent with the purpose of the action” would require  
 3 development of additional details and evaluation to determine if the concept is consistent  
 4 with the stated purpose for the action, as described in Chapter 2, Purpose and Need for  
 5 the Action. Concepts identified as “possibly consistent with the purpose of the action”  
 6 were integrated into one or more of the alternatives evaluated in this EIS.

7 Based upon the comparison of screening criteria to the alternative concepts  
 8 developed by Reclamation 17 of the 23 alternative concepts would be included in  
 9 one or more of the alternatives evaluated in this EIS. The next step in the  
 10 development of the alternatives is to combine the alternative concepts into  
 11 specific alternatives and determine if the range of alternatives is adequate to  
 12 address the significant issues in implementing a program that supports the  
 13 purpose of the action.

14 **3.4.2 Identification of Alternatives**

15 The 17 alternative concepts were compiled into five alternatives. Development of  
 16 the alternatives was informed by comments received about the alternative  
 17 concepts. For example, numerous comments were received to evaluate an  
 18 alternative that included assumptions identical to the Second Basis of Comparison  
 19 assumptions in which the 2008 USFWS BO and 2009 NMFS BO would not be  
 20 implemented. One of the scoping comments identified specific alternatives that  
 21 included several alternative concepts included in Table 3.1; however, some of the  
 22 specified alternative concepts were not consistent with assumptions for the Year  
 23 2030 and were modified to reflect implementable concepts.

24 Several of the alternative concepts are consistent with the No Action Alternative  
 25 assumptions related to actions that would have occurred with or without  
 26 implementation of the 2008 USFWS BO and 2009 NMFS BO. Therefore, the  
 27 following alternative concepts are included under the No Action Alternative,  
 28 Second Basis of Comparison, and all other alternatives.

- 29 • Alternative Concept 8 to restore or create at least 10,000 acres of tidally-  
 30 influenced seasonal or perennial wetlands.
- 31 • Alternative Concept 16 to support the fish-doubling goals under CVPIA and  
 32 state ecosystem restoration programs.
- 33 • Alternative Concept 17 to operate the CVP and SWP to avoid dead-pool  
 34 conditions in the CVP and SWP reservoirs, to the extent possible based upon  
 35 hydrologic conditions.

- 1 • Alternative Concept 20 to increase regional and local water supplies that  
2 could be used when CVP and SWP water supplies are reduced due to  
3 hydrologic and regulatory restrictions.
- 4 Using these concepts, the alternative concepts were combined into Alternatives 1  
5 through 5 in a manner to avoid conflicts between concepts within an alternative.
- 6 The range of alternatives in the EIS includes the No Action Alternative and  
7 Alternatives 1 through 5, as described below.

### 8 **3.4.3 No Action Alternative**

9 The No Action Alternative, the Preferred Alternative, is described in Section  
10 3.3.2, of this chapter.

### 11 **3.4.4 Alternative 1**

12 Alternative 1 was created because many comments requested an alternative that  
13 reflected conditions without implementation of the 2008 USFWS BO and the  
14 2009 NMFS BO. Since the Second Basis of Comparison is not a true alternative,  
15 in accordance with NEPA guidelines, Reclamation could not select Second Basis  
16 of Comparison as a preferred alternative. Therefore, Alternative 1 was defined as  
17 being identical to the Second Basis of Comparison, as defined in Section 3.3.2.

### 18 **3.4.5 Alternative 2**

19 Alternative 2 was first included in the Notice of Intent and identified as an initial  
20 proposed action that included the operational actions of the 2008 USFWS BO and  
21 2009 NMFS BO. Alternative 2 does not include RPA actions that would require  
22 future studies and environmental documentation to define recommended actions  
23 (generally, structural actions).

24 The definition of Alternative 2 is based upon the following assumptions that are  
25 briefly described below.

- 26 • Continued long-term operation of the CVP and SWP in accordance with  
27 ongoing management policies, criteria, and regulations, including water right  
28 permits and licenses issued by the SWRCB and implementation of the 2008  
29 USFWS BO and 2009 NMFS BO, as described under the No Action  
30 Alternative.
- 31 • Implementation of existing and future actions described in the 2008 USFWS  
32 BO and 2009 NMFS BO that would occur by 2030 without implementation of  
33 the BOs, as described above for the No Action Alternative in Sections 3.4.1.2  
34 and 3.4.1.3.
- 35 • Implementation of future actions not described in the 2009 NMFS BO that  
36 would occur by 2030 without implementation of any alternatives considered  
37 in this EIS.

38 Alternative 2 conditions assume that climate change conditions would have  
39 changed between 2015 and 2030. It is anticipated that by 2030, there will be less

1 snowfall over the long-term average conditions and higher mean sea level  
2 elevations.

3 Alternative 2 would not include actions in the 2008 USFWS BO and 2009 NMFS  
4 BO that have not been fully defined at this time; and therefore, would require  
5 future engineering and environmental evaluation prior to implementation. These  
6 following actions are not included in Alternative 2.

- 7 • 2009 NMFS BO RPA Action I.2.5, Winter-Run Passage and Re-Introduction  
8 Program at Shasta Dam.
- 9 • 2009 NMFS BO RPA Action II.3, Structural Improvements for Temperature  
10 Management on the American River.
- 11 • 2009 NMFS BO RPA Action II.5, Fish Passage at Nimbus and Folsom Dams.
- 12 • 2009 NMFS BO RPA Action II.6, Implement Actions to Reduce Genetic  
13 Effects of Nimbus and Trinity River Fish Hatchery Operations.
- 14 • 2009 NMFS BO RPA Action III.2.1, Increase and Improve Quality of  
15 Spawning Habitat with Addition of Gravel.
- 16 • 2009 NMFS BO RPA Action III.2.2, Conduct Floodplain Restoration and  
17 Inundation Flows in Winter or Spring to Inundate Steelhead Juvenile Rearing  
18 Habitat on Stanislaus River.
- 19 • 2009 NMFS BO RPA Action III.2.3, Restore Freshwater Migratory Habitat  
20 for Juvenile Steelhead on Stanislaus River.
- 21 • 2009 NMFS BO RPA Action III.2.4, Fish Passage at New Melones, Tulloch,  
22 and Goodwin Dams.
- 23 • 2009 NMFS BO RPA Action IV.4, Tracy Fish Collection Facility  
24 Improvements to Reduce Pre-Screen Loss and Improve Screening Efficiency.
- 25 • 2009 NMFS BO RPA Action IV.4.2 Skinner Fish Collection Facility  
26 Improvements to Reduce Pre-Screen Loss and Improve Screening Efficiency.
- 27 • 2009 NMFS BO RPA Action IV.4.3 Tracy Fish Collection Facility and the  
28 Skinner Fish Collection Facility Actions to Improve Salvage Monitoring,  
29 Reporting and Release Survival Rates.

#### 30 **3.4.5.1 Continued Long-Term Operation of the CVP and SWP Facilities**

31 The CVP and SWP operations and ongoing operational management policies of  
32 the CVP and SWP under Alternative 2 would be identical to the operational  
33 assumptions described in Appendix 3A, No Action Alternative: Central Valley  
34 Project and State Water Project Operations.

1 **3.4.5.2 Actions in the 2008 USFWS BO and 2009 NMFS BO that Would**  
2 **Have Occurred without Implementation of the Biological**  
3 **Opinions**

4 Actions included in the 2008 USFWS BO and 2009 NMFS BO that would have  
5 occurred with or without the BOs, would be identical under Alternative 2 as under  
6 the No Action Alternative and the Second Basis of Comparison.

7 **3.4.5.3 Future Actions not included in the 2008 USFWS BO and 2009**  
8 **NMFS BO that Would Have Occurred without Implementation of**  
9 **the Biological Opinions**

10 Alternative 2 also includes assumptions unrelated to implementation of the 2008  
11 USFWS BO and 2009 NMFS BO, including: climate change and sea level rise;  
12 development of lands in accordance with general plans in areas served by CVP  
13 and SWP water supplies; and reasonable and foreseeable projects that have been  
14 approved and are anticipated to be implemented by 2030. These items included in  
15 Alternative 2 are identical as under the No Action Alternative and the Second  
16 Basis of Comparison.

17 **3.4.5.4 Vegetation Management Along Levees**

18 Alternative 2 includes vegetation management operations along levees for flood  
19 management in accordance with policies issued by the USACE in 2009 and 2010.

20 **3.4.6 Alternative 3**

21 Alternative 3 was developed based upon a scoping comment from the Coalition  
22 for a Sustainable Delta which identified “RPA Alternative 1,” and a scoping  
23 comment received from Oakdale Irrigation District (OID) and South San Joaquin  
24 Irrigation District (SSJID) (included in the Scoping Report in Appendix 23A of  
25 this EIS). The definition of Alternative 3 is based upon the following  
26 assumptions that are briefly described below.

- 27 • Continued long-term operation of the CVP and SWP in accordance with  
28 ongoing management policies, criteria, and regulations, including water right  
29 permits and licenses issued by the SWRCB; without the operational  
30 requirements of the 2008 USFWS BO and the 2009 NMFS BO; plus  
31 implementation of the 2012 operations plan for New Melones Reservoir  
32 proposed by OID and SSJID.
- 33 • Implementation of actions described in the Coalition for a Sustainable Delta  
34 scoping comment letter related to “RPA Alternative 1.”
- 35 • Implementation of existing and future actions described in the 2008 USFWS  
36 BO and 2009 NMFS BO that would occur by 2030 without implementation of  
37 the BOs, as described above for the No Action Alternative in Sections 3.4.1.2  
38 and 3.4.1.3.
- 39 • Implementation of future actions not described in the 2009 NMFS BO that  
40 would occur by 2030 without implementation of any alternatives considered  
41 in this EIS.

1 Alternative 3 would not include implementation of actions described in the 2008  
 2 USFWS BO and 2009 NMFS BO that would not occur by 2030 without  
 3 implementation of the BOs.

4 Alternative 3 conditions assume that climate change conditions would have  
 5 changed between 2015 and 2030. It is anticipated that by 2030, there will be less  
 6 snowfall over the long-term average conditions and higher mean sea level  
 7 elevations.

#### 8 **3.4.6.1 Continued Long-Term Operation of the CVP and SWP Facilities**

9 The CVP and SWP operations and ongoing operational management policies of  
 10 the CVP and SWP under Alternative 3 would be similar to the operational  
 11 assumptions under the Second Basis of Comparison with the following changes to  
 12 water demand assumptions, OMR criteria, and operations of New Melones  
 13 Reservoir to meet SWRCB D-1641 flow requirements on the San Joaquin River at  
 14 Vernalis.

15 Alternative 3 would include additional demands for American River water  
 16 supplies as compared to the No Action Alternative or Second Basis of  
 17 Comparison. The additional demands would provide water supplies of up to  
 18 17 TAF/year under a Warren Act Contract for El Dorado Irrigation District and  
 19 15 TAF/year under a long-term CVP water service contract with El Dorado  
 20 County Water Agency. During the review of the numerical modeling analyses  
 21 used in this EIS, it was discovered that the demands for these El Dorado Irrigation  
 22 District and the El Dorado County Water Agency contracts were not included in  
 23 the CalSim II modeling analysis for Alternative 3 as presented in Chapters 5  
 24 through 21. A sensitivity analysis using the CalSim II model to compare the  
 25 results of the analysis with and without these demands is presented in Appendix  
 26 5B of this EIS for Alternative 3. The results of the sensitivity analysis have been  
 27 used in conjunction with the results presented in Chapters 5 through 21 to analyze  
 28 the effects of including the CVP water service contract for El Dorado County  
 29 Water Agency in Alternative 3.

##### 30 **3.4.6.1.1 Old and Middle River Criteria**

31 The OMR flow criteria under Alternative 3 are based on concepts addressed in the  
 32 2008 USFWS BO and 2009 NMFS BO related to adaptive restrictions for  
 33 temperature, turbidity, salinity, and presence of Delta Smelt. The OMR flow  
 34 criteria in the Alternative 3 are similar to those of the No Action Alternative, as  
 35 described in Appendix 3A, No Action Alternative: Central Valley Project and  
 36 State Water Project Operations, with the exception of the following changes:

- 37 • Reduce OMR criteria to a level between -5,000 cfs and -3,500 cfs only when  
 38 appropriate based on analysis of turbidity levels and normalized salvage data  
 39 in the south Delta
- 40 • Reduce OMR to no more negative than -5,000 cfs when more than 25 percent  
 41 of the Delta Smelt collected in the spring kodiak or 20 mm trawl are located in  
 42 the south Delta or the adult cumulative salvage index immediately preceding

1 spawning is high; lift this restriction if Qwest is >12,000 cfs and/or secchi  
2 depth in the south Delta is >85 cm

3 For the purpose of quantitative analysis in this EIS, the numerical model  
4 represented this concept with the following assumptions.

- 5 • Action 1 that protects the pre-spawning adult Delta Smelt from entrainment is  
6 modified to limit exports such that the average daily OMR flow is no more  
7 negative than -3,500 cfs for a total duration of 14 days, with a 5-day running  
8 average no more negative than -4,375 cfs (within 25 percent of the monthly  
9 criteria).
- 10 • Action 2 that protects adult Delta Smelt within the Delta from entrainment is  
11 modified to limit exports so that the average daily OMR flow is no more  
12 negative than -3,500 or -7,500 cfs depending on the previous month's ending  
13 X2 location (-3,500 cfs if X2 is east of Roe Island, or -7,500 cfs if X2 is west  
14 of Roe Island), with a 5-day running average within 25 percent of the monthly  
15 criteria (no more negative than -4,375 cfs if X2 is east of Roe Island, or  
16 -9,375 cfs if X2 is west of Roe Island).
- 17 • Action 3 that protects larval and juvenile Delta Smelt from entrainment is  
18 modified to limit exports so that the average daily OMR flow is no more  
19 negative than -1,250, -3,500, or -7,500 cfs, depending on the previous  
20 month's ending X2 location (-1,250 cfs if X2 is east of Chipps Island,  
21 -7,500 cfs if X2 is west of Roe Island, or -3,500 cfs if X2 is between Chipps  
22 and Roe Island, inclusively), with a 5-day running average within 25 percent  
23 of the monthly criteria (no more negative than -1,562 cfs if X2 is east of  
24 Chipps Island, -9,375 cfs if X2 is west of Roe Island, or -4,375 cfs if X2 is  
25 between Chipps and Roe Island).
- 26 • Temporal off-ramp for Action 3 is assumed to occur no later than June 15  
27 (changed from June 30).
- 28 • An off-ramp based on QWest (westerly flow on the San Joaquin River past  
29 Jersey Point calculated as a combination of San Joaquin River at Blind Point,  
30 Three Mile Slough and Dutch Slough) is assumed. If Qwest is greater than  
31 12,000 cfs, then the Action 3 is discontinued. Because Action 2 is defined to  
32 occur between Actions 1 and 3, the Qwest off-ramp also results in  
33 discontinuation of Action 2 if it happens before Action 3 is triggered. In  
34 monthly CalSim II modeling, previous month's QWest value is used for  
35 determining the off-ramp, therefore if the off-ramp occurs within the previous  
36 month, actions in that previous month are assumed to continue until the end of  
37 the month.

#### 38 **3.4.6.1.2 New Melones Operations Criteria**

39 Alternative 3 assumes that the flood control operations for the New Melones  
40 Reservoir would be the same as under the No Action Alternative. However, New  
41 Melones Reservoir would be operated for different fishery flows, water quality  
42 flows, and San Joaquin River base flows and pulse flows at Vernalis.

1 *Fishery*

2 In the Alternative 3 simulation, fishery flows are modeled per the OID and SSJID  
 3 2012 operations proposal, as summarized in Tables 3.2 through 3.4. These flows  
 4 include an outmigration pulse flow from April 1 through May 15. Total annual  
 5 volume dedicated to fishery flows vary from 174 to 318 TAF depending on the  
 6 hydrologic conditions defined by the New Melones water supply forecast (the  
 7 end-of-February New Melones Storage, plus the March - September forecast of  
 8 inflow to the reservoir).

9 **Table 3.2 Annual Fishery Flow Allocation in New Melones**

Melones Water Supply Forecast (TAF)	Fishery Base Flows (TAF)
0 to 1,800	174
1,801 to 2,500	235
>2,500	318

10 **Table 3.3 Monthly “Base” Flows for Fisheries Purposes Based on the Annual**  
 11 **Fishery Volume**

Annual Fishery Flow Volume (TAF)	Monthly Fishery Base Flows (cfs)											
	Oct	Nov	Dec	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep
235	252	300	300	150	173	200	200	200	200	200	200	200
318	300	300	300	300	300	300	1,500	850	200	200	200	200

12 **Table 3.4 April 1 through May 31 “Pulse” Flows for Fisheries Purposes Based on**  
 13 **the Annual Fishery Volume**

Melones Water Supply Forecast (TAF)	Fishery Pulse Flows (CFS) April 1 –May 31
0 to 1,800	750
1,801 to 2,500	1,500
>2,500	1,500

14 *Water Quality*

15 Alternative 3 assumes that no water is released from New Melones Reservoir to  
 16 meet the SWRCB D-1641 water quality criteria in the San Joaquin River. Water  
 17 is released to meet the SWRCB D-1422 DO criteria; however, the compliance  
 18 point is moved from Ripon to the Orange Blossom Bridge under the Alternative 3.

1 *Bay-Delta Flows*

2 Alternative 3 assumes that no water is released from New Melones Reservoir to  
3 meet the SWRCB D-1641 Bay-Delta flow requirements on the San Joaquin River  
4 at Vernalis for base flows or pulse flows.

5 **3.4.6.2 Actions Related to Predation Control, Wetlands Restoration,**  
6 **Juvenile Salmonid Trap and Haul Program, and Chinook Salmon**  
7 **Ocean Harvest**

8 Alternative 3 includes the following actions as described in “RPA Alternative 1”  
9 in the Coalition for a Sustainable Delta scoping comment.

- 10 • Implement predator control programs for Black Bass, Striped Bass, and  
11 Pikeminnow to protect salmonids and Delta Smelt as follows:
  - 12 – Black Bass catch limit changed to allow catch of 12-inch fish with a bag  
13 limit of 10
  - 14 – Striped Bass catch limit changed to allow catch of 12-inch fish with a bag  
15 limit of 5
  - 16 – Establish a Pikeminnow sport-fishing reward program with a 8-inch limit  
17 at \$2/fish
- 18 • Restore or create at least 10,000 acres of tidally influenced seasonal or  
19 perennial wetlands. These conditions are the same as under the No Action  
20 Alternative and Second Basis of Comparison.
- 21 • Establish a trap and haul program for juvenile salmonids entering the Delta  
22 from the San Joaquin River in March through June as follows:
  - 23 – Begin operation of downstream migrant fish traps upstream of the Head of  
24 Old River on the San Joaquin River
  - 25 – “Barge” all captured juvenile salmonids through the Delta, release at  
26 Chipps Island.
  - 27 – Tag subset of fish in order to quantify effectiveness of the program
  - 28 – Attempt to capture 10 percent to 20 percent of out-migrating juvenile  
29 salmonids
- 30 • Work with Pacific Fisheries Management Council, CDFW, and NMFS to  
31 minimize harvest mortality of natural origin Central Valley Chinook Salmon,  
32 including fall-run Chinook Salmon, by evaluating and modifying ocean  
33 harvest for consistency with Viable Salmonid Population Standards; including  
34 harvest management plan to show that abundance, productivity, and diversity  
35 (age-composition) are not appreciably reduced.

36 Any changes in harvest limitations would require review and approval from the  
37 California Fish and Game Commission; and for some species, the Pacific  
38 Fisheries Management Council.

1    **3.4.6.3    *Actions in the 2008 USFWS BO and 2009 NMFS BO that Would***  
 2    ***Have Occurred without Implementation of the Biological***  
 3    ***Opinions***

4    Actions included in the 2008 USFWS BO and 2009 NMFS BO that would have  
 5    occurred with or without the BOs, would be identical under Alternative 3 as under  
 6    the No Action Alternative and the Second Basis of Comparison.

7    **3.4.6.4    *Future Actions not included in the 2008 USFWS BO and 2009***  
 8    ***NMFS BO that Would Have Occurred without Implementation of***  
 9    ***the Biological Opinions***

10   Alternative 3 also includes assumptions unrelated to implementation of the 2008  
 11   USFWS BO and 2009 NMFS BO, including: climate change and sea level rise;  
 12   development of lands in accordance with general plans in areas served by CVP  
 13   and SWP water supplies; and reasonable and foreseeable projects that have been  
 14   approved and are anticipated to be implemented by 2030. These items included in  
 15   Alternative 3 are identical as under the No Action Alternative and the Second  
 16   Basis of Comparison.

17   **3.4.6.5    *Vegetation Management Along Levees***

18   Alternative 3 includes vegetation management operations along levees for flood  
 19   management in accordance with policies issued by the USACE in 2009 and 2010.

20   **3.4.7        Alternative 4**

21   Alternative 4 was developed based upon a scoping comment from the Coalition  
 22   for a Sustainable Delta which identified “RPA Alternative 2” (included in the  
 23   Scoping Report in Appendix 23A of this EIS). The definition of Alternative 4 is  
 24   based upon the following assumptions that are briefly described below.

- 25   • Continued long-term operation of the CVP and SWP in accordance with  
 26   ongoing management policies, criteria, and regulations, including water right  
 27   permits and licenses issued by the SWRCB; without the operational  
 28   requirements of the 2008 USFWS BO and the 2009 NMFS BO, as described  
 29   under Second Basis of Comparison.
- 30   • Implementation of actions described in the Coalition for a Sustainable Delta  
 31   scoping comment letter related to “RPA Alternative 2.”
- 32   • Implementation of existing and future actions described in the 2008 USFWS  
 33   BO and 2009 NMFS BO that would occur by 2030 without implementation of  
 34   the BOs, as described above for the No Action Alternative in Sections 3.4.1.2  
 35   and 3.4.1.3.
- 36   • Implementation of future actions not described in the 2009 NMFS BO that  
 37   would occur by 2030 without implementation of any alternatives considered  
 38   in this EIS.

39   Alternative 4 would not include implementation of actions described in the 2008  
 40   USFWS BO and 2009 NMFS BO that would not occur by 2030 without  
 41   implementation of the BOs.

1 The “RPA Alternative 2” also included a provision to “Advance the timing of  
2 upgrades at the Sacramento Regional Wastewater Treatment Plant to 2017; and  
3 implement advanced treatment technologies at the Fairfield-Suisun Sewer District  
4 treatment plant to reduce nutrients in the effluent.” However, both of these  
5 actions would be complete by 2030, the study period considered in this EIS. The  
6 Sacramento Regional Wastewater Treatment Plant must comply with the National  
7 Pollutant Discharge Elimination System permit issued on December 9, 2010 by  
8 the Central Valley Regional Water Quality Control Board to reduce nutrients in  
9 the effluent discharged to the Sacramento River by 2020 (SRCSD 2012). The  
10 Fairfield Suisun Sewer District must comply with similar permit conditions issued  
11 by the San Francisco Bay Regional Water Quality Control Board in March 2015  
12 (SFRRWQCB 2015). Because the Environmental Consequences analysis in this  
13 EIS is conducted as a “snapshot” in time at 2030, inclusion of a provision to  
14 require compliance with the discharge requirements prior to 2020 could not be  
15 evaluated.

16 Alternative 4 conditions assume that climate change conditions would have  
17 changed between 2015 and 2030. It is anticipated that by 2030, there will be less  
18 snowfall over the long-term average conditions and higher mean sea level  
19 elevations.

20 **3.4.7.1 Continued Long-Term Operation of the CVP and SWP Facilities**

21 The ongoing operational management policies of the CVP and SWP under  
22 Alternative 4 would be identical to operations described under the Second Basis  
23 of Comparison.

24 **3.4.7.2 Actions Related to Floodplain Protection, Levee Vegetation,  
25 Predation Control, Wetlands Restoration, Juvenile Salmonid Trap  
26 and Haul Program, and Chinook Salmon Ocean Harvest**

27 Alternative 4 includes the following actions as described in “RPA Alternative 1”  
28 in the Coalition for a Sustainable Delta scoping comment.

- 29 • Limiting floodplain development to protect salmonids and Delta Smelt by  
30 implementing the following actions:
- 31 – Incorporate guidance into flood hazard mapping to help communities  
32 comply with the ESA
  - 33 – Require communities to demonstrate ESA compliance for all flood plain  
34 map revisions
  - 35 – Prioritize consideration of ESA listed species and critical habitat when  
36 selecting flood insurance studies
  - 37 – Develop and implement floodplain management criteria
  - 38 – Refine community rating system to provide credits for natural and  
39 beneficial functions

- 1       – Prohibit new development and substantial improvements to existing  
 2       development within any designated floodway or within 170 feet of the  
 3       ordinary high water line of any floodway
- 4       • Modify the requirements of the USACE related to removal of vegetation on  
 5       levees. USACE requires removal of vegetation on levees. DWR and USACE  
 6       have been working to develop a plan that would allow for the continuation of  
 7       existing vegetation on levees until levee maintenance or repairs requires  
 8       removal of the vegetation. Under Alternative 4, trees and shrubs would be  
 9       planted along the levees; and vegetation, woody material, and root re-  
 10      enforcement material would be installed on the levees instead of riprap for  
 11      erosion protection.
- 12      • Implement predator control programs for Black Bass, Striped Bass, and  
 13      Pikeminnow to protect salmonids and Delta Smelt as follows:
- 14      – Black Bass catch limit changed to allow catch of 12-inch fish with a bag  
 15      limit of 10
- 16      – Striped Bass catch limit changed to allow catch of 12-inch fish with a bag  
 17      limit of 5
- 18      – Establish a Pikeminnow sport-fishing reward program with a 8-inch limit  
 19      at \$2/fish
- 20      • Restore or create at least 10,000 acres of tidally influenced seasonal or  
 21      perennial wetlands. These conditions are the same as under the No Action  
 22      Alternative and Second Basis of Comparison.
- 23      • Establish a trap and haul program for juvenile salmonids entering the Delta  
 24      from the San Joaquin River in March through June as follows:
- 25      – Begin operation of downstream migrant fish traps upstream of the Head of  
 26      Old River on the San Joaquin River
- 27      – “Barge” all captured juvenile salmonids through the Delta, release at  
 28      Chipps Island.
- 29      – Tag subset of fish in order to quantify effectiveness of the program
- 30      – Attempt to capture 10 percent to 20 percent of outmigrating juvenile  
 31      salmonids
- 32      • Work with Pacific Fisheries Management Council, CDFW, and NMFS to  
 33      impose salmon harvest restrictions to reduce by-catch of winter-run and  
 34      spring-run Chinook Salmon to less than 10 percent of age-3 cohort in all  
 35      years.
- 36      Any changes in harvest limitations would require review and approval from the  
 37      California Fish and Game Commission; and for some species, the Pacific  
 38      Fisheries Management Council.

1    **3.4.7.3    *Actions in the 2008 USFWS BO and 2009 NMFS BO that Would***  
2                    ***Have Occurred without Implementation of the Biological***  
3                    ***Opinions***

4    Actions included in the 2008 USFWS BO and 2009 NMFS BO that would have  
5    occurred with or without the BOs, would be identical under Alternative 4 as under  
6    the No Action Alternative and the Second Basis of Comparison.

7    **3.4.7.4    *Future Actions not included in the 2008 USFWS BO and 2009***  
8                    ***NMFS BO that Would Have Occurred without Implementation of***  
9                    ***the Biological Opinions***

10   Alternative 4 also includes assumptions unrelated to implementation of the 2008  
11   USFWS BO and 2009 NMFS BO, including: climate change and sea level rise;  
12   development of lands in accordance with general plans in areas served by CVP  
13   and SWP water supplies; and reasonable and foreseeable projects that have been  
14   approved and are anticipated to be implemented by 2030. These items included in  
15   Alternative 4 are identical as under the No Action Alternative and the Second  
16   Basis of Comparison.

17   **3.4.8        Alternative 5**

18   Alternative 5 is similar to the No Action Alternative with positive OMR criteria in  
19   April and May which causes increased Delta outflow; and use of the SWRCB D-  
20   1641 pulse flow at Vernalis. Alternative 5 was developed considering comments  
21   from environmental interest groups during the scoping process. Alternative 5 also  
22   provides another method to operate the New Melones Reservoir as compared to  
23   the other alternatives.

24   The definition of Alternative 5 is based upon the following assumptions that are  
25   briefly described below.

- 26   • Continued long-term operation of the CVP and SWP in accordance with  
27   ongoing management policies, criteria, and regulations, including water right  
28   permits and licenses issued by the SWRCB; and the operational requirements  
29   of the 2008 USFWS BO and the 2009 NMFS BO.
- 30   • Implementation of existing and future actions described in the 2008 USFWS  
31   BO and 2009 NMFS BO that would occur by 2030 without implementation of  
32   the BOs, as described above for the No Action Alternative in Sections 3.4.1.2  
33   and 3.4.1.3.
- 34   • Implementation of actions described in the 2008 USFWS BO and 2009 NMFS  
35   BO that would not occur by 2030 without implementation of the BOs.
- 36   • Implementation of future actions not described in the 2009 NMFS BO that  
37   would occur by 2030 without implementation of any alternatives considered  
38   in this EIS.

39   Alternative 5 conditions assume that climate change conditions would have  
40   changed between 2015 and 2030. It is anticipated that by 2030, there will be less  
41   snowfall over the long-term average conditions and higher mean sea level  
42   elevations.

**3.4.8.1 Continued Long-Term Operation of the CVP and SWP Facilities**

The CVP and SWP operations and ongoing operational management policies of the CVP and SWP under Alternative 5 would be similar to the operational assumptions under the No Action Alternative with the following changes to water demand assumptions, OMR criteria, and operations of New Melones Reservoir to meet SWRCB D-1641 flow requirements on the San Joaquin River at Vernalis.

**3.4.8.1.1 Water Demands**

Alternative 5 would include additional water demands for users of water from the American River watershed as compared to the No Action Alternative or Second Basis of Comparison. Under Alternative 5, up to 17 TAF/year would be provided to the El Dorado Irrigation District under a Warren Act Contract to allow water to be conveyed through Folsom Lake; and up to 15 TAF/year would be provided to El Dorado County Water Agency under a separate long-term CVP water service contract. During the review of the numerical modeling analyses used in this EIS, it was discovered that the demands for these El Dorado Irrigation District and the El Dorado County Water Agency contracts were not included in the CalSim II modeling analysis for Alternative 3 as presented in Chapters 5 through 21. A sensitivity analysis using the CalSim II model to compare the results of the analysis with and without these demands is presented in Appendix 5B of this EIS for Alternative 3. The results of the sensitivity analysis have been used in conjunction with the results presented in Chapters 5 through 21 to analyze the effects of including the CVP water service contract for El Dorado County Water Agency in Alternative 3.

**3.4.8.1.2 Old and Middle River Criteria**

The OMR flow criteria under Alternative 5 is similar to the assumptions under the No Action Alternative and based on concepts addressed in the 2008 USFWS BO and 2009 NMFS BO plus a requirement for positive OMR (no reverse flows) in April and May of all water year types.

**3.4.8.1.3 New Melones Operations Criteria**

Alternative 5 assumptions for New Melones Reservoir operations are similar to assumptions under the No Action Alternative except for SWRCB D-1641 requirements for the San Joaquin River pulse flows at Vernalis, as summarized in Table 3.5.

**Table 3.5 Bay-Delta Vernalis Flow Objectives (average monthly cfs)**

<b>60-20-20 Index</b>	<b>Pulse Flow Required if X2 is West of Chipps Island</b>	<b>Pulse Flow required if X2 is East of Chipps Island</b>
Wet	8,620	7,330
Above Normal	7,020	5,730
Below Normal	5,480	4,620
Dry	4,880	4,020
Critical	3,540	3,110

1     **3.4.8.2     *Actions in the 2008 USFWS BO and 2009 NMFS BO that Would***  
2                   ***Have Occurred without Implementation of the Biological***  
3                   ***Opinions***

4     Actions included in the 2008 USFWS BO and 2009 NMFS BO that would have  
5     occurred with or without the BOs, would be identical under Alternative 5 as under  
6     the No Action Alternative and the Second Basis of Comparison.

7     **3.4.8.3     *Actions in the 2009 NMFS BO that Would Not Have Occurred***  
8                   ***without Implementation of the Biological Opinions***

9     Actions included in the 2008 USFWS BO and 2009 NMFS BO that would not  
10    have occurred without the BOs, would be identical under Alternative 5 as under  
11    the No Action Alternative.

12    **3.4.8.4     *Future Actions not included in the 2008 USFWS BO and 2009***  
13                   ***NMFS BO that Would Have Occurred without Implementation of***  
14                   ***the Biological Opinions***

15    Alternative 5 also includes assumptions unrelated to implementation of the 2008  
16    USFWS BO and 2009 NMFS BO, including: climate change and sea level rise;  
17    development of lands in accordance with general plans in areas served by CVP  
18    and SWP water supplies; and reasonable and foreseeable projects that have been  
19    approved and are anticipated to be implemented by 2030. These items included in  
20    Alternative 5 are identical as under the No Action Alternative and the Second  
21    Basis of Comparison.

22    **3.4.8.5     *Vegetation Management Along Levees***

23    Alternative 5 includes vegetation management operations along levees for flood  
24    management in accordance with policies issued by the USACE in 2009 and 2010.

25    **3.4.9        *Alternatives Considered but Not Evaluated in Detail***

26    As described above, 6 of the 23 alternative concepts identified for inclusion in the  
27    alternatives to be evaluated in this EIS were eliminated for further evaluation for  
28    several reasons, as described below.

29    **3.4.9.1     *Alternative Concept 6: Modify Flows in San Joaquin River at***  
30                   ***Vernalis***

31    The 2009 NMFS BO included two phases related to implementation of the San  
32    Joaquin River Inflow to Export Ratio. The first phase, to be implemented in 2010  
33    and 2011, assumed CVP and SWP operations under the Vernalis Adaptive  
34    Management Plan (VAMP) which provided for Reclamation to purchase water  
35    from non-CVP water users in the San Joaquin River watershed. The second phase  
36    was designed to be implemented following the completion of VAMP when  
37    Reclamation could no longer purchase water to meet flow requirements of the  
38    SWRCB D-1641 in the Delta.

39    Alternative Concept 6 recommended an operations that CVP could not meet  
40    without VAMP authorizations. Therefore, Alternative Concept 6 did not meet the  
41    provision in the purpose of the action to be “consistent with Federal Reclamation  
42    law; other Federal laws; Federal permits and licenses; State of California water

1 rights, permits, and licenses.” Alternative Concept 6 was not retained for analysis  
2 in the EIS.

3 **3.4.9.2 Alternative Concept 14: Advance the Timing of Upgrades at**  
4 **Wastewater Treatment Plants**

5 Alternative Concept 14 would advance the timing of upgrades at the Sacramento  
6 Regional Wastewater Treatment Plant to 2017; and implement advanced  
7 treatment technologies at the Fairfield-Suisun Sewer District treatment plant to  
8 reduce nutrients in the effluent.” However, both of these actions would be  
9 complete by 2030, the study period considered in this EIS. The Sacramento  
10 Regional Wastewater Treatment Plant must comply with the National Pollutant  
11 Discharge Elimination System permit issued on December 9, 2010 by the Central  
12 Valley Regional Water Quality Control Board to reduce nutrients in the effluent  
13 discharged to the Sacramento River by 2020 (SRCSD 2012). The Fairfield  
14 Suisun Sewer District must comply with similar permit conditions issued by the  
15 San Francisco Bay Regional Water Quality Control Board in March 2015  
16 (SFRRWQCB 2015).

17 Because the Environmental Consequences analysis in this EIS is conducted as a  
18 “snapshot” in time at 2030, inclusion of a provision to require compliance with  
19 the discharge requirements prior to 2020 would not be evaluated. Therefore,  
20 Alternative Concept 14 was not retained for analysis in the EIS.

21 **3.4.9.3 Alternative Concept 18: Change to CVP Operations to Meet In-**  
22 **Basin Water Demands prior to Meeting other CVP Water**  
23 **Demands**

24 Alternative Concept 18 would require operations of the CVP to meet in-basin  
25 water demands in the Trinity, Sacramento, American, and Stanislaus rivers  
26 watersheds prior to use of the CVP water in other portions of the service area.  
27 However, the CVP is operated as integrated system to satisfy statutory,  
28 regulatory, and contractual obligations to the fullest extent possible, in accordance  
29 with the purpose of the action. Therefore, Alternative Concept 18 was not  
30 retained for analysis in the EIS.

31 **3.4.9.4 Alternative Concept 21: Change methods used to monitor and**  
32 **predict OMR criteria**

33 Alternative Concept 21 addresses an item that is related to methods to implement  
34 OMR monitoring and projections. The alternatives considered in this EIS address  
35 approaches to continued operation of the CVP and SWP. Methods to monitor and  
36 predict criteria used in CVP and SWP operations are considered by Reclamation  
37 as part of the operations of the CVP. Changes in methods used to monitor and  
38 predict OMR values can be applied to any of the alternatives considered in this  
39 EIS; and would not result in differentiations between alternatives. Therefore,  
40 Alternative Concept 21 was not retained for analysis in the EIS.

1    **3.4.9.5    Alternative 22: Prioritize Use of CVPIA Restoration Funds in the**  
2    **Watersheds that Generated the Funds**

3    As described above, the locations of CVPIA restoration activities are determined  
4    based upon scientific framework throughout the CVP service area that connects  
5    restoration actions to environmental and population responses across watersheds  
6    (Reclamation 2013c). A system-wide science-based approach with performance  
7    indices, monitoring, and scientific review of results is used to provide direction as  
8    the CVPIA adapts to changing conditions. Changing the approach from the  
9    current CVPIA implementation plan could be considered to be inconsistent with  
10   Federal law. Therefore, Alternative Concept 22 was not retained for analysis in  
11   the EIS.

12   **3.4.9.6    Alternative 23: Completely Cease Operations of the CVP and**  
13   **SWP**

14   Complete cessation of CVP and SWP operations would not be consistent with the  
15   requirement of the purpose of the action to operate the CVP and SWP in a manner  
16   that is similar to historic operational parameters with certain modifications; and it  
17   would not be consistent with Federal Reclamation law; other Federal laws;  
18   Federal permits and licenses; State of California water rights, permits, and  
19   licenses related to delivery of water by CVP and SWP to water rights holder and  
20   related to flood management operations at the CVP and SWP reservoirs.  
21   Therefore, Alternative Concept 23 was not retained for analysis in the EIS.

22   **3.5        Assumptions for Cumulative Effects Analysis**

23   The CEQ regulations define cumulative effects as the impact on environmental,  
24   human, and community resources that results from the incremental impact of the  
25   proposed project when added to other past, present, and reasonably foreseeable  
26   future actions regardless of what agency (Federal or non-Federal) or persons  
27   undertakes such actions. Cumulative effects can result from individually minor  
28   but collectively significant actions taking place over time (40 CFR 1508.7,  
29   1508.25.) Future cumulative impacts should not be speculative but should be  
30   based upon known or reasonably foreseeable long-range plans, regulations,  
31   operating agreements, or other information that establishes them as reasonably  
32   foreseeable.

33   The reasonably foreseeable future actions included in the cumulative effects  
34   analysis are summarized below. The projects and actions are organized into:

- 35   • Water Supply and Water Quality Projects and Actions potentially affected by  
36    long-term operation of the SWP and CVP (organized geographically from  
37    north to south)
- 38   • Ecosystem Improvement Projects and Actions potentially affected by long-  
39    term operation of the SWP and CVP or potentially affecting resources  
40    analyzed in this EIS (organized geographically from north to south)

### 1 **3.5.1 Water Supply and Water Quality Projects and Actions**

2 There are numerous water supply and water quality projects and actions that could  
3 be potentially affected by changes in the coordinated long-term operation of the  
4 CVP and SWP, or could affect the CVP and SWP operations. Major future water  
5 supply and water quality projects and actions are discussed below.

#### 6 **3.5.1.1 Bay-Delta Water Quality Control Plan Update**

7 In accordance with the federal Clean Water Act and the Porter-Cologne Water  
8 Quality Control Act, basin plans must be developed for each hydrologic area.  
9 Each basin plan must contain water quality objectives to ensure the reasonable  
10 protection of beneficial uses, as well as a program of implementation for  
11 achieving those objectives. Federal regulations require each state to adopt water  
12 quality standards to protect the public health or welfare, enhance the quality of  
13 water, and serve the purposes of the Clean Water Act. In California, the  
14 beneficial uses and water quality objectives form the basis of the water quality  
15 control standards. In the Sacramento-San Joaquin Bay Delta, water quality and  
16 flow objectives to meet water quality criteria are included in the Water Quality  
17 Control Plan for the San Francisco Bay/Sacramento-San Joaquin Delta Estuary  
18 (Bay-Delta WQCP) (SWRCB 2006). The SWRCB and the Central Valley and  
19 San Francisco Regional Water Quality Control Boards are in the process of  
20 updating the Bay-Delta WQCP. The updates, or amendments, are being prepared  
21 in two phases. Initially, the SWRCB and Regional Water Quality Control Boards  
22 are evaluating new flow objectives for the Lower San Joaquin River and the  
23 tributaries of Stanislaus, Tuolumne, and Merced rivers; and southern Delta  
24 salinity objectives. The second phase is evaluating changes to other portions of  
25 the Bay-Delta WQCP including Delta outflows, SWP and CVP export  
26 restrictions, and other requirements in the Bay-Delta to protect fish and wildlife  
27 beneficial uses. A third phase will consider and assign responsibility for  
28 implementing measures to achieve the water quality objectives established in the  
29 first two phases (SWRCB 2012).

30 Ongoing programs to adopt and implement total maximum daily loads are  
31 described in Chapter 6, Surface Water Quality.

#### 32 **3.5.1.2 Bay Delta Conservation Plan and the California Water Fix**

33 The Bay Delta Conservation Plan (BDCP) and the California WaterFix are being  
34 developed by Federal and State agencies and other stakeholders to achieve the  
35 dual goals of a reliable water supply for California and a healthy California Bay  
36 Delta ecosystem that supports the State's economy. The program would construct  
37 a new conveyance facility and modify operation of existing CVP and SWP Delta  
38 facilities; and reduce ecological stressors that impair the function or the use of the  
39 Delta by aquatic and terrestrial resources.

40 The Recirculated Draft EIR/Supplemental Draft EIS (RDEIR/SDEIS) was issued  
41 by DWR and Reclamation. The RDEIR/SDEIS evaluated new alternatives in  
42 addition to the alternatives included in the Public Draft EIR/EIS that combined  
43 ecosystem restoration approaches and Delta conveyance approaches. During the  
44 last 50 years, several broad conveyance approaches have been studied to address

1 urban water quality, water supply reliability, and environmental concerns in the  
2 Delta: physical barriers, hydraulic barriers, through-Delta facilities, and isolated  
3 facilities. Several alternative Delta conveyance facilities are being evaluated as  
4 part of the EIR/EIS process. These alternatives included use of an isolated facility  
5 that would convey water around or under the Delta for local supply and export  
6 through a hydraulically isolated channel or pipeline and with continual use of the  
7 existing south Delta intakes (dual conveyance alternatives); and continuation of  
8 the use of the through-Delta conveyance with channel modifications.

9 **3.5.1.3 Shasta Lake Water Resources Investigation**

10 The Shasta Lake Water Resources Investigation is currently being conducted by  
11 Reclamation to determine the type and extent of federal interest in a multiple  
12 purpose plan to modify Shasta Dam and Reservoir to increase the survival of  
13 anadromous fish populations in the upper Sacramento River; increase water  
14 supplies and water supply reliability for agricultural, municipal, industrial, and  
15 environmental purposes (Reclamation 2013d). To the extent possible through  
16 meeting these objectives, alternatives evaluated in the EIS included features to  
17 benefit other identified water and related resource needs including ecosystem  
18 conservation and enhancement, improve hydropower generation capability, flood  
19 damage reduction, maintain and increase recreation opportunities, and maintain or  
20 improve water quality conditions in the Sacramento River and the Delta  
21 consistent with the objectives of the CALFED Bay-Delta Program. Alternatives  
22 for expansion of Shasta Lake included, among other features, raising the dam  
23 from 6.5 to 18.5 feet above current elevation, which would result in additional  
24 storage capacity of 256,000 to 634,000 acre-feet, respectively. The increased  
25 capacity would improve water supply reliability and increase the cold water pool,  
26 which would provide improved water temperature conditions for anadromous fish  
27 in the Sacramento River downstream of the dam. The Final EIS, published in  
28 December 2014, identified the preferred alternative to include an 18.5 foot raise  
29 of Shasta Dam to provide an additional 634,000 acre-feet of storage with  
30 augmentation of spawning gravel programs and restoration of riparian, floodplain,  
31 and side channel habitat in the upper Sacramento River (Reclamation 2014g).

32 **3.5.1.4 North of Delta Offstream Storage Investigation**

33 The North-of-the-Delta Offstream Storage Investigation evaluates the feasibility  
34 of offstream storage in the northern Sacramento Valley for improved water supply  
35 and water supply reliability, improved water quality, and enhanced survival of  
36 anadromous fish and other aquatic species (DWR 2013). Specific primary  
37 planning objectives are to: 1) increase water supplies to meet existing contract  
38 requirements, including improved water supply reliability, and provide greater  
39 flexibility in water management for agricultural, environmental, and municipal  
40 and industrial users; 2) increase the survival of anadromous fish populations in the  
41 Sacramento River, as well as the survivability of other aquatic species; and  
42 3) improve drinking water quality in the Delta. To the extent possible through  
43 meeting these objectives, alternatives include ecosystem conservation and  
44 enhancement, provide ancillary hydropower generation capability to the statewide  
45 power grid, and create incremental flood damage reduction opportunities in

1 support of major northern California flood-control reservoirs consistent with the  
 2 objectives of the CALFED Bay Delta Program. All alternatives include  
 3 construction of a dam and reservoir near Sites, located to the west of Maxwell  
 4 (California), with various facilities and configurations for conveyance into and  
 5 out of the reservoir, which would result in additional storage capacity ranging  
 6 from 1200 to 1900 TAF.

7 **3.5.1.5 Federal Energy Regulatory Commission License Renewals**

8 There are 22 hydroelectric generation FERC permits that will expire prior to 2030  
 9 (FERC 2015). Fifteen projects in the Sacramento River watershed include one on  
 10 the Pit River (upstream of Shasta Lake), six on the Feather River, four on the  
 11 Yuba River, one on the Bear River, one on the American River, and one each on  
 12 Cow and Battle creeks. Projects in the San Joaquin River watershed include four  
 13 on the San Joaquin River, one on the Stanislaus River, two on the Merced River,  
 14 and one on the Tuolumne River. The FERC must complete analyses under NEPA  
 15 and ESA to consider the effects of the hydropower operations on the environment,  
 16 including flow regimes, water quality, fish passage, recreation, aquatic and  
 17 riparian habitat, and special status species.

18 **3.5.1.5.1 Federal Energy Regulatory Commission License Renewal for**  
 19 **SWP Oroville Project**

20 The Oroville Facilities, as part of SWP, are also operated for flood management,  
 21 power generation, water quality improvement in the Delta, recreation, and fish  
 22 and wildlife enhancement. The objective of the relicensing process was to  
 23 continue operation and maintenance of the Oroville Facilities for electric power  
 24 generation, along with implementation of any terms and conditions to be  
 25 considered for inclusion in a new FERC hydroelectric license. The initial FERC  
 26 license for the Oroville Facilities, issued on February 11, 1957, expired on  
 27 January 31, 2007. The Final EIR/EIS were completed in 2007 (FERC 2007). At  
 28 this time, the revised BOs and FERC license have not been issued.

29 **3.5.1.5.2 Federal Energy Regulatory Commission Relicensing for Yuba**  
 30 **River Watershed Hydroelectric Projects**

31 The Nevada Irrigation District is applying for a new license for the Yuba-Bear  
 32 Project (FERC Project No. 2266), and PG&E are applying for the Drum-  
 33 Spaulding Project (FERC Project No. 2310). The Yuba-Bear Project is located on  
 34 the Middle and South Yuba rivers, Bear River, and Jackson and Canyon creeks  
 35 (FERC 2013). Concurrently, PG&E is applying for a license renewal for the  
 36 Drum-Spaulding Project which is located on the Bear and Yuba rivers.  
 37 Operations of the two projects are coordinated in many factors. The FERC  
 38 relicensing processes for these two projects in underway.

1 **3.5.1.5.3 FERC Relicense Renewal for Turlock Irrigation District and**  
2 **Modesto Irrigation District Don Pedro Project**

3 The Don Pedro Project is located on the Tuolumne River in Tuolumne County.  
4 The initial license was issued for operations between 1971 and 1991 followed by  
5 requirements to evaluate fisheries water needs in the Tuolumne River.

6 In 1987, after the Turlock Irrigation District and Modesto Irrigation District  
7 applied to amend their license to add a fourth generating unit, FERC approved an  
8 amended fish study plan with possible changes in 1998. In 1996, FERC amended  
9 the license to implement amended minimum flow criteria and require fish  
10 monitoring studies for completion in 2005. In 2002, NMFS requested that FERC  
11 initiate formal consultation on the effects of the Don Pedro Project on Central  
12 Valley steelhead. The FERC approved the Summary Report on fisheries in 2008.  
13 In 2009, NMFS, USFWS, CDFW, and several environmental interest groups filed  
14 requests for rehearing on the license. FERC denied portions of the request but  
15 required instream flow studies to be conducted and required NMFS to be included  
16 for consultation on any authorized changes to minimum flow release schedules.

17 The FERC also directed the appointment of an administrative law judge to assist  
18 in assessing the need for and feasibility for interim measures prior to relicensing.  
19 A final report was completed in 2010. Following the completion of the report and  
20 a monitoring plan by the affected districts, FERC approved an order modifying  
21 and approving instream flow and monitoring study plans. A final license  
22 application, including an Environmental Report, was submitted to FERC in  
23 April 2014 (TID and MID 2014). The current license expires in 2016.

24 The objective of the relicensing process is to continue operation and maintenance  
25 of the Don Pedro Project facilities for electric power generation, along with  
26 implementation of any terms and conditions to be considered for inclusion in a  
27 new FERC hydroelectric license.

28 **3.5.1.5.4 FERC Relicense Renewal for Merced Irrigation District's Merced**  
29 **River Hydroelectric Project**

30 The Merced River Hydroelectric Project is located on the Merced River in  
31 Mariposa County and includes both Lake McClure and McSwain Reservoir, two  
32 powerhouses (New Exchequer and McSwain), and recreation facilities. The  
33 initial FERC license expires on February 28, 2014. The objective of the  
34 relicensing process is to continue operation and maintenance of the Merced River  
35 Hydroelectric Project facilities for electric power generation, along with  
36 implementation of any terms and conditions to be considered for inclusion in a  
37 new FERC hydroelectric license (Merced ID 2013).

38 **3.5.1.6 El Dorado Water and Power Authority Supplemental Water**  
39 **Rights Project**

40 The El Dorado Water and Power Authority (EDWPA) proposes to establish  
41 permitted water rights allowing diversion of water from the American River basin  
42 to meet planned future water demands in the El Dorado Irrigation District and  
43 Georgetown Divide Public Utility District service areas and other areas located

1 within El Dorado County that are outside of these service areas. The EDWPA  
 2 filed petitions with the SWRCB for partial assignment of State Filed Applications  
 3 5644 and 5645, and accompanying applications allowing for the total withdrawal  
 4 and use of 40,000 acre-feet per year, consistent with the diversion and storage  
 5 locations allowed under the El Dorado-Sacramento Municipal Utility District  
 6 Cooperation Agreement (EDWPA 2010).

### 7 **3.5.1.7 Semitropic Water Storage District Delta Wetlands**

8 In 1987, Delta Wetlands, a California Corporation, proposed a project for water  
 9 storage and wildlife habitat enhancement on four privately owned islands in the  
 10 Delta. The four islands were Bacon Island and Bouldin Island in San Joaquin  
 11 County and Holland Tract and Webb Tract in Contra Costa County,  
 12 encompassing approximately 23,000 acres. The Delta Wetlands Project would  
 13 store water on two Reservoir Islands (Bacon Island and Webb Tract) for  
 14 subsequent release into the Delta, and habitat enhancement to compensate for  
 15 wetland and wildlife effects of the water storage operations with a Habitat  
 16 Management Plan on two Habitat Islands (Bouldin Island and Holland Tract).

17 In 2007, the Delta Wetlands Project partnered with the Semitropic Water Storage  
 18 District (Semitropic WSD) to: 1) provide water to Semitropic WSD to augment its  
 19 water supply, and 2) bank water within the Semitropic Groundwater Storage Bank  
 20 and Antelope Valley Water Bank. The designated places of use for Delta  
 21 Wetlands Project water would include: Semitropic WSD; Member Agencies of  
 22 the Metropolitan Water District of Southern California, the Western Municipal  
 23 Water District of Riverside County, and select service areas of the Golden State  
 24 Water Company. The project would include improvements of 27 miles of levees  
 25 and screened diversions to divert water during high-flow periods in the winter  
 26 months of December through March into Webb Tract (100,000 acre-feet of  
 27 storage) and Bacon Island (115,000 acre-feet of storage). The water would not be  
 28 diverted in a manner that would adversely affect senior legal water rights holders,  
 29 including the SWP and CVP. Stored water would be discharged into False River  
 30 (from Webb Tract) and Middle River (from Bacon Island) for export when excess  
 31 SWP or CVP diversion capacity is available, in the summer and fall months of  
 32 July through November. Any water that could not be exported from the Delta in a  
 33 given year would be available to increase Delta outflow in the fall months of  
 34 September through November. Semitropic WSD issued a Draft EIR in 2010 and  
 35 a Final EIR in 2011 (SWSD 2011).

### 36 **3.5.1.8 North Bay Aqueduct Alternative Intake**

37 DWR is evaluating the implementation of an alternative intake on the Sacramento  
 38 River upstream of the Sacramento Regional Wastewater Treatment Plant, and  
 39 conveyance facility to connect the intake with the existing North Bay Aqueduct.  
 40 The proposed alternative intake would be operated in conjunction with the  
 41 existing North Bay Aqueduct intake at Barker Slough. The proposed project  
 42 would be designed to improve water quality and to provide reliable deliveries of  
 43 SWP supplies to its contractors, the Solano County Water Agency and the Napa  
 44 County Flood Control and Water Conservation District (DWR 2011a).

1 The proposed project would include construction and operation of a 240 cfs  
2 capacity intake with state-of-the-art positive barrier fish screens, pumping plant,  
3 sediment basins, and ancillary support facilities located on the west side of the  
4 Sacramento River near south Sacramento. The conveyance facility would include  
5 an approximately 30 mile long, 72 to 84-inch diameter underground steel and/or  
6 concrete pipeline to convey the water from the alternate intake to the existing  
7 North Bay Aqueduct. Two options are proposed for the location of the alternate  
8 intake facility. Alternate intake site 1 is located on the outside edge of Garcia  
9 Bend of the Sacramento River (on the west bank), approximately 500 feet south  
10 of the boundary of the City of West Sacramento. Alternate intake site 2 is located  
11 immediately south of the outside edge of Garcia Bend of the Sacramento River  
12 (on the west bank), approximately 2,500 feet south of the boundary of the City of  
13 West Sacramento. The intake and pumping plant facility would be constructed on  
14 the water side of the Sacramento River levee and the remaining components  
15 would be constructed on the land side of the levee. The intake would extend  
16 about 100 feet from the top of the levee into the river. The exact amount of this  
17 extension would depend on the site option selected. A fish screen would be  
18 installed on the face of the intake structure to prevent fish from swimming or  
19 being drawn into the intake and it would be designed to meet CDFW, NMFS, and  
20 USFWS criteria. The dimensions of the fish screen would be based on an  
21 anticipated approach velocity of 0.2 feet per second at the fish screen. Flow-  
22 control louvers behind the screen would control flow rates through the screen to  
23 assure uniform water velocity across the screen. Normal operation would keep  
24 the top of the screen below low water elevation. A reduction in pumping would  
25 occur any time the screens are not submerged or the water velocities increased.  
26 Above the screen would be concrete panels which extend to the 200 year flood  
27 elevation. A log boom would be installed in front of the fish screen to block large  
28 debris from blocking or damaging the intake. The intake would be equipped with  
29 an automatic fish screen cleaning system.

### 30 **3.5.1.9 Los Vaqueros Reservoir Expansion Phase 2**

31 Los Vaqueros Reservoir is an off-stream reservoir in the Kellogg Creek watershed  
32 to the west of the Delta. The Los Vaqueros Reservoir initial construction was  
33 completed in 1997 as a 100 TAF off-stream storage reservoir owned and operated  
34 by Contra Costa Water District to improve delivered water quality and emergency  
35 storage reliability to their customers. In 2012, the Los Vaqueros Reservoir was  
36 expanded to a total storage capacity of 160,000 acre-feet (Phase 1) to provide  
37 additional water quality and supply reliability benefits, and to adjust the timing of  
38 its Delta water diversions to accommodate the life cycles of Delta aquatic species,  
39 thus reducing species impact and providing a net benefit to the Delta  
40 environment. As part of the Storage Investigation Program described in the  
41 CALFED Bay Delta Program Record of Decision, additional expansion up to  
42 275 TAF (Phase 2) is being evaluated by Contra Costa Water District, DWR, and  
43 Reclamation. The alternatives considered in the evaluation also consider methods  
44 to convey water from Los Vaqueros Reservoir to the South Bay Aqueduct to  
45 provide water to Zone 7 Water Agency, Alameda County Water District, and  
46 Santa Clara Valley Water District (Reclamation, CCWD, and Western 2010).

1     **3.5.1.10   Upper San Joaquin River Basin Storage Investigation**

2     The Upper San Joaquin River Basin Storage Investigation is being conducted by  
3     Reclamation and DWR to evaluate alternative plans to increase Upper San  
4     Joaquin River Storage to enhance the San Joaquin River restoration efforts and  
5     improve water supply reliability for agricultural, municipal and industrial, and  
6     environmental uses in the Friant Division, the San Joaquin Valley, and other  
7     regions of the state. The investigation is evaluating integration of conjunctive  
8     management and water transfer concepts into plan formulations. Additional  
9     storage is also expected to provide incidental flood damage reduction benefits  
10    (Reclamation 2014c).

11    Reclamation is analyzing alternatives for a new dam and a 1,260 TAF reservoir  
12    along the San Joaquin upstream of Millerton Lake in an area known as  
13    Temperance Flat. Primary planning objectives are to: 1) increase water supply  
14    reliability, and 2) enhance flow and temperature conditions to support the San  
15    Joaquin River Restoration Program. Operation variables include reservoir  
16    carryover, new or shifting water supply beneficiaries, and alternative conveyance  
17    routes.

18    **3.5.1.11   Central Valley RWQCB Irrigated Lands Regulatory Program**

19    The Irrigated Lands Regulatory Program regulates discharges from irrigated  
20    agricultural lands. Its purpose is to prevent agricultural discharges from impairing  
21    the waters that receive the discharges. The California Water Code authorizes the  
22    SWRCB and Regional Water Quality Control Boards to conditionally waive  
23    waste discharge requirements if this is in the public interest. On this basis, the  
24    Los Angeles, Central Coast, Central Valley, and San Diego regional water quality  
25    control boards have issued conditional waivers of waste discharge requirements to  
26    growers that contain conditions requiring water quality monitoring of receiving  
27    waters. In 2010, the Central Valley Regional Water Quality Control Board  
28    proposed to expand the requirements to groundwater especially for regulation of  
29    discharges with higher concentrations of nutrients (CVRWQCB 2011).  
30    Participation in the waiver program is voluntary; however, non-participant  
31    dischargers must file a permit application as an individual discharger, stop  
32    discharging, or apply for coverage by joining an established coalition group. The  
33    waivers must include corrective actions when impairments are found.

34    **3.5.1.12   San Luis Reservoir Low Point Improvement Project**

35    The San Luis Reservoir Low Point Improvement Project is proposed by  
36    Reclamation, the Santa Clara Valley Water District, and the San Luis and Delta  
37    Mendota Water Authority. As part of this project, Reclamation is investigating  
38    three alternatives to address the water quality problems within the CVP's San  
39    Felipe Division (Santa Clara and San Benito counties) that arise when San Luis  
40    Reservoir levels drop below 300,000 acre-feet during late summer in dry water  
41    years, resulting in large algal blooms. The alternatives being considered are to  
42    1) expand the 6,000 acre-feet Pacheco Reservoir to 80,000 acre-feet or  
43    130,000 acre-feet, 2) lower the San Felipe Intake at San Luis Reservoir, or  
44    3) implement a combination comprehensive plan. The combination

1 comprehensive plan would involve increasing groundwater recharge and recovery  
2 capacity, implementing desalination measures, re-operating Santa Clara Valley  
3 Water District's raw- and treated-water systems, and implementing institutional  
4 measures. If Pacheco Reservoir were to be enlarged, the reservoir would be filled  
5 with Delta water; thus, additional impacts on Delta aquatic species (e.g., juvenile  
6 salmonids and Delta Smelt) could result from an increase in Delta exports. The  
7 environmental scoping report for the San Luis Reservoir Low Point Improvement  
8 Project was released in January 2009 and the plan formulation report was  
9 published in January 2011 (Reclamation et al. 2011).

10 **3.5.1.13 Westlands v. United States Settlement**

11 In August 2015, Westlands Water District and the United States agreed upon a  
12 settlement involving several litigations, as described below. The settlement is  
13 contingent upon Congressional authorization of enabling legislation (Reclamation  
14 2015). The following information provides a summary from the Reclamation  
15 news release in October 2015.

16 In 2000, the court in *Firebaugh Canal Co v. United States*, issued an Order  
17 requiring the Secretary of the Interior to provide drainage service to lands served  
18 by the San Luis Unit of the Central Valley Project. In 2007 Reclamation signed a  
19 Record of Decision selecting a drainage plan and finding that the cost of  
20 providing drainage for lands served by the San Luis Unit. Reclamation began  
21 implementing the selected drainage plan in a portion of Westlands Water District  
22 in 2010 on a court-ordered schedule.

23 In 2011, individual landowners within Westlands Water District filed a takings  
24 claim against the United States alleging that failure to provide drainage service  
25 has caused a physical taking of their lands without just compensation in violation  
26 of the Fifth Amendment (*Etchegoinberry v. United States*). The Court of Federal  
27 Claims denied the government's motion to dismiss the complaint.

28 In January 2012, Westlands filed a breach of contract case alleging that the  
29 government's failure to provide drainage service to the Westlands Water District  
30 service area constituted a breach of Westlands Water District 1963 Water Service  
31 and 1965 Repayment contracts (including the interim renewal of those contracts).  
32 The case is currently pending.

33 Under the proposed terms of the Settlement, Westlands Water District will:

- 34 • Permanently retire not less than 100,000 acres of land from production.  
35 Westlands Water District will agree to permanently retire a total of not less  
36 than 100,000 acres of lands within its boundaries utilizing those lands only for  
37 the following purposes:
  - 38 – Management of drain water, including irrigation of reuse areas;
  - 39 – Renewable energy projects;
  - 40 – Upland habitat restoration projects; or
  - 41 – Other uses subject to the consent of the United States.

- 1 • Cap contract deliveries at 75 percent of its CVP contact amount (from  
2 1.193 million acre-feet to 895 thousand acre-feet). Any water above this  
3 75 percent cap, that would have been delivered to Westlands Water District,  
4 would instead be available to the United States for other public purposes  
5 under the CVP.
- 6 • Assume all responsibility for drainage in accordance with all legal  
7 requirements under state and federal law. Westlands Water District would  
8 become legally responsible for the management of drainage water within its  
9 boundaries, in accordance with federal and California law.
- 10 • Indemnify the United States for any damages and pay compensation for  
11 claims arising out of the *Etchegoinberry litigation*. Under the Settlement  
12 Westlands Water District will indemnify the United States for any claims  
13 (past, present and future) arising out of a failure to provide drainage service  
14 with Westlands Water District. Westlands Water District would also  
15 intervene in the *Etchigoinberry* case for Settlement purposes and would pay  
16 compensation to individual landowners.
- 17 • Continue to wheel water to Lemoore Naval Air Station. As part of the overall  
18 Settlement, CVP water will be made available to Lemoore Naval Air Station  
19 and Westlands Water District would agree to wheel all CVP water made  
20 available to Lemoore under the same terms and conditions as Westlands  
21 Water District wheels water to other Westlands Water District's contractors.
- 22 • Be relieved from potential drainage repayment. If the United States were to  
23 expend significant funds to provide a drainage solution, Reclamation would  
24 seek repayment from Westlands Water District (over 50 years, with no  
25 interest, commencing after completion of each separable element). By taking  
26 responsibility for drainage, Westlands Water District would also eliminate  
27 responsibility for repayment.

28 Under the Terms of the Settlement, the United States will:

- 29 • Be relieved of all statutory obligations to provide drainage. The Settlement  
30 Agreement would relieve the Department of the Interior from all drainage  
31 obligations imposed by the San Luis Act, including implementation of the  
32 2007 ROD, which is estimated to cost approximately \$3.5 billion  
33 (\$513 million authorized). Westlands Water District will agree to dismiss  
34 with prejudice the *Westlands v. U.S.* breach of contract litigation and will join  
35 the U.S. in petitioning for vacatur of the 2000 Order Modifying Partial  
36 Judgment in the *Firebaugh* case directing implementation of drainage service  
37 and control schedules.
- 38 • Receive a waiver of claims for potential damages due to a failure to provide  
39 drainage service. Westlands Water District will agree to provide for the  
40 release, waiver and abandonment of all past, present and future claims arising  
41 from the government's failure to provide drainage service under the San Luis  
42 Act, including those by individual landowners within Westlands Water  
43 District's service area, and would further agree to indemnify the United States

- 1 for any and all claims relating to the provision of drainage service or lack  
2 thereof within the Westlands service area.
- 3 • Relieve Westlands Water District repayment obligation for CVP construction  
4 charges to date (approximately \$375 million). Westlands Water District will  
5 be relieved of its current, unpaid capitalized construction costs for the CVP,  
6 the present value of which is currently estimated to be \$375 million. Under  
7 the Settlement, Westlands Water District will still be responsible for  
8 Operation and Maintenance, the payment of restoration fund charges pursuant  
9 to the CVPIA, and for future CVP construction charges.
  - 10 • Convert Westlands Water District water service contract into a repayment  
11 contract. The Secretary will convert Westlands Water District’s current 9(e)  
12 water service contract to a 9(d) repayment contract consistent with existing  
13 key terms and conditions. As a “paid out” contractor, the benefit of this  
14 conversion is permanent right to a stated share of CVP water. However, the  
15 terms and conditions of the contract—including the so called “shortage  
16 clause” – will otherwise be the same as in the current 9(e) contract.
  - 17 • Retain the right to cease water deliveries if Westlands Water District fails to  
18 meet its drainage obligation. Language in the Settlement makes the United  
19 States’ obligation to provide water to Westlands under the 9(d) Repayment  
20 Contract conditional upon Westlands Water District’s fulfillment of its  
21 obligations to manage drainage water within its service area.
  - 22 • Issue a water service contract to Lemoore Naval Air Station. As part of the  
23 overall Settlement, the United States is authorized to enter into a water service  
24 contract with Lemoore Naval Air Station to provide a guaranteed quantity of  
25 CVP water to meet the needs of the Naval Air Station associated with air  
26 operations and Westlands Water District will agree to wheel all CVP water  
27 made available to Lemoore.

28 **3.5.1.14 Contra Loma Reservoir and Recreation Resource Management**  
29 **Plan**

30 The Contra Loma Recreation Resource Management Plan is a long-term plan to  
31 guide management of the resources on the federal lands within the 80-acre Contra  
32 Loma Reservoir and surrounding 661 acres of recreation areas in Contra Loma  
33 Regional Park and Antioch Community Park (Reclamation 2014f). The East Bay  
34 Regional Park District manages the federal lands and public recreation facilities  
35 under an agreement with Reclamation. The proposed plan is to expand  
36 recreational use and facilities to increase recreational demands, including  
37 establishment of an additional all-weather sports field, fishermen’s shelter,  
38 playground structure, a disc golf course, and expanded swim lagoon and trails.

39 **3.5.1.15 San Luis Reservoir State Recreation Area Resource Management**  
40 **Plan/General Plan**

41 The Resource Management Plan addressed recreational plans for the San Luis  
42 Reservoir State Recreation Area and adjacent lands in Merced County that are  
43 owned by Reclamation and managed by the California Department Parks and

1 Recreation, DWR, and CDFW (Reclamation and CDPR 2013). The plan would  
 2 focus on boating management, cultural resources management, vegetation  
 3 management, enhanced trails management, expanded visitor experiences and  
 4 education opportunities, and road and utility upgrades.

### 5 **3.5.1.16 Future Water Supply Projects**

6 Many of the future projects would directly increase regional and local water  
 7 supplies through groundwater storage and recovery programs, improved  
 8 conveyance that connects water supplies from different water agencies, recycled  
 9 water projects, and desalination projects. Water resources projects that have been  
 10 approved and are being implemented were previously described in this chapter  
 11 under the No Action Alternative. The following major water supply projects are  
 12 currently being evaluated and are considered under the Cumulative Effects  
 13 analysis.

- 14 • Future Groundwater Storage and Recovery Projects
  - 15 – City of Roseville (City of Roseville 2012)
  - 16 – Mokelumne River Water & Power Authority (MORE 2015)
  - 17 – Northeastern San Joaquin County Groundwater Banking Authority
  - 18 (NSJCGBA 2011)
  - 19 – Stockton East Water District (SEWD 2012)
  - 20 – Madera Irrigation District (Reclamation 2011b)
  - 21 – Kings River Conservation District (KRCD 2012b)
  - 22 – Buena Vista Water Storage District and Rosedale Rio Bravo Water
  - 23 Storage District (BVWSD 2015)
  - 24 – City of Los Angeles (City of Los Angeles 2010, 2013b)
  - 25 – Los Angeles County (Los Angeles County 2013b)
  - 26 – City of San Diego (City of San Diego 2009a, 2009b)
  - 27 – Rancho California Water District (RCWD 2011, 2012)
  - 28 – Eastern Municipal Water District (EMWD 2014c)
  - 29 – Jurupa Community Services District (JCSD et al. 2010)
- 30 • Major Conveyance Projects
  - 31 – Bay Area Regional Water Supply Reliability (CCWD 2014, EBMUD
  - 32 2014)
  - 33 – Friant-Kern Canal and Madera Canal Capacity Restoration Projects
  - 34 (SJRRP 2011, 2015)
  - 35 – Los Banos Creek Water Resources Management Plan (SJRECWA 2012)
  - 36 – Sacramento River Water Reliability Project (Reclamation 2004b)

- 1 • Major Recycle Water Projects (more than 10,000 acre-feet/year)
  - 2 – City of Fresno (City of Fresno 2011)
  - 3 – City of Los Angeles (City of Los Angeles 2005)
  - 4 – Central Basin Municipal Water District (CBMWD 2010)
  - 5 – Foothill Municipal Water District (MWDSC 2010)
  - 6 – Upper San Gabriel Valley Municipal Water District (USGVMWD 2013)
  - 7 – West Basin Municipal Water District (WBMWD 2011, 2015a)
  - 8 – Olivenhain Municipal Water District (OMWD 2015)
  - 9 – Eastern Municipal Water District (EMWD 2014c)
  - 10 – Inland Empire Utilities Agency (IEUA 2014)
  - 11 – Palmdale Water District (PWD 2010)
  - 12 – East Valley Water Reclamation Authority (Antelope Valley 2013)
- 13 • Major Future Coastal Desalination Water Projects
  - 14 – San Francisco Bay Area Regional Desalination Project (BARDP 2015)
  - 15 – City of Santa Barbara (City of Santa Barbara 2015)
  - 16 – Camrosa Water District (CWD 2015)
  - 17 – City of Long Beach (City of Long Beach 2015)
  - 18 – City of Huntington Beach (City of Huntington Beach 2010)
  - 19 – City of Oceanside (City of Oceanside 2012)
  - 20 – City of Carlsbad (City of Carlsbad 2006)
  - 21 – West Basin Municipal Water District (WBMWD 2015b)
  - 22 – Metropolitan Water District of Orange County (MWD OC 2015)
  - 23 – San Diego County Water Authority in the Southern California Region
  - 24 (SDCWA 2009, 2015)
- 25 • Long-term and short-term Water Transfers to provide water to municipal,
  - 26 agricultural, and ecosystem water users, including wildlife refuges including
  - 27 programs that transfer water from northern California to the San Joaquin
  - 28 Valley and southern California across the Delta (Reclamation and SLDMWA
  - 29 2015; BWGWD 2015).

### 30 **3.5.2 Ecosystem Improvement Projects and Actions**

31 There are numerous ecosystem improvement projects and actions that could be  
32 potentially affected by changes in the coordinated long-term operation of the CVP  
33 and SWP, or could affect the CVP and SWP operations. Major future water  
34 supply and water quality projects and actions are discussed below.

#### 35 **3.5.2.1 Mill Creek Riparian Assessment**

36 The need to restore and maintain riparian habitat in Mill Creek is identified in the  
37 Anadromous Fish Restoration Program and CALFED Bay-Delta Ecosystem  
38 Restoration Program goals, objectives, and targets. The AFRP is one of five  
39 CVPIA programs that have been integrated with the Ecosystem Restoration Plan.  
40 Both of these programs prioritize establishment, restoration, and maintenance of  
41 anadromous fish habitat on this stream, particularly in the arena of riparian habitat  
42 and flow enhancement. In response to this identified need, Reclamation and  
43 USFWS is implementing the Mill Creek Riparian Assessment. The project

1 includes: 1) riparian habitat and condition mapping and vegetation classification  
 2 of the Mill Creek watershed, 2) identifying and prioritizing areas that should be  
 3 restored, enhanced, and/or preserved in addition to existing conservation  
 4 easements, and 3) identifying the types of restoration actions that should occur at  
 5 the prioritized sites (USFWS 2010).

### 6 **3.5.2.2 Yolo County Habitat/Natural Community Conservation Plan**

7 The Yolo County Habitat Joint Powers Authority, consisting of five local public  
 8 agencies, launched the Yolo Natural Heritage Program in March 2007. This  
 9 effort includes the continuing preparation of a joint Habitat Conservation Plan/  
 10 Natural Community Conservation Plan (HCP/NCCP). Member agencies include  
 11 Yolo County and the cities of Davis, Woodland, West Sacramento, and Winters.

12 The HCP/NCCP describes the measures that local agencies will implement to  
 13 conserve biological resources, obtain permits for urban growth and public  
 14 infrastructure projects, and continue to maintain the agricultural heritage and  
 15 productivity of Yolo County. The nearly 653,820-acre planning area provides  
 16 habitat for covered species occurring within five dominant habitats/natural  
 17 communities. The plan proposes to address 63 covered species, including seven  
 18 state-listed species: palmate-bracted bird's-beak, Colusa grass, Crampton's  
 19 tuctoria, giant garter snake, Swainson's hawk, western yellow-billed cuckoo, and  
 20 bank swallow. Interim conservation activities include acquiring permanent  
 21 conservation easements for sensitive species habitat in the plan area  
 22 (YNHP 2015).

### 23 **3.5.2.3 California EcoRestore**

24 California EcoRestore is an initiative by the California Natural Resources Agency  
 25 to coordinate and advance habitat restoration for at least 30,000 acres by 2019  
 26 (CNRA 2015a, 2015b). This acreage includes 25,000 acres of habitat restoration  
 27 identified in the 2008 USFWS BO and 2009 NMFS BO, and 5,000 acres of  
 28 habitat enhancements. Some of these programs would be funded by federal and  
 29 state water agencies that are required to mitigate impacts of the CVP and SWP.  
 30 Other programs would be sponsored by a combination of funds from state bonds  
 31 (Proposition 1 and 1E), Assembly Bill 32 Greenhouse Gas Reduction Fund,  
 32 federal agencies, local agencies, and private investments. The California Delta  
 33 Conservancy will lead implementation of identified restoration projects in  
 34 collaboration with local governments and with a priority on using public lands in  
 35 the Delta.

36 Many of the programs to be implemented under California EcoRestore in Suisun  
 37 Marsh, Yolo Bypass, and Cache Slough are discussed separately under the No  
 38 Action Alternative and cumulative effects in this EIS.

### 39 **3.5.2.4 North Delta Flood Control and Ecosystem Restoration Project**

40 The North Delta Flood Control and Ecosystem Restoration Project is proposed  
 41 near the confluence of the Cosumnes and Mokelumne rivers by the DWR and  
 42 encompasses approximately 197 square miles. Consistent with objectives  
 43 contained in the CALFED Record of Decision, the project is intended to improve

1 flood management and provide ecosystem benefits in the North Delta area  
2 through actions such as construction of setback levees and configuration of flood  
3 bypass areas to create quality habitat for species of concern. These actions are  
4 focused on McCormack-Williamson Tract and Staten Island. The project would  
5 implement flood control improvements in a manner that benefits aquatic and  
6 terrestrial habitats, species, and ecological processes. Flood control  
7 improvements are needed to reduce damage to land uses, infrastructure, and the  
8 Bay-Delta ecosystem resulting from overflows caused by insufficient channel  
9 capacities and catastrophic levee failures in the 197 square-mile project study  
10 area. The proposed project as described in the Final EIR (DWR 2010b) included:  
11 portions of the levee system degraded to allow controlled flow across  
12 McCormack-Williamson Tract; levee modification to mitigate hydraulic impacts;  
13 channel dredging to increase flood conveyance capacity; an off-channel detention  
14 basin on Staten Island; ecosystem restoration where floodplain forests and  
15 marshes would be developed at McCormack-Williamson Tract and the Grizzly  
16 Slough property; setback levee on Staten Island to expand the floodway  
17 conveyance; and opening up the southern portion of McCormack-Williamson  
18 Tract to boating; improving Delta Meadows property; providing access and  
19 interpretive kiosks for wildlife viewing; and providing restroom, circulation,  
20 parking, and signage infrastructure to support such uses.

### 21 **3.5.2.5 Franks Tract Project**

22 Reclamation has conducted studies to evaluate the feasibility of modifying the  
23 hydrodynamic conditions near Franks Tract to improve Delta water quality and  
24 enhance the aquatic ecosystem. The results of these studies have indicated that  
25 modifying the hydrodynamic conditions near Franks Tract may substantially  
26 reduce salinity in the Delta and protect fishery resources, including populations of  
27 Delta Smelt. Reclamation evaluated installing operable gates to control the flow  
28 of water at key locations (Threemile Slough and/or West False River) to reduce  
29 sea water intrusion, and to positively influence movement of fish species of  
30 concern to areas that provide favorable habitat conditions. The project gates  
31 would be operated seasonally and during certain hours of the day, depending on  
32 fisheries and tidal conditions. Boat passage facilities would be included to allow  
33 for passing of watercraft when the gates are in operation. The Franks Tract  
34 Project is consistent with ongoing planning efforts for the Delta to help balance  
35 competing uses and create a more sustainable system for the future. By protecting  
36 fish resources, this project also could improve operational reliability of the CVP  
37 and SWP because curtailments in water exports (pumping restrictions) are likely  
38 to be less frequent. Franks Tract was previously evaluated as part of DWR's  
39 Flooded Island Pre-Feasibility Study Report (DWR 2007).

## 40 **3.6 Summary of Environmental Consequences**

41 Conditions in 2030 related to environmental and human resources that would  
42 occur with implementation of the No Action Alternative were compared to  
43 conditions under the Second Basis of Comparison; and conditions under

1 Alternatives 1 through 5 were compared to the conditions under the No Action  
2 Alternative and the Second Basis of Comparison, as described in Chapter 4,  
3 Approach to Environmental Analysis. The results of these analyses by alternative  
4 are described in Chapters 5 through 21 of this EIS and summarized in Tables 3.6  
5 and 3.7.

6 The tables present summarize the results of both quantitative and qualitative  
7 impact analyses. The tables include relative quantitative differences for adverse  
8 impacts to provide a basis for consideration of mitigation measures. Potential  
9 mitigation measures were considered related to the comparison of Alternatives 1  
10 through 5 to the No Action Alternative. Mitigation measures were not included to  
11 address adverse impacts of implementation of Alternatives 1 through 5 and the No  
12 Action Alternative as compared to the Second Basis of Comparison because this  
13 analysis was included in this EIS for information purposes only.

14 Changes in surface water conditions are provided as a basis for identifying the  
15 impacts as described in Aquatic, Terrestrial, and Recreation resources. Therefore,  
16 no mitigation measures are presented for Surface Water Resources.

17 Differences in the quantitative analyses of 5 percent or less are considered to be  
18 “similar” because the modeling analyses are based on CalSim II model output  
19 which operates with monthly time steps. Therefore, it was determined that  
20 changes in the model of 5 percent or less were related to the uncertainties in the  
21 model processing.

1 **Table 3.6 Comparison of Alternatives 1 through 5 to No Action Alternative**

	<b>Alternative 1 Compared to the No Action Alternative</b>	<b>Alternative 2 Compared to the No Action Alternative</b>	<b>Alternative 3 Compared to the No Action Alternative</b>	<b>Alternative 4 Compared to the No Action Alternative</b>	<b>Alternative 5 Compared to the No Action Alternative</b>
<b>SURFACE WATER</b>					
Trinity Lake	Water surface elevations similar. Storage similar or increased.	No change.	Water surface elevations similar. Storage similar or increased.	Water surface elevations similar. Storage similar or increased.	Water surface elevations similar. Storage similar or increased.
Trinity River at Lewiston Dam	Flows similar or increased.	No change.	Flows similar or increased.	Flows similar or increased.	Water surface elevations similar. Storage similar.
Shasta Lake	Water surface elevations similar. Storage similar or increased.	No change.	Water surface elevations similar. Storage similar or increased.	Water surface elevations similar. Storage similar or increased.	Water surface elevations similar. Storage similar.
Sacramento River at Keswick Dam	Flows similar or increased except reduced in September and November (up to 44%).	No change.	Flows similar or increased except reduced in September and November (up to 42%).	Flows similar or increased except reduced in September and November (up to 44%).	Flows similar.
Sacramento River at Freeport	Flows similar or increased except reduced in September and November (up to 47%).	No change.	Flows similar or increased except reduced in September and November (up to 48%).	Flows similar or increased except reduced in September and November (up to 47%).	Flows similar.
Clear Creek near Igo	Flows same except reduced in May (41%).	No change.	Flows same except reduced in May (29%).	Flows same except reduced in May (41%).	No change.
Lake Oroville	Water surface elevations similar. Storage reduced except in June (up to 22%).	No change.	Water surface elevations similar. Storage similar or increased.	Water surface elevations similar. Storage reduced except in June (up to 22%).	Water surface elevations similar. Storage similar.

	<b>Alternative 1 Compared to the No Action Alternative</b>	<b>Alternative 2 Compared to the No Action Alternative</b>	<b>Alternative 3 Compared to the No Action Alternative</b>	<b>Alternative 4 Compared to the No Action Alternative</b>	<b>Alternative 5 Compared to the No Action Alternative</b>
Feather River downstream of Thermalito Complex	Flows similar or increased except reduced in July-September and November-December (up to 65%).	No change.	Flows similar or increased except reduced in July-September and October-January (up to 70%).	Flows similar or increased except reduced in July-September and November-December (up to 65%).	Flows similar or increased except reduced in April-May (up to 27%).
Folsom Lake	Water surface elevations similar Storage similar or increased except reduced in June-August in above normal and below normal years (up to 15%).	No change.	Water surface elevations similar Storage similar or increased except reduced in July-August in above normal and August-September in below normal years (up to 10%).	Water surface elevations similar Storage similar or increased except in reduced June-August in above normal and below normal years (up to 15%).	Water surface elevations similar. Storage similar.
American River at Nimbus Dam	Flows similar or increased except reduced in September-November and June-July (up to 48%).	No change.	Flows similar or increased except reduced in August-November and June (up to 46%).	Flows similar or increased except reduced in September-November and June-July (up to 48%).	Flows similar or increased except reduced in September and April-May (up to 14%).
New Melones Reservoir	Water surface elevations similar Storage similar or increased.	No change.	Water surface elevations similar Storage similar or increased.	Water surface elevations similar Storage similar or increased.	Water surface elevations similar. Storage reduced in July-September in above normal years (up to 6%); and all months in below normal, dry, and critical dry years (up to 19 percent).
Stanislaus River at Goodwin Dam	Flows similar or increased except reduced in July-August, December, and March (up to 18%).	No change.	Flows similar or increased except reduced in October and February-July (up to 73%).	Flows similar or increased except reduced in July-August, December, and March (up to 18%).	Flows similar or increased except reduced in June-August (up to 18%).

Chapter 3: Description of Alternatives

	<b>Alternative 1 Compared to the No Action Alternative</b>	<b>Alternative 2 Compared to the No Action Alternative</b>	<b>Alternative 3 Compared to the No Action Alternative</b>	<b>Alternative 4 Compared to the No Action Alternative</b>	<b>Alternative 5 Compared to the No Action Alternative</b>
San Joaquin River at Vernalis	Flows similar or increased except reduced in October and April (up to 19%).	No change.	Flows similar or increased except reduced in October and May-June (up to 21%).	Flows similar or increased except reduced in October and April (up to 19%).	Flows similar or increased.
San Luis Reservoir	Water surface elevations similar Storage similar or increased.	No change.	Water surface elevations similar Storage similar or increased.	Water surface elevations similar Storage similar or increased.	Water surface elevations similar Storage similar or increased except in below normal years in June-July (up to 9%); in dry years in April-September (up to 17%); and in critical dry years in April-January (up to 18%).
Flows into Yolo Bypass	Flows similar or increased except in October in wet years (20%).	No change.	Flows similar or increased except in October in wet years (25%).	Flows similar or increased except in October in wet years (20%).	Flows similar.
Delta Outflow	Reduced flows in many months. Increased flows in some months, including in December, February-March, and June in wet years (up to 1,492 cfs); and similar or increased flows in June and September in dry years (up to 385 cfs).	No change.	Reduced flows in many months. Increased flows in some months, including in December-March, in wet years (up to 3,307cfs); and increased flows in January-February and June-July in dry years (up to 277 cfs).	Reduced flows in many months. Increased flows in some months, including in December, February-March, and June in wet years (up to 1,492 cfs); and similar or increased flows in June and September in dry years (up to 385 cfs).	Flows would be similar or increased.
Reverse Flows in Old and Middle Rivers	Increased negative flows except in July-September.	No change.	Increased negative flows except in July-September.	Increased negative flows except in July-September.	Increased positive flows except in July-August.

	<b>Alternative 1 Compared to the No Action Alternative</b>	<b>Alternative 2 Compared to the No Action Alternative</b>	<b>Alternative 3 Compared to the No Action Alternative</b>	<b>Alternative 4 Compared to the No Action Alternative</b>	<b>Alternative 5 Compared to the No Action Alternative</b>
<b>Water Supplies</b>					
Non-CVP and Non-SWP Deliveries	Deliveries similar. No mitigation needed.	No change. No mitigation needed.	Deliveries similar. No mitigation needed.	Deliveries similar. No mitigation needed.	Deliveries similar. No mitigation needed.
CVP Water Deliveries (including CVP agricultural and municipal and industrial water service contracts; Sacramento River Settlement Contracts, San Joaquin River Exchange Contracts, and Eastside Division Contracts)	Deliveries similar or increased. No mitigation needed.	No change. No mitigation needed.	Deliveries similar or increased. No mitigation needed.	Deliveries similar or increased. No mitigation needed.	Deliveries similar or increased in wet to dry years. Reduced deliveries in the Eastside Division Contractors in critical dry years (8%). Potential Mitigation measure: Reclamation would support water transfers from other basin water rights holders.
SWP Water Deliveries (In accordance with Table A contracts without Article 21 water)	Deliveries similar or increased. No mitigation needed.	No change. No mitigation needed.	Deliveries similar or increased. No mitigation needed.	Deliveries similar or increased. No mitigation needed.	Deliveries similar or increased. No mitigation needed.

	<b>Alternative 1 Compared to the No Action Alternative</b>	<b>Alternative 2 Compared to the No Action Alternative</b>	<b>Alternative 3 Compared to the No Action Alternative</b>	<b>Alternative 4 Compared to the No Action Alternative</b>	<b>Alternative 5 Compared to the No Action Alternative</b>
<b>Surface Water Quality</b>					
Salinity in Northern Delta (near Emmaton)	Salinity increased in fall and winter months (up to 377%).  Reduced in June in wet to dry years (up to 30%).  Potential Mitigation Measures: Continued coordination of CVP and SWP operations to reduce salinity to the extent possible. Other mitigation measures have not been identified at this time.	No change.  No mitigation needed.	Salinity increased in fall and winter months in wet and above normal years (up to 378%).  Reduced in June of above normal years and September of below normal years (up to 8%).  Potential Mitigation Measures: Continued coordination of CVP and SWP operations to reduce salinity to the extent possible. Other mitigation measures have not been identified at this time.	Salinity increased in the western Delta in fall and winter months (up to 377%).  Potential Mitigation Measures: Continued coordination of CVP and SWP operations to reduce salinity to the extent possible. Other mitigation measures have not been identified at this time.	Salinity increased in January-February in all years (up to 8%).  Reduced in April-June in critical dry years (up to 15%).  Potential Mitigation Measures: Continued coordination of CVP and SWP operations to reduce salinity to the extent possible. Other mitigation measures have not been identified at this time.
Salinity in Western Delta (near Port Chicago)	Salinity increased in Oct-March in below normal, dry, and critical dry years, and September wet and above normal years (up to 96%).  Potential Mitigation Measures: Continued coordination of CVP and SWP operations to reduce salinity to the extent possible. Other mitigation measures have not been identified at this time.	No change.  No mitigation needed.	Salinity increased in October-January, April-May, June, and September in wet and above normal years (up to 95%).  Potential Mitigation Measures: Continued coordination of CVP and SWP operations to reduce salinity to the extent possible. Other mitigation measures have not been identified at this time.	Salinity increased in Oct-March in below normal, dry, and critical dry years, and September wet and above normal years (up to 96%).  Potential Mitigation Measures: Continued coordination of CVP and SWP operations to reduce salinity to the extent possible. Other mitigation measures have not been identified at this time.	Salinity similar in most months except reduced in April-May in dry and critical dry years (up to 8%).  No mitigation needed.

	<b>Alternative 1 Compared to the No Action Alternative</b>	<b>Alternative 2 Compared to the No Action Alternative</b>	<b>Alternative 3 Compared to the No Action Alternative</b>	<b>Alternative 4 Compared to the No Action Alternative</b>	<b>Alternative 5 Compared to the No Action Alternative</b>
Salinity in Western Central Delta (near Antioch)	Salinity increased in fall and winter months (up to 265%).  Reduced in June in wet to below normal years (up to 14%).  Potential Mitigation Measures: Continued coordination of CVP and SWP operations to reduce salinity to the extent possible. Other mitigation measures have not been identified at this time.	No change.  No mitigation needed.	Salinity increased in fall and winter months (up to 262%).  Potential Mitigation Measures: Continued coordination of CVP and SWP operations to reduce salinity to the extent possible. Other mitigation measures have not been identified at this time.	Salinity increased in fall and winter months (up to 265%).  Reduced in June in wet to below normal years (up to 14%).  Potential Mitigation Measures: Continued coordination of CVP and SWP operations to reduce salinity to the extent possible. Other mitigation measures have not been identified at this time.	Salinity increased in February in critical dry years (7%).  Reduced in April-May in below normal to critical dry years, and in June in critical dry years (up to 20%).  Potential Mitigation Measures: Continued coordination of CVP and SWP operations to reduce salinity to the extent possible. Other mitigation measures have not been identified at this time.
Salinity in Western Central Delta (near Contra Costa Water District Intakes)	Salinity increased in October-January and September in wet and above normal years (up to 65%).  Reduced in March-June in wet to below normal years (up to 32%).  Potential Mitigation Measures: Continued coordination of CVP and SWP operations to reduce salinity to the extent possible. Other mitigation measures have not been identified at this time.	No change.  No mitigation needed.	Salinity increased in October-December in all year types, and January in above normal to dry years, and in September in wet and above normal years (up to 76%).  Reduced in April-June (up to 34%).  Potential Mitigation Measures: Continued coordination of CVP and SWP operations to reduce salinity to the extent possible. Other mitigation measures have not been identified at this time.	Salinity increased in October-January and September in wet and above normal years (up to 65%).  Reduced in March-June in wet to below normal years (up to 32%).  Potential Mitigation Measures: Continued coordination of CVP and SWP operations to reduce salinity to the extent possible. Other mitigation measures have not been identified at this time.	Salinity increased in April-June in below normal to critical dry years (up to 40%).  Potential Mitigation Measures: Continued coordination of CVP and SWP operations to reduce salinity to the extent possible. Other mitigation measures have not been identified at this time.

	<b>Alternative 1 Compared to the No Action Alternative</b>	<b>Alternative 2 Compared to the No Action Alternative</b>	<b>Alternative 3 Compared to the No Action Alternative</b>	<b>Alternative 4 Compared to the No Action Alternative</b>	<b>Alternative 5 Compared to the No Action Alternative</b>
Salinity in Southern Delta (near CVP and SWP intakes)	Salinity increased in fall and early winter months (up to 65%). Reduced in February-June (up to 22%). Potential Mitigation Measures: Continued coordination of CVP and SWP operations to reduce salinity to the extent possible. Other mitigation measures have not been identified at this time.	No change. No mitigation needed.	Salinity increased in October-December (up to 29% at Jones Pumping Plant intake and up to 41% at Clifton Court intake). Reduced in June (up to 13% at Jones Pumping Plant intake and up to 19% at Clifton Court intake). Potential Mitigation Measures: Continued coordination of CVP and SWP operations to reduce salinity to the extent possible. Other mitigation measures have not been identified at this time.	Salinity increased in fall and early winter months (up to 65%). Reduced in February-June (up to 22%). Potential Mitigation Measures: Continued coordination of CVP and SWP operations to reduce salinity to the extent possible. Other mitigation measures have not been identified at this time.	Salinity increased in June in dry and critical dry years (up to 12%). Potential Mitigation Measures: Continued coordination of CVP and SWP operations to reduce salinity to the extent possible. Other mitigation measures have not been identified at this time.
Mercury in Delta Fish	Mercury concentrations similar or reduced concentrations. No mitigation needed.	No change. No mitigation needed.	Mercury concentrations similar or reduced concentrations. No mitigation needed.	Mercury concentrations similar or reduced concentrations. No mitigation needed.	Mercury concentrations similar concentrations. No mitigation needed.
Selenium in Delta and Delta Fish	Selenium concentrations similar concentrations. No mitigation needed.	No change. No mitigation needed.	Selenium concentrations similar concentrations. No mitigation needed.	Selenium concentrations similar concentrations. No mitigation needed.	Selenium concentrations similar concentrations. No mitigation needed.
<b>Groundwater Resources</b>					
Trinity River Region	Similar groundwater conditions. No mitigation needed.	No change. No mitigation needed.	Similar groundwater conditions. No mitigation needed.	Similar groundwater conditions. No mitigation needed.	Similar groundwater conditions. No mitigation needed.
Central Valley Region: Sacramento Valley	Similar groundwater conditions. No mitigation needed.	No change. No mitigation needed.	Similar groundwater conditions. No mitigation needed.	Similar groundwater conditions. No mitigation needed.	Similar groundwater conditions. No mitigation needed.

	<b>Alternative 1 Compared to the No Action Alternative</b>	<b>Alternative 2 Compared to the No Action Alternative</b>	<b>Alternative 3 Compared to the No Action Alternative</b>	<b>Alternative 4 Compared to the No Action Alternative</b>	<b>Alternative 5 Compared to the No Action Alternative</b>
Central Valley Region: San Joaquin Valley	Reduced groundwater pumping (8%); and higher groundwater elevations (2-200 feet). Potentially improved groundwater quality. Reduced subsidence potential. No mitigation needed.	No change. No mitigation needed.	Reduced groundwater pumping (6%); and higher groundwater elevations (2-200 feet). Potentially improved groundwater quality. Reduced subsidence potential. No mitigation needed.	Reduced groundwater pumping (8%); and higher groundwater elevations (2-200 feet). Potentially improved groundwater quality. Reduced subsidence potential. No mitigation needed.	Similar groundwater pumping; and similar to higher groundwater elevations (2-25 feet). Similar groundwater quality. Similar subsidence potential. No mitigation needed.
San Francisco Bay Area, Central Coast, and Southern California Region	Potentially reduced groundwater pumping; and potentially higher groundwater elevations. Potentially improved groundwater quality. Less subsidence potential. No mitigation needed.	No change. No mitigation needed.	Potentially reduced groundwater pumping; and potentially higher groundwater elevations. Potentially improved groundwater quality. Less subsidence potential. No mitigation needed.	Potentially reduced groundwater pumping; and potentially higher groundwater elevations. Potentially improved groundwater quality. Less subsidence potential. No mitigation needed.	Similar groundwater pumping; and groundwater elevations. Potentially similar groundwater quality. Similar subsidence potential. No mitigation needed.
<b>CVP and SWP Energy Resources</b>					
Energy Generated and Used by CVP and SWP Water Users	Similar CVP net generation. Decreased SWP net generation over the long-term (41%). Potentially reduced energy use by CVP and SWP water users. No mitigation needed.	No change. No mitigation needed.	Similar CVP net generation. Decreased SWP net generation over the long-term (27%). Potentially reduced energy use by CVP and SWP water users. No mitigation needed.	Similar CVP net generation. Decreased SWP net generation over the long-term (41%). Potentially reduced energy use by CVP and SWP water users. No mitigation needed.	Similar CVP and SWP net generation. Similar reduced energy use. No mitigation needed.

Chapter 3: Description of Alternatives

	<b>Alternative 1 Compared to the No Action Alternative</b>	<b>Alternative 2 Compared to the No Action Alternative</b>	<b>Alternative 3 Compared to the No Action Alternative</b>	<b>Alternative 4 Compared to the No Action Alternative</b>	<b>Alternative 5 Compared to the No Action Alternative</b>
Sacramento River System: Spring-run Chinook Salmon	Reduced habitat conditions due to lack of measures to address high water temperatures caused by climate change by 2030.  Potential mitigation measure: Implement fish passage around dams.	Reduced habitat conditions due to lack of measures to address high water temperatures caused by climate change by 2030; reduced pulse flows along lower Clear Creek; and lack of measures to increase efficiency of fish handling facilities at Banks and Jones pumping plants.  Potential mitigation measure: Implement fish passage around dams to reduce temperature impacts. No mitigation measures have been identified for remaining impacts.	Reduced habitat conditions due to lack of measures to address high water temperatures caused by climate change by 2030.  Improved conditions due to predator controls.  Potential mitigation measure: Implement fish passage around dams.	Reduced habitat conditions due to lack of measures to address high water temperatures caused by climate change by 2030.  Improved conditions due to predator controls.  Potential mitigation measure: Implement fish passage around dams.	Similar conditions.  No mitigation needed.
Sacramento River System: Fall-run Chinook Salmon	Similar conditions.  No mitigation needed.	Reduced habitat conditions due to reduced pulse flows along lower Clear Creek; and lack of measures to increase efficiency of fish handling facilities at Banks and Jones pumping plants.  No mitigation measures have been identified for remaining impacts.	Similar conditions.  No mitigation needed.	Similar conditions.  No mitigation needed.	Similar conditions.  No mitigation needed.

	<b>Alternative 1 Compared to the No Action Alternative</b>	<b>Alternative 2 Compared to the No Action Alternative</b>	<b>Alternative 3 Compared to the No Action Alternative</b>	<b>Alternative 4 Compared to the No Action Alternative</b>	<b>Alternative 5 Compared to the No Action Alternative</b>
Sacramento River System: Late Fall-run Chinook Salmon	Similar conditions. No mitigation needed.	Reduced habitat conditions due to lack of measures to increase efficiency of fish handling facilities at Banks and Jones pumping plants. Potential mitigation measure: Implement fish passage around dams to reduce temperature impacts. No mitigation measures have been identified for remaining impacts.	Similar conditions. No mitigation needed.	Similar conditions. No mitigation needed.	Similar conditions. No mitigation needed.
Sacramento River System: Steelhead	Reduced habitat conditions due to lack of measures to address high water temperatures caused by climate change by 2030. Potential mitigation measure: Implement fish passage around dams.	Reduced habitat conditions due to lack of measures to address high water temperatures caused by climate change by 2030. Potential mitigation measure: Implement fish passage around dams.	Reduced habitat conditions due to lack of measures to address high water temperatures caused by climate change by 2030. Potential mitigation measure: Implement fish passage around dams.	Reduced habitat conditions due to lack of measures to address high water temperatures caused by climate change by 2030. Potential mitigation measure: Implement fish passage around dams.	Similar conditions. No mitigation needed.
Sacramento River System: Green Sturgeon and White Sturgeon	Likely to result in improved conditions. No mitigation needed.	Similar conditions. No mitigation needed.	Likely to result in improved conditions. No mitigation needed.	Likely to result in improved conditions. No mitigation needed.	Similar conditions. No mitigation needed.

Chapter 3: Description of Alternatives

	<b>Alternative 1 Compared to the No Action Alternative</b>	<b>Alternative 2 Compared to the No Action Alternative</b>	<b>Alternative 3 Compared to the No Action Alternative</b>	<b>Alternative 4 Compared to the No Action Alternative</b>	<b>Alternative 5 Compared to the No Action Alternative</b>
Delta: Delta Smelt	Reduced habitat conditions due to increased potential for entrainment during larval and juvenile stages, and increased salinity in the fall in the western Delta.  No mitigation measures have been identified at this time.	Similar conditions. No mitigation needed.	Reduced habitat conditions due to increased potential for entrainment during larval and juvenile stages, and increased salinity in the fall in the western Delta.  No mitigation measures have been identified at this time.	Reduced habitat conditions due to increased potential for entrainment during larval and juvenile stages, and increased salinity in the fall in the western Delta.  No mitigation measures have been identified at this time.	Similar conditions. No mitigation needed.
Delta: Longfin Smelt	Reduced habitat conditions due to more negative Old and Middle River flows and other factors (as indicated by lower Longfin Smelt abundance indices).  No mitigation measures have been identified at this time.	Similar conditions. No mitigation needed.	Reduced habitat conditions due to more negative Old and Middle River flows and other factors (as indicated by lower Longfin Smelt abundance indices).  No mitigation measures have been identified at this time.	Reduced habitat conditions due to more negative Old and Middle River flows and other factors (as indicated by lower Longfin Smelt abundance indices).  No mitigation measures have been identified at this time.	Similar conditions. No mitigation needed.

	<b>Alternative 1 Compared to the No Action Alternative</b>	<b>Alternative 2 Compared to the No Action Alternative</b>	<b>Alternative 3 Compared to the No Action Alternative</b>	<b>Alternative 4 Compared to the No Action Alternative</b>	<b>Alternative 5 Compared to the No Action Alternative</b>
New Melones Reservoir; Reservoir Fish	Similar conditions. No mitigation needed.	Similar conditions. No mitigation needed.	Similar conditions. No mitigation needed.	Similar conditions. No mitigation needed.	Similar conditions. No mitigation needed.
Stanislaus River: Other Fish	Similar conditions. No mitigation needed.	Similar conditions. No mitigation needed.	Similar conditions for lampreys and Hardheads.  Adverse conditions for Striped Bass due to changes in harvest limitations.  No mitigation needed for lamprey and Hardhead. No mitigation measures have been identified at this time for Striped Bass.	Similar conditions for lampreys and Hardheads.  Adverse conditions for Striped Bass due to changes in harvest limitations.  No mitigation needed for lamprey and Hardhead. No mitigation measures have been identified at this time for Striped Bass.	Similar conditions. No mitigation needed.
Pacific Ocean: Killer Whale	Similar conditions. No mitigation needed.	Similar conditions. No mitigation needed.	Similar conditions. No mitigation needed.	Similar conditions. No mitigation needed.	Similar conditions. No mitigation needed.
<b>Terrestrial Resources</b>					
Terrestrial Resources along Shoreline of CVP and SWP Reservoirs	Similar conditions. No mitigation needed.	No change. No mitigation needed.	Similar conditions. No mitigation needed.	Similar conditions. No mitigation needed.	Similar conditions. No mitigation needed.
Terrestrial Resources along Rivers Downstream of CVP and SWP Reservoirs	Similar or improved conditions along Trinity, Sacramento, American, and Feather rivers.  Reduced conditions along Stanislaus River.  No mitigation measures identified at this time for changes along the Stanislaus River.	No change. No mitigation needed.	Similar or improved conditions along Trinity, Sacramento, American, and Feather rivers.  Reduced conditions along Stanislaus River.  No mitigation measures identified at this time for changes along the Stanislaus River.	Similar or improved conditions along Trinity, Sacramento, American, and Feather rivers.  Reduced conditions along Stanislaus River.  No mitigation measures identified at this time for changes along the Stanislaus River.	Similar or improved conditions along Trinity, Sacramento, American, and Feather rivers.  Improved conditions along Stanislaus River.  No mitigation needed.

Chapter 3: Description of Alternatives

	<b>Alternative 1 Compared to the No Action Alternative</b>	<b>Alternative 2 Compared to the No Action Alternative</b>	<b>Alternative 3 Compared to the No Action Alternative</b>	<b>Alternative 4 Compared to the No Action Alternative</b>	<b>Alternative 5 Compared to the No Action Alternative</b>
Terrestrial Resources in Yolo Bypass	Similar conditions in Yolo Bypass. No mitigation needed.	No change. No mitigation needed.	Similar or improved conditions in Yolo Bypass. No mitigation needed.	Similar conditions in Yolo Bypass. No mitigation needed.	Similar conditions in Yolo Bypass. No mitigation needed.
Terrestrial Resources in Western Delta	Increased extent of salt water in the fall months of wet and above normal years in western Delta which could adversely affect terrestrial resources that use freshwater habitat. No mitigation measures identified at this time.	No change. No mitigation needed.	Increased extent of salt water in the fall months of wet and above normal years in western Delta which could adversely affect terrestrial resources that use freshwater habitat. No mitigation measures identified at this time.	Increased extent of salt water in the fall months of wet and above normal years in western Delta which could adversely affect terrestrial resources that use freshwater habitat. No mitigation measures identified at this time.	Similar habitat in western Delta. No mitigation needed.
<b>Geology and Soils Resources</b>					
Geology and Soils Resources	Similar conditions. No mitigation needed.	No change. No mitigation needed.	Similar conditions. No mitigation needed.	Similar conditions. No mitigation needed.	Similar conditions. No mitigation needed.
<b>Agricultural Resources</b>					
Agricultural Production and Employment	Similar conditions. No mitigation needed.	No change. No mitigation needed.	Similar conditions. No mitigation needed.	Similar conditions. No mitigation needed.	Similar conditions. No mitigation needed.
<b>Land Use</b>					
Municipal and Industrial Land Use	Similar conditions. No mitigation needed.	No change. No mitigation needed.	Similar conditions. No mitigation needed.	Similar conditions. No mitigation needed.	Similar conditions. No mitigation needed.
<b>Visual Resources</b>					
Visual Resources of Land Irrigated with CVP and SWP Water	Similar conditions. No mitigation needed.	No change. No mitigation needed.	Similar conditions. No mitigation needed.	Similar conditions. No mitigation needed.	Similar conditions. No mitigation needed.
Visual Resources at Reservoirs that Store CVP and SWP Water	Similar or improved conditions. No mitigation needed.	No change. No mitigation needed.	Similar or improved conditions. No mitigation needed.	Similar or improved conditions. No mitigation needed.	Similar conditions. No mitigation needed.

	<b>Alternative 1 Compared to the No Action Alternative</b>	<b>Alternative 2 Compared to the No Action Alternative</b>	<b>Alternative 3 Compared to the No Action Alternative</b>	<b>Alternative 4 Compared to the No Action Alternative</b>	<b>Alternative 5 Compared to the No Action Alternative</b>
<b>Recreation Resources</b>					
Recreation Resources at Reservoirs that Store CVP and SWP Water	Similar or improved conditions. No mitigation needed.	No change. No mitigation needed.	Similar or improved conditions. No mitigation needed.	Similar or improved conditions. No mitigation needed.	Similar conditions. No mitigation needed.
Recreation Resources in Rivers downstream of CVP and SWP Reservoirs	Similar or improved conditions. No mitigation needed.	No change. No mitigation needed.	Similar or improved conditions. Reduced opportunities for Striped Bass and sport ocean salmon fishing. No mitigation measures identified at this time.	Similar or improved conditions. Reduced opportunities for Striped Bass and sport ocean salmon fishing. No mitigation measures identified at this time.	Similar conditions. No mitigation needed.
<b>Air Quality and Greenhouse Gas Emissions</b>					
Emissions of Criteria Air Pollutants and Precursors and/or Exposure of Sensitive Receptors to Substantial Concentrations of Air Contaminants from Diesel Engines at Groundwater Wells	Similar air quality conditions in the Trinity River Region and Sacramento Valley. Improved air quality conditions in the San Joaquin Valley and the San Francisco Bay Area, Central Coast, and Southern California regions. No mitigation needed.	No change. No mitigation needed.	Similar air quality conditions in the Trinity River Region and Sacramento Valley. Reduced air quality conditions in the San Joaquin Valley and the San Francisco Bay Area, Central Coast, and Southern California regions. No mitigation needed.	Similar air quality conditions in the Trinity River Region and Sacramento Valley. Improved air quality conditions in the San Joaquin Valley and the San Francisco Bay Area, Central Coast, and Southern California regions. No mitigation needed.	Similar air quality conditions in the Trinity River Region and Sacramento Valley. Similar air quality conditions in the San Joaquin Valley and the San Francisco Bay Area, Central Coast, and Southern California regions. No mitigation needed.

Chapter 3: Description of Alternatives

	<b>Alternative 1 Compared to the No Action Alternative</b>	<b>Alternative 2 Compared to the No Action Alternative</b>	<b>Alternative 3 Compared to the No Action Alternative</b>	<b>Alternative 4 Compared to the No Action Alternative</b>	<b>Alternative 5 Compared to the No Action Alternative</b>
Increased Greenhouse Gas Emissions (GHG) due to Changes in Energy Resources Related to CVP and SWP Water Use	Overall changes are not known at this time due to complexity of energy demands associated with alternative water supplies. However, GHG emissions could increase in the San Francisco Bay Area, Central Coast, and Southern California regions.	No change.	Overall changes are not known at this time due to complexity of energy demands associated with alternative water supplies. However, GHG emissions could increase in the San Francisco Bay Area, Central Coast, and Southern California regions.	Overall changes are not known at this time due to complexity of energy demands associated with alternative water supplies. However, GHG emissions could increase in the San Francisco Bay Area, Central Coast, and Southern California regions.	Overall changes are not known at this time due to complexity of energy demands associated with alternative water supplies. However, GHG emissions could increase in the San Francisco Bay Area, Central Coast, and Southern California regions.
<b>Cultural Resources</b>					
Potential for Disturbance of Cultural Resources	Similar conditions. No mitigation needed.	No change. No mitigation needed.	Similar conditions. No mitigation needed.	Similar conditions. No mitigation needed.	Similar conditions. No mitigation needed.
<b>Public Health</b>					
Water Supply Availability for Wildland Firefighting	Similar conditions. No mitigation needed.	No change. No mitigation needed.	Similar conditions. No mitigation needed.	Similar conditions. No mitigation needed.	Similar conditions. No mitigation needed.
Potential Exposure to Mercury in Fish in Delta	Similar or reduced concentrations. No mitigation needed.	No change. No mitigation needed.	Similar or reduced concentrations. No mitigation needed.	Similar or reduced concentrations. No mitigation needed.	Similar concentrations. No mitigation needed.
<b>Socioeconomics</b>					
Agricultural and Municipal and Industrial Employment	Similar conditions. No mitigation needed.	No change. No mitigation needed.	Similar conditions. No mitigation needed.	Similar conditions. No mitigation needed.	Similar conditions. No mitigation needed.
Municipal and Industrial Water Supply Operating Expenses	Similar conditions. No mitigation needed.	No change. No mitigation needed.	Similar conditions. No mitigation needed.	Similar conditions. No mitigation needed.	Similar conditions. No mitigation needed.
Recreational Economics CVP and SWP Reservoirs	Similar or improved conditions. No mitigation needed.	No change. No mitigation needed.	Similar or improved conditions. No mitigation needed.	Similar or improved conditions. No mitigation needed.	Similar or improved conditions. No mitigation needed.

	<b>Alternative 1 Compared to the No Action Alternative</b>	<b>Alternative 2 Compared to the No Action Alternative</b>	<b>Alternative 3 Compared to the No Action Alternative</b>	<b>Alternative 4 Compared to the No Action Alternative</b>	<b>Alternative 5 Compared to the No Action Alternative</b>
Recreational Economics Related to Striped Bass Fishing in Delta	Similar conditions. No mitigation needed.	No change. No mitigation needed.	Reduced recreational opportunities and associated economics. No mitigation identified at this time.	Reduced recreational opportunities and associated economics. No mitigation identified at this time.	Similar conditions. No mitigation needed.
Commercial and Sport Ocean Salmon Fishing	Similar conditions. No mitigation needed.	No change. No mitigation needed.	Reduced commercial and sport ocean salmon fishing and associated economics. No mitigation identified at this time.	Reduced commercial and sport ocean salmon fishing and associated economics. No mitigation identified at this time.	Similar conditions. No mitigation needed.
<b>Indian Trust Assets</b>					
Potential for Disturbance of Indian Trust Assets	No change. No mitigation needed.	No change. No mitigation needed.	No change. No mitigation needed.	No change. No mitigation needed.	No change. No mitigation needed.
<b>Environmental Justice</b>					
Emissions of Criteria Air Pollutants and Precursors and/or Exposure of Sensitive Receptors to Substantial Concentrations of Air Contaminants from Diesel Engines at Groundwater Wells	Improved air quality conditions. No mitigation needed.	No change. No mitigation needed.	Reduced air quality conditions. No mitigation needed.	Improved air quality conditions. No mitigation needed.	Similar air quality conditions. No mitigation needed.
Potential Exposure to Mercury in Fish in Delta	Similar or reduced concentrations. No mitigation needed.	No change. No mitigation needed.	Similar or reduced concentrations. No mitigation needed.	Similar or reduced concentrations. No mitigation needed.	Similar concentrations. No mitigation needed.

1 **Table 3.7 Comparison of No Action Alternative and Alternatives 1 through 5 to Second Basis of Comparison**

	<b>No Action Alternative Compared to Second Basis of Comparison</b>	<b>Alternative 1 Compared to the Second Basis of Comparison</b>	<b>Alternative 2 Compared to the Second Basis of Comparison</b>	<b>Alternative 3 Compared to the Second Basis of Comparison</b>	<b>Alternative 4 Compared to the Second Basis of Comparison</b>	<b>Alternative 5 Compared to the Second Basis of Comparison</b>
<b>SURFACE WATER CONDITIONS</b>						
Trinity Lake	Water surface elevations similar Storage would be similar in most months, except reduced in November-December in above normal years (up to 6%) and all months in critical dry years (up to 10%).	No change.	Water surface elevations similar Storage would be similar in most months, except reduced in November-December in above normal years (up to 6%) and all months in critical dry years (up to 10%).	Water surface elevations similar Storage similar or increased.	No change.	Water surface elevations similar Storage would be similar in most months, except reduced in all months in critical dry years (up to 10%).
Trinity River at Lewiston Dam	Flows similar or increased except reduced in December-February in wet to below normal years (up to 30%).	No change.	Flows similar or increased except reduced in December-February in wet to below normal years (up to 30%).	Flows similar or increased.	No change.	Flows similar or increased except reduced in December-February in wet to below normal years (up to 21%).
Shasta Lake	Water surface elevations similar Storage reduced in September-February in wet to dry years (up to 11%) and in all months in critical dry years (up to 14%).	No change.	Water surface elevations similar Storage reduced in September-February in wet to dry years (up to 11%) and in all months in critical dry years (up to 14%).	Water surface elevations similar Storage similar or increased.	No change.	Water surface elevations similar Storage reduced in September-February in most months of wet to dry years (up to 10%), and in all months in critical dry years (up to 17%).

	<b>No Action Alternative Compared to Second Basis of Comparison</b>	<b>Alternative 1 Compared to the Second Basis of Comparison</b>	<b>Alternative 2 Compared to the Second Basis of Comparison</b>	<b>Alternative 3 Compared to the Second Basis of Comparison</b>	<b>Alternative 4 Compared to the Second Basis of Comparison</b>	<b>Alternative 5 Compared to the Second Basis of Comparison</b>
Sacramento River at Keswick Dam	Flows reduced (up to 21%) except September and November.	No change.	Flows reduced (up to 21%) except September and November.	Flows similar or increased except reduced in August in below normal years (up to 6%).	No change.	Flows reduced (up to 16%) except September and November.
Sacramento River at Freeport	Flows similar or increased except reduced in May and June (up to 27%).	No change.	Flows similar or increased except reduced in May and June (up to 27%).	Flows similar or increased except reduced in June in below normal years (up to 13%).	No change.	Flows similar or increased except reduced in May and June (up to 28%).
Clear Creek near Igo	Flows similar or increased.	No change.	Flows similar or increased.	No change.	No change.	Flows similar or increased.
Lake Oroville	Water surface elevations similar. Similar in most months May-July in wet to dry years and in all months in critical dry years. Reduced in many months from September-February in all year types (up to 18%).	No change.	Water surface elevations similar. Similar in most months May-July in wet to dry years and in all months in critical dry years. Reduced in many months from September-February in all year types (up to 18%).	Water surface elevations similar. Storage similar.	No change.	Water surface elevations similar. Similar in most months May-July in wet to dry years and in all months in critical dry years. Reduced in many months from September-February in all year types (up to 18%).
Feather River downstream of Thermalito Complex	Flows similar or increased except reduced in August-June (up to 52%).	No change.	Flows similar or increased except reduced in August-June (up to 52%).	Flows similar or increased except reduced in August-June (up to 28%).	No change.	Flows similar or increased except reduced in August-June (up to 58%).

Chapter 3: Description of Alternatives

	<b>No Action Alternative Compared to Second Basis of Comparison</b>	<b>Alternative 1 Compared to the Second Basis of Comparison</b>	<b>Alternative 2 Compared to the Second Basis of Comparison</b>	<b>Alternative 3 Compared to the Second Basis of Comparison</b>	<b>Alternative 4 Compared to the Second Basis of Comparison</b>	<b>Alternative 5 Compared to the Second Basis of Comparison</b>
Folsom Lake	Water surface elevations similar Storage similar in many months except reduced flows in September-January (up to 12%) in wet to below normal years and July-September in critical dry years (up to 11%).	No change.	Water surface elevations similar Storage similar in many months except reduced flows in September-January (up to 12%) in wet to below normal years and July-September in critical dry years (up to 11%).	Water surface elevations similar Storage similar.	No change.	Water surface elevations similar Storage similar in many months except reduced flows in August-January (up to 13%) in wet to below normal years and July in critical dry years (8%).
American River at Nimbus Dam	Flows similar or increased except reduced in June-August, December, February, and April (up to 25%).	No change.	Flows similar or increased except reduced in June-August, December, February, and April (up to 25%).	Flows similar or increased except reduced flows in June-August and April (up to 17%).	No change.	Flows similar or increased except reduced in December-February, April, June, and August (up to 25%).
New Melones Reservoir	Water surface elevations similar Storage similar in wet, below normal, and dry years, and in most months in above normal and critical dry years. Storage reduced in October in above normal water years (6%) and in October-January and April-June in critical dry years (up to 7%).	No change.	Water surface elevations similar Storage similar in wet, below normal, and dry years, and in most months in above normal and critical dry years. Storage reduced in October in above normal water years (6%) and in October-January and April-June in critical dry years (up to 7%).	Water surface elevations similar Storage similar or increased.	No change.	Water surface elevations similar Storage reduced in all months in all water year types (up to 23%).

	<b>No Action Alternative Compared to Second Basis of Comparison</b>	<b>Alternative 1 Compared to the Second Basis of Comparison</b>	<b>Alternative 2 Compared to the Second Basis of Comparison</b>	<b>Alternative 3 Compared to the Second Basis of Comparison</b>	<b>Alternative 4 Compared to the Second Basis of Comparison</b>	<b>Alternative 5 Compared to the Second Basis of Comparison</b>
Stanislaus River at Goodwin Dam	Flows similar or increased except reduced in November-March and May-June (up to 25%).	No change.	Flows similar or increased except reduced in November-March and May-June (up to 25%).	Flows reduced in all months (up to 79%) except April and August.	No change.	Flows reduced in all months (up to 25%) except October, April, and May.
San Joaquin River at Vernalis	Flows similar or increased except reduced in November and May-June (up to 9%).	No change.	Flows similar or increased except reduced in November and May-June (up to 9%).	Flows similar or increased except reduced in May-June (up to 27%).	No change.	Flows similar or increased except reduced in November and June (up to 10%).
San Luis Reservoir	Water surface elevations reduced in all months in wet to below normal water years and in February-September in dry and critical dry years (up to 16%). Storage reduced in October-June in most water years (up to 71%).	No change.	Water surface elevations reduced in all months in wet to below normal water years and in February-September in dry and critical dry years (up to 16%). Storage reduced in October-June in most water years (up to 71%).	Water surface elevations similar except reduced in January-February in above normal years (up to 6%) and February-August in critical dry years (up to 7%). Storage similar or increased in some months except in December-February and June in wet years (up to 16%), October-July in above normal and below normal years (up to 40%), January-September in dry years (up to 19%), and October-August in critical dry years (up to 29%).	No change.	Water surface elevations reduced in all months in all year types (up to 70%). Storage would be reduced in October-August in wet to below normal years (up to 17%), in January-September in dry years (up to 14%), and in all months in critical dry years (up to 14%).

	<b>No Action Alternative Compared to Second Basis of Comparison</b>	<b>Alternative 1 Compared to the Second Basis of Comparison</b>	<b>Alternative 2 Compared to the Second Basis of Comparison</b>	<b>Alternative 3 Compared to the Second Basis of Comparison</b>	<b>Alternative 4 Compared to the Second Basis of Comparison</b>	<b>Alternative 5 Compared to the Second Basis of Comparison</b>
Flows into Yolo Bypass	Flows similar or increased except reduced in November-December in wet years (up to 15%), January-March in above normal years (14%), December-March in below normal years (up to 25%), and December in dry years (6%).	No change.	Flows similar or increased except reduced in November-December in wet years (up to 15%), January-March in above normal years (14%), December-March in below normal years (up to 25%), and December in dry years (6%).	Flows similar except reduced in October of wet years (6%).	No change.	Flows similar or increased except reduced in November-January in wet years (up to 15%), January-March in above normal years (15%), December-March in below normal years (up to 24%), and December in dry years (7%).
Delta Outflow	Flows similar or increased in many months. Reduced flows in some months, including in December, February-March, and June in wet years (up to 1,590 cfs).	No change.	Flows similar or increased in many months. Reduced flows in some months, including in December, February-March, and June in wet years (up to 1,590 cfs).	Flows would increase in many months. Reduced flows in some months, including October and March-June in wet years (up to 1,127 cfs), and October and May-June in dry years (up to 373 cfs).	No change.	Flows similar or increased in many months. Reduced flows in some months, including in December, February-March, and June in wet years (up to 1,713 cfs), and June in dry years (526 cfs).
Reverse Flows in Old and Middle Rivers	Increased positive flows except in June-August in most years and March in wet years.	No change.	Increased positive flows except in June-August in most years and March in wet years.	Increased negative flows in June-August in most years and March in wet years.	No change.	Increased negative flows in July-August in most years and March and June in wet years.

	<b>No Action Alternative Compared to Second Basis of Comparison</b>	<b>Alternative 1 Compared to the Second Basis of Comparison</b>	<b>Alternative 2 Compared to the Second Basis of Comparison</b>	<b>Alternative 3 Compared to the Second Basis of Comparison</b>	<b>Alternative 4 Compared to the Second Basis of Comparison</b>	<b>Alternative 5 Compared to the Second Basis of Comparison</b>
<b>Water Supplies</b>						
Non-CVP and Non-SWP Deliveries	Deliveries similar.	Deliveries similar.	Deliveries similar.	Deliveries similar.	Deliveries similar.	Deliveries similar.
North of Delta CVP Water Deliveries: Agricultural Water Contractors	Deliveries reduced up to 16% over the long-term to 34% in critical dry years.	No change.	Deliveries reduced up to 16% over the long-term to 34% in critical dry years.	Deliveries similar over the long-term. Reduced up to 9% in dry years to 11% in critical dry years.	No change.	Deliveries reduced up to 16% over the long-term to 31% in critical dry years.
North of Delta CVP Water Deliveries: Municipal and Industrial Water Contractors	Deliveries similar.	No change.	Deliveries similar.	Deliveries similar.	No change.	Deliveries similar.
South of Delta CVP Water Deliveries: Agricultural Water Contractors	Deliveries reduced up to 23% over the long-term to 33% in critical dry years.	No change.	Deliveries reduced up to 23% over the long-term to 33% in critical dry years.	Deliveries similar over the long-term. Reduced up to 8% in dry years to 14% in critical dry years.	No change.	Deliveries reduced up to 24% over the long-term to 33% in critical dry years.
South of Delta CVP Water Deliveries: Municipal and Industrial Water Contractors	Deliveries reduced up to 10% over the long-term to 5% in critical dry years.	No change.	Deliveries reduced up to 10% over the long-term to 5% in critical dry years.	Deliveries similar.	No change.	Deliveries reduced up to 10% over the long-term to 8% in critical dry years.
CVP Water Deliveries: Eastside Division Contractors	Deliveries reduced up to 19% in critical dry years.	No change.	Deliveries reduced up to 19% in critical dry years.	Deliveries similar.	No change.	Deliveries reduced up to 19% in critical dry years.
North of Delta: SWP Water Deliveries under Table A without Article 21 water	Deliveries reduced up to 13% over the long-term to 20% in critical dry years.	No change.	Deliveries reduced up to 13% over the long-term to 20% in critical dry years.	Deliveries similar over the long-term and in dry years. Reduced by 10% in critical dry years.	No change.	Deliveries reduced up to 19% over the long-term to 21% in critical dry years.

Chapter 3: Description of Alternatives

	<b>No Action Alternative Compared to Second Basis of Comparison</b>	<b>Alternative 1 Compared to the Second Basis of Comparison</b>	<b>Alternative 2 Compared to the Second Basis of Comparison</b>	<b>Alternative 3 Compared to the Second Basis of Comparison</b>	<b>Alternative 4 Compared to the Second Basis of Comparison</b>	<b>Alternative 5 Compared to the Second Basis of Comparison</b>
North of Delta: SWP Water Deliveries under Table A without Article 21 water	Deliveries reduced up to 18% over the long-term to 22% in critical dry years.	No change.	Deliveries reduced up to 18% over the long-term to 22% in critical dry years.	Deliveries similar over the long-term and in dry years. Reduced by 11% in critical dry years.	No change.	Deliveries reduced up to 19% over the long-term to 23% in critical dry years.
<b>Surface Water Quality</b>						
Salinity in Northern Delta (near Emmaton)	Salinity increased in June in wet to dry years (up to 21%). Reduced in fall and winter months in wet and above normal years (up to 79%).	No change.	Salinity increased in June in wet to dry years (up to 21%). Reduced in fall and winter months in wet and above normal years (up to 79%).	Salinity increased in June in wet to dry years (up to 35%). Reduced in fall and winter months in wet and above normal years (up to 24%).	No change.	Salinity increased in June in wet to dry years (up to 21%). Reduced in fall and winter months in wet and above normal years (up to 79%).
Salinity in Western Delta (near Port Chicago)	Salinity reduced in September-May (up to 49%).	No change.	Salinity reduced in September-May (up to 49%).	Salinity increased in June in wet to below normal years (up to 9%). Reduced in January-March (up to 25%).	No change.	Salinity reduced in September-May (up to 49%).
Salinity in Western Central Delta (near Antioch)	Salinity increased in June in wet to below normal years (up to 16%). Reduced in fall and winter months (up to 73%).	No change.	Salinity increased in June in wet to below normal years (up to 16%). Reduced in fall and winter months (up to 73%).	Salinity increased in May in wet years and June in wet to dry years (up to 20%). Reduced in January-April (up to 40%).	No change.	Salinity increased in June in wet to below normal years (up to 14%). Reduced in fall and winter months (up to 73%).

	<b>No Action Alternative Compared to Second Basis of Comparison</b>	<b>Alternative 1 Compared to the Second Basis of Comparison</b>	<b>Alternative 2 Compared to the Second Basis of Comparison</b>	<b>Alternative 3 Compared to the Second Basis of Comparison</b>	<b>Alternative 4 Compared to the Second Basis of Comparison</b>	<b>Alternative 5 Compared to the Second Basis of Comparison</b>
Salinity in Western Central Delta (near Contra Costa Water District Intakes)	Salinity increased in March-June (up to 47%). Reduced in October-January and September (up to 42%).	No change.	Salinity increased in March-June (up to 47%). Reduced in October-January and September (up to 42%).	Salinity increased in March-April in dry and critical dry years (up to 16%). Reduced in December-February in dry and critical dry years (up to 23%).	No change.	Salinity increased in March-June (up to 63%). Reduced in October-January and September (up to 41%).
Salinity in Southern Delta (near CVP and SWP intakes)	Salinity increased in February-June (up to 23%). Reduced in October-January (up to 28%).	No change.	Salinity increased in February-June (up to 23%). Reduced in October-January (up to 28%).	Salinity increased in February-May in dry and critical dry years (up to 23%).	No change.	Salinity increased in February-June (up to 26%). Reduced in October-January (up to 28%).
Mercury in Delta Fish	Mercury concentrations increased near Rock Slough, San Joaquin River at Antioch, and Montezuma Slough (up to 7%).	No change.	Mercury concentrations increased near Rock Slough, San Joaquin River at Antioch, and Montezuma Slough (up to 7%).	Similar conditions.	No change.	Mercury concentrations increased near Rock Slough, San Joaquin River at Antioch, and Montezuma Slough (up to 7%).
Selenium in Delta and Delta Fish	Selenium concentrations similar concentrations.	No change.	Selenium concentrations similar concentrations.	Selenium concentrations similar concentrations.	No change.	Selenium concentrations similar concentrations.
<b>Groundwater Resources</b>						
Trinity River Region	Similar groundwater conditions.	No change.	Similar groundwater conditions.	Similar groundwater conditions.	No change.	Similar groundwater conditions.

Chapter 3: Description of Alternatives

	<b>No Action Alternative Compared to Second Basis of Comparison</b>	<b>Alternative 1 Compared to the Second Basis of Comparison</b>	<b>Alternative 2 Compared to the Second Basis of Comparison</b>	<b>Alternative 3 Compared to the Second Basis of Comparison</b>	<b>Alternative 4 Compared to the Second Basis of Comparison</b>	<b>Alternative 5 Compared to the Second Basis of Comparison</b>
Central Valley Region: Sacramento Valley	Similar groundwater conditions.	No change.	Similar groundwater conditions.	Similar groundwater conditions.	No change.	Similar groundwater conditions.
Central Valley Region: San Joaquin Valley	Increased groundwater pumping (8%); and lower groundwater elevations (2-200 feet).  Potentially reduced groundwater quality.  Increased subsidence potential.	No change.	Increased groundwater pumping (8%); and lower groundwater elevations (2-200 feet).  Potentially reduced groundwater quality.  Increased subsidence potential.	Similar groundwater pumping; and similar to lower groundwater elevations (2-25 feet).  Similar groundwater quality.  Similar subsidence potential.	No change.	Increased groundwater pumping (8%); and lower groundwater elevations (2-200 feet).  Potentially reduced groundwater quality.  Increased subsidence potential.
San Francisco Bay Area, Central Coast, and Southern California Region	Potentially increased groundwater pumping; and potentially lower groundwater elevations.  Potentially reduced groundwater quality.  Increased subsidence potential.	No change.	Potentially increased groundwater pumping; and potentially lower groundwater elevations.  Potentially reduced groundwater quality.  Increased subsidence potential.	Potentially increased groundwater pumping; and potentially lower groundwater elevations.  Potentially reduced groundwater quality.  Increased subsidence potential.	No change.	Potentially increased groundwater pumping; and potentially lower groundwater elevations.  Potentially reduced groundwater quality.  Increased subsidence potential.

	<b>No Action Alternative Compared to Second Basis of Comparison</b>	<b>Alternative 1 Compared to the Second Basis of Comparison</b>	<b>Alternative 2 Compared to the Second Basis of Comparison</b>	<b>Alternative 3 Compared to the Second Basis of Comparison</b>	<b>Alternative 4 Compared to the Second Basis of Comparison</b>	<b>Alternative 5 Compared to the Second Basis of Comparison</b>
<b>CVP and SWP Energy Resources</b>						
Energy Generated and Used by CVP and SWP Water Users	Similar CVP net generation. Increased net generation over the long-term (29%). Potentially increased energy use by CVP and SWP water users.	No change.	Similar CVP net generation. Increased net generation over the long-term (29%). Potentially increased energy use by CVP and SWP water users.	Similar CVP net generation. Increased net generation over the long-term (10%). Potentially increased energy use by CVP and SWP water users.	No change.	Similar CVP net generation. Increased net generation over the long-term (30%). Potentially increased energy use by CVP and SWP water users.
<b>Aquatic Resources</b>						
Trinity River: Coho Salmon	Similar conditions.	No change.	Similar conditions.	Similar conditions.	No change.	Similar conditions.
Trinity River: Spring-run Chinook Salmon	Similar conditions.	No change.	Similar conditions.	Similar conditions.	No change.	Similar conditions.
Trinity River: Fall-run Chinook Salmon	Similar conditions.	No change.	Similar conditions.	Similar conditions.	No change.	Similar conditions.
Trinity River: Steelhead	Similar conditions.	No change.	Similar conditions.	Similar conditions.	No change.	Similar conditions.
Trinity River: Green Sturgeon	Similar conditions.	No change.	Similar conditions.	Similar conditions.	No change.	Similar conditions.
Trinity Lake and Lewiston Reservoir: Reservoir Fish	Similar conditions.	No change.	Similar conditions.	Similar conditions.	No change.	Similar conditions.
Trinity River: Pacific Lamprey	Similar conditions.	No change.	Similar conditions.	Similar conditions.	No change.	Similar conditions.
Trinity River: Eulachon	Similar conditions.	No change.	Similar conditions.	Similar conditions.	No change.	Similar conditions.

Chapter 3: Description of Alternatives

	<b>No Action Alternative Compared to Second Basis of Comparison</b>	<b>Alternative 1 Compared to the Second Basis of Comparison</b>	<b>Alternative 2 Compared to the Second Basis of Comparison</b>	<b>Alternative 3 Compared to the Second Basis of Comparison</b>	<b>Alternative 4 Compared to the Second Basis of Comparison</b>	<b>Alternative 5 Compared to the Second Basis of Comparison</b>
Sacramento River System: Winter-run Chinook Salmon	Improved habitat conditions due to fish passage at dams and other actions to address high water temperatures caused by climate change by 2030.	No change.	Similar conditions.	Improved habitat conditions due to improved escapement potential and predator controls.	Similar conditions.	Improved habitat conditions due to fish passage at dams and other actions to address high water temperatures caused by climate change by 2030.
Sacramento River System: Spring-run Chinook Salmon	Improved habitat conditions due to fish passage at dams and other actions to address high water temperatures caused by climate change by 2030.	No change.	Similar conditions.	Improved habitat conditions due to harvest limitations and predator controls.	Similar conditions.	Improved habitat conditions due to fish passage at dams and other actions to address high water temperatures caused by climate change by 2030.
Sacramento River System: Fall-run Chinook Salmon	Similar conditions.	No change.	Similar conditions.	Similar conditions.	Similar conditions.	Similar conditions.
Sacramento River System: Late Fall-run Chinook Salmon	Improved habitat conditions due to measures to increase efficiency of fish handling facilities at Banks and Jones pumping plants.	No change.	Similar conditions.	Similar conditions.	Similar conditions.	Improved habitat conditions due to measures to increase efficiency of fish handling facilities at Banks and Jones pumping plants.

	<b>No Action Alternative Compared to Second Basis of Comparison</b>	<b>Alternative 1 Compared to the Second Basis of Comparison</b>	<b>Alternative 2 Compared to the Second Basis of Comparison</b>	<b>Alternative 3 Compared to the Second Basis of Comparison</b>	<b>Alternative 4 Compared to the Second Basis of Comparison</b>	<b>Alternative 5 Compared to the Second Basis of Comparison</b>
Sacramento River System: Steelhead	Improved habitat conditions due to fish passage programs to address high water temperatures caused by climate change by 2030; and measures to increase efficiency of fish handling facilities at Banks and Jones pumping plants.	No change.	Similar conditions.	Similar conditions.	Similar conditions.	Improved habitat conditions due to fish passage programs to address high water temperatures caused by climate change by 2030; and measures to increase efficiency of fish handling facilities at Banks and Jones pumping plants.
Sacramento River System: Green Sturgeon and White Sturgeon	Reduced habitat conditions due to lack of measures to address high water temperatures caused by climate change by 2030 that are not improved by other actions.	No change.	Similar conditions.	Improved habitat conditions due to lower water temperatures.	No change.	Reduced habitat conditions due to lack of measures to address high water temperatures caused by climate change by 2030 that are not improved by other actions.
Delta: Delta Smelt	Improved habitat conditions due to reduced potential for entrainment during larval and juvenile stages, and reduced salinity in the fall in the western Delta.	No change.	Similar conditions.	Similar conditions.	No change.	Improved habitat conditions due to reduced potential for entrainment during larval and juvenile stages, and reduced salinity in the fall in the western Delta.

Chapter 3: Description of Alternatives

	<b>No Action Alternative Compared to Second Basis of Comparison</b>	<b>Alternative 1 Compared to the Second Basis of Comparison</b>	<b>Alternative 2 Compared to the Second Basis of Comparison</b>	<b>Alternative 3 Compared to the Second Basis of Comparison</b>	<b>Alternative 4 Compared to the Second Basis of Comparison</b>	<b>Alternative 5 Compared to the Second Basis of Comparison</b>
Delta: Longfin Smelt	Improved habitat conditions due to more positive Old and Middle River flows and other factors (as indicated by higher Longfin Smelt abundance indices).	No change.	Similar conditions.	Similar conditions.	No change.	Improved habitat conditions due to more positive Old and Middle River flows and other factors (as indicated by higher Longfin Smelt abundance indices).
Delta: Sacramento Splittail	Similar conditions.	No change.	Similar conditions.	Similar conditions.	No change.	Similar conditions.
Sacramento River System: Reservoir Fish	Similar conditions.	No change.	Similar conditions.	Similar conditions.	No change.	Similar conditions.
Sacramento River System: Pacific Lamprey	Similar conditions.	No change.	Similar conditions.	Similar conditions.	No change.	Similar conditions.
Sacramento River System: Striped Bass, American Shad, and Hardhead	Similar conditions for Hardhead. Improved habitat conditions for Striped Bass and American Shad due to improved survival in larval and juvenile stages and reduced salinity in the spring in the western Delta.	No change.	Similar conditions.	Similar habitat conditions for Hardhead, Striped Bass, and American Shad. Adverse conditions for Striped Bass due to changes in harvest limitations.	No change in habitat conditions for Hardhead, Striped Bass, and American Shad. Adverse conditions for Striped Bass due to changes in harvest limitations.	Similar conditions for Hardhead. Improved habitat conditions for Striped Bass and American Shad due to improved survival in larval and juvenile stages and reduced salinity in the spring in the western Delta.

	<b>No Action Alternative Compared to Second Basis of Comparison</b>	<b>Alternative 1 Compared to the Second Basis of Comparison</b>	<b>Alternative 2 Compared to the Second Basis of Comparison</b>	<b>Alternative 3 Compared to the Second Basis of Comparison</b>	<b>Alternative 4 Compared to the Second Basis of Comparison</b>	<b>Alternative 5 Compared to the Second Basis of Comparison</b>
Stanislaus River: Fall-run Chinook Salmon	Similar or improved conditions.	No change.	Similar conditions.	Potential improved habitat conditions due to predator controls, trap and haul operations, and harvest restrictions; however, the effectiveness of these measures is uncertain.	Potential improved habitat conditions due to predator controls, trap and haul operations, and harvest restrictions; however, the effectiveness of these measures is uncertain.	Similar or improved conditions.
Stanislaus River: Steelhead	Improved habitat conditions due to measures to address high water temperatures caused by climate change by 2030; and measures to increase efficiency of fish handling facilities at Banks and Jones pumping plants.	No change.	Similar conditions.	Potential improved habitat conditions due to predator controls and trap and haul operations; however, the effectiveness of these measures is uncertain.	Potential improved habitat conditions due to predator controls and trap and haul operations; however, the effectiveness of these measures is uncertain.	Improved habitat conditions due to measures to address high water temperatures caused by climate change by 2030; and measures to increase efficiency of fish handling facilities at Banks and Jones pumping plants.
Stanislaus River: White Sturgeon	Conditions may be similar; however, improved conditions could occur due to lower water temperatures.	No change.	Similar conditions.	Similar conditions.	No change.	Conditions may be similar; however, improved conditions could occur due to lower water temperatures.
New Melones Reservoir; Reservoir Fish	Similar conditions.	No change.	Similar conditions.	Improved conditions for black bass nest survival.	No change.	Similar conditions.

Chapter 3: Description of Alternatives

	<b>No Action Alternative Compared to Second Basis of Comparison</b>	<b>Alternative 1 Compared to the Second Basis of Comparison</b>	<b>Alternative 2 Compared to the Second Basis of Comparison</b>	<b>Alternative 3 Compared to the Second Basis of Comparison</b>	<b>Alternative 4 Compared to the Second Basis of Comparison</b>	<b>Alternative 5 Compared to the Second Basis of Comparison</b>
Stanislaus River: Other Fish	Similar conditions.	No change.	Similar conditions.	Similar conditions for lamprey and Hardhead. Adverse conditions for Striped Bass due to changes in harvest limitations.	Similar conditions for lamprey and Hardhead. Adverse conditions for Striped Bass due to changes in harvest limitations.	Similar conditions.
Pacific Ocean: Killer Whale	Similar conditions.	No change.	Similar conditions.	Similar conditions.	No change.	Similar conditions.
<b>Terrestrial Resources</b>						
Terrestrial Resources along Shoreline of CVP and SWP Reservoirs	Similar conditions.	No change.	Similar conditions.	Similar conditions.	No change.	Similar conditions.
Terrestrial Resources along Rivers Downstream of CVP and SWP Reservoirs	Similar or improved conditions along Trinity, Sacramento, American, and Stanislaus rivers. Reduced conditions along Feather River. No mitigation measures identified at this time for changes along Feather River.	No change.	Similar or improved conditions along Trinity, Sacramento, American, and Stanislaus rivers. Reduced conditions along Feather River. No mitigation measures identified at this time for changes along Feather River.	Similar or improved conditions along Trinity, Sacramento, Feather, and American rivers. Reduced conditions along Stanislaus River. No mitigation measures identified at this time for changes along Stanislaus River.	No change.	Similar or improved conditions along Trinity, American, and Stanislaus rivers. Reduced conditions along Feather and Sacramento rivers. No mitigation measures identified at this time for changes along Feather and Sacramento rivers.
Terrestrial Resources in Yolo Bypass	Similar conditions in Yolo Bypass.	No change.	Similar conditions in Yolo Bypass.	Similar conditions in Yolo Bypass.	No change.	Similar or reduced conditions in Yolo Bypass.
Terrestrial Resources in Western Delta	Increased extent of freshwater habitat in western Delta.	No change.	Increased extent of freshwater habitat in western Delta.	Similar conditions.	No change.	Increased extent of freshwater habitat in western Delta.

	<b>No Action Alternative Compared to Second Basis of Comparison</b>	<b>Alternative 1 Compared to the Second Basis of Comparison</b>	<b>Alternative 2 Compared to the Second Basis of Comparison</b>	<b>Alternative 3 Compared to the Second Basis of Comparison</b>	<b>Alternative 4 Compared to the Second Basis of Comparison</b>	<b>Alternative 5 Compared to the Second Basis of Comparison</b>
<b>Geology and Soils Resources</b>						
Geology and Soils Resources	Similar conditions.	No change.	Similar conditions.	Similar conditions.	No change.	Similar conditions.
<b>Agricultural Resources</b>						
Agricultural Production and Employment	Similar conditions.	No change.	Similar conditions.	Similar conditions.	No change.	Similar conditions.
<b>Land Use</b>						
Municipal and Industrial Land Use	Similar conditions.	No change.	Similar conditions.	Similar conditions.	No change.	Similar conditions.
<b>Visual Resources</b>						
Visual Resources of Land Irrigated with CVP and SWP Water	Similar conditions.	No change.	Similar conditions.	Similar conditions.	No change.	Similar conditions.

Chapter 3: Description of Alternatives

	<b>No Action Alternative Compared to Second Basis of Comparison</b>	<b>Alternative 1 Compared to the Second Basis of Comparison</b>	<b>Alternative 2 Compared to the Second Basis of Comparison</b>	<b>Alternative 3 Compared to the Second Basis of Comparison</b>	<b>Alternative 4 Compared to the Second Basis of Comparison</b>	<b>Alternative 5 Compared to the Second Basis of Comparison</b>
Visual Resources at Reservoirs that Store CVP and SWP Water	<p>Similar conditions at Trinity Lake, Shasta Lake, Lake Oroville, and New Melones Reservoir.</p> <p>Similar conditions at San Luis Reservoir in above normal to dry years.</p> <p>Reduced conditions at San Luis Reservoir in wet and critical dry years (up to 6%).</p> <p>Potentially reduced conditions in the San Francisco Bay Area, Central Coast, and Southern California regions (up to 18%).</p>	No change.	<p>Similar conditions at Trinity Lake, Shasta Lake, Lake Oroville, and New Melones Reservoir.</p> <p>Similar conditions at San Luis Reservoir in above normal to dry years.</p> <p>Reduced conditions at San Luis Reservoir in wet and critical dry years (up to 6%).</p> <p>Potentially reduced conditions in the San Francisco Bay Area, Central Coast, and Southern California regions (up to 18%).</p>	Similar conditions.	No change.	<p>Similar conditions at Trinity Lake, Shasta Lake, Lake Oroville, and New Melones Reservoir.</p> <p>Similar conditions at San Luis Reservoir in above normal to dry years.</p> <p>Reduced conditions at San Luis Reservoir in wet and critical dry years (up to 9%).</p> <p>Potentially reduced conditions in the San Francisco Bay Area, Central Coast, and Southern California regions (up to 18%).</p>

	<b>No Action Alternative Compared to Second Basis of Comparison</b>	<b>Alternative 1 Compared to the Second Basis of Comparison</b>	<b>Alternative 2 Compared to the Second Basis of Comparison</b>	<b>Alternative 3 Compared to the Second Basis of Comparison</b>	<b>Alternative 4 Compared to the Second Basis of Comparison</b>	<b>Alternative 5 Compared to the Second Basis of Comparison</b>
<b>Recreation Resources</b>						
Recreation Resources at Reservoirs that Store CVP and SWP Water	Similar conditions at Trinity Lake, Shasta Lake, Lake Oroville, and New Melones Reservoir. Similar conditions at San Luis Reservoir in above normal to dry years. Reduced conditions at San Luis Reservoir in wet and critical dry years (up to 6%). Potentially reduced conditions in the San Francisco Bay Area, Central Coast, and Southern California regions (up to 18%).	No change.	Similar conditions at Trinity Lake, Shasta Lake, Lake Oroville, and New Melones Reservoir. Similar conditions at San Luis Reservoir in above normal to dry years. Reduced conditions at San Luis Reservoir in wet and critical dry years (up to 6%). Potentially reduced conditions in the San Francisco Bay Area, Central Coast, and Southern California regions (up to 18%).	Similar conditions.	No change.	Similar conditions at Trinity Lake, Shasta Lake, Lake Oroville, and New Melones Reservoir. Similar conditions at San Luis Reservoir in above normal to dry years. Reduced conditions at San Luis Reservoir in wet and critical dry years (up to 9%). Potentially reduced conditions in the San Francisco Bay Area, Central Coast, and Southern California regions (up to 18%).
Recreation Resources in Rivers downstream of CVP and SWP Reservoirs	Similar or improved conditions; except reduced conditions in June and August along the Feather and American rivers, and in May along the Feather River and Sacramento River near Freeport.	No change.	Similar or improved conditions; except reduced conditions in June and August along the Feather and American rivers, and in May along the Feather River and Sacramento River near Freeport.	Similar or improved conditions along rivers. Reduced opportunities for Striped Bass and sport ocean salmon fishing.	No change along rivers. Reduced opportunities for Striped Bass and sport ocean salmon fishing.	Similar or improved conditions; except reduced conditions in May and June and August along the Sacramento and Feather rivers, in August along the American River; and in June-August along Stanislaus River.

	<b>No Action Alternative Compared to Second Basis of Comparison</b>	<b>Alternative 1 Compared to the Second Basis of Comparison</b>	<b>Alternative 2 Compared to the Second Basis of Comparison</b>	<b>Alternative 3 Compared to the Second Basis of Comparison</b>	<b>Alternative 4 Compared to the Second Basis of Comparison</b>	<b>Alternative 5 Compared to the Second Basis of Comparison</b>
<b>Air Quality and Greenhouse Gas Emissions</b>						
Emissions of Criteria Air Pollutants and Precursors and/or Exposure of Sensitive Receptors to Substantial Concentrations of Air Contaminants from Diesel Engines at Groundwater Wells	Similar air quality conditions in the Trinity River Region and Sacramento Valley.  Potential increase in emissions (up to 18%) in the San Joaquin Valley and the San Francisco Bay Area, Central Coast, and Southern California regions.	No change.	Similar air quality conditions in the Trinity River Region and Sacramento Valley.  Potential increase in emissions (up to 18%) in the San Joaquin Valley and the San Francisco Bay Area, Central Coast, and Southern California regions.	Similar conditions.	No change.	Similar air quality conditions in the Trinity River Region and Sacramento Valley.  Potential increase in emissions (up to 18%) in the San Joaquin Valley and the San Francisco Bay Area, Central Coast, and Southern California regions.
Increased Greenhouse Gas Emissions due to Changes in Energy Resources Related to CVP and SWP Water Use	Overall changes are not known at this time due to complexity of energy demands associated with alternative water supplies. However, GHG emissions could be reduced in the San Francisco Bay Area, Central Coast, and Southern California regions.	No change.	Overall changes are not known at this time due to complexity of energy demands associated with alternative water supplies. However, GHG emissions could be reduced in the San Francisco Bay Area, Central Coast, and Southern California regions.	Overall changes are not known at this time due to complexity of energy demands associated with alternative water supplies. However, GHG emissions could be reduced in the San Francisco Bay Area, Central Coast, and Southern California regions.	No change.	Overall changes are not known at this time due to complexity of energy demands associated with alternative water supplies. However, GHG emissions could be reduced in the San Francisco Bay Area, Central Coast, and Southern California regions.

	<b>No Action Alternative Compared to Second Basis of Comparison</b>	<b>Alternative 1 Compared to the Second Basis of Comparison</b>	<b>Alternative 2 Compared to the Second Basis of Comparison</b>	<b>Alternative 3 Compared to the Second Basis of Comparison</b>	<b>Alternative 4 Compared to the Second Basis of Comparison</b>	<b>Alternative 5 Compared to the Second Basis of Comparison</b>
<b>Cultural Resources</b>						
Potential for Disturbance of Cultural Resources	Similar conditions.	No change.	Similar conditions.	Similar conditions.	No change.	Similar conditions.
<b>Public Health</b>						
Water Supply Availability for Wildland Firefighting	Similar conditions at Trinity Lake, Shasta Lake, Lake Oroville, Folsom Lake, and New Melones Reservoir. Reduced potential at San Luis Reservoir (6%).	No change.	Similar conditions at Trinity Lake, Shasta Lake, Lake Oroville, Folsom Lake, and New Melones Reservoir. Reduced potential at San Luis Reservoir (6%).	Similar conditions.	No change.	Similar conditions at Trinity Lake, Shasta Lake, Lake Oroville, Folsom Lake, and New Melones Reservoir. Reduced potential at San Luis Reservoir (9%).
Potential Exposure to Mercury in Fish in Delta	Increased near Rock Slough, San Joaquin River at Antioch, and Montezuma Slough (up to 7%).	No change.	Increased near Rock Slough, San Joaquin River at Antioch, and Montezuma Slough (up to 7%).	Similar conditions.	No change.	Increased near Rock Slough, San Joaquin River at Antioch, and Montezuma Slough (up to 7%).
<b>Socioeconomics</b>						
Agricultural and Municipal and Industrial Employment	Similar conditions.	No change.	Similar conditions.	Similar conditions.	No change.	Similar conditions.
Municipal and Industrial Water Supply Operating Expenses	Similar conditions.	No change.	Similar conditions.	Similar conditions.	No change.	Similar conditions.

Chapter 3: Description of Alternatives

	<b>No Action Alternative Compared to Second Basis of Comparison</b>	<b>Alternative 1 Compared to the Second Basis of Comparison</b>	<b>Alternative 2 Compared to the Second Basis of Comparison</b>	<b>Alternative 3 Compared to the Second Basis of Comparison</b>	<b>Alternative 4 Compared to the Second Basis of Comparison</b>	<b>Alternative 5 Compared to the Second Basis of Comparison</b>
Recreational Economics CVP and SWP Reservoirs	Similar conditions at Trinity Lake, Shasta Lake, Lake Oroville, Folsom Lake, and New Melones Reservoir. Reduced potential at San Luis Reservoir and reservoirs that store CVP and SWP water in San Francisco Bay Area, Central Coast, and Southern California regions.	No change.	Similar conditions at Trinity Lake, Shasta Lake, Lake Oroville, Folsom Lake, and New Melones Reservoir. Reduced potential at San Luis Reservoir and reservoirs that store CVP and SWP water in San Francisco Bay Area, Central Coast, and Southern California regions.	Similar conditions.	No change.	Similar conditions at Trinity Lake, Shasta Lake, Lake Oroville, Folsom Lake, and New Melones Reservoir. Reduced potential at San Luis Reservoir and reservoirs that store CVP and SWP water in San Francisco Bay Area, Central Coast, and Southern California regions.
Recreational Economics Related to Striped Bass Fishing in Delta	Similar conditions.	No change.	Similar conditions.	Reduced recreational opportunities and associated economics.	Reduced recreational opportunities and associated economics.	Similar conditions.
Commercial and Sport Ocean Salmon Fishing	Similar conditions.	No change.	Similar conditions.	Reduced commercial and sport ocean salmon fishing and associated economics.	Reduced commercial and sport ocean salmon fishing and associated economics.	Similar conditions.
<b>Indian Trust Assets</b>						
Potential for Disturbance of Indian Trust Assets	No change.	No change.	No change.	No change.	No change.	No change.

	<b>No Action Alternative Compared to Second Basis of Comparison</b>	<b>Alternative 1 Compared to the Second Basis of Comparison</b>	<b>Alternative 2 Compared to the Second Basis of Comparison</b>	<b>Alternative 3 Compared to the Second Basis of Comparison</b>	<b>Alternative 4 Compared to the Second Basis of Comparison</b>	<b>Alternative 5 Compared to the Second Basis of Comparison</b>
<b>Environmental Justice</b>						
Emissions of Criteria Air Pollutants and Precursors and/or Exposure of Sensitive Receptors to Substantial Concentrations of Air Contaminants from Diesel Engines at Groundwater Wells	Potential increase in emissions (up to 18%).	No change.	Potential increase in emissions (up to 18%).	Similar conditions.	No change.	Potential increase in emissions (up to 18%).
Potential Exposure to Mercury in Fish in Delta	Increased near Rock Slough, San Joaquin River at Antioch, and Montezuma Slough (up to 7%).	No change.	Increased near Rock Slough, San Joaquin River at Antioch, and Montezuma Slough (up to 7%).	Similar conditions.	No change.	Increased near Rock Slough, San Joaquin River at Antioch, and Montezuma Slough (up to 7%).

**Chapter 4**

**1 Approach to Environmental Analysis**

2 This chapter describes the organization of the remaining chapters in the  
3 Environmental Impact Statement (EIS). It also defines the scope, extent, and  
4 framework of the environmental analysis, including a description of resources  
5 areas evaluated and not evaluated.

6 The resource chapters in this EIS (Chapters 5 through 21) describe the affected  
7 environment and the impact analysis for each resource associated with  
8 implementation of the No Action Alternative, Second Basis of Comparison, and  
9 Alternatives 1 through 5. Potential mitigation measures (if necessary and  
10 available) to avoid, reduce, or otherwise minimize potential adverse impacts to  
11 the environment due to implementation of Alternatives 1 through 5 as compared  
12 to conditions under the No Action Alternative are discussed within each resource  
13 section. Potential cumulative effects that would occur with implementation of the  
14 alternatives are described in each resource chapter.

**15 4.1 Basis of the Environmental Analysis**

16 The impact analysis is focused on the coordinated long-term operation of the  
17 Central Valley Project (CVP) and the State Water Project (SWP). This EIS  
18 addresses conditions that would result from the long-term operation of  
19 Alternatives 1 through 5 as compared to the long-term conditions that would  
20 occur under the No Action Alternative and the Second Basis of Comparison in the  
21 Year 2030. This EIS does not address interim changes that would occur between  
22 now and 2030.

23 This EIS does not address the impacts that could occur between now and 2030  
24 due to the construction of projects that are assumed to be implemented under the  
25 No Action Alternative, Second Basis of Comparison, and Alternatives 1  
26 through 5. As described in Chapter 3, Description of Alternatives, there are  
27 several ongoing projects that are assumed to be implemented in 2030, including  
28 facilities that require construction. The 2030 conditions assume the projected  
29 long-term conditions for each ongoing project as described in their respective  
30 environmental documents. This EIS does not address the construction activities  
31 of each ongoing project because those impacts are addressed in separate  
32 environmental documents for each project.

33 Implementation of the No Action Alternative and Alternatives 1, 3, 4, and 5 also  
34 could result in construction of facilities (e.g., fish passage facilities around dams  
35 or across the Delta under these alternatives). Because, at this time, it is not known  
36 if construction will be required to implement these provisions or the nature of  
37 future facilities, this EIS does not address the construction activities of the future  
38 facilities. Impacts of future facilities will be addressed in separate environmental

1 documents for each project. It is assumed that the provisions in the alternatives,  
2 including construction activities, would be implemented in 2030.

## 3 **4.2 Resources Considered for Environmental** 4 **Analysis**

5 The resources and issues included in Chapters 5 through 22 were identified  
6 through a review of scoping comments and subsequent comments received from  
7 agencies and the public during preparation of this EIS, as described in Chapter 3,  
8 Description of Alternatives. The resources and issues are described and analyzed  
9 in the following chapters of this EIS.

- 10 • Chapter 5 – Surface Water Resources and Water Supplies
- 11 • Chapter 6 – Surface Water Quality
- 12 • Chapter 7 – Groundwater Resources and Groundwater Quality
- 13 • Chapter 8 – Energy
- 14 • Chapter 9 – Fish and Aquatic Resources
- 15 • Chapter 10 – Terrestrial Biological Resources
- 16 • Chapter 11 – Geology and Soils Resources
- 17 • Chapter 12 – Agricultural Resources
- 18 • Chapter 13 – Land Use
- 19 • Chapter 14 – Visual Resources
- 20 • Chapter 15 – Recreation Resources
- 21 • Chapter 16 – Air Quality and Greenhouse Gas Emissions
- 22 • Chapter 17 – Cultural Resources
- 23 • Chapter 18 – Public Health
- 24 • Chapter 19 – Socioeconomics
- 25 • Chapter 20 – Indian Trust Assets
- 26 • Chapter 21 – Environmental Justice
- 27 • Chapter 22 – Other National Environmental Policy Act (NEPA)  
28 Considerations
- 29 • Chapter 23 – Consultation and Coordination
- 30 • Chapter 24 – Distribution of Draft EIS
- 31 • Chapter 25 – List of Preparers
- 32 • Chapter 26 – Index

1 As described above, this EIS only addresses long-term operational impacts. It is  
2 assumed that the coordinated long-term operation of the CVP and SWP would not  
3 result in substantial impacts to transportation, noise, hazards and hazardous  
4 materials, infrastructure related to public services and utilities, and  
5 paleontological resources because there would not be ongoing construction  
6 activities and the operation and maintenance activities would be similar to  
7 conditions under the No Action Alternative or the Second Basis of Comparison.

8 Scoping comments were received related to potential impacts to transportation on  
9 highways and airports due to dust generated from noncultivated agricultural lands.  
10 The potential for changes in dust generation is addressed in Chapter 16, Air  
11 Quality and Greenhouse Gas Emissions; based upon the impact assessment, it  
12 does not appear that the amount of noncultivated land would change substantially  
13 between the alternatives and result in substantial change in dust generation.

14 It is recognized that the ability to fund some public services and utilities could be  
15 affected through implementation of the alternatives evaluated in this EIS. These  
16 potential changes related to water supply costs are addressed in Chapter 19,  
17 Socioeconomics.

18 Chapter 23 includes a discussion of comments received during scoping and  
19 meetings that were held throughout preparation of the EIS with stakeholders.  
20 Chapter 24 includes a list of recipients of this Draft EIS. Chapter 25 includes a  
21 list of preparers of this Draft EIS.

## 22 **4.3 Methodology for the Environmental Analysis**

23 This EIS assesses the potential impacts of changes that could result on the  
24 resources identified above from implementation of each of the alternatives as  
25 compared to the No Action Alternative and the Second Basis of Comparison. The  
26 impact analysis includes an evaluation of potential direct, indirect, and cumulative  
27 effects by resource.

### 28 **4.3.1 Geographic Range of Analysis**

29 The project area that could be affected varies by resource. As described in  
30 Chapter 1, Introduction, the project area includes most of the CVP facilities and  
31 CVP service areas, and all of the SWP facilities and the SWP service areas. For  
32 the analysis purposes, the project area was divided into five regions, as shown in  
33 Figure 4.1 at the end of this chapter. The geographic extent for each resource is  
34 described by applicable regions in Chapters 5 through 21. The geographic range  
35 of the project area encompasses 35 counties. The locations of CVP and SWP  
36 water supply facilities, locations of CVP and SWP water users, and areas  
37 potentially affected by the long-term coordinated operation of the CVP and SWP,  
38 are summarized in Table 4.1.

1 **Table 4.1 Geographic Range of the EIS Analysis**

<b>Region</b>	<b>County</b>	<b>Reasons for Inclusion of County in Project Area</b>
Trinity River	Trinity	CVP Facilities: Trinity Lake, and Lewiston and Whiskeytown reservoirs Trinity River downstream of Lewiston Dam
	Humboldt	Trinity River to confluence of lower Klamath River Lower Klamath River from Trinity County border to Del Norte County border
	Del Norte	Lower Klamath River from Humboldt County border to Pacific Ocean
Central Valley	Shasta	CVP Facilities: Shasta Lake and Keswick Reservoir Sacramento River downstream of Keswick Dam to Tehama County border
		CVP Water Users: Anderson-Cottonwood Irrigation District Bella Vista Water District Centerville Community Services District City of Redding City of Shasta Lake Clear Creek Community Services District Mountain Gate Community Services District Redding Rancheria Tribe Shasta Community Services District Shasta County Service Area No. 25 Shasta County Water Agency U.S. Forest Service Multiple Contracts with Individuals and Businesses
	Plumas	SWP Facilities: Antelope Lake, Lake Davis, and Frenchman Lake
		SWP Water Users: Plumas County Flood Control and Water Conservation District
	Tehama	CVP Facilities: Portion of the Tehama Colusa Canal and Corning Canal Sacramento River within Tehama County
		CVP Water Users: Corning Water District Kirkwood Water District Thomes Creek Water District Proberta Water District Lake California Property Owners Association Multiple Contracts with Individuals and Businesses

Region	County	Reasons for Inclusion of County in Project Area
Central Valley (continued)	Glenn	CVP Facilities: Portion of the Tehama Colusa Canal Sacramento River within Glenn County
		CVP Water Users: 4-E Water District Elk Creek Community Services District Glenn-Colusa Irrigation District Glide Water District Kanawha Water District Orland-Artois Water District Provident Irrigation District Stony Creek Water District U.S. Forest Service Portion of Sacramento National Wildlife Refuge
	Colusa	CVP Facilities: Portion of the Tehama Colusa Canal Sacramento River within Colusa County
		CVP Water Users: 4-M Water District Cachil Dehe Band of Wintu Indians of the Colusa Indian Community Carter Mutual Water Company Colusa County Water District Colusa Drain Mutual Water Company Cortina Water District County of Colusa County of Colusa (Stonyford) Davis Water District Glenn Valley Water District Holthouse Water District La Grande Water District Maxwell Irrigation District Myers-Marsh Mutual Water Company Princeton-Codora-Glenn Irrigation District Reclamation District No. 1004 Reclamation District No. 108 Roberts Ditch Irrigation Company Sartain Mutual Water Company Westside Water District Colusa National Wildlife Refuge Delevan National Wildlife Refuge Portion of Sacramento National Wildlife Refuge Multiple Contracts with Individuals and Businesses
	Butte	SWP Facilities: Lake Oroville and Thermalito Reservoir Sacramento River within Butte County
		CVP Water User: Gray Lodge Wildlife Area  SWP Water User: Butte County Water and Resources Conservation District

Chapter 4: Approach to Environmental Analysis

<b>Region</b>	<b>County</b>	<b>Reasons for Inclusion of County in Project Area</b>
Central Valley (continued)	Sutter	Sacramento River within Sutter County
		CVP Water Users: Feather Water District Meridian Farms Water Company Natomas Basin Conservancy Pleasant Grove Verona Mutual Water Company Sutter Mutual Water Company Tisdale Irrigation and Drainage Company Sutter National Wildlife Refuge
		SWP Water Users: City of Yuba City
	Yuba	Sacramento River within Yuba County
		Water Supplies from Yuba County Water Agency are available to CVP and SWP
	Nevada	Water Supplies from Nevada County flow in the Bear River into CVP facilities on the American River
	Placer	CVP Water Facilities: Portion of Folsom Lake
		CVP Water Users: Placer County Water Agency City of Roseville San Juan Water District
	El Dorado	CVP Water Facilities: Portion of Folsom Lake
		CVP Water Users: El Dorado Irrigation District El Dorado County Water Agency
	Sacramento	CVP Water Facilities: Portion of Folsom Lake, Lake Natoma, and Folsom South Canal American River downstream of Nimbus Dam to confluence with Sacramento River Sacramento River and Delta within Sacramento County
		CVP Water Users: City of Folsom City of Sacramento Natomas Central Mutual Water Company Reclamation District No. 1000 Regional Water Authority Sacramento County Sacramento County Water Agency Sacramento Municipal Utility District Sacramento Suburban Water District San Juan Water District Natomas Basin Conservancy

Region	County	Reasons for Inclusion of County in Project Area
Central Valley (continued)	Yolo	CVP Facilities: Portion of the Tehama Colusa Canal Sacramento River and Delta within Yolo County Yolo Bypass
		CVP Water Users: City of West Sacramento Conaway Preservation Group Dunnigan Water District Eastside Mutual Water Company Pelger Mutual Water Company Reclamation District No. 900 Multiple Contracts with Individuals and Businesses
	Solano (included in San Francisco Bay Area Region in some chapters)	SWP Facilities: Portion of the North Bay Aqueduct Sacramento River and Delta within Solano County Yolo Bypass
		SWP Water Users: Solano County Water Agency
	Stanislaus	CVP Facilities: New Melones Reservoir and portion of the Delta Mendota Canal Stanislaus River downstream of New Melones Dam to confluence with San Joaquin River San Joaquin River within Stanislaus County
		SWP Facilities: Portion of the California Aqueduct
		CVP Water Users: Del Puerto Water District Oakdale Irrigation District Patterson Irrigation District West Stanislaus Irrigation District Portion of San Luis National Wildlife Refuge
		SWP Water Users: Oak Flat Water District
	Merced	CVP Facilities: San Luis and O'Neill reservoirs, portions of Delta-Mendota Canal and San Luis Canal San Joaquin River within Merced County
		SWP Facilities: San Luis and O'Neill reservoirs and portion of California Aqueduct

Chapter 4: Approach to Environmental Analysis

Region	County	Reasons for Inclusion of County in Project Area

1 **4.3.2 Regulatory Environment and Compliance Requirements**  
2 Potential actions that could be implemented under the alternatives evaluated in  
3 this EIS that are located on Federal or state lands, or actions that are implemented,  
4 funded, or approved by Federal and state agencies, need to be compliant with  
5 appropriate Federal and state agency policies and regulations. Federal and state  
6 policies and regulations that could be relevant to implementation of the  
7 alternatives evaluated in this EIS are summarized in Appendix 4A.

1 **4.3.3 Affected Environment**

2 The Affected Environment portions of Chapters 5 through 21 provide an adequate  
3 level of detail for the quantitative and qualitative impact analyses presented in this  
4 EIS. Changes in CVP and SWP operations could result in changes to:

- 5 • Water elevations in reservoirs that store CVP and SWP water supplies,  
6 including reservoirs owned by regional and local water agencies that use CVP  
7 and/or SWP water, and associated use of the reservoir or surrounding areas to  
8 support biological resources, visual resources, recreation, and cultural  
9 resources
- 10 • Flow rates and water quality in rivers downstream of CVP and SWP  
11 reservoirs, and associated use of the rivers to support biological resources,  
12 protection of soils from erosion along the rivers, and recreation
- 13 • Flows and water quality in the Delta, including Delta outflow and reverse  
14 flows, and associated use of the rivers to support beneficial uses including  
15 biological resources and food and water supplies for human consumption
- 16 • CVP and SWP deliveries, and associated changes in groundwater use, CVP  
17 and SWP energy use and generation, and land use which could affect air  
18 quality, human health, soil erosion, and cultural resources.

19 References are provided for each chapter and not compiled for the entire EIS.

20 **4.3.4 Impact Analysis**

21 In accordance with the Council on Environmental Quality regulations, an EIS  
22 must evaluate the effects of implementation of the alternatives on the  
23 environment, any adverse environmental effects which cannot be avoided, the  
24 relationship between short-term uses of the human environment and long-term  
25 productivity, and any irreversible or irretrievable commitments of resources if the  
26 alternatives are implemented. The impact analyses sections address direct,  
27 indirect, and cumulative effects of the alternatives in each resource chapter  
28 (Chapters 5 through 21), and are organized in the following manner to describe  
29 the approach and present the results of the impact assessment.

- 30 • Potential Mechanisms for Change and Analytical Tools
- 31 • Conditions in Year 2030 without Implementation of Alternatives 1 through 5
- 32 • Evaluation of Alternatives
  - 33 – Comparison of the No Action Alternative to the Second Basis of
  - 34 Comparison
  - 35 – Comparison of Alternatives 1 through 5 to the No Action Alternative
  - 36 – Comparison of Alternatives 1 through 5 to the Second Basis of
  - 37 Comparison
  - 38 – Summary of Impact Analysis
  - 39 – Potential Mitigation Measures
  - 40 – Cumulative Effects Analysis

1 The impact analysis includes quantitative and qualitative analyses depending  
2 upon the availability of acceptable numerical analytical tools and available  
3 information. The quantitative analyses include numerous analytical tools, as  
4 summarized in Figure 4.2.

5 An EIS must identify relevant, reasonable mitigation measures that are not  
6 already included in the proposed action or alternatives to the proposed action that  
7 could avoid, minimize, rectify, reduce, eliminate, or compensate for the project's  
8 adverse environmental effects (40 Code of Federal Regulations [CFR] 1502.14,  
9 1502.16, 1508.8). Mitigation measures are presented for each resource to avoid,  
10 minimize, rectify, reduce, eliminate, or compensate for adverse environmental  
11 effects of Alternatives 1 through 5 as compared to the No Action Alternative.  
12 Mitigation measures were not included to address adverse impacts under the  
13 alternatives as compared to the Second Basis of Comparison because this analysis  
14 was included in this EIS for information purposes only.

15 The cumulative effects of implementation of reasonably foreseeable projects and  
16 the alternatives as compared to conditions under the No Action Alternative and  
17 Second Basis of Comparison are discussed for each resource in Chapters 5  
18 through 21. Cumulative effects are impacts on the environment that result from  
19 the incremental impacts of an alternative when added to other past, present, and  
20 reasonably foreseeable future actions of Federal, state, or local agencies or  
21 individual entities or persons (40 CFR 1508.7). Such impacts can result from  
22 individually minor, but collectively significant, actions taking place over time  
23 (40 CFR 1508.8).

#### 24 **4.3.5 Other NEPA Considerations**

25 The irreversible and irretrievable commitments of resources, and the relationship  
26 between short-term uses of the environment and long-term productivity are  
27 discussed in Chapter 22, Other NEPA Considerations.

#### 28 **4.3.6 Consultation and Coordination**

29 Public outreach and agency involvement efforts related to preparation of the Draft  
30 EIS and Final EIS are presented in Chapter 23, Consultation and Coordination. A  
31 listing of the agencies, other entities, and interest groups that received a copy of  
32 the Draft EIS and Final EIS is presented in Chapter 24, Distribution of Draft EIS.  
33 A list of preparers of the EIS is presented in Chapter 25.

Chapter 5

1 **Surface Water Resources and Water**  
2 **Supplies**

3 **5.1 Introduction**

4 This chapter describes the surface water resources and water supplies in the study  
5 area and potential changes that could occur as a result of implementing the  
6 alternatives evaluated in this Environmental Impact Statement (EIS).  
7 Implementation of the alternatives could affect these resources through potential  
8 changes in operation of the Central Valley Project (CVP) and State Water Project  
9 (SWP) and ecosystem restoration components of the long-term operation of the  
10 CVP and SWP.

11 **5.2 Regulatory Environment and Compliance**  
12 **Requirements**

13 Potential actions that could be implemented under the alternatives evaluated in  
14 this EIS could affect surface water resources, including rivers and reservoirs  
15 directly or indirectly impacted by changes in the operations of the CVP or SWP  
16 water facilities and users of CVP and SWP water supplies. Actions located on  
17 public agency lands or implemented, funded, or approved by Federal and state  
18 agencies would need to be compliant with appropriate Federal and state agency  
19 policies and regulations, as summarized in Chapter 4, Approach to  
20 Environmental Analysis.

21 **5.3 Affected Environment**

22 This section describes the surface water resources and water supplies that could  
23 be potentially affected by the implementation of the alternatives considered in this  
24 EIS, including:

- 25 • **Surface Water Hydrology:** Changes in surface water hydrology may occur  
26 in the rivers within the Trinity River and Central Valley regions due to  
27 changes in CVP and SWP operations as some rivers in these regions are used  
28 to convey CVP and/or SWP water supplies. Changes in reservoir elevations  
29 may occur within the Trinity River, Central Valley, San Francisco Bay Area,  
30 Central Coast, and Southern California regions due to changes in CVP and  
31 SWP operations. The ongoing CVP and SWP facilities and operations are  
32 described in Appendix 3A, No Action Alternative: Central Valley Project and  
33 State Water Project Operations.

- 1 • **Summaries of the Water Supplies used by CVP and SWP Water Users:**  
2 The water users which may be affected by changes in CVP and SWP  
3 operations are located in the Trinity River, Central Valley, San Francisco Bay  
4 Area, Central Coast, and Southern California regions.

### 5 **5.3.1 Overview of California Water Supply and Water** 6 **Management Facilities**

#### 7 **5.3.1.1 Sources of Water in California**

8 Variability and uncertainty are the dominant characteristics of California’s water  
9 resources. Precipitation is the source of 97 percent of California’s water supply  
10 (DWR 2009a). It varies greatly from year to year, as well as by season and  
11 location within the state. The unpredictability and geographic variation in  
12 precipitation that California receives make it challenging to manage the available  
13 runoff to meet urban, agricultural, and environmental water needs. With climate  
14 change, precipitation patterns are expected to become even more unpredictable, as  
15 described in Appendix 5A, CalSim II and DSM2 Modeling.

16 In an average water year, precipitation provides California with approximately  
17 200 million acre-feet (MAF) of water falling as either rain or snow (DWR 2009a),  
18 including up to 10 MAF from surface water flows entering California due to  
19 precipitation falling in the Klamath River and Lost River watersheds in Oregon;  
20 and the Colorado River watershed in Wyoming, Colorado, Utah, Nevada, New  
21 Mexico, and Arizona, and northwestern Mexico. The total volume of water the  
22 state receives can vary dramatically between dry and wet years. California may  
23 receive less than 100 MAF of water during a dry year and more than 300 MAF in  
24 a wet year (Western Regional Climate Center 2011).

25 The majority of California’s precipitation occurs between November and April,  
26 while most of the state’s demand for water is in the summer months (Western  
27 Regional Climate Center 2011). In addition, most of the precipitation falls in the  
28 northern portion of the state and much of the state water demand comes from the  
29 central and southern portions of the state where the major agricultural and  
30 population centers are located on the Central Valley floor and in Southern  
31 California. In some years, the northern regions of the state can receive 100 inches  
32 or more of precipitation, while the southern regions receive only a few inches.

33 Over time, annual precipitation trends have been changing and continue to  
34 change, as shown on Figure 5.1. From 1906 to 1960, 33 percent of the water  
35 years in California were classified by the California Department of Water  
36 Resources (DWR) as “dry” or “critically dry” and that percentage increased to  
37 36 percent from 1961 to 2013 (DWR 2014a). From 1906 to 1960, 45 percent of  
38 the water years in California were classified by DWR as “above normal” or “wet”  
39 and that percentage increased to 49 percent from 1961 to 2013. Additionally, the  
40 1906 to 1960 period had 42 percent of water years classified as extreme  
41 (“critically dry” or “wet”) and that percentage increased to 51 percent after 1960.

1 Although there were more extreme water year classifications in the later period,  
2 the overall precipitation averages in pre-1960 years and post-1960 years have  
3 little differences.

4 Despite having similar precipitation averages, the year to year variation and  
5 patterns of extreme condition occurrences are significantly different between the  
6 time periods. The year to year statewide precipitation variation is larger and more  
7 frequent from 1961 to 2013 than 1906 to 1960. Also, the occurrence of a year to  
8 year change of more than 10 inches of precipitation is 3 times higher in the post-  
9 1960 time period as compared to the pre-1960 time period. There are also more  
10 occurrences of sequential “critically dry” years and sequential “wet” years after  
11 1960.

12 Approximately 50 percent of the precipitation that California receives evaporates,  
13 is used consumptively by native vegetation and crops (not including irrigation  
14 water supplies), is used by managed wetlands, flows into streams within Oregon  
15 or Nevada, flows into saline water bodies (such as Salton Sea), or percolates into  
16 saline groundwater aquifers (DWR 2013a). Therefore, less than 50 percent of the  
17 water that enters California, or less than 100 MAF per year, is available for use by  
18 urban, agricultural, and other environmental uses, collectively.

### 19 **5.3.1.2 Development of Major California Water Management Facilities**

20 Due to the hydrologic variability that ranges from dry summers and fall months to  
21 floods in winter and spring, water from precipitation in the winter and spring must  
22 be stored for use in the summer and fall. During an average hydrological year,  
23 approximately 15 MAF of water is stored in the Sierra Nevada snowpack (DWR  
24 2013a). However, not all of the snowpack becomes available in a timely manner  
25 for uses throughout the state. Therefore, Federal, state, and local agencies and  
26 private entities have constructed reservoirs, aqueducts, pipelines, and water  
27 diversion facilities to capture and use the rainfall and the subsequent snowmelt.

#### 28 **5.3.1.2.1 Water Facilities Development through the Early 1900s**

29 Spanish settlements were initially established in the late 1700s in southern  
30 California, including conveyance systems to bring water to the pueblos. The first  
31 water storage and diversion project in California was constructed in 1772,  
32 including a 12-foot high dam on the San Diego River and 6 miles of canals to  
33 deliver water to the San Diego Mission (Reclamation 1997). Over the next  
34 80 years, other irrigation systems were constructed to provide water for  
35 communities and irrigated lands. The major levee was constructed in the Delta in  
36 1840 along Grand Island to protect agricultural lands from floods.

37 After California became a state in 1850, the state legislature adopted English  
38 Common Law, which included the doctrine of riparian rights to provide water  
39 supplies to lands adjacent to rivers and streams (Reclamation 1997). The  
40 California legislature at this time also recognized “pueblo water rights” that were  
41 granted under both Spanish and Mexican governments, including water rights on  
42 the Los Angeles and San Diego rivers. Water rights also were influenced by the  
43 practice of miners of “posting notice” at their points of diversion to substantiate

1 water rights as an “appropriative right” for areas not adjacent to the rivers and  
2 streams. This set of appropriative rights was catalogued with respect to “first in  
3 time, first in right.” Appropriative water rights were given statutory recognition  
4 in 1872.

5 Between the 1850s and early 1900s, numerous dams and canals were constructed  
6 by miners, agricultural water users, and communities (Reclamation 1997). In the  
7 1870s, the first wells were constructed with wood-burning engines. By the late  
8 1890s, natural gas engines and electricity became available to power pumps.  
9 Between 1906 and 1910, over 4,000 natural gas or electric groundwater pumps  
10 were installed in the San Joaquin Valley. Substantial use of groundwater caused  
11 extensive groundwater aquifer depletions and land subsidence in some areas of  
12 the Central Valley. The availability of electricity to communities also resulted in  
13 more hydroelectric generation facilities and associated dams being constructed  
14 throughout the Sierra Nevada.

#### 15 **5.3.1.2.2 Conceptual Development of the Central Valley Project and State** 16 **Water Project**

17 The need for coordinated water development was evaluated in the 1870s when  
18 Congress authorized the Alexander Commission to evaluate water supply  
19 concepts in the Sacramento and San Joaquin rivers watersheds, including  
20 reservoirs and large-scale irrigation water supply projects (Reclamation 1997).

##### 21 *1919 Marshall Plan*

22 In 1919, Colonel Robert Marshall, chief geographer for the U.S. Geological  
23 Survey, proposed a major water storage and conveyance plan to irrigate lands in  
24 the Central Valley and San Francisco Bay Area and provide water to communities  
25 in the San Francisco Bay Area and southern California (Marshall 1919). The  
26 Marshall Plan recommended two major dams on the San Joaquin River near  
27 Friant and Stanislaus River between the present locations of Tulloch and  
28 Goodwin dams to serve the eastern San Joaquin Valley and reduce groundwater  
29 overdraft in Tulare and Kern counties; four dams on Kern River to serve the Los  
30 Angeles area; and dams on the Sacramento River near Red Bluff, Klamath River  
31 downstream of Klamath Falls, and dams along the Sacramento River tributaries to  
32 provide stored water into two canals along the western and eastern sides of the  
33 Central Valley to provide exchange water to San Joaquin River water rights  
34 holders affected by the San Joaquin River dam, water to other San Joaquin Valley  
35 users, and water to communities in Contra Costa, Alameda, Santa Clara, and San  
36 Francisco counties.

##### 37 *1930s State Water Plan*

38 During the 1920s, the California state legislature commissioned a series of  
39 investigations to further evaluate the Marshall Plan (DPW 1930; Reclamation  
40 1997). The 1930 Division of Water Resources Bulletin No. 25 outlined a  
41 statewide water plan, including the concept that became the CVP and SWP. The  
42 plan included 37 water supply and flood management reservoirs, including a dam  
43 on the San Joaquin River near Friant and canals to distribute the water along the  
44 eastern San Joaquin Valley to reduce groundwater overdraft in Tulare and Kern

1 counties; 14 dams along the Trinity River, Sacramento River, and Sacramento  
 2 River tributaries to provide water to the San Joaquin River water rights  
 3 contractors affected by the dam on the San Joaquin River and water users on the  
 4 west side of the San Joaquin Valley and in Contra Costa County; and eight dams  
 5 on San Joaquin Valley rivers to provide water to the San Joaquin Valley. These  
 6 dams included recommended facilities near the present CVP Trinity, Shasta,  
 7 Folsom, New Melones, and Friant dams and the present SWP Oroville Dam. The  
 8 recommendations also included a Delta Cross Channel canal to improve south  
 9 Delta water quality; a canal from a south Delta pumping plant to a regulating  
 10 reservoir and pumping plant near Mendota; canals from Mendota to the San  
 11 Joaquin Valley; a canal from the Delta into Contra Costa County; and expansion  
 12 of the San Joaquin River and associated channels with five operable barriers along  
 13 the San Joaquin River.

14 The study also addressed use of aquifer storage, improved navigation along the  
 15 Sacramento and San Joaquin rivers, flood management, salt water barrier along  
 16 the western Delta, recycled wastewater and stormwater in Southern California,  
 17 and importation of Colorado River water to Southern California.

18 In 1933, the state authorized the Central Valley Project Act. However, during the  
 19 1930s depression, the state could not raise the funds. The state appealed to the  
 20 Federal Government for assistance. The overall SWP was approved by the State  
 21 Legislature in 1941.

22 As described above, six of the 37 dams in the SWP were included in the CVP and  
 23 SWP facilities (Reclamation 1997). However, most of the recommended dams  
 24 were constructed by the U.S. Army Corps of Engineers (USACE), local or  
 25 regional water supply and/or flood management agencies, and hydropower  
 26 entities on the Yuba, Bear, Feather, American, Mokelumne, Calaveras,  
 27 Chowchilla, Fresno, Merced, Tuolumne, Stanislaus, Kings, Kaweah, Tule, and  
 28 Kern rivers. Dams on the Fresno and Chowchilla rivers were initially developed  
 29 by the USACE; however, the Hidden and Buchanan dams, respectively, were  
 30 integrated into the CVP to supply water to portions of the eastern side of the San  
 31 Joaquin Valley (DPW 1930; Reclamation 1997).

32 **5.3.1.2.3 Overview of the Central Valley Project**

33 With the passage of the Rivers and Harbors Act of 1935, Congress appropriated  
 34 funds and authorized construction of the CVP by the USACE (Reclamation 1997;  
 35 Reclamation 2011a). When the Rivers and Harbors Act was reauthorized in 1937,  
 36 the construction and operation of the CVP was assigned to Reclamation, and the  
 37 CVP became subject to Reclamation Law (as defined in the Reclamation Act of  
 38 1902 and subsequent legislation).

39 The CVP facilities were initiated in the late 1930s (Reclamation 1997, 2011a).  
 40 The CVP facilities, as shown on Figure 5.2, include:

- 41 • Trinity and Lewiston dams on the Trinity River.
- 42 • Shasta and Keswick dams on the Sacramento River.

- 1 • Red Bluff Pumping Plant on the Sacramento River to deliver water into the  
2 Tehama-Colusa Canal and the Corning Canal.
- 3 • Folsom and Nimbus dams on the American River and the Folsom-South  
4 Canal.
- 5 • Delta Cross Channel in the Delta.
- 6 • Rock Slough Intake to deliver water into the Contra Costa Canal, Contra  
7 Costa Pumping Plant, and Contra Loma Reservoir.
- 8 • Friant Dam along the San Joaquin River to deliver water into the Friant-Kern  
9 and Madera.
- 10 • C.W. Jones Pumping Plant (Jones Pumping Plant) (previously known as the  
11 Tracy Pumping Plant) in the south Delta to deliver water into the Delta-  
12 Mendota Canal and Mendota Pool.
- 13 • Delta-Mendota Canal/California Aqueduct Intertie downstream of the CVP  
14 Jones Pumping Plant and the SWP Banks Pumping Plant.
- 15 • San Luis Reservoir-related facilities, including the CVP facilities consisting of  
16 the O'Neill Forebay, Pumping Plant, and Canal; Coalinga Canal, Pleasant  
17 Valley Pumping Plant, and San Luis Drain. The O'Neill Forebay is operated  
18 in coordination with the SWP. The SWP facilities operated in coordination  
19 with the CVP include the B.F. Sisk San Luis Dam (the major dam that forms  
20 San Luis Reservoir), San Luis Canal, Los Banos and Little Panoche dams, and  
21 associated pumping plants.
- 22 • Pacheco Tunnel and Conduit to deliver water from the San Luis Reservoir into  
23 the San Justo Dam and Reservoir, Hollister Conduit, and Santa Clara Tunnel  
24 and Conduit.
- 25 • New Melones Dam along the Stanislaus River.

26 The CVP reservoirs are listed in Table 5.1 and shown on Figures 5.3 through 5.5.  
27 Table 5.1 also includes reservoirs of the Bureau of Reclamation Orland Project  
28 (which are not part of CVP) because these reservoirs also affect hydrology of  
29 Stony Creek, a tributary to the Sacramento River.

1 **Table 5.1 Major Central Valley Project and Orland Project Reservoirs**

Project	Reservoir	Dam	Stream	Year Initiated	Capacity (acre-feet)
CVP	Millerton Lake	Friant	San Joaquin River	1942	524,000
CVP	Shasta Lake	Shasta	Sacramento River	1945	4,552,000
CVP	Keswick Reservoir	Keswick	Sacramento River	1950	23,772
CVP	Trinity Lake	Trinity	Trinity River	1962	2,447,650
CVP	Lewiston Reservoir	Lewiston	Trinity River	1963	14,660
CVP	Spring Creek Reservoir	Spring Creek Debris Dam	Spring Creek (tributary of Sacramento River)	1963	5,874
CVP	Whiskeytown Lake	Whiskeytown	Clear Creek (tributary of Sacramento River)	1963	241,100
CVP	Folsom Lake	Folsom	American River	1956	967,000
CVP	Lake Natoma	Nimbus	American River	1955	9,000
CVP	Contra Loma Reservoir	Contra Loma	Off-Stream	1967	2,627
CVP	Martinez Reservoir	Martinez	Wildcat Creek	1938	268
CVP	San Luis Reservoir	B.F. Sisk	San Luis Creek	1967	2,041,000
CVP	O'Neill Forebay	O'Neill	San Luis Creek	1967	56,400
CVP	Los Banos Creek Reservoir	Los Banos Detention	Los Banos Creek	1965	34,600
CVP	Little Panoche Creek Reservoir	Little Panoche Detention	Little Panoche Creek	1966	5,580
CVP	San Justo Reservoir	San Justo	Offstream	1985	10,300
CVP	Funks Reservoir	Funks	Funks Creek	1976	2,460
CVP	New Melones Reservoir	New Melones	Stanislaus River	1979	2,400,000
CVP	Hensley Lake	Hidden	Fresno River	1975	90,000
CVP	H.V. Eastman Lake	Buchanan	Chowchilla River	1975	150,000
Orland	East Park Reservoir	East Park	Little Stony Creek (tributary of Sacramento River)	1910	51,000
Orland	Stony Gorge Reservoir	Stony Gorge	Stony Creek (tributary of Sacramento River)	1928	50,350

3 Note: CVP is Central Valley Project; Orland is Orland Project

1 Detailed information describing the CVP facilities and operations is presented in  
2 Appendix 3A, No Action Alternative: Central Valley Project and State Water  
3 Project Operations.

#### 4 **5.3.1.2.4 Overview of the State Water Project**

5 As the CVP facilities were being constructed after World War II, the state began  
6 investigations to meet additional water needs through development of the  
7 California Water Plan. In 1957, DWR published Bulletin Number 3 that  
8 identified new facilities to provide flood control in northern California and water  
9 supplies to the San Francisco Bay Area, San Joaquin Valley, San Luis Obispo and  
10 Santa Barbara counties in the Central Coast Region, and southern California  
11 (DWR 1957, 2012; Reclamation 2011a). The study identified a seasonal  
12 deficiency of 2.675 MAF/year in 1950 that resulted in groundwater overdraft  
13 throughout many portions of California. The report described facilities to meet  
14 the water demands and reduce groundwater overdraft, including facilities that  
15 would become part of the SWP.

16 In 1960, California voters authorized the Burns-Porter Act to construct the initial  
17 SWP facilities. The SWP facilities, as shown on Figure 5.2, include:

- 18 • Antelope Lake, Lake Davis, and Frenchman Lake on the upper Feather River  
19 upstream of Oroville Dam.
- 20 • Oroville Dam and Thermalito Diversion Dam on the Feather River.
- 21 • Barker Slough Pumping Plant in the north Delta which delivers water to the  
22 North Bay Aqueduct.
- 23 • Clifton Court Forebay and Harvey O. Banks Pumping Plant (Banks Pumping  
24 Plant) in the south Delta, which delivers water into the Bethany Forebay and  
25 California Aqueduct.
- 26 • South Bay Pumping Plant to deliver water from Bethany Forebay to the South  
27 Bay Aqueduct and Lake Del Valle.
- 28 • San Luis Reservoir-related facilities, including the SWP facilities B.F. Sisk  
29 San Luis Dam (the major dam that forms San Luis Reservoir), San Luis  
30 Canal, Los Banos and Little Panoche dams, and associated pumping plants,  
31 and the CVP O'Neill Forebay. These facilities are operated in coordination  
32 between the SWP and CVP.
- 33 • California Aqueduct to deliver water to the San Joaquin Valley, Central Coast,  
34 and southern California. The California Aqueduct extends from the Banks  
35 Pumping Plant to San Luis Reservoir and continues to Lake Perris in  
36 Riverside County. The California Aqueduct reach in southern California also  
37 includes Quail Lake, Pyramid Lake, Castaic Lake, Silverwood Lake, Crafton  
38 Hills Reservoir, and Lake Perris.
- 39 • The Coastal Branch of the California Aqueduct to deliver water from the  
40 California Aqueduct to San Luis Obispo and Santa Barbara counties.

1 Major SWP reservoirs are listed in Table 5.2 and shown on Figures 5.3  
 2 through 5.6.

3 **Table 5.2 State Water Project Reservoirs**

Reservoir	Dam	Stream	Year Initiated	Capacity (acre-feet)
Frenchman Lake	Frenchman	Little Last Chance Creek (tributary of Feather River)	1961	55,477
Antelope Lake	Antelope	Indian Creek (tributary of Feather River)	1964	22,566
Lake Davis	Grizzly Valley	Big Grizzly Creek (tributary of Feather River)	1966	83,000
Oroville Reservoir	Oroville	Feather River	1968	3,537,577
Thermalito Pool	Thermalito Diversion	Feather River	1967	13,328
Thermalito Forebay	Thermalito Forebay	Cottonwood Creek (tributary of Feather River)	1967	11,768
Thermalito Afterbay	Thermalito Afterbay	Feather River	1967	57,041
Clifton Court Forebay	Clifton Court Forebay	Old River	1970	29,000
Bethany Forebay	Bethany Forebay	Italian Slough	1961	5,250
Patterson Reservoir	Patterson	Offstream	1962	98
Lake Del Valle	Del Valle	Arroyo Valle	1968	77,100
Quail Lake	No dam	Offstream	Historic	5,654
Pyramid Lake	Pyramid	Piru Creek	1973	180,000
Castaic Lake	Castaic	Castaic Creek	1973	323,700
Silverwood Lake	Cedar Springs	Mojave River (West Fork)	1971	78,000
Crafton Hills Reservoir	Crafton Hills	Yucaipa Creek	2001	130
Lake Perris	Perris	Bernasconi Pass	1973	131,452

5 Detailed information describing the SWP is presented in Appendix 3A, No Action  
 6 Alternative: Central Valley Project and State Water Project Operations.

### 7 **5.3.1.2.5 Other Major Water Supply and Flood Management Reservoirs**

8 During the past 100 years, numerous water supply, flood management, and  
 9 hydroelectric generation reservoirs were constructed throughout California.  
 10 Many of these projects were constructed on tributaries to the Sacramento and San  
 11 Joaquin rivers and tributaries to the Tulare Lake Basin. Operations of these  
 12 non-CVP and non-SWP reservoirs affect flow patterns into the Sacramento and  
 13 San Joaquin rivers and the Delta. However, implementation of the alternatives

1 evaluated in this EIS would not result in changes in operations in most of these  
 2 reservoirs, except on the lower Stanislaus River.

3 Major non-CVP and non-SWP reservoirs in the Sacramento Valley and San  
 4 Joaquin Valley watersheds, generally with storage capacities greater than  
 5 100,000 acre-feet, which could affect operations of CVP or SWP reservoirs or  
 6 Delta facilities or could be affected by implementation of the alternatives  
 7 evaluated in this EIS, are listed in Tables 5.3 and 5.4.

8 **Table 5.3 Major Non-Central Valley Project and Non-State Water Project Reservoirs**

 4 USACE 2008.

### 5 **5.3.2 Hydrologic Conditions and Major Surface Water Facilities**

6 This section of Chapter 5 provides an overview of hydrologic conditions in the  
 7 Trinity River and Central Valley watersheds. As described below, not all of the  
 8 tributaries and sub-watersheds would be affected by changes in the CVP and SWP  
 9 operations considered under the alternatives in this EIS.

10 Changes in surface water hydrology may occur in the rivers within the Trinity  
 11 River and Central Valley regions due to changes in CVP and SWP operations  
 12 because some rivers in these regions are used to convey CVP and/or SWP water

1 supplies. Tributaries to the Sacramento and San Joaquin rivers that are not  
2 affected by CVP and SWP operations are also discussed briefly in this section to  
3 provide an overview of the major streams in the Central Valley watersheds.  
4 Available information related to flow conditions between Water Years 2001 and  
5 2012 (October 2000 through September 2012) are provided for reservoirs and  
6 rivers that are affected by CVP and/or SWP operations.

7 In the San Francisco Bay Area, Central Coast, and Southern California regions,  
8 the surface water streams generally are not used to convey CVP and SWP water  
9 supplies. The streams downstream of reservoirs that store CVP and SWP water  
10 supplies generally receive either reservoir overflows in storm conditions or  
11 minimum instream flows related to water rights and/or aquatic resources  
12 beneficial uses. After the minimum instream flow requirements are fulfilled, the  
13 remaining volumes of water are provided to municipal, agricultural, and/or  
14 environmental water users. Changes in CVP and SWP water operations will not  
15 affect the need to meet minimum instream flows or high flows during storm  
16 conditions.

### 17 **5.3.2.1 Trinity River Region**

18 The Trinity River Region includes the area along the Trinity River from Trinity  
19 Lake to the confluence with the Klamath River; and along the lower Klamath  
20 River from the confluence with the Trinity River to the Pacific Ocean. The  
21 Trinity River Region includes Trinity Lake, Lewiston Reservoir, the Trinity River  
22 between Lewiston Reservoir and the confluence with the Klamath River, and  
23 along the lower Klamath River.

#### 24 **5.3.2.1.1 Trinity River Watershed**

25 The Trinity River watershed extends over approximately 1,897,600 acres and  
26 ranges in elevation from over 9,000 feet above sea level in the headwaters area to  
27 less than 300 feet at the confluence of the Trinity River with the Klamath River  
28 (California North Coast Regional Water Quality Control Board [NCRWQCB]  
29 et al. 2009; U.S. Fish and Wildlife Service [USFWS] et al. 1999). Average  
30 precipitation in the Trinity River watershed range from 30 to 70 inches per year,  
31 with a long-term average of approximately 62 inches per year. Over 90 percent of  
32 the precipitation has historically occurred between October and April.  
33 Precipitation ranges from mostly snow at higher elevations to mostly rain near the  
34 confluence with the Klamath River.

35 The Trinity River includes the mainstem, North Fork Trinity River, South Fork  
36 Trinity River, New River, and numerous smaller streams (NCRWQCB et al.  
37 2009; USFWS et al. 1999). The mainstem of the Trinity River flows 170 miles to  
38 the west from the headwaters to the confluence with the Klamath River. The  
39 CVP Trinity and Lewiston dams are located at approximately River Miles 105  
40 and 112, respectively; and upstream of the confluences of the Trinity River and  
41 the North Fork, South Fork, and New River. Flows on the North Fork, South  
42 Fork, and New River are not affected by CVP facilities. The Trinity River flows  
43 approximately 112 miles from Lewiston Dam to the Klamath River through

1 Trinity and Humboldt counties and the Hoopa Indian Reservation within Trinity  
2 and Humboldt counties.

3 Trinity Lake, a CVP facility on the Trinity River formed by the Trinity Dam, was  
4 constructed by 1962. The 2.4-MAF reservoir is located approximately 50 miles  
5 northwest of Redding (USFWS et al. 1999). Lewiston Reservoir, a CVP facility  
6 on the Trinity River formed by Lewiston Dam, was constructed by 1963 and is  
7 located 7 miles downstream of the Trinity Dam. Lewiston Reservoir is used as a  
8 regulating reservoir for downstream releases to the Trinity River and to  
9 Whiskeytown Lake, located in the adjacent Clear Creek watershed. Water is  
10 diverted from the lower outlets in Trinity Lake to Lewiston Reservoir to provide  
11 cold water to Trinity River. There are no other major dams in the Trinity River  
12 watershed.

13 Prior to completion of Trinity and Lewiston dams, flows in the Trinity River were  
14 highly variable and could range from over 100,000 cubic feet per second (cfs) in  
15 the winter and spring to 25 cfs in the summer and fall (USFWS et al. 1999). Total  
16 annual flow volume at Lewiston (immediately downstream of the current location  
17 of Lewiston Dam) ranged from 0.27 to 2.7 MAF with a long-term average of  
18 1.2 MAF.

19 A large portion of the Trinity River flows upstream of Trinity Lake and Lewiston  
20 Dam is exported to the Sacramento River watershed through CVP facilities. The  
21 reduction in flows in the Trinity River initially caused substantial reductions in  
22 the Trinity River fish populations (Department of the Interior [DOI] 2000). In  
23 response to the reductions in fish populations, Congress enacted legislation and  
24 directed that restoration actions be evaluated for the Trinity River. In December  
25 2000, the U.S. Department of the Interior (DOI) adopted the Trinity River  
26 Mainstem Fishery Restoration Record of Decision (Trinity River ROD) which  
27 restored Trinity River flow and habitat to produce a healthy, functioning alluvial  
28 river system. The Trinity River ROD included physical channel rehabilitation;  
29 sediment management; watershed restoration; and variable annual instream flow  
30 releases from Lewiston Dam based on forecasted hydrology for the Trinity River  
31 Basin as of April 1<sup>st</sup> each year that range from 368,600 acre-feet/year in critically  
32 dry years to 815,000 acre-feet/year in extremely wet years. The Trinity River  
33 ROD was challenged in United States District Court for the Eastern District of  
34 California (District Court); and the changes in operations related to flow were not  
35 allowed to proceed while supplemental environmental documentation was  
36 prepared and reviewed (NCRWQCB et al. 2009). In 2004, the United States  
37 Court of Appeals for the Ninth Circuit entered an opinion that reversed the  
38 District Court order; and all actions in the Trinity River ROD were mandated.  
39 The flow actions were not completely implemented until several infrastructure  
40 projects in the Trinity River channel were completed to protect areas from flood  
41 damage.

42 Additional water releases periodically occur into the Trinity River as part of flood  
43 control operations and to provide other flow releases (NCRWQCB et al. 2009;  
44 Reclamation 2011a). Although flood control is not an authorized purpose of the  
45 Trinity River Division, flood control benefits are provided through normal

1 operations. The Reclamation Safety of Dams release criteria generally provide  
2 for maximum storage in Trinity Lake of 2.1 between November and March.  
3 Initial flood releases are discharged from Trinity Lake into Lewiston Reservoir,  
4 and then, through the powerplant and into Whiskeytown Lake in the Clear Creek  
5 watershed. To reduce the potential for flooding on the Trinity River, releases into  
6 Trinity River generally are less than 11,000 cfs from Lewiston Dam (under Safety  
7 of Dams criteria) due to local high water concerns in the floodplain and local  
8 bridge flow capacities. Reclamation has periodically released water from  
9 Lewiston Dam into the Trinity River to improve late summer flow conditions to  
10 avoid fish die-offs in the lower Klamath River or for tribal requirements along the  
11 Trinity River (DOI 2014; Trinity River Restoration Program [TRPP] 2014).

12 Temperature objectives for the Trinity River are set forth in State Water  
13 Resources Control Board (SWRCB) Water Rights Order 90-5, as summarized in  
14 Appendix 3A, No Action Alternative: Central Valley Project and State Water  
15 Project Operations. These objectives vary by reach and by season. Between  
16 Lewiston Dam and Douglas City Bridge, the daily average temperature should not  
17 exceed 60 degrees Fahrenheit (°F) from July 1 to September 14, and 56°F from  
18 September 15 to September 30. From October 1 to December 31, the daily  
19 average temperature should not exceed 56°F between Lewiston Dam and the  
20 confluence of the North Fork Trinity River.

21 Historical water storage volumes and water storage elevations for Trinity Lake for  
22 Water Years 2001 through 2012 are presented on Figures 5.7 and 5.8 (DWR  
23 2013d, 2013e). Trinity Lake storage varies in accordance with upstream  
24 hydrology and downstream water demands and instream flow requirements.  
25 Reclamation maintains at least 600 TAF in Trinity Reservoir, except during the  
26 10 to 15 percent of the years when Shasta Lake is also drawn down.

27 Historical water storage volumes and water storage elevations in Lewiston  
28 Reservoir for Water Years 2001 through 2012 are presented on Figures 5.9  
29 and 5.10 (DWR 2013g, 2013h). The Lewiston Reservoir water storage volume is  
30 more consistent throughout the year because this reservoir is used to regulate flow  
31 releases to the powerplant and other downstream uses; and not to provide  
32 long-term water storage.

33 Trinity River flows downstream of Lewiston Reservoir at Douglas City are  
34 presented on Figure 5.11 (DWR 2013i). The flow record is limited at the Douglas  
35 City gauge to 2003 through 2012. The mean monthly flows reflect the wet year  
36 pattern in 2006 and the drier year patterns in 2008 and 2009.

### 37 **5.3.2.1.2 Lower Klamath River from Trinity River Confluence to the** 38 **Pacific Ocean**

39 The Klamath River watershed extends over 15,600 square miles from southern  
40 Oregon to northern California, and ranges in elevation from over 9,500 feet above  
41 sea level near the headwaters to sea level at the Pacific Ocean (USFWS et al.  
42 1999). The Klamath River watershed is generally divided into two or three  
43 subbasins. For the purpose of this study, the upper Klamath River basin extends  
44 over 60 miles from the headwaters to Iron Gate Dam (DOI and DFG 2012).

1 The lower Klamath River basin extends 190 miles from Iron Gate Dam to the  
 2 Pacific Ocean. Four major tributaries flow into the lower Klamath River,  
 3 including Shasta, Scott, Salmon, and Trinity rivers. The lower Klamath River  
 4 flows 43.5 miles from the confluence with the Trinity River to the Pacific Ocean  
 5 (USFWS et al. 1999). Downstream of the Trinity River confluence, the Klamath  
 6 River flows through Humboldt and Del Norte counties and through the Hoopa  
 7 Indian Reservation, Yurok Indian Reservation, and Resighini Indian Reservation  
 8 within Humboldt and Del Norte counties (DOI and Department of Fish and Game  
 9 [now known as Department of Fish and Wildlife] DFG 2012).

10 The Trinity River is the largest tributary to the Klamath River (DOI and DFG  
 11 2012). There are no dams located in the Klamath River watershed downstream of  
 12 the confluence with the Trinity River. The western portion of the Klamath River  
 13 watershed receives substantial rainfall during the winter months. Average  
 14 precipitation in the western portion of the watershed ranges from 60 to 125 inches  
 15 per year (DWR 2013a). Due to the heavy precipitation and the upstream water  
 16 supply projects in the Klamath River, approximately 85 percent of the flows in the  
 17 lower Klamath River occur due to runoff in the lower watershed during the winter  
 18 months (DOI and DFG 2012).

19 The Klamath River estuary extends from approximately 5 miles upstream of the  
 20 Pacific Ocean (DOI and DFG 2012). This area is generally under tidal effects and  
 21 salt water can occur up to 4 miles from the coastline during high tides in summer  
 22 and fall when Klamath River flows are low. Klamath River flows at Klamath  
 23 within the Klamath River estuary are affected by tidal influence within the  
 24 estuary, as presented on Figure 5.12 (DWR 2014d).

25 **5.3.2.2 Central Valley Region**

26 The Central Valley Region extends from above Shasta Lake to the Tehachapi  
 27 Mountains, and includes the Sacramento Valley, San Joaquin Valley, Delta, and  
 28 Suisun Marsh.

29 **5.3.2.2.1 Sacramento Valley**

30 Rivers in the Sacramento Valley that could be affected by changes in CVP and  
 31 SWP operations include the following:

- 32 • Clear Creek from Whiskeytown Reservoirs to the confluence with the  
 33 Sacramento River
- 34 • Sacramento River from Shasta Lake to the confluence with the San Joaquin  
 35 River in the Delta
- 36 • Feather River from upstream of Oroville Reservoir to the confluence with the  
 37 Sacramento River
- 38 • Yuba River from New Bullards Bar Reservoir to the confluence with the  
 39 Feather River
- 40 • Bear River from Camp Far West Reservoir to the confluence with the  
 41 Feather River

- 1 • American River from Folsom Lake to the confluence with the  
2 Sacramento River

3 Flows from smaller tributaries to the Sacramento River and the Cosumnes and  
4 Mokelumne rivers in the Sacramento Valley contribute substantial flows into the  
5 Sacramento River and affect CVP and SWP operations; however, flows in these  
6 rivers would not be affected by changes in CVP and SWP operations. Therefore,  
7 hydrologic conditions on these waterbodies are not described in this EIS.

8 The Sacramento River watershed encompasses an area over 15,360,000 acres in  
9 the northern portion of the Central Valley; extends from the foothills of the Coast  
10 Ranges and Klamath Mountains on the west; extends from the foothills of the  
11 Sierra Nevada and Cascade Range on the east; and extends through the Delta on  
12 the south (Reclamation 2013a).

13 Ground surface elevations in the northern portion of the Sacramento River  
14 watershed range from approximately 14,000 feet above mean sea level in the  
15 headwaters of the Sacramento River to approximately 1,070 feet at Shasta Lake  
16 (Reclamation 2013a). In the mountains surrounding the valley, annual average  
17 precipitation generally ranges between 60 and 70 inches up to 90 inches, with  
18 snow prevalent at higher elevations. The floor of the Sacramento Valley is  
19 relatively flat, with elevations ranging from approximately 60 to 300 feet above  
20 mean sea level. This area is characterized by hot dry summers and mild winters.  
21 Average precipitation ranges from 15 to 20 inches per year, falling mostly as rain.

22 The Sacramento River flows approximately 351 miles from the north near Mount  
23 Shasta to the confluence with the San Joaquin River at Collinsville in the western  
24 Delta (Reclamation 2013a). The Sacramento River receives contributing flows  
25 from numerous major and minor streams and rivers that drain the east and west  
26 sides of the basin. The Sacramento River also receives imported flows from the  
27 Trinity River watershed, as discussed above. The volume of flow increases as the  
28 river progresses southward, and is increased considerably by the contribution of  
29 flows from the Feather River and the American River.

### 30 *Upper Sacramento River Watershed Hydrology*

31 The portion of the watershed upstream of Keswick Dam includes the McCloud  
32 River, Pit River, Squaw Creek, headwaters of the Sacramento River, and Goose  
33 Lake basins. The Goose Lake basin is located within the Pit River watershed;  
34 however, water rarely spills from Goose Lake into the Pit River. The last  
35 recorded spill occurred in 1880 (Reclamation 2013a). Long-term average annual  
36 inflows into Shasta Lake are approximately 4.875 MAF between the mid-1940s  
37 and 2010.

38 The McCloud River watershed extends over approximately 402,000 acres  
39 (Reclamation 2013a). The McCloud River flows approximately 59 miles from  
40 the headwaters in Moosehead Creek located southeast of Mount Shasta, through  
41 McCloud Reservoir, and into Shasta Lake. McCloud Reservoir is operated  
42 primarily to generate hydroelectric power.

1 The Pit River watershed extends over approximately 3,008,000 acres along the  
2 north and south forks of the Pit River basins, and includes 21 named tributaries  
3 and numerous smaller tributaries (Reclamation 2013a). Pacific Gas and Electric  
4 Company operate several hydropower diversions and reservoirs within the Pit  
5 River watershed.

6 The Squaw Creek watershed extends over approximately 66,000 acres located to  
7 the east of Shasta Lake (Reclamation 2013a).

8 The Sacramento River extends approximately 40 miles from the headwaters to  
9 Shasta Lake downstream of the town of Delta (Reclamation 2013a). The basin  
10 extends into portions of Mount Shasta and the Trinity and Klamath mountains.

11 Hydrological conditions in these upper watersheds would not be affected by  
12 implementation of the alternatives considered in this EIS.

### 13 *Whiskeytown Lake*

14 Whiskeytown Lake is located within the Clear Creek watershed. The Clear Creek  
15 watershed is 238 square miles that extends from the Trinity Mountains to the  
16 confluence with the Sacramento River downstream of the City of Redding (DWR  
17 1986 and Western Shasta Resource Conservation District [WSRCD] 2004).

18 Hydrology in the watershed is divided into the upper 238-square mile watershed  
19 upstream of Whiskeytown Dam at River Mile 18.1, and the lower 49 square miles  
20 watershed downstream of the dam. Clear Creek flows approximately 17 miles  
21 from the Trinity Mountains into Whiskeytown Lake. Clear Creek continues for  
22 18.1 miles downstream of Whiskeytown Lake into the Sacramento River  
23 downstream of the CVP Keswick Dam and south of the City of Redding.

24 Whiskeytown Dam, a CVP facility constructed by 1963, is the only dam on Clear  
25 Creek and is located approximately 16.5 miles downstream of the headwaters  
26 (Reclamation 1997). Whiskeytown Lake, which is formed by the dam, has a  
27 storage capacity of 0.241 MAF; and regulates runoff from Clear Creek and  
28 diversions from the Trinity River watershed, as described in Appendix 3A, No  
29 Action Alternative: Central Valley Project and State Water Project Operations.  
30 Flows from Lewiston Reservoir in the Trinity River watershed are diverted to  
31 Whiskeytown Lake through the Clear Creek Tunnel. Currently, the Clear Creek  
32 Tunnel between Lewiston Reservoir and Whiskeytown Lake has a capacity of  
33 3,200 cfs (Reclamation 2011b).

34 Water from Whiskeytown Lake is released to the Sacramento River through the  
35 Spring Creek Tunnel which conveys water to the Spring Creek Conduit, and then  
36 to Keswick Reservoir. Water from Whiskeytown Lake also is released into Clear  
37 Creek directly from Whiskeytown Lake; or during high flow conditions  
38 (e.g., flood flows), from a Glory Hole within Whiskeytown Lake through a  
39 conduit into Clear Creek. Most of the flows are released through the Spring  
40 Creek Tunnel and Powerplant to Keswick Reservoir. These flows into Keswick  
41 Reservoir provide cold water flows that reduce temperatures in the upper  
42 Sacramento River, especially during the fall months. Water also is discharged  
43 from Whiskeytown Lake to Clear Creek to provide for instream flows and water

1 for users located in the CVP Clear Creek South Unit within, or adjacent to, the  
2 Clear Creek watershed.

3 The capacity of the outlet from Whiskeytown Dam that conveys water to Clear  
4 Creek is 1,240 cfs when the water elevation in Whiskeytown Lake is at  
5 1,220.5 feet. To provide flows into Clear Creek in excess of 1,240 cfs, the  
6 Whiskeytown Reservoir water elevations need to be raised higher than 1,220 feet  
7 to allow water to flow through the Glory Hole spillway, as described below  
8 (CALFED 2004; Reclamation 2009a).

9 Historical water storage volume and water storage elevations related to  
10 Whiskeytown Lake for Water Years 2001 through 2012 are presented on  
11 Figures 5.13 and 5.14 (DWR 2013j, 2013k, 2013l). Whiskeytown Lake storage is  
12 relatively constant due to agreements between Reclamation and the National Park  
13 Service to maintain certain winter and summer lake elevations for recreation.  
14 Whiskeytown Lake outflow variations were greater prior to 2006 when Trinity  
15 River restoration flows were implemented which reduced the amount of water  
16 available for conveyance to CVP water users. In addition, hydrologic conditions  
17 in the years following 2006 were drier than the water years between 2001  
18 and 2006.

19 *Implementation of 2009 National Marine Fisheries Service Biological*  
20 *Opinion*

21 In accordance with the 2009 National Marine Fisheries Service (NMFS)  
22 Biological Opinion (BO) Reasonable and Prudent Alternative (RPA),  
23 Reclamation is required to manage Whiskeytown Lake releases to meet daily  
24 water temperatures in Clear Creek at Igo, as discussed in Appendix 3A, No  
25 Action Alternative: Central Valley Project and State Water Project Operations.

26 *Clear Creek*

27 Substantial modifications of the Clear Creek stream channel occurred due to  
28 placer mining activities from the mid-1800s through the early 1900s. In addition,  
29 several irrigation diversions were constructed along the lower Clear Creek reach  
30 during the late 1800s and early 1900s. One of the largest diversions was the  
31 15-foot-high, 200-foot-wide McCormick-Saeltzer Dam constructed in 1903 at  
32 River Mile 6.5 (approximately 12 miles downstream of Whiskeytown Dam). The  
33 downstream of Whiskeytown Dam was constructed upstream of a steep gorge  
34 along Clear Creek and removed in 2001. More recent channel modifications  
35 occurred in the lower Clear Creek due to gravel extraction activities from the  
36 1950s to 1970s.

37 Construction of Whiskeytown Dam modified the hydraulics, gravel loading, and  
38 sediment transport in the lower Clear Creek. The overall average annual flow in  
39 the lower Clear Creek was reduced by 87 percent following construction of the  
40 dam (DWR 1984, 1986). The dam also reduced gravel loading into the lower  
41 Clear Creek and the frequency of high flow events that move the gravel and  
42 remove fine sediments from riffles. This change in hydrology and loss of gravel  
43 loading adversely affected the salmonid habitat downstream of Whiskeytown  
44 Dam, including compaction of riffles with sand. Recently, minimum flow

1 releases from Whiskeytown Lake into Clear Creek occur in accordance with  
 2 Federal and state requirements (DWR 1984), as described in Appendix 3A, No  
 3 Action Alternative: Central Valley Project and State Water Project Operations.  
 4 Historical flow data has been collected since 1941 at the Igo Gage at River  
 5 Mile 10.9 (approximately 7.2 miles downstream of Whiskeytown Dam)  
 6 (DWR 1986 and WSRCD 2004).

7 Since the early 1980s, numerous studies were conducted to evaluate methods to  
 8 rehabilitate and/or restore habitat along lower Clear Creek. In the 1990s,  
 9 additional studies were conducted following the adoption of the 1992 Central  
 10 Valley Project Improvement Act (CVPIA). In 1998, a watershed management  
 11 plan prepared by the WSRCD evaluated methods to achieve healthy fish  
 12 populations, diverse biological habitats, recreational opportunities, clean and safe  
 13 conditions for visitors, and protection of property rights developed by the Lower  
 14 Clear Creek Coordinated Resource Management and Planning Group of local  
 15 landowners, stakeholders, and agencies (WSRCD 1998). The recommendations  
 16 included the following:

- 17 • Removal of the McCormick-Saeltzer Dam.
- 18 • Inject gravel downstream of Whiskeytown Dam and reconstruct gravel  
 19 channels below McCormick-Saeltzer Dam to reduce stranding.
- 20 • Modify water release patterns from Whiskeytown Dam.
- 21 • Reduce exotic vegetation along Clear Creek.
- 22 • Reduce sands in Clear Creek through erosion control programs in the lower  
 23 watershed.

24 This and other studies led to the formation of the Lower Clear Creek Floodway  
 25 Rehabilitation Project that was implemented under CVPIA (CALFED 2004,  
 26 WSRCD 2002). Initial actions under this program included gravel augmentation  
 27 initiated in 1996, increase in Whiskeytown Dam releases initiated in 2001,  
 28 removal of the McCormick-Saeltzer Dam in 2001, reconstruction and  
 29 revegetation of the floodway, and reduction of watershed erosion.

30 Following the removal of the McCormick-Saeltzer Dam, extensive  
 31 geomorphological studies have been conducted to recommend approaches for  
 32 restoration of the channel and adjacent floodplain downstream of the McCormick-  
 33 Saeltzer Dam site. Based upon hydrological data collected at the Igo gage, one of  
 34 the studies discussed that peak flow events in lower Clear Creek following  
 35 completion of Whiskeytown Dam occur about once every 3 years; although, the  
 36 pre-dam frequency was approximately once every 2 years. Clear Creek flows at  
 37 Igo between 2000 and 2012 are presented on Figure 5.15. During this period,  
 38 high flow events occurred in April and May of 2003 and December 2005 (DWR  
 39 2013s). The high flow events: 1) naturally moved gravel placed downstream of  
 40 Whiskeytown Dam and along Clear Creek; 2) developed and maintained Clear  
 41 Creek channel and adjacent floodplain habitat for spring-run and fall-run Chinook  
 42 Salmon and steelhead; 3) created and maintained deep pools in the channel to  
 43 support spawning of spring-run Chinook Salmon and steelhead, and create

1 appropriate salmonid habitat within and along Clear Creek; and 4) established and  
2 maintained nesting and foraging habitat for neotropical migrant birds, native  
3 resident birds, and amphibians.

4 Following removal of McCormick-Saeltzer Dam, the Clear Creek channel and  
5 adjacent floodplain geomorphology changed. The Clear Creek channel capacity  
6 is generally about 3,000 cfs. The 2004 studies indicated that flows in excess of  
7 3,000 cfs are required to overflow from the Clear Creek channel onto the adjacent  
8 floodplains. The study discussed that during pre- and post-Whiskeytown periods,  
9 the 5-year flood event at Igo decreased from 9,000 to 3,400 cfs and the 2.5-year  
10 flood event decreased from 6,200 to 1,800 cfs. Therefore, the study discussed  
11 that flows in excess of 5,000 cfs did not occur more frequently than 3 times in  
12 10 years (CALFED 2004).

13 *Implementation of 2009 National Marine Fisheries Service Biological*  
14 *Opinion*

15 The 2009 NMFS BO RPA requires Reclamation to release spring attraction flows  
16 for adult spring-run Chinook Salmon and channel maintenance flows in Clear  
17 Creek and to continue gravel augmentation programs initiated under CVPIA. The  
18 spring attraction flows are to be released from Whiskeytown Lake into Clear  
19 Creek in at least two pulse flows of at least 600 cfs in May and June.

20 The channel maintenance flows are to be released at a minimum flow of  
21 3,250 cfs, which is excess of the 1,240 cfs capacity of the Whiskeytown Dam  
22 outlet to Clear Creek. Therefore, to provide channel maintenance flows, the  
23 Whiskeytown Lake water elevation must be increased to provide flow of water  
24 over the Glory Hole inlet. The Glory Hole is designed to operate with the higher  
25 water elevations during flood events. However, during non-flood periods, raising  
26 the water elevations and operating the Glory Hole inlet can cause safety concerns  
27 for recreationists along the Whiskeytown Lake shoreline.

28 *Shasta Lake and Keswick Reservoir*

29 The CVP Shasta and Keswick dams are located at approximately River Miles 308  
30 and 299, respectively, as described in Appendix 3A, No Action Alternative:  
31 Central Valley Project and State Water Project Operations. Shasta Lake, a CVP  
32 facility on the Sacramento River formed by Shasta Dam, is located near Redding.  
33 Construction on the 4.552-MAF reservoir was initiated in 1945. Water flows  
34 from Shasta Lake along the Sacramento River into the 0.0238 MAF Keswick  
35 Reservoir, a CVP facility, which operates as an afterbay, or regulating reservoir,  
36 for Shasta Lake hydropower operations. Construction on Keswick Reservoir was  
37 initiated in 1950. A temperature control device at Shasta Dam was constructed  
38 between 1996 and 1998 to provide cold water without power bypass to the  
39 Sacramento River downstream of Keswick Reservoir.

40 Historical water storage volumes and water storage elevations for Shasta Lake for  
41 Water Years 2001 through 2012 are presented on Figures 5.16 and 5.17 (DWR  
42 2013m, 2013n, 2013o). Shasta Lake storage varies in accordance with upstream  
43 hydrology and downstream water demands and instream flow requirements. For  
44 example, storage declined during the drier years in 2008 and 2009.

1 Keswick Reservoir receives water from Shasta Lake and Whiskeytown Lake, as  
 2 described above; and from Spring Creek. Flows on Spring Creek are partially  
 3 regulated by the CVP Spring Creek Debris Dam (Reclamation 2014d, 2014e).  
 4 The debris dam minimizes the potential for debris entering the Spring Creek  
 5 Powerplant, which is located at the discharge end of the Spring Creek Conduit  
 6 immediately upstream of Keswick Reservoir. The debris dam also controls  
 7 contaminated runoff from old mine tailings on upper Spring Creek, which reduces  
 8 water quality effects on aquatic resources.

9 The Keswick Reservoir water storage volume is more consistent throughout the  
 10 year because this reservoir is used to regulate flow releases to the powerplant and  
 11 other downstream uses and not to provide long-term water storage, as shown on  
 12 Figures 5.18 and 5.19 (DWR 2013p, 2013q, 2013r).

13 *Implementation of 2009 National Marine Fisheries Service Biological*  
 14 *Opinion*

15 The 2009 NMFS BO RPA requires Reclamation meet specific temperature  
 16 requirements at Balls Ferry, Jelly's Ferry, and Bend Bridge based upon minimum  
 17 end-of-September storage in Shasta Lake for a specified frequency over 10 years,  
 18 as described in Appendix 3A, No Action Alternative: Central Valley Project and  
 19 State Water Project Operations. Reclamation also is required to evaluate a  
 20 monthly Keswick release schedule to address releases in fall and early winter  
 21 within the range of 7,000 and 3,250 cfs; to be adjusted in consideration of the  
 22 water year type, Shasta Lake storage, and the need to provide flow releases under  
 23 the 2009 NMFS BO RPA and to meet other Federal and state water quality  
 24 requirements in the Delta.

25 *Sacramento River from Keswick Dam to the Delta*

26 Water released from Shasta Dam travels approximately 245 miles over three to  
 27 four days to the northern Delta boundary near Freeport (Reclamation 2013a). The  
 28 upper reach of the Sacramento River flows for approximately 60 miles from  
 29 Keswick Dam to Red Bluff; and the middle reach of the Sacramento River flows  
 30 approximately 160 miles from Red Bluff to the confluence with the Feather River.  
 31 The lower reach of the Sacramento River flows for approximately 20 river miles  
 32 between the confluence with the Feather River and Freeport, immediately  
 33 downstream of the confluence with the American River.

34 Moderately high releases (greater than 10,000 cfs) are typically sustained during  
 35 the major irrigation season of June through September. Flows are released in the  
 36 fall months from CVP and SWP reservoirs to meet water temperature criteria for  
 37 winter-run Chinook Salmon spawning and incubation, to provide suitable habitat  
 38 for spring-run and early returning fall-run Chinook Salmon, provide water  
 39 supplies to rice farms for rice stubble decomposition, and to provide water for  
 40 wildlife refuges.

41 *Sacramento River from Keswick Dam to Red Bluff*

42 Reclamation operates the Shasta, Sacramento River, and Trinity River divisions  
 43 of the CVP to meet (to the extent possible) the provisions of SWRCB Order  
 44 90-05. An April 5, 1960 Memorandum of Agreement between Reclamation and

1 California Department of Fish and Wildlife (CDFW) originally established flow  
2 objectives in the Sacramento River for the protection and preservation of fish and  
3 wildlife resources. The agreement provided for minimum releases into the natural  
4 channel of the Sacramento River at Keswick Dam for normal and critically dry  
5 years, as described in Appendix 3A, No Action Alternative: Central Valley  
6 Project and State Water Project Operations. Since October 1981, Keswick Dam  
7 has operated based on a minimum release of 3,250 cfs for normal years from  
8 September 1 through the end of February, in accordance with an agreement  
9 between Reclamation and CDFW. This release schedule was included in  
10 SWRCB Order 90-05, which maintains a minimum release of 3,250 cfs at  
11 Keswick Dam and Red Bluff Pumping Plant from September through the end of  
12 February in all water years except critically dry years.

13 Generally, releases from Keswick Reservoir are implemented to comply with the  
14 minimum fishery requirement by October 15 each year and to minimize changes  
15 in Keswick releases between October 15 and December 31. Releases may be  
16 increased during this period to meet downstream needs such as higher outflows in  
17 the Delta to meet water quality requirements, or to meet flood control  
18 requirements. Releases from Keswick Dam may be reduced when downstream  
19 tributary inflows increase to a level that will meet flow needs. Reclamation  
20 attempts to establish a base flow that minimizes release fluctuations to reduce  
21 impacts to fisheries and bank erosion from October through December.

22 The Sacramento River between Keswick Dam and the City of Red Bluff flows  
23 through the northern foothills of the Sacramento Valley. Flows are influenced by  
24 outflow from Keswick Reservoir and inflows from Clear Creek (described  
25 above); and Cow Creek, Bear Creek, Cottonwood Creek, Battle Creek, and  
26 Paynes Creek which provide 15 to 20 percent of the flows in this reach as  
27 measured at Bend Bridge. There are several moderate major diversions along the  
28 Sacramento River upstream of Red Bluff, including the CVP Wintu Pumping  
29 Plant to provide water for the Bella Vista Water District, and the Anderson-  
30 Cottonwood Irrigation District Diversion. Both of these diversions near Redding  
31 provide water to agricultural, municipal, and industrial water users (Reclamation  
32 1997). No major storage or diversion structures have been constructed in the  
33 tributary watersheds in this reach of the Sacramento River, although several small  
34 diversions for irrigation, domestic use, and hydroelectric power generation are  
35 present (Reclamation 1997). Flow patterns on one major tributary in this reach,  
36 Battle Creek, are undergoing changes as the Battle Creek Salmon and Steelhead  
37 Restoration Project is implemented to restore ecological processes along 42 miles  
38 of Battle Creek and 6 miles of tributaries while minimizing reductions to  
39 hydroelectric power generation through the decommissioning of five powerplants.

#### 40 *Sacramento River from Red Bluff to the Delta*

41 Between Red Bluff and Colusa, the Sacramento River is a meandering stream,  
42 migrating through alluvial deposits between widely spaced levees. From Colusa  
43 to the northern boundary of the Delta near Freeport, flows increase due to the  
44 addition of the Feather and American rivers flows.

1 Recent mean daily flows in the Sacramento River at Bend Bridge (near Red  
2 Bluff), Vina Bridge (near Tehama), Hamilton City, Wilkins Slough (upstream of  
3 the Feather River confluence), Verona (downstream of the Feather River  
4 confluence), and Freeport (downstream of the American River Confluence and  
5 near the northern boundary of the Delta), are presented on Figures 5.20  
6 through 5.25 (DWR 2013u, 2013v, 2013w, 2013x, 2013y, 2013z). Flows in  
7 the Sacramento River generally peak during winter and spring storm events.  
8 Upstream of Hamilton City, sharp increases in flow occur during rainfall events,  
9 such as events in February 2004, December 2005/January 2006, and January  
10 2010. Downstream of Hamilton City, the high flow events occur over a longer  
11 period of time as water flows into the river from the tributaries.

12 Historically, Reclamation has maintained a minimum flow of 5,000 cfs at Chico  
13 Landing to support navigation in accordance with references to Sacramento River  
14 Division operations in the River and Harbors Act of 1935 and the Rivers and  
15 Harbors Act of 1937. Currently, there is no commercial traffic between  
16 Sacramento and Chico Landing, and USACE has not dredged this reach to  
17 preserve channel depths since 1972. However, long-time water users diverting  
18 from the river have set their pump intakes just below this level. Therefore, the  
19 CVP is operated to meet the navigation flow requirement of 5,000 cfs at the  
20 Wilkins Slough gauging station when diversions are occurring downstream, under  
21 all but the most critical water supply conditions.

22 Major diversions in this reach of the Sacramento River include the CVP Red  
23 Bluff Pumping Plant, Glenn-Colusa Irrigation District (GCID) intake, and  
24 individual diversions for the CVP Sacramento River Settlement Contractors. The  
25 Red Bluff Pumping Plant was completed in August 2012 to improve fish passage  
26 conditions on the Sacramento River by removing the Red Bluff Diversion Dam,  
27 and to continue to divert water from the Sacramento River into the Tehama-  
28 Colusa and Corning canals. The GCID Main Pump Station is located near  
29 Hamilton City to divert water into the GCID Canal that conveys water to over  
30 130,000 acres, including the USFWS Sacramento National Wildlife Refuge; and  
31 terminates at the Colusa Basin Drain near Williams. In 2001, the GCID Fish  
32 Screen was completed in addition to several canal improvements to allow year-  
33 round water deliveries.

34 Major streams entering the Sacramento River between Red Bluff and the Feather  
35 River include Antelope, Elder, Mill, Thomes, Deer, Stony, Big Chico, and Butte  
36 creeks. No major storage or diversion structures have been constructed on  
37 Antelope, Elder, Mill, and Thomes creeks, although several small seasonal  
38 diversions for irrigation, domestic use, and hydroelectric power generation are  
39 present (Reclamation 1997). Moderate non-CVP and non-SWP diversion dams  
40 are located on Deer, Big Chico, and Butte creeks.

41 Stony Creek flows are controlled by East Park Dam, Stony Gorge Dam, and  
42 Black Butte Dam (Reclamation 1997). East Park and Stony Gorge reservoirs  
43 store surplus water for irrigation deliveries and are operated by Reclamation as  
44 part of the Orland Project which is independent of the CVP. Black Butte Dam is  
45 operated by the USACE for flood control and irrigation supply. Black Butte Dam

1 operations are coordinated with the CVP. The GCID canal, which crosses Stony  
2 Creek downstream of Black Butte Dam, includes a seasonal gravel dam  
3 constructed across the creek on the downstream side of the canal.

4 The Sacramento River between Red Bluff and Chico Landing, the Sacramento  
5 River Flood Control Project has provided bank protection and incidental channel  
6 modification since 1958 (DWR 2013t). Between Chico Landing and Colusa, the  
7 flood management facilities consist of levees and overflow areas. Black Butte  
8 Reservoir regulates Stony Creek flood flows, which enter the Sacramento River  
9 downstream of Hamilton City. Right bank levees from Ord Ferry through Colusa  
10 prevent Sacramento River flood water from entering the Colusa Basin, except  
11 when flows exceed 300,000 cfs near Ord Ferry (DWR 2013t). Three flood relief  
12 weirs along the right bank, downstream of Chico Landing, allow flood flows to  
13 spill into the Butte Basin Overflow Area. The left bank levee begins midway  
14 between Ord Ferry and Butte City and extends south through Verona, and  
15 includes the Moulton and Colusa weirs that allow flood flows to spill into the  
16 Butte Basin Overflow Area. The natural Sutter Basin overflow (Sutter Bypass) to  
17 the east of the Sacramento River and downstream of the Sutter Buttes was  
18 included in the Sacramento River Flood Control Project. The Sutter Bypass  
19 conveys floodwaters from the Butte Basin Overflow Area, Butte Creek,  
20 Wadsworth Canal, and Reclamation Districts 1660 and 1500 drainage plants, state  
21 drainage plants, and Tisdale Weir to the confluence of the Sacramento and  
22 Feather rivers. Downstream of Colusa, Reclamation Districts 70, 108, and  
23 787 pump flood waters from adjacent closed basin lands into the river.

24 The Colusa Basin Drain provides drainage for a large portion of the irrigated  
25 lands on the western side of the Sacramento Valley in Glenn, Colusa, and Yolo  
26 counties; and supplies irrigation water to lands in this area. Water from the drain  
27 is discharged to the Sacramento River through the Knights Landing Outfall, a  
28 gravity flow structure and prevents the Sacramento River from flowing into the  
29 Colusa Basin.

30 *Implementation of 2009 National Marine Fisheries Service Biological*  
31 *Opinion*

32 The 2009 NMFS BO RPA requires Reclamation to evaluate approaches to  
33 provide minimum flows at Wilkins Slough of less than 5,000 cfs.

34 *Yolo Bypass*

35 Flows from the Sacramento River, Feather River, Sutter Bypass, and Natomas  
36 Cross Canal join upstream of Verona on the Sacramento River. When the  
37 Sacramento River flows exceed 62,000 cfs, flows spill over the Fremont Weir into  
38 the Yolo Bypass. The Yolo Basin was a natural overflow area located to the west  
39 of the Sacramento River. The Sacramento River Flood Control Project modified  
40 the basin by confining the extent of overflow through a leveed bypass and  
41 allowing flood flows to enter the Yolo Bypass from the Sacramento River over  
42 the Fremont and Sacramento weirs. The Yolo Bypass conveys floodwaters  
43 around the Sacramento metropolitan area and reconnects to the Sacramento River

1 at Rio Vista (DWR 2013t). Tributaries within the Yolo Bypass include the Cache  
2 Creek Detention Basin, Willow Slough, and Putah Creek.

3 Flows also enter the Yolo Bypass from the Colusa Basin, including from the  
4 Colusa Basin Drain through the Knights Landing Ridge Cut. In 2011 and 2012,  
5 construction at the outfall gates required water from the Colusa Basin Drain to be  
6 diverted into the Yolo Bypass. These events temporarily resulted in a fall pulse  
7 flow in the Yolo Bypass that increased the volume of flow by more than 300 to  
8 900 percent (Frantzich 2014).

9 Historical mean daily flows into the Yolo Bypass at Fremont Weir are presented  
10 on Figure 5.26 (DWR 2013aa). Between 2002 and 2012, flows have entered the  
11 Yolo Bypass at Fremont Weir during 13 periods, including:

- 12 • January 2002 – spill continued for 7 days with flows up to 30,000 cfs
- 13 • January 2003 – spill continued for 6 days with flows up to 22,000 cfs
- 14 • May 2003 – spill continued for 1 day with flows up to 100 cfs
- 15 • January 2004 – spill continued for 3 days with flows up to 3,000 cfs
- 16 • February 2004 – spill continued for 20 days with flows up to 79,000 cfs
- 17 • May 2005 – spill continued for 4 days with flows up to 35,000 cfs
- 18 • January/February 2006 (2 events) – spill continued for a total of 37 days with  
19 flows up to 205,000 cfs
- 20 • March/April/May 2006 – spill continued for 65 days with flows up to  
21 96,000 cfs
- 22 • January 2010 – spill continued for 4 days with flows up to 5,000 cfs
- 23 • December 2010 – spill continued for 4 days with flows up to 9,000 cfs
- 24 • March/April 2011 – spill continued for 24 days with flows up to 85,000 cfs
- 25 • December 2012 – spill continued for 5 days with flows up to 26,000 cfs

26 *Implementation of 2009 National Marine Fisheries Service Biological*  
27 *Opinion*

28 The 2009 NMFS BO RPA requires Reclamation to evaluate approaches to  
29 increase acreage of seasonal floodplain rearing habitat with biologically  
30 appropriate durations and magnitudes, from December through April, in the lower  
31 Sacramento River basin, on a return rate of approximately one to three years. The  
32 initial performance measure was defined in the RPA as 17,000 to 20,000 acres of  
33 floodplain rearing habitat, such as in the Yolo Bypass, excluding tidally  
34 influenced areas. Reclamation also is required to develop enhancement plans for  
35 Lower Putah Creek, Liberty Island/Lower Cache Slough, and Lower Yolo  
36 Bypass. The plans also are required to develop improvements to Fremont Weir  
37 and Lisbon Weir to eliminate migration barriers and stranding potential.

1 *Feather River Watershed*

2 The Feather River, with a drainage area of 3,607 square miles on the east side of  
3 the Sacramento Valley, is the largest tributary to the Sacramento River below  
4 Shasta Dam (Reclamation 1997, DWR 2007a). The Feather River enters the  
5 Sacramento River from the east at Verona. The total flow is provided by the  
6 Feather River and tributaries, which include the Yuba and Bear rivers.

7 *Upper Feather River, Lake Oroville, and the Thermalito Complex*

8 The upper Feather River includes numerous reservoirs and powerplant diversions,  
9 including the 1,308-TAF Lake Almanor owned by Pacific Gas & Electric  
10 Company; and the SWP Upper Feather River Lakes, including Antelope Lake,  
11 Lake Davis, and Frenchman Lake. The major SWP facility on the Feather River  
12 is the 3,500-TAF Lake Oroville, which is formed by the Oroville Dam located at  
13 the confluence of the North, Middle, and South forks of the Feather River. Lake  
14 Oroville stores winter and spring runoff, which is released into the Feather River  
15 to meet SWP water demands; provide pumpback capability to allow for on-peak  
16 electrical generation; provide 750 TAF of flood control storage, recreation, and  
17 freshwater releases to control salinity intrusion in the Delta; and for fish and  
18 wildlife protection, as described in Appendix 3A, No Action Alternative: Central  
19 Valley Project and State Water Project Operations. Historical water storage  
20 volumes and water storage elevations for Lake Oroville for Water Years 2001  
21 through 2012 are presented on Figures 5.27 and 5.28 (DWR 2013 ab, 2013ac).

22 A maximum of 17,400 cfs can be released from Lake Oroville through the  
23 Edward Hyatt Powerplant, and the Thermalito Power Canal into the Thermalito  
24 Diversion Pool. Water continues through the Thermalito Diversion Pool into the  
25 Feather River Fish Hatchery and the 11,768-acre-foot Thermalito Forebay formed  
26 by the Thermalito Diversion Dam. Water is released from the Thermalito  
27 Forebay through the Thermalito Powerplant into the Thermalito Afterbay and the  
28 low flow channel of the Feather River.

29 Historical water storage volumes and water storage elevations for Thermalito  
30 Afterbay for Water Years 2001 through 2012 are presented on Figures 5.29  
31 and 5.30 (DWR 2013ab, 2013ac, 2013ad). Water from the afterbay flows into the  
32 Feather River. Historical mean daily flows in the Feather River are presented on  
33 Figure 5.31 (DWR 2013af). Local agricultural districts divert water directly from  
34 the afterbay.

35 Maximum allowable ramp-down release requirements in the low flow channel of  
36 the Feather River are required to prevent rapid reductions in water levels that  
37 could potentially cause redd dewatering and stranding of juvenile salmonids and  
38 other aquatic organisms. Water releases from Lake Oroville are also affected by  
39 temperature criteria, as described in Appendix 3A, No Action Alternative: Central  
40 Valley Project and State Water Project Operations.

41 Major diversions on the Feather River downstream of the Thermalito Complex  
42 include diversions into the Western Canal, Richvale Canal, the Pacific Gas and  
43 Electric Company Lateral, and the Sutter-Butte Canal. Some of the water  
44 diverted into these canals is exported to the Butte Creek watershed. Riparian

1 water users along the Feather River also divert water for agricultural and  
2 municipal uses within the Feather River and Butte Creek watersheds  
3 (Reclamation 1997; DWR 2007).

#### 4 *Lower Yuba River*

5 The Yuba River watershed extends over 1,339 square miles in the Sierra Nevada.  
6 The Yuba River is a major tributary to the Feather River, and historically has  
7 contributed over 40 percent of the lower Feather River flows (Reclamation 1997).  
8 The major reservoir in the watershed is the 970-TAF New Bullards Bar Reservoir  
9 that is owned and operated by the Yuba County Water Agency to provide flood  
10 control, water storage, and hydroelectric generation (Yuba County Water Agency  
11 [YCWA] 2012). The Yuba River watershed also includes over 400 TAF  
12 additional storage in reservoirs located upstream of New Bullards Bar Reservoir.

13 Water is diverted from New Bullards Bar Reservoir through the Colgate Tunnel  
14 and Powerhouse and discharged into the Yuba River. The 70-TAF Englebright  
15 Lake is formed by the Harry L. Englebright Dam downstream of New Bullards  
16 Dam. Englebright Lake was constructed by the California Debris Commission to  
17 trap and store sediment from historical hydraulic mining sites in the upper  
18 watershed and provide recreation and hydroelectric generation opportunities  
19 (USACE 2013). Following decommissioning of the California Debris  
20 Commission in 1986, administration of Englebright Dam and Lake was assumed  
21 by the USACE (USACE 2012, 2013, 2014). Major water diversions from the  
22 Yuba River occur 12.5 miles downstream of Englebright Dam at Daguerre Point  
23 Dam. Water transfers have occurred between Yuba County Water Agency and  
24 other water agencies, including CVP and SWP water users, since 2008 under the  
25 Lower Yuba River Accord, as described in Appendix 3A, No Action Alternative:  
26 Central Valley Project and State Water Project Operations (Lower Yuba River  
27 Accord, River Management Team [LYRARMT] 2013).

#### 28 *American River from Folsom Lake to Sacramento River*

29 The American River watershed extends over 1,895 square miles and contributes  
30 approximately 15 percent of the flow in the lower Sacramento River.

#### 31 *Folsom Lake and Lake Natoma*

32 Folsom Lake and Lake Natoma on the American River are located within portions  
33 of the American River watershed that could be affected by changes in CVP and/or  
34 SWP operations. Folsom Lake is a CVP facility formed by Folsom Dam 7 miles  
35 upstream of the CVP Nimbus Dam (Reclamation et al. 2006). Folsom, Lake is  
36 the largest reservoir in the American River watershed, and has a capacity of  
37 967 TAF. Numerous smaller reservoirs in the upper basin provide hydroelectric  
38 generation and water supply and are not owned or operated by Reclamation or  
39 DWR. The total upstream reservoir storage above Folsom Lake is approximately  
40 820 TAF. Ninety percent of this upstream storage is provided by five reservoirs:  
41 French Meadows (136 TAF); Hell Hole (208 TAF); Loon Lake (76 TAF); Union  
42 Valley (271 TAF); and Ice House (46 TAF).

1 Nimbus Dam creates Lake Natoma, a forebay built to re-regulate flows of the  
2 American River and to direct water into the CVP Folsom South Canal. Releases  
3 from Nimbus Dam to the American River pass through the Nimbus Powerplant  
4 when releases are less than 5,000 cfs or the spillway gates for higher flows. The  
5 American River flows 23 miles between Nimbus Dam and the confluence with  
6 the Sacramento River. Historical water storage volumes and water storage  
7 elevations for Folsom Lake and Lake Natoma for Water Years 2001 through 2012  
8 are presented on Figures 5.32 through 5.35) (DWR 2013ag, 2013ah, 2013ai,  
9 2013aj). Median daily flows in American River downstream of Nimbus Dam are  
10 presented in Figure 5.36 (DWR 2013ak).

11 Water is diverted to municipal and industrial water users, including water rights  
12 holders, upstream of Folsom Dam, from the Folsom South Canal, and from the  
13 American River downstream of Folsom Dam. During extreme critical dry years,  
14 water elevations in Folsom Lake can be too low for adequate operation of  
15 diversion facilities; and Reclamation has provided temporary barges with intake  
16 and conveyance facilities to divert water from the lake to the adjacent water users.

17 *Lower American River Flows*

18 Flow patterns in the lower American River (downstream of Lake Natoma) are  
19 influenced by operations of the CVP both within the American River watershed  
20 and within the entire Sacramento River watershed. Flows can be affected by local  
21 operations such as flood management requirements at Folsom Lake and Lake  
22 Natoma, federal and state flow requirements, temperature requirements and water  
23 uses in the American River watershed. Flows can also be affected by delta  
24 operations including outflow and salinity requirements as well as exports within  
25 and south of the delta. Recent mean daily flows in the American River are  
26 presented on Figure 5.36 (DWR 2013ak).

27 *Lower American River Flood Management*

28 Flood management requirements and regulating criteria for October 1 through  
29 May 31 each year were specified in 1987 by the USACE to manage flooding in  
30 the Sacramento area, as practicable; provide maximum amount of water  
31 conservation storage in Folsom without impairing the flood control; and provide  
32 maximum amount of power practicable and be consistent with required flood  
33 control operations and the conservation functions of the reservoir. Following  
34 significant flood events in February 1986 and January 1997, the lower American  
35 River flooding issues were analyzed; and revised flood operations criteria were  
36 developed by the Sacramento Area Flood Control Agency (SAFCA), as described  
37 in Appendix 3A, No Action Alternative: Central Valley Project and State Water  
38 Project Operations. The SAFCA release criteria are generally equivalent to the  
39 USACE plan, except the SAFCA diagram may prescribe flood releases earlier  
40 than the USACE plan. The SAFCA diagram also relies on Folsom Dam outlet  
41 capacity to make the earlier flood releases. The outlet capacity at Folsom Dam is  
42 currently limited to 32,000 cfs based on lake elevation. Since 1996, Reclamation  
43 has operated according to modified flood control criteria, which reserve 400 to  
44 670 TAF of flood control space in Folsom Reservoir in combination with empty

1 reservoir space in Hell Hole, Union Valley, and French Meadows to be treated as  
2 if it were available in Folsom Reservoir.

3 Reclamation and USACE constructed an auxiliary spillway under the Joint  
4 Federal Project, at Folsom Dam in accordance with the recommendations of the  
5 Water Control Manual Update (Reoperation Study). The USACE is also  
6 implementing increased system capabilities provided by the authorized features of  
7 the Common Features Project to strengthen the American River levees to convey  
8 up to 160,000 cfs and completion of the authorized Folsom Dam Mini-Raise  
9 Project.

#### 10 *Lower American River Minimum Flow and Temperature Requirements*

11 The minimum allowable flows in the lower American River are defined by  
12 SWRCB Water Right Decision 893 (D-893), which states that, in the interest of  
13 fish conservation, releases should not ordinarily fall below 250 cfs between  
14 January 1 and September 15 or below 500 cfs at other times. D-893 minimum  
15 flows are rarely the controlling objective of CVP operations at Nimbus Dam.  
16 Nimbus Dam releases are nearly always controlled during significant portions of a  
17 water year by either flood control requirements or are coordinated with other CVP  
18 and SWP releases to meet CVP water supply and Delta operations objectives.  
19 Power regulation and management needs occasionally control Nimbus Dam  
20 releases. Nimbus Dam releases generally exceed the D-893 minimum flows in all  
21 but the driest of conditions.

22 Dedication of water in accordance with Section 3406(b)(2) of CVPIA on the  
23 American River provides instream flows below Nimbus Dam greater than those  
24 that would have occurred under pre-CVPIA conditions, as described in Appendix  
25 3A, No Action Alternative: Central Valley Project and State Water Project  
26 Operations. Instream flow objectives from October through May generally aim to  
27 provide suitable habitat for salmon and steelhead spawning, incubation, and  
28 rearing, while considering impacts to other CVP and SWP uses. Instream flow  
29 objectives for June to September endeavor to provide suitable flows and water  
30 temperatures for juvenile steelhead rearing, while balancing the effects on  
31 temperature operations into October and November to help support fall-run  
32 Chinook Salmon spawning.

33 In July 2006, Reclamation, the Sacramento Area Water Forum and other  
34 stakeholders agreed to a flow and temperature regime (known as the Lower  
35 American River Flow Management Standard [FMS]) to improve conditions for  
36 fish in the lower American River, as described in Appendix 3A, No Action  
37 Alternative: Central Valley Project and State Water Project Operations.  
38 Minimum flow requirements during October, November, and December are  
39 primarily intended to address fall-run Chinook Salmon spawning, and flow  
40 requirements during January and February address fall-run Chinook Salmon egg  
41 incubation and steelhead spawning. From March through May, minimum flow  
42 requirements are primarily intended to facilitate steelhead spawning and egg  
43 incubation, as well as juvenile rearing and downstream movement of fall-run  
44 Chinook Salmon and steelhead. The June through September flows are designed

1 to address over-summer rearing by juvenile steelhead, although this period  
2 partially overlaps with adult fall-run Chinook Salmon immigration.

3 Water temperature control operations in the lower American River are affected by  
4 many factors and operational tradeoffs. These include available cold water  
5 resources, Nimbus release schedules, annual hydrology, Folsom power penstock  
6 shutter management flexibility, Folsom Dam Urban Water Supply Temperature  
7 Control Device (TCD) management, and Nimbus Hatchery considerations, as  
8 described in Appendix 3A, No Action Alternative: Central Valley Project and  
9 State Water Project Operations. Meeting both the summer steelhead and fall  
10 salmon temperature objectives without negatively impacting other CVP project  
11 purposes requires reserving water in Folsom Lake for use in the fall to provide  
12 suitable fall-run Chinook Salmon spawning temperatures. In most years, the  
13 volume of cold water is not sufficient to support strict compliance with the  
14 summer water temperature target of 65°F at the downstream end of the  
15 compliance reach at the Watt Avenue Bridge; while at the same time reserving  
16 adequate water for fall releases to protect fall-run Chinook Salmon, or in some  
17 cases, continuing to meet steelhead over-summer rearing objectives later in the  
18 summer. The Folsom Water Supply Intake TCD has provided additional  
19 flexibility to conserve cold water for later use.

20 *American River Flows to Meet Delta Salinity Requirements*

21 Folsom Reservoir also is operated by Reclamation to release water to meet Delta  
22 salinity and flow objectives established to improve fisheries conditions. Weather  
23 conditions combined with tidal action and local accretions from runoff and return  
24 flows can quickly affect Delta salinity conditions, and require increases in spring  
25 Delta inflow to maintain salinity standards, as described in Appendix 3A, No  
26 Action Alternative: Central Valley Project and State Water Project Operations. In  
27 accordance with Federal and state regulatory requirements, the CVP and SWP are  
28 frequently required to release water from upstream reservoirs to maintain Delta  
29 water quality. Folsom Lake is located closer to the Delta than Lake Oroville and  
30 Shasta Lake; therefore, the water generally is first released from Folsom Lake.  
31 Water released from Lake Oroville and Shasta Lake generally reaches the Delta in  
32 approximately three and four days, respectively. As water from the other  
33 reservoirs arrives in the Delta, Folsom Reservoir releases can be reduced.

34 *Implementation of 2009 National Marine Fisheries Service Biological*  
35 *Opinion*

36 The 2009 NMFS BO RPA requires Reclamation to implement the FMS; minimize  
37 flow fluctuation effects in the lower American River between January and May;  
38 and meet specific temperature requirements in the lower American River, as  
39 described in Appendix 3A, No Action Alternative: Central Valley Project and  
40 State Water Project Operations, through operational modifications of temperature  
41 control shutters on Folsom Dam, and installation of structural improvements  
42 (TCDs or the functional equivalent) on several intakes in Folsom Lake and  
43 Lake Natoma.

### 1 **5.3.2.2.2 San Joaquin Valley**

2 The San Joaquin Valley is divided into two drainage major drainage basins. The  
3 northern drainage basin extends from the San Joaquin River along the southern  
4 boundary of the Delta and along the adjacent lands to the San Joaquin River from  
5 the northern drainage of the San Joaquin River in Madera County to the southern  
6 drainage in Fresno County (DWR 2013a). The northern drainage basin includes  
7 the San Joaquin River; five major tributaries that flow from westward from the  
8 Sierra Nevada, including Fresno, Chowchilla, Tuolumne, Merced, Stanislaus, and  
9 Calaveras rivers; and three major creeks that flow eastward from the Coast Range,  
10 including Del Puerto, Orestimba, and Panoche Creek. All flows in the San  
11 Joaquin River flow westward to the Delta.

12 The southern drainage basin (also known as the Tulare Lake Basin) extends into  
13 the southern San Joaquin Valley between the Sierra Nevada on the east,  
14 Tehachapi Mountains on the south, and the Coast Range on the west (DWR  
15 2013a). The southern basin includes four major tributaries, including Kings,  
16 Kaweah, Tule, and Kern rivers, which drain towards three ancient lakes on the  
17 valley floor, including the Tulare, Buena Vista, and Goose lakes. Flows into  
18 these lakes have declined as water supply projects and agricultural development  
19 has occurred. The northern and southern drainage basins are generally  
20 hydrologically separated by a low, broad ridge that extends across the San  
21 Joaquin Valley between the San Joaquin and Kings rivers. However, in flood  
22 years, water flows from the Kings River through the James Bypass and Fresno  
23 Slough into the San Joaquin River near Mendota; therefore, the basins become  
24 hydrologically connected.

25 Flows from Fresno, Chowchilla, Tuolumne, Merced, Calaveras, Kings, Kaweah,  
26 Tule, and Kern rivers contribute substantial flows into the San Joaquin Valley and  
27 affect operations of CVP and SWP water users and operations. However, the  
28 operations of reservoirs on these rivers are not modified within the alternatives  
29 evaluated in this EIS. Therefore, these rivers are not discussed in this chapter.  
30 This chapter will focus on the flows in the San Joaquin and Stanislaus rivers that  
31 are affected by changes in CVP and SWP operations considered in the alternatives  
32 evaluated in this EIS.

#### 33 *San Joaquin River*

34 The San Joaquin River flows 100 miles from Friant Dam to the Delta. Flows in  
35 the upper San Joaquin River are regulated by the CVP Friant Dam which forms  
36 Millerton Lake. Flows downstream of Friant Dam are influenced by flows from  
37 tributary rivers and streams, as described below; including CVP operations of  
38 New Melones Reservoir on the Stanislaus River. Flows on the San Joaquin River  
39 have recently changed since the expiration of the Vernalis Adaptive Management  
40 Plan in 2012.

#### 41 *Millerton Lake*

42 Operations of Millerton Lake and the CVP Friant Division will not be modified  
43 by changes in CVP and SWP operations under the alternatives considered in this  
44 EIS. Therefore, Millerton Lake and Friant Division are not analyzed in this EIS.

1 The following information is presented to provide a general understanding of  
2 Millerton Lake and Friant Division operations as part of the CVP.

3 Friant Dam is located on the San Joaquin River, 25 miles northeast of Fresno  
4 where the San Joaquin River exits the Sierra foothills and enters the valley. The  
5 drainage basin is 1,676 square miles. Millerton Lake, formed by Friant Dam, has  
6 a capacity of 520 TAF. Several reservoirs in the upper portion of the San Joaquin  
7 River watershed, including Mammoth Pool and Shaver Lake, affect the inflow to  
8 Millerton Lake (Reclamation and DWR 2011).

9 Millerton Lake provides flood control capacity on the San Joaquin River, provides  
10 downstream releases to meet senior water rights requirements above Mendota  
11 Pool, and provides conservation storage as well as diversion into Madera and  
12 Friant-Kern Canals. Flood control storage space in Millerton Lake is based on a  
13 complex formula, which considers storage in upstream reservoirs, forecasted  
14 snowmelt, and time of year. Flood management releases occur approximately  
15 once every 3 years and are managed based on downstream channel design  
16 capacity to the extent possible.

17 *San Joaquin River from Friant Dam to Mendota Pool*

18 Historically, in the 40-mile reach between Friant Dam and the Gravelly Ford,  
19 flow is influenced by releases from Friant Dam, with minor contributions from  
20 agricultural and urban return flows. Gravelly Ford, located downstream of Friant  
21 Dam, is a sandy and gravelly section of the San Joaquin River that is subject to  
22 high losses of river flow. The 17-mile reach of the San Joaquin River between  
23 Gravelly Ford and the Mendota Pool historically has been generally dry since  
24 construction of Friant Dam except when flood control flows are released from  
25 Millerton Lake. Reclamation releases water from Millerton Lake to comply with  
26 Holding Contracts between Reclamation and riparian water right holders  
27 downstream of Friant Dam that will provide for at least 5 cfs past each of the  
28 Holding Contract diversion locations that extend to Gravelly Ford (San Joaquin  
29 River Restoration Program [SJRRP] 2011a). The typical release from  
30 Millerton Lake to provide water to water rights holders is approximately 125 cfs  
31 (SWRCB 2012).

32 Two major flood control facilities, the Chowchilla and Eastside bypasses,  
33 intercept flows of the San Joaquin, Fresno, and Chowchilla rivers and smaller San  
34 Joaquin River tributaries to provide flood protection for downstream agricultural  
35 lands. During flood control operations, up to 6,500 cfs of excess flows in the San  
36 Joaquin River at Mendota Pool are diverted into the Chowchilla Bypass which  
37 conveys water to the Chowchilla River. The East Side Bypass conveys high  
38 flows from the Chowchilla River to the San Joaquin River upstream of Fremont  
39 Ford. These bypasses are located in highly permeable soils and are used to  
40 provide an area for groundwater recharge using flood flows.

41 The 50-TAF Mendota Pool serves as a forebay for diversions to the Main and  
42 Outside canals; and is the termination of the Delta-Mendota Canal, which conveys  
43 CVP water from the Delta, as described in Appendix 3A, No Action Alternative:  
44 Central Valley Project and State Water Project Operations. Water also enters

1 Mendota Pool via Fresno Slough (also known as James Bypass) which conveys  
 2 flood flows to the San Joaquin River from the Kings River (located in the Tulare  
 3 Lake Basin). Recent mean daily flows in the San Joaquin River at Mendota are  
 4 presented on Figure 5.37 (DWR 2013al).

5 *San Joaquin River Restoration Program: Friant Dam to Confluence of*  
 6 *Merced River*

7 In 2006, parties to *NRDC, et al., v. Rodgers, et al.*, executed a stipulation of  
 8 settlement that called for a comprehensive long-term effort to restore flows to the  
 9 San Joaquin River from Friant Dam to the confluence of the Merced River and a  
 10 self-sustaining Chinook Salmon fishery while reducing or avoiding adverse water  
 11 supply impacts. The SJRRP implements the settlement consistent with the  
 12 San Joaquin River Restoration Settlement Act in Public Law 111-11. The  
 13 USFWS issued a Programmatic BO for the implementation of the SJRRP on  
 14 August 21, 2012 and NMFS issued a Programmatic BO on September 18, 2012  
 15 for SJRRP flow releases of up to 1,660 cfs from Millerton Lake into the San  
 16 Joaquin River. The settlement-required flow targets for releases from Millerton  
 17 Lake include six water year types for releases depending upon available water  
 18 supply as measures of inflow to Millerton Lake, as described in Appendix 3A, No  
 19 Action Alternative: Central Valley Project and State Water Project Operations.  
 20 The Millerton Lake releases include the flexibility to reshape and retune releases  
 21 forwards or backwards by 4 weeks during the spring and fall pulse periods. Flood  
 22 flows may potentially occur and meet or exceed the Settlement flow targets. If  
 23 flood flows meet the settlement flow targets, then Reclamation would not release  
 24 additional water from Millerton Lake. The San Joaquin River channel  
 25 downstream of Friant Dam currently lacks the capacity to convey flows to the  
 26 Merced River and releases are limited accordingly. Reclamation has initiated  
 27 planning and environmental compliance activities to improve river channel  
 28 conveyance and allow for the full release of SJRRP flows. Diversions and  
 29 infiltration losses reduce the amount of Settlement flows reaching the San Joaquin  
 30 River and Merced River confluence. For the purposes of this analysis, flows that  
 31 reach the Merced confluence are assumed to continue to the Delta.

32 *San Joaquin River from Merced River to the Delta*

33 Two major tributaries, the Tuolumne and Stanislaus rivers, join the San Joaquin  
 34 River between the confluence with the Merced River and Vernalis (located at the  
 35 southeastern boundary of the Delta). The flows in this reach are influenced by  
 36 flow and water quality requirements at Vernalis as well as releases from the  
 37 upstream reach and the two major tributaries. Recent mean daily flows in the San  
 38 Joaquin River at Vernalis are presented on Figure 5.38 (DWR 2013am).

39 *Stanislaus River*

40 The Stanislaus River originates in the western slopes of the Sierra Nevada and  
 41 drains a watershed of approximately 900 square miles. The median annual  
 42 unimpaired runoff in the basin is approximately 1.08 MAF per year (SWRCB  
 43 2012). Snowmelt from March through early July contributes the largest portion  
 44 of the flows in the Stanislaus River, with the highest runoff occurring in the  
 45 months of April, May, and June.

1 The North, Middle, and South forks of the Stanislaus River converge upstream of  
2 the CVP New Melones Reservoir. The 2.4 MAF New Melones Reservoir is  
3 located approximately 60 miles upstream from the confluence of the Stanislaus  
4 River and the San Joaquin River. Water from New Melones Reservoir flows into  
5 Tulloch Reservoir (Reclamation 2010a). Tulloch Reservoir is owned and  
6 operated by the Tri-Dams Project for recreation, power, and flow re-regulation of  
7 New Melones Reservoir releases. Water released by Tulloch Reservoir and  
8 Powerplant flows downstream to Goodwin Reservoir where water is either  
9 diverted to canals to serve, Oakdale Irrigation District, South San Joaquin  
10 Irrigation District, and Stockton East Water District; or released from Goodwin  
11 Reservoir to the lower Stanislaus River (SWRCB 2012).

12 Below Goodwin Dam, the lower Stanislaus River flows approximately 40 miles to  
13 the confluence with the San Joaquin River. Agricultural return flows and  
14 operational spills from irrigation canals also enter the lower Stanislaus River.

15 *New Melones Reservoir*

16 The operating criteria for New Melones Reservoir are constrained by water rights  
17 requirements, flood control operations, contractual obligations, and federal  
18 requirements under the Federal Endangered Species Act (ESA) and CVPIA.  
19 Reclamation must operate New Melones Reservoir to meet senior water rights  
20 and in-basin demands. Senior water rights are defined for both current and future  
21 upstream water right holders in accordance with the SWRCB Decision 1422  
22 (D-1422) and Decision 1616 (D-1616); through protest settlement agreements  
23 with Tuolumne and Calaveras Counties; and for current downstream water right  
24 holders and riparian rights whose priorities are either senior to Reclamation or  
25 senior to appropriative rights in general, respectively, as described in  
26 Appendix 3A, No Action Alternative: Central Valley Project and State Water  
27 Project Operations. Reclamation also is required to make full contract amounts  
28 available to Stockton East Water District and Central San Joaquin Water  
29 Conservation District except for when contractual shortage provisions apply.

30 Required releases include flows to meet flow and water quality requirements  
31 included in the SWRCB Revised Decision 1641 (D-1641). This includes  
32 dissolved oxygen requirements in the lower Stanislaus River in accordance with  
33 the Central Valley Regional Water Quality Control Board (CVRWQCB) Basin  
34 Plan; minimum flow requirements in the lower San Joaquin River at Vernalis per  
35 SWRCB D-1641; and total dissolved solids requirement in the lower San Joaquin  
36 River at Vernalis per SWRCB D-1641.

37 Reservoir storage varies in accordance with upstream hydrology and downstream  
38 water demands and instream flow requirements. Recent water storage volumes  
39 and elevations for Water Years 2001 through 2012 in New Melones and Goodwin  
40 reservoirs are presented on Figures 5.39 through 5.42 (DWR 2013an, 2013ao,  
41 2013ap, 2013aq). Recent mean daily flows in the Stanislaus River downstream of  
42 Goodwin Dam are presented on Figure 5.43 (DWR 2013as).

1            *Implementation of 2009 National Marine Fisheries Service Biological*  
 2            *Opinion*

3 The 2009 NMFS BO RPA requires Reclamation to adaptively manage available  
 4 flows to meet minimum instream flow, ramping flow, pulse flow, floodplain  
 5 inundation, and geomorphic and function flow patterns, through the following  
 6 actions. The available flows to meet the 2009 NMFS BO RPA are defined  
 7 following compliance with water rights needs.

- 8     • Minimum base flows to optimize available steelhead habitat for adult  
 9       migration, spawning, and juvenile rearing by water year type, as measured  
 10      downstream of Goodwin Dam, as specified in Appendix 2-E of the 2009  
 11      NMFS BO RPA.
- 12    • Fall pulse flows to improve instream conditions sufficiently to attract  
 13      steelhead to the Stanislaus River.
- 14    • Winter instability flows to simulate natural variability in the winter  
 15      hydrograph and to enhance access to varied rearing habitats.
- 16    • Channel forming and maintenance flows in the 3,000 to 5,000 cfs range in  
 17      above normal and wet years to maintain spawning and rearing habitat quality  
 18      after March 1 to protect incubating eggs and to provide outmigration flow  
 19      cues and late spring flows.
- 20    • Outmigration flow cues to enhance likelihood of anadromy.
- 21    • Late spring flows for conveyance and maintenance of downstream migratory  
 22      habitat quality in the lowest reaches and into the Delta.

23 The 2009 NMFS BO also required Reclamation to meet temperature requirements  
 24 at Orange Blossom Bridge and Knights Ferry to protect steelhead, as discussed in  
 25 Appendix 3A, No Action Alternative: Central Valley Project and State Water  
 26 Project Operations. Reclamation is also required to evaluate an approach to  
 27 operate New Melones Reservoir flow releases to achieve floodplain inundation  
 28 flows and improved freshwater migratory habitat for steelhead. Reclamation also  
 29 participates in gravel augmentation to improve spawning habitat.

30 **5.3.2.2.3 Delta and Suisun Marsh**

31 The Delta and Suisun Marsh area constitutes a natural floodplain that covers  
 32 1,315 square miles and drains approximately 40 percent of the state (DWR  
 33 2013a). The Delta and Suisun Marsh have a complex web of channels and islands  
 34 and is located at the confluence of the Sacramento and San Joaquin rivers.

35 Historically, the natural Delta system was formed by water inflows from upstream  
 36 tributaries in the Delta watershed and outflow to Suisun Bay and San Francisco  
 37 Bay. In the late 1800s, local land reclamation efforts in the Delta resulted in the  
 38 construction of channels and levees that began altering the Delta's surface water  
 39 flows. Over time, the natural pattern of water flows continued to change as the  
 40 result of upper watershed diversions and the construction of facilities to divert and  
 41 export water through the Delta to areas where supplemental water supplies are

1 needed, including densely populated areas such as San Francisco and Southern  
2 California and agricultural regions such as the San Joaquin Valley and Tulare  
3 Lake. The SWP and CVP use the Delta as the hub of their conveyance systems to  
4 deliver water to large pumps located in the southern Delta.

5 Inflows to the Delta occur primarily from the Sacramento River system and Yolo  
6 Bypass, the San Joaquin River, and other eastside tributaries such as the  
7 Mokelumne, Calaveras, and Cosumnes rivers. In general, in any given year,  
8 approximately 77 percent of water enters the Delta from the Sacramento River,  
9 approximately 15 percent enters from the San Joaquin River, and approximately  
10 8 percent enters from the eastside tributaries (DWR 1994). The Delta is tidally  
11 influenced; rise and fall varies from less than 1 foot in the eastern Delta to more  
12 than 5 feet in the western Delta (DWR 2013a).

13 Water quality in the Delta is highly variable and strongly influenced by inflows  
14 from the rivers and by seawater intrusion into the western and central portions of  
15 the Delta during periods of low outflow that may be affected by high volumes of  
16 export pumping. The concentrations of salts and other materials in the Delta are  
17 affected by river inflows, tidal flows, agricultural diversions, drainage flows,  
18 wastewater discharges, water exports, cooling water intakes and discharges, and  
19 groundwater accretions. Seawater intrusion into the Delta is dependent on tidal  
20 conditions, inflows to the Delta, and Delta channel geometry. Delta channels are  
21 typically less than 30 feet deep, unless dredged, and vary in width from less than  
22 100 feet to more than 1 mile. Although some channels are edged with riparian  
23 and aquatic vegetation, steep mud or rip-rap covered levees border most channels.  
24 To enhance flow and aid in levee maintenance, vegetation is often removed from  
25 the channel margins. The tidal currents carry large volumes of seawater back and  
26 forth through the San Francisco Bay-Delta Estuary with the tidal cycle. The  
27 mixing zone of salt and fresh water can shift 2 to 6 miles daily depending on the  
28 tides, and may reach far into the Delta during periods of low inflow.

29 Salinity objectives adopted by the SWRCB were established to protect beneficial  
30 uses, including agricultural and municipal water supplies, and fisheries. The CVP  
31 and SWP facilities are operated to comply with the requirements that would  
32 protect the Delta water quality, as described in Appendix 3A, No Action  
33 Alternative: Central Valley Project and State Water Project Operations. These  
34 operational requirements affect the hydrology in the Delta.

35 Hydrological conditions in the Delta and Suisun Marsh are substantially affected  
36 by structures that route water through the Delta towards the major Delta water  
37 diversions in the south Delta, including the CVP Jones Pumping Plant, the SWP  
38 Banks Pumping Plant, the Delta-Mendota/California Aqueduct Intertie, the CVP  
39 Contra Costa Canal Pumping Plant at Rock Slough, and the Contra Costa Water  
40 District (CCWD) intakes on Old and Middle rivers; while protecting Delta water  
41 quality for these intakes, the SWP Barker Slough Pumping Plant in the north  
42 Delta and over 1,800 municipal and agricultural in-Delta diversions (DWR  
43 2010b). These structures include the Delta Cross Channel and temporary barriers  
44 in the south Delta. Diversion patterns for the major facilities also are regulated to  
45 maintain Delta water quality and to protect fish that are listed as threatened or

1 endangered species under ESA in accordance with the SWRCB D-1641, 2008  
 2 USFWS BO, and the 2009 NMFS BO. The diversion patterns are implemented to  
 3 maintain ratios of exports of the CVP and SWP facilities to the Delta inflow;  
 4 ratios of San Joaquin River inflow to Delta exports; and reverse flow conditions  
 5 in Old and Middle rivers (known as the OMR criteria). Operations of the Jones  
 6 and Banks pumping plants are affected by downstream CVP and SWP water  
 7 demands and reservoir operations in San Luis Reservoir that is jointly used by the  
 8 CVP and SWP.

9 Facilities implemented in Suisun Marsh also affect hydrologic and water quality  
 10 conditions throughout the Delta. To meet the Delta water quality requirements  
 11 and water rights requirements of users located upstream of the Delta, the CVP and  
 12 SWP are operated in a coordinated manner in accordance with Coordinated  
 13 Operation Agreement (COA), as described in the following section.

14 *Delta Cross Channel*

15 The Delta Cross Channel (DCC) is a gated diversion channel in the Sacramento  
 16 River near Walnut Grove and Snodgrass Slough, as described in Appendix 3A,  
 17 No Action Alternative: Central Valley Project and State Water Project  
 18 Operations. When the gates are open, water flows from the Sacramento River  
 19 through the cross channel to channels of the lower Mokelumne and San Joaquin  
 20 Rivers toward the interior Delta. The DCC operation improves water quality in  
 21 the interior Delta by improving circulation patterns of good quality water from the  
 22 Sacramento River towards Delta diversion facilities.

23 Reclamation operates the DCC in the open position to (1) improve the movement  
 24 of water from the Sacramento River to the export facilities at the Banks and Jones  
 25 Pumping Plants, (2) improve water quality in the southern Delta, and (3) reduce  
 26 salt water intrusion rates in the western Delta. During the late fall, winter, and  
 27 spring, the gates are often periodically closed to protect out migrating salmonids  
 28 from entering the interior Delta. In addition, whenever flows in the Sacramento  
 29 River at Sacramento reach 20,000 to 25,000 cfs (on a sustained basis) the gates  
 30 are closed to reduce potential scouring and flooding that might occur in the  
 31 channels on the downstream side of the gates.

32 Flow rates through the gates are determined by Sacramento River stage and are  
 33 not affected by export rates in the south Delta. The DCC also serves as a link  
 34 between the Mokelumne River and the Sacramento River for small craft, and is  
 35 used extensively by recreational boaters and fishermen whenever it is open. The  
 36 SWRCB D-1641 requires closure of the DCC gates for fisheries protection as  
 37 follows.

- 38 • From November through January, the DCC may be closed for up to 45 days  
 39 for fishery protection purposes.
- 40 • From February 1 through May 20, the gates are closed for fishery protection  
 41 purposes.
- 42 • The gates may also be closed for 14 days for fishery protection purposes  
 43 during the May 21 through June 15 time period.

1        *Implementation of 2009 National Marine Fisheries Service Biological*  
2        *Opinion*

3        The 2009 NMFS BO RPA requires Reclamation to close the DCC for additional  
4        days from October 1 through November 30, if fish are present; December 1  
5        through December 14, unless closures cause adverse impacts on water quality  
6        conditions; and December 15 through January 31.

7        *Temporary Agricultural Barriers*

8        The DWR South Delta Temporary Barrier Project (TBP) was initiated in 1991 to  
9        seasonally construct and demolish four rock barriers across south Delta channels,  
10       as described in Appendix 3A, No Action Alternative: Central Valley Project and  
11       State Water Project Operations. In various combinations, these barriers improve  
12       water levels and San Joaquin River salmon migration in the south Delta. The  
13       existing TBP consists of installation and removal of temporary rock barriers at the  
14       following locations.

- 15       • Middle River near Victoria Canal, about 0.5 miles south of the confluence of  
16       Middle River, Trapper Slough, and North Canal.
- 17       • Old River near Tracy, about 0.5 miles east of the DMC intake.
- 18       • Grant Line Canal near Tracy Boulevard Bridge, about 400 feet east of Tracy  
19       Boulevard Bridge.
- 20       • The head of Old River (HOR) at the confluence of Old River and San Joaquin  
21       River.

22       The barriers on Middle River, Old River near Tracy, and Grant Line Canal are  
23       flow control facilities designed to improve water levels for agricultural diversions  
24       and are in place during the irrigation season. The Head of Old River Barrier  
25       (HORB) is only installed from early September to November 30th when  
26       requested by CDFW if needed to improve dissolved oxygen in the San Joaquin  
27       River. The HORB also has been installed in the spring months to improve  
28       outmigrating conditions for juvenile salmonids.

29       The agricultural barriers at Middle River and Old River near Tracy can be  
30       installed as early as March 1 if the HORB is installed; and can be fully operated  
31       as early as April 1, if the HORB is installed, or May 15, if the HORB is not  
32       installed. From May 15 to May 31 (if the barrier at the head of Old River is  
33       removed), the barrier tide gates are tied open in Middle River and Old River near  
34       Tracy. After May 31, the barriers in Middle River, Old River near Tracy, and  
35       Grant Line Canal are permitted to be operational until they are completely  
36       removed by November 30.

37       *Major Delta Water Diversions*

38       Major water diversions in the Delta include the CVP Jones Pumping Plant, the  
39       SWP Banks Pumping Plant, the CVP Contra Costa Canal Pumping Plant at Rock  
40       Slough, the SWP Barker Slough Pumping Plant for the North Bay Aqueduct,  
41       Contra Costa Water District intakes on Old and Middle rivers, and over  
42       1,800 municipal and agricultural diversions for in-Delta use (DWR 2010b).

1 Delta channels have been modified to allow transport of Delta inflow to the  
2 diversions throughout the Delta, including the CVP and SWP south Delta intakes,  
3 and to reduce the effects of pumping on the direction of flows and salinity  
4 intrusion within the Delta. The conveyance of water from the Sacramento River  
5 southward through the Delta to the CVP and SWP south Delta intakes is aided by  
6 the Delta Cross Channel (DCC), a constructed, gated channel that conveys water  
7 from the Sacramento River to the Mokelumne River.

#### 8 *CVP Jones Pumping Plant*

9 The CVP Jones Pumping Plant, located about 5 miles north of Tracy, has a  
10 permitted diversion capacity of 4,600 cfs and sits at the end of a 2.5-mile long  
11 earth-lined intake channel that extends to Old River, as described in  
12 Appendix 3A, No Action Alternative: Central Valley Project and State Water  
13 Project Operations. Water diverted at the Jones Pumping Plant is discharged to  
14 the CVP Delta-Mendota Canal (DMC) which extends 117 miles to the Mendota  
15 Pool. Water from Jones Pumping Plant may be pumped from the DMC O'Neill  
16 Forebay, and then pumped into San Luis Reservoir by the Gianelli Pumping-  
17 Generating Plant. The DMC has an initial capacity of 4,600 cfs at Jones Pumping  
18 Plant that decreases to about 3,200 cfs at its terminus.

#### 19 *SWP Clifton Court and Banks Pumping Plant*

20 The SWP facilities in the southern Delta include the 31-TAF Clifton Court  
21 Forebay (CCF), located about 10 miles northwest of the city of Tracy, and the  
22 Banks Pumping Plant, as described in Appendix 3A, No Action Alternative:  
23 Central Valley Project and State Water Project Operations. Water is diverted  
24 from Old River into CCF that provides storage for off-peak pumping, moderates  
25 the effect of the pumps on the fluctuation of flow and stage in adjacent Delta  
26 channels, and collects sediment upstream of the Banks Pumping Plant and the  
27 California Aqueduct. Water flows from CCF to Banks Pumping Plant which  
28 conveys the water to California Aqueduct. The California Aqueduct transports  
29 water to O'Neill Forebay, from which water can be released to the San Luis  
30 Canal, a portion of the California Aqueduct jointly owned by the SWP and CVP;  
31 or pumped into San Luis Reservoir at the Gianelli Pumping Plant. Water from  
32 San Luis Reservoir is released into the San Luis Canal which ends near Kettleman  
33 City. From that location, the California Aqueduct continues to southern  
34 California.

35 The nominal capacity of the Banks Pumping Plant is 10,300 cfs. Permits issued  
36 by the USACE regulate the rate of diversion of water into CCF. This diversion  
37 rate is normally restricted to 6,680 cfs as a three-day average inflow to CCF and  
38 6,993 cfs as a one-day average inflow to CCF. CCF diversions may be greater  
39 than these rates between December 15 and March 15, when the inflow into CCF  
40 may be augmented by one-third of the San Joaquin River flow at Vernalis when  
41 those flows are equal to or greater than 1,000 cfs.

42 In 2000, the maximum diversion rate was increased for the months of July,  
43 August, and September through 2016 to recover export reductions that occurred  
44 due to actions taken to benefit fisheries resources. The expanded maximum

1 allowable daily diversion rate into CCF was increased from 13,870 acre-feet to  
2 14,860 acre-feet and three-day average diversions from 13,250 acre-feet to  
3 14,240 acre-feet (500 cfs per day equals 990 acre-feet per day). Implementation  
4 of this action is contingent on meeting the following conditions.

5 • The increased diversion rate will not result in greater annual SWP water  
6 supply allocations than would occur in the absence of the increased diversion  
7 rate. Water pumped due to the increased capacity will only be used to offset  
8 reduced diversions that occurred or will occur because of actions taken to  
9 benefit fisheries.

10 • Use of the increased diversion rate will be in accordance with all terms and  
11 conditions of existing BOs governing SWP operations.

12 • All three temporary agricultural barriers (Middle River, Old River near Tracy  
13 and Grant Line Canal) must be in place and operating when SWP diversions  
14 are increased.

15 Between July 1 and September 30, if the combined salvage of listed fish species  
16 reaches a level of concern, the relevant fish regulatory agencies will determine  
17 whether the 500 cfs increased diversion is or continues to be implemented.  
18 Variations to hydrologic conditions coupled with regulatory requirements may  
19 limit the ability of the SWP to fully utilize the proposed increased diversion rate.  
20 Also, facility capabilities may limit the ability of the SWP to fully utilize the  
21 increased diversion rate. The CCF radial gates are closed during critical periods  
22 of the ebb/flood tidal cycle to protect water levels relied upon by local agricultural  
23 water diverters in the south Delta area.

24 Banks Pumping Plant is operated to minimize the impact on power loads on the  
25 California electrical grid to the extent practical. Generally more pump units are  
26 operated during off-peak periods and fewer during peak periods with water stored  
27 temporarily in CCF. Because the installed capacity of the pumping plant is  
28 10,300 cfs, the plant can be operated to reduce power grid impacts by running all  
29 available pumps at night and fewer during the higher energy-demand hours.

#### 30 *SWP Barker Slough Pumping Plant*

31 The SWP Barker Slough Pumping Plant (BSPP) diverts water from Barker  
32 Slough into the SWP North Bay Aqueduct (NBA) for delivery to the Solano  
33 County Water Agency and the Napa County Flood Control and Water  
34 Conservation District, as described in Appendix 3A, No Action Alternative:  
35 Central Valley Project and State Water Project Operations. The current 162.5-cfs  
36 NBA intake with a positive barrier fish screen, located approximately 10 miles  
37 from the Sacramento River at the end of Barker Slough.

38 The NBA was designed to deliver up to 131,181 acre-feet per year SWP water  
39 supply contracts. However, the ability of BSPP to deliver this amount of water is  
40 limited due to several factors. The current BSPP pumping capacity is limited due  
41 to a thick bio-film growth on the interior of the NBA pipeline and a need to  
42 reduce the pressure in the pipeline within safe limits. Water quality in Barker  
43 Slough becomes degraded during winter and spring rainfall events due to elevated

1 levels of coliform bacteria, organic matter, turbidity, and pollutants from the  
 2 upstream watershed, which limits the period of time that the BSPP can be  
 3 operated each year. In 2008, USFWS issued a BO for preservation of delta smelt  
 4 that reduced the total BSPP annual diversion to 71 TAF. In 2009, CDFW issued  
 5 an incidental take permit for the preservation of longfin smelt that restricted  
 6 pumping rates during dry and critical dry years from January 15 to March 31.  
 7 As tidal wetlands in Suisun Marsh and Cache Slough and floodplains in the Yolo  
 8 Bypass are restored in accordance with the 2008 USFWS BO and 2009 NMFS  
 9 BO, respectively, Delta smelt, longfin smelt and salmonid populations in the  
 10 Barker Slough area are anticipated to increase which could further restrict  
 11 diversions at BSPP.

#### 12 *Contra Costa Water District Intakes*

13 The CCWD diverts approximately 127 TAF per year, including approximately  
 14 110 TAF under the CVP water service contract. The CCWD diverts water at the  
 15 CVP Rock Slough Intake, and at the CCWD Mallard Slough, Old River, and  
 16 Middle River (on Victoria Canal) intakes, as described in Appendix 3A, No  
 17 Action Alternative: Central Valley Project and State Water Project Operations.  
 18 Water diverted at Mallard Slough, Old River, and Middle River intakes occur  
 19 under water rights issued by the SWRCB to CCWD. Water diverted at Rock  
 20 Slough, Old River, and Middle River intakes occur under water rights issued by  
 21 the SWRCB to Reclamation for the CVP. All four intakes have positive barrier  
 22 fish screens. Water from the Old River and Middle River intakes can be diverted  
 23 to the 160-TAF Los Vaqueros Reservoir when Delta salinity is low. When Delta  
 24 salinity is high, typically in the fall months, CCWD blends low salinity water  
 25 from Los Vaqueros Reservoir with water from the Delta to meet CCWD water  
 26 quality goals. Water from Los Vaqueros Reservoir is also used by CCWD when  
 27 Delta diversions are restricted.

28 The Mallard Slough Intake, located on a channel that extends to Suisun Bay  
 29 (across from Chipps Island), can divert water into the CCWD conveyance system,  
 30 as described in Appendix 3A, No Action Alternative: Central Valley Project and  
 31 State Water Project Operations. Generally, less than 3 percent of CCWD  
 32 diversions are from Mallard Slough intake due to high salinity in Suisun Bay from  
 33 late spring until winter.

34 The CVP Rock Slough Intake, located about four miles southeast of Oakley, can  
 35 divert into the CVP Contra Costa Canal for conveyance into the CCWD water  
 36 system. CCWD may divert approximately 30 percent to 50 percent of its total  
 37 supply through the Rock Slough Intake depending upon salinity.

38 The Old River Intake, located on Old River near State Route 4, can divert water to  
 39 the CVP Contra Costa Canal or to the 160-TAF Los Vaqueros Reservoir.  
 40 Diversion to Los Vaqueros Reservoir storage is limited to 200 cfs by the terms of  
 41 the Los Vaqueros Project BOs and SWRCB Decision 1629 (D-1629), the water  
 42 right decision for the Los Vaqueros Project.

43 The Middle River Intake (formerly referred to as Alternative Intake Project),  
 44 located on Victoria Canal, diverts water to the Contra Costa Canal or to

1 Los Vaqueros Reservoir. Salinity at the Middle River Intake is generally lower in  
2 the late summer and fall than at the other intakes. Therefore, CCWD can decrease  
3 winter and spring diversions while still meeting water quality goals in the summer  
4 and fall through use of the Middle River Intake.

5 *Delta-Mendota Canal/California Aqueduct Intertie*

6 The DMC/California Aqueduct Intertie between the DMC and the California  
7 Aqueduct allows water to flow in both directions between the CVP and SWP  
8 conveyance facilities, as described in Appendix 3A, No Action Alternative:  
9 Central Valley Project and State Water Project Operations. The DMC/California  
10 Aqueduct Intertie achieves multiple benefits, including meeting current water  
11 supply demands, allowing for the maintenance and repair of the CVP Delta export  
12 and conveyance facilities, and providing operational flexibility to respond to  
13 emergencies. The DMC/California Aqueduct Intertie can be used under one of  
14 the following three different scenarios.

- 15 • Up to 467 cfs may be pumped from the DMC to the California Aqueduct to  
16 ease DMC conveyance constraints related to Jones Pumping Plant capacity  
17 limitations.
- 18 • Up to 467 cfs may be pumped from the DMC to the California Aqueduct to  
19 minimize impacts on water deliveries due to temporary restrictions in flow or  
20 water levels on the lower DMC (south of the Intertie) or the upper California  
21 Aqueduct (north of the Intertie) for system maintenance or due to an  
22 emergency shutdown.
- 23 • Up to 900 cfs may be conveyed from the California Aqueduct to the DMC  
24 using gravity flow to minimize impacts on water deliveries due to temporary  
25 restrictions in flow or water levels on the lower California Aqueduct  
26 (downstream of the Intertie) or the upper DMC (upstream of the Intertie) for  
27 system maintenance or for an emergency shutdown.

28 *San Luis Reservoir*

29 The 2.027-MAF San Luis Reservoir, formed by Sisk Dam, is jointly operated by  
30 Reclamation and DWR, with approximately 0.965 MAF used by the CVP and  
31 1.062 MAF used by the SWP. Water generally is diverted into San Luis  
32 Reservoir during late fall through early spring when irrigation water demands of  
33 CVP and SWP water users are low and are being met by Delta exports.

34 When all SWP demands are met, including diversion to storage facilities south of  
35 the Delta and Table A demands, and the Delta is in excess conditions, DWR  
36 would use available excess pumping capacity at Banks Pumping Plant to make  
37 excess water supplies, called Article 21 water under the long-term SWP water  
38 supply contracts, available to the SWP Contractors. Article 21 of the SWP water  
39 contracts describes the conditions under which water can be delivered in addition  
40 to the amounts specified in Table A of the contracts.

41 Unlike Table A water, which is an allocated annual SWP supply made available  
42 for scheduled delivery throughout the year, Article 21 water is an interruptible  
43 water supply made available only when certain conditions exist. However, while

1 not a dependable supply, Article 21 water is an important part of the total SWP  
 2 supplies provided to the SWP contractors. As with all SWP water, Article 21  
 3 water is pumped consistent with the existing terms and conditions of SWP water  
 4 rights permits, and is pumped from the Delta under the same environmental,  
 5 regulatory, and operational constraints that apply to all SWP operations.

6 Article 21 water is only available as long as the required conditions exist as  
 7 determined by DWR. As Article 21 deliveries are in addition to scheduled  
 8 Table A deliveries, this supply is delivered to SWP contractors that can, on  
 9 relatively short notice, put it to beneficial use. SWP contractors have used  
 10 Article 21 water to meet needs such as additional short-term irrigation demands,  
 11 replenishment of local groundwater basins, short-term substitution of local  
 12 supplies and storage in local surface reservoirs for later use by the requesting  
 13 SWP contractor, all of which provide SWP contractors with opportunities for  
 14 better water management through more efficient coordination with their local  
 15 water supplies. Allocated Article 21 water to a SWP contractor cannot be  
 16 transferred.

17 Article 21 water is typically offered to SWP contractors on a short-term (daily or  
 18 weekly) basis when all of the following conditions exist: the SWP share of San  
 19 Luis Reservoir is physically full, or projected to be physically full; other SWP  
 20 reservoirs south of the Delta are at their storage targets or the SWP conveyance  
 21 capacity to fill these reservoirs is maximized; the Delta is in excess condition;  
 22 current Table A and SWP operational demands are being fully met; and Banks  
 23 Pumping Plant has export capacity beyond that which is needed to meet all  
 24 Table A and other SWP operational demands. The increment of available unused  
 25 Banks Pumping Plant capacity is offered as the Article 21 delivery capacity.  
 26 SWP contractors then indicate their desired rate of delivery of Article 21 water.  
 27 DWR allocates the available Article 21 water in proportion to the requesting SWP  
 28 contractors annual Table A amounts if requests exceed the amount offered.  
 29 Deliveries can be discontinued at any time when SWP operations change. In the  
 30 modeling for Article 21, deliveries are only made in months when the SWP share  
 31 of San Luis Reservoir is full. In actual operations, Article 21 may be offered a  
 32 short period in advance of actual filling.

33 By April or May, demands from both agricultural and M&I SWP Contractors  
 34 usually exceed the pumping rate at Banks Pumping Plant, and releases from San  
 35 Luis Reservoir to the SWP facilities are needed to supplement the Delta pumping  
 36 at Banks Pumping Plant to meet SWP contractor demands for Table A water.

37 Historical water storage volumes and water storage elevations for San Luis  
 38 Reservoir for Water Years 2001 through 2012 are presented on Figures 5.44  
 39 and 5.45 (DWR 2013as, 2013at).

40 The San Luis Complex consists of the following.

- 41 • O'Neill Pumping-Generating Plant (CVP facility)
- 42 • William R. Gianelli Pumping-Generating Plant (joint CVP and SWP facility)
- 43 • San Luis Canal (joint CVP and SWP facility)

- 1 • Dos Amigos Pumping Plant (joint CVP and SWP facility)
- 2 • Coalinga Canal (CVP facility)
- 3 • Pleasant Valley Pumping Plant (CVP facility)
- 4 • Los Banos and Little Panoche Detention Dams and Reservoirs (joint CVP and
- 5 SWP facilities)

6 The CVP diverts water from San Luis Reservoir by the Pacheco Pumping Plant  
7 through the Pacheco Tunnel and Pacheco Conduit that conveys water to CVP  
8 water service contractors in Santa Clara and San Benito counties, as described in  
9 Appendix 3A, No Action Alternative: Central Valley Project and State Water  
10 Project Operations.

11 *Regulatory Limitations on Operations of Delta Water Diversions*

12 Operations of the CVP and SWP are implemented in accordance with SWRCB  
13 water rights and water quality decisions, including SWRCB D-1641, and the 2008  
14 USFWS BO and 2009 NMFS BO.

15 *Decision 1641*

16 The SWRCB adopted the 1995 Bay-Delta Plan on May 22, 1995, which became  
17 the basis of SWRCB D-1641 (adopted on December 29, 1999 and revised on  
18 March 15, 2000). The SWRCB D-1641 amended certain terms and conditions of  
19 the SWP and CVP water rights to include flow and water quality objectives to  
20 assure protection of beneficial uses in the Delta and Suisun Marsh. SWRCB also  
21 grants conditional changes to points of diversion for the CVP and SWP under  
22 SWRCB D-1641. The SWRCB adopted a revised Bay-Delta Plan on  
23 December 13, 2006; however, there were no changes to the beneficial uses or  
24 water quality objectives. The changes were primarily to improve readability and  
25 consistency to reflect current physical conditions and other regulations.

26 The requirements in SWRCB D-1641 address the standards for fish and wildlife  
27 protection, water supply water quality, and Suisun Marsh salinity. These  
28 objectives include specific Delta outflow requirements throughout the year,  
29 specific export limits in the spring, and export limits based on a percentage of  
30 estuary inflow throughout the year. The water quality objectives are designed to  
31 protect agricultural, municipal and industrial, and fishery uses, and vary  
32 throughout the year and by water year type. One of the requirements is to provide  
33 a minimum flow on the Sacramento River at Rio Vista in September through  
34 December of 3,000 to 4,500 cfs, depending on the month and water year type, to  
35 protect water quality for Delta water users.

36 The SWRCB D-1641 includes two Delta outflow criteria. A Net Delta Outflow  
37 Index is specified for all months in all water year types. A “spring X2” Delta  
38 outflow is specified from February through June to maintain freshwater and  
39 estuarine conditions in the western Delta to protect aquatic life. The criteria  
40 require operations of the CVP and SWP upstream reservoir releases and Delta  
41 exports in a manner that maintains a salinity objective at an “X2” location. X2  
42 refers to the horizontal distance from the Golden Gate Bridge up the axis of the

1 Delta estuary to where tidally averaged near-bottom salinity concentration of  
 2 2 parts of salt in 1,000 parts of water occurs; the X2 standard was established to  
 3 improve shallow water estuarine habitat in the months of February through June  
 4 and relates to the extent of salinity movement into the Delta (DWR, Reclamation,  
 5 USFWS and NMFS 2013). The location of X2 is important to both aquatic life  
 6 and water supply beneficial uses.

7 During February through June, SWRCB D-1641 also limits CVP and SWP  
 8 exports as compared to Delta inflows (also known as the “E/I Ratio”) to reduce  
 9 potential impacts on migrating salmon and spawning Delta smelt, Sacramento  
 10 Splittail, and Striped Bass.

11 Historical mean daily Delta outflow flows for Water Years 2001 through 2012 are  
 12 presented on Figure 5.46 (DWR 2013au).

13 Historical mean daily flows for Water Years 2001 through 2012 are presented on  
 14 Figures 5.46 through 5.52 for diversions at Jones, Banks, Barker Slough, and  
 15 Contra Costa Canal pumping plants; and Contra Costa Water District intakes at  
 16 Old River and Middle River (DWR 2013av, 2103aw, 2013ax, 2013ay, 2013az,  
 17 2013ba).

18 *Joint Point of Diversion*

19 SWRCB D-1641 authorized the SWP and CVP to jointly use both Jones and  
 20 Banks pumping plants in the southern Delta, with conditional limitations and  
 21 required response coordination plans (referred to as Joint Point of Diversion  
 22 [JPOD]). Use of JPOD is based on staged implementation and conditional  
 23 requirements for each stage of implementation. The stages of JPOD in  
 24 SWRCB D-1641 are:

- 25 • Stage 1—for water service to a group of CVP water service contractors (Cross  
 26 Valley contractors, San Joaquin Valley National Cemetery and Musco Family  
 27 Olive Company), and to recover export reductions implemented to benefit  
 28 fish;
- 29 • Stage 2—for any purpose authorized under the current CVP and SWP water  
 30 right permits; and
- 31 • Stage 3—for any purpose authorized, up to the physical capacity of the  
 32 diversion facilities.

33 In general, JPOD capabilities are used to accomplish four basic CVP and SWP  
 34 objectives:

- 35 • When wintertime excess pumping capacity becomes available during Delta  
 36 excess conditions and total CVP and SWP San Luis storage is not projected to  
 37 fill before the spring pulse flow period, the Project with the deficit in San Luis  
 38 storage may elect to pursue the use of JPOD capabilities;
- 39 • When summertime pumping capacity is available at Banks Pumping Plant and  
 40 CVP reservoir conditions can support additional releases, the CVP may elect  
 41 to use JPOD capabilities to enhance annual CVP south of Delta water  
 42 supplies;

- 1 • When summertime pumping capacity is available at Banks or Jones Pumping  
2 Plant to facilitate water transfers, JPOD may be used to further facilitate the  
3 water transfer; and
- 4 • During certain coordinated CVP and SWP operation scenarios for fishery  
5 entrainment management, JPOD may be used to shift CVP and SWP exports  
6 to the facility with the least fishery entrainment impact while minimizing  
7 export at the facility with the most fishery entrainment impact.

8 Each stage of JPOD has regulatory terms and conditions that must be satisfied in  
9 order to implement JPOD. All stages require a response plan to ensure water  
10 elevations in the southern Delta will not be lowered to the injury of local riparian  
11 water users (Water Level Response Plan); and a response plan to ensure the water  
12 quality in the southern and central Delta will not be significantly degraded  
13 through operations of the JPOD to the injury of water users in the southern and  
14 central Delta. Stage 2 has an additional requirement to complete an operations  
15 plan that will protect fish and wildlife and other legal users of water (Fisheries  
16 Response Plan). Stage 3 has an additional requirement to protect water levels in  
17 the southern Delta. All JPOD diversions under excess conditions in the Delta are  
18 junior to CCWD water right permits for the Los Vaqueros Project, and must have  
19 an X2 location west of certain compliance locations consistent with the 1993 Los  
20 Vaqueros BO for Delta smelt.

21 *Implementation of 2008 USFWS and 2009 NMFS Biological Opinions*

22 The 2008 USFWS BO and the 2009 NMFS BO restrict CVP and SWP diversions  
23 to reduce reverse flows in OMR. The 2008 USFWS BO also includes criteria for  
24 fall Delta outflow. The 2009 NMFS BO includes criteria for a San Joaquin River  
25 Inflow/Export (I:E) ratio.

26 *2008 USFWS BO OMR Criteria*

27 The 2008 USFWS BO restricts south Delta pumping to preserve certain OMR  
28 flows as prescribed in the following three actions.

- 29 • **Action 1:** to protect adult Delta smelt migration and entrainment. Limits  
30 exports so that the average daily OMR flow is no more negative  
31 than -2,000 cfs for a total duration of 14 days, with a 5-day running average  
32 no more negative than -2,500 cfs (within 25 percent).
  - 33 – December 1 to December 20 – Based upon turbidity data from turbidity  
34 stations (Prisoner’s Point, Holland Cut, and Victoria Canal) and salvage  
35 data from CVP and SWP fish handling facilities at the south Delta intakes,  
36 and other parameters important to the protection of delta smelt including,  
37 but not limited to, preceding conditions of X2, Fall Midwater Trawl  
38 Survey (FMWT), and river flows.
  - 39 – After December 20 – The action will begin if the three-day average  
40 turbidity at Prisoner’s Point, Holland Cut, and Victoria Canal exceeds  
41 12 nephelometric turbidity units (NTU).

- 1           – Triggers would be based on:
- 2           ○ Three-day average of 12 NTU or greater at all three turbidity stations;
- 3           or
- 4           ○ Three days of delta smelt salvage after December 20 at either facility
- 5           or cumulative daily salvage count that is above a risk threshold based
- 6           upon the “daily salvage index” approach reflected in a daily salvage
- 7           index value of greater than or equal to 0.5 (daily delta smelt salvage is
- 8           greater than one-half prior year FMWT index value). The window for
- 9           triggering Action 1 concludes when either off-ramp condition
- 10          described below is met. These off-ramp conditions may occur without
- 11          Action 1 ever being triggered. If this occurs, then Action 3 is
- 12          triggered, unless the Service concludes on the basis of the totality of
- 13          available information that Action 2 should be implemented instead.
- 14          – Action 1 offramps occur when water temperature reaches 12 degrees
- 15          Centigrade (°C) based on a three station daily mean at the temperature
- 16          stations: Mossdale, Antioch, and Rio Vista; or the onset of spawning
- 17          based upon the presence of spent females in the Spring Kodiak Trawl
- 18          Survey or at the CVP or SWP fish handling facilities.
- 19          • **Action 2:** to protect adult Delta smelt migration and entrainment. An action
- 20          implemented using an adaptive process to tailor protection to changing
- 21          environmental conditions after Action 1. As in Action 1, the intent is to
- 22          protect pre-spawning adults from entrainment and, to the extent possible, from
- 23          adverse hydrodynamic conditions. The range of net daily OMR flows will be
- 24          no more negative than -1,250 to -5,000 cfs. Depending on extant conditions,
- 25          specific OMR flows within this range are recommended by the USFWS Smelt
- 26          Working Group (SWG) from the onset of Action 2 through its termination.
- 27          The SWG would provide weekly recommendations based upon review of the
- 28          sampling data, from real-time salvage data at the CVP and SWP, and utilizing
- 29          most up-to-date technological expertise and knowledge relating population
- 30          status and predicted distribution to monitored physical variables of flow and
- 31          turbidity. The USFWS will make the final determination.
- 32          – Action 2 begins immediately following Action 1. If Action 1 is not
- 33          implemented based upon triggers, the SWG may recommend a start date
- 34          for Action 2.
- 35          – Action 2 is suspended when whenever a three-day flow average is greater
- 36          than or equal to 90,000 cfs in Sacramento River at Rio Vista and
- 37          10,000 cfs in San Joaquin River at Vernalis. Once such flows have
- 38          abated, the OMR flow requirements of Action 2 are restarted.
- 39          – Offramps for Action 2 are related to water temperature reaches 12°C
- 40          based on a three-station daily average at the temperature stations: Rio
- 41          Vista, Antioch, and Mossdale; or the onset of spawning based upon the
- 42          presence of a spent female in the Spring Kodiak Trawl Survey or at the
- 43          CVP or SWP fish handling facilities.

- 1 • **Action 3:** to protect larval and juvenile Delta Smelt. Minimize the number of  
2 larval delta smelt entrained at the facilities by managing the hydrodynamics in  
3 the Central Delta flow levels pumping rates spanning a time sufficient for  
4 protection of larval delta smelt. Net daily OMR flow will be no more  
5 negative than -1,250 to -5,000 cfs based on a 14-day running average with a  
6 simultaneous 5-day running average within 25 percent of the applicable  
7 requirement for OMR. Depending on extant conditions, specific OMR flows  
8 within this range are recommended by the SWG from the onset of Action 3  
9 through its termination.
- 10 – Action 3 begins when temperature reaches 12°C based on a three-station  
11 average at the temperature stations: Mossdale, Antioch, and Rio Vista; or  
12 onset of spawning based upon the presence of a spent female in the Spring  
13 Kodiak Trawl Survey or at the CVP or SWP fish handling facilities.
- 14 – Offramps for Action 3 would occur by June 30; or if water temperature  
15 reaches a daily average of 25°C for three consecutive days 10 at Clifton  
16 Court Forebay.

17 *2009 NMFS BO OMR Criteria*

18 The 2009 NMFS BO includes OMR criteria to protect juvenile salmonids during  
19 winter and spring emigration downstream into the San Joaquin River, and to  
20 increase survival of salmonids and green sturgeon entering the San Joaquin River  
21 from Georgiana Slough and the lower Mokelumne River by reducing the potential  
22 for entrainment at the south Delta intakes. The action is implemented from  
23 January 1 through June 15, and reduces exports, as necessary, to limit negative  
24 flows to -2,500 to -5,000 cfs in Old and Middle Rivers, depending on the presence  
25 of salmonids. The reverse flow is managed within this range to reduce flows  
26 toward the pumps during periods of increased salmonid presence. The negative  
27 flow objective within the range is determine based on the decision tree presented  
28 in Table 5.8.

1 **Table 5.8 Old and Middle River Criteria under the 2009 NMFS BO**

Date	Action Triggers	Action Responses
January 1 – June 15	January 1 – June 15	-5,000 cfs
January 1 – June 15 First Stage Trigger (increasing level of concern)	Daily SWP/CVP older juvenile loss density (fish per TAF): 1) is greater than incidental take limit divided by 2000, with a minimum value of 2.5 fish per TAF, or 2) daily loss is greater than daily measured fish density divided by 12 TAF, or 3) Coleman National Fish Hatchery coded wire tag late-fall run or Livingston Stone National Fish Hatchery coded wire tag winter-run cumulative loss greater than 0.5%, or 4) daily loss of wild steelhead (intact adipose fin) is greater than the daily measured fish density divided by 12 TAF.	-3,500 to -5,000 cfs
January 1 – June 15 Second Stage Trigger (analogous to high concern level)	Daily SWP/CVP older juvenile loss density (fish per TAF) is: 1) greater than incidental take limit divided by 1000, with a minimum value of 2.5 fish per TAF, or 2) daily loss is greater than daily fish density divided by 8 TAF, or 3) Coleman National Fish Hatchery coded wire tag late-fall run or Livingston Stone National Fish Hatchery coded wire tag winter-run cumulative loss greater than 0.5%, or 4) daily loss of wild steelhead (intact adipose fin) is greater than the daily measured fish density divided by 8 TAF.	-2,500 to -5,000 cfs
End of Triggers	Continue action until June 15 or until average daily water temperature at Mossdale is greater than 72°F (22°C) for 7 consecutive days (1 week), whichever is earlier.	No OMR restriction

2 *2009 NMFS BO San Joaquin River Inflow: Export Ratio*

3 The 2009 NMFS BO requires south Delta exports to be reduced during April and  
4 May to protect emigrating steelhead from the lower San Joaquin River into the  
5 south Delta channels and intakes. The I:E ratio from April 1 through May 31  
6 specifies that Reclamation operates the New Melones Reservoir to maintain the  
7 2009 NMFS BO flow schedule for the Stanislaus River at Goodwin in accordance  
8 with Action III.1.3 and Appendix 2-E of the 2009 NMFS BO. In addition, the  
9 CVP and SWP pumps are operated to meet the ratios based upon a 14-day  
10 running average, as summarized in Table 5.9.

1 **Table 5.9 Inflow:Export Ratios under the 2009 NMFS BO**

San Joaquin Valley Classification	San Joaquin River flow at Vernalis (cfs):CVP/SWP combined export ratio (cfs)
Critically dry	1:1
Dry	2:1
Below normal	3:1
Above normal	4:1
Wet	4:1
Vernalis flow equal to or greater than 21,750 cfs	Unrestricted exports until flood recedes below 21,750 cfs.

2 During multiple dry years, the ratio will be limited to 1:1 if the New Melones  
 3 Index related to storage is less than 1,000 TAF and the sum of the “indicator”  
 4 numbers established for water year classifications in SWRCB D-1641 (based on  
 5 the San Joaquin Valley 60-20-20 Water Year Classification in SWRCB D-1641)  
 6 is greater than 6 for the past two years and the current year. The indicator  
 7 numbers are 1 for a critically dry year, 2 for a dry year, 3 for a below normal year,  
 8 4 for an above normal year, and 5 for a wet year.

9 Implementation of the I:E ratio under all conditions would allow a minimum  
 10 pumping rate of 1,500 cfs to meet public health and safety needs of communities  
 11 that solely rely upon water diverted from the CVP and SWP pumping plants.

12 *2008 USFWS BO Fall X2 Criteria*

13 The 2008 USFWS BO also includes an additional Delta salinity requirement in  
 14 September and October in wet and above normal water years. This new  
 15 requirement is frequently referred to as “Fall X2.” The action requires that  
 16 2 Practical Salinity Units (psu) is maintained at 74 kilometers (km) during wet  
 17 years, and 81 km during above normal water years when the preceding year was  
 18 wet or above normal based upon the Sacramento Basin 40-30-30 index in the  
 19 SWRCB D-1641. In November of these years, there is no specific X2  
 20 requirement; however, there is a requirement that all inflow into SWP and CVP  
 21 upstream reservoirs be conveyed downstream to augment Delta outflow to  
 22 maintain X2 at the locations in September and October. If storage increases  
 23 during November under this action, the increased storage volume is to be released  
 24 in December in addition to the requirements under SWRCB D-1641 net Delta  
 25 Outflow Index.

26 *Coordinated Operation Agreement*

27 The CVP and SWP are operated in a coordinated manner in accordance with  
 28 Public Law 99-546 (October 27, 1986), directing the Secretary to execute the  
 29 COA. The CVP and SWP are also operated under the SWRCB decisions and  
 30 water right orders related to the CVP’s and SWP’s water right permits and  
 31 licenses to appropriate water by diverting to storage, by directly diverting to use,  
 32 or by re-diverting releases from storage later in the year or in subsequent years.

1 The CVP and SWP are permitted by SWRCB to store water, divert water and re-  
 2 divert CVP and SWP water that has been stored in upstream reservoirs. The CVP  
 3 and SWP have built water storage and water delivery facilities in the Central  
 4 Valley to deliver water supplies to CVP and SWP contractors, including senior  
 5 water users. The CVP's and SWP's water rights are conditioned by the SWRCB  
 6 to protect the beneficial uses of water within the watersheds.

7 As conditions of the water right permits and licenses, SWRCB requires the CVP  
 8 and SWP to meet specific water quality objectives within the Delta. Reclamation  
 9 and DWR coordinate operation of the CVP and SWP, pursuant to the COA, to  
 10 meet these and other operating requirements. The COA is an agreement between  
 11 the Federal government and the State of California for the coordinated operation  
 12 of the CVP and SWP. The agreement suspended a 1960 agreement and  
 13 superseded annual coordination agreements that had been implemented following  
 14 construction of the SWP.

15 *Obligations for In-Basin Uses*

16 In-basin uses are defined in the COA as legal uses of water in the Sacramento  
 17 Basin, including the water required under the SWRCB D-1485.

18 Balanced water conditions are defined in the COA as periods when it is mutually  
 19 agreed that releases from upstream reservoirs plus unregulated flows  
 20 approximately equals the water supply needed to meet Sacramento Valley  
 21 in-basin uses plus exports. Excess water conditions are periods when it is  
 22 mutually agreed that releases from upstream reservoirs plus unregulated flow  
 23 exceed Sacramento Valley in-basin uses plus exports.

24 During excess water conditions, sufficient water is available to meet all beneficial  
 25 needs, and the CVP and SWP are not required to make additional releases. In  
 26 excess water conditions, water accounting is not required and some of the excess  
 27 water is available to CVP water contractors, SWP water contractors, and users  
 28 located upstream of the Delta. However, during balanced water conditions, CVP  
 29 and SWP share the responsibility in meeting in-basin uses.

30 When water must be withdrawn from reservoir storage to meet in-basin uses,  
 31 75 percent of the responsibility is borne by the CVP and 25 percent is borne by  
 32 the SWP. When unstored water is available for export (i.e., Delta exports exceed  
 33 storage withdrawals while balanced water conditions exist), the sum of CVP  
 34 stored water, SWP stored water, and the unstored water for export is allocated  
 35 55/45 to the CVP and SWP, respectively. The percentages and ratios included in  
 36 the COA were derived from negotiations between Reclamation and DWR for  
 37 SWRCB D-1485 standards and CVP and SWP annual supplies existing at the  
 38 time and projected into the future. Reclamation and DWR have continued to  
 39 apply these ratios as new SWRCB standards and other statutory and regulatory  
 40 changes have been adopted.

41 *Accounting and Coordination of Operations*

42 Reclamation and DWR coordinate on a daily basis to determine target Delta  
 43 outflow for water quality, reservoir release levels necessary to meet in-basin

1 demands, schedules for joint use of the San Luis Unit facilities, and for the use of  
2 each other's facilities for pumping and wheeling. During balanced water  
3 conditions, daily water accounting is maintained for the CVP and SWP  
4 obligations. This accounting allows for flexibility in operations and avoids the  
5 necessity of daily changes in reservoir releases that originate several days' travel  
6 time from the Delta.

7 The accounting language of the COA provides the mechanism for determining the  
8 responsibility of each project for Delta outflow influenced standards; however,  
9 real-time operations dictate actions. For example, conditions in the Delta can  
10 change rapidly. Weather conditions combined with tidal action can quickly affect  
11 Delta salinity conditions, and therefore, the Delta outflow required to maintain  
12 standards. If, in this circumstance, it is decided the reasonable course of action is  
13 to increase upstream reservoir releases, then the response may be to increase  
14 Folsom Reservoir releases first because the released water will reach the Delta  
15 before flows released from other CVP and SWP reservoirs. Lake Oroville water  
16 releases require about three days to reach the Delta, while water released from  
17 Shasta Lake requires five days to travel from Keswick Reservoir to the Delta. As  
18 water from the other reservoirs arrives in the Delta, Folsom Reservoir releases can  
19 be adjusted downward. Any imbalance in meeting each project's initial shared  
20 obligation would be captured by the COA accounting.

21 Reservoir release changes are one means of adjusting to changing in-basin  
22 conditions. Increasing or decreasing project exports can also immediately achieve  
23 changes to Delta outflow. As with changes in reservoir releases, imbalances in  
24 meeting the CVP and SWP initial shared obligations are captured by the COA  
25 accounting.

26 The duration of balanced water conditions varies from year to year. Some very  
27 wet years have had no periods of balanced conditions, while very dry years may  
28 have had long continuous periods of balanced conditions, and still other years  
29 may have had several periods of balanced conditions interspersed with excess  
30 water conditions.

### 31 *Joint Facilities in Suisun Marsh*

32 The Suisun Marsh Preservation Agreement (SMPA) requires DWR and  
33 Reclamation to meet salinity standards, sets a timeline for implementing the Plan  
34 of Protection, and delineates monitoring and mitigation requirements in  
35 accordance with SWRCB D-1641 to implement and operate physical facilities in  
36 the Marsh; and management of Delta outflow.

### 37 *Suisun Marsh Salinity Control Gates*

38 The Suisun Marsh Salinity Control Gates (SMSCG) are located on Montezuma  
39 Slough about two miles downstream from the confluence of the Sacramento and  
40 San Joaquin Rivers, near Collinsville. The objective of SMSCG operation is to  
41 decrease the salinity of the water in Montezuma Slough by restricting the flow of  
42 higher salinity water from Grizzly Bay into Montezuma Slough during incoming  
43 tides and retaining lower salinity Sacramento River water from the previous ebb  
44 tide. Operation of the gates in this fashion lowers salinity in Suisun Marsh

1 channels and results in a net movement of water from east to west. When Delta  
2 outflow is low to moderate and the gates are not operating, tidal flow past the gate  
3 is approximately 5,000 to 6,000 cfs while the net flow is near zero. When  
4 operated, flood tide flows are arrested while ebb tide flows remain in the range of  
5 5,000 to 6,000 cfs. The net flow in Montezuma Slough becomes approximately  
6 2,500 to 2,800 cfs. The USACE permit for operating the SMSCG requires that it  
7 be operated between October and May only when needed to meet Suisun Marsh  
8 salinity standards. Historically, the gate has been operated as early as October 1,  
9 although in some years (e.g., 1996) the gate was not operated at all. When the  
10 channel water salinity decreases sufficiently below the salinity standards, or at the  
11 end of the control season, CVP and SWP provide unrestricted movement through  
12 Montezuma Slough.

13 The approximately 2,800 cfs net flow induced by SMSCG operation is effective  
14 at moving the salinity downstream in Montezuma Slough. Salinity is reduced by  
15 roughly 100 percent at Belden's Landing, and by lesser amounts farther west  
16 along Montezuma Slough. At the same time, the salinity field in Suisun Bay  
17 moves upstream as net Delta outflow (measured nominally at Chipps Island) is  
18 reduced by gate operation. Net outflow through Carquinez Strait is not affected.  
19 The SMSCG are operated during the salinity control season, which spans from  
20 October to May.

#### 21 *Roaring River Distribution System*

22 The Roaring River Distribution System (RRDS) was constructed during 1979 and  
23 1980 to provide lower salinity water to 5,000 acres of private and 3,000 acres of  
24 CDFW-managed wetlands on Simmons, Hammond, Van Sickle, Wheeler, and  
25 Grizzly islands.

26 The RRDS includes a 40-acre intake pond that supplies water to Roaring River  
27 Slough. Motorized slide gates in Montezuma Slough and flap gates in the pond  
28 control flows through the culverts into the pond. A manually operated flap gate  
29 and flashboard riser are located at the confluence of Roaring River and  
30 Montezuma Slough to allow drainage back into Montezuma Slough for  
31 controlling water levels in the distribution system and for flood protection.  
32 DWR owns and operates this drain gate to ensure the Roaring River levees are  
33 not compromised during extremely high tides.

34 Water is diverted through a bank of eight 60-inch-diameter culverts equipped with  
35 fish screens into the Roaring River intake pond on high tides to raise the water  
36 surface elevation in RRDS above the adjacent managed wetlands. Managed  
37 wetlands north and south of the RRDS receive water, as needed, through publicly  
38 and privately owned turnouts on the system.

#### 39 *Morrow Island Distribution System*

40 The Morrow Island Distribution System (MIDS) was constructed in 1979 and  
41 1980 in the southwestern Suisun Marsh to channel drainage water from the  
42 adjacent managed wetlands for discharge into Suisun Slough and Grizzly Bay.  
43 This approach increases circulation and reduces salinity in Goodyear Slough.

1 The MIDS is used year-round, but most intensively from September through June.  
2 When managed wetlands are filling and circulating, water is tidally diverted from  
3 Goodyear Slough just south of Pierce Harbor through three 48-inch culverts.  
4 Drainage water from Morrow Island is discharged into Grizzly Bay by way of the  
5 C-Line Outfall (two 36-inch culverts) and into the mouth of Suisun Slough by  
6 way of the M-Line Outfall (three 48-inch culverts), rather than back into  
7 Goodyear Slough. This helps prevent increases in salinity due to drainage water  
8 discharges into Goodyear Slough. The M-Line ditch is approximately 1.6 miles  
9 long and the C-Line ditch is approximately 0.8 miles long.

10 **5.3.2.3 CVP and SWP Conveyance Facilities Downstream of San Luis**  
11 **Reservoir**

12 Water is released from the San Luis Reservoir into the lower portion the  
13 California Aqueduct that extends to Lake Perris in Riverside County and delivers  
14 water to the San Joaquin Valley, Central Coast, and southern California. The first  
15 reach of the California Aqueduct, the San Luis Canal, is jointly owned by the  
16 SWP and CVP and extends from San Luis Reservoir to Kettleman City. This  
17 reach includes Dos Amigos, Buena Vista, Teerink, and Chrisman pumping plants.

18 Near Kettleman City, water is diverted into the SWP Coastal Branch Aqueduct to  
19 serves agricultural areas west of the California Aqueduct and communities in  
20 San Luis Obispo and Santa Barbara counties.

21 The California Aqueduct continues into southern California through the  
22 Edmonston Pumping Plant, located at the foot of the Tehachapi Mountains, that  
23 raises the water 1,926 feet into approximately 8 miles of tunnels and siphons that  
24 convey water into Antelope Valley. At that location, the California Aqueduct  
25 divides into two branches; the East Branch and the West Branch.

26 The East Branch conveys water through the Tehachapi East Afterbay, Alamo  
27 Powerplant, Pearblossom Pumping Plant, and Mojave Siphon Powerplant into  
28 Silverwood Lake in the San Bernardino Mountains, which stores 73,000 acre-feet  
29 of water. From Silverwood Lake, water flows through the San Bernardino Tunnel  
30 into Devil Canyon Powerplant to Lake Perris. Lake Perris, located near the City  
31 of Riverside, provides up to 131,500 acre-feet of storage, and serves as a  
32 regulatory and emergency water supply facility for the East Branch. The Phase I  
33 of the East Branch Extension was completed in 2003 and conveys water to San  
34 Gorgonio Pass Water Agency and the eastern portion of the San Bernardino  
35 Valley Municipal Water District.

36 The West Branch conveys water through Oso Pumping Plant, Quail Lake, Lower  
37 Quail Canal, and William E. Warne Powerplant into Pyramid Lake in Los  
38 Angeles County. Water from Pyramid Lake is conveyed through the Angeles  
39 Tunnel, Castaic Powerplant, Elderberry Forebay, and Castaic Lake. Castaic Lake,  
40 located north of the City of Santa Clarita, provides 324,000 acre-feet of storage,  
41 and is a regulatory and emergency water supply facility for the West Branch. The  
42 Castaic Powerplant is owned and operated by the Los Angeles Department of  
43 Water and Power.

1 **5.3.2.4 Non-CVP and SWP Reservoirs that Store CVP and SWP Water**

2 The CVP and SWP water is delivered to water agencies. Some of those water  
3 agencies store the water in regional and local reservoirs. These reservoirs  
4 frequently store non-CVP and SWP water supplies, including local runoff or  
5 water diverted under separate water rights or contracts. The capacities of these  
6 reservoirs are listed in Tables 5.5, 5.6, and 5.7.

7 In the San Francisco Bay Area Region, CVP water is stored in the Contra Costa  
8 Water District Los Vaqueros Reservoir and the East Bay Municipal Utility  
9 District Upper San Leandro, San Pablo, Briones, and Lafayette reservoirs and  
10 Lake Chabot. The Los Vaqueros Reservoir, as previously described, also stores  
11 water diverted from the Delta under separate water rights. The East Bay  
12 Municipal Utility District reservoirs primarily store water diverted under water  
13 rights on the Mokelumne River.

14 In the Central Coast Region, a portion of the SWP water supply diverted in the  
15 Coastal Branch can be stored in Cachuma Lake for use by southern Santa Barbara  
16 County communities. Cachuma Lake is a facility owned and operated by  
17 Reclamation in Santa Barbara County as part of the Cachuma Project (not  
18 the CVP).

19 In the Southern California Region, SWP water is stored in the Metropolitan Water  
20 District of Southern California's Diamond Valley Lake and Lake Skinner; United  
21 Water Conservation District's Lake Piru; City of Escondido's Dixon Lake; City  
22 of San Diego's San Vicente, El Capitan, Lower Otay, Hodges, and Murray  
23 reservoirs; Helix Water District's Lake Jennings; Sweetwater Authority's  
24 Sweetwater Reservoir; and San Diego County Water Authority's Olivenhain  
25 Reservoir. There are future plans to expand local and regional water surface  
26 water storage.

27 **5.3.3 Water Supplies Used by Central Valley Project and State**  
28 **Water Project Water Users**

29 The CVP and SWP water supplies are the only water supplies available to some  
30 water users, many of the CVP Sacramento River Settlement Contractors,  
31 communities near Redding (Centerville, Clear Creek, and Shasta community  
32 services districts; Shasta County Water Agency), communities in the San Joaquin  
33 Valley (cities of Avenal, Coalinga, and Huron), and some communities served by  
34 the Antelope Valley-East Kern Water Agency. Other CVP and SWP water users  
35 rely upon other surface water supplies and groundwater. However, when the CVP  
36 and SWP water supplies are limited due to climate conditions and hydrology, the  
37 other surface water supplies are also limited.

38 Several CVP and SWP water users also rely upon other imported water supplies,  
39 including water from Solano Project (used by the Solano County Water Agency),  
40 San Francisco Public Utilities Commission (used by portions of the service areas  
41 of Alameda County Water District, Santa Clara Valley Water District, and Zone 7  
42 Water Agency), and the Colorado River (used by portions of the service area of  
43 the Metropolitan Water District of Southern California and Coachella Valley  
44 Water District). These surface water supplies are also subject to reductions due to

1 hydrologic conditions. In the case of water users that rely upon Colorado River  
2 water supplies, Delta water is used to dilute the salts and trace elements  
3 (e.g., selenium) in the Colorado River water in addition to providing direct water  
4 supplies (Reclamation 2012).

5 In response to recent reductions in CVP and SWP water supply reliability, water  
6 agencies have been improving regional and local water supply reliability through  
7 enhanced water conservation efforts, wastewater effluent and stormwater  
8 recycling, construction of surface water and groundwater storage facilities, and  
9 construction of desalination treatment plants for brackish water sources and ocean  
10 water sources. In addition, many agencies have constructed conveyance facilities  
11 to allow sharing of water supplies between communities, including the recent Bay  
12 Area Regional Water Supply Reliability project that provided conveyance  
13 opportunities between several CVP and SWP water users in the San Francisco  
14 Bay Area Region.

15 Water conservation is an integral part of water management in the study area.  
16 Water use efficiency programs and initiatives reduce the need for more expensive  
17 water supplies by facilitating the efficient use of existing water supplies. For  
18 example, a cost-effective component of many water plans is to reduce water use  
19 through educational tools that include commercial and residential guidance for  
20 water efficient landscapes, water use calculators for agricultural and municipal  
21 users, and conservation websites. All of these efforts are implemented to meet the  
22 statewide goals to reduce municipal per capita water use by 20 percent by 2020  
23 and to optimize agricultural water use efficiency.

24 Water transfers also are an integral part of water management. Historically, water  
25 transfers primarily were in-basin transfers (e.g., Sacramento Valley water seller to  
26 Sacramento Valley water user) (Reclamation 2013b; DWR, Reclamation, USFWS  
27 and NMFS 2013). However, between 2001 and 2012, water transfers from the  
28 Sacramento Valley to the areas located south of the Delta of up to 298,806 acre-  
29 feet occurred (not including water transfers under the Environmental Water  
30 Account Program in the early 2000s) (DWR, Reclamation, USFWS and NMFS  
31 2013). These transfers occurred in drier years. In the 2012 and 2013, the  
32 following types of water transfers occurred (DWR and SWRCB 2014).

- 33 • Water transfers involving CVP and SWP water:
  - 34 – 2012: 47,420 acre-feet of water transfers (43 percent were between
  - 35 agricultural water users, 36 percent were between municipal water users,
  - 36 and 21 percent were between agricultural and municipal water users).
  - 37 – 2013: 63,790 acre-feet of water transfers (28 percent were between
  - 38 agricultural water users, and 72 percent were between agricultural and
  - 39 municipal water users).
- 40 • Water transfers involving non-CVP and SWP water:
  - 41 – 2012: 188,074 acre-feet of water transfers (72 percent were between
  - 42 agricultural water users, 14 percent were from agricultural water users to

1 wildlife refuges, and 14 percent were between agricultural and municipal  
2 water users).

3 – 2013: 268,370 acre-feet of water transfers (72 percent were between  
4 agricultural water users, 1 percent were from agricultural water users to  
5 wildlife refuges, and 27 percent were between agricultural and municipal  
6 water users).

7 Until recently, most of the water transfers extended for one or two years. In 2008,  
8 one of the first long-term water transfer agreements was approved by the SWRCB  
9 for the Lower Yuba River Accord. The plan was designed to protect and enhance  
10 fisheries resources in the Lower Yuba River, increase local water supply  
11 reliability, provide DWR with increased operational flexibility for protection of  
12 Delta fisheries resources, and provide added dry-year water supplies to CVP and  
13 SWP water users, as described in Appendix 3A, No Action Alternative: Central  
14 Valley Project and State Water Project Operations. In 2013, Reclamation  
15 approved an overall program for a 25-year period (2014 to 2038) to transfer up to  
16 150,000 acre-feet per year of water from the San Joaquin River Exchange  
17 Contractors Water Authority to DOI for refuge water supplies or CVP and SWP  
18 water users (Reclamation 2013b). Reclamation is currently evaluating a long-  
19 term water transfer program (2015 to 2024) between water sellers in the  
20 Sacramento Valley and water users located in the San Francisco Bay Area and  
21 south of the Delta (Reclamation 2014b).

#### 22 **5.3.4 Surface Water Resources and Water Supplies During** 23 **Droughts**

24 Drought is a gradual phenomenon and can best be thought of as a condition of  
25 water shortage for a particular user in a particular location. Although persistent  
26 drought may be characterized as an emergency, it differs from typical emergency  
27 events. Most natural disasters, such as floods or forest fires, occur relatively  
28 rapidly and afford little time for preparing for disaster response. Droughts occur  
29 slowly, over a period of time. There is no universal definition of when a drought  
30 begins or ends. Impacts of drought are typically felt first by those most reliant on  
31 annual rainfall -- ranchers engaged in dryland grazing, rural residents relying on  
32 wells in low-yield rock formations, or small water systems lacking a reliable  
33 water source. Criteria used to identify statewide drought conditions do not  
34 address these localized impacts. Drought impacts increase with the length of a  
35 drought, as carry-over supplies in reservoirs are depleted and water levels in  
36 groundwater basins decline.

37 Measurements of California water conditions cover only a small slice of the past.  
38 Widespread collection of rainfall and streamflow information began around the  
39 turn of the 20th century. During our period of recorded hydrology, the most  
40 significant statewide droughts occurred during 1928-34, 1976-77, 1987-92, and  
41 2007-09. A significant regional drought occurred in parts of Southern California  
42 in 1999-2002. Historical data combined with estimates created from indirect  
43 indicators such as tree rings suggest that the 1928-34 event may have been the  
44 driest period in the Sacramento River watershed since about the mid-1550s.

1 **5.3.4.1 Prior General Drought Responses**

2 Previous droughts that have occurred throughout California's history are  
3 constantly shaping and innovating the ways in which DWR and Reclamation  
4 handle both public health standards and urban and agricultural water demand, as  
5 well as protecting the Delta ecosystem and its inhabitants. The most notable  
6 droughts in recent history are the droughts that occurred in 1976-77 and 1987-92.  
7 The climactic situation helped shape legislation and stressed the importance of  
8 maintaining water supplies for all water users.

9 The impacts of a dry hydrology in 1976 were mitigated by reservoir storage and  
10 groundwater availability. The immediate succession of an even drier 1977,  
11 however, set the stage for widespread impacts. In 1977 CVP agricultural water  
12 contractors received 25 percent of their allocations, municipal contractors  
13 received 25 to 50 percent, and the exchange contractors received 75 percent.  
14 SWP agricultural contractors received 40 percent of their allocations and urban  
15 contractors received 90 percent.

16 Managing Delta salinity is a major challenge, given the competing needs to  
17 preserve critical carry-over storage and to release water from storage to meet  
18 Bay-Delta water quality standards. In February 1977, the SWRCB adopted an  
19 interim water quality control plan to modify Delta standards to allow the SWP to  
20 conserve storage in Lake Oroville. As extremely dry conditions continued that  
21 spring, the SWRCB subsequently adopted an emergency regulation superseding  
22 its interim water quality control plan, temporarily eliminating most water quality  
23 standards and forbidding the SWP to export stored water. As a further measure to  
24 conserve reservoir storage, DWR constructed temporary facilities (i.e., rock  
25 barriers, new diversions for Sherman Island agricultural water users, and facilities  
26 to provide better water quality for duck clubs in Suisun Marsh) in the Delta to  
27 help manage salinity with physical, rather than hydraulic, approaches.

28 In 1977, SWP and CVP contractors used water exchanges to respond to drought.  
29 One of the largest exchanges involved 435,000 acre-feet of SWP contract water  
30 made available by Metropolitan Water District of Southern California and three  
31 other SWP Southern California water contractors for use by San Joaquin Valley  
32 irrigators and urban agencies in the San Francisco Bay area.

33 During the 1987-92 drought, the state's 1990 population was close to 80 percent  
34 of present amounts and irrigated acreage was roughly the same as that of the  
35 present, but the institutional setting for water management differed significantly.  
36 Delta regulatory constraints affecting CVP and SWP operations were based on  
37 SWRCB D-1485, which had taken effect in 1978 immediately following the  
38 1976-77 drought. In addition to SWRCB D-1485 requirements on CVP and SWP  
39 operations in the Delta, other operational constraints included water temperature  
40 standards imposed by the SWRCB through Water Rights Orders 90-5 and 91-01  
41 for portions of the Sacramento and Trinity rivers. As part of managing salinity  
42 during the drought, DWR installed temporary barriers at two South Delta  
43 locations (along Middle River and in Old River near the Delta-Mendota Canal  
44 intake) to improve water levels and water quality/water circulation for  
45 agricultural diverters.

#### 1 **5.3.4.2 Recent General Drought Response**

2 As a result of more recent drought conditions, California Governor Edmund G.  
3 Brown issued a Drought Emergency Proclamation on January 17, 2014 that is  
4 effective through May 31, 2016. This proclamation directs the SWRCB to,  
5 among other things, consider petitions, such as Temporary Urgency Change  
6 Petitions (TUCP), to modify requirements for reservoir releases or diversion  
7 limitations that were established to implement a water quality control plan.

8 On January 29, 2014, Reclamation and DWR sought a temporary modification to  
9 their water rights permits and licenses through a TUCP, allowing the CVP and  
10 SWP to reduce Delta outflow and thus conserve upstream storage for later use.  
11 The resultant January 31, 2014, Governor's Executive Order (January Order) also  
12 allowed the projects to pump at a minimum level (up to a total of 1,500 cfs) to  
13 supply essential public health and safety needs when Delta outflow was lower  
14 than would typically allow such pumping. Reclamation and DWR convened a  
15 Real Time Drought Operations Management Team (RTDOMT) comprised of  
16 representatives from Reclamation, DWR, USFWS, NMFS, CDFW, and SWRCB  
17 to discuss more flexible operations of the projects while protecting beneficial  
18 uses. Throughout 2014, the federal and state fish and wildlife agencies worked in  
19 close coordination with Reclamation and DWR to receive, analyze, and respond  
20 to the CVP and SWP operators' requests for additional operational flexibility  
21 while still remaining within the boundaries of the applicable environmental laws  
22 and regulations.

23 The January Order was amended several times to allow project operators to pump  
24 at higher levels to capture storm run-off. The January Order was also extended  
25 and/or amended to modify SWRCB D-1641 Delta Outflow requirements. The  
26 *CVP and SWP Drought Operations Plan and Operational Forecast for*  
27 *April 1, 2014 through November 15, 2014* (DOP) (Reclamation and DWR 2014a),  
28 outlined critical CVP/SWP operational considerations including providing for  
29 essential human health and safety needs; maintaining salinity control; planning for  
30 installation of three emergency drought barriers; maintaining adequate water  
31 supply reserves for 2015; providing for cold water species' needs, CVP and SWP  
32 water supplies, and refuge water supplies; and providing for operational  
33 flexibility, exchanges, and transfers. The DOP included upstream tributary  
34 operations as well as further modifications to D-1641 provisions associated with  
35 Delta outflow levels, maximum export limits, Delta E:I averaging period,  
36 combined export limitations, Vernalis base and pulse flows, and agricultural  
37 salinity compliance locations. Modifications to the DOP were requested in  
38 September 2014, regarding changes to San Joaquin River flows at Vernalis and  
39 extension of the water transfer window.

40 The *CVP and SWP Drought Contingency Plan for October 15, 2014 through*  
41 *January 15, 2015* (Drought Contingency Plan) (Reclamation and DWR 2015a),  
42 was prepared by Reclamation and DWR in response to the SWRCB  
43 October 7, 2014 Modified TUC Order. This Plan provided an overview of  
44 current conditions and available supplies as they related to projected flow and  
45 storage conditions for assumed hydrology, and addressed projected water

1 operations based on various hydrologic scenarios and potential adjustments to  
2 regulatory requirement through January 15, 2015.

3 The subsequent *Drought Contingency Plan for January 15, 2015 through*  
4 *September 30, 2015*, was prepared to incorporate changes in snowpack, reservoir  
5 storage, and updated hydrologic forecasts. The January 15, 2015, *Drought*  
6 *Contingency Plan* appended a December 12, 2014 working draft of the  
7 *Interagency 2015 Drought Strategy for the CVP and SWP* (Reclamation and  
8 DWR 2014b). The 2015 Drought Strategy described the anticipated coordination,  
9 process, planning, and potential drought response actions for 2015.

10 Similar to 2014, Reclamation and DWR jointly filed several TUCPs starting on  
11 January 23, 2015, to temporarily modify requirements in their water right permits  
12 and licenses for the SWP and CVP. The TUCPs requested temporary  
13 modification of requirements included in SWRCB Revised D-1641 to meet water  
14 quality objectives in the *Water Quality Control Plan for the San Francisco*  
15 *Bay/Sacramento–San Joaquin Delta Estuary*. Specifically, the TUCPs during  
16 2015 requested modifications to Delta outflow, San Joaquin River flow, DCC  
17 gate operation, and export limit objectives/or requirements, as well as upstream  
18 tributary operations, Rio Vista flows, western Delta salinity, and San Joaquin  
19 River salinity objectives.

20 The combination of virtually no snowpack and diminished reservoir storage in the  
21 spring of 2015 convinced federal and state wildlife and water agency managers  
22 that an emergency salinity barrier on West False River in the Sacramento-San  
23 Joaquin Delta was needed to repel salinity that could threaten a source of water  
24 used by 25 million Californians. Installation of a single emergency salinity  
25 barrier across West False River began in early May; with removal scheduled by  
26 mid-November. The barrier helped to limit the tidal push of saltwater from San  
27 Francisco Bay into the central Delta and helped minimize the amount of fresh  
28 water that must be released during the summer from upstream reservoirs to repel  
29 saltwater. Sufficient reserves in upstream reservoirs are needed to repel saltwater  
30 and prevent the contamination of water supplies for residents of the Delta; Contra  
31 Costa, Alameda and Santa Clara counties, and the 25 million people who rely on  
32 the Delta-based federal and state water projects for at least some of their supplies.  
33 Removal of the emergency barrier by November 15 is needed to avoid the flood  
34 season and harm to migratory fish. While it is in place, boaters used alternative  
35 routes between the San Joaquin River and the Delta's interior.

### 36 **5.3.4.3 Recent Drought Effects on Surface Water Resources and** 37 **Supplies**

38 California is currently in its fourth consecutive year of below-average rainfall and  
39 very low snowpack. Water Year 2015 is also the eighth of 9 years with below-  
40 average runoff, which has resulted in chronic and significant shortages to  
41 municipal and industrial, agricultural, and refuge water supplies and historically  
42 low levels of groundwater. As of October 2015, 46 percent of the state was  
43 experiencing an Extreme Drought and 25 percent was experiencing an  
44 Exceptional Drought, as recorded by the National Drought Mitigation Center,

1 U.S. Drought Monitor (Drought Monitor 2015). Of particular concern has been  
 2 the state's critically low snow pack which typically provides much of California's  
 3 seasonal water storage. On April 1, 2015, for the first time in 75 years of early-  
 4 April measurements, DWR found no snow at the Phillips snow course, a primary  
 5 snowpack measurement site in the Sierra Nevada mountain range. Lack of  
 6 precipitation the last several years has also contributed to low reservoir storage  
 7 levels in the Sacramento watershed. Shasta Reservoir on the Sacramento River  
 8 and Lake Oroville on the Feather River, and Folsom Lake on the American River  
 9 were at 35 and 30 percent of capacity, respectively, on October 5, 2015 (58 and  
 10 49 percent of historical average, respectively). Trinity Lake on the Trinity River  
 11 was at 22 percent of capacity and 32 percent of historical average. The San  
 12 Joaquin River watershed in particular has experienced severely dry conditions for  
 13 the past three years, with and New Melones Reservoir at 11 percent capacity  
 14 (20 percent historical average as of October 5, 2015).

15 Recently, one of the most critical reservoir water elevations has occurred at  
 16 Folsom Lake. On October 5, 2015, the storage was at 17 percent of capacity, or  
 17 21 percent of historical average at this time of the year. When the water  
 18 elevations in Folsom Lake decline substantially, the intakes along Folsom Dam  
 19 may not be able to operate at full capacity. Therefore, in 2015, Reclamation  
 20 installed a barge and pump system in Folsom Lake to allow diversions when low  
 21 water surface elevations would cause capacity issues for existing intakes.

22 Overall, in 2014 and 2015, CVP and SWP water allocations were substantially  
 23 reduced. The final 2014 water allocations and the February 2015 water  
 24 allocations were as follows (Reclamation 2015; DWR 2014e, 2015):

- 25 • CVP agricultural water contractors: zero percent in 2014 and 2015.
- 26 • CVP municipal and industrial contractors: 50 percent in 2014 and 25 percent  
 27 in 2015.
- 28 • CVP Eastside Division contractors: 55 percent in 2014 and zero percent in  
 29 2015.
- 30 • CVP Friant Water Division Class I and II contractors: zero percent in 2014  
 31 and 2015.
- 32 • CVP Sacramento River Water Rights Settlement Contractors and Sacramento  
 33 Valley wildlife refuges (Level 2 water supplies): 75 percent in 2014 and 2015  
 34 (based on preliminary allocations in February 2016).
- 35 • CVP San Joaquin River Exchange Contractors and San Joaquin Valley  
 36 wildlife refuges (Level 2 water supplies): 65 percent in 2014 and 75 percent in  
 37 2015 (based on preliminary allocations in February 2016). In 2014 and 2015,  
 38 San Joaquin River Exchange Contractors received a portion of the contract  
 39 amounts from Millerton Lake.
- 40 • SWP agricultural and urban contractors: up to 20 percent of the Table A water  
 41 contract amounts in 2014 and 2015.

- 1 • SWP Feather River water rights contractors: 100 percent in 2014 and  
2 50 percent in 2015.

3 The Congressional Research Service summarized the following information  
4 prepared by the SWRCB to describe the economic impacts of the 2014 drought  
5 period (CRS 2015):

- 6 • 428,000 acres agricultural lands idled in the Central Valley, Central Coast,  
7 and Southern California regions.
- 8 • \$447 million of increased cost to increase groundwater pumping.
- 9 • \$2.2 billion total economic loss, including \$1.5 billion direct loss to  
10 agriculture (or 3 percent of the total average agricultural production value).
- 11 • 17,100 agricultural-related jobs lost (including 3.8 percent of total farm  
12 employment).
- 13 • Unaccounted loses for commercial and recreational fishing, reservoir and river  
14 recreation, and non-agricultural water dependent industrial job losses.

15 Responses to droughts have changed since the 1976-77 drought. The federal and  
16 state governments have acknowledged the droughts early in the process and  
17 implemented emergency actions to preserve water supplies for future years in  
18 case the droughts extend over long-periods. As discussed above in this section,  
19 these actions have included reductions in water supply allocations as well as  
20 modification of regulatory requirements to protect future water supplies for all  
21 beneficial uses. The responses to drought are generally limited to short-term  
22 actions, including stringent water conservation by municipal users, increased  
23 groundwater pumping by municipal and agricultural users, and modification of  
24 regulatory requirements. However, these short-term responses generally cannot  
25 be maintained on a long-term basis without economic effects. Following the  
26 drought in 1987-92, longer term programs were initiated by both municipal and  
27 industrial water users. For example, water recycling increased 144 percent  
28 between 1977 and 1987, and 251 percent between 2009 and 1987 (SWRCB  
29 2009). Other long-term water supply reduction programs were initiated after the  
30 previous droughts, including increased use of drip irrigation. For example,  
31 Westlands Water District increased the use of drip irrigation from 3 percent of the  
32 crops in 1990 to 65 percent of the crops in 2011 (WWD 2013). However, these  
33 types of long-term responses take time to implement and once the savings are  
34 realized, there is less flexibility to respond to future droughts because the savings  
35 have occurred on a long-term basis.

36 It is also recognized that some effects of droughts do not occur within the year  
37 that the drought occurs. For example, increased use of groundwater in one year  
38 may result in subsidence in following years. Effects in commercial and sport  
39 fishing ocean salmon fishing also would not be realized in the years that the  
40 drought occurs because loss of spawning populations affects available salmon  
41 stocks for several years and future spawning populations. For example, coded  
42 wire tag recoveries of Sacramento River fall-run Chinook Salmon for commercial

1 fishing noticeably declined following the 1987-1992 and 2007-09 droughts up to  
2 95 percent (PFMC 2015).

### 3 **5.4 Impact Analysis**

4 This section describes the potential mechanisms and analytical methods for  
5 change in surface water resources, results of the impact analysis, potential  
6 mitigation measures, and cumulative effects.

#### 7 **5.4.1 Potential Mechanisms for Change and Analytical Methods**

8 As described in Chapter 4, Approach to Environmental Analysis, the impact  
9 assessment considers changes in surface water resources conditions related to  
10 changes in CVP and SWP operations under the alternatives as compared to the No  
11 Action Alternative and Second Basis of Comparison.

##### 12 **5.4.1.1 Changes in CVP and SWP Reservoir Storage and Downstream 13 River Flows**

14 Changes in CVP and SWP operations under the alternatives as compared to the  
15 No Action Alternative and the Second Basis of Comparison would result in  
16 changes to reservoir storage volumes (and elevations) and flow patterns in the  
17 downstream rivers. Numerical models are available to quantitatively analyze the  
18 changes in CVP and SWP reservoirs and pumping plants in the Central Valley,  
19 affected surface water bodies, and deliveries of CVP and SWP water. Changes in  
20 reservoirs that store CVP and SWP water outside of the Central Valley are not  
21 included in the CVP and SWP numerical models, and are evaluated qualitatively.

22 The surface water supply analysis was conducted using the CalSim II model, as  
23 described in Appendix 5A, CalSim II and DSM2 Modeling, to simulate the  
24 operational assumptions of each alternative that were described in Chapter 3,  
25 Description of Alternatives.

##### 26 **5.4.1.1.1 Use of CalSim II Model**

27 CalSim II is a reservoir-river basin planning model developed by DWR and  
28 Reclamation to simulate the operation of the CVP and SWP over a range of  
29 different hydrologic conditions. Inputs to CalSim II include water demands  
30 (including water rights), stream accretions and depletions, reservoir inflows,  
31 irrigation efficiencies, and parameters to calculate return flows, non-recoverable  
32 losses and groundwater operations. Sacramento Valley and tributary rim basin  
33 hydrology uses an adjusted historical sequence of monthly stream flows over an  
34 82-year period (1922 to 2003) to represent a sequence of flows at a future level of  
35 development. Adjustments to historic water supplies are imposed based on future  
36 land use conditions and historical meteorological and hydrologic conditions. The  
37 resulting hydrology represents the water supply available from Central Valley  
38 streams to the CVP and SWP at a future level of development. Water rights  
39 deliveries to non-CVP and non-SWP water rights holders are not modified in the  
40 CalSim II simulations of the alternatives. CalSim II produces outputs for river

1 flows and diversions, reservoir storage, Delta flows and exports, Delta inflow and  
2 outflow, deliveries to project and non-project users, and controls on project  
3 operations.

4 The CalSim II model monthly simulation of an actual daily (or even hourly)  
5 operation of the CVP and SWP results in several limitations in use of the model  
6 results. The model results must be used in a comparative manner to reduce the  
7 effects of use of monthly assumptions and other assumptions that are indicative of  
8 real-time operations, but do not specific match real-time observations. The  
9 CalSim II model output is based upon a monthly time step. The CalSim II model  
10 output includes minor fluctuations of up to 5 percent due to model assumptions  
11 and approaches. Therefore, if the quantitative changes between a specific  
12 alternative and the No Action Alternative and/or Second Basis of Comparison are  
13 5 percent or less, the conditions under the specific alternative would be  
14 considered to be “similar” to conditions under the No Action Alternative and/or  
15 Second Basis of Comparison.

16 Under extreme hydrologic and operational conditions where there is not enough  
17 water supply to meet all requirements, CalSim II utilizes a series of operating  
18 rules to reach a solution to allow for the continuation of the simulation. It is  
19 recognized that these operating rules are a simplified version of the very complex  
20 decision processes that CVP and SWP operators would use in actual extreme  
21 conditions. Therefore, model results and potential changes under these extreme  
22 conditions should be evaluated on a comparative basis between alternatives and  
23 are an approximation of extreme operational conditions. As an example, CalSim  
24 II model results show simulated occurrences of extremely low storage conditions  
25 at CVP and SWP reservoirs during critical drought periods when storage is at  
26 dead pool levels at or below the elevation of the lowest level outlet. Simulated  
27 occurrences of reservoir storage conditions at dead pool levels may occur  
28 coincidentally with simulated impacts that are determined to be potentially  
29 significant. When reservoir storage is at dead pool levels, there may be instances  
30 in which flow conditions fall short of minimum flow criteria, salinity conditions  
31 may exceed salinity standards, diversion conditions fall short of allocated  
32 diversion amounts, and operating agreements are not met.

#### 33 **5.4.1.1.2 Analysis of Changes in Reservoir Storage and Downstream** 34 **River Flows**

35 CalSim II outputs for the alternatives are compared to the CalSim II outputs for  
36 the No Action Alternative and the Second Basis of Comparison to evaluate  
37 changes in reservoir storages at Trinity Lake, Shasta Lake, Lake Oroville, Folsom  
38 Lake, New Melones Reservoir, and San Luis Reservoir; flows downstream of  
39 CVP and SWP reservoirs in Trinity, Sacramento, Feather, American, Stanislaus  
40 rivers and Clear Creek; flows from the Sacramento River at Fremont Weir into  
41 the Yolo Bypass; Delta outflow; and reverse flows in Old and Middle rivers  
42 (OMR criteria).

1 The analyses discussed in Chapters 5 through 21 do not include specific analysis  
2 for Millerton Lake and the San Joaquin River between Friant Dam and the  
3 confluence with the Stanislaus River under Alternatives 1 through 5 as compared  
4 to the No Action Alternative and Second Basis of Comparison. The results of  
5 these analyses (presented in Appendix 5A, CalSim II and DSM2 Modeling)  
6 indicated that there were no differences in Millerton Lake storage or San Joaquin  
7 River flows upstream of the confluence with the Stanislaus River between  
8 Alternatives 1 through 5 as compared to the No Action Alternative and Second  
9 Basis of Comparison because implementation of the alternatives would not affect  
10 the operations of Millerton Lake. Therefore, conditions at Millerton Lake and the  
11 San Joaquin River between Friant Dam and the confluence of the Stanislaus River  
12 are not analyzed in this EIS.

13 The analyses discussed in Chapters 5 through 21 do not include specific analysis  
14 for creeks downstream of San Luis Reservoir complex. Unlike the rivers located  
15 downstream of CVP and SWP reservoirs (e.g., Sacramento River downstream of  
16 Shasta Dam), river channels located downstream of the San Luis Reservoir  
17 complex are not used to convey CVP and SWP water. Instream flows in these  
18 rivers would not be affected by changes in CVP and SWP operations. Therefore,  
19 flows in streams downstream of San Luis Reservoir are not analyzed in this EIS.

20 Reservoirs that store CVP and SWP water are also located in the San Francisco  
21 Bay Area, Central Coast, and Southern California regions. Many of these  
22 reservoirs also store water from other water supplies including CVP and SWP  
23 water. These reservoirs are not included in the CalSim II model simulation.  
24 Storage volumes in non-CVP and SWP reservoirs located south of the Delta that  
25 store CVP or SWP water also are affected by the availability local runoff stored in  
26 these reservoirs; and from imported Colorado River water in some Southern  
27 California reservoirs. This EIS does not analyze availability of future local runoff  
28 or imported Colorado River water supplies in 2030. For this EIS, it is assumed  
29 that under a worst-case scenario, changes in CVP and SWP water deliveries  
30 would result in similar changes to storage in these reservoirs. For example,  
31 reductions in CVP or SWP deliveries would result in reductions in storage in  
32 reservoirs located south of the Delta. Generally, river channels located  
33 downstream of these reservoirs are not used to convey CVP and SWP water.  
34 Instream flows in these rivers would not be affected by changes in CVP and SWP  
35 operations. Therefore, flows in these streams are not analyzed in this EIS.

#### 36 **5.4.1.2 Changes in Flows over Fremont Weir into Yolo Bypass**

37 All of the alternatives, including the No Action Alternative and the Second Basis  
38 of Comparison, include operations of an operable gate at Fremont Weir, as  
39 described in Chapter 3, Description of Alternatives. Results of the CalSim II  
40 model were used to assess changes in average monthly flows that would flow into  
41 the Yolo Bypass over an operable gate at Fremont Weir. Operational assumptions  
42 for the operable gate were developed for the purposes of this EIS analysis, and are  
43 the same in all alternatives and the Second Basis of Comparison. Specific  
44 operational assumptions are being developed by Reclamation and others in a  
45 separate analysis that includes separate environmental documentation. Although

1 the operational assumptions for an operable gate at Fremont Weir would be the  
2 same under all alternatives and the Second Basis of Comparison; the flow patterns  
3 into the Yolo Bypass would change based upon the magnitude of flows in the  
4 Sacramento River at Fremont Weir, as evaluated quantitatively using CalSim II  
5 model output. Assumptions used in the CalSim II model are described in  
6 Appendix 5A, CalSim II and DSM2 Modeling.

7 Flows also enter the Yolo Bypass at the Sacramento Weir (downstream of  
8 Fremont Weir) at a lower flow rate. However, the Sacramento Weir operations  
9 are assumed to remain as described in Section 5.3, Affected Environment, in all  
10 alternatives and the Second Basis of Comparison.

#### 11 **5.4.1.3 Changes in Delta Conditions**

12 Changes in CVP and SWP operations under the alternatives as compared to the  
13 No Action Alternative and Second Basis of Comparison would change the Delta  
14 inflows from the tributary watersheds, Delta outflow, and reverse flows in Old  
15 and Middle River (as indicated by OMR flows). Results of the CalSim II model  
16 were used to assess changes in Delta outflow and positive and negative OMR  
17 flows. Assumptions used in the CalSim II model are described in Appendix 5A,  
18 CalSim II and DSM2 Modeling.

#### 19 **5.4.1.4 Changes in Delta Exports and CVP and SWP Deliveries**

20 Changes in CVP and SWP operations under the alternatives as compared to the  
21 No Action Alternative and Second Basis of Comparison would change CVP and  
22 SWP exports and deliveries, as analyzed using the CalSim II model. Assumptions  
23 used in the CalSim II model are described in Appendix 5A, CalSim II and DSM2  
24 Modeling.

25 It should be noted that deliveries to CVP and SWP water users located to the  
26 south of the Delta are not necessarily the same volume as the Delta export  
27 patterns because a portion of the exported water is stored in San Luis Reservoir  
28 and released on a different pattern than Delta exports.

29 It also should be noted that the monthly CalSim II model results do not represent  
30 daily water operations decisions, especially for extreme conditions. For example,  
31 in very dry years, the model simulates minimum reservoir volumes (also known  
32 as “dead pool conditions”) that appear to prevent Reclamation and DWR from  
33 meeting their contractual obligations, including water deliveries to CVP  
34 Sacramento River Settlement Contractors, CVP San Joaquin River Exchange  
35 Contractors, SWP Feather River Service Area Contractors, and Level II refuge  
36 water supplies. Such model results are anomalies that reflect the inability of the  
37 monthly model to make real-time policy decisions under extreme circumstances.  
38 Projected reservoir storage conditions near dead pool conditions should only be  
39 considered as an indicator of stressed water supply conditions, and not necessarily  
40 reflective of actual CVP and SWP operations in the future.

**5.4.1.5 Effects Related to Water Transfers**

Historically water transfer programs have been developed on an annual basis. The demand for water transfers is dependent upon the availability of water supplies to meet water demands. Water transfer transactions have increased over time as CVP and SWP water supply availability has decreased, especially during drier water years.

Parties seeking water transfers generally acquire water from sellers who have available surface water who can make the water available through releasing previously stored water, pumping groundwater instead of using surface water (groundwater substitution), idle crops, or substitute crops that uses less water in order to reduce normal consumptive use of surface water.

Water transfers using CVP and SWP Delta pumping plants and south of Delta canals generally occur when there is unused capacity in these facilities. These conditions generally occur during drier water year types when the flows from upstream reservoirs plus unregulated flows are adequate to meet the Sacramento Valley water demands and the CVP and SWP export allocations (defined as “balanced Delta conditions” in the COA, as described in Appendix 3A, No Action Alternative: Central Valley Project and State Water Project Operations). In nonwet years, the CVP and SWP water allocations would be less than full contract amounts; therefore, capacity may be available in the CVP and SWP conveyance facilities to move water from other sources.

Water transfers using CVP and SWP conveyance facilities frequently do not occur when releases from upstream reservoirs plus unregulated flows are greater than the Sacramento Valley water demands and the CVP and SWP export allocations (defined as “excess Delta conditions in the COA) because the available water is being conveyed to meet the CVP and SWP contract demands. This condition generally occurs in winter and spring months of wet years.

Without implementation of the 2008 USFWS BO and 2009 NMFS BO, water transfers could occur in most months when exports are less than conveyance capacity. The 2008 USFWS BO and 2009 NMFS BO include export restrictions in the winter and spring months that limit use of the conveyance capacity.

Transfers requiring conveyance through the Delta occur when pumping and conveyance capacity at the CVP or SWP export facilities is available. Reclamation and DWR must coordinate review of the transfer proposals and related CVP and SWP operations to assure that the CVP and SWP are not impacted including the ability to exercise their own water rights or to meet their legal and regulatory requirements are not diminished or limited in any way. To avoid impacts to Delta water quality the individual transfer is assessed a carriage water loss to account for flows required to avoid impacts to Delta water quality or flow objectives. All transfers are required to be implemented in accordance with all existing regulations and requirements, including not causing adverse impacts on other water users in accordance with SWRCB requirements.

1 Reclamation recently prepared a long-term regional water transfer environmental  
2 document which evaluated potential changes in surface water conditions related to  
3 water transfer actions (Reclamation 2014i). Results from this analysis were used  
4 to inform the impact assessment of potential effects of water transfers under the  
5 alternatives as compared to the No Action Alternative and the Second Basis of  
6 Comparison.

7 **5.4.2 Conditions in Year 2030 without implementation of**  
8 **Alternatives 1 through 5**

9 The impact analysis in this EIS is based upon the comparison of the alternatives to  
10 the No Action Alternative and the Second Basis of Comparison in the Year 2030.  
11 Changes that would occur over the next 15 years without implementation of the  
12 alternatives are not analyzed in this EIS. However, the changes that are assumed  
13 to occur by 2030 under the No Action Alternative and the Second Basis of  
14 Comparison are summarized in this section.

15 Many of the changed conditions would occur in the same manner under both the  
16 No Action Alternative and the Second Basis of Comparison. Other future  
17 conditions would be different under the No Action Alternative as compared to the  
18 Second Basis of Comparison due to the implementation of the 2008 USFWS BO  
19 and 2009 NMFS BO under the No Action Alternative.

20 This section of Chapter 5 provides qualitative projections of the No Action  
21 Alternative as compared to existing conditions described under the Affected  
22 Environment; and qualitative projections of the Second Basis of Comparison as  
23 compared to “recent historical conditions.” Recent historical conditions are not  
24 the same as existing conditions which include implementation of the 2008  
25 USFWS BO and 2009 NMFS BO; and consider changes that would have occurred  
26 without implementation of the 2008 USFWS BO and the 2009 NMFS BO.

27 **5.4.2.1 Common Changes in Conditions under the No Action**  
28 **Alternative and Second Basis of Comparison**

29 Conditions in 2030 would be different than existing conditions due to:

- 30 • Climate change and sea-level rise  
31 • General plan development throughout California, including increased water  
32 demands in portions of Sacramento Valley  
33 • Implementation of reasonable and foreseeable water resources management  
34 projects to provide water supplies

35 These changes would result in a decline of the long-term average CVP and SWP  
36 water supply deliveries by 2030 as compared to recent historical long-term  
37 average deliveries.

38 **5.4.2.1.1 Changes in Conditions due to Climate Change and Sea-Level Rise**

39 It is anticipated that climate change would result in more short-duration high-  
40 rainfall events and less snowpack in the winter and early spring months. The  
41 reservoirs would be full more frequently by the end of April or May by 2030 than

1 in recent historical conditions. However, as the water is released in the spring,  
2 there would be less snowpack to refill the reservoirs. This condition would  
3 reduce reservoir storage and available water supplies to downstream uses in the  
4 summer. The reduced end-of-September storage also would reduce the ability to  
5 release stored water to downstream regional reservoirs. These conditions would  
6 occur for all reservoirs in the California foothills and mountains, including  
7 non-CVP and SWP reservoirs.

8 Sea level rise also would result in reduced CVP and SWP reservoir storage. As  
9 sea level rise occurs, the location of the salt water-freshwater zone moves further  
10 inland. However, the CVP and SWP must continue to meet the salinity criteria to  
11 protect Delta water users and Delta aquatic resources, including the SWRCB  
12 D-1641 and other salinity criteria to protect Delta water users. To meet these  
13 criteria, the amount of water released from CVP and SWP reservoirs must be  
14 increased as compared to recent historical conditions.

15 Climate change also would cause changes in stream flows. During the storm  
16 events, the flows would be higher than in recent historical conditions because a  
17 larger portion of the precipitation would occur as rainfall instead of snowfall.  
18 Flows would increase in the spring as more water is released from CVP and SWP  
19 reservoirs to meet Delta salinity criteria. In the summer and fall months, flows  
20 could be lower due to reduced amounts of water remaining in reservoir storage.

21 Climate change also would reduce groundwater supplies due to reduced  
22 groundwater recharge potential and increased groundwater overdraft potential as  
23 surface water supplies decline. However, in some locations, sustainable  
24 groundwater supplies could remain similar to recent historical conditions or rise  
25 due to implementation of groundwater management plans to reduce groundwater  
26 overdraft, including the completion of ongoing groundwater recharge and  
27 recovery programs.

#### 28 **5.4.2.1.2 General Plan Development in California**

29 Counties and cities throughout California have adopted general plans which  
30 identify land use classifications including those for municipal and industrial uses  
31 and those for agricultural uses. Preparation of general plans includes an  
32 environmental evaluation under the California Environmental Quality Act to  
33 identify adverse impacts to the physical environment and to provide mitigation  
34 measures to reduce those impacts to a level of less than significance. Most of the  
35 counties where CVP and SWP water supplies are delivered have adopted general  
36 plans following the environmental review of the plans and appropriate  
37 alternatives. Population projections from those general plan evaluations are  
38 provided to the State Department of Finance and are used to project future water  
39 needs and the potential for conversion of existing undeveloped lands and  
40 agricultural lands. Many of the existing general plans for counties with municipal  
41 areas recently have been modified to include land use and population projections  
42 through 2030. The No Action Alternative and the Second Basis of Comparison  
43 assume that land uses will develop through 2030 in accordance with existing  
44 general plans.

1 Development in accordance with the general plans in the Sacramento Valley  
2 would result in increased water demands. By 2030, water demands associated  
3 with water rights and CVP and SWP contracts in the Sacramento Valley is  
4 projected to increase by 443,000 acre-feet per year, especially in the communities  
5 in El Dorado, Placer, and Sacramento Counties. Increased water demands in the  
6 Sacramento Valley would result in reductions in CVP and SWP water supply  
7 availability for other water users under the No Action Alternative and the Second  
8 Basis of Comparison.

9 **5.4.2.1.3 Reasonable and Foreseeable Water Resources Management**  
10 **Projects**

11 The No Action Alternative and the Second Basis of Comparison assumes  
12 completion of water resources management and environmental restoration  
13 projects that would have occurred without implementation of the 2008 USFWS  
14 BO and 2009 NMFS BO by 2030, as described in Chapter 3, Description of  
15 Alternatives.

16 The No Action Alternative and the Second Basis of Comparison would include  
17 the following actions included in the 2008 USFWS BO and 2009 NMFS BO that  
18 are ongoing.

- 19 • Restoration of more than 10,000 acres of intertidal and associated subtidal  
20 wetlands in Suisun Marsh and Cache Slough and at least 17,000 to  
21 20,000 acres of seasonal floodplain restoration in Yolo Bypass
- 22 • Gravel augmentation in the Sacramento Valley watershed
- 23 • Replacement of the Spring Creek Temperature Control Curtain
- 24 • Restoration of Battle Creek
- 25 • Implementation of Red Bluff Pumping Plant
- 26 • Implementation of the CVPIA Anadromous Fish Screen Program
- 27 • Implementation of the American River Flow Management Standard

28 Under the No Action Alternative and Second Basis of Comparison, it is assumed  
29 that water demands would be met on a long-term basis and in dry and critical dry  
30 years using a combination of conservation, CVP and SWP water supplies, other  
31 imported water supplies, groundwater, recycled water, infrastructure  
32 improvements, desalination water treatment, and water transfers and exchanges.  
33 It is anticipated that individual communities or users could be in a situation that  
34 would not allow for affordable water supply options, and that water demands  
35 could not be fully met. However, on a regional scale, it is anticipated that water  
36 demands would be met.

37 The assumptions related to 2030 municipal water demands are based upon a  
38 review of the 2010 Urban Water Management Plans (UWMPs) prepared by CVP  
39 and SWP water users. The No Action Alternative and the Second Basis of  
40 Comparison assumptions related to future water supplies presented in the  
41 UWMPs were evaluated to determine if the projects were reasonable and certain

1 to occur by 2030. Projects that had undergone environmental review, were under  
 2 design, or under construction were included in the future water supply  
 3 assumptions for 2030 in the No Action Alternative and the Second Basis of  
 4 Comparison. Projects described in the UWMPs that currently were under  
 5 evaluation were included in the Cumulative Effects analysis for future water  
 6 supplies. Future water supplies considered for municipalities by 2030 are  
 7 presented in Appendix 5D and summarized in Table 5.10.

8 **Table 5.10 Future Long-Term Average Municipal Water Supply Assumptions for**  
 9 **CVP and SWP Water Users**

	2030 Water Demands and Water Supplies				
	Central Valley Region – Sacramento Valley	Central Valley Region – San Joaquin Valley	San Francisco Bay Area Region	Central Coast and Southern California Regions	Total
2030 Water Demand (after conservation)	747,771	378,999	784,313	5,653,807	7,564,890
CVP Deliveries	214,187	131,150	311,370	–	656,707
SWP Deliveries	88,192	82,946	143,045	1,798,353	2,112,536
Water Rights	724,583	170,600	127,400	240,333	1,262,916
Groundwater	136,759	188,346	101,704	2,216,118	2,642,927
Recycled Wastewater	24,324	25,000	44,270	404,449	498,043
Recycled Stormwater	–	–	–	21,400	21,400
Desalination Water Treatment	–	–	5,100	454,145	459,245
Transfers and Exchanges	156,325	30,000	16,700	–	203,025
Non-CVP and SWP Imported Water Supplies	205,276	–	76,400	1,319,321	1,600,997
<b>Total Supplies</b>	<b>1,549,646</b>	<b>628,042</b>	<b>825,989</b>	<b>6,454,119</b>	<b>9,457,796</b>

Note: Does not include the East Bay Municipal Utility District dry year water supply.

10 The No Action Alternative and the Second Basis of Comparison assume that  
 11 several CVP and SWP water users also rely upon other imported water supplies,  
 12 including water from Solano Project (used by the Solano County Water Agency),  
 13 San Francisco Public Utilities Commission (used by portions of the service areas  
 14 of Alameda County Water District, Santa Clara Valley Water District, and Zone 7  
 15 Water Agency), and the Colorado River (used by portions of the service area of  
 16 the Metropolitan Water District of Southern California).

1 The No Action Alternative and the Second Basis of Comparison assume that  
2 groundwater would continue to be used even if groundwater overdraft conditions  
3 continue or become worse. It is recognized that in September 2014 the  
4 Sustainable Groundwater Management Act (SGMA) was enacted. The SGMA  
5 provides for the establishment of a Groundwater Sustainability Agencies (GSAs)  
6 to prepare Groundwater Sustainability Plans (GSPs) that will include best  
7 management practices for sustainable groundwater management. The SGMA  
8 defines sustainable groundwater management as “the management and use of  
9 groundwater in a manner that can be maintained during the planning and  
10 implementation horizon without causing undesirable results.” Undesirable results  
11 are defined as any of the following effects.

- 12 • Chronic lowering of groundwater levels (not including overdraft during a  
13 drought if a basin is otherwise managed)
- 14 • Significant and unreasonable reduction of groundwater storage
- 15 • Significant and unreasonable seawater intrusion
- 16 • Significant and unreasonable degraded water quality, including the migration  
17 of contaminant plumes that impair water supplies
- 18 • Significant and unreasonable land subsidence that substantially interferes with  
19 surface land uses
- 20 • Depletions of interconnected surface water that have significant and  
21 unreasonable adverse impacts on beneficial uses of the surface water

22 The SGMA requires the formation of GSPs in groundwater basins or subbasins  
23 that DWR designates as medium or high priority based upon groundwater  
24 conditions identified using the CAGESM results by 2022. Sustainable  
25 groundwater operations must be achieved within 20 years following completion  
26 of the GSPs. In some areas with adjudicated groundwater basins, sustainable  
27 groundwater management could be achieved and/or maintained by 2030.  
28 However, to achieve sustainable conditions in many areas, measures could require  
29 several years to design and construct water supply facilities to replace  
30 groundwater, such as seawater desalination. Therefore, it does not appear to be  
31 reasonable and foreseeable that sustainable groundwater management would be  
32 achieved by 2030; and it is assumed that groundwater pumping will continue to  
33 be used to meet water demands not fulfilled with surface water supplies or other  
34 alternative water supplies in 2030.

35 The No Action Alternative and the Second Basis of Comparison assumptions also  
36 include implementation of numerous conservation efforts and major water supply  
37 projects, including regional and local recycling projects, surface water and  
38 groundwater storage projects, conveyance improvement projects, and desalination  
39 projects, as described in Chapter 3, Description of Alternatives. There are over  
40 50 projects considered in the study area to be included in the No Action  
41 Alternative, including the following major water supply projects.

- 1 • Cambria Emergency Water Supply Project desalination project (CCSD 2014)
- 2 • Carlsbad Metropolitan Water District (MWD) water recycling project
- 3 (Carlsbad MWD 2012)
- 4 • Central Basin Municipal Water District Southeast Water Reliability Project
- 5 (CBMWD 2011)
- 6 • City of Los Angeles Department of Water and Power groundwater recharge
- 7 projects (City of Los Angeles 2011, 2013)
- 8 • City of Oxnard GREAT Program Desalter (City of Oxnard 2013)
- 9 • Eastern Municipal Water District (EMWD) water recycling programs
- 10 (EMWD 2014a, 2014b)
- 11 • Fresno Irrigation District (FID) groundwater recharge projects (FID 2015)
- 12 • Inland Empire Utilities Agency (IEUA) groundwater recharge projects
- 13 (IEUA 2015).
- 14 • Kern County and Antelope Valley-East Kern Water Agency (AVEK 2011)
- 15 • Los Angeles County Sanitation District expansion of water recycling
- 16 programs (LACSD 2005)
- 17 • San Benito County Water District (SBCWD) expansion of water treatment
- 18 plant to treat CVP water (SBCWD 2014)
- 19 • San Diego County Water Authority (SDCWA) Carlsbad Seawater
- 20 Desalination Facility (SDCWA 2014)
- 21 • Santa Barbara desalination water treatment plant (KEYT News [KEYT]
- 22 2015).
- 23 • SCVWD wastewater recycling projects (SCVWD 2012a)
- 24 • Victor Valley Wastewater Reclamation Authority (VWVRA) water recycling
- 25 programs (VWVRA 2015)
- 26 • Water Replenishment District (WRD) Groundwater Reliability Improvement
- 27 Program and water recycling programs (WRD 2012, 2015)
- 28 • West Basin Municipal Water District recycling water programs (WBMWD
- 29 2011)
- 30 • Western Development and Storage Antelope Valley Water Bank (Reclamation
- 31 2010b)
- 32 • Western Municipal Water District (WMD) Arlington Desalter Expansion to
- 33 use saline groundwater (WMD 2015)
- 34 • Woodland-Davis Clean Water Agency (WDCWA) water treatment plant
- 35 (WDCWA 2013)

1 Water transfer programs, including those that require Warren Act contracts with  
2 Reclamation to convey non-CVP water in CVP facilities, are anticipated to  
3 continue under the No Action Alternative and the Second Basis of Comparison.  
4 Transfer programs generally involve annual crop changes using temporary crop  
5 idling or shifting, release of stored water in reservoirs on different patterns for the  
6 purchasers' water demands, and/or groundwater substitution (DWR and  
7 Reclamation 2014). The transfers must be approved by the CVP and/or SWP if  
8 the transfer involves CVP or SWP water or utilizes CVP or SWP facilities.  
9 Except for water transfers among CVP water users, water transfers also require  
10 approval from the SWRCB. Environmental documentation is required for all  
11 water transfers involving CVP and/or SWP water supplies or facilities. Under  
12 State law, water transfers cannot result in injury to other legal users of water;  
13 unreasonable impacts on fish and wildlife and instream uses; and unreasonable  
14 economic or environmental impact on the county in which the transfer water  
15 originates. It is assumed that transfers would continue under the No Action  
16 Alternative and the Second Basis of Comparison in a similar manner as have  
17 occurred for the past 10 years. It is anticipated that the number of long-term  
18 transfer agreements could increase to facilitate annual decisions for water  
19 transfers.

20 **5.4.2.2 Changes in Conditions under the No Action Alternative**

21 CVP and SWP operational criteria under the No Action Alternative would be the  
22 same as described under the Affected Environment. However, due to the climate  
23 change and sea-level rise and increased water demands in the Sacramento Valley,  
24 CVP and SWP water deliveries would be less in 2030 than under recent historical  
25 conditions. It is anticipated that climate change and sea level rise conditions  
26 would result in lower reservoir storage and elevations and flows in the rivers by  
27 the end of September.

28 **5.4.2.3 Changes in Conditions under the Second Basis of Comparison**

29 CVP and SWP operational criteria under the Second Basis of Comparison would  
30 not include implementation of the 2008 USFWS BO and 2009 NMFS BO. As  
31 described in Section 5.4.4.1, CVP and SWP water deliveries would higher than  
32 under existing conditions which include implementation of the BOs. However,  
33 due to the climate change and sea level rise and increased water demands in the  
34 Sacramento Valley, CVP and SWP water supply availability and deliveries would  
35 be less in 2030 than under recent historical conditions that existed prior to  
36 implementation of the BOs. It is anticipated that climate change and sea level rise  
37 conditions would result in lower reservoir storage and elevations and flows in the  
38 rivers by the end of September.

39 **5.4.3 Evaluation of Alternatives**

40 As described in Chapter 4, Approach to Environmental Analysis, Alternatives 1  
41 through 5 have been compared to the No Action Alternative; and the No Action  
42 Alternative and Alternatives 1 through 5 have been compared to the Second Basis  
43 of Comparison.

1 During review of the numerical modeling analyses used in this EIS, two issues  
2 were discovered. First, it was discovered that the demands for the El Dorado  
3 Irrigation District (EID) and El Dorado County Water Agency (EDCWA)  
4 contracts were not included in Alternatives 3 and 5, as intended. Second, an error  
5 was determined in the CalSim II model assumptions related to the Stanislaus  
6 River operations for the Second Basis of Comparison, Alternative 1, and  
7 Alternative 4 model runs.

8 With respect to the water demands, the 17 TAF per year Warren Act Contract for  
9 EIS and 15 TAF per year under a CVP water service contract for EDCWA were  
10 not included in Alternatives 3 and 5, as intended. These demands are not included  
11 in the analysis presented in Chapters 5 through 21 of the EIS. A sensitivity  
12 analysis comparing the results of the analysis with and without these demands is  
13 presented in Appendix 5B of this EIS for Alternatives 3 and 5. The sensitivity  
14 analysis focuses on potential changes that would occur within Folsom Lake and  
15 along the American River. The results of this analysis indicate that surface water  
16 and water temperature conditions in Folsom Lake and in the American River  
17 would be similar (within 5 percent or less) in the model run with these demands  
18 as compared to model runs without these demands; except in August of critical  
19 dry years. In August of critical dry years, the American River flows under  
20 Alternative 3 would be 6 percent less with these demands than without these  
21 demands. It is anticipated that similar results would occur under the No Action  
22 Alternative. The results of these model runs indicated that there was not  
23 sensitivity with the addition of these demands in the analyses; therefore, no  
24 further model simulations were necessary to capture potential effects and the  
25 inclusion of these contracts would not change the previous conclusions in  
26 Chapters 5 through 21.

27 With respect to the CalSim II model assumptions related to the Stanislaus River  
28 operations for the Second Basis of Comparison, Alternative 1, and Alternative 4  
29 model runs, a sensitivity analysis was conducted as presented in Appendix 5C.  
30 Appendix 5C includes a comparison of the CalSim II model run results presented  
31 in this chapter and CalSim II model run results with the error corrected.  
32 Appendix 5C also includes a discussion of changes in the comparison of the  
33 following alternative analysis.

- 34 • No Action Alternative compared to the Second Basis of Comparison
- 35 • Alternative 1 compared to the No Action Alternative
- 36 • Alternative 3 compared to the Second Basis of Comparison
- 37 • Alternative 5 compared to the Second Basis of Comparison

38 Model results for Alternatives 1, 4, and Second Basis of Comparison are the  
39 same, therefore Alternative 4 results are not presented separately. Model results  
40 for Alternative 2 and No Action Alternative are the same, therefore Alternative 2  
41 results are not presented separately. Alternative 3 was not compared to the No  
42 Action Alternative because the model error did not occur in either of these  
43 model runs.

1 **5.4.3.1 No Action Alternative**

2 As described in Chapter 4, Approach to Environmental Analysis, the No Action  
3 Alternative is compared to the Second Basis of Comparison.

4 **5.4.3.1.1 Trinity River Region**

5 *Changes in CVP and SWP Reservoir Storage and Downstream River Flows*

6 Changes in Trinity Lake storage and surface water elevations under the No Action  
7 Alternative as compared to the Second Basis of Comparison in Trinity Lake are  
8 summarized in Tables 5.11 and 5.12. A summary of the results is provided  
9 following Table 5.12.

10 **Table 5.11 Changes in Trinity Lake Storage under the No Action Alternative as**  
11 **Compared to the Second Basis of Comparison**

Water Year	End of Month Storage (TAF)											
	Oct	Nov	Dec	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep

3 The following changes in Trinity Lake storage and surface water elevation would  
 4 occur under the No Action Alternative as compared to the Second Basis of  
 5 Comparison.

- 6 • In wet years, below normal, and dry years, storage would be similar (within  
 7 5 percent) in all months.
- 8 • In above-normal years, storage would be similar in January through October  
 9 and less in November and December (up to 5.7 percent).
- 10 • In critical dry years, storage would be less in all months (up to 10.3 percent).

- 1 • In all months, in all water year types, surface water elevations would be  
2 similar.
- 3 The following changes would occur on the Trinity River under the No Action  
4 Alternative as compared to the Second Basis of Comparison, as shown on  
5 Figures 5.53 through 5.55.
- 6 • Over long-term conditions (over the 82-year analysis period), flows would be  
7 similar in March through November and reduced in December through  
8 February (up to 9.5 percent).
- 9 • In wet years, flows would be similar in April through November and reduced  
10 in December through March (up to 11.2 percent).
- 11 • In dry years, flows would be similar all months.

12 **5.4.3.1.2 Central Valley Region**

13 *Changes in CVP and SWP Reservoir Storage and Downstream River Flows*  
14 *Shasta Lake and Sacramento River*

15 Storage levels and surface water elevations in Shasta Lake under the No Action  
16 Alternative as compared to the Second Basis of Comparison are summarized in  
17 Tables 5.13 and 5.14. Changes in flows in the Sacramento River downstream of  
18 Keswick Dam and at Freeport are shown on Figures 5.56 through 5.61. The  
19 results are summarized in Table 5.14.

The following changes in Shasta Lake storage and surface water elevations would occur under the No Action Alternative as compared to the Second Basis of Comparison.

- In wet years, storage would be similar in October and December through August and reduced in September and November (up to 8.2 percent).
- In above-normal years, storage would be similar in January through September and reduced in October through December (up to 7.5 percent).
- In below-normal years, storage would be similar in March through September and reduced in October through February (up to 10.5 percent).

- 1 • In dry years, storage would be similar in January through October and reduced  
2 in November and December (up to 6.1 percent).
- 3 • In critical dry years, storage would be reduced under all months (up to  
4 14.4 percent).
- 5 • In all months, in all water year types, surface water elevations would be  
6 similar.

7 The following changes in Sacramento River flows would occur under the No  
8 Action Alternative as compared to the Second Basis of Comparison, as shown on  
9 Figures 5.56 through 5.61.

- 10 • Sacramento River downstream of Keswick Dam (Figures 5.56 through 5.58).
  - 11 – Over long-term conditions, similar flows would occur in October,  
12 February through May, July, and August; increased flows in September  
13 and November (up to 37.7 percent); and reduced flows in December,  
14 January, and June (up to 7.8 percent).
  - 15 – In wet years, similar flows would occur in January through July; increased  
16 flows in September through November (up to 77.7 percent); and reduced  
17 flows in December and August (up to 14.6 percent).
  - 18 – In dry years, similar flows would occur in July through October,  
19 December through March, and May; increased flows in November  
20 (33.4 percent); and reduced flows in April and June (up to 7.3 percent).
- 21 • Sacramento River near Freeport (near the northern boundary of the Delta)  
22 (Figures 5.59 through 5.61).
  - 23 – Over long-term conditions, similar flows would occur in October,  
24 December through May, and August; increased flows in September,  
25 November, and July (up to 43.3 percent); and reduced flows in June  
26 (11.4 percent).
  - 27 – In wet years, similar flows would occur in January through June and  
28 October; increased flows in July through September and November (up to  
29 90.3 percent); and reduced flows in December (10.7 percent).
  - 30 – In dry years, similar flows would occur in August through October and  
31 December through April; increased flows in November and July (up to  
32 15.8 percent); and reduced flows in May and June (up to 11.9 percent).

33 *Lake Oroville and Feather River*

34 Storage levels and surface water elevations in Lake Oroville under the No Action  
35 Alternative as compared to the Second Basis of Comparison are summarized in  
36 Tables 5.15 and 5.16. Changes in flows in the Feather River downstream of  
37 Thermalito Complex are shown on Figures 5.62 through 5.64. The results are  
38 summarized in Table 5.16.

The following changes in Lake Oroville storage and surface water elevations would occur under the No Action Alternative as compared to the Second Basis of Comparison.

- In wet years, storage would be similar in January through August and reduced in September through December (up to 17.9 percent).
- In above-normal years, storage would be similar in February through August and reduced in September through January (up to 13.2 percent).
- In below-normal years, storage would be similar in May through July and reduced in August through April (up to 17.7 percent).

- 1 • In dry years, storage would be similar in June and reduced in all other months  
2 (up to 12.5 percent).
- 3 • In critical dry years, storage would be similar under all months.
- 4 • In all months, in all water year types, surface water elevations would be  
5 similar.

6 The following changes in Feather River flows would occur under the No Action  
7 Alternative as compared to the Second Basis of Comparison, as shown on  
8 Figures 5.62 through 5.64.

- 9 • Over long-term conditions, similar flows would occur in November and April;  
10 increased flows in July through September (up to 76.1 percent); and reduced  
11 flows in October, December through March, May, and June (up to  
12 27.2 percent).
- 13 • In wet years, similar flows would occur in October through November and  
14 March through May; increased flows in July through September (up to  
15 184 percent) and reduced flows in December through February (up to  
16 26.0 percent).
- 17 • In dry years, similar flows would occur in November through March;  
18 increased flows in April and July (up to 52.4 percent); and reduced flows in  
19 August through October and May and June (up to 27.6 percent).

20 *Folsom Lake and American River*

21 Storage levels and surface water elevations in Folsom Lake under the No Action  
22 Alternative as compared to the Second Basis of Comparison are summarized in  
23 Tables 5.17 and 5.18. Changes in flows in the American River downstream of  
24 Nimbus Dam are shown on Figures 5.65 through 5.67. The results are  
25 summarized in Table 5.18.

The following changes in Folsom Lake storage would occur under the No Action Alternative as compared to the Second Basis of Comparison.

- In wet years, storage would be similar in December through August and reduced in September through November (up to 10.8 percent).
- In above-normal years, storage would be similar in January through June, September, and October; reduced in November and December (up to 8.2 percent); and increased in July and August (up to 5.7 percent).
- In below-normal years, storage would be similar in February through May; reduced in October through January (up to 11.9 percent); and increased in July through September (up to 17.1 percent).

- 1 • In dry years, storage would be similar in all months.
- 2 • In critical dry years, storage would be similar in October through June and  
3 reduced in July through September (up to 10.8 percent).
- 4 • In all months, in all water year types, surface water elevations would be  
5 similar.
- 6 The following changes in American River flows would occur under the No Action  
7 Alternative as compared to the Second Basis of Comparison, as shown on  
8 Figures 5.65 through 5.67.
- 9 • Over long-term conditions, similar flows would occur in November through  
10 May and July; increased flows in September and October (up to 44.7 percent);  
11 and reduced flows in June and August (up to 6.1 percent).
- 12 • In wet years, similar flows would occur in October through November and  
13 January through July; increased flows in September (91.1 percent) and  
14 reduced flows in December and August (up to 10.7 percent).
- 15 • In dry years, similar flows would occur in all months except October,  
16 February and July; increased flows in October (16.5 percent); and reduced  
17 flows in February and July (up to 7.3 percent).

18 *Clear Creek*

19 Changes in flows in Clear Creek downstream of Whiskeytown Dam are  
20 summarized in Table 5.19. Monthly Clear Creek flows under the No Action  
21 Alternative as compared to the Second Basis of Comparison are identical except  
22 in May. In May, under the No Action Alternative, flows are up to 40.7 percent  
23 higher than under the Second Basis of Comparison in accordance with the 2009  
24 NMFS BO.

- 3 The following changes in New Melones Reservoir storage would occur under the  
 4 No Action Alternative as compared to the Second Basis of Comparison.
- 5 • In wet, below-normal, and dry years, storage would be similar in all months.
  - 6 • In above-normal years, storage would be similar in all months except October  
 7 when storage would be reduced by 5.7 percent.
  - 8 • In critical dry years, storage would be similar in February, March, and July  
 9 through September and reduced in October through January and April through  
 10 June (up to 6.9 percent).

- 1 • In all months, in all water year types, surface water elevations would be  
2 similar.

3 Flows in the Stanislaus River downstream of Goodwin Dam are shown on  
4 Figures 5.68 to 5.70. Changes in flows in these rivers are summarized below.

- 5 • Over long-term conditions, similar flows would occur in May and July  
6 through September; increased flows in October, March, and April (up to  
7 148.7 percent); and reduced flows in November through February and June  
8 (up to 33.8 percent).
- 9 • In wet years, similar flows would occur in February and April; increased  
10 flows in October, March, May, July, and August (up to 117.1 percent); and  
11 reduced flows in September, November through January, and June (up to  
12 50.8 percent).
- 13 • In dry years, similar flows would occur in July through September; increased  
14 flows in October and April (up to 154.3 percent); and reduced flows in  
15 November through March, May, and June (up to 35.7 percent).

16 *San Joaquin River at Vernalis*

17 Flows in the San Joaquin River at Vernalis are summarized below, as shown on  
18 Figures 5.71 through 5.73.

- 19 • Over long-term conditions, similar flows would occur in July through  
20 September and November through May; increased flows in October  
21 (19 percent); and reduced flows in June (8 percent).
- 22 • In wet years, similar flows would occur in July through September and  
23 November through May; increased flows in October (16.8 percent); and  
24 reduced flows in June (9.4 percent).
- 25 • In dry years, similar flows would occur in November through March and May  
26 through September; and increased flows in October and April (up to  
27 18.3 percent).

28 *San Luis Reservoir*

29 Storage levels and surface water elevations in San Luis Reservoir under the No  
30 Action Alternative as compared to the Second Basis of Comparison are  
31 summarized in Tables 5.22 and 5.23. A summary of the results is provided  
32 following Table 5.23.

1  
2

3 The following changes in San Luis Reservoir storage would occur under the No  
 4 Action Alternative as compared to the Second Basis of Comparison.

- 5 • In wet years, storage would be similar in June and September; increased in  
 6 March, July, and August (up to 9.6 percent); and reduced in October through  
 7 February, April, and May (up to 57.2 percent).
- 8 • In above-normal years, storage would be similar in July and September;  
 9 increased in August (9.5 percent); and reduced in October through June (up to  
 10 71.2 percent).

- 1 • In below-normal years, storage would be similar in July and September;  
2 increased in August (20.4 percent); and reduced in October through June (up  
3 to 67.1 percent).
- 4 • In dry years, storage would be similar in September; increased in July  
5 (34.2 percent); and reduced in October through June and August (up to  
6 44.0 percent).
- 7 • In critical dry years, storage would be similar in September; increased in July  
8 (60.2 percent); and reduced in August and October through June (up to  
9 51.1 percent).

10 The following changes in San Luis Reservoir surface water elevations would  
11 occur under the No Action Alternative as compared to the Second Basis of  
12 Comparison.

- 13 • In wet years, surface water elevations would be less in all months (up to  
14 10.7 percent).
- 15 • In above-normal years, surface water elevations would be less in all months  
16 (up to 13.0 percent).
- 17 • In below-normal years, surface water elevations would be less in all months  
18 (up to 16.0 percent).
- 19 • In dry years, surface water elevations would be similar in September through  
20 January and less in February through August (up to 10.4 percent).
- 21 • In critical dry years, surface water elevations would be similar in October  
22 through January and reduced in February through September (up to  
23 9.7 percent).

24 *Changes in Flows into the Yolo Bypass at Fremont Weir*

25 Flows from the Sacramento River into the Yolo Bypass at Fremont Weir under  
26 the No Action Alternative as compared to the Second Basis of Comparison are  
27 summarized in Table 5.24. The results are summarized following Table 5.24.

1 **Table 5.24 Changes in Flows into the Yolo Bypass at Fremont Weir under the No**  
 2 **Action Alternative as Compared to the Second Basis of Comparison**

3 The following changes in flows from the Sacramento River into Yolo Bypass at  
 4 Fremont Weir would occur under the No Action Alternative as compared to the  
 5 Second Basis of Comparison.

- 6 • In wet years, flows into Yolo Bypass would be similar in January through  
 7 September; increased in October (25 percent); and reduced in November and  
 8 December (up to 14.8 percent).
- 9 • In above-normal years, flows into Yolo Bypass would be similar in April  
 10 through December and reduced in January through March (up to  
 11 13.9 percent).

- 1 • In below-normal years, flows into Yolo Bypass would be similar in April  
2 through November and reduced in December through March (up to  
3 25.3 percent).
- 4 • In dry years, flows into Yolo Bypass would be similar in January through  
5 November and reduced in December (5.9 percent).
- 6 • In critical dry years, flows into Yolo Bypass would be similar in all months.

7 *Changes in Delta Conditions*

8 Delta outflow under the No Action Alternative as compared to the Second Basis  
9 of Comparison are summarized below and shown on Figures 5.74 through 5.76.

- 10 • In wet years, average monthly Delta outflow in July through November,  
11 January, April, and May (up to 13,683 cfs) and decrease in December,  
12 February, March, and June (up to 1,590 cfs).
- 13 • In dry years, average monthly Delta outflow would be similar or increase (up  
14 to 3,114 cfs).

15 The OMR conditions under the No Action Alternative as compared to the Second  
16 Basis of Comparison are summarized below and shown on Figures 5.76  
17 through 5.78.

- 18 • Under the No Action Alternative, OMR flows are negative except in April and  
19 May of wet and above normal years and April of below normal years. Under  
20 the Second Basis of Comparison, OMR flows are negative in all months of all  
21 water year types.
- 22 • In wet years, average monthly OMR flows would be more positive in  
23 September through February, April, and May (up to 10,005 cfs) and more  
24 negative in March and June through August (up to 923 cfs).
- 25 • In dry years, average monthly OMR flows would be more positive in August  
26 through June (up to 3,489 cfs) and more negative in June (2,073 cfs).

27 *Changes in CVP and SWP Exports and Deliveries*

28 Delta exports under the No Action Alternative as compared to the Second Basis  
29 of Comparison are summarized in Table 5.25.

1 **Table 5.25 Changes in Exports at Jones and Banks Pumping Plants under the No**  
 2 **Action Alternative as Compared to the Second Basis of Comparison**

- 3 The following changes would occur in CVP and SWP exports under the No  
 4 Action Alternative as compared to the Second Basis of Comparison.
- 5 • Long-term average annual exports would be 1,051 TAF (18 percent) less  
 6 under the No Action Alternative as compared to the Second Basis of  
 7 Comparison.
  - 8 • In wet years, total exports would be similar in June and September; reduced in  
 9 October through February, April, and May (up to 57.2 percent); and increased  
 10 in March, July, and August (up to 9.6 percent).
  - 11 • In above-normal and below-normal years, total exports would be similar in  
 12 July and September; reduced in October through June (up to 71.2 and

1 67.1 percent, respectively); and increased in August (up to 9.5 and  
 2 20.4 percent, respectively).

- 3 • In dry and critical dry years, total exports would be similar in September;  
 4 reduced in October through June and August (up to 44.9 and 51.1 percent,  
 5 respectively); and increased in July (34.2 and 60.2 percent, respectively).

6 Deliveries to CVP and SWP water users decline under the No Action  
 7 Alternative as compared to the Second Basis of Comparison, as summarized in  
 8 Tables 5.26 and 5.27, respectively, due to reduced water supply availability and  
 9 export limitations.

10 **Table 5.26 Changes in CVP Water Deliveries under the No Action Alternative as**  
 11 **Compared to the Second Basis of Comparison**

Annual Average Deliveries (TAF)					
		No Action Alternative	Second Basis of Comparison	No Action Alternative as Compared to the Second Basis of Comparison

	Dry	608	622	-13	-2
	Critical Dry	449	511	-63	-12

1 The following changes in CVP water deliveries would occur under the No Action  
 2 Alternative as compared to the Second Basis of Comparison.

- 3 • Deliveries to CVP North of Delta agricultural water service contractors would  
 4 be reduced by 16 percent over the long-term conditions (averaged over the  
 5 82-year period analyzed with CalSim II), 30 percent in dry years, and  
 6 34 percent in critical dry years.
- 7 • Deliveries to CVP North of Delta M&I contractors would be similar in total;  
 8 however, deliveries to the American River CVP contractors would be reduced  
 9 by 6 percent over the long-term conditions, 8 percent in dry years, and 6  
 10 percent in critical dry years.
- 11 • Deliveries to CVP South of Delta agricultural water service contractors would  
 12 be reduced by 23 percent over the long-term conditions, 32 percent in dry  
 13 years, and 33 percent in critical dry years.
- 14 • Deliveries to CVP South of Delta M&I contractors would be reduced by  
 15 10 percent over the long-term conditions, 9 percent in dry years, and 5 percent  
 16 in critical dry years.
- 17 • Deliveries to the Eastside contractors would be similar under the long-term  
 18 conditions and dry years, but reduce by 12 percent in critical dry years.

	Dry	10	229	-219	-96
	Critical Dry	12	158	-146	-92

- 1 The following changes in SWP water deliveries would occur under the No Action
- 2 Alternative as compared to the Second Basis of Comparison.
- 3 • Deliveries without Article 21 water to SWP North of Delta water contractors
- 4 would be reduced by 18 percent over the long-term conditions; 18 percent in
- 5 dry years; and 20 percent in critical dry years.
- 6 • Deliveries without Article 21 water to SWP South of Delta water contractors
- 7 would be reduced by 18 percent over the long-term conditions; 19 percent in
- 8 dry years; and 22 percent in critical dry years.

- 1 • Deliveries of Article 21 water to SWP North of Delta water contractors would  
2 be increased by 9 percent over the long-term conditions; 7 percent in dry  
3 years; and 9 percent in critical dry years.
- 4 • Deliveries of Article 21 water to SWP South of Delta water contractors would  
5 be reduced by 83 percent over the long-term conditions; 96 percent in dry  
6 years; and 92 percent in critical dry years.

7 *Effects Related to Cross Delta Water Transfers*

8 Potential effects to surface water resources could be similar to those identified in  
9 a recent environmental analysis conducted by Reclamation for long-term water  
10 transfers from the Sacramento to San Joaquin valleys (Reclamation 2014i).  
11 Potential effects were identified as reduced surface water storage in upstream  
12 reservoirs and changes in flow patterns in river downstream of the reservoirs if  
13 water was released from the reservoirs in patterns that were different than would  
14 have been used by the water seller's. Because all water transfers would be  
15 required to avoid adverse impacts to other water users and biological resources  
16 (see Section 3.A.6.3, Transfers), including impacts associated with changes in  
17 reservoir storage and river flow patterns; the analysis indicated that water  
18 transfers would not result in substantial changes in storage or river flows. For the  
19 purposes of this EIS, it is anticipated that similar conditions would occur due to  
20 cross Delta water transfers under the No Action Alternative and the Second Basis  
21 of Comparison.

22 Under the No Action Alternative, the timing of cross Delta water transfers would  
23 be limited to July through September in accordance with the 2008 USFWS BO  
24 and 2009 NMFS BO. The maximum amount of water to be transferred would be  
25 600,000 acre-feet per year in critical dry years or in dry years following a dry or  
26 critical dry year. In all other water year types, the maximum amount of water  
27 would be 360,000 acre-feet per year. The maximum amount of water that can be  
28 exported in the CVP and SWP facilities is approximately 770,000 acre-feet per  
29 month. As indicated in Table 5.25, capacity would be available under the No  
30 Action Alternative between July and September for water transfers in all water  
31 year types.

32 Under the Second Basis of Comparison, water could be transferred throughout the  
33 year. As indicated in Table 5.25, capacity would be available under the Second  
34 Basis of Comparison in all months of all water year types without a maximum  
35 volume of transferred water.

36 Overall, the potential for water transfer conveyance would be less under the No  
37 Action Alternative than under the Second Basis of Comparison.

38 **5.4.3.1.3 San Francisco Bay Area, Central Coast, and Southern California**  
39 **Regions**

40 *Potential Changes in Surface Water Resources at Reservoirs that Store CVP and*  
41 *SWP Water*

42 The San Francisco Bay Area, Central Coast, and Southern California regions  
43 include numerous reservoirs that store CVP and SWP water supplies, including

1 CVP and SWP reservoirs, that primarily provide water supplies for M&I water  
2 users. Changes in the availability of CVP and SWP water supplies for storage in  
3 these reservoirs under the No Action Alternative as compared to the Second Basis  
4 of Comparison would be consistent with the following changes in water deliveries  
5 to M&I water users, as summarized in Tables 5.26 and 5.27.

- 6 • Deliveries to CVP South of Delta M&I contractors and reservoirs in the San  
7 Francisco Bay Area would be reduced by 10 percent over the long-term  
8 conditions; 9 percent in dry years; and 7 percent in critical dry years.
- 9 • Deliveries without Article 21 water to SWP South of Delta water contractors  
10 and reservoirs in the San Francisco Bay Area, Central Coast, and Southern  
11 California regions would be reduced by 18 percent over the long-term  
12 conditions; 19 percent in dry years; and 22 percent in critical dry years.
- 13 • Deliveries of Article 21 water to SWP South of Delta water contractors and  
14 reservoirs in the San Francisco Bay Area, Central Coast, and Southern  
15 California regions would be reduced by 83 percent over the long-term  
16 conditions; 96 percent in dry years; and 92 percent in critical dry years.

17 *Changes in CVP and SWP Deliveries*

18 Deliveries to CVP and SWP water users are described in Section 5.4.3.1.2,  
19 Central Valley Region.

20 **5.4.3.2 Alternative 1**

21 As described in Chapter 3, Description of Alternatives, Alternative 1 is identical  
22 to the Second Basis of Comparison. Alternative 1 is compared to the No Action  
23 Alternative and the Second Basis of Comparison. However, because water  
24 resource conditions under Alternative 1 are identical to water resource conditions  
25 under the Second Basis of Comparison; Alternative 1 is only compared to the No  
26 Action Alternative.

27 **5.4.3.2.1 Alternative 1 Compared to the No Action Alternative**

28 *Trinity River Region*

29 *Changes in CVP and SWP Reservoir Storage and Downstream River Flows*

30 Changes in Trinity Lake storage and surface water elevations under Alternative 1  
31 as compared to the No Action Alternative are summarized in Tables 5.28  
32 and 5.29. A summary of the results is provided following Table 5.29.

1 The following changes in Trinity Lake storage and surface water elevation would  
2 occur under Alternative 1 as compared to the No Action Alternative.

- 3 • In wet years and dry years, storage would be similar in all months.
- 4 • In above-normal years, storage would be similar in January through October  
5 and increased in November and December (up to 6.0 percent).
- 6 • In below-normal years, storage would be similar in January through October  
7 and increased in November and December (up to 5.2 percent).
- 8 • In critical dry years, storage would be increased in all months (up to  
9 11.5 percent).
- 10 • In all months, in all water year types, surface water elevations would be  
11 similar.

12 The following changes would occur on the Trinity River under Alternative 1 as  
13 compared to the No Action Alternative, as shown on Figures 5.53 through 5.55.

- 14 • Over long-term conditions, flows would be similar in March through  
15 November and increased in December through February (up to 10.5 percent).
- 16 • In wet years, flows would be similar in April through November and  
17 increased in December through March (up to 12.6 percent).
- 18 • In dry years, flows would be similar all months.

19 *Central Valley Region*

20 *Changes in CVP and SWP Reservoir Storage and Downstream River Flows*

21 *Shasta Lake and Sacramento River*

22 Storage levels and surface water elevations in Shasta Lake under Alternative 1 as  
23 compared to the No Action Alternative are summarized in Tables 5.30 and 5.31.  
24 Changes in flows in the Sacramento River downstream of Keswick Dam and at  
25 Freeport are shown on Figures 5.56 through 5.61. The results are summarized  
26 following Table 5.31.

1

3 The following changes in Shasta Lake storage and surface water elevations would  
 4 occur under Alternative 1 as compared to the No Action Alternative.

- 5 • In wet years, storage would be similar in December through August and  
 6 October and increased in September and November (up to 8.9 percent).
- 7 • In above-normal years, storage would be similar in January through  
 8 September and increased in October through December (up to 8.1 percent).
- 9 • In below-normal years, storage would be similar in March through September  
 10 and increased in October through February (up to 11.7 percent).

- 1 • In dry years, storage would be similar in February through October and  
2 increased in November through January (up to 6.5 percent).
- 3 • In critical dry years, storage would be increased under all months (up to  
4 16.8 percent).
- 5 • In all months, in all water year types, surface water elevations would be  
6 similar.
- 7 The following changes in Sacramento River flows would occur under  
8 Alternative 1 as compared to the No Action Alternative, as shown on Figures 5.56  
9 through 5.61.
- 10 • Sacramento River downstream of Keswick Dam (Figures 5.56 through 5.58).
- 11 – Over long-term conditions, similar flows would occur in October,  
12 February through May, July, and August; reduced flows in September and  
13 November (up to 27.4 percent); and increased flows in December,  
14 January, and June (up to 8.4 percent).
- 15 – In wet years, similar flows would occur in January through July; reduced  
16 flows in September through November (up to 43.7 percent); and increased  
17 flows in December and August (up to 17.0 percent).
- 18 – In dry years, similar flows would occur in July through October,  
19 December through March, and May; reduced flows in November  
20 (25.0 percent); and increased flows in April and June (up to 7.8 percent).
- 21 • Sacramento River near Freeport (near the northern boundary of the Delta)  
22 (Figures 5.59 through 5.61).
- 23 – Over long-term conditions, similar flows would occur in October,  
24 December through May, and August; reduced flows in September,  
25 November, and July (up to 30.2 percent); and increased flows in June  
26 (12.8 percent).
- 27 – In wet years, similar flows would occur in January through June and  
28 October; reduced flows in July through September and November (up to  
29 47.4 percent); and increased flows in December (6.6 percent).
- 30 – In dry years, similar flows would occur in August through October and  
31 December through April; reduced flows in November and July (up to  
32 13.6 percent); and increased flows in May and June (up to 13.5 percent).

33 *Lake Oroville and Feather River*

34 Storage levels and surface water elevations in Lake Oroville under Alternative 1  
35 as compared to the No Action Alternative are summarized in Tables 5.32  
36 and 5.33. Changes in flows in the Feather River downstream of Thermalito  
37 Complex are shown on Figures 5.62 through 5.64. The results are summarized  
38 following Table 5.33.

3 The following changes in Lake Oroville storage and surface water elevations  
 4 would occur under Alternative 1 as compared to the No Action Alternative.

- 5 • In wet years, storage would be similar in January through August and reduced  
 6 in September through December (up to 21.8 percent).
- 7 • In above-normal years, storage would be similar in February through August  
 8 and reduced in September through January (up to 15.2 percent).
- 9 • In below-normal years, storage would be similar in May through July and  
 10 reduced in August through April (up to 21.5 percent).

- 1 • In dry years, storage would be similar in June and reduced in all other months  
2 (up to 14.2 percent).
- 3 • In critical dry years, storage would be similar under all months.
- 4 • In all months, in all water year types, surface water elevations would be  
5 similar.

6 The following changes in Feather River flows would occur under Alternative 1 as  
7 compared to the No Action Alternative, as shown in Figures 5.62 through 5.64.

- 8 • Over long-term conditions, similar flows would occur in November and April;  
9 reduced flows in July through September (up to 43.2 percent); and increased  
10 flows in October, December through March, May, and June (up to  
11 37.4 percent).
- 12 • In wet years, similar flows would occur in October, November, and March  
13 through May; reduced flows in July through September (up to 64.9 percent);  
14 and increased flows in December through February and June (up to  
15 35.1 percent).
- 16 • In dry years, similar flows would occur in December through April; reduced  
17 flows in July (34.4 percent); and increased flows in August through October,  
18 May, and June (up to 38.1 percent).

19 *Folsom Lake and American River*

20 Storage levels and surface water elevations in Folsom Lake under Alternative 1 as  
21 compared to the No Action Alternative are summarized in Tables 5.34 and 5.35.  
22 Changes in flows in the American River downstream of Nimbus Dam are shown  
23 on Figures 5.65 through 5.67. The results are summarized following Table 5.35.

 11 reduced in June through September (up to 14.6 percent); and increased in  
 12 October through January (up to 13.5 percent).

- 1 • In dry years, storage would be similar in all months.
- 2 • In critical dry years, storage would be similar in October through June and  
3 increased in July through September (up to 12.1 percent).
- 4 • In all months, in all water year types, surface water elevations would be  
5 similar.
- 6 The following changes in American River flows would occur under Alternative 1  
7 as compared to the No Action Alternative, as shown on Figures 5.65  
8 through 5.67.
- 9 • Over long-term conditions, similar flows would occur in November through  
10 May and July; reduced flows in September and October (up to 30.9 percent);  
11 and increased flows in June (5.4 percent).
- 12 • In wet years, similar flows would occur in October, November, and January  
13 through July; reduced flows in September (47.7 percent); and increased flows  
14 in August (12.0 percent).
- 15 • In dry years, similar flows would occur in November through January, March  
16 through June, August, and September; reduced flows in October  
17 (14.1 percent); and increased flows in February and July (up to 7.9 percent).

18 *Clear Creek*

19 Changes in flows in Clear Creek downstream of Whiskeytown Dam are  
20 summarized in Table 5.36.

21 Monthly Clear Creek flows under Alternative 1 as compared to the No Action  
22 Alternative are identical except in May. In May, under Alternative 1, flows are  
23 up to 28.9 percent lower than under the No Action Alternative.

3 The following changes in New Melones Reservoir storage would occur under  
 4 Alternative 1 as compared to the No Action Alternative.

- 5 • In wet years, storage would be similar in all months.
- 6 • In above-normal years, storage would be similar in December through  
 7 September and increased in October and November (up to 6.0 percent).
- 8 • In below-normal years, storage would be similar in November through  
 9 September and increased in October (5.4 percent).
- 10 • In dry years, storage would be similar in all months.

1 • In critical dry years, storage would be similar in July through September and  
2 increased in October through June (up to 7.5 percent).

3 • In all months, in all water year types, surface water elevations would be  
4 similar.

5 Flows in the Stanislaus River downstream of Goodwin Dam are shown on  
6 Figures 5.68 to 5.70. Changes in flows in these rivers are summarized below.

7 • Over long-term conditions, similar flows would occur in July through  
8 September; reduced flows in October, March, and April (up to 59.8 percent);  
9 and increased flows in November through February and June (up to  
10 51.1 percent).

11 • In wet years, similar flows would occur in February and April; reduced flows  
12 in October, March, May, July, and August (up to 53.9 percent); and increased  
13 flows in September, November through January, and June (up to  
14 103.2 percent).

15 • In dry years, similar flows would occur in July through September; reduced  
16 flows in October and April (up to 60.7 percent); and increased flows in  
17 November through March, May, and June (up to 55.5 percent).

18 *San Joaquin River at Vernalis*

19 Flows in the San Joaquin River at Vernalis are summarized below, as shown on  
20 Figures 5.71 through 5.73.

21 • Over long-term conditions, similar flows would occur in July through  
22 September and November through May; reduced flows in October  
23 (16.1 percent); and increased flows in June (8.4 percent).

24 • In wet years, similar flows would occur in July through September and  
25 November through May; reduced flows in October (14.4 percent); and  
26 increased flows in June (10.4 percent).

27 • In dry years, similar flows would occur in November through March and May  
28 through September; and reduced flows in October and April (up to  
29 15.3 percent).

30 *San Luis Reservoir*

31 Storage levels and surface water elevations in San Luis Reservoir under  
32 Alternative 1 as compared to the No Action Alternative are summarized in  
33 Tables 5.39 and 5.40. The results are summarized following Table 5.40.

1 The following changes in San Luis Reservoir storage would occur under  
2 Alternative 1 as compared to the No Action Alternative.

- 3 • In wet years, storage would be increased in all months (up to 108.8 percent).  
4 Water storage elevations would be increased in all months (up to  
5 12.0 percent).
- 6 • In above-normal years, storage would be increased in all months (up to  
7 151.4 percent). Water storage elevations would be increased in all months (up  
8 to 15.0 percent).
- 9 • In below-normal years, storage would be increased in all months (up to  
10 203.1 percent). Water storage elevations would be increased in all months (up  
11 to 19.0 percent).
- 12 • In dry years, storage would be increased in all months (up to 70.3 percent).  
13 Water storage elevations would be increased in all months (up to  
14 11.6 percent).
- 15 • In critical dry years, storage would be increased in all months (up to  
16 57.1 percent). Water storage elevations would be increased in all months (up  
17 to 10.8 percent).

18 *Changes in Flows into the Yolo Bypass*

19 Flows from the Sacramento River into the Yolo Bypass at Fremont Weir under  
20 Alternative 1 as compared to the No Action Alternative are summarized in  
21 Table 5.41. The results are summarized following Table 5.41.

3 The following changes in flows from the Sacramento River into Yolo Bypass at  
 4 Fremont Weir would occur under Alternative 1 as compared to the No Action  
 5 Alternative.

- 6 • In wet years, flows into Yolo Bypass would be similar in January through  
 7 September; reduced in October (20 percent); and increased in November and  
 8 December (up to 17.4 percent).
- 9 • In above-normal years, flows into Yolo Bypass would be similar in April  
 10 through December; and increased in January through March (up to  
 11 16.2 percent).

- 1 • In below-normal years, flows into Yolo Bypass would be similar in April  
2 through November; and increased in December through March (up to  
3 33.9 percent).
- 4 • In dry years, flows into Yolo Bypass would be similar in January through  
5 November; and increased in December (6.2 percent).
- 6 • In critical dry years, flows into Yolo Bypass would be similar in all months.

7 *Changes in Delta Conditions*

8 Delta outflow under Alternative 1 as compared to the No Action Alternative are  
9 summarized below and shown on Figures 5.74 through 5.76.

- 10 • In wet years, average monthly Delta outflow would increase in December,  
11 February, March, and June (up to 1,492 cfs) and decrease in July through  
12 November, January, April, and May (up to 13,683 cfs).
- 13 • In dry years, average monthly Delta outflow would be similar in September;  
14 decrease in July, August, and October through May (up to 3,114 cfs); and  
15 increase in June (385 cfs).

16 The OMR conditions under Alternative 1 are shown on Figures 5.77 through 5.79.

- 17 • In all water years, average monthly OMR flows would be negative in all  
18 months under Alternative 1. Under the No Action Alternative, OMR flows  
19 would be positive only in wet and above normal years in April and May and  
20 April in above normal years.
- 21 • In wet years, average monthly OMR flows, would be more positive in June  
22 through August and March (up to 923 cfs); and more negative in April  
23 through June and September through February (up to 10,005 cfs).
- 24 • In dry years, average monthly OMR flows would be positive in July (up to  
25 2,073 cfs), and more negative in August through June (up to 3,489 cfs).

26 *Changes in CVP and SWP Exports and Deliveries*

27 Delta exports under Alternative 1 as compared to the No Action Alternative are  
28 summarized in Table 5.42.

1 **Table 5.42 Changes in Exports at Jones and Banks Pumping Plants under the**  
 2 **Alternative 1 as Compared to the No Action Alternative**

Water Year	Monthly Volume (TAF)

3 The following changes would occur in CVP and SWP exports under Alternative 1  
 4 as compared to the No Action Alternative.

- 5 • Long-term average annual exports would be 1,051 TAF (22 percent) more  
 6 under Alternative 1 as compared to the No Action Alternative.
- 7 • In wet years, total exports would be similar in June and September; increased  
 8 in October through February, April through May (up to 133.6 percent); and  
 9 reduced in March, July, and August (up to 8.7 percent).
- 10 • In above-normal years, total exports would be similar in July and September;  
 11 increased in October through June (up to 244 percent); and reduced in August  
 12 (8.7 percent).

- 1 • In below-normal years, total exports would be similar in July and September;  
2 increased in October through June (up to 203.9 percent); and reduced in  
3 August (16.9 percent).
- 4 • In dry years, total exports would be similar in September; increased in  
5 October through June and August (up to 81.5 percent); and reduced in July  
6 (25.5 percent).
- 7 • In critical dry years, total exports would be similar in September; increased in  
8 October through June and August (up to 104.4 percent); and reduced in July  
9 (37.6 percent).

10 Deliveries to CVP and SWP water users increase under Alternative 1 as compared  
11 to the No Action Alternative, as summarized in Tables 5.43 and 5.44,  
12 respectively, due to increased water supply availability and less export limitations.

13 **Table 5.43 Changes CVP Water Deliveries under the Alternative 1 as Compared to**  
14 **the No Action Alternative**

Annual Average Deliveries (TAF)					
		Alternative 1	No Action Alternative	Alternative 1 as compared to the No Action Alternative	
				Difference	Percent Change

CVP Water Service Contracts	Long Term	118	104	15	14
	Dry	98	84	13	15
	Critical Dry	25	4	21	525

Annual Average Deliveries (TAF)					
		Alternative 1	No Action Alternative	Alternative 1 as compared to the No Action Alternative	
				Difference	Percent Change
Total Water Rights and CVP Service Contracts Deliveries	Long Term	632	612	20	3
	Dry	622	608	14	2
	Critical Dry	511	449	62	14

- 1 The following changes in CVP water deliveries would occur under Alternative 1  
2 as compared to the No Action Alternative.
- 3 • Deliveries to CVP North of Delta agricultural water service contractors would  
4 be increased by 18 percent over the long-term conditions, 43 percent in dry  
5 years, and 50 percent in critical dry years.
  - 6 • Deliveries to CVP North of Delta M&I contractors would be similar in total,  
7 however, deliveries to the American River CVP contractors would be  
8 increased by 6 percent over the long-term conditions, 8 percent in dry years,  
9 and 7 percent in critical dry years.
  - 10 • Deliveries to CVP South of Delta agricultural water service contractors would  
11 be increased by 30 percent over the long-term conditions, 46 percent in dry  
12 years, and 49 percent in critical dry years.
  - 13 • Deliveries to CVP South of Delta M&I contractors would be increased by  
14 12 percent over the long-term conditions, 10 percent in dry years, and  
15 5 percent in critical dry years.
  - 16 • Deliveries to the Eastside contractors would be similar under long-term  
17 conditions and in dry years and increase by 14 percent in critical dry years.

1 **Table 5.44 Changes SWP Water Deliveries under the Alternative 1 as Compared to**  
 2 **the No Action Alternative**

	Dry	1,732	1,406	327	23
	Critical Dry	1,494	1,173	321	27

Annual Average Deliveries (TAF)					
		Alternative 1	No Action Alternative	Alternative 1 as compared to the No Action Alternative	
				Difference	Percent Change
SWP M&I Article 21 Deliveries	Long Term	104	20	84	418
	Dry	86	5	82	1788
	Critical Dry	58	5	53	1054
Total SWP Agricultural and M&I Users (without Article 21)	Long Term	2,933	2,410	523	22
	Dry	2,299	1,861	439	24
	Critical Dry	1,978	1,551	427	28
Total SWP Agricultural and M&I Article 21 Deliveries	Long Term	282	47	236	504
	Dry	229	10	219	2265
	Critical Dry	158	12	146	1219

1 The following changes in SWP water deliveries would occur under Alternative 1  
 2 as compared to the No Action Alternative.

- 3 • Deliveries without Article 21 water to SWP North of Delta water contractors  
 4 would be increased by 22 percent over the long-term conditions; 22 percent in  
 5 dry years; and 25 percent in critical dry years.
- 6 • Deliveries without Article 21 water to SWP South of Delta water contractors  
 7 would be increased by 22 percent over the long-term conditions; 24 percent in  
 8 dry years; and 28 percent in critical dry years.
- 9 • Deliveries of Article 21 water to SWP North of Delta water contractors would  
 10 be reduced by 9 percent over the long-term conditions; 6 percent in dry years;  
 11 and 9 percent in critical dry years.
- 12 • Deliveries of Article 21 water to SWP South of Delta water contractors would  
 13 be increased by 504 percent over the long-term conditions; 2,265 percent in  
 14 dry years; and 1,219 percent in critical dry years.

15 *Effects Related to Cross Delta Water Transfers*

16 Potential effects to surface water resources could be similar to those identified in  
 17 a recent environmental analysis conducted by Reclamation for long-term water  
 18 transfers from the Sacramento to San Joaquin valleys (Reclamation 2014i).  
 19 Potential effects were identified as reduced surface water storage in upstream  
 20 reservoirs and changes in flow patterns in river downstream of the reservoirs if  
 21 water was released from the reservoirs in patterns that were different than would

1 have been used by the water seller's. Because all water transfers would be  
2 required to avoid adverse impacts to other water users and biological resources  
3 (see Section 3.A.6.3, Transfers), including impacts associated with changes in  
4 reservoir storage and river flow patterns; the analysis indicated that water  
5 transfers would not result in substantial changes in storage or river flows. For the  
6 purposes of this EIS, it is anticipated that similar conditions would occur due to  
7 cross Delta water transfers under Alternative 1 and the No Action Alternative.

8 Under Alternative 1, water could be transferred throughout the year. As indicated  
9 in Table 5.42, capacity would be available under Alternative 1 in all months of all  
10 water year types without a maximum volume of transferred water. Under the No  
11 Action Alternative, the timing of cross Delta water transfers would be limited to  
12 July through September, and the volume would be limited to 600,000 acre-feet  
13 per year in drier years and 360,000 acre-feet in all other years, in accordance with  
14 the 2008 USFWS BO and 2009 NMFS BO. As indicated in Table 5.42, capacity  
15 would be available under the No Action Alternative between July and September  
16 for water transfers in all water year types.

17 Overall, the potential for water transfer conveyance would be greater under  
18 Alternative 1 as compared to the No Action Alternative.

19 *San Francisco Bay Area, Central Coast, and Southern California Regions*

20 *Potential Changes in Surface Water Resources at Reservoirs that Store CVP*  
21 *and SWP Water*

22 The San Francisco Bay Area, Central Coast, and Southern California regions  
23 include numerous reservoirs that store CVP and SWP water supplies, including  
24 CVP and SWP reservoirs, that primarily provide water supplies for M&I water  
25 users. Changes in the availability CVP and SWP water supplies for storage in  
26 these reservoirs under Alternative 1 as compared to the No Action  
27 Alternative would be consistent with the following changes in water deliveries to  
28 M&I water users, as summarized in Tables 5.43 and 5.44.

- 29 • Deliveries to CVP South of Delta M&I contractors would be increased by  
30 11 percent over the long-term conditions; 10 percent in dry years; and  
31 7 percent in critical dry years.
- 32 • Deliveries without Article 21 water to SWP South of Delta water contractors  
33 would be increased by 22 percent over the long-term conditions; 24 percent in  
34 dry years; and 28 percent in critical dry years.
- 35 • Deliveries of Article 21 water to SWP South of Delta water contractors would  
36 be increased by 504 percent over the long-term conditions; 2,265 percent in  
37 dry years; and 1,219 percent in critical dry years.

38 *Changes in CVP and SWP Exports and Deliveries*

39 Deliveries to CVP and SWP water users are described above in the Central Valley  
40 Region.

1 **5.4.3.2.2 Alternative 1 Compared to the Second Basis of Comparison**

2 Alternative 1 is identical to the Second Basis of Comparison.

3 **5.4.3.3 Alternative 2**

4 Surface water resources conditions under Alternative 2 would be identical to the  
5 surface water resources conditions under the No Action Alternative; therefore,  
6 Alternative 2 is only compared to the Second Basis of Comparison.

7 **5.4.3.3.1 Alternative 2 Compared to the Second Basis of Comparison**

8 Changes to surface water resources conditions under Alternatives 2 as compared  
9 to the Second Basis of Comparison would be the same as the impacts described in  
10 Section 5.4.3.1, No Action Alternative.

11 **5.4.3.4 Alternative 3**

12 CVP and SWP operations under Alternative 3 are similar to the Second Basis of  
13 Comparison with modified OMR flow criteria and New Melones Reservoir  
14 operations. Alternative 3 would include changed water demands for American  
15 River water supplies as compared to the No Action Alternative or Second Basis of  
16 Comparison. Alternative 3 would provide water supplies of up to 17 TAF per  
17 year under a Warren Act Contract for El Dorado Irrigation District and 15 TAF  
18 per year under a CVP water service contract for El Dorado County Water Agency.  
19 These demands are not included in the analysis presented in this section of the  
20 EIS. A sensitivity analysis comparing the results of the analysis with and without  
21 these demands is presented in Appendix 5B of this EIS.

22 **5.4.3.4.1 Alternative 3 Compared to the No Action Alternative**

23 *Trinity River Region*

24 *Changes in CVP and SWP Reservoir Storage and Downstream River Flows*

25 Changes in Trinity Lake storage and surface water elevations under Alternative 3  
26 as compared to the No Action Alternative are summarized in Tables 5.45  
27 and 5.45. The results are summarized following Table 5.45.

1  
2

1 The following changes in Trinity Lake storage would occur under Alternative 3 as  
2 compared to the No Action Alternative.

- 3 • In wet, above-normal years, below-normal, and dry years, storage would be  
4 similar in all months.
- 5 • In critical dry years, storage would be increased in all months (up to  
6 11.9 percent).
- 7 • In all months, in all water year types, surface water elevations would be  
8 similar.

9 The following changes would occur on the Trinity River under Alternative 3 as  
10 compared to the No Action Alternative, as summarized in Figures 5.53  
11 through 5.55.

- 12 • Over long-term conditions, flows would be similar in March through  
13 November and increased in December through February (up to 11.8 percent).
- 14 • In wet years, flows would be similar in April through October; reduced in  
15 November (7.0 percent) and increased in December through March (up to  
16 15.1 percent).
- 17 • In dry years, flows would be similar in all months.

18 *Central Valley Region*

19 *Changes in CVP and SWP Reservoir Storage and Downstream River Flows*  
20 *Shasta Lake and Sacramento River*

21 Storage levels and surface water elevations in Shasta Lake under Alternative 3 as  
22 compared to the No Action Alternative are summarized in Tables 5.47 and 5.48.  
23 Changes in flows in the Sacramento River downstream of Keswick Dam and at  
24 Freeport are shown on Figures 5.56 through 5.61. The results are summarized  
25 following Table 5.48.

3 The following changes in Shasta Lake storage and surface water elevations would  
 4 occur under Alternative 3 as compared to the No Action Alternative.

- 5 • In wet years, storage would be similar in December through August and  
 6 increased in September and November (up to 8.7 percent).
- 7 • In above-normal years, storage would be similar in January through October  
 8 and increased in November and December (up to 7.1 percent).
- 9 • In below-normal years, storage would be similar in March through September  
 10 and increased in October through February (up to 11.9 percent).

- 1 • In dry years, storage would be similar in March through October and  
2 increased in November through January (up to 7.4 percent).
- 3 • In critical dry years, storage would increase in all months (up to 12.2 percent).
- 4 • In all months, in all water year types, surface water elevations would be  
5 similar.

6 The following changes in Sacramento River flows would occur under  
7 Alternative 3 as compared to the No Action Alternative, as shown on Figures 5.56  
8 through 5.61.

- 9 • Sacramento River downstream of Keswick Dam (Figures 5.56 through 5.58).
  - 10 – Over long-term conditions, similar flows would occur in October,  
11 February through May, July, and August; reduced flows in September and  
12 November (up to 20.1 percent); and increased flows in December,  
13 January, and June (up to 8.9 percent).
  - 14 – In wet years, similar flows would occur in February through August;  
15 reduced flows in September through November (up to 42.1 percent); and  
16 increased flows in December and January (up to 16.9 percent).
  - 17 – In dry years, similar flows would occur in July through September and  
18 December through May; reduced flows in November (24.6 percent); and  
19 increased flows in January and June (up to 7.3 percent).
- 20 • Sacramento River near Freeport (near the northern boundary of the Delta)  
21 (Figures 5.59 through 5.61).
  - 22 – Over long-term conditions, similar flows would occur in October,  
23 December through May, July, and August; reduced flows in September  
24 and November (up to 30.1 percent); and increased flows in June  
25 (12.1 percent).
  - 26 – In wet years, similar flows would occur in January through May, July, and  
27 October; reduced flows in August, September, and November (up to  
28 48.1 percent); and increased flows in December and June (up to  
29 6.6 percent).
  - 30 – In dry years, similar flows would occur in July through October and  
31 December through April; reduced flows in November (14.2 percent); and  
32 increased flows in May and June (up to 15.7 percent).

33 *Lake Oroville and Feather River*

34 Storage levels and surface water elevations in Lake Oroville under Alternative 3  
35 as compared to the No Action Alternative are summarized in Tables 5.49  
36 and 5.50. Changes in flows in the Feather River downstream of Thermalito  
37 Complex are shown on Figures 5.62 through 5.64. The results are summarized  
38 following Table 5.50.

- 3 The following changes in Lake Oroville storage and surface water elevations  
 4 would occur under Alternative 3 as compared to the No Action Alternative.
- 5 • In wet years, storage would be similar in January through August and  
 6 increased in September through December (up to 18.5 percent).
  - 7 • In above-normal years, storage would be similar in February through August  
 8 and increased in September through January (up to 18.5 percent).
  - 9 • In below-normal years, storage would be similar in June through September  
 10 and increased in October through May (up to 22.5 percent).

- 1 • In dry years, storage would be similar in May through September and  
2 increased in October through April (up to 12.3 percent).
- 3 • In critical dry years, storage would be similar under all months.
- 4 • In all months, in all water year types, surface water elevations would be  
5 similar.

6 The following changes in Feather River flows would occur under Alternative 3 as  
7 compared to the No Action Alternative, as shown on Figures 5.62 through 5.64.

- 8 • Over long-term conditions, similar flows would occur in October, November,  
9 March, April, and July; reduced flows in August and September (up to  
10 49.4 percent); and increased flows in December through February, May, and  
11 June (up to 33.9 percent).
- 12 • In wet years, similar flows would occur in October, November, February  
13 through May, and July; reduced flows in August and September (up to  
14 70.0 percent) and increased flows in December, January, and June (up to  
15 28.1 percent).
- 16 • In dry years, similar flows would occur in September and January through  
17 April; reduced flows in October through December and July (up to  
18 14.5 percent); and increased flows in May, June, and August (36.9 percent).

19 *Folsom Lake and American River*

20 Storage levels and surface water elevations in Folsom Lake under Alternative 3 as  
21 compared to the No Action Alternative are summarized in Tables 5.51 and 5.52.  
22 Changes in flows in the American River downstream of Nimbus Dam are shown  
23 on Figures 5.65 through 5.67. The results are summarized following Table 5.52.

3 The following changes in Folsom Lake storage would occur under Alternative 3  
 4 as compared to the No Action Alternative.

- 5 • In wet years, storage would be similar in December through August and  
 6 increased in September through December (up to 12.1 percent).
- 7 • In above-normal years, storage would be similar in January through June,  
 8 September, and October; and increased in November and December (up to  
 9 6.3 percent); and reduced in July and August (up to 6.7 percent).
- 10 • In below-normal years, storage would be similar in February through July;  
 11 reduced in August and September (up to 10.0 percent); and increased in  
 12 October through January (up to 15.0 percent).

- 1 • In dry years, storage would be similar in all months.
- 2 • In critical dry years, storage would be similar in October through July and  
3 increased in August and September (up to 11.6 percent).
- 4 • In all months, in all water year types, surface water elevations would be  
5 similar.
- 6 The following changes in American River flows would occur under Alternative 3  
7 as compared to the No Action Alternative, as shown on Figures 5.65  
8 through 5.67.
- 9 • Over long-term conditions, similar flows would occur in November, January  
10 through May, July, and August; reduced flows in September and October (up  
11 to 28.7 percent); and increased flows in June (5.8 percent).
- 12 • In wet years, similar flows would occur in October, November, and January  
13 through July; reduced flows in September (45.9 percent); and increased flows  
14 in August and December (up to 8.5 percent).
- 15 • In dry years, similar flows would occur in November through January and  
16 March through September; reduced flows in October (11.2 percent); and  
17 increased flows in February (6.1 percent).

18 *Clear Creek*

19 Changes in flows in Clear Creek downstream of Whiskeytown Dam are  
20 summarized in Table 5.53.

21 Monthly Clear Creek flows under Alternative 3 as compared to the No Action  
22 Alternative are identical except in May. In May, under Alternative 3, flows are  
23 up to 28.9 percent lower than under the No Action Alternative.

1 The following changes in New Melones Reservoir storage would occur under  
2 Alternative 3 as compared to the No Action Alternative.

- 3 • In wet years, storage would be increased in all months (up to 13.3 percent).
- 4 • In above-normal years, storage would be increased in all months (up to  
5 23.3 percent).
- 6 • In below-normal years, storage would be increased in all months (up to  
7 19.8 percent).
- 8 • In dry years, storage would be increased in all months (up to 25.3 percent).
- 9 • In critical dry years, storage would be increased in all months (up to  
10 37.8 percent).
- 11 • In all months, in all water year types, surface water elevations would be  
12 similar.

13 Flows in the Stanislaus River downstream of Goodwin Dam are shown on  
14 Figures 5.68 to 5.70. Changes in flows in these rivers are summarized below.

- 15 • Over long-term conditions, reduced flows would occur in October and March  
16 through June (up to 58.3 percent); and increased flows in November through  
17 February and July through September (up to 36.81 percent).
- 18 • In wet years, similar flows would occur in April; reduced flows in October,  
19 March, and May (up to 52.9 percent); and increased flows in June through  
20 September and November through February (up to 67.8 percent).
- 21 • In dry years, similar flows would occur in March and July through September;  
22 reduced flows in October and April through June (up to 59.6 percent); and  
23 increased flows in November through February (up to 37.0 percent).

24 *San Joaquin River at Vernalis*

25 Flows in the San Joaquin River at Vernalis under Alternative 3 as compared to the  
26 No Action Alternative are summarized below, as shown on Figures 5.71  
27 through 5.73.

- 28 • Over long-term conditions, similar flows would occur in November through  
29 September and reduced flows in October (15.7 percent).
- 30 • In wet years, similar flows would occur in November through August;  
31 reduced flows in October (14.1 percent); and increased flows in September  
32 (5.7 percent).
- 33 • In dry years, similar flows would occur in November through March and July  
34 through September and reduced flows in October and April through June (up  
35 to 15.2 percent).

36 *San Luis Reservoir*

37 Storage levels and surface water elevations in San Luis Reservoir under  
38 Alternative 3 as compared to the No Action Alternative are summarized in  
39 Tables 5.56 and 5.57. The results are summarized following Table 5.57.

1

1 The following changes in San Luis Reservoir storage would occur under  
2 Alternative 3 as compared to the No Action Alternative.

- 3 • In wet years, storage would be increased in all months (up to 96.3 percent).  
4 Water storage elevations would be increased in all months (up to  
5 13.0 percent).
- 6 • In above-normal years, storage would be increased in all months (up to  
7 111.4 percent). Water storage elevations would be similar in October through  
8 March and increased in April through September (up to 11.3 percent).
- 9 • In below-normal years, storage would be increased in all months (up to  
10 106.9 percent). Water storage elevations would be similar in September and  
11 increased in October through August (up to 10.7 percent).
- 12 • In dry years, storage would be similar in September and increased in October  
13 through August (up to 52.1 percent). Water storage elevations would be  
14 similar December through May and July through October and increased in  
15 November and June (up to 6.8 percent).
- 16 • In critical dry years, storage would be similar in February through May and  
17 increased in June through January (up to 29.2 percent). Water storage  
18 elevations would be similar in all months.

19 *Changes in Flows into the Yolo Bypass*

20 Flows from the Sacramento River into the Yolo Bypass at Fremont Weir under  
21 Alternative 3 as compared to the No Action Alternative are summarized in  
22 Table 5.58. The results are summarized following Table 5.58.

1  
2

- 1 The following changes in flows from the Sacramento River into Yolo Bypass at  
2 Fremont Weir would occur under Alternative 3 as compared to the No Action  
3 Alternative.
- 4 • In wet years, flows into Yolo Bypass would be similar in January through  
5 September; reduced in October (24.5 percent) and increased in November and  
6 December (up to 15.1 percent).
  - 7 • In above-normal years, storage would be similar in April through January and  
8 increased in February and March (up to 11.7 percent).
  - 9 • In below-normal years, flows into Yolo Bypass would be similar in April  
10 through November and increased in December through March (up to  
11 32.0 percent).
  - 12 • In dry years, flows into Yolo Bypass would be similar in January through  
13 November and increased in December (6.0 percent).
  - 14 • In critical dry years, flows into Yolo Bypass would be similar in all months.

15 *Changes in Delta Conditions*

16 Delta outflow under Alternative 3 as compared to the No Action Alternative are  
17 summarized below and shown on Figures 5.74 through 5.76.

- 18 • In wet years, average monthly Delta outflow would increase in December  
19 through March (up to 3,307 cfs) and decrease in April through November (up  
20 to 13,678 cfs).
- 21 • In dry years, average monthly Delta outflow would increase January,  
22 February, June, and July (up to 277 cfs) and decrease in August through  
23 December and March through May (up to 2,902 cfs).

24 The OMR conditions under Alternative 3 as compared to the No Action  
25 Alternative are shown on Figures 5.77 through 5.79.

- 26 • Under Alternative 3, OMR flows are negative in all months of all water year  
27 types except in April in a wet year (405 cfs). Under the No Action  
28 Alternative, OMR flows are negative except in April and May of wet and  
29 above-normal years and April of below-normal years.
- 30 • In wet years, average monthly OMR flows would be more positive in July and  
31 August (up to 800 cfs) and more negative in September through June (up to  
32 4,477 cfs).
- 33 • In dry years, average monthly OMR flows would be more positive in July and  
34 January (up to 728 cfs) and more negative in August through December and  
35 February through June (up to 1,847 cfs).

36 *Changes in CVP and SWP Exports and Deliveries*

37 Delta exports under Alternative 3 as compared to the No Action Alternative are  
38 summarized in Table 5.59.

1 **Table 5.59 Changes in Exports at Jones and Banks Pumping Plants under**  
 2 **Alternative 3 as Compared to the No Action Alternative**

Water Year	Monthly Volume (TAF)

Critical Dry	2.2	9.2	4.6	1.7	0.1	0.4	37.3	11.0	104.1	-28.9	10.9	1.4

- 1 The following changes would occur in CVP and SWP exports under Alternative 3  
2 as compared to the No Action Alternative.
- 3 • Long-term average annual exports would be 726 TAF (15 percent) more  
4 under Alternative 3 as compared to the No Action Alternative.
  - 5 • In wet years, total exports would be similar in March, July, and September;  
6 increased in October, February and April through June (up to 142.4 percent);  
7 and reduced in August (7.1 percent).
  - 8 • In above-normal years, total exports would be similar in December, January,  
9 and July through September and increased in October, November, and  
10 February through June (up to 292 percent).
  - 11 • In below-normal years, total exports would be similar in December, January,  
12 July, and August and increased in September through November and February  
13 through June (up to 166.5 percent).
  - 14 • In dry years, total exports would be similar in September and December, and  
15 July; increased in October, November, March through June, and August (up to  
16 92.5 percent); and reduced in July (7.6 percent).
  - 17 • In critical dry years, total exports would be similar in September, October, and  
18 December through March; increased in November, April through June and  
19 August (up to 104.1 percent); and reduced in July (28.9 percent).
- 20 Deliveries to CVP and SWP water users increase under Alternative 3 as compared  
21 to the No Action Alternative, as summarized in Tables 5.60 and 5.61,  
22 respectively, due to increased water supply availability and export limitations.

1 **Table 5.60 Changes CVP Water Deliveries under Alternative 3 as Compared to the**

	Dry	633	608	25	4
	Critical Dry	514	449	65	14

- 1 The following changes in CVP water deliveries would occur under Alternative 3
- 2 as compared to the No Action Alternative.

- 1 • Deliveries to CVP North of Delta agricultural water service contractors would  
2 be increased by 13 percent over the long-term conditions and 29 percent in  
3 dry and critical dry years.
- 4 • Deliveries to CVP North of Delta M&I contractors would be similar in total;  
5 however, deliveries to the American River CVP contractors would increase by  
6 5 percent over the long-term conditions and 7 percent in dry years, and remain  
7 similar in critical dry years.
- 8 • Deliveries to CVP South of Delta agricultural water service contractors would  
9 be increased by 28 percent over the long-term conditions, 34 percent in dry  
10 years, and 27 percent in critical dry years.
- 11 • Deliveries to CVP South of Delta M&I contractors would be similar in critical  
12 dry years and increased by 10 percent over the long-term conditions and 8  
13 percent in dry years.
- 14 • Deliveries to the Eastside contractors would be similar under long-term  
15 conditions and dry years and increased by 14 percent in critical dry years.

	Dry	47	10	37	384
	Critical Dry	38	12	26	214

1 The following changes in SWP water deliveries would occur under Alternative 3  
2 as compared to the No Action Alternative.

- 3 • Deliveries without Article 21 water to SWP North of Delta water contractors  
4 would be increased by 17 percent over the long-term conditions and in dry  
5 years and 13 percent in critical dry years.
- 6 • Deliveries without Article 21 water to SWP South of Delta water contractors  
7 would be increased by 17 percent over the long-term conditions and in dry  
8 years and 14 percent in critical dry years.
- 9 • Deliveries of Article 21 water to SWP North of Delta water contractors would  
10 be similar over the long-term conditions and in dry and critical dry years.
- 11 • Deliveries of Article 21 water to SWP South of Delta water contractors would  
12 be increased by 128 percent over the long-term conditions, 384 percent in dry  
13 years, and 214 percent in critical dry years.

14 *Effects Related to Cross Delta Water Transfers*

15 Potential effects to surface water resources could be similar to those identified in  
16 a recent environmental analysis conducted by Reclamation for long-term water  
17 transfers from the Sacramento to San Joaquin valleys (Reclamation 2014i).

18 Potential effects were identified as reduced surface water storage in upstream  
19 reservoirs and changes in flow patterns in river downstream of the reservoirs if  
20 water was released from the reservoirs in patterns that were different than would  
21 have been used by the water seller's. Because all water transfers would be  
22 required to avoid adverse impacts to other water users and biological resources  
23 (see Section 3.A.6.3, Transfers), including impacts associated with changes in  
24 reservoir storage and river flow patterns, the analysis indicated that water  
25 transfers would not result in substantial changes in storage or river flows. For the  
26 purposes of this EIS, it is anticipated that similar conditions would occur due to  
27 cross Delta water transfers under Alternative 3 and the No Action Alternative.

28 Under Alternative 3, water could be transferred throughout the year. As indicated  
29 in Table 5.59, capacity would be available under Alternative 3 in all months of all  
30 water year types without a maximum volume of transferred water. Under the No  
31 Action Alternative, the timing of cross Delta water transfers would be limited to  
32 July through September, and the volume would be limited to 600,000 acre-feet  
33 per year in drier years and 360,000 acre-feet in all other years, in accordance with  
34 the 2008 USFWS BO and 2009 NMFS BO. As indicated in Table 5.59, capacity  
35 would be available under the No Action Alternative between July and September  
36 for water transfers in all water year types.

37 Overall, the potential for water transfer conveyance would be greater under  
38 Alternative 3 as compared to the No Action Alternative.

1 *San Francisco Bay Area, Central Coast, and Southern California Regions*  
2 *Potential Changes in Surface Water Resources at Reservoirs that Store CVP*  
3 *and SWP Water*

4 The San Francisco Bay Area, Central Coast, and Southern California regions  
5 include numerous reservoirs that store CVP and SWP water supplies, including  
6 CVP and SWP reservoirs, that primarily provide water supplies for M&I water  
7 users. Changes in the availability CVP and SWP water supplies for storage in  
8 these reservoirs under Alternative 3 as compared to the No Action  
9 Alternative would be consistent with the following changes in water deliveries to  
10 M&I water users, as summarized in Tables 5.60 and 5.61.

- 11 • Deliveries to CVP South of Delta M&I contractors would be similar in critical  
12 dry years; and increased by 9 percent over the long-term conditions and  
13 8 percent in dry years.
- 14 • Deliveries without Article 21 water to SWP South of Delta water contractors  
15 would be increased by 17 percent over the long-term conditions and in dry  
16 years and 14 percent in critical dry years.
- 17 • Deliveries of Article 21 water to SWP South of Delta water contractors would  
18 be increased by 128 percent over the long-term conditions, 384 percent in dry  
19 years, and 214 percent in critical dry years.

20 *Changes in CVP and SWP Exports and Deliveries*

21 Deliveries to CVP and SWP water users are described above in the Central Valley  
22 Region.

23 **5.4.3.4.2 Alternative 3 Compared to the Second Basis of Comparison**

24 *Trinity River Region*

25 *Changes in CVP and SWP Reservoir Storage and Downstream River Flows*

26 Changes in Trinity Lake storage and surface water elevations under Alternative 3  
27 as compared to the Second Basis of Comparison are summarized in Tables 5.62  
28 and 5.63. The results are summarized following Table 5.63.

3 Shasta Lake storage and surface water elevation would be similar under  
 4 Alternative 3 as compared to the Second Basis of Comparison in all months and  
 5 all water years.

6 The following changes in Sacramento River flows would occur under  
 7 Alternative 3 as compared to the Second Basis of Comparison, as shown on  
 8 Figures 5.56 through 5.61.

- 9 • Sacramento River downstream of Keswick Dam (Figures 5.56 through 5.58)  
 10 would be similar in all months over the long-term conditions and in wet and  
 11 dry years.

- 1 • Sacramento River near Freeport (near the northern boundary of the Delta)
- 2 (Figures 5.59 through 5.61).
- 3 – Over long-term conditions and in wet years, flows would be similar in all
- 4 months.
- 5 – In dry years, similar flows would occur in July through May; and
- 6 increased flows in June (11 percent).

7 *Lake Oroville and Feather River*

8 Storage levels and surface water elevations in Lake Oroville under Alternative 3  
 9 as compared to the Second Basis of Comparison are summarized in Tables 5.66  
 10 and 5.67. Changes in flows in the Feather River downstream of Thermalito  
 11 Complex are shown on Figures 5.62 through 5.64. The results are summarized  
 12 following Table 5.67.

1 Lake Oroville storage and surface water elevation would be similar under  
2 Alternative 3 as compared to the Second Basis of Comparison in all months and  
3 all water years.

4 The following changes in Feather River flows would occur under Alternative 3 as  
5 compared to the Second Basis of Comparison, as shown on Figures 5.62  
6 through 5.64.

- 7 • Over long-term conditions, similar flows would occur in November and  
8 January through June; reduced flows in October, December, and September  
9 (up to 12.5 percent); and increased flows in July and August (up to  
10 17.0 percent).
- 11 • In wet years, similar flows would occur in November and January through  
12 May; reduced flows in October, December, and September (up to  
13 14.6 percent); and increased flows in June through August (up to  
14 10.9 percent).
- 15 • In dry years, similar flows would occur in November and January through  
16 June; reduced flows in August through October (up to 21.2 percent); and  
17 increased flows in July (37.1 percent).

18 *Folsom Lake and American River*

19 Storage levels and surface water elevations in Folsom Lake under Alternative 3 as  
20 compared to the Second Basis of Comparison are summarized in Tables 5.68  
21 and 5.69. Changes in flows in the American River downstream of Nimbus Dam  
22 are shown on Figures 5.65 through 5.67. The results are summarized following  
23 Table 5.69.

- 1 The following changes in New Melones Reservoir storage and surface water  
 2 elevations would occur under Alternative 3 as compared to the Second Basis of  
 3 Comparison.
- 4 • In wet years, storage would be similar in March through May and increased in  
 5 June through February (up to 8.4 percent).
  - 6 • In above normal years, storage would be increased in all months (up to  
 7 16.3 percent).
  - 8 • In below normal years, storage would be increased in all months (up to  
 9 14.7 percent).
  - 10 • In dry years, storage would be increased in all months (up to 19.6 percent).
  - 11 • In critical dry years, storage would be increased in all months (up to  
 12 32.1 percent).
  - 13 • In all months, in all water year types, surface water elevations would be  
 14 similar.

15 Flows in the Stanislaus River downstream of Goodwin Dam are shown on  
 16 Figures 5.68 to 5.70. Changes in flows in the river are summarized below.

- 17 • Over long-term conditions, similar flows would occur in October, December,  
 18 January, and March; reduced flows would occur in November, May, and June  
 19 (up to 52.3 percent); and increased flows in February, April, July, and August  
 20 through September (up to 26.8 percent).
- 21 • In wet years, similar flows would occur in October, November, January, and  
 22 April; reduced flows in May and June (up to 44.8 percent); and increased  
 23 flows in December, February, March, and July through September (up to  
 24 68.6 percent).
- 25 • In dry years, similar flows would occur in July through October; reduced  
 26 flows in November through March and May through June (up to  
 27 36.0 percent); and increased flows in April (40.2 percent).

28 *San Joaquin River at Vernalis*

29 Flows in the San Joaquin River at Vernalis under Alternative 3 as compared to the  
 30 Second Basis of Comparison are summarized below, as shown on Figures 5.71  
 31 through 5.73.

- 32 • Over long-term conditions, similar flows would occur in July through May  
 33 and reduced flows in June (11.8 percent).
- 34 • In wet years, similar flows would occur in September through January, March  
 35 through May, and July; reduced flows in June (8.3 percent); and increased  
 36 flows in August and February (6.2 percent).
- 37 • In dry years, similar flows would occur in July through March; reduced flows  
 38 in May and June (up to 12.3 percent); and increased flows in April  
 39 (6.6 percent).

1 The following changes in San Luis Reservoir storage would occur under  
2 Alternative 3 as compared to the Second Basis of Comparison.

- 3 • In wet years, storage would be similar in July through November and March  
4 through May and reduced in December through February and June (up to  
5 15.7 percent). Surface water elevations would be similar in all months.
- 6 • In above-normal years, storage would be similar in November; increased in  
7 August and September (up to 12.1 percent); and reduced in October and  
8 December through July (up to 21.7 percent). Surface water elevations would  
9 be similar in March through December and reduced in January and February  
10 (up to 6.0 percent).
- 11 • In below-normal years, storage would be similar in August and September and  
12 reduced in October through July (up to 40.1 percent). Surface water  
13 elevations would be similar in all months.
- 14 • In dry years, storage would be reduced in January through September (up to  
15 19.2 percent) and increased in October through December (up to  
16 13.2 percent). Surface water elevations would be similar in all months.
- 17 • In critical dry years, storage would be reduced in October through August (up  
18 to 28.5 percent) and increased in September (7.6 percent). Surface water  
19 elevations would be similar September through January and reduced in  
20 February through August (up to 7.4 percent).

21 *Changes in Flows into the Yolo Bypass*

22 Flows from the Sacramento River into the Yolo Bypass at Fremont Weir under  
23 Alternative 3 as compared to the Second Basis of Comparison are summarized in  
24 Table 5.75. The results are summarized following Table 5.75.

1  
2

1 The following changes in flows from the Sacramento River into the Yolo Bypass  
2 at Fremont Weir would occur under Alternative 3 as compared to the Second  
3 Basis of Comparison.

- 4 • In wet years, flows into the Yolo Bypass would be similar in November  
5 through September and reduced in October (5.6 percent).
- 6 • In above-normal, below-normal, dry, and critical dry years, flows into the  
7 Yolo Bypass would be similar in all months.

8 *Changes in Delta Conditions*

9 Delta outflow under Alternative 3 as compared to the Second Basis of  
10 Comparison are summarized below and shown on Figures 5.74 through 5.76.

- 11 • In wet years, average monthly Delta outflow would increase in November  
12 through February and July through September (up to 2,546 cfs) and decrease  
13 in October and March through June (up to 1,127 cfs).
- 14 • In dry years, average monthly Delta outflow would increase in November  
15 through April, July and August (up to 3,391 cfs) and decrease in October,  
16 May, and June (up to 373 cfs).

17 The OMR conditions under Alternative 3 as compared to the Second Basis of  
18 Comparison are shown on Figures 5.77 through 5.79.

- 19 • Under Alternative 3, OMR flows are negative in all months of all water year  
20 types except in April in wet year (405 cfs). Under Second Basis of  
21 Comparison, OMR flows are negative in all months of all water year types.
- 22 • In wet years, flows would be more positive in September through February,  
23 April, and May (up to 5,528 cfs) and more negative in March and June  
24 through August (up to 1,453 cfs).
- 25 • In dry years, flows would be more positive in August through May (up to  
26 3,249 cfs); and more negative flows in June and July (up to 1,345 cfs).

27 *Changes in CVP and SWP Exports and Deliveries*

28 Delta exports under Alternative 3 as compared to the Second Basis of Comparison  
29 are summarized in Table 5.76.

1 **Table 5.76 Changes in Exports at Jones and Banks Pumping Plants under**  
 2 **Alternative 3 as Compared to the Second Basis of Comparison**

1 The following changes would occur in CVP and SWP exports under Alternative 3  
 2 as compared to the Second Basis of Comparison.

- 3 • Long-term average annual exports would be 326 TAF (6 percent) less under  
 4 Alternative 3 as compared to the Second Basis of Comparison.
- 5 • In wet years, total exports would be similar in July through November,  
 6 February, and April; increased exports in March, May, and June (up to  
 7 14.0 percent); and reduced in December and January (up to 22.8 percent).
- 8 • In above-normal years, total exports would be similar in June through  
 9 November, March, and April; reduced exports in December through February  
 10 (up to 42.2 percent); and increased in May (up to 13.8 percent).
- 11 • In below-normal years, total exports would be similar in October through  
 12 December; reduced exports in January through June (up to 41.5 percent); and  
 13 increased in July through September (up to 25.7 percent).
- 14 • In dry years, total exports would be similar in August through December and  
 15 April; reduced exports in January through March (up to 39.3 percent); and  
 16 increased exports in May through July (up to 22.1 percent).
- 17 • In critical dry years, total exports would be similar in April, June, August, and  
 18 September; reduced exports in October through March and May (up to  
 19 38.3 percent); and increased exports in July (14.0 percent).

20 Deliveries to CVP and SWP water users would be similar under Alternative 3 as  
 21 compared to the Second Basis of Comparison, as summarized in Tables 5.77  
 22 and 5.78.

23 **Table 5.77 Changes CVP Water Deliveries under Alternative 3 as Compared to the**

	Dry	703	759	-54	-3
	Critical Dry	250	280	-27	-2
<b>Eastside Contractors Deliveries</b>					
Water Rights	Long Term	513	514	-1	0
	Dry	524	524	0	0
	Critical Dry	478	486	-8	-2
CVP Water Service Contracts	Long Term	123	118	5	4
	Dry	109	98	12	12
	Critical Dry	36	25	11	44
Total Water Rights and CVP Service Contracts Deliveries	Long Term	636	632	4	1
	Dry	633	621	11	2
	Critical Dry	514	511	3	1

1 The following changes in CVP water deliveries would occur under Alternative 3  
 2 as compared to the Second Basis of Comparison.

- 3 • Deliveries to CVP North of Delta agricultural water service contractors would  
 4 be reduced by 5 percent over the long-term conditions, 9 percent in dry years,  
 5 and 11 percent in critical dry years.
- 6 • Deliveries to CVP North of Delta M&I contractors (including American River  
 7 CVP contractors) would be similar in long-term conditions and dry and  
 8 critical dry years.
- 9 • Deliveries to CVP South of Delta agricultural water service contractors would  
 10 be similar over the long-term conditions and reduced by 8 percent in dry years  
 11 and 14 percent in critical dry years.
- 12 • Deliveries to CVP South of Delta M&I contractors would be similar in long-  
 13 term conditions and dry and critical dry years.
- 14 • Deliveries to the Eastside contractors would be similar under long-term  
 15 conditions, dry years, and in critical dry years.

16 **Table 5.78 Changes SWP Water Deliveries under Alternative 3 as Compared to the**

	Dry	11	86	-75	-87
	Critical Dry	10	58	-48	-83

Annual Average Deliveries (TAF)					
		Alternative 3	Second Basis of Comparison	Alternative 3 as Compared to the Second Basis of Comparison	
				Difference	Percent Change
Total SWP Agricultural and M&I Users (without Article 21)	Long Term	2,822	2,933	-111	-4
	Dry	2,182	2,299	-117	-5
	Critical Dry	1,770	1,978	-208	-11
Total SWP Agricultural and M&I Article 21 Deliveries	Long Term	106	282	-176	-62
	Dry	47	229	-182	-80
	Critical Dry	38	158	-120	-76

1 The following changes in SWP water deliveries would occur under Alternative 3  
 2 as compared to the Second Basis of Comparison.

- 3 • Deliveries without Article 21 water to SWP North of Delta water contractors  
 4 would be similar over the long-term conditions and in dry years and reduced  
 5 by 10 percent in critical dry years.
- 6 • Deliveries without Article 21 water to SWP South of Delta water contractors  
 7 would be similar over the long-term conditions and in dry years and reduced  
 8 by 11 percent in critical dry years.
- 9 • Deliveries of Article 21 water to SWP North of Delta water contractors would  
 10 be similar over the long-term conditions and in dry and critical dry years.
- 11 • Deliveries of Article 21 water to SWP South of Delta water contractors would  
 12 be reduced by 62 percent over the long-term conditions; 80 percent in dry  
 13 years; and 76 percent in critical dry years.

14 *Effects Related to Cross Delta Water Transfers*

15 Potential effects to surface water resources could be similar to those identified in  
 16 a recent environmental analysis conducted by Reclamation for long-term water  
 17 transfers from the Sacramento to San Joaquin valleys (Reclamation 2014i).  
 18 Potential effects were identified as reduced surface water storage in upstream  
 19 reservoirs and changes in flow patterns in river downstream of the reservoirs if  
 20 water was released from the reservoirs in patterns that were different than would  
 21 have been used by the water seller's. Because all water transfers would be  
 22 required to avoid adverse impacts to other water users and biological resources  
 23 (see Section 3.A.6.3, Transfers), including impacts associated with changes in

1 reservoir storage and river flow patterns, the analysis indicated that water  
2 transfers would not result in substantial changes in storage or river flows. For the  
3 purposes of this EIS, it is anticipated that similar conditions would occur due to  
4 cross Delta water transfers under Alternative 3 and the Second Basis of  
5 Comparison.

6 Under Alternative 3 and the Second Basis of Comparison, water could be  
7 transferred throughout the year. As indicated in Table 5.76, capacity would be  
8 available under Alternative 3 and the Second Basis of Comparison in a similar  
9 manner in all months of all water year types.

#### 10 *San Francisco Bay Area, Central Coast, and Southern California Regions*

##### 11 *Potential Changes in Surface Water Resources at Reservoirs that Store CVP* 12 *and SWP Water*

13 The San Francisco Bay Area, Central Coast, and Southern California regions  
14 include numerous reservoirs that store CVP and SWP water supplies, including  
15 CVP and SWP reservoirs, that primarily provide water supplies for M&I water  
16 users. Changes in the availability CVP and SWP water supplies for storage in  
17 these reservoirs under Alternative 3 as compared to the Second Basis of  
18 Comparison would be consistent with the following changes in water deliveries to  
19 M&I water users, as summarized in Tables 5.77 and 5.78.

- 20 • Deliveries to CVP South of Delta M&I contractors would be similar in long-  
21 term conditions and dry and critical dry years.
- 22 • Deliveries without Article 21 water to SWP South of Delta water contractors  
23 would be similar over the long-term conditions and in dry years and reduced  
24 by 11 percent in critical dry years.
- 25 • Deliveries of Article 21 water to SWP South of Delta water contractors would  
26 be reduced by 62 percent over the long-term conditions, 80 percent in dry  
27 years, and 76 percent in critical dry years.

##### 28 *Changes in CVP and SWP Exports and Deliveries*

29 Deliveries to CVP and SWP water users are described above in the Central Valley  
30 Region.

#### 31 **5.4.3.5 Alternative 4**

32 Surface water resources conditions under Alternative 4 would be identical to the  
33 surface water resources conditions under the Second Basis of Comparison;  
34 therefore, Alternative 4 is only compared to the No Action Alternative.

##### 35 **5.4.3.5.1 Alternative 4 Compared to the No Action Alternative**

36 Changes in surface water resources under Alternative 4 as compared to the No  
37 Action Alternative would be the same as the impacts described in Section  
38 5.4.3.2.1, Alternative 1 Compared to the No Action Alternative.

1    **5.4.3.6    Alternative 5**  
2    CVP and SWP operations under Alternative 5 are similar to the No Action  
3    Alternative with modified Old and Middle River flow criteria and New Melones  
4    Reservoir operations. Alternative 5 would include changed water demands for  
5    American River water supplies as compared to the No Action Alternative or  
6    Second Basis of Comparison. Alternative 5 would provide water supplies of up to  
7    17 TAF per year under a Warren Act Contract for El Dorado Irrigation District  
8    and 15 TAF per year under a CVP water service contract for El Dorado County  
9    Water Agency. These demands are not included in the analysis presented in this  
10   section of the EIS. A sensitivity analysis comparing the results of the analysis  
11   with and without these demands is presented in Appendix 5B of this EIS.

12   **5.4.3.6.1   Alternative 5 Compared to the No Action Alternative**

13    *Trinity River Region*

14      *Changes in CVP and SWP Reservoir Storage and Downstream River Flows*

15    Changes in Trinity Lake storage and surface water elevations under Alternative 5  
16    as compared to the No Action Alternative are summarized in Tables 5.79  
17    and 5.80. The results are summarized following Table 5.80.

1 Shasta Lake storage and surface water elevations would be similar in all months  
2 and all water year types under Alternative 5 as compared to the No Action  
3 Alternative.

4 The following changes in Sacramento River flows would occur under  
5 Alternative 5 as compared to the No Action Alternative, as shown on Figures 5.56  
6 through 5.61.

- 7 • Sacramento River flows downstream of Keswick Dam (Figures 5.56 through  
8 5.58) would be similar over the long-term conditions and in wet and dry years.
- 9 • Sacramento River near Freeport (near the northern boundary of the Delta)  
10 (Figures 5.59 through 5.61) would be similar over the long-term conditions  
11 and in wet and dry years.

12 *Lake Oroville and Feather River*

13 Storage levels and surface water elevations in Lake Oroville under Alternative 5  
14 as compared to the No Action Alternative are summarized in Tables 5.83 and  
15 5.84. Changes in flows in the Feather River downstream of Thermalito Complex  
16 are shown on Figures 5.62 through 5.64. The results are summarized following  
17 Table 5.84.

1 Lake Oroville storage and surface water elevations would be similar in all months  
2 and all water year types under Alternative 5 as compared to the No Action  
3 Alternative.

4 The following changes in Feather River flows would occur under Alternative 5 as  
5 compared to the No Action Alternative, as shown on Figures 5.62 through 5.64.

- 6 • Over long-term conditions, similar flows would occur in June through April  
7 and reduced flows in May (6.6 percent).
- 8 • In wet years, similar flows would occur in all months.
- 9 • In dry years, similar flows would occur in September through April and June;  
10 reduced flows in May (27.1 percent) and increased flows in July and August  
11 (up to 8.9 percent).

12 *Folsom Lake and American River*

13 Storage levels and surface water elevations in Folsom Lake under Alternative 5 as  
14 compared to the No Action Alternative are summarized in Tables 5.85 and 5.86.  
15 Changes in flows in the American River downstream of Nimbus Dam are shown  
16 on Figures 5.65 through 5.67. The results are summarized following Table 5.86.

- 1 The following changes in New Melones Reservoir storage and elevation would  
2 occur under Alternative 5 as compared to the No Action Alternative.
- 3 • In wet years, storage would be similar in all months.
  - 4 • In above normal years, storage would be similar in October through June and  
5 reduced in July through September (up to 5.7 percent).
  - 6 • In below normal years, storage would be reduced in all months (up to  
7 9.2 percent).
  - 8 • In dry years, storage would be reduced in all months (up to 10.2 percent).
  - 9 • In critical dry years, storage would be reduced in all months (up to  
10 18.9 percent).
  - 11 • In all months, in all water year types, surface water elevations would be  
12 similar.

13 Flows in the Stanislaus River downstream of Goodwin Dam are shown on  
14 Figures 5.68 to 5.70. Changes in flows in these rivers are summarized below.

- 15 • Over long-term conditions, flows would be similar in September through  
16 February and June; reduced flows would occur in March, July, and August (up  
17 to 8.0 percent); and increased flows in April and May (up to 22.4 percent).
- 18 • In wet years, similar flows would occur in October, November, January,  
19 February, and April through June and reduced flows in December, March, and  
20 July through September (up to 18.0 percent).
- 21 • In dry years, similar flows would occur in June through March and increased  
22 flows in April and May (up to 47.3 percent).

23 *San Joaquin River at Vernalis*

24 Flows in the San Joaquin River at Vernalis under Alternative 5 as compared to the  
25 No Action Alternative are summarized below, as shown on Figures 5.71 through  
26 5.73.

- 27 • Over long-term conditions and wet years, similar flows would occur in all  
28 months.
- 29 • In dry years, similar flows would occur in June through March and increased  
30 flows in April and May (up to 15.7 percent).San Luis Reservoir.

31 Storage levels and surface water elevations in San Luis Reservoir under  
32 Alternative 5 as compared to the No Action Alternative are summarized in  
33 Tables 5.90 and 5.91. The results are summarized following Table 5.91.

1

- 1 The following changes in San Luis Reservoir storage would occur under  
2 Alternative 5 as compared to the No Action Alternative.
- 3 • In wet years, storage would be similar in January through May and increased  
4 in June through December (up to 10.0 percent).
  - 5 • In above-normal years, storage would be similar in all months.
  - 6 • In below-normal years, storage would be similar in November, February  
7 through April, August, and September; reduced in June and July (up to  
8 9.2 percent); and increased in October, December, January, and May (up to  
9 8.3 percent).
  - 10 • In dry years, storage would be similar in October through March and reduced  
11 in April through September (up to 17.3 percent).
  - 12 • In critical dry years, storage would be similar in February and March; and  
13 reduced in April through January (up to 18.2 percent).
  - 14 • Surface water elevations would be similar in all months, in all water years.

15 *Changes in Flows into the Yolo Bypass*

16 Flows from the Sacramento River into the Yolo Bypass at Fremont Weir under  
17 Alternative 5 as compared to the No Action Alternative are summarized in  
18 Table 5.92. The results are summarized following Table 5.92.

1  
2

1 Flows from the Sacramento River into Yolo Bypass at Fremont Weir would be  
2 similar under Alternative 5 and the No Action Alternative.

3 *Changes in Delta Conditions*

4 Delta outflow under Alternative 5 as compared to the No Action Alternative are  
5 summarized below and shown on Figures 5.74 through 5.76.

- 6 • In wet years, average monthly Delta outflow would be similar.  
7 • In dry years, average monthly Delta outflow would be similar in July through  
8 April and increased in May and June (up to 1,377 cfs).

9 The OMR conditions under Alternative 5 as compared to the No Action  
10 Alternative are shown on Figures 5.77 through 5.79.

- 11 • Under Alternative 5, OMR flows would be negative except in April and May  
12 of all water year types. Under the No Action Alternative, OMR flows would  
13 be negative except in April and May of wet and above normal years and April  
14 of below normal years.  
15 • In wet years, OMR flows would be more positive or no change in September,  
16 October, January, and April through June (up to 171 cfs) and more negative in  
17 November, December, March, and August (up to 124 cfs).  
18 • In dry years, OMR flows would be more positive or no change in October  
19 through March (up to 1,359 cfs) and more negative in June through September  
20 (up to 568 cfs).

21 *Changes in CVP and SWP Exports and Deliveries*

22 Delta exports under Alternative 5 as compared to the No Action Alternative are  
23 summarized in Table 5.93.

1

1 The following changes would occur in CVP and SWP exports under Alternative 5  
 2 as compared to the No Action Alternative.

- 3 • Long-term average annual exports would be 45 TAF (1 percent) less under  
 4 Alternative 5 as compared to the No Action Alternative.
- 5 • In wet years, total exports would be similar in all months.
- 6 • In above-normal years, total exports would be similar in June through April  
 7 and reduced in May (13.0 percent).
- 8 • In below-normal years, total exports would be similar in June through March  
 9 and reduced in April and May (up to 45.4 percent).
- 10 • In dry years, total exports would be similar in June, July, and September  
 11 through March; reduced in April and May (up to 67.0 percent); and increased  
 12 in August (12.8 percent).
- 13 • In critical dry years, total exports would be similar in June, July, and  
 14 September through March; reduced in April and May (up to 77.5 percent); and  
 15 increased August (25.9 percent).

16 Deliveries to CVP and SWP water users would be similar under Alternative 5 as  
 17 compared to the No Action Alternative, as summarized in Tables 5.94 and 5.95,  
 18 respectively.

19 **Table 5.94 Changes CVP Water Deliveries under Alternative 5 as Compared to the**  
 20 **No Action Alternative**

Annual Average Deliveries (TAF)					
		Alternative 5	No Action Alternative	Alternative 5 as compared to the No Action Alternative	
				Difference	Percent Change
<b>North of Delta</b>					
CVP Agricultural Water Service Contractors	Long Term	185	185	0	0
	Dry	85	86	0	0
	Critical Dry	24	24	0	0
CVP M&I (Including American River Contractors and Contra Costa Water District)	Long Term	386	386	0	0
	Dry	384	385	0	0
	Critical Dry	384	383	1	0

Chapter 5: Surface Water Resources and Water Supplies

Annual Average Deliveries (TAF)					
		Alternative 5	No Action Alternative	Alternative 5 as compared to the No Action Alternative	
				Difference	Percent Change

Total CVP Agricultural, M&I, San Joaquin River Exchange Contractors, and Refuge Level 2 Deliveries	Long Term	2,071	2,084	-13	-1
	Dry	1,689	1,700	-11	-1
	Critical Dry	1,183	1,186	-3	0
<b>Eastside Contractors Deliveries</b>					
Water Rights	Long Term	502	508	-6	-1
	Dry	524	524	0	0
	Critical Dry	406	445	-39	-9
CVP Water Service Contracts	Long Term	100	104	-4	-4
	Dry	69	84	-16	-19
	Critical Dry	8	4	4	100
Total Water Rights and CVP Service Contracts Deliveries	Long Term	602	612	-10	-2
	Dry	593	608	-15	-2
	Critical Dry	414	449	-35	-8

- 1 The following changes in CVP water deliveries would occur under Alternative 5  
2 as compared to the No Action Alternative.
- 3 • Deliveries to CVP North of Delta agricultural water service contractors would  
4 be similar over the long-term conditions and in dry and critical dry years.
  - 5 • Deliveries to CVP North of Delta M&I contractors would be similar over the  
6 long-term conditions and in dry and critical dry years in total and for the  
7 American River CVP contractors.
  - 8 • Deliveries to CVP South of Delta agricultural water service contractors would  
9 be similar over the long-term conditions and in dry and critical dry years.

- 1 • Deliveries to CVP South of Delta M&I contractors would be similar over the
- 2 long-term conditions and in dry and critical dry years.
- 3 • Deliveries to the Eastside contractors would be similar under long-term
- 4 conditions and dry years; and reduced by 8 percent in critical dry years.

5 **Table 5.95 Changes SWP Water Deliveries under the Alternative 5 as Compared to**  
 6 **the No Action Alternative**

Annual Average Deliveries (TAF)

	Critical Dry	4	7	-3	-43
SWP M&I Users (without Article 21)	Long Term	1,784	1,800	-15	-1
	Dry	1,397	1,406	-9	-1
	Critical Dry	1,157	1,173	-16	-1
SWP M&I Article 21 Deliveries	Long Term	19	20	-1	-7
	Dry	5	5	0	4
	Critical Dry	3	5	-2	-37
Total SWP Agricultural and M&I Users (without Article 21)	Long Term	2,383	2,410	-27	-1
	Dry	1,845	1,861	-15	-1
	Critical Dry	1,526	1,551	-25	-2
Total SWP Agricultural and M&I Article 21 Deliveries	Long Term	43	47	-4	-8
	Dry	11	10	1	12
	Critical Dry	7	12	-5	-41

1 The following changes in SWP water deliveries would occur under Alternative 5  
2 as compared to the No Action Alternative.

- 3 • Deliveries without Article 21 water to SWP North of Delta water contractors  
4 would be similar over the long-term conditions and in dry and critical dry  
5 years.
- 6 • Deliveries without Article 21 water to SWP South of Delta water contractors  
7 would be similar over the long-term conditions and in dry and critical dry  
8 years.
- 9 • Deliveries of Article 21 water to SWP North of Delta water contractors would  
10 be similar over the long-term conditions and in dry and critical dry years.
- 11 • Deliveries of Article 21 water to SWP South of Delta water contractors would  
12 be reduced by 8 percent over the long-term conditions and 41 percent in  
13 critical dry years; and increased by 12 percent in dry years.

14 *Effects Related to Cross Delta Water Transfers*

15 Potential effects to surface water resources could be similar to those identified in  
16 a recent environmental analysis conducted by Reclamation for long-term water  
17 transfers from the Sacramento to San Joaquin valleys (Reclamation 2014i).

18 Potential effects were identified as reduced surface water storage in upstream  
19 reservoirs and changes in flow patterns in river downstream of the reservoirs if  
20 water was released from the reservoirs in patterns that were different than would  
21 have been used by the water seller's. Because all water transfers would be  
22 required to avoid adverse impacts to other water users and biological resources  
23 (see Section 3.A.6.3, Transfers), including impacts associated with changes in  
24 reservoir storage and river flow patterns, the analysis indicated that water  
25 transfers would not result in substantial changes in storage or river flows. For the  
26 purposes of this EIS, it is anticipated that similar conditions would occur due to  
27 cross Delta water transfers under Alternative 5 and the No Action Alternative.

28 Under Alternative 5 and the No Action Alternative, the timing of cross Delta  
29 water transfers would be limited to July through September, and the volume  
30 would be limited to 600,000 acre-feet per year in drier years and 360,000 acre-  
31 feet in all other years, in accordance with the 2008 USFWS BO and 2009 NMFS  
32 BO. As indicated in Table 5.93, capacity would be available under the No Action  
33 Alternative between July and September for water transfers in all water year  
34 types.

35 Overall, the potential for water transfer conveyance would be similar under  
36 Alternative 5 as compared to the No Action Alternative.

37 *San Francisco Bay Area, Central Coast, and Southern California Regions*

38 *Potential Changes in Surface Water Resources at Reservoirs that Store CVP*  
39 *and SWP Water*

40 The San Francisco Bay Area, Central Coast, and Southern California regions  
41 include numerous reservoirs that store CVP and SWP water supplies, including  
42 CVP and SWP reservoirs, that primarily provide water supplies for M&I water

1 users. Changes in the availability CVP and SWP water supplies for storage in  
2 these reservoirs under Alternative 5 as compared to the No Action  
3 Alternative would be consistent with the following changes in water deliveries to  
4 M&I water users, as summarized in Tables 5.94 and 5.95.

- 5 • Deliveries to CVP South of Delta M&I contractors would be similar over the  
6 long-term conditions and in dry and critical dry years.
- 7 • Deliveries without Article 21 water to SWP South of Delta water contractors  
8 would be similar over the long-term conditions and in dry and critical dry  
9 years.
- 10 • Deliveries of Article 21 water to SWP South of Delta water contractors would  
11 be reduced by 8 percent over the long-term conditions and 41 percent in  
12 critical dry years; and increased by 12 percent in dry years.

13 *Changes in CVP and SWP Exports and Deliveries*

14 Deliveries to CVP and SWP water users are described above in the Central Valley  
15 Region.

16 **5.4.3.6.2 Alternative 5 Compared to the Second Basis of Comparison**

17 *Trinity River Region*

18 *Changes in CVP and SWP Reservoir Storage and Downstream River Flows*

19 Changes in Trinity Lake storage and surface water elevations under Alternative 5  
20 as compared to the Second Basis of Comparison are summarized in Tables 5.96  
21 and 5.97. The results are summarized following Table 5.97.

1 The following changes in Trinity Lake storage and surface water elevations would  
2 occur under Alternative 5 as compared to the Second Basis of Comparison.

- 3 • In wet, below normal, and dry years, storage would be similar.
- 4 • In above normal years, storage would be similar in January through October  
5 and reduced in November and December (up to 5.3 percent).
- 6 • In critical dry years, storage would be reduced in all months (up to  
7 10.0 percent).
- 8 • In all months, in all water year types, surface water elevations would be  
9 similar.

10 The following changes would occur on the Trinity River under Alternative 5 as  
11 compared to the Second Basis of Comparison, as summarized on Figures 5.53  
12 through 5.55.

- 13 • Over long-term conditions, flows would be similar in March through  
14 November and January and reduced in December and February (up to  
15 9.6 percent).
- 16 • In wet years, flows would be similar in January and April through November  
17 and reduced in December, February, and March (up to 13.9 percent).
- 18 • In dry years, flows would be similar in all months.

19 *Central Valley Region*

20 *Changes in CVP and SWP Reservoir Storage and Downstream River Flows*

21 *Shasta Lake and Sacramento River*

22 Storage levels and surface water elevations in Shasta Lake under Alternative 5 as  
23 compared to the Second Basis of Comparison are summarized in Tables 5.98 and  
24 5.99. Changes in flows in the Sacramento River downstream of Keswick Dam  
25 and at Freeport are shown on Figures 5.56 through 5.61. The results are  
26 summarized following Table 5.99.

- 1 The following changes in Shasta Lake storage and surface water elevation would  
2 occur under Alternative 5 as compared to the Second Basis of Comparison.
- 3 • In wet years, storage would be similar in October and December through  
4 August and reduced in November and September (up to 8.1 percent).
  - 5 • In above normal years, storage would be similar in February through  
6 September and reduced in October through December (up to 7.5 percent).
  - 7 • In below normal years, storage would be similar in March through September  
8 and reduced in October through February (up to 9.9 percent).
  - 9 • In dry years, storage would be similar in January through October and reduced  
10 in November through December (up to 5.9 percent).
  - 11 • In critical dry years, storage would be reduced in all months (up to  
12 16.8 percent).
  - 13 • In all months, in all water year types, surface water elevations are similar.
- 14 The following changes in Sacramento River flows would occur under  
15 Alternative 5 as compared to the Second Basis of Comparison, as shown on  
16 Figures 5.56 through 5.61.
- 17 • Sacramento River downstream of Keswick Dam (Figures 5.56 through 5.58).
    - 18 – Over long-term conditions, flows would be similar in July, August,  
19 October, and February through April; reduced in December, January, May  
20 and June (up to 8.2 percent); and increased in September and November  
21 (up to 38.5 percent).
    - 22 – In wet years, flows would be similar in January through July; reduced in  
23 December and August (up to 15.0 percent); and increased in September  
24 through November (up to 77.3 percent).
    - 25 – In dry years, similar flows would occur in July through October and  
26 December through March; reduced in April through June (up to  
27 10.1 percent); and increased flows in November (32.1 percent).
  - 28 • Sacramento River near Freeport (near the northern boundary of the Delta)  
29 (Figures 5.59 through 5.61).
    - 30 – Over long-term conditions, flows would be similar in October and  
31 December through April; reduced in May and June (up to 11.5 percent);  
32 and increased in July through September and November (43.4 percent).
    - 33 – In wet years, flows would be similar in October and January through June;  
34 reduced in December (6.2 percent); and increased in July through  
35 September and November (up to 89.0 percent).
    - 36 – In dry years, similar flows would occur in August through October and  
37 December through April; reduced in May and June (up to 13.6 percent);  
38 and increased flows in July and November (up to 19.3 percent).

*Lake Oroville and Feather River*

Storage levels and surface water elevations in Lake Oroville under Alternative 5 as compared to the Second Basis of Comparison are summarized in Tables 5.100 and 5.101. Changes in flows in the Feather River downstream of Thermalito Complex are shown on Figures 5.62 through 5.64. The results are summarized following Table 5.101.

1 The following changes in Lake Oroville storage and surface water elevation  
2 would occur under Alternative 5 as compared to the Second Basis of Comparison.

- 3 • In wet years, storage would be similar in January through August and reduced  
4 in September through December (up to 18.1 percent).
- 5 • In above-normal years, storage would be similar in March through August and  
6 reduced in September through February (up to 14.0 percent).
- 7 • In below-normal years, storage would be similar in May through July and  
8 reduced in August through April (up to 17.1 percent).
- 9 • In dry years, storage would be similar in May and June and reduced in July  
10 through April (up to 11.4 percent).
- 11 • In critical dry years, storage would be similar in all months.
- 12 • Surface water elevations would be similar in all months, in all years.

13 The following changes in Feather River flows would occur under Alternative 5 as  
14 compared to the No Action Alternative, as shown on Figures 5.62 through 5.64.

- 15 • Over long-term conditions, similar flows would occur in November and April;  
16 reduced flows in October, December through March, May, and June (up to  
17 27.7 percent); and increased flows in July through September (up to  
18 76.2 percent).
- 19 • In wet years, similar flows would occur in October, November, March  
20 through May; reduced flows in December through February and June (up to  
21 25.6 percent); and increased flows in July through September (up to  
22 181.9 percent).
- 23 • In dry years, similar flows would occur in November through April; reduced  
24 flows in October, May, June, August, and September (up to 45.4 percent); and  
25 increased flows in July (60.4 percent).

26 *Folsom Lake and American River*

27 Storage levels and surface water elevations in Folsom Lake under Alternative 5 as  
28 compared to the Second Basis of Comparison are summarized in Tables 5.102  
29 and 5.103. Changes in flows in the American River downstream of Nimbus Dam  
30 are shown on Figures 5.65 through 5.67. The results are summarized below  
31 following 5.103.

1 The following changes in Folsom Lake storage and surface water elevation would  
2 occur under Alternative 5 as compared to the Second Basis of Comparison.

- 3 • In wet years, storage would be similar in December through July and reduced  
4 in August through November (up to 7.4 percent).
- 5 • In above normal years, storage would be similar in January through June,  
6 August, and October; reduced in September, November, and December (up to  
7 8.3 percent); and increased in July (5.4 percent).
- 8 • In below normal years, storage would be similar in February through May;  
9 reduced in August through January (up to 13.2 percent); and increased in June  
10 and July (up to 10.2 percent).
- 11 • In dry years, storage would be similar in all months.
- 12 • In critical dry years, storage would be similar in August and June and reduced  
13 in July (8.0 percent).
- 14 • Surface water elevations would be similar in all months, in all years.

15 The following changes in American River flows would occur under Alternative 5  
16 as compared to the Second Basis of Comparison, as shown on Figures 5.62  
17 through 5.64.

- 18 • Over long-term conditions, similar flows would occur in November through  
19 July; reduced flows in August (5.8 percent) and increased in September and  
20 October (42.4 percent).
- 21 • In wet years, similar flows would occur in October, November, and January  
22 through July; reduced flows in December and August (up to 13.7 percent);  
23 and increased flows in September (88.2 percent).
- 24 • In dry years, similar flows would occur in November through September and  
25 increased flows in October (16.7 percent).

#### 26 *Clear Creek*

27 Changes in flows in Clear Creek downstream of Whiskeytown Dam are  
28 summarized in Table 5.104.

29 Monthly Clear Creek flows under Alternative 5 as compared to the Second Basis  
30 of Comparison are identical except in May. In May, under Alternative 5, flows  
31 are up to 40.7 percent higher than under the Second Basis of Comparison.

3 *New Melones Reservoir and Stanislaus River*  
 4 Storage levels and surface water elevations in New Melones Reservoir under  
 5 Alternative 5 as compared to the Second Basis of Comparison are summarized in  
 6 Tables 5.105 and 5.106. Changes in flows in the Stanislaus River downstream of  
 7 Goodwin Dam are shown on Figures 5.68 through 5.70. The results are  
 8 summarized following Table 5.106.

The following changes in New Melones Reservoir storage would occur under Alternative 5 as compared to the Second Basis of Comparison.

- In wet years, storage would be reduced in all months (up to 9.3 percent).
- In above-normal years, storage would be reduced in all months (up to 9.9 percent).
- In below-normal years, storage would be reduced in all months (up to 13.1 percent).
- In dry years, storage would be reduced in all months (up to 14.3 percent).

- 1 • In critical dry years, storage would be reduced in all months (up to  
2 23.2 percent).
- 3 • Surface water elevations would be similar in all months, in all water year  
4 types.
- 5 Flows in the Stanislaus River downstream of Goodwin Dam are shown on  
6 Figures 5.68 to 5.70. Changes in flows in the river are summarized below.
- 7 • Over long-term conditions, similar flows would occur in August; reduced  
8 flows would occur in November through February, June, July, August, and  
9 September (up to 35.8 percent) and increased flows in October and March  
10 through May (up to 144.8 percent).
- 11 • In wet years, similar flows would occur in February and April; reduced flows  
12 in November through January and June through September (up to  
13 52.8 percent) and increased flows in October and March (up to 113.1 percent).
- 14 • In dry years, similar flows would occur in July through September; reduced  
15 flows in November through March and June (up to 35.7 percent); and  
16 increased flows in October, April, and May (150.1 percent).

17 *San Joaquin River at Vernalis*

18 Flows in the San Joaquin River at Vernalis under Alternative 5 as compared to the  
19 Second Basis of Comparison are summarized below, as shown on Figures 5.71  
20 through 5.73.

- 21 • Over long-term conditions, similar flows would occur in November through  
22 March, May, and July through September; reduced flows in June  
23 (8.2 percent); and increased flows in October and April (18.7 percent).
- 24 • In wet years, similar flows would occur in November through May and July  
25 through September; reduced flows in June (9.8 percent); and increased flows  
26 in October (16.2 percent).
- 27 • In dry years, similar flows would occur in November through March and June  
28 through September and increased flows in October, April, and May (up to  
29 24.5 percent).

30 *San Luis Reservoir*

31 Storage levels and surface water elevations in San Luis Reservoir under  
32 Alternative 5 as compared to the Second Basis of Comparison are summarized in  
33 Tables 5.107 and 5.108. The results are summarized following Table 5.108.

1 The following changes in San Luis Reservoir storage and surface water elevations  
2 would occur under Alternative 5 as compared to the Second Basis of Comparison.

- 3 • In wet years, storage would be reduced in all months (up to 48.9 percent).  
4 Surface water elevations would be similar in September and March and  
5 reduced in October through February and April through August (up to  
6 9.9 percent).
- 7 • In above-normal years, storage would be reduced in all months (up to  
8 59.3 percent). Surface water elevations would be similar in September and  
9 reduced in October through August (up to 12.9 percent).
- 10 • In below-normal years, storage would be reduced in all months (up to  
11 70.0 percent). Surface water elevations would be similar in September and  
12 reduced in October through August (up to 16.7 percent).
- 13 • In dry years, storage would be reduced in all months (up to 51.4 percent).  
14 Surface water elevations would be similar in October through December and  
15 reduced in January through September (up to 13.9 percent).
- 16 • In critical dry years, storage would be reduced in all months (46.3 percent).  
17 Surface water elevations would be reduced in all months (up to 13.5 percent).

18 *Changes in Flows into the Yolo Bypass*

19 Flows from the Sacramento River into the Yolo Bypass at Fremont Weir under  
20 Alternative 5 as compared to the Second Basis of Comparison are summarized in  
21 Table 5.109. The results are summarized following Table 5.109.

1  
2

1 The following changes in flows from the Sacramento River into the Yolo Bypass  
2 at Fremont Weir would occur under Alternative 5 as compared to the Second  
3 Basis of Comparison.

- 4 • In wet years, flows would be similar in February through September; reduced  
5 flows in November through January (up to 15.0 percent); and increased in  
6 October (15.8 percent).
- 7 • In above-normal years, flows would be similar in April through December and  
8 reduced flows in January through March (up to 14.8 percent).
- 9 • In below-normal years, flows would be similar in April through November  
10 and reduced flows in December through March (up to 24.0 percent).
- 11 • In dry years, flows would be similar in January through November and  
12 reduced flows in December (up to 7.4 percent).
- 13 • In critical dry years, flows would be similar in all months.

14 *Changes in Delta Conditions*

15 Delta outflow under Alternative 5 as compared to the Second Basis of  
16 Comparison are summarized below and shown on Figures 5.74 through 5.76.

- 17 • In wet years, average monthly Delta outflow would be increased in July  
18 through November, January, and April and May (up to 13,666 cfs) and  
19 reduced in December, February, March, and June (up to 1,713 cfs).
- 20 • In dry years, average monthly Delta outflow would be increased in July  
21 through May (up to 3,384 cfs) and reduced in June (526 cfs).

22 *Changes in OMR Flows*

23 The OMR conditions under Alternative 5 as compared to the Second Basis of  
24 Comparison are shown on Figures 5.77 through 5.79.

- 25 • Under Alternative 5, OMR flows would be negative except in April and May  
26 of all water year types. Under the Second Basis of Comparison, OMR flows  
27 would be negative in all months.
- 28 • In wet years, OMR flows would be more positive in September through  
29 February, April and May (up to 10,017 cfs) and more negative in March and  
30 June through August (up to 964 cfs).
- 31 • In dry years, OMR flows would be more positive in September through June  
32 (up to 4,724 cfs) and more negative in July and August (up to 2,620 cfs).

33 *Changes in CVP and SWP Exports and Deliveries*

34 Delta exports under Alternative 5 as compared to the Second Basis of Comparison  
35 are summarized in Table 5.110.

1  
2

- 1 The following changes would occur in CVP and SWP exports under Alternative 5  
2 as compared to the Second Basis of Comparison.
- 3 • Long-term average annual exports would be 1,096 TAF (19 percent) less  
4 under Alternative 5 as compared to the Second Basis of Comparison.
  - 5 • In wet years, total exports would be similar in June and September; increased  
6 exports in March, July, and August (up to 9.6 percent); and reduced in  
7 October through February, April, and May (up to 57.6 percent).
  - 8 • In above-normal years, total exports would be similar in July and September;  
9 increased exports in August (8.9 percent); and reduced in October through  
10 June (up to 74.7 percent).
  - 11 • In below-normal years, total exports would be similar in September; increased  
12 exports in July and August (up to 22.3 percent); and reduced in October  
13 through June (up to 82.0 percent).
  - 14 • In dry years, total exports would be similar in August and September;  
15 increased in July (43.2 percent); and reduced exports in October through June  
16 (up to 81.8 percent).
  - 17 • In critical dry years, total exports would be similar in September; increased in  
18 July and August (up to 72.3 percent); and reduced exports in October through  
19 June (up to 83.2 percent).
- 20 Deliveries to CVP and SWP water users would decline under Alternative 5 as  
21 compared to the Second Basis of Comparison, as summarized in Tables 5.111 and  
22 5.112, respectively, due to reduced water supply availability and export  
23 limitations.

1 **Table 5.111 Changes CVP Water Deliveries under Alternative 5 as Compared to the**  
 2 **Second Basis of Comparison**

Annual Average Deliveries (TAF)					
		Alternative 5	Second Basis of Comparison	Alternative 5 as compared to the Second Basis of Comparison

CVP Water Service Contracts	Long Term	100	118	-19	-16
	Dry	69	98	-29	-30
	Critical Dry	8	25	-17	-68

Annual Average Deliveries (TAF)					
		Alternative 5	Second Basis of Comparison	Alternative 5 as compared to the Second Basis of Comparison	
				Difference	Percent Change
Total Water Rights and CVP Service Contracts Deliveries	Long Term	602	632	-30	-5
	Dry	593	622	-29	-5
	Critical Dry	414	511	-97	-19

- 1 The following changes in CVP water deliveries would occur under Alternative 5  
 2 as compared to the Second Basis of Comparison.
- 3 • Deliveries to CVP North of Delta agricultural water service contractors would  
 4 be reduced by 16 percent over the long-term conditions, 30 percent in dry  
 5 years, and 31 percent in critical dry years.
  - 6 • Deliveries to CVP North of Delta M&I contractors would be similar in long-  
 7 term conditions and dry and critical dry years; however, American River  
 8 Contractors would be reduced by 6 percent over the long-term conditions,  
 9 9 percent in dry years, and 8 percent in critical dry years.
  - 10 • Deliveries to CVP South of Delta agricultural water service contractors would  
 11 be reduced by 24 percent over the long-term conditions, 33 percent in dry  
 12 years, and 33 percent in critical dry years.
  - 13 • Deliveries to CVP South of Delta M&I contractors would be reduced by  
 14 10 percent in long-term conditions, 8 percent in dry years, and 6 percent in  
 15 critical dry years.
  - 16 • Deliveries to the Eastside contractors would be reduced by 5 percent under  
 17 long-term conditions and dry years and 19 percent in critical dry years.

	Dry	1,845	2,299	-454	-20
	Critical Dry	1,526	1,978	-452	-23
Total SWP Agricultural and M&I Article 21 Deliveries	Long Term	43	282	-239	-85
	Dry	11	229	-218	-95
	Critical Dry	7	158	-151	-95

- 1 The following changes in SWP water deliveries would occur under Alternative 5  
2 as compared to the Second Basis of Comparison.
- 3 • Deliveries without Article 21 water to SWP North of Delta water contractors  
4 would be reduced by 19 percent over the long-term conditions, 18 percent in  
5 dry years, and 21 percent in critical dry years.
  - 6 • Deliveries without Article 21 water to SWP South of Delta water contractors  
7 would be reduced by 19 percent over the long-term conditions, 20 percent in  
8 dry years, and 23 percent in critical dry years.

- 1 • Deliveries of Article 21 water to SWP North of Delta water contractors would  
2 be increased by 13 percent over the long-term conditions, 11 percent in dry  
3 years, and 15 percent in critical dry years.
- 4 • Deliveries of Article 21 water to SWP South of Delta water contractors would  
5 be reduced by 85 percent over the long-term conditions, 95 percent in dry  
6 years, and 95 percent in critical dry years.

7 *Effects Related to Cross Delta Water Transfers*

8 Potential effects to surface water resources could be similar to those identified in  
9 a recent environmental analysis conducted by Reclamation for long-term water  
10 transfers from the Sacramento to San Joaquin valleys (Reclamation 2014i).  
11 Potential effects were identified as reduced surface water storage in upstream  
12 reservoirs and changes in flow patterns in river downstream of the reservoirs if  
13 water was released from the reservoirs in patterns that were different than would  
14 have been used by the water seller's. Because all water transfers would be  
15 required to avoid adverse impacts to other water users and biological resources  
16 (see Section 3.A.6.3, Transfers), including impacts associated with changes in  
17 reservoir storage and river flow patterns, the analysis indicated that water  
18 transfers would not result in substantial changes in storage or river flows. For the  
19 purposes of this EIS, it is anticipated that similar conditions would occur due to  
20 cross Delta water transfers under Alternative 5 and the Second Basis of  
21 Comparison.

22 Under Alternative 5, the timing of cross Delta water transfers would be limited to  
23 July through September in accordance with the 2008 USFWS BO and 2009  
24 NMFS BO. The maximum amount of water to be transferred would be  
25 600,000 acre-feet per year in critical dry years or in dry years following a dry or  
26 critical dry year. In all other water year types, the maximum amount of water  
27 would be 360,000 acre-feet per year. The maximum amount of water that can be  
28 exported in the CVP and SWP facilities is approximately 770,000 acre-feet per  
29 month. As indicated in Table 5.110, capacity would be available under  
30 Alternative 5 between July and September for water transfers in all water year  
31 types.

32 Under the Second Basis of Comparison, water could be transferred throughout the  
33 year. As indicated in Table 5.110, capacity would be available under the Second  
34 Basis of Comparison in all months of all water year types without a maximum  
35 volume of transferred water.

36 Overall, the potential for water transfer conveyance would be less under  
37 Alternative 5 than under the Second Basis of Comparison.

38 *San Francisco Bay Area, Central Coast, and Southern California Regions*

39 *Potential Changes in Surface Water Resources at Reservoirs that Store CVP*  
40 *and SWP Water*

41 The San Francisco Bay Area, Central Coast, and Southern California regions  
42 include numerous reservoirs that store CVP and SWP water supplies, including  
43 CVP and SWP reservoirs, that primarily provide water supplies for M&I water

1 users. Changes in the availability CVP and SWP water supplies for storage in  
 2 these reservoirs under Alternative 5 as compared to the Second Basis of  
 3 Comparison would be consistent with the following changes in water deliveries to  
 4 M&I water users, as summarized in Tables 5.111 and 5.112.

- 5 • Deliveries to CVP South of Delta M&I contractors would be reduced by  
 6 10 percent in long-term conditions, 9 percent in dry years, and 8 percent in  
 7 critical dry years.
- 8 • Deliveries without Article 21 water to SWP South of Delta water contractors  
 9 would be reduced by 19 percent over the long-term conditions, 20 percent in  
 10 dry years, and 23 percent in critical dry years.
- 11 • Deliveries of Article 21 water to SWP South of Delta water contractors would  
 12 be reduced by 85 percent over the long-term conditions, 95 percent in dry  
 13 years, and 95 percent in critical dry years.

14 *Changes in CVP and SWP Exports and Deliveries*

15 Deliveries to CVP and SWP water users are described above in the Central Valley  
 16 Region.

17 **5.4.3.7 Summary of Impact Analysis**

18 The results of the impact analysis on surface water conditions and water supplies  
 19 due to implementation of Alternatives 1 through 5 as compared to the No Action  
 20 Alternative and the Second Basis of Comparison are presented in Tables 5.113  
 21 through 5.116.

22 **Table 5.113 Comparison of Surface Water Conditions under Alternatives 1**  
 23 **through 5 to the No Action Alternative**

Alternative	Potential Change	Consideration for Mitigation Measures
Alternative 1	<p><b>Trinity Lake</b>                      In wet years and dry years, storage would be similar in all months.                      In above-normal years, storage would be similar in January through October and increased in November and December (up to 6 percent).                      In below-normal years, storage would be similar in January through October and increased in November and December (up to 5 percent).                      In critical dry years, storage would be increased in all months (up to 12 percent).                      In all months, in all water year types, surface water elevations would be similar.</p> <p><b>Trinity River downstream of Lewiston Dam</b>                      Over long-term conditions, flows would be similar in March through November; and increased in December through February (up to 11 percent).                      In wet years, flows would be similar in April through November and increased in December through March (up to 13 percent).                      In dry years, flows would be similar all months.</p> <p><b>Shasta Lake</b>                      In wet years, storage would be similar in December through August and October and increased in September and November (up to 9 percent).</p>	<p>Environmental effects associated with changes in the following physical conditions are related to impacts on biological resources (as described in Chapter 9, Fish and Aquatic Resources, and Chapter 10, Terrestrial Biological Resources), and recreation resources (as described in Chapter 15, Recreation Resources).                      Mitigation measures, if needed, related to environmental changes caused by changes in surface water conditions are presented in Chapters 9, 10, and 15.</p>

Alternative	Potential Change	Consideration for Mitigation Measures
	<p>In above-normal years, storage would be similar in January through September and increased in October through December (up to 8 percent).</p> <p>In below-normal years, storage would be similar in March through September and increased in October through February (up to 12 percent).</p> <p>In dry years, storage would be similar in February through October and increased in November through January (up to 7 percent).</p> <p>In critical dry years, storage would be increased under all months (up to 17 percent).</p> <p>In all months, in all water year types, surface water elevations would be similar.</p> <p><b>Sacramento River at Keswick</b></p> <p>Over long-term conditions, similar flows would occur in October, February through May, July, and August; reduced flows in September and November (up to 27 percent); and increased flows in December, January, and June (up to 8 percent).</p> <p>In wet years, similar flows would occur in January through July; reduced flows in September through November (up to 44 percent); and increased flows in December and August (up to 17 percent).</p> <p>In dry years, similar flows would occur in July through October, December through March, and May; reduced flows in November (25 percent); and increased flows in April and June (up to 8 percent).</p> <p><b>Sacramento River at Freeport</b></p> <p>Over long-term conditions, similar flows would occur in October, December through May, and August; reduced flows in September, November, and July (up to 30 percent); and increased flows in June (13 percent).</p> <p>In wet years, similar flows would occur in January through June and October; reduced flows in July through September and November (up to 47 percent); and increased flows in December (7 percent).</p> <p>In dry years, similar flows would occur in August through October and December through April; reduced flows in November and July (up to 14 percent); and increased flows in May and June (up to 14 percent).</p> <p><b>Lake Oroville</b></p> <p>In wet years, storage would be similar in January through August and reduced in September through December (up to 22 percent).</p> <p>In above-normal years, storage would be similar in February through August and reduced in September through January (up to 15 percent).</p> <p>In below-normal years, storage would be similar in May through July and reduced in August through April (up to 22 percent).</p> <p>In dry years, storage would be similar in June and reduced in all other months (up to 14 percent).</p> <p>In critical dry years, storage would be similar under all months.</p> <p>In all months, in all water year types, surface water elevations would be similar.</p> <p><b>Feather River downstream of Thermalito Complex</b></p> <p>Over long-term conditions, similar flows would occur in November and April; reduced flows in July through September (up to 43 percent); and increased flows in October, December through March, May, and June (up to 37 percent).</p>	

Chapter 5: Surface Water Resources and Water Supplies

Alternative	Potential Change	Consideration for Mitigation Measures
	<p>In wet years, similar flows would occur in October, November, and March through May; reduced flows in July through September (up to 65 percent); and increased flows in December through February and June (up to 35 percent).</p> <p>In dry years, similar flows would occur in December through April; reduced flows in July (34 percent); and increased flows in August through October, May, and June (up to 38 percent).</p> <p><b>Folsom Lake</b></p> <p>In wet years, storage would be similar in December through August; and increased in September through December (up to 12 percent).</p> <p>In above-normal years, storage would be similar in January through July and September through October; increased in November and December (up to 9 percent); and reduced in August (5 percent).</p> <p>In below-normal years, storage would be similar in February through May; reduced in June through September (up to 15 percent); and increased in October through January (up to 14 percent).</p> <p>In dry years, storage would be similar in all months.</p> <p>In critical dry years, storage would be similar in October through June and increased in July through September (up to 12 percent).</p> <p>In all months, in all water year types, surface water elevations would be similar.</p> <p><b>American River downstream of Nimbus Dam</b></p> <p>Over long-term conditions, similar flows would occur in November through May and July; reduced flows in September and October (up to 31 percent); and increased flows in June (5 percent).</p> <p>In wet years, similar flows would occur in October, November, and January through July; reduced flows in September (48 percent); and increased flows in August (12 percent).</p> <p>In dry years, similar flows would occur in November through January, March through June, August, and September; reduced flows in October (14 percent); and increased flows in February and July (up to 8 percent).</p> <p><b>Clear Creek downstream of Whiskeytown Dam</b></p> <p>Flows identical June through April and reduced in May (41 percent).</p> <p><b>New Melones Reservoir</b></p> <p>In wet years, storage would be similar in all months.</p> <p>In above normal years, storage would be similar in December through September and increased in October and November (up to 6 percent).</p> <p>In below normal years, storage would be similar in November through September and increased in October (5 percent).</p> <p>In dry years, storage would be similar in all months.</p> <p>In critical dry years, storage would be similar in July through September and increased in October through June (up to 8 percent).</p> <p>In all months, in all water year types, surface water elevations would be similar.</p> <p><b>Stanislaus River downstream of Goodwin Dam</b></p> <p>Over long-term conditions, similar flows would occur in July through September; reduced flows in October, March, and April (up to 60 percent); and increased flows in November through February and June (up to 51 percent).</p>	

Alternative	Potential Change	Consideration for Mitigation Measures
	<p>In wet years, similar flows would occur in February and April; reduced flows in October, March, May, July, and August (up to 54 percent); and increased flows in September, November through January, and June (up to 103 percent).</p> <p>In dry years, similar flows would occur in July through September; reduced flows in October and April (up to 61 percent); and increased flows in November through March, May, and June (up to 56 percent).</p> <p><b>San Joaquin River at Vernalis</b></p> <p>Over long-term conditions, similar flows would occur in July through September and November through May; reduced flows in October (16 percent); and increased flows in June (8 percent).</p> <p>In wet years, similar flows would occur in July through September and November through May; reduced flows in October (14 percent); and increased flows in June (10 percent).</p> <p>In dry years, similar flows would occur in November through March and May through September and reduced flows in October and April (up to 15 percent).</p> <p><b>San Luis Reservoir</b></p> <p>In wet years, storage would be increased in all months (up to 109 percent). Water storage elevations would be increased in all months (up to 12 percent).</p> <p>In above-normal years, storage would be increased in all months (up to 151 percent). Water storage elevations would be increased in all months (up to 15 percent).</p> <p>In below-normal years, storage would be increased in all months (up to 203 percent). Water storage elevations would be increased in all months (up to 19 percent).</p> <p>In dry years, storage would be increased in all months (up to 70 percent). Water storage elevations would be increased in all months (up to 12 percent).</p> <p>In critical dry years, storage would be increased in all months (up to 57 percent). Water storage elevations would be increased in all months (up to 11 percent).</p> <p><b>Yolo Bypass</b></p> <p>In wet years, flows into Yolo Bypass would be similar in January through September; reduced in October (20 percent); and increased in November and December (up to 17 percent).</p> <p>In above-normal years, flows into Yolo Bypass would be similar in April through December and increased in January through March (up to 16 percent).</p> <p>In below-normal years, flows into Yolo Bypass would be similar in April through November and increased in December through March (up to 34 percent).</p> <p>In dry years, flows into Yolo Bypass would be similar in January through November and increased in December (6 percent).</p> <p>In critical dry years, flows into Yolo Bypass would be similar in all months.</p> <p><b>Delta Outflow</b></p> <p>In wet years, average monthly Delta outflow would increase in December, February, March, and June (up to 1,492 cfs) and decrease in July through November, January, April, and May (up to 13,683 cfs).</p> <p>In dry years, average monthly Delta outflow would be similar in September; decrease in July, August, and October through May (up to 3,114 cfs); and increase in June (385 cfs).</p>	

Chapter 5: Surface Water Resources and Water Supplies

Alternative	Potential Change	Consideration for Mitigation Measures
	<p><b>Reverse Flows in Old and Middle Rivers</b></p> <p>In wet years, average monthly OMR flows, would be more positive in June through August and March (up to 923 cfs) and more negative in April through June and September through February (up to 10,005 cfs).</p> <p>In dry years, average monthly OMR flows would be positive in July (up to 2,073 cfs) and more negative in August through June (up to 3,489 cfs).</p>	
Alternative 2	Surface water conditions identical under Alternative 2 as under No Action Alternative.	None needed.
Alternative 3	<p><b>Trinity Lake</b></p> <p>In wet, above-normal years, below normal, and dry years, storage would be similar in all months.</p> <p>In critical dry years, storage would be increased in all months (up to 12 percent).</p> <p>In all months, in all water year types, surface water elevations would be similar.</p> <p><b>Trinity River downstream of Lewiston Dam</b></p> <p>Over long-term conditions, flows would be similar in March through November; and increased in December through February (up to 12 percent).</p> <p>In wet years, flows would be similar in April through October; reduced in November (7 percent); and increased in December through March (up to 15 percent).</p> <p>In dry years, flows would be similar in all months.</p> <p><b>Shasta Lake</b></p> <p>In wet years, storage would be similar in December through August and increased in September and November (up to 9 percent).</p> <p>In above-normal years, storage would be similar in January through October and increased in November and December (up to 7 percent).</p> <p>In below-normal years, storage would be similar in March through September; and increased in October through February (up to 12 percent).</p> <p>In dry years, storage would be similar in March through October and increased in November through January (up to 7 percent).</p> <p>In critical dry years, storage would increase in all months (up to 12 percent).</p> <p>In all months, in all water year types, surface water elevations would be similar.</p> <p><b>Sacramento River at Keswick</b></p> <p>Over long-term conditions, similar flows would occur in October, February through May, July, and August; reduced flows in September and November (up to 20 percent); and increased flows in December, January, and June (up to 9 percent).</p> <p>In wet years, similar flows would occur in February through August; reduced flows in September through November (up to 42 percent); and increased flows in December and January (up to 17 percent).</p> <p>In dry years, similar flows would occur in July through September and December through May; reduced flows in November (25 percent) and increased flows in January and June (up to 7 percent).</p> <p><b>Sacramento River at Freeport</b></p> <p>Over long-term conditions, similar flows would occur in October, December through May, July, and August; reduced flows in September and November (up to 30 percent); and increased flows in June (12 percent).</p>	<p>Environmental effects associated with changes in the following physical conditions are related to impacts on biological resources (as described in Chapter 9, Fish and Aquatic Resources, and Chapter 10, Terrestrial Biological Resources), and recreation resources (as described in Chapter 15, Recreation Resources).</p> <p>Mitigation measures, if needed, related to environmental changes caused by changes in surface water conditions are presented in Chapters 9, 10, and 15.</p>

Alternative	Potential Change	Consideration for Mitigation Measures
	<p>In wet years, similar flows would occur in January through May, July, and October; reduced flows in August, September, and November (up to 48.1 percent); and increased flows in December and June (up to 7 percent).</p> <p>In dry years, similar flows would occur in July through October and December through April; reduced flows in November (14 percent); and increased flows in May and June (up to 16 percent).</p> <p><b>Lake Oroville</b></p> <p>In wet years, storage would be similar in January through August and increased in September through December (up to 19 percent).</p> <p>In above-normal years, storage would be similar in February through August; and increased in September through January (up to 19 percent).</p> <p>In below-normal years, storage would be similar in June through September; and increased in October through May (up to 23 percent).</p> <p>In dry years, storage would be similar in May through September and increased in October through April (up to 12 percent).</p> <p>In critical dry years, storage would be similar under all months.</p> <p>In all months, in all water year types, surface water elevations would be similar.</p> <p><b>Feather River downstream of Thermalito Complex</b></p> <p>Over long-term conditions, similar flows would occur in October, November, March, April, and July; reduced flows in August and September (up to 49 percent); and increased flows in December through February, May, and June (up to 34 percent).</p> <p>In wet years, similar flows would occur in October, November, February through May, and July; reduced flows in August and September (up to 70 percent) and increased flows in December, January, and June (up to 28 percent).</p> <p>In dry years, similar flows would occur in September and January through April; reduced flows in October through December and July (up to 14 percent); and increased flows in May, June, and August (37 percent).</p> <p><b>Folsom Lake</b></p> <p>In wet years, storage would be similar in December through August and increased in September through December (up to 12 percent).</p> <p>In above-normal years, storage would be similar in January through June, September, and October; increased in November and December (up to 6 percent); and reduced in July and August (up to 7 percent).</p> <p>In below-normal years, storage would be similar in February through July; reduced in August and September (up to 10 percent); and increased in October through January (up to 15 percent).</p> <p>In dry years, storage would be similar in all months.</p> <p>In critical dry years, storage would be similar in October through July and increased in August and September (up to 12 percent).</p> <p>In all months, in all water year types, surface water elevations would be similar.</p> <p><b>American River downstream of Nimbus Dam</b></p> <p>Over long-term conditions, similar flows would occur in November, January through May, July, and August; reduced flows in September and October (up to 29 percent); and increased flows in June (6 percent).</p>	

Chapter 5: Surface Water Resources and Water Supplies

Alternative	Potential Change	Consideration for Mitigation Measures
	<p>In wet years, similar flows would occur in October, November, and January through July; reduced flows in September (46 percent); and increased flows in August and December (up to 9 percent).</p> <p>In dry years, similar flows would occur in November through January and March through September; reduced flows in October (11 percent); and increased flows in February (6 percent).</p> <p><b>Clear Creek downstream of Whiskeytown Dam</b> Flows would be identical June through April and reduced in May (29 percent).</p> <p><b>New Melones Reservoir</b> In wet years, storage would be increased in all months (up to 13 percent). In above-normal years, storage would be increased in all months (up to 23 percent). In below-normal years, storage would be increased in all months (up to 20 percent). In dry years, storage would be increased in all months (up to 25 percent). In critical dry years, storage would be increased in all months (up to 38 percent). In all months, in all water year types, surface water elevations would be similar.</p> <p><b>Stanislaus River downstream of Goodwin Dam</b> Over long-term conditions, reduced flows would occur in October and March through June (up to 58 percent) and increased flows in November through February and July through September (up to 37 percent). In wet years, similar flows would occur in April; reduced flows in October, March, and May (up to 53 percent) and increased flows in June through September and November through February (up to 68 percent). In dry years, similar flows would occur in March and July through September; reduced flows in October and April through June (up to 60 percent); and increased flows in November through February (up to 37 percent).</p> <p><b>San Joaquin River at Vernalis</b> Over long-term conditions, similar flows would occur in November through September and reduced flows in October (16 percent). In wet years, similar flows would occur in November through August; reduced flows in October (14 percent); and increased flows in September (6 percent). In dry years, similar flows would occur in November through March and July through September and reduced flows in October and April through June (up to 15 percent).</p> <p><b>San Luis Reservoir</b> In wet years, storage would be increased in all months (up to 96 percent). Water storage elevations would be increased in all months (up to 13 percent). In above-normal years, storage would be increased in all months (up to 111 percent). Water storage elevations would be similar in October through March and increased in April through September (up to 11 percent). In below-normal years, storage would be increased in all months (up to 107 percent). Water storage elevations would be similar in September and increased in October through August (up to 11 percent).</p>	

Alternative	Potential Change	Consideration for Mitigation Measures
	<p>In dry years, storage would be similar in September; and increased in October through August (up to 52 percent). Water storage elevations would be similar December through May and July through October and increased in November and June (up to 7 percent).</p> <p>In critical dry years, storage would be similar in February through May and increased in June through January (up to 29 percent). Water storage elevations would be similar in all months.</p> <p><b>Yolo Bypass</b></p> <p>In wet years, flows into Yolo Bypass would be similar in January through September; reduced in October (25 percent); and increased in November and December (up to 15 percent).</p> <p>In above-normal years, storage would be similar in April through January and increased in February and March (up to 17 percent).</p> <p>In below-normal years, flows into Yolo Bypass would be similar in April through November and increased in December through March (up to 32 percent).</p> <p>In dry years, flows into Yolo Bypass would be similar in January through November and increased in December (6 percent).</p> <p>In critical dry years, flows into Yolo Bypass would be similar in all months.</p> <p><b>Delta Outflow</b></p> <p>In wet years, average monthly Delta outflow would increase in December through March (up to 3,307 cfs) and decrease in April through November (up to 13,678 cfs).</p> <p>In dry years, average monthly Delta outflow would increase in January, February, June, and July (up to 277 cfs) and decrease in August through December and March through May (up to 2,902 cfs).</p> <p><b>Reverse Flows in Old and Middle Rivers</b></p> <p>In wet years, average monthly OMR flows would be more positive in July and August (up to 800 cfs) and more negative in September through June (up to 4,477 cfs).</p> <p>In dry years, average monthly OMR flows would be more positive in July and January (up to 728 cfs) and more negative in August through December and February through June (up to 1,847 cfs).</p>	
Alternative 4	<p><b>Trinity Lake</b></p> <p>In wet years and dry years, storage would be similar in all months.</p> <p>In above-normal years, storage would be similar in January through October and increased in November and December (up to 6 percent).</p> <p>In below-normal years, storage would be similar in January through October and increased in November and December (up to 5 percent).</p> <p>In critical dry years, storage would be increased in all months (up to 12 percent).</p> <p>In all months, in all water year types, surface water elevations would be similar.</p> <p><b>Trinity River downstream of Lewiston Dam</b></p> <p>Over long-term conditions, flows would be similar in March through November; and increased in December through February (up to 11 percent).</p> <p>In wet years, flows would be similar in April through November and increased in December through March (up to 13 percent).</p> <p>In dry years, flows would be similar all months.</p>	<p>Environmental effects associated with changes in the following physical conditions are related to impacts on biological resources (as described in Chapter 9, Fish and Aquatic Resources, and Chapter 10, Terrestrial Biological Resources), and recreation resources (as described in Chapter 15, Recreation Resources).</p> <p>Mitigation measures, if needed, related to environmental changes caused by changes in surface water conditions are presented in Chapters 9, 10, and 15.</p>

Chapter 5: Surface Water Resources and Water Supplies

Alternative	Potential Change	Consideration for Mitigation Measures
	<p><b>Shasta Lake</b></p> <p>In wet years, storage would be similar in December through August and October and increased in September and November (up to 9 percent).</p> <p>In above-normal years, storage would be similar in January through September and increased in October through December (up to 8 percent).</p> <p>In below-normal years, storage would be similar in March through September and increased in October through February (up to 12 percent).</p> <p>In dry years, storage would be similar in February through October and increased in November through January (up to 7 percent).</p> <p>In critical dry years, storage would be increased under all months (up to 17 percent).</p> <p>In all months, in all water year types, surface water elevations would be similar.</p> <p><b>Sacramento River at Keswick</b></p> <p>Over long-term conditions, similar flows would occur in October, February through May, July, and August; reduced flows in September and November (up to 27 percent); and increased flows in December, January, and June (up to 8 percent).</p> <p>In wet years, similar flows would occur in January through July; reduced flows in September through November (up to 44 percent); and increased flows in December and August (up to 17 percent).</p> <p>In dry years, similar flows would occur in July through October, December through March, and May; reduced flows in November (25 percent); and increased flows in April and June (up to 8 percent).</p> <p><b>Sacramento River at Freeport</b></p> <p>Over long-term conditions, similar flows would occur in October, December through May, and August; reduced flows in September, November, and July (up to 30 percent); and increased flows in June (13 percent).</p> <p>In wet years, similar flows would occur in January through June and October; reduced flows in July through September and November (up to 47 percent); and increased flows in December (7 percent).</p> <p>In dry years, similar flows would occur in August through October and December through April; reduced flows in November and July (up to 14 percent); and increased flows in May and June (up to 14 percent).</p> <p><b>Lake Oroville</b></p> <p>In wet years, storage would be similar in January through August and reduced in September through December (up to 22 percent).</p> <p>In above-normal years, storage would be similar in February through August and reduced in September through January (up to 15 percent).</p> <p>In below-normal years, storage would be similar in May through July and reduced in August through April (up to 22 percent).</p> <p>In dry years, storage would be similar in June and reduced in all other months (up to 14 percent).</p> <p>In critical dry years, storage would be similar under all months.</p> <p>In all months, in all water year types, surface water elevations would be similar.</p>	

Alternative	Potential Change	Consideration for Mitigation Measures
	<p><b>Feather River downstream of Thermalito Complex</b>                      Over long-term conditions, similar flows would occur in November and April; reduced flows in July through September (up to 43 percent); and increased flows in October, December through March, May, and June (up to 37 percent).                      In wet years, similar flows would occur in October, November, and March through May; reduced flows in July through September (up to 65 percent); and increased flows in December through February and June (up to 35 percent).                      In dry years, similar flows would occur in December through April; reduced flows in July (34 percent); and increased flows in August through October, May, and June (up to 38 percent).</p> <p><b>Folsom Lake</b>                      In wet years, storage would be similar in December through August; and increased in September through December (up to 12 percent).                      In above-normal years, storage would be similar in January through July and September through October; increased in November and December (up to 9 percent); and reduced in August (5 percent).                      In below-normal years, storage would be similar in February through May; reduced in June through September (up to 15 percent); and increased in October through January (up to 14 percent).                      In dry years, storage would be similar in all months.                      In critical dry years, storage would be similar in October through June and increased in July through September (up to 12 percent).                      In all months, in all water year types, surface water elevations would be similar.</p> <p><b>American River downstream of Nimbus Dam</b>                      Over long-term conditions, similar flows would occur in November through May and July; reduced flows in September and October (up to 31 percent); and increased flows in June (5 percent).                      In wet years, similar flows would occur in October, November, and January through July; reduced flows in September (48 percent); and increased flows in August (12 percent).                      In dry years, similar flows would occur in November through January, March through June, August, and September; reduced flows in October (14 percent); and increased flows in February and July (up to 8 percent).</p> <p><b>Clear Creek downstream of Whiskeytown Dam</b>                      Flows identical June through April and reduced in May (41 percent).</p> <p><b>New Melones Reservoir</b>                      In wet years, storage would be similar in all months.                      In above normal years, storage would be similar in December through September and increased in October and November (up to 6 percent).                      In below normal years, storage would be similar in November through September and increased in October (5 percent).                      In dry years, storage would be similar in all months.                      In critical dry years, storage would be similar in July through September and increased in October through June (up to 8 percent).</p>	

Alternative	Potential Change	Consideration for Mitigation Measures
	<p>In all months, in all water year types, surface water elevations would be similar.</p> <p><b>Stanislaus River downstream of Goodwin Dam</b>                      Over long-term conditions, similar flows would occur in July through September; reduced flows in October, March, and April (up to 60 percent); and increased flows in November through February and June (up to 51 percent).                      In wet years, similar flows would occur in February and April; reduced flows in October, March, May, July, and August (up to 54 percent); and increased flows in September, November through January, and June (up to 103 percent).                      In dry years, similar flows would occur in July through September; reduced flows in October and April (up to 61 percent); and increased flows in November through March, May, and June (up to 56 percent).</p> <p><b>San Joaquin River at Vernalis</b>                      Over long-term conditions, similar flows would occur in July through September and November through May; reduced flows in October (16 percent); and increased flows in June (8 percent).                      In wet years, similar flows would occur in July through September and November through May; reduced flows in October (14 percent); and increased flows in June (10 percent).                      In dry years, similar flows would occur in November through March and May through September and reduced flows in October and April (up to 15 percent).</p> <p><b>San Luis Reservoir</b>                      In wet years, storage would be increased in all months (up to 109 percent). Water storage elevations would be increased in all months (up to 12 percent).                      In above-normal years, storage would be increased in all months (up to 151 percent). Water storage elevations would be increased in all months (up to 15 percent).                      In below-normal years, storage would be increased in all months (up to 203 percent). Water storage elevations would be increased in all months (up to 19 percent).                      In dry years, storage would be increased in all months (up to 70 percent). Water storage elevations would be increased in all months (up to 12 percent).                      In critical dry years, storage would be increased in all months (up to 57 percent). Water storage elevations would be increased in all months (up to 11 percent).</p> <p><b>Yolo Bypass</b>                      In wet years, flows into Yolo Bypass would be similar in January through September; reduced in October (20 percent); and increased in November and December (up to 17 percent).                      In above-normal years, flows into Yolo Bypass would be similar in April through December and increased in January through March (up to 16 percent).                      In below-normal years, flows into Yolo Bypass would be similar in April through November and increased in December through March (up to 34 percent).                      In dry years, flows into Yolo Bypass would be similar in January through November and increased in December (6 percent).                      In critical dry years, flows into Yolo Bypass would be similar in all months.</p>	

Alternative	Potential Change	Consideration for Mitigation Measures
	<p><b>Delta Outflow</b>                      In wet years, average monthly Delta outflow would increase in December, February, March, and June (up to 1,492 cfs) and decrease in July through November, January, April, and May (up to 13,683 cfs).                      In dry years, average monthly Delta outflow would be similar in September; decrease in July, August, and October through May (up to 3,114 cfs); and increase in June (385 cfs).</p> <p><b>Reverse Flows in Old and Middle Rivers</b>                      In wet years, average monthly OMR flows, would be more positive in June through August and March (up to 923 cfs) and more negative in April through June and September through February (up to 10,005 cfs).                      In dry years, average monthly OMR flows would be positive in July (up to 2,073 cfs) and more negative in August through June (up to 3,489 cfs).</p>	
Alternative 5	<p><b>Trinity Lake</b>                      Similar storage and surface water elevations in all months and all water year types.</p> <p><b>Trinity River downstream of Lewiston Dam</b>                      Similar flows in all months for long-term conditions and wet and dry years.</p> <p><b>Shasta Lake</b>                      Similar storage and surface water elevations in all months and all water year types.</p> <p><b>Sacramento River at Keswick</b>                      Similar flows in all months for long-term conditions and wet and dry years.</p> <p><b>Sacramento River at Freeport</b>                      Similar flows in all months for long-term conditions and wet and dry years.</p> <p><b>Lake Oroville</b>                      Similar storage and surface water elevations in all months and all water year types.</p> <p><b>Feather River downstream of Thermalito Complex</b>                      Over long-term conditions, similar flows would occur in June through April and reduced flows in May (7 percent).                      In wet years, similar flows would occur in all months.                      In dry years, similar flows would occur in September through April and June; reduced flows in May (27 percent); and increased flows in July and August (up to 9 percent).</p> <p><b>Folsom Lake</b>                      Similar storage and surface water elevations in all months and all water year types.</p> <p><b>American River downstream of Nimbus Dam</b>                      Similar flows in all months for long-term conditions and wet and dry years.</p> <p><b>Clear Creek downstream of Whiskeytown Dam</b>                      Flows would be identical in all months.</p> <p><b>New Melones Reservoir</b>                      In wet years, storage would be similar in all months.                      In above normal years, storage would be similar in October through June and reduced in July through September (up to 6 percent).                      In below normal years, storage would be reduced in all months (up to 9 percent).                      In dry years, storage would be reduced in all months (up to 10 percent).</p>	<p>Environmental effects associated with changes in stream flows and reservoir storage related to fish and aquatic resources, terrestrial resources, and recreation are related to impacts on biological resources (as described in Chapter 9, Fish and Aquatic Resources, and Chapter 10, Terrestrial Biological Resources), and recreation resources (as described in Chapter 15, Recreation Resources).</p> <p>Mitigation measures, if needed, related to environmental changes caused by changes in surface water conditions are presented in Chapters 9, 10, and 15.</p>

Alternative	Potential Change	Consideration for Mitigation Measures
	<p>In critical dry years, storage would be reduced in all months (up to 19 percent).                      In all months, in all water year types, surface water elevations would be similar.</p> <p><b>Stanislaus River downstream of Goodwin Dam</b>                      Over long-term conditions, flows would be similar in September through February and June; reduced flows would occur in March, July, and August (up to 8 percent); and increased flows in April and May (up to 22 percent).                      In wet years, similar flows would occur in October, November, January, February, and April through June and reduced flows in December, March, and July through September (up to 18 percent).                      In dry years, similar flows would occur in June through March and increased flows in April and May (up to 47 percent).</p> <p><b>San Joaquin River at Vernalis</b>                      Over long-term conditions and wet years, similar flows would occur in all months.                      In dry years, similar flows would occur in June through March and increased flows in April and May (up to 16 percent).</p> <p><b>San Luis Reservoir</b>                      In wet years, storage would be similar in January through May and increased in June through December (up to 10 percent).                      In above-normal years, storage would be similar in all months.                      In below-normal years, storage would be similar in November, February through April, August, and September; reduced in June and July (up to 9 percent); and increased in October, December, January, and May (up to 8 percent).                      In dry years, storage would be similar in October through March; and reduced in April through September (up to 17 percent).                      In critical dry years, storage would be similar in February and March and reduced in April through January (up to 18 percent).                      Surface water elevations would be similar in all months, in all water years.</p> <p><b>Yolo Bypass</b>                      Similar flows into the Yolo Bypass in all months and all water year types.</p> <p><b>Delta Outflow</b>                      In wet years, average monthly Delta outflow would be similar.                      In dry years, average monthly Delta outflow would be similar in July through April and increased in May and June (up to 1,377 cfs).</p> <p><b>Reverse Flows in Old and Middle Rivers</b>                      In wet years, OMR flows would be more positive or no change in September, October, January, and April through June (up to 171 cfs) and more negative in November, December, March, and August (up to 124 cfs).                      In dry years, OMR flows would be more positive or no change in October through March (up to 1,359 cfs) and more negative in June through September (up to 568 cfs).</p>	

1 **Table 5.114 Comparison of CVP and SWP Water Supply Deliveries under**  
 2 **Alternatives 1 through 5 to the No Action Alternative**

Alternative	Potential Change	Consideration for Mitigation Measures
Alternative 1	<p>Long-term average annual exports would be 1,051 TAF (22 percent) more under Alternative 1 as compared to the No Action Alternative.</p> <p>Deliveries to CVP North of Delta agricultural water service contractors would be increased by 18 percent over the long-term conditions, 43 percent in dry years, and 50 percent in critical dry years.</p> <p>Deliveries to CVP North of Delta M&amp;I contractors would be similar in total; however, deliveries to the American River CVP contractors would be increased by 6 percent over the long-term conditions, 8 percent in dry years, and 7 percent in critical dry years.</p> <p>Deliveries to CVP South of Delta agricultural water service contractors would be increased by 30 percent over the long-term conditions, 46 percent in dry years, and 49 percent in critical dry years.</p> <p>Deliveries to CVP South of Delta M&amp;I contractors would be increased by 12 percent over the long-term conditions, 10 percent in dry years, and 5 percent in critical dry years.</p> <p>Deliveries to the Eastside contractors would be similar under long-term conditions and in dry years, but increased by 14 percent in critical dry years.</p> <p>Deliveries under Table A contracts without Article 21 water to SWP North of Delta water contractors would be increased by 22 percent over the long-term conditions, 22 percent in dry years, and 25 percent in critical dry years.</p> <p>Deliveries under Table A contracts without Article 21 water to SWP South of Delta water contractors would be increased by 22 percent over the long-term conditions, 24 percent in dry years, and 28 percent in critical dry years.</p>	None needed.
Alternative 2	Water supply conditions identical under Alternative 2 as under No Action Alternative.	None needed.
Alternative 3	<p>Long-term average annual exports would be 726 TAF (15 percent) more under Alternative 3 as compared to the No Action Alternative.</p> <p>Deliveries to CVP North of Delta agricultural water service contractors would be increased by 13 percent over the long-term conditions and 29 percent in dry and critical dry years.</p> <p>Deliveries to CVP North of Delta M&amp;I contractors would be similar in total; however, deliveries to the American River CVP contractors would increase by 5 percent over the long-term conditions and 7 percent in dry years, but remain similar in critical dry years.</p> <p>Deliveries to CVP South of Delta agricultural water service contractors would be increased by 28 percent over the long-term conditions, 34 percent in dry years, and 27 percent in critical dry years.</p> <p>Deliveries to CVP South of Delta M&amp;I contractors would be similar in critical dry years and increased by 10 percent over the long-term conditions and 8 percent in dry years.</p> <p>Deliveries to the Eastside contractors would be similar under long-term conditions and dry years and increased by 14 percent in critical dry years.</p>	None needed.

Chapter 5: Surface Water Resources and Water Supplies

Alternative	Potential Change	Consideration for Mitigation Measures
	<p>Deliveries under Table A contracts without Article 21 water to SWP North of Delta water contractors would be increased by 17 percent over the long-term conditions and in dry years and 13 percent in critical dry years.</p> <p>Deliveries under Table A contracts without Article 21 water to SWP South of Delta water contractors would be increased by 17 percent over the long-term conditions and in dry years and 14 percent in critical dry years.</p>	
Alternative 4	Same water supply conditions as described for Alternative 1 compared to the No Action Alternative.	None needed.
Alternative 5	<p>Long-term average annual exports would be 45 TAF (1 percent) less under Alternative 5 as compared to the No Action Alternative.</p> <p>Deliveries to CVP North of Delta agricultural water service contractors would be similar over the long-term conditions and in dry and critical dry years.</p> <p>Deliveries to CVP North of Delta M&amp;I contractors would be similar over the long-term conditions and in dry and critical dry years in total and for the American River CVP contractors.</p> <p>Deliveries to CVP South of Delta agricultural water service contractors would be similar over the long-term conditions and in dry and critical dry years.</p> <p>Deliveries to CVP South of Delta M&amp;I contractors would be similar over the long-term conditions and in dry and critical dry years.</p> <p>Deliveries to the Eastside contractors would be similar under long-term conditions and dry years; and reduced by 8 percent in critical dry years.</p> <p>Deliveries under Table A contracts without Article 21 water to SWP North of Delta water contractors would be similar over the long-term conditions and in dry and critical dry years.</p> <p>Deliveries under Table A contracts without Article 21 water to SWP South of Delta water contractors would be similar over the long-term conditions and in dry and critical dry years.</p>	To mitigate reductions of up to 7 percent in critical dry years to the Eastside Contractors, Reclamation would support water transfers from other basin water rights holders to the Eastside Contractors.

Note: Due to the limitations and uncertainty in the CalSim II monthly model and other analytical tools, incremental differences of 5 percent or less between alternatives and the No Action Alternative are considered to be “similar.”

2

**Table 5.115 Comparison of Surface Water Conditions under the No Action Alternative and Alternatives 1 through 5 to the Second Basis of Comparison**

Alternative	Potential Change	Consideration for Mitigation Measures
No Action Alternative	<p><b>Trinity Lake</b>                      In wet years, below normal, and dry years, storage would be similar in all months.                      In above-normal years, storage would be similar in January through October; and less in November and December (up to 6 percent).                      In critical dry years, storage would be less in all months (up to 10 percent).                      In all months, in all water year types, surface water elevations would be similar.</p> <p><b>Trinity River downstream of Lewiston Dam</b>                      Over long-term conditions (over the 82-year analysis period), flows would be similar in March through November and reduced in December through February (up to 10 percent).                      In wet years, flows would be similar in April through November and reduced in December through March (up to 11 percent).                      In dry years, flows would be similar all months.</p> <p><b>Shasta Lake</b>                      In wet years, storage would be similar in October and December through August and reduced in September and November (up to 8 percent).                      In above-normal years, storage would be similar in January through September and reduced in October through December (up to 8 percent).                      In below-normal years, storage would be similar in March through September and reduced in October through February (up to 11 percent).                      In dry years, storage would be similar in January through October and reduced in November and December (up to 6 percent).                      In critical dry years, storage would be reduced under all months (up to 14 percent).                      In all months, in all water year types, surface water elevations would be similar.</p> <p><b>Sacramento River at Keswick</b>                      Over long-term conditions, similar flows would occur in October, February through May, July, and August; increased flows in September and November (up to 38 percent); and reduced flows in December, January, and June (up to 8 percent).                      In wet years, similar flows would occur in January through July; increased flows in September through November (up to 78 percent); and reduced flows in December and August (up to 15 percent).                      In dry years, similar flows would occur in July through October, December through March, and May; increased flows in November (33 percent); and reduced flows in April and June (up to 7 percent).</p> <p><b>Sacramento River at Freeport</b>                      Over long-term conditions, similar flows would occur in October, December through May, and August; increased flows in September, November, and July (up to 43 percent); and reduced flows in June (11 percent).                      In wet years, similar flows would occur in January through June and October; increased flows in July through September and November (up to 90 percent); and reduced flows in December (11 percent).</p>	Not considered for this comparison.

Chapter 5: Surface Water Resources and Water Supplies

Alternative	Potential Change	Consideration for Mitigation Measures
	<p>In dry years, similar flows would occur in August through October and December through April; increased flows in November and July (up to 16 percent); and reduced flows in May and June (up to 12 percent).</p> <p><b>Lake Oroville</b></p> <p>In wet years, storage would be similar in January through August; and reduced in September through December (up to 18 percent).</p> <p>In above normal years, storage would be similar in February through August and reduced in September through January (up to 13 percent).</p> <p>In below normal years, storage would be similar in May through July and reduced in August through April (up to 18 percent).</p> <p>In dry years, storage would be similar in June and reduced in all other months (up to 13 percent).</p> <p>In critical dry years, storage would be similar under all months.</p> <p>In all months, in all water year types, surface water elevations would be similar.</p> <p><b>Feather River downstream of Thermalito Complex</b></p> <p>Over long-term conditions, similar flows would occur in November and April; increased flows in July through September (up to 76 percent); and reduced flows in October, December through March, May, and June (up to 27 percent).</p> <p>In wet years, similar flows would occur in October through November and March through May; increased flows in July through September (up to 184 percent); and reduced flows in December through February (up to 26 percent).</p> <p>In dry years, similar flows would occur in November through March; increased flows in April and July (up to 52 percent); and reduced flows in August through October and May and June (up to 28 percent).</p> <p><b>Folsom Lake</b></p> <p>In wet years, storage would be similar in December through August and reduced in September through November (up to 11 percent).</p> <p>In above-normal years, storage would be similar in January through June, September, and October; reduced in November and December (up to 8 percent); and increased in July and August (up to 6 percent).</p> <p>In below-normal years, storage would be similar in February through May; reduced in October through January (up to 12 percent); and increased in July through September (up to 17 percent).</p> <p>In dry years, storage would be similar in all months.</p> <p>In critical dry years, storage would be similar in October through June and reduced in July through September (up to 11 percent).</p> <p>In all months, in all water year types, surface water elevations would be similar.</p> <p><b>American River downstream of Nimbus Dam</b></p> <p>Over long-term conditions, similar flows would occur in November through May and July; increased flows in September and October (up to 45 percent); and reduced flows in June and August (up to 6 percent).</p> <p>In wet years, similar flows would occur in October through November and January through July; increased flows in September (91 percent); and reduced flows in December and August (up to 11 percent).</p>	

Alternative	Potential Change	Consideration for Mitigation Measures
	<p>In dry years, similar flows would occur in all months except October, February and July; increased flows in October (17 percent); and reduced flows in February and July (up to 7 percent).</p> <p><b>Clear Creek downstream of Whiskeytown Dam</b> Flows identical June through April and increased in May (41 percent).</p> <p><b>New Melones Reservoir</b> In wet, below-normal, and dry years, storage would be similar in all months. In above-normal years, storage would be similar in all months except October when storage would be reduced by 6 percent. In critical dry years, storage would be similar in February, March, and July through September and reduced in October through January and April through June (up to 7 percent). In all months, in all water year types, surface water elevations would be similar.</p> <p><b>Stanislaus River downstream of Goodwin Dam</b> Over long-term conditions, similar flows would occur in May and July through September; increased flows in October, March, and April (up to 149 percent); and reduced flows in November through February and June (up to 34 percent). In wet years, similar flows would occur in February and April; increased flows in October, March, May, July, and August (up to 117 percent); and reduced flows in September, November through January, and June (up to 51 percent). In dry years, similar flows would occur in July through September; increased flows in October and April (up to 154 percent); and reduced flows in November through March, May, and June (up to 36 percent).</p> <p><b>San Joaquin River at Vernalis</b> Over long-term conditions, similar flows would occur in July through September and November through May; increased flows in October (19 percent); and reduced flows in June (8 percent). In wet years, similar flows would occur in July through September and November through May; increased flows in October (17 percent); and reduced flows in June (9 percent). In dry years, similar flows would occur in November through March and May through September and increased flows in October and April (up to 18 percent).</p> <p><b>San Luis Reservoir</b> In wet years, storage would be similar in June and September; increased in March, July, and August (up to 10 percent); and reduced in October through February, April, and May (up to 57 percent). Surface water elevations would be less in all months (up to 11 percent). In above-normal years, storage would be similar in July and September; increased in August (10 percent); and reduced in October through June (up to 71 percent). Surface water elevations would be less in all months (up to 13 percent). In below-normal years, storage would be similar in July and September; increased in August (20 percent); and reduced in October through June (up to 67 percent). Surface water elevations would be less in all months (up to 16 percent).</p>	

Chapter 5: Surface Water Resources and Water Supplies

Alternative	Potential Change	Consideration for Mitigation Measures
	<p>In dry years, storage would be similar in September; increased in July (34 percent); and reduced in October through June and August (up to 44 percent). Surface water elevations would be similar in September through January and less in February through August (up to 10 percent).</p> <p>In critical dry years, storage would be similar in September; increased in July (60 percent); and reduced in August and October through June (up to 51 percent). Alternative 1	Surface water conditions identical under Alternative 1 as under Second Basis of Comparison.	None needed.
Alternative 2	Same surface water conditions as described for No Action Alternative as compared to the Second Basis of Comparison.	Not considered for this comparison.
Alternative 3	<p><b>Trinity Lake</b></p> <p>Similar storage and surface water elevations in all months and all water year types.</p> <p><b>Trinity River downstream of Lewiston Dam</b></p> <p>Similar flows in all months for long-term conditions and wet and dry years.</p> <p><b>Shasta Lake</b></p> <p>Similar storage and surface water elevations in all months and all water year types.</p> <p><b>Sacramento River at Keswick</b></p> <p>Similar flows in all months for long-term conditions and wet and dry years.</p>	Not considered for this comparison.

Alternative	Potential Change	Consideration for Mitigation Measures
	<p><b>Sacramento River at Freeport</b>                      Similar flows in all months for long-term conditions and wet years.                      In dry years, similar flows would occur in July through May and increased flows in June (11 percent).</p> <p><b>Lake Oroville</b>                      Similar storage and surface water elevations in all months and all water year types.</p> <p><b>Feather River downstream of Thermalito Complex</b>                      Over long-term conditions, similar flows would occur in November and January through June; reduced flows in October, December, and September (up to 13 percent); and increased flows in July and August (up to 17 percent).                      In wet years, similar flows would occur in November and January through May; reduced flows in October, December, and September (up to 15 percent); and increased flows in June through August (up to 11 percent).                      In dry years, similar flows would occur in November and January through June; reduced flows in August through October (up to 21 percent); and increased flows in July (37 percent).</p> <p><b>Folsom Lake</b>                      Similar storage and surface water elevations in all months and all water year types.</p> <p><b>American River downstream of Nimbus Dam</b>                      Similar flows in all months for long-term conditions and wet and dry years.</p> <p><b>Clear Creek downstream of Whiskeytown Dam</b>                      Flows would be identical in all months.</p> <p><b>New Melones Reservoir</b>                      In wet years, storage would be similar in March through May and increased in June through February (up to 8 percent).                      In above-normal years, storage would be increased in all months (up to 16 percent).                      In below-normal years, storage would be increased in all months (up to 15 percent).                      In dry years, storage would be increased in all months (up to 20 percent).                      In critical dry years, storage would be increased in all months (up to 32 percent).                      In all months, in all water year types, surface water elevations would be similar.</p> <p><b>Stanislaus River downstream of Goodwin Dam</b>                      Over long-term conditions, similar flows would occur in October, December, January, and March; reduced flows would occur in November, May, and June (up to 52 percent); and increased flows in February, April, July, and August through September (up to 27 percent).                      In wet years, similar flows would occur in October, November, January, and April; reduced flows in May and June (up to 45 percent); and increased flows in December, February, March, and July through September (up to 69 percent).                      In dry years, similar flows would occur in July through October; reduced flows in November through March and May through June (up to 36 percent); and increased flows in April (40 percent).</p>	

Chapter 5: Surface Water Resources and Water Supplies

Alternative	Potential Change	Consideration for Mitigation Measures
	<p><b>San Joaquin River at Vernalis</b>                      Over long-term conditions, similar flows would occur in July through May and reduced flows in June (12 percent). In wet years, similar flows would occur in September through January, March through May, and July; reduced flows in June (8 percent); and increased flows in August and February (6 percent).                      In dry years, similar flows would occur in July through March; reduced flows in May and June (up to 12 percent); and increased flows in April (7 percent).</p> <p><b>San Luis Reservoir</b>                      In wet years, storage would be similar in July through November and March through May and reduced in December through February and June (up to 16 percent). Surface water elevations would be similar in all months.                      In above-normal years, storage would be similar in November; increased in August and September (up to 12 percent); and reduced in October and December through July (up to 22 percent). Surface water elevations would be similar in March through December and reduced in January and February (up to 6 percent).                      In below-normal years, storage would be similar in August and September and reduced in October through July (up to 40 percent). Surface water elevations would be similar in all months.                      In dry years, storage would be reduced in January through September (up to 19 percent) and increased in October through December (up to 13 percent). Surface water elevations would be similar in all months.                      In critical dry years, storage would be reduced in October through August (up to 29 percent) and increased in September (8 percent). Surface water elevations would be similar September through January and reduced in February through August (up to 7 percent).</p> <p><b>Yolo Bypass</b>                      In wet years, flows into the Yolo Bypass would be similar in November through September and reduced in October (6 percent).                      In above-normal, below-normal, dry, and critical dry years, flows into the Yolo Bypass would be similar in all months.</p> <p><b>Delta Outflow</b>                      In wet years, average monthly Delta outflow would increase in November through February and July through September (up to 2,546 cfs) and decrease in October and March through June (up to 1,127 cfs).                      In dry years, average monthly Delta outflow would increase in November through April, July and August (up to 3,391 cfs) and decrease October, May, and June (up to 373 cfs).</p> <p><b>Reverse Flows in Old and Middle Rivers</b>                      In wet years, flows would be more positive in September through February, April, and May (up to 5,528 cfs) and more negative in March and June through August (up to 1,453 cfs).                      In dry years, flows would be more positive in August through May (up to 3,249 cfs) and more negative flows in June and July (up to 1,345 cfs).</p>	
Alternative 4	Surface water conditions identical under Alternative 4 as under Second Basis of Comparison.	None needed.

Alternative	Potential Change	Consideration for Mitigation Measures
Alternative 5	<p><b>Trinity Lake</b>                      In wet, below-normal, and dry years, storage would be similar.                      In above-normal years, storage would be similar in January through October and reduced in November and December (up to 5 percent).                      In critical dry years, storage would be reduced in all months (up to 10 percent).                      In all months, in all water year types, surface water elevations would be similar.</p> <p><b>Trinity River downstream of Lewiston Dam</b>                      Over long-term conditions, flows would be similar in March through November and January and reduced in December and February (up to 10 percent).                      In wet years, flows would be similar in January and April through November and reduced in December, February, and March (up to 14 percent).                      In dry years, flows would be similar in all months.</p> <p><b>Shasta Lake</b>                      In wet years, storage would be similar in October and December through August and reduced in November and September (up to 8 percent).                      In above-normal years, storage would be similar in February through September and reduced in October through December (up to 8 percent).                      In below-normal years, storage would be similar in March through September and reduced in October through February (up to 10 percent).                      In dry years, storage would be similar in January through October and reduced in November through December (up to 6 percent).                      In critical dry years, storage would be reduced in all months (up to 17 percent).                      In all months, in all water year types, surface water elevations are similar.</p> <p><b>Sacramento River at Keswick</b>                      Over long-term conditions, flows would be similar in July, August, October, and February through April; reduced in December, January, May and June (up to 8 percent); and increased in September and November (up to 39 percent).                      In wet years, flows would be similar in January through July; reduced in December and August (up to 15 percent); and increased in September through November (up to 77 percent).                      In dry years, similar flows would occur in July through October and December through March; reduced in April through June (up to 10 percent); and increased flows in November (32 percent).</p> <p><b>Sacramento River at Freeport</b>                      Over long-term conditions, flows would be similar in October and December through April; reduced in May and June (up to 12 percent); and increased in July through September and November (43 percent).                      In wet years, flows would be similar in October and January through June; reduced in December (6 percent); and increased in July through September and November (up to 89 percent).                      In dry years, similar flows would occur in August through October and December through April; reduced in May and June (up to 14 percent); and increased flows in July and November (up to 19 percent).</p>	<p>Not considered for this comparison.</p>

Chapter 5: Surface Water Resources and Water Supplies

Alternative	Potential Change	Consideration for Mitigation Measures
	<p><b>Lake Oroville</b>                      In wet years, storage would be similar in January through August; and reduced in September through December (up to 18 percent).                      In above-normal years, storage would be similar in March through August and reduced in September through February (up to 14 percent).                      In below-normal years, storage would be similar in May through July and reduced in August through April (up to 17 percent).                      In dry years, storage would be similar in May and June and reduced in July through April (up to 11 percent).                      In critical dry years, storage would be similar in all months.                      Surface water elevations would be similar in all months, in all years.</p> <p><b>Feather River downstream of Thermalito Complex</b>                      Over long-term conditions, similar flows would occur in November and April; reduced flows in October, December through March, May, and June (up to 28 percent); and increased flows in July through September (up to 76 percent).                      In wet years, similar flows would occur in October, November, March through May; reduced flows in December through February and June (up to 26 percent); and increased flows in July through September (up to 182 percent).                      In dry years, similar flows would occur in November through April; reduced flows in October, May, June, August, and September (up to 45 percent); and increased flows in July (60 percent).</p> <p><b>Folsom Lake</b>                      In wet years, storage would be similar in December through July and reduced in August through November (up to 7 percent).                      In above-normal years, storage would be similar in January through June, August, and October; reduced in September, November, and December (up to 8 percent); and increased in July (5 percent).                      In below-normal years, storage would be similar in February through May; reduced in August through January (up to 13 percent); and increased in June and July (up to 10 percent).                      In dry years, storage would be similar in all months.                      In critical dry years, storage would be similar in August and June and reduced in July (8 percent).                      Surface water elevations would be similar in all months, in all years.</p> <p><b>American River downstream of Nimbus Dam</b>                      Over long-term conditions, similar flows would occur in November through July; reduced flows in August (6 percent); and increased in September and October (42 percent).                      In wet years, similar flows would occur in October, November, and January through July; reduced flows in December and August (up to 14 percent); and increased flows in September (88 percent).                      In dry years, similar flows would occur in November through September; and increased flows in October (17 percent).</p>	

Alternative	Potential Change	Consideration for Mitigation Measures
	<p><b>Clear Creek downstream of Whiskeytown Dam</b>                      Flows identical June through April and increased in May (41 percent).</p> <p><b>New Melones Reservoir</b>                      In wet years, storage would be reduced in all months (up to 9 percent).                      In above-normal years, storage would be reduced in all months (up to 10 percent).                      In below-normal years, storage would be reduced in all months (up to 13 percent).                      In dry years, storage would be reduced in all months (up to 14 percent).                      In critical dry years, storage would be reduced in all months (up to 23 percent).                      Surface water elevations would be similar in all months, in all water year types.</p> <p><b>Stanislaus River downstream of Goodwin Dam</b>                      Over long-term conditions, similar flows would occur in August; reduced flows would occur in November through February, June, July, August, and September (up to 36 percent); and increased flows in October and March through May (up to 149 percent).                      In wet years, similar flows would occur in February and April; reduced flows in November through January and June through September (up to 53 percent); and increased flows in October and March (up to 113 percent).                      In dry years, similar flows would occur in July through September; reduced flows in November through March and June (up to 36 percent); and increased flows in October, April, and May (150 percent).</p> <p><b>San Joaquin River at Vernalis</b>                      Over long-term conditions, similar flows would occur in November through March, May, and July through September; reduced flows in June (8 percent); increased flows in October and April (19 percent).                      In wet years, similar flows would occur in November through May and July through September; reduced flows in June (10 percent); and increased flows in October (16 percent).                      In dry years, similar flows would occur in November through March and June through September; and increased flows in October, April, and May (up to 25 percent).</p> <p><b>San Luis Reservoir</b>                      In wet years, storage would be reduced in all months (up to 49 percent). Surface water elevations would be similar in September and March; and reduced in October through February and April through August (up to 10 percent).                      In above-normal years, storage would be reduced in all months (up to 59 percent). Surface water elevations would be similar in September; and reduced in October through August (up to 13 percent).                      In below-normal years, storage would be reduced in all months (up to 70 percent). Surface water elevations would be similar in September; and reduced in October through August (up to 17 percent).                      In dry years, storage would be reduced in all months (up to 51 percent). Surface water elevations would be similar in October through December; and reduced in January through September (up to 14 percent).</p>	

Chapter 5: Surface Water Resources and Water Supplies

Alternative	Potential Change	Consideration for Mitigation Measures
	<p>In critical dry years, storage would be reduced in all months (46 percent). Surface water elevations would be reduced in all months (up to 14 percent).</p> <p><b>Yolo Bypass</b></p> <p>In wet years, flows would be similar in February through September; reduced flows in November through January (up to 15 percent); and increased in October (16 percent). In above-normal years, flows would be similar in April through December and reduced flows in January through March (up to 15 percent). In below-normal years, flows would be similar in April through November and reduced flows in December through March (up to 24 percent). In dry years, flows would be similar in January through November and reduced flows in December (up to 7 percent). In critical dry years, flows would be similar in all months.</p> <p><b>Delta Outflow</b></p> <p>In wet years, average monthly Delta outflow would be increased in July through November, January, and April and May (up to 13,666 cfs) and reduced in December, February, March, and June (up to 1,713 cfs). In dry years, average monthly Delta outflow would be increased in July through May (up to 3,384 cfs) and reduced in June (526 cfs).</p> <p><b>Reverse Flows in Old and Middle Rivers</b></p> <p>In wet years, OMR flows would be more positive in September through February, April and May (up to 10,017 cfs) and more negative in March and June through August (up to 964 cfs). In dry years, OMR flows would be more positive in September through June (up to 4,724 cfs) and more negative in July and August (up to 2,620 cfs).</p>	

1 **Table 5.116 Comparison of CVP and SWP Water Supply Deliveries under the No**  
 2 **Action Alternative and Alternatives 1 through 5 to the Second Basis of Comparison**

Alternative	Potential Change	Consideration for Mitigation Measures
No Action Alternative	<p>Long-term average annual exports would be 1,051 TAF (18 percent) less under the No Action Alternative as compared to the Second Basis of Comparison.</p> <p>Deliveries to CVP North of Delta agricultural water service contractors would be reduced by 16 percent over the long-term conditions, 30 percent in dry years, and 34 percent in critical dry years.</p> <p>Deliveries to CVP North of Delta M&amp;I contractors would be similar in total; however, deliveries to the American River CVP contractors would be reduced by 6 percent over the long-term conditions, 8 percent in dry years, and 6 percent in critical dry years.</p> <p>Deliveries to CVP South of Delta agricultural water service contractors would be reduced by 23 percent over the long-term conditions, 32 percent in dry years, and 33 percent in critical dry years.</p> <p>Deliveries to CVP South of Delta M&amp;I contractors would be reduced by 10 percent over the long-term conditions, 9 percent in dry years, and 5 percent in critical dry years.</p> <p>Deliveries to the Eastside contractors would be similar under the long-term conditions and in dry years but were reduced by 12 percent in critical dry years.</p> <p>Deliveries under Table A contracts without Article 21 water to SWP North of Delta water contractors would be reduced by 18 percent over the long-term conditions, 18 percent in dry years, and 20 percent in critical dry years.</p> <p>Deliveries under Table A contracts without Article 21 water to SWP South of Delta water contractors would be reduced by 18 percent over the long-term conditions, 19 percent in dry years, and 22 percent in critical dry years.</p>	Not considered for this comparison.
Alternative 1	Water supply conditions identical under Alternative 1 as under Second Basis of Comparison.	None needed.
Alternative 2	Same water supply effects as described for No Action Alternative as compared to the Second Basis of Comparison.	Not considered for this comparison.
Alternative 3	<p>Long-term average annual exports would be 326 TAF (6 percent) less under Alternative 3 as compared to the Second Basis of Comparison.</p> <p>Deliveries to CVP North of Delta agricultural water service contractors would be reduced by 5 percent over the long-term conditions, 9 percent in dry years, and 11 percent in critical dry years.</p> <p>Deliveries to CVP North of Delta M&amp;I contractors (including American River CVP contractors) would be similar in long-term conditions and dry and critical dry years.</p> <p>Deliveries to CVP South of Delta agricultural water service contractors would be similar over the long-term conditions and reduced by 8 percent in dry years and 14 percent in critical dry years.</p> <p>Deliveries to CVP South of Delta M&amp;I contractors would be similar in long-term conditions and dry and critical dry years.</p> <p>Deliveries to the Eastside contractors would be similar under long-term conditions and dry and critical dry years.</p> <p>Deliveries under Table A contracts without Article 21 water to SWP North of Delta water contractors would be similar over the long-term conditions and in dry years and reduced by 10 percent in critical dry years.</p>	Not considered for this comparison.

Alternative	Potential Change	Consideration for Mitigation Measures
	Deliveries under Table A contracts without Article 21 water to SWP South of Delta water contractors would be similar over the long-term conditions and in dry years and reduced by 11 percent in critical dry years.	
Alternative 4	Water supply conditions identical under Alternative 4 as under Second Basis of Comparison.	None needed.
Alternative 5	<p>Long-term average annual exports would be 1,096 TAF (19 percent) less under Alternative 5 as compared to the Second Basis of Comparison.</p> <p>Deliveries to CVP North of Delta agricultural water service contractors would be reduced by 16 percent over the long-term conditions, 30 percent in dry years, and 31 percent in critical dry years.</p> <p>Deliveries to CVP North of Delta M&amp;I contractors would be similar in long-term conditions and dry and critical dry years; however, American River Contractors would be reduced by 6 percent over the long-term conditions, 9 percent in dry years, and 8 percent in critical dry years.</p> <p>Deliveries to CVP South of Delta agricultural water service contractors would be reduced by 24 percent over the long-term conditions, 33 percent in dry years, and 33 percent in critical dry years.</p> <p>Deliveries to CVP South of Delta M&amp;I contractors would be reduced by 10 percent in long-term conditions, 8 percent in dry years, and 6 percent in critical dry years.</p> <p>Deliveries to the Eastside contractors would be reduced by 5 percent under long-term conditions and dry years and reduced by 19 percent in critical dry years.</p> <p>Deliveries under Table A contracts without Article 21 water to SWP North of Delta water contractors would be reduced by 19 percent over the long-term conditions, 18 percent in dry years, and 21 percent in critical dry years.</p> <p>Deliveries under Table A contracts without Article 21 water to SWP South of Delta water contractors would be reduced by 19 percent over the long-term conditions, 20 percent in dry years, and 23 percent in critical dry years.</p>	Not considered for this comparison.

Note: Due to the limitations and uncertainty in the CalSim II monthly model and other analytical tools, incremental differences of 5 percent or less between alternatives and the Second Basis of Comparison are considered to be "similar."

1 **5.4.3.8 Potential Mitigation Measures**

2 Mitigation measures are presented in this section to avoid, minimize, rectify,  
 3 reduce, eliminate, or compensate for adverse environmental effects of  
 4 Alternatives 1 through 5 as compared to the No Action Alternative. Mitigation  
 5 measures were not included to address adverse impacts under the alternatives as  
 6 compared to the Second Basis of Comparison because this analysis was included  
 7 in this EIS for information purposes only.

8 **5.4.3.8.1 Surface Water Conditions**

9 As described above and summarized in Table 5.113, implementation of  
 10 Alternatives 1 through 5 as compared to the No Action Alternative would result in  
 11 reductions in river flows downstream of CVP and SWP reservoirs and Delta  
 12 outflow, and increased negative OMR flows. Environmental effects associated  
 13 with changes in these physical conditions are related to impacts on biological  
 14 resources (as described in Chapter 9, Fish and Aquatic Resources, and  
 15 Chapter 10, Terrestrial Biological Resources), and recreation resources

1 (as described in Chapter 15, Recreation Resources). Mitigation measures, if  
2 needed, related to environmental changes caused by changes in surface water  
3 conditions are presented in Chapters 9, 10, and 15.

4 **5.4.3.8.2 CVP and SWP Water Supply Deliveries**

5 Implementation of Alternatives 1 through 4 would not result in adverse impacts to  
6 CVP and SWP water deliveries as compared to the No Action Alternative, as  
7 summarized in Table 5.114. Therefore, no mitigation measures are required.

8 Implementation of Alternative 5 would result in up to 8 percent reductions of  
9 CVP water deliveries to the Eastside Contractors (Stockton East Water District  
10 and Central San Joaquin Water Conservation District) in critical dry years. A  
11 potential mitigation measure for this reduction in critical dry years would be:

- 12 • Reclamation would support water transfers from other basin water rights  
13 holders to the Eastside Contractors. .

14 **5.4.3.9 Cumulative Effects Analysis**

15 As described in Chapter 3, the cumulative effects analysis considers projects,  
16 programs, and policies that are not speculative and are based upon known or  
17 reasonably foreseeable long-range plans, regulations, operating agreements, or  
18 other information that establishes them as reasonably foreseeable.

19 The cumulative effects analysis Alternatives 1 through 5 for Water Supplies are  
20 summarized in Table 5.117.

1  
2

**Table 5.117 Summary of Cumulative Effects on Water Supply Deliveries under Alternatives 1 through 5 as Compared to the No Action Alternative**

Scenarios	Actions	Cumulative Effects of Actions
<p>Past &amp; Present, and Future Actions Included in All Alternatives in Year 2030</p>	<p>Consistent with Affected Environment conditions plus:</p> <p>Actions in the 2008 USFWS BO and 2009 NMFS BO that would have occurred without implementation of the BOs, as described in Section 3.3.1.2 (of Chapter 3, Descriptions of Alternatives), including climate change and sea level rise</p> <p>Actions not included in the 2008 USFWS BO and 2009 NMFS BO that would have occurred without implementation of the BOs, as described in Section 3.3.1.3 (of Chapter 3, Descriptions of Alternatives):</p> <ul style="list-style-type: none"> <li>• Implementation of Federal and state policies and programs, including Clean Water Act (e.g., Total Maximum Daily Loads); Safe Drinking Water Act; Clean Air Act; and flood management programs</li> <li>• General plans for 2030.</li> <li>• Trinity River Restoration Program.</li> <li>• Central Valley Project Improvement Act programs</li> <li>• Iron Mountain Mine Superfund Site</li> <li>• Nimbus Fish Hatchery Fish Passage Project</li> <li>• Folsom Dam Water Control Manual Update</li> <li>• FERC Relicensing for the Middle Fork of the American River Project</li> <li>• Lower Mokelumne River Spawning Habitat Improvement Project</li> <li>• Dutch Slough Tidal Marsh Restoration</li> <li>• Suisun Marsh Habitat Management, Preservation, and Restoration Plan Implementation</li> <li>• Tidal Wetland Restoration: Yolo Ranch, Northern Liberty Island Fish Restoration Project, Prospect Island Restoration Project, and Calhoun Cut/Lindsey Slough Tidal Habitat Restoration Project</li> <li>• San Joaquin River Restoration Program</li> <li>• Stockton Deep Water Ship Channel Dissolved Oxygen Project</li> <li>• Grasslands Bypass Project</li> <li>• Central Valley Salinity Alternatives for Long-Term Sustainability (CV-SALTS)</li> <li>• Future water supply projects, including water recycling, desalination, groundwater banks and wellfields, and conveyance facilities</li> </ul>	<p><u>These effects would be the same under all alternatives.</u></p> <p>Climate change and sea level rise, development under the general plans, FERC relicensing projects, and some future projects to improve water quality and/or habitat are anticipated to reduce carryover storage in reservoirs, stream flows and Delta outflow, and the availability of CVP and SWP water supplies as compared to past conditions.</p> <p>Some future water quality and habitat projects could modify surface water conditions; however, water supplies are not anticipated to be affected.</p> <p>Future water supply projects are anticipated to both improve water supply reliability due to reduced surface water supplies and to accommodate planned growth in the general plans. Most of these programs were initiated prior to implementation of the 2008 USFWS BO and 2009 NMFS BO which reduced CVP and SWP water supply reliability.</p>

Chapter 5: Surface Water Resources and Water Supplies

Scenarios	Actions	Cumulative Effects of Actions
<p>Future Actions Considered as Cumulative Effects Actions in All Alternatives in Year 2030</p>	<p>Actions as described in Section 3.5 (of Chapter 3, Descriptions of Alternatives):</p> <ul style="list-style-type: none"> <li>• Bay-Delta Water Quality Control Plan Update</li> <li>• FERC Relicensing Projects</li> <li>• Bay Delta Conservation Plan (including the California WaterFix alternative)</li> <li>• Shasta Lake Water Resources, North-of-the-Delta Offstream Storage, Los Vaqueros Reservoir Expansion Phase 2, and Upper San Joaquin River Basin Storage Investigations</li> <li>• El Dorado Water and Power Authority Supplemental Water Rights Project</li> <li>• Sacramento River Water Reliability Project</li> <li>• Semitropic Water Storage District Delta Wetlands</li> <li>• North Bay Aqueduct Alternative Intake</li> <li>• Irrigated Lands Regulatory Program</li> <li>• San Luis Reservoir Low Point Improvement Project</li> <li>• <i>Westlands Water District v. United States Settlement</i></li> <li>• Future water supply projects, including water recycling, desalination, groundwater banks and wellfields, and conveyance facilities (projects that did not have completed environmental documents during preparation of the EIS)</li> </ul>	<p><u>These effects would be the same under all alternatives.</u></p> <p>Most of the future reasonably foreseeable actions are anticipated to reduce water supply impacts due to climate change, sea level rise, increased water allocated to improve habitat conditions, and future growth.</p> <p>Some of the reasonably foreseeable actions related to improved water quality and habitat conditions (e.g., Water Quality Control Plan Update and FERC Relicensing Projects), could in further reductions in CVP and SWP water deliveries.</p>
<p>No Action Alternative with Associated Cumulative Effects Actions in Year 2030</p>	<p>Full implementation of the 2008 USFWS BO and 2009 NMFS BO</p>	<p>Implementation of No Action Alternative would result in changes stream flows, increased Delta outflow, and reduced CVP and SWP water supplies as compared to historical conditions prior to the BOs.</p> <p>The availability of future water supply projects (discussed above) could reduce the effects of reduced CVP and SWP water supplies. However, these actions also could result in less water for future growth as compared to future conditions without the No Action Alternative.</p>

Chapter 5: Surface Water Resources and Water Supplies

Scenarios	Actions	Cumulative Effects of Actions
<p>Alternatives 1 and 4 with Associated Cumulative Effects Actions in Year 2030</p>	<p>No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant)</p>	<p>Implementation of Alternatives 1 and 4 with reasonably foreseeable actions would result in changes in stream flows, reduced Delta outflows, and increased CVP and SWP water supplies as compared to the No Action Alternative with the added actions.</p> <p>The future water supply projects (discussed above) would be more available to provide water for future growth as compared to future conditions with the No Action Alternative.</p>
<p>Alternative 2 with Associated Cumulative Effects Actions in Year 2030</p>	<p>Full implementation of the 2008 USFWS BO and 2009 NMFS BO CVP and SWP operational actions No implementation of structural improvements or other actions that require further study to develop a more detailed action description.</p>	<p>Implementation of Alternative 2 with reasonably foreseeable actions for water supplies would be the same as for the No Action Alternative with the added actions.</p>
<p>Alternative 3 with Associated Cumulative Effects Actions in Year 2030</p>	<p>No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant) Slight increase in positive Old and Middle River flows in the winter and spring months</p>	<p>Implementation of Alternative 3 with reasonably foreseeable actions would result in changes in stream flows, reduced Delta outflows, and increased CVP and SWP water supplies as compared to the No Action Alternative with the added actions.</p> <p>The future water supply projects (discussed above) would be more available to provide water for future growth as compared to future conditions with the No Action Alternative.</p>
<p>Alternative 5 with Associated Cumulative Effects Actions in Year 2030</p>	<p>Full implementation of the 2008 USFWS BO and 2009 NMFS BO Positive Old and Middle River flows and increased Delta outflow in spring months</p>	<p>Implementation of Alternative 5 with reasonably foreseeable actions would result in changes in stream flows, increased Delta outflows, and reduced CVP and SWP water supplies as compared to the No Action Alternative with the added actions.</p> <p>The availability of future water supply projects (discussed above) could reduce the effects of reduced CVP and SWP water supplies. However, these actions also could result in less water for future growth as compared to future conditions under the No Action Alternative.</p>

# 1 **Surface Water Resources and Water** 2 **Supply Figures**

3 The following figures are included in Chapter 5, Surface Water Resources and  
4 Water Supply.

- 5 • 5.1 California Precipitation Trends
- 6 • 5.2 California Major Water Supply Facilities
- 7 • 5.3 Northern California Major Water Supply Facilities
- 8 • 5.4 San Joaquin Valley and Tulare Lake Major Water Supply Facilities
- 9 • 5.5 San Francisco Bay Area Major Water Supply Facilities
- 10 • 5.6 Central Coast and Southern California Major Water Supply Facilities
- 11 • 5.7 Historical Water Years 2001-2012 Trinity Lake Storage
- 12 • 5.8 Historical Water Year 2001 – 2012 Trinity Lake Elevation
- 13 • 5.9 Historical Water Year 2001 – 2012 Lewiston Reservoir Storage
- 14 • 5.10 Historical Water Year 2001 – 2012 Lewiston Reservoir Elevation
- 15 • 5.11 Historical Water Year 2003 – 2012 Trinity River Mean Daily Flows at  
16 Douglas City
- 17 • 5.12 Historical Water Year 2005 – 2012 Klamath River Mean Daily Flows at  
18 Klamath
- 19 • 5.13 Historical Water Year 2001 – 2012 Whiskeytown Lake Storage
- 20 • 5.14 Historical Water Year 2001 – 2012 Whiskeytown Lake Elevation
- 21 • 5.15 Historical Water Year 2001 – 2012 Clear Creek Mean Daily Flows at Igo
- 22 • 5.16 Historical Water Year 2001 – 2012 Shasta Lake Storage
- 23 • 5.17 Historical Water Year 2001 – 2012 Shasta Lake Elevation
- 24 • 5.18 Historical Water Year 2001 – 2012 Keswick Reservoir Storage
- 25 • 5.19 Historical Water Year 2001 – 2012 Keswick Reservoir Elevation
- 26 • 5.20 Historical Water Year 2001 – 2012 Sacramento River Mean Daily Flows  
27 at Bend Bridge
- 28 • 5.21 Historical Water Year 2001 – 2012 Sacramento River Mean Daily Flows  
29 at Vina Bridge
- 30 • 5.22 Historical Water Year 2001 – 2012 Sacramento River Mean Daily Flows  
31 at Hamilton City

Chapter 5: Surface Water Resources and Water Supply Figures

- 1 • 5.23 Historical Water Year 2001 – 2012 Sacramento River Mean Daily Flows  
2 at Wilkins Slough
- 3 • 5.24 Historical Water Year 2001 – 2012 Sacramento River Mean Daily Flows  
4 at Verona
- 5 • 5.25 Historical Water Year 2001 – 2012 Sacramento River Mean Daily Flows  
6 at Freeport
- 7 • 5.26 Historical Water Year 2001 – 2012 Flows into Yolo Bypass over  
8 Fremont Weir
- 9 • 5.27 Historical Water Year 2001 – 2012 Lake Oroville Storage
- 10 • 5.28 Historical Water Year 2001 – 2012 Lake Oroville Elevation
- 11 • 5.29 Historical Water Year 2001 – 2012 Thermalito Reservoir Storage
- 12 • 5.30 Historical Water Year 2008 – 2012 Thermalito Reservoir Elevation
- 13 • 5.31 Historical Water Year 2001 – 2012 Feather River Mean Daily Flows near  
14 Gridley
- 15 • 5.32 Historical Water Year 2001 – 2012 Folsom Lake Storage
- 16 • 5.33 Historical Water Year 2001 – 2012 Folsom Lake Elevation
- 17 • 5.34 Historical Water Year 2001 – 2012 Lake Natoma Storage
- 18 • 5.35 Historical Water Year 2001 – 2012 Lake Natoma Elevation
- 19 • 5.36 Historical Water Year 2001 – 2012 American River Mean Daily Flows at  
20 Fair Oaks
- 21 • 5.37 Historical Water Year 2001 – 2012 San Joaquin River Mean Daily Flows  
22 at Mendota
- 23 • 5.38 Historical Water Year 2001 – 2012 San Joaquin River Mean Daily Flows  
24 at Vernalis
- 25 • 5.39 Historical Water Year 2001 – 2012 New Melones Reservoir Storage
- 26 • 5.40 Historical Water Year 2001 – 2012 New Melones Reservoir Elevation
- 27 • 5.41 Historical Water Year 2001 – 2012 Goodwin Reservoir Storage
- 28 • 5.42 Historical Water Year 2001 – 2012 Goodwin Reservoir Elevation
- 29 • 5.43 Historical Water Year 2001 – 2012 Stanislaus River Mean Daily Flows  
30 at Orange Blossom Bridge
- 31 • 5.44 Historical Water Year 2001 – 2012 San Luis Reservoir Storage
- 32 • 5.45 Historical Water Year 2001 – 2012 San Luis Reservoir Elevation
- 33 • 5.46 Historical Water Year 2001 – 2012 Delta Outflow Mean Daily Flows

- 1 • 5.47 Historical Water Year 2001 – 2012 Jones Pumping Plant Mean Daily  
2 Flows
- 3 • 5.48 Historical Water Year 2001 – 2012 Banks Pumping Plant Mean Daily  
4 Flows
- 5 • 5.49 Historical Water Year 2008 – 2012 Barker Slough Pumping Plant Mean  
6 Daily Flows
- 7 • 5.50 Historical Water Year 2008 – 2012 Contra Costa Canal Rock Slough  
8 Intake Mean Daily Flows
- 9 • 5.51 Historical Water Year 2008 – 2012 Contra Costa Water District Old  
10 River Intake Mean Daily Flows
- 11 • 5.52 Historical Water Year 2010 – 2012 Contra Costa Water District Middle  
12 River Intake Mean Daily Flows
- 13 • 5.53 Trinity River below Lewiston Reservoir, Long-Term Average Flow
- 14 • 5.54 Trinity River below Lewiston Reservoir, Wet Year, Long-Term Average  
15 Flow
- 16 • 5.55 Trinity River below Lewiston Reservoir, Dry Year Long-Term Average  
17 Flow
- 18 • 5.56 Sacramento River downstream of Keswick Reservoir, Long-Term  
19 Average Flow
- 20 • 5.57 Sacramento River downstream of Keswick Reservoir, Wet Year Long-  
21 Term Average Flow
- 22 • 5.58 Sacramento River downstream of Keswick Reservoir, Dry Year Long-  
23 Term Average Flow
- 24 • 5.59 Sacramento River at Freeport, Long-Term Average Flow
- 25 • 5.60 Sacramento River at Freeport, Wet Year Long-Term Average Flow
- 26 • 5.61 Sacramento River at Freeport, Dry Year Long-Term Average Flow
- 27 • 5.62 Feather River downstream of Thermalito, Long-Term Average Flow
- 28 • 5.63 Feather River downstream of Thermalito, Wet Year Long-Term Average  
29 Flow
- 30 • 5.64 Feather River downstream of Thermalito, Dry Year Long-Term Average  
31 Flow
- 32 • 5.65 American River downstream of Nimbus Dam, Long-Term Average Flow
- 33 • 5.66 American River downstream of Nimbus Dam, Wet Year Long-Term  
34 Average Flow
- 35 • 5.67 American River downstream of Nimbus Dam, Dry Year Long-Term  
36 Average Flow

## Chapter 5: Surface Water Resources and Water Supply Figures

- 1 • 5.68 Stanislaus River below Goodwin, Long-Term Average Flow
- 2 • 5.69 Stanislaus River below Goodwin, Wet Year Long-Term Average Flow
- 3 • 5.70 Stanislaus River below Goodwin, Dry Year Long-Term Average Flow
- 4 • 5.71 San Joaquin River at Vernalis, Long-Term Average Flow
- 5 • 5.72 San Joaquin River at Vernalis, Wet Year Long-Term Average Flow
- 6 • 5.73 San Joaquin River at Vernalis, Dry Year Long-Term Average Flow
- 7 • 5.74 Sacramento/San Joaquin River Delta Outflow, Long-Term Average Flow
- 8 • 5.75 Sacramento/San Joaquin River Delta Outflow, Wet Year Long-Term  
9 Average Flow
- 10 • 5.76 Sacramento/San Joaquin River Delta Outflow, Dry Year Long-Term  
11 Average Flow
- 12 • 5.77 Old and Middle River, Long-Term Average Flow
- 13 • 5.78 Old and Middle River, Wet Year Long-Term Average Flow
- 14 • 5.79 Old and Middle River, Dry Year Long-Term Average Flow

<sup>15</sup> Based on the 82-year simulation period; Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

<sup>16</sup> Wet-Year and Dry-Year as defined by the Sacramento 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999), projected to year 2030

**Chapter 6****1 Surface Water Quality****2 6.1 Introduction**

3 This chapter describes Surface Water Quality in the study area; and potential  
4 changes that could occur as a result of implementing the alternatives evaluated in  
5 this Environmental Impact Statement (EIS). Implementation of the alternatives  
6 could affect these resources through potential changes in operation of the Central  
7 Valley Project (CVP) and State Water Project (SWP) and ecosystem restoration.

**8 6.2 Regulatory Environment and Compliance**  
**9 Requirements**

10 Potential actions that could be implemented under the alternatives evaluated in  
11 this EIS could affect surface water resources impacted by changes in the  
12 operations of CVP or SWP reservoirs and in the vicinity of and lands served by  
13 CVP and SWP water supplies. Actions located on public agency lands; or  
14 implemented, funded, or approved by Federal and state agencies would need to be  
15 compliant with appropriate Federal and state agency policies and regulations, as  
16 summarized in Chapter 4, Approach to Environmental Analyses.

17 Several of the Federal and state laws and regulations that provide quantitative  
18 criteria to determine compliance also are summarized in this subsection of this  
19 chapter to provide context for information provided in the remaining sections of  
20 this chapter.

**21 6.2.1 Federal Water Pollution Control Act Amendments of 1972**  
**22 (Clean Water Act)**

23 The Federal Water Pollution Control Act Amendments of 1972, also known as the  
24 Clean Water Act (CWA), established the institutional structure for the U.S.  
25 Environmental Protection Agency (USEPA) to regulate discharges of pollutants  
26 into the waters of the United States, establish water quality standards, conduct  
27 planning studies, and provide funding for specific grant projects. The CWA was  
28 further amended through the CWA of 1977 and the Water Quality Act of 1987.  
29 The California State Water Resources Control Board (SWRCB) has been  
30 designated by the USEPA to develop and enforce water quality objectives and  
31 implementation plans in California, as described below under State Policies and  
32 Regulations.

33 The California RWQCBs have adopted, and the SWRCB has approved, water  
34 quality control plans (basin plans) for each watershed basin in the State. The  
35 basin plans designate the beneficial uses of waters within each watershed basin,  
36 and water quality objectives designed to protect those uses pursuant to

1 Section 303 of the CWA. The beneficial uses together with the water quality  
 2 objectives that are contained in the basin plans constitute State water quality  
 3 standards.

4 Under the CWA section 303(d), the USEPA identifies and ranks water bodies for  
 5 which existing pollution controls are insufficient to attain or maintain water  
 6 quality standards based upon information prepared by all states, territories, and  
 7 authorized Indian tribes (referred to collectively as “states” in the CWA). This  
 8 list of impaired waters for each state comprises the state’s 303(d) list. Each state  
 9 must establish priority rankings and develop Total Maximum Daily Load  
 10 (TMDL) values for all impaired waters. TMDLs calculate the greatest pollutant  
 11 load that a water body can receive and still meet water quality standards and  
 12 designated beneficial uses.

13 Section 305(b) of the CWA requires every state to submit a biennial water quality  
 14 assessment of all state waters. These state-wide reports serve as the basis for  
 15 USEPA’s national Water Quality Inventory Report to Congress. Each water body  
 16 is assessed regarding its ability to support the most common beneficial uses:  
 17 aquatic life, drinking water supply, fish consumption, non-contact recreation,  
 18 shell fishing, and swimming; also known as core beneficial uses (SWRCB  
 19 2010a).The USEPA requires states to integrate the 303(d) and 305(b) reports. For  
 20 California, this report is called the California 303(d)/305(b) Integrated Report,  
 21 and is prepared by the SWRCB using Integrated Reports submitted by each  
 22 RWQCB (SWRCB 2010a). The 303(d) and 305(b) processes are further  
 23 explained below under State Policies and Regulations.

24 The California Environmental Protection Agency, SWRCB, and RWQCBs have  
 25 identified numerous water bodies within the project area that do not comply with  
 26 applicable water quality standards and either adopted or are developing TMDLs,  
 27 shown below in Table 6.1.

28 **Table 6.1 Constituents of Concern per the 303(d) list within the Study Area**

Region	Waterbody	Constituent of Concern	TMDL Status <sup>1</sup>
Trinity and Lower Klamath Rivers	Trinity Lake (was Claire Engle Lake)	Mercury	Expected: 2019
	Trinity River HU, Lower Trinity HA; Trinity River HU, Middle HA; Trinity River HU, South Fork HA; Trinity River, Upper HA; Trinity River HU, Upper HA, Trinity River, East Fork	Sedimentation/Siltation, Temperature <sup>2</sup> , Mercury <sup>3</sup>	Approved: 2001
	Klamath River HU, Lower HA, Klamath Glen HAS	Nutrients, Organic, Enrichment/Low Dissolved Oxygen, Water Temperature	Approved: 2010
		Sedimentation/Siltation	Expected: 2025

Region	Waterbody	Constituent of Concern	TMDL Status <sup>1</sup>
Sacramento River Basin	Shasta Lake (where West Squaw Creek Enters); Keswick Reservoir (portion downstream from Spring Creek); Spring Creek, Lower (Iron Mountain Mine to Keswick Reservoir)	Acid Mine Drainage <sup>4</sup> , Cadmium, Copper, Zinc	Expected: 2020
	Shasta Lake; Whiskeytown Lake (areas near Oak Bottom, Brandy Creek Campgrounds and Whiskeytown); Clear Creek (below Whiskeytown Lake, Shasta County)	Mercury	Expected: 2021
	Sacramento River (Keswick Dam to the Delta) <sup>5</sup>	Unknown Toxicity	Expected: 2019
		Chlordane <sup>6</sup> , DDT, Mercury <sup>7</sup> , PCBs, Dieldrin <sup>8</sup>	Expected: 2021
	Colusa Basin Drain	Diazinon	Expected: 2008
		Malathion	Expected: 2010
		Azinphos-methyl (Guthion), Group A Pesticides, Unknown Toxicity	Expected: 2019
		DDT, Dieldrin, E. coli, Low Dissolved Oxygen, Mercury, Carbofuran	Expected: 2021
	Oroville Lake; Feather River, Lower (Lake Oroville Dam to Confluence with Sacramento River), Yuba River, Lower <sup>9</sup>	Group A Pesticides	Expected: 2011
		Chlorpyrifos, Unknown Toxicity	Expected: 2019
		Mercury, PCBs	Expected: 2021
	Folsom Lake; Natoma, Lake; American River, Lower (Nimbus Dam to confluence with Sacramento River) <sup>10</sup>	Mercury	Expected: 2019
		Unknown Toxicity, PCBs	Expected: 2021
	Cache Creek, Lower (Clear Lake Dam to Cache Creek Settling Basin near Yolo Bypass)	Mercury	Approved: 2007
Unknown Toxicity		Expected: 2019	
Boron		Expected: 2021	
San Joaquin River and Tulare Basins	Mendota Pool; Panoche Creek (Silver Creek to Belmont Avenue)	Mercury <sup>11</sup>	Expected: 2021
		Selenium	Expected: 2019
		Sediment Toxicity <sup>12</sup>	Expected: 2021
		Sedimentation/Siltation <sup>12</sup>	Expected: 2007

Chapter 6: Surface Water Quality

Region	Waterbody	Constituent of Concern	TMDL Status <sup>1</sup>
	Agatha Canal (Merced County); Grasslands Marshes; Mud Slough, North (downstream of San Luis Drain); Salt Slough (upstream from confluence with San Joaquin River) <sup>13</sup>	Selenium <sup>14</sup>	Approved: 2002
		Chlorpyrifos	Approved: 2008
		Boron, Electrical Conductivity, Pesticides, Unknown Toxicity <sup>15</sup>	Expected: 2019
		Escherichia coli, Mercury, pH, Prometryn	Expected: 2021
	San Luis Reservoir	Mercury	Expected: 2021
	O'Neil Forebay		Expected: 2012
	Millerton Lake; San Joaquin River (Friant Dam to Stanislaus River) <sup>16</sup>	Selenium <sup>17, 18</sup>	Approved: 2002
		Chlorpyrifos, Diazinon <sup>19</sup>	Approved: 2007
		DDE20, DDT, Group A Pesticides	Expected: 2011
			Expected: 2012
		Boron <sup>21</sup> , Invasive Species <sup>23</sup> , Unknown Toxicity	Expected: 2019
		Arsenic <sup>24</sup> , Electrical Conductivity <sup>18, 22</sup> , Mercury <sup>18</sup> , Water Temperature <sup>26</sup>	Expected: 2021
		alpha.-BHC <sup>20</sup> , Escherichia coli <sup>18, 25</sup> ,	Expected: 2022
	San Joaquin River (Stanislaus River to Delta Boundary)	Chlorpyrifos, Electrical Conductivity	Approved: 2007
		DDE, DDT, Group A Pesticides	Expected: 2011
		Mercury	Expected: 2012
		Toxaphene, Unknown Toxicity	Expected: 2019
		Diuron, Escherichia coli, Water Temperature	Expected: 2021
	Merced River, Lower; Tuolumne River, Lower; New Melones Reservoir; Tulloch Reservoir; Stanislaus River, Lower <sup>27</sup>	Diazinon	Expected: 2010
		Group A Pesticides	Expected: 2011
		Chlorpyrifos, Mercury, Water Temperature	Expected: 2021
		Unknown Toxicity	Expected: 2022
		Invasive Species	Expected: 2019

Region	Waterbody	Constituent of Concern	TMDL Status <sup>1</sup>
	Cosumnes River, Lower (below Michigan Bar; partly in Delta Waterways, eastern portion)	Escherichia coli, Sediment Toxicity	Expected: 2021
	Mokelumne River, Lower (in Delta Waterways, eastern portion)	Copper, Zinc	Expected: 2020
		Chlorpyrifos, Mercury, Dissolved Oxygen, Unknown Toxicity	Expected: 2021
	Calaveras River, Lower (from Stockton Diverting Canal to the San Joaquin River; partly in Delta waterways, eastern portion)	Chlorpyrifos, Diazinon	Approved: 2007
		Pathogens	Approved: 2008
		Organic Enrichment/Low Dissolved Oxygen	Expected: 2012
		Mercury	Expected: 2021
	Kings River, Lower (Island Weir to Stinson and Empire Weirs); Kings River, Lower (Pine Flat Reservoir to Island Weir); Kaweah River (below Terminus Dam, Tulare County); Kaweah River, Lower (includes St Johns River) <sup>28</sup>	Electrical Conductivity, Molybdenum, Toxaphene	Expected: 2015
		Chlorpyrifos <sup>29</sup> , pH <sup>30</sup> , Unknown Toxicity	Expected: 2021
	Sacramento-San Joaquin River Delta	Sacramento San Joaquin Delta	Mercury
PCBs			Expected: 2008
Selenium			Expected: 2010
Chlordane, DDT, Dieldrin			Expected: 2013
Dioxin compounds, Furan Compounds, Invasive Species			Expected: 2019
Delta waterways (central, eastern, northern, northwestern, western portion, southern portions, export area, and Stockton Ship Channel)		Chlorpyrifos <sup>31</sup> , Diazinon, Organic Enrichment/Low Dissolved Oxygen <sup>32</sup>	Approved: 2007
		Pathogens <sup>32</sup>	Expected: 2008
		Mercury	Expected: 2009
		Chlordane <sup>33</sup> , DDT, Dieldrin <sup>33</sup> , Group A Pesticides	Expected: 2011
		Dioxin <sup>32</sup> , Electrical Conductivity <sup>34</sup> , Furan Compounds <sup>32</sup> , Invasive Species, PCBs <sup>35</sup> , Unknown Toxicity	Expected: 2019

Chapter 6: Surface Water Quality

Region	Waterbody	Constituent of Concern	TMDL Status <sup>1</sup>
Suisun Bay and Suisun Marsh	Suisun Bay	Mercury	Approved: 2008
		PCBs	Expected: 2008
		Selenium	Expected: 2010
		Chlordane, DDT, Dieldrin	Expected: 2013
		Dioxin compounds, Furan Compounds, Invasive Species	Expected: 2019
	Suisun Marsh Wetlands	Mercury, Nutrients, Organic Enrichment/Low Dissolved Oxygen, Salinity/TDS/Chlorides	Expected: 2013
San Francisco Bay Region	Carquinez Strait and San Pablo Bay	Mercury	Approved: 2008
		PCBs	Expected: 2008
		Selenium	Expected: 2010
		Chlordane, DDT, Dieldrin	Expected: 2013
		Dioxin compounds, Furan Compounds, Invasive Species	Expected: 2019

1 Source: SWRCB 2011A

2 Notes:

3 1 TMDL status is either expected to be completed or approved by USEPA in the year  
4 specified

5 2 Water temperature is only a constituent of concern for the South Fork Trinity River and  
6 a TMDL is expected to be completed in 2019.

7 3 Mercury is only a constituent of concern for the East Fork Trinity River in the upper  
8 hydrologic area and a TMDL is expected to be completed in 2019.

9 4 Acid Mine Drainage is a constituent of concern at Spring Creek only

10 5 Chlordane, DDT, PCBs, Dieldrin not constituents of concern for Sacramento River  
11 (Keswick Dam to Red Bluff)

12 6 Chlordane not a constituent of concern for Sacramento River (Red Bluff to Knights  
13 Landing)

14 7 Mercury not a constituent of concern for Sacramento River (Keswick Dam to  
15 Cottonwood Creek). Mercury TMDL is expected to be complete in 2012 for Sacramento  
16 River (Knights Landing to the Delta)

17 8 Dieldrin TMDL for Sacramento from Knights Landing to the Delta is expected to be  
18 completed in 2022.

- 1 9 Mercury is the only constituent of concern for Yuba River and a TMDL is expected to be  
 2 complete in 2021. Mercury TMDL expected to be complete in 2021 for Feather River,  
 3 Lower (Lake Oroville Dam to Confluence with Sacramento River). Mercury and PCBs are  
 4 the only constituents of concern for Lake Oroville and TMDLs are expected to be  
 5 complete in 2021 for both constituents.
- 6 10 Mercury is the only constituent of concern for Folsom Lake and Lake Natoma.  
 7 Mercury TMDL is expected to be completed in 2010 for American River, Lower (Nimbus  
 8 Dam to confluence with Sacramento River)
- 9 11 Mercury TMDL for Panoche Creek (Silver Creek to Belmont Avenue) expected to be  
 10 complete in 2020.
- 11 12 Not a constituent of concern for Mendota Pool
- 12 13 pH and selenium are the only constituents of concern for Agatha Canal (Merced  
 13 County). Electrical conductivity and Selenium are the only constituents of concern for  
 14 Grasslands Marshes. Boron, Electrical Conductivity, Pesticides, Selenium, and Unknown  
 15 Toxicity are the only constituents of concern for Mud Slough, North (downstream of San  
 16 Luis Drain). pH, selenium, and pesticides are not constituents of concern for Salt Slough  
 17 (upstream from confluence with San Joaquin River)
- 18 14 The CVRWQCB completed a TMDL for selenium in the lower San Joaquin River  
 19 (downstream of the Merced River) in 2001 and Salt Slough in 1997/1999, and USEPA  
 20 approved this in 2002.
- 21 15 The unknown toxicity TMDL for Mud Slough (downstream of San Luis Drain) is  
 22 expected to be written and complete in 2021.
- 23 16 Mercury is the only constituent of concern for Millerton Lake and a TMDL is expected  
 24 to be complete in 2019.
- 25 17 Selenium is only a constituent of concern in San Joaquin River (Mud Slough to  
 26 Merced River)
- 27 18 Electrical conductivity, Escherichia coli, mercury and selenium are not constituents of  
 28 concern for San Joaquin River (Mendota Pool to Bear Creek). The Electrical Conductivity  
 29 TMDL for San Joaquin River (Bear Creek to Merced River) is expected to be written and  
 30 complete in 2019. The Mercury TMDL for San Joaquin River (Bear Creek to Stanislaus  
 31 River) is expected to be written and complete in 2012.
- 32 19 Diazinon not a constituent of concern for San Joaquin River (Bear Creek to Mud  
 33 Slough and Merced River to Tuolumne River)
- 34 20 DDE and alpha.-BHC is only a constituent of concern in San Joaquin River (Merced  
 35 River to Tuolumne River)
- 36 21 The Boron TMDL for San Joaquin River (Merced to Tuolumne River) was approved by  
 37 the USEPA in 2007. Boron is not a constituent of concern for the San Joaquin River  
 38 (Tuolumne River to Stanislaus River).
- 39 22 The Electrical Conductivity TMDL for San Joaquin River (Tuolumne River to  
 40 Stanislaus River) is expected to be written and complete in 2021.

## Chapter 6: Surface Water Quality

- 1 23 Invasive species only a constituent of concern for the San Joaquin River (Friant Dam  
2 to Mendota Pool).
- 3 24 Arsenic not a constituent of concern in San Joaquin River except Bear Creek to Mud  
4 Slough.
- 5 25 Escherichia coli is not a constituent of concern for San Joaquin River (Mendota Pool  
6 to Bear Creek and Merced River to Stanislaus River). The Escherichia coli TMDL for San  
7 Joaquin River (Bear Creek to Mud Slough) is expected to be written and complete in  
8 2021.
- 9 26 Water temperature is only a constituent of concern for San Joaquin River (Merced  
10 River to Stanislaus River)
- 11 27 Mercury is the only constituent of concern for New Melones Reservoir and Tulloch  
12 Reservoir. The diazinon TMDL for lower Merced River and lower Stanislaus River is  
13 expected to be complete in 2008. The Chlorpyrifos TMDL for the lower Merced River is  
14 expected to be complete in 2008. The Mercury TMDL for lower Merced River is expected  
15 to be complete in 2019 and lower Stanislaus River TMDL is expected to be complete in  
16 2020. The Unknown Toxicity TMDL for lower Stanislaus River is expected to be complete  
17 in 2019 and lower Merced River is expected in 2021.
- 18 28 The only constituents of concern for Kings River, Lower (Island Weir to Stinson and  
19 Empire Weirs) are electrical conductivity, toxaphene, molybdenum.
- 20 29 Chlorpyrifos is only a constituent of concern for Kings River, Lower (Pine Flat  
21 Reservoir to Island Weir).
- 22 30 pH is only a constituent of concern for Kaweah River (below Terminus Dam, Tulare  
23 County).
- 24 31 Chlorpyrifos TMDL for Delta waterways (central portion) expected to be complete in  
25 2019. Chlorpyrifos TMDL for Delta waterways (western portion) expected to be complete  
26 in 2006.
- 27 32 Not a constituent of concern for Delta waterways except for Stockton Ship Channel.
- 28 33 Not a constituent of concern for Delta waterways except for northern portion.
- 29 34 Not a constituent of concern for Delta waterways (central, northern, eastern portions,  
30 and Stockton Ship Channel)
- 31 35 Not a constituent of concern for Delta waterways except for the northern portion and  
32 the Stockton Ship Channel.
- 33 National Toxics Rule (NTR) was established by USEPA in accordance with  
34 CWA section 303 to provide ambient water quality criteria for priority toxic  
35 pollutants to protect aquatic life and human health.
- 36 The Secretary of the Interior established the first antidegradation policy in 1968.  
37 In 1975, USEPA included the antidegradation requirements in the Water Quality  
38 Standards Regulation (40 Code of Federal Regulations [CFR] 130.17, 40 CFR  
39 55340-41). The requirements were included in the 1987 CWA amendment in  
40 section 303(d)(4(B)). The Federal antidegradation policy requires states to

1 develop regulations to allow increases in pollutant loadings or changes in surface  
 2 water quality only if: 1) existing surface water uses are maintained and protected,  
 3 and established water quality requirements are met; 2) if water quality  
 4 requirements cannot be maintained by a project, water quality must be maintained  
 5 to fully protect “fishable/swimmable” uses and other existing uses; and 3) for  
 6 Outstanding National Resource Waters water quality criteria where “States may  
 7 allow some limited activities which result in temporary and short-term changes in  
 8 water quality” (Water Quality Standards Regulations) but would not impact  
 9 existing uses or special use of these waters.

## 10 **6.2.2 Major California Water Quality Regulations**

11 The Porter Cologne Water Quality Control Act (Porter-Cologne Act) established  
 12 the SWRCB and divided the state into nine regions, each overseen by a RWQCB.  
 13 The nine RWQCBs have the primary responsibility for the coordination and  
 14 control of water quality within their respective jurisdictional boundaries. The  
 15 SWRCB and the RWQCBs have been delegated Federal authority to implement  
 16 the requirements of the Federal CWA in California. The RWQCBs that have  
 17 jurisdiction over the water bodies in the project area are the NCRWQCB,  
 18 CVRWQCB, SFB RWQCB, Central Coast RWQCB, Los Angeles RWQCB,  
 19 Santa Ana RWQCB, San Diego RWQCB, Lahontan RWQCB, and Colorado  
 20 River RWQCB. The Porter-Cologne Act requires the RWQCBs to prepare and  
 21 periodically update basin plans. Basin plans establish beneficial uses of water,  
 22 water quality objectives, and implementation programs for achieving the  
 23 objectives.

24 The State of California has adopted several water quality policies that are similar  
 25 to federal water quality policies, including the California Toxics Rule (CTR) and  
 26 the Policy for Implementing Toxic Standards for Inland Surface Waters, Enclosed  
 27 Bays, and Estuaries of California (State Implementation Policy).

28 The CTR is applicable to all State waters, as are the USEPA advisory National  
 29 Recommended Water Quality Criteria. Fresh water criteria apply to waters of  
 30 salinity less than 1 parts per thousand 95 percent or more of the time, seawater  
 31 criteria are for water greater than 10 parts per thousand 95 percent or more of the  
 32 time, and estuarine waters use the more stringent of the two possible criteria, in  
 33 absence of estuary-specific criteria.

34 The State Implementation Policy for water quality control, adopted in 2000,  
 35 applies to discharges of toxic pollutants into the inland surface waters, enclosed  
 36 bays, and estuaries of California subject to regulation under the Porter-Cologne  
 37 Act and the Federal CWA. This policy establishes:

- 38 • Implementation provisions for priority pollutant criteria promulgated by the  
 39 USEPA through the NTR and the CTR, and for priority pollutant objectives  
 40 established by RWQCBs in their basin plans;
- 41 • Monitoring requirements for 2,3,7,8-tetrachlorodibenzodioxin (TCDD)  
 42 equivalents; and
- 43 • Chronic toxicity control provisions.

1     **6.2.2.1     Basin Plans**

2     The RWQCBs are required to formulate and adopt basin plans for all areas under  
3     their jurisdiction under the Porter-Cologne Act. Each basin plan must contain  
4     water quality objectives to ensure the reasonable protection of beneficial uses, as  
5     well as a program of implementation for achieving water quality objectives with  
6     the basin plans.

7     Section 13050(f) of the Porter-Cologne Act lists the beneficial uses of the waters  
8     of the state that may be protected against water quality degradation, which include  
9     but are not limited to: domestic, municipal, agricultural, and industrial supply;  
10    power generation; recreation; aesthetic enjoyment; navigation; and preservation  
11    and enhancement of fish, and wildlife and other aquatic resources or preserves.  
12    Basin plans must designate and protect beneficial uses in the region. A uniform  
13    list of beneficial uses is defined by the SWRCB, however each RWQCB may  
14    identify additional beneficial uses specific to local water bodies.

15    Basin plans must adopt water quality standards to protect public health or welfare,  
16    enhance the quality of water, and serve the purposes of the CWA. These water  
17    quality standards include: designated beneficial uses; water quality objectives to  
18    protect the beneficial uses; implementation of the Federal and State policies for  
19    antidegradation; and general policies for application and implementation.

20    The basin plans are subject to modification, considering applicable laws, policies,  
21    technologies, water quality conditions and priorities. Basin plans must be  
22    assessed every three years for the appropriateness of existing standards and  
23    evaluation and prioritization of basin planning issues. In California however,  
24    water bodies are assessed every two years for CWA 303(d) and 305(b)  
25    requirements. Revisions are accomplished through Basin Plan amendments.  
26    Once a Basin Plan amendment is adopted in noticed public hearings, it must be  
27    approved by the SWRCB, Office of Administrative Law and in some cases, the  
28    USEPA.

29    **6.2.2.1.1    California 303(d)/305(b) Integrated Reports**

30    The California 303(d)/305(b) Integrated Report is updated biennially for inclusion  
31    in the USEPA's national Water Quality Inventory Report to Congress. The report  
32    is composed of the current California 303(d) list, and all current listing decisions  
33    for contaminants in impaired water bodies. The statewide report is the  
34    compilation of 303(d)/305(b) Integrated Reports submitted by each RWQCB.  
35    The final California 303(d) list must be submitted to and approved by the USEPA  
36    before it becomes effective.

37    The most recent statewide report is the 2010 California 305(b)/303(d) Integrated  
38    Report, accompanied by the 2010 Staff Report, which outlines the process by  
39    which water bodies were assessed for impairment and by which listing decisions  
40    were made. Each successive 303(d) list updates the previous approved 303(d)  
41    list, in this case the 2006 Section 303(d) list. The updates are made by each  
42    RWQCB in accordance with the Water Quality Control Policy for Developing  
43    California's CWA Section 303(d) list ("Listing Policy").

1 For the 2010 Integrated Report, the data assessed included the 2006 California  
2 CWA Section 303(d) list and its supporting data and information, applicable  
3 Surface Water Ambient Monitoring Program (SWAMP) data from 2000 to 2007,  
4 data from several local monitoring programs, and data provided during public  
5 solicitation. Data incorporated into the assessment were existing and readily  
6 available to RWQCB staff.

7 Data were assessed to identify the beneficial uses for each water body, and  
8 whether water quality criteria were being met. The core beneficial uses most  
9 commonly evaluated were aquatic life, drinking water supply, fish consumption,  
10 non-contact recreation, shell fishing, and swimming. The water quality criteria  
11 considered included water quality objectives set forth by RWQCB Basin Plans,  
12 criteria included in Statewide Basin Plans, the CTR, and maximum contaminant  
13 level MCLs. Narrative “Evaluation Guidelines” were designated for pollutants  
14 without numeric Basin Plan Objectives, MCLs or CTR criteria, as described in the  
15 Listing Policy.

16 The data and assessment results were summarized in LOEs for water body  
17 segment-contaminant combinations. The LOEs include specific information used  
18 to determine whether water quality standards are being met for the water body  
19 segment, including: affected beneficial uses; relevant pollutant; relevant water  
20 quality criteria; and detailed information regarding data samples and quality  
21 assurance information. Fact sheets were prepared that summarize the LOEs and  
22 the reasoning for inclusion or exclusion of the water body-pollutant combination  
23 from the 303(d) list. The fact sheets are stored in the Water Boards’ California  
24 Water Quality Assessment (CalWQA) database.

25 Water body segment-contaminant combinations were categorized into one of  
26 three Beneficial Use Support Ratings: fully supporting (supporting), not  
27 supporting, and insufficient information. These Beneficial Use Support Ratings  
28 were used as the basis for categorizing the water bodies into Integrated Report  
29 categories.

30 For water bodies that are in need of a TMDL, the Listing Policy provides  
31 instruction for scheduling TMDL development, based on, among other factors,  
32 the significance of the water segment, the degree that water quality objectives are  
33 not met or that beneficial uses are threatened, and the potential threat to human  
34 health and the environment.

35 The 2010 California 305(b)/303(d) Integrated Report results in a significant  
36 increase in proposed 303(d) listings in comparison to previous years. This is  
37 likely the result of a large volume of water quality data available for the 2010  
38 assessment, which was not available for the 2006 assessment. There are also  
39 more protective water quality standards for some water bodies, requiring their  
40 addition to the 303(d) list.

#### 41 **6.2.2.2 Central Valley Salinity Alternatives for Long-term Sustainability** 42 **(CV-SALTS)**

43 In 2006, the CVRWQCB, the SWRCB, and stakeholders began a joint effort to  
44 address salinity and nitrate problems in California's Central Valley and adopt

1 long-term solutions that will lead to enhanced water quality and economic  
2 sustainability. This effort is referred to as the CV-SALTS Initiative. The goal of  
3 CV-SALTS is to develop a comprehensive region-wide Salt and Nitrate  
4 Management Plan (SNMP) describing a water quality protection strategy that will  
5 be implemented through a mix of voluntary and regulatory efforts. The SNMP  
6 may include recommendations for numeric water quality objectives, beneficial  
7 use designation refinements, and/or other refinements, enhancements, or basin  
8 plan revisions. The SNMP will serve as the basis for amendments to the three  
9 water quality control plans that cover the Central Valley Region (Sacramento  
10 River and San Joaquin River Basin Plan, the Tulare Lake Basin Plan and the  
11 Sacramento/San Joaquin Rivers Bay-Delta Plan) and the San Francisco Bay Area  
12 Region Basin Plan. The Basin Plan Amendments (BPAs) will likely establish a  
13 comprehensive implementation plan to achieve water quality objectives for  
14 salinity (including nitrate) in the Region's surface waters and groundwater; and  
15 the SNMP may include recommendations for numeric water quality objectives,  
16 beneficial use designation refinements, and/or other refinements, enhancements,  
17 or Basin Plan revisions.

## 18 **6.3 Affected Environment**

19 This section describes surface water quality that could be potentially affected by  
20 the implementation of the alternatives considered in this EIS. Changes in water  
21 quality due to changes in CVP and SWP operations may occur in the Trinity  
22 River, Central Valley, San Francisco Bay Area, and Central Coast and Southern  
23 California regions. Changes to surface water bodies and water supplies are  
24 described in Chapter 5, Surface Water Resources and Water Supplies.

25 This chapter focuses on constituents of concerns that could be affected by changes  
26 in CVP and SWP water operations. The constituents of concern have been  
27 identified in the Final California 2010 Integrated Report (303(d) List/305(b)  
28 Report) as well as other water quality reports. This section provides descriptions  
29 of sources of constituents, water quality effects, water quality objectives and/or  
30 guidelines, and plans to improve water quality.

### 31 **6.3.1 Beneficial Uses of Surface Waters in the Study Area**

32 Water quality conditions throughout the study area are assessed and described by  
33 the RWQCB Basin Plans and Integrated Reports. Each region has specific  
34 beneficial uses, as summarized in Table 6.2 and water quality constituents of  
35 concern; however, several pollutants are prevalent throughout the study area. The  
36 origins and prevalence of these pollutants are discussed below.

1 **Table 6.2 Designated Beneficial Uses within Project Study Area**

Surface Water Body	Municipal and Domestic Supply (MUN)	Agricultural Supply (AGR)	Industrial Service Supply (IND)	Industrial Process Supply (PRO)	Groundwater Recharge (GWR)	Fresh water Replenishment (FRSH)	Navigation (NAV)	Hydropower Generation (POW)	Water Contact Recreation (REC-1)	Non-Contact Water Recreation (REC-2)	Commercial and Sport Fishing (COMM)	Warm Fresh water Habitat (WARM)	Cold Fresh water Habitat (COLD)	Wildlife Habitat (WILD)	Rare, Threatened, or Endangered Species (RARE)	Marine Habitat (MAR)	Migration of Aquatic Organisms (MIGR)	Spawning, Reproduction, and/or Early Development (SPWN)	Shellfish Harvesting (SHELL)	Estuarine Habitat (EST)	Aquaculture (AQUA)	Native American Culture (CUL)	Flood Peak Attenuation/ Flood Water Storage (FLD)	Wetland Habitat (WET)	Water Quality Enhancement (WQE)

2 Notes:

3 E: Existing Beneficial Use; P: Potential Beneficial Use

4 1 Includes beneficial uses for the Trinity River within the Hoopa Valley Indian Reservation as designated by the Hoopa Valley Indian Reservation  
 5 Water Quality Control Plan, which, in addition to beneficial uses shown, also designates the Lower Trinity River as a Wild and Scenic waterway,  
 6 providing for scenic, fisheries, wildlife and recreational purposes.

7 2 Not all beneficial uses are present uniformly throughout this water body. They have been summarized to reflect beneficial uses present in  
 8 multiple segments of the water body.

9 3 Canoeing and rafting included in REC-1 designation.

## Chapter 6: Surface Water Quality

- 1 4 Resident does not include anadromous. Any Segments with both COLD and WARM beneficial use designations will be considered COLD water  
2 bodies for the application of water quality objectives.
- 3 5 Cold water protection for salmon and steelhead.
- 4 6 Warm water protection for striped bass, sturgeon, and shad.
- 5 7 Beneficial uses vary throughout the Delta and will be evaluated on a case-by-case basis. COMM is a designated beneficial use for the  
6 Sacramento San Joaquin Delta and Yolo Bypass waterways listed in Appendix 43 of the Basin Plan for the Sacramento River and San Joaquin  
7 River Basins and not any tributaries to the listed waterways or portions of the listed waterways outside of the legal Delta boundary unless  
8 specifically designated.
- 9 8 Delta beneficial uses are shown as designated by the Water Quality Control Plan for the Sacramento River Basin and the San Joaquin River  
10 Basin, and the Water Quality Control Plan for the San Francisco Bay/Sacramento San Joaquin Delta Estuary.
- 11 9 Per State Water Board Resolution No. 90-28, Marsh Creek and Marsh Creek Reservoir in Contra Costa County are assigned the following  
12 beneficial uses: REC-1 and REC-2 (potential uses), WARM, WILD and RARE. COMM is a designated beneficial use for Marsh Creek and its  
13 tributaries listed in Appendix 43 of the Basin Plan for the Sacramento River and San Joaquin River Basins within the legal Delta boundary.

### 1 **6.3.1.1 Water Temperature**

2 Water temperature is a concern in regions throughout California including the  
 3 lower Klamath River, Trinity Lake, Sacramento River, and the San Joaquin River.  
 4 These regions support warm and cold fresh water habitat and other aquatic  
 5 beneficial uses. Water bodies in these areas must maintain water temperatures  
 6 supportive of resident and seasonal fish species habitats, particularly for  
 7 endangered species. Common narrative and numeric water quality objectives for  
 8 water temperature in water bodies within the study area are specified in each of  
 9 the basin plans for the North Coast, Central Valley, Tulare Lake and the San  
 10 Francisco Bay regions (NCRWQCB 2011; CVRWQCB 2004, and 2011; SFB  
 11 RWQCB 2013):

- 12 • The natural receiving water temperature of intrastate waters shall not be  
 13 altered unless it can be demonstrated to the satisfaction of the Regional Water  
 14 Board that such alteration in temperature does not adversely affect beneficial  
 15 uses.
- 16 • At no time or place shall the temperature of cold or warm-intrastate waters be  
 17 increased by more than 5° F above natural receiving water temperature.

18 Water quality objectives for water temperature within the project study area are  
 19 also specified in the SWRCB *Water Quality Control Plan for Control of*  
 20 *Temperature in the Coastal and Interstate Waters and Enclosed Bays and*  
 21 *Estuaries of California (Statewide Temperature Plan).*

22 Further information on the measurement and enforcement of water quality  
 23 objectives for temperature is included in the Statewide Temperature Plan  
 24 (SWRCB 1998).

### 25 **6.3.1.2 Salinity**

26 Salinity, a measure of dissolved salts in water, is a concern in the tidally-  
 27 influenced Delta as it can cause impacts on domestic supply, agriculture, industry,  
 28 and wildlife (CALFED 2007). The impacts of salinity on the domestic supply of  
 29 water in the Delta include aesthetic (skin or tooth discoloration), or cosmetic  
 30 (taste, odor, or color) effects, and increasing the need to reduce salinity for M&I  
 31 uses by blending which can lead to a reduction in the quantity of usable water.  
 32 Salts, such as bromide, in drinking water can increase the formation of harmful  
 33 byproducts (see the Bromide, Organics, and Pathogens section). Salinity in the  
 34 Delta impacts agriculture by reducing crop yields and salinity in the soil can cause  
 35 plant stress. Another salt ion, chloride, in high concentrations in municipal and  
 36 industrial supply has been known to cause corrosion in canned goods because of  
 37 residual salts in paper boxes or linerboard.

38 Some fish and wildlife are also affected by salinity concentrations in the Delta  
 39 because certain levels of salinity are required during different life stages to  
 40 survive. One measure of salinity in the western Delta is “X2.” X2 refers to the  
 41 horizontal distance from the Golden Gate Bridge up the axis of the Delta estuary  
 42 to where tidally averaged near-bottom salinity concentration of 2 parts of salt in  
 43 1,000 parts of water occurs. The X2 standard was established to improve shallow

1 water estuarine habitat in the months of February through June and relates to the  
2 extent of salinity movement into the Delta (DWR, Reclamation, USFWS and  
3 NMFS 2013). The location of X2 is important to both aquatic life and water  
4 supply beneficial uses.

5 The CVP and SWP are operated to achieve salinity objectives in the Delta, as  
6 described in detail in Appendix 3A, No Action Alternative: Central Valley Project  
7 and State Water Project Operations.

8 The SWRCB D-1641 includes “spring X2” criteria that require operations of the  
9 CVP and SWP to include upstream reservoir releases from February through June  
10 to maintain freshwater and estuarine conditions in the western Delta to protect  
11 aquatic life. In addition, the 2008 U.S. Fish and Wildlife Service (USFWS)  
12 Biological Opinion (BO) also includes an additional Delta salinity requirement in  
13 September and October in wet and above normal water years (Fall X2), as  
14 described in Chapter 5, Surface Water Resources and Water Supplies.

### 15 **6.3.1.3 Mercury**

16 Mercury is a constituent of concern throughout California, both as total mercury  
17 and as biologically-formed methylmercury, which is more available for food  
18 chain exposure and toxicity. Mercury present in the Delta, its tributaries, Suisun  
19 Marsh, and San Francisco Bay is derived both from current processes and as a  
20 result of historical deposition. Most of the mercury present in these locations is  
21 the result of historical mining of mercury ore in the Coast Ranges (via Putah and  
22 Cache creeks to the Yolo Bypass) and the extensive use of elemental mercury to  
23 aid gold extraction processes in the Sierra Nevada (via Sacramento, San Joaquin,  
24 Cosumnes, and Mokelumne rivers) (Alpers et al. 2008; Wiener et al. 2003).  
25 Elemental mercury from historical gold mining processes appears to be more  
26 bioavailable than that from mercury ore tailings because mercury used in gold  
27 mining processes was purified before use (CVRWQCB 2010a). Additional  
28 sources of mercury include atmospheric deposition from both local and distant  
29 sources, and discharges from wastewater treatment plants (SWRCB 2014a).

30 Methylation of mercury is an important step in the entrance of mercury into food  
31 chain (USEPA 2001a). This transformation can occur in both sediment and the  
32 water column. Methylmercury is absorbed more quickly by aquatic organisms  
33 than inorganic mercury, and it biomagnifies (i.e., increases the concentration of  
34 methylmercury in predatory fish from eating smaller contaminated fish and  
35 invertebrates). The pH of water, the length of the aquatic food chain, water  
36 temperature, and dissolved organic material and sulfate are all factors that can  
37 contribute to the bioaccumulation of methylmercury in aquatic organisms. The  
38 proportion of an area that is wetlands, the soil type, and erosion can also  
39 contribute to the amount of mercury that is transported from soils to water bodies.  
40 These effects can be seen in the variability in bioaccumulated mercury in the  
41 Sacramento-San Joaquin River Delta.

42 Consumption of contaminated fish is the major pathway for human exposure to  
43 methylmercury (USEPA 2001a). Once consumed, methylmercury is almost  
44 completely absorbed into the blood and transported to all tissues, and is also

1 transmitted to the fetus through the placenta. Neurotoxicity from methylmercury  
 2 can result in mental retardation, cerebral palsy, deafness, blindness, and dysarthria  
 3 in utero, and in sensory and motor impairments in adults. Cardiovascular and  
 4 immunological effects from low-dose methylmercury exposure have also been  
 5 reported.

6 In an effort to protect aquatic and human health, USEPA recommended maximum  
 7 concentrations “without yielding unacceptable effects” in 2001 for acute  
 8 exposure, identified as the criteria maximum concentration (CMC), and for  
 9 chronic exposure, identified as the criterion continuous concentration (CCC)  
 10 (USEPA 2001a and USEPA 2014a). Current state-wide water quality criteria for  
 11 mercury were established in the CTR in 2000 (USEPA 2000a). Under these  
 12 requirements, total recoverable mercury for the protection of human health was  
 13 set as limits for consumption of water and organisms as well as consumption of  
 14 organisms only, as summarized in Table 6.3. Mercury objectives are also  
 15 included in some California RWQCB basin plans, as discussed in subsequent  
 16 sections of this chapter. Where both a CTR criterion and a Basin Plan objective  
 17 exist, the more stringent value applies (SWRCB 2006a).

18 **Table 6.3 Water Quality Criteria for Mercury and Methylmercury (as Total Mercury)**

NRWQC	For the protection of freshwater species		CMC = 1.4 µg/l
			CCC = 0.77 µg/l
	For the protection of saltwater species		CMC = 1.8 µg/l
			CCC = 0.94 µg/l
For the protection of human health <sup>1</sup>		0.3 mg/kg <sup>2</sup>	
CTR	For the protection of human health	Consumption of water + organism	0.050 µg/l
		Consumption of organism only	0.051 µg/l

19 Source: NRWQC (National Recommended Water Quality Criteria) - USEPA 2014a; CTR  
 20 (California Toxic Rule) - USEPA 2000a, USEPA 2001b

21 Notes:

22 1 For the consumption of organisms only and based on a total consumption 0.0175 kg  
 23 fish and shellfish per day.

24 2 Methylmercury in fish tissue (wet weight)

25 A review of the mercury human health criteria by USEPA in 2001 concluded that  
 26 a fish tissue (including shellfish) residue water quality criterion for  
 27 methylmercury is more appropriate than a water-column-based water quality  
 28 criterion (USEPA 2001a). A fish tissue criterion directly addresses the dominant  
 29 human exposure route for methylmercury, and thus is more closely tied to the  
 30 CWA goal of protecting public health. The USEPA also strongly encourages  
 31 States and authorized Tribes to develop local or regional water quality criteria if  
 32 they will be more appropriate for the target population.

1 The SWRCB is considering adopting statewide objectives for methylmercury  
2 based on the USEPA criteria, which would apply to inland waters, enclosed bays,  
3 and estuaries (SWRCB 2006a). These objectives would be applicable to waters  
4 that are not listed as impaired or that do not require a TMDL. Potential elements  
5 include a methylmercury fish tissue objective, a total mercury water quality  
6 objective, a methylmercury water quality objective, or some combination of these.  
7 Implementation procedures related to the NPDES permitting process also may be  
8 included.

9 The CTR criterion may be implemented as a fish tissue-based objective (FTO), or  
10 it may be converted into an ambient methylmercury water quality objective  
11 (AWQO), the latter reflecting the USEPA's fish consumption rate of 0.0175 kg  
12 fish/day, or site-specific consumption rates that more accurately reflect local  
13 consumption patterns (SWRCB 2006a). A USFWS evaluation of the USEPA  
14 criterion for methylmercury concluded that the FTO of 0.3 mg methylmercury/kg  
15 fish would be insufficient to protect three species that may occur in the study area  
16 including California Least Tern, California Clapper Rail, and Bald Eagle  
17 evaluated in the study.

#### 18 **6.3.1.4 Selenium**

19 Selenium is a constituent of concern in the project area because of its potential  
20 effects on water quality and on aquatic and terrestrial resources primarily in the  
21 San Joaquin Valley and the San Francisco Bay, as well as some locations in  
22 Southern California (SWRCB 2011a). Elevated concentrations of selenium in  
23 soil and waterways within the San Joaquin Valley, and to some extent in the San  
24 Francisco Bay, are due primarily to erosion of uplifted selenium-enriched  
25 Cretaceous and Tertiary marine sedimentary rock located at the base of the east-  
26 facing side of the Coastal Range (Presser and Piper 1998; Presser 1994). The  
27 selenium-enriched soil derived from the eroded rock has been transported to the  
28 western San Joaquin Valley through natural processes; selenium is mobilized  
29 from the soil by irrigation practices and transported to waterways receiving  
30 agricultural drainage (Presser and Ohlendorf 1987). Other sources of selenium to  
31 the western Delta and San Francisco Bay include several oil refineries located in  
32 the vicinity of Carquinez Strait and San Pablo Bay (Presser and Luoma 2013;  
33 SWRCB 2011a). The specific water bodies within these areas that may be  
34 affected by the project and are impaired by selenium, as specified on the  
35 California CWA Section 303(d) list, include the Panoche Creek (from Silver  
36 Creek to Belmont Avenue), Mendota Pool, Grasslands Marshes, San Joaquin  
37 River (from Mud Slough to Merced River), Sacramento-San Joaquin Delta, and  
38 Suisun Bay (SWRCB 2011a).

39 Adverse effects of selenium may occur as a result of either a selenium deficiency  
40 or excess in the diet (ATSDR 2003; Ohlendorf 2003); the latter is the primary  
41 concern in the case of the impaired water bodies on the 303(d) list. Because of  
42 the known effects of selenium bioaccumulation from water to aquatic organisms  
43 and to higher trophic levels in the food chain, the fresh water, estuarine and  
44 wildlife habitat; spawning, reproduction, and/or early development; and rare,  
45 threatened, or endangered species beneficial uses of the water bodies are the most

1 sensitive receptors to selenium exposure. Thus, excessive exposure can lead to  
2 selenium toxicity or selenosis and result in death or deformities of fish embryos,  
3 fry, or larvae (Ohlendorf 2003, Janz et al. 2010). Consequently, regulatory  
4 agencies have established exposure criteria to protect the beneficial uses of the  
5 water bodies.

6 Agencies such as the Agency for Toxic Substances and Disease Registry  
7 (ATSDR), California Office of Environmental Health Hazard Assessment  
8 (OEHHA), USEPA, SWRCB, and RWQCBs have determined acceptable  
9 selenium exposure levels for humans and water bodies in California. The  
10 ATSDR has stated the minimum risk levels (MRLs) for selenium to be ingested  
11 over a one-year period is 0.005 mg/kg/day, with an uncertainty factor of 3  
12 (ATSDR 2013a). The 0.005 mg/kg/day value is also used by OEHHA to develop  
13 guidelines for consuming fish (OEHHA 2008). USEPA has set 50 µg/l as the  
14 maximum MCL for selenium in drinking water and OEHHA has set a more  
15 stringent draft public health goal (PHG) of 30 µg/l for selenium in drinking water  
16 (USEPA 2009a; OEHHA 2010). USEPA has also specified through the  
17 California Toxics Rule that the water quality criteria for aquatic life in all of  
18 California's fresh water bodies except for the San Joaquin River from Merced  
19 River to Vernalis are 20 µg/l for short-term (1-hour average) and 5 µg/l for long-  
20 term (4-day average) exposure (USEPA 2000a). For the San Joaquin River from  
21 Merced River to Vernalis, the short-term exposure is 12 µg/l and long-term limit  
22 is 5 µg/l, as stated in the Sacramento-San Joaquin River Basin Plan (CVRWQCB  
23 2011). The water quality criteria for aquatic life in all of California's water  
24 bodies is 5 µg/l (4-day average exposure) and 20 µg/l (1-hour exposure) (USEPA  
25 2014a).

26 The USEPA, Reclamation, the SWRCB, and the RWQCBs have created plans to  
27 reduce the toxic levels of selenium in California's impaired water bodies. The  
28 USEPA's Action Plan consists of recommendations to restore water quality and to  
29 protect aquatic species in the San Francisco Bay and Sacramento-San Joaquin  
30 Delta, which include strengthening selenium water quality criteria to reduce long-  
31 term exposure of sensitive aquatic and terrestrial species to selenium (USEPA  
32 2012a). Grasslands Marshes, located in the San Joaquin Valley, include an area  
33 contaminated with selenium from agricultural irrigation and drainage practices  
34 when the marshes were irrigated with a blend of subsurface agricultural drainage  
35 water and higher-quality water. Reclamation's Grasslands Bypass Project  
36 reroutes the discharge of selenium-laden subsurface agriculture water from  
37 upstream agricultural dischargers that formerly passed through the Grassland  
38 Water District and nearby wildlife refuges and wetlands to Mud Slough by  
39 conveying it through a portion of the San Luis Drain. The project began in 1996  
40 and has since reduced the selenium load discharged from the Grassland Drainage  
41 Area from 9,600 lbs to 2,200 lbs in 2011 (GBPOC 2013). Both the USEPA  
42 Action Plan and the Grasslands Bypass Project reduce selenium levels in  
43 waterways to meet the water quality objective targeted for December 2019. The  
44 CVRWQCB released a draft waste discharge requirement in May 2014 that  
45 suggests a performance goal of 15 µg/l (monthly mean) and water quality  
46 objective of 5 µg/l (4-day average) for Mud Slough (north) and the San Joaquin

1 River (CVRWQCB 2014a). This water quality objective for a 4-day average  
 2 selenium concentration is consistent with the TMDL for the lower San Joaquin  
 3 River (CVRWQCB 2001). The USEPA also released draft water quality criteria  
 4 for the protection of freshwater aquatic life from toxic effects of selenium, shown  
 5 in Table 6.4 (USEPA 2014b).

6 **Table 6.4 Draft Water Quality Criteria for Selenium**

Media Type	Fish Tissue	–	Water Column <sup>3</sup>	–
Criterion Element	Egg/Ovary <sup>1</sup>	Fish Whole-Body or Muscle <sup>2</sup>	Monthly Average Exposure	Intermittent Exposure <sup>4</sup>
Magnitude	15.2 mg/kg	8.1 mg/kg whole body or 11.8 mg/kg muscle (skinless, boneless filet)	1.3 µg/l in lentic aquatic systems 4.8 µg/l in lotic aquatic systems	$WQC_{int} = \frac{WQC_{30-day} - C_{bkgrnd}(1 - f_{int})}{f_{int}}$
Duration	Instantaneous measurements <sup>5</sup>	Instantaneous measurements <sup>5</sup>	30 days	Number of days/month with an elevated concentration

7 Source: USEPA 2014b

8 1 Overrides any whole-body, muscle, or water column elements when fish egg/vary  
 9 concentrations are measured.

10 2 Overrides any water column element when both fish tissue and water concentrations  
 11 are measured,

12 3 Water column values are based on dissolved total selenium in water

13 4 Where  $WQC_{30-day}$  is the water column monthly element, for either a lentic or lotic  
 14 system, as appropriate.  $C_{bkgrnd}$  is the average background selenium concentration, and  
 15  $f_{int}$  is the fraction of any 30-day period during which elevated selenium concentrations  
 16 occur, with  $f_{int}$  assigned a value  $\geq 0.033$  (corresponding to 1 day).

17 5 Instantaneous measurement. Fish tissue data provide point measurements that reflect  
 18 integrative accumulation of selenium over time and space in the fish at a given site.  
 19 Selenium concentrations in fish tissue are expected to change only gradually over time in  
 20 response to environmental fluctuations.

21 **6.3.1.5 Nutrients**

22 Nutrients are a constituent of concern in the lower Klamath River hydrologic area  
 23 (Klamath Glen HSA) and the Suisun Marsh Wetlands (SWRCB 2011a) (Klamath  
 24 Glen HSA; SWRCB 2011a). Nutrients, such as nitrogen and phosphorus, come  
 25 from natural sources such as weathering of rocks and soil, and from the ocean  
 26 when nutrients are mixed in the water current, as well as animal manure,  
 27 atmospheric deposition, and nutrient recycling in sediment (NOAA 2014; USEPA

1 1998). Anthropogenic sources include fertilizers, detergents, sewage treatment  
 2 plants, septic systems, combined sewer overflows, and sediment mobilization  
 3 (USEPA 1998).

4 Nutrients are essential to maintaining a healthy water system. However, over  
 5 enrichment of nitrogen and phosphorus can contribute to a process known as  
 6 eutrophication where there is an excessive growth of macrophytes, phytoplankton,  
 7 or potentially toxic algal blooms. Eutrophication may also lead to a decrease of  
 8 dissolved oxygen, typically at night, when plants stop producing oxygen through  
 9 photosynthesis but continue to use oxygen. Low dissolved oxygen levels can kill  
 10 fish, cause an imbalance of prey and predator species, and result in a decline in  
 11 aquatic resources (USEPA 1998). Severely low dissolved oxygen conditions are  
 12 referred to as anoxic and may enhance methylmercury production (SFB RWQCB  
 13 2012a). Over enrichment can also contribute to cloudy or murky water clarity by  
 14 increasing the amount of materials (i.e., algae) suspended in the water.

#### 15 **6.3.1.6 Dissolved Oxygen**

16 Dissolved oxygen is a constituent of concern in the project area primarily in the  
 17 lower Klamath River, Sacramento-San Joaquin River Delta, and Suisun Marsh  
 18 Wetlands (SWRCB 2011a). Oxygen in water comes primarily from the  
 19 atmosphere through diffusion at the water surface, as well as from groundwater  
 20 discharge into streams and when plants undergo photosynthesis releasing oxygen  
 21 in exchange for carbon dioxide (USGS 2014; NOAA 2008a). Levels of dissolved  
 22 oxygen vary with several factors including season, time of day, water  
 23 temperature, salinity, and organic matter. The season and time of day dictate  
 24 photosynthesis processes, which require sunlight. Increases in water temperature  
 25 and salinity reduce the solubility of oxygen (NOAA 2008b). Fungus and the  
 26 bacteria use oxygen when decomposing organic matter in water bodies. So, the  
 27 more organic matter present in a water body, the more potential for dissolved  
 28 oxygen levels to decline.

29 Adverse effects of low dissolved oxygen are a concern for water quality and  
 30 aquatic organisms. Low dissolved oxygen impairs growth, immunity,  
 31 reproduction, and causes asphyxiation and death (NCRWQCB 2011).

32 To protect aquatic life, USEPA has established water quality standards for  
 33 dissolved oxygen (USEPA 1986a). However, to protect the beneficial uses of  
 34 California's water bodies (Table 6.2), including warm and cold freshwater  
 35 habitats in both tidal and non-tidal waters, site-specific water quality objectives  
 36 were established.

37 Future plans to maintain a healthy level of dissolved oxygen in water bodies are  
 38 also site-specific, such as plans for the San Joaquin River and the Stockton Deep  
 39 Water Ship Channel (CVRWQCB 2011).

#### 40 **6.3.1.7 Pesticides**

41 Pesticides are constituents of concern throughout the study area and particularly  
 42 in the Central Valley. Major pesticides of concern include organophosphate (OP)  
 43 pesticides – primarily diazinon and chlorpyrifos, and organochlorine (OC)

1 pesticides – mainly Dichloro-Diphenyl-Trichloroethane (DDT) and Group A  
2 compounds. The toxicity and fates of these pesticides are described in the  
3 following sections.

#### 4 **6.3.1.7.1 Organophosphate Pesticides**

5 The two most prevalent OP pesticides in the study area are man-made pesticides,  
6 diazinon and chlorpyrifos, which have been used extensively in agricultural and  
7 residential applications. Former and current uses of diazinon and chlorpyrifos  
8 have resulted in the contamination of water bodies throughout the Central Valley,  
9 as identified on the 303(d) list (SWRCB 2011a). The CVRWQCB has also  
10 identified hot spots of contamination, particularly in the Delta and in urban areas  
11 of Stockton and Sacramento (CVRWQCB 2003).

12 Pesticides are primarily transported into streams and rivers in runoff from  
13 agriculture (CVRWQCB 2011) but also occur or have occurred in urban non-  
14 point runoff and stormwater discharges. Treated municipal wastewater can also  
15 be a point source. However, OP pesticides, diazinon and chlorpyrifos, have been  
16 banned from non-agricultural uses since December 31st, 2004 and December,  
17 2001, respectively. Reported non-agricultural pesticide use of diazinon and  
18 chlorpyrifos declined substantially in some counties between 2000 and 2009  
19 (CVRWQCB 2014b). However, the reduction of OP pesticide use has resulted in  
20 the increasing use of pyrethroids and carbamates as alternative pesticides in urban  
21 and agricultural areas.

22 Diazinon was one of the most common insecticides in the U.S. for household  
23 lawn and garden pest control, indoor residential crack and crevice treatments and  
24 pet collars until all residential uses of diazinon were phased out, between 2002  
25 and 2004 (USEPA 2004). Diazinon usage was then prohibited for several  
26 agricultural uses in 2007, with only a few remaining agricultural uses permitted,  
27 including uses on some fruit, vegetable, nut and field crops, and as an ear-tag on  
28 non-lactating cattle (USEPA 2007). The highest continued use of diazinon is on  
29 almonds and stone fruits (USEPA 2004).

#### 30 **6.3.1.7.2 Organochlorine Pesticides**

31 Organochlorine (OC) pesticides are mainly comprised of Dichloro-Diphenyl-  
32 Trichloroethane (DDT) and Group A Pesticides (CVRWQCB 2010b). DDT is a  
33 persistent chemical that binds tightly to soil and sediment, and breaks down  
34 slowly in the environment. It degrades to the isomers o,p'- and p,p'- DDT; o,p'-  
35 and p,p'-Dichloro-Diphenyl-Dichloroethylene (DDE) and o,p'- and p,p'-  
36 Dichloro-Diphenyl-Dichloroethane (DDD). Group A Pesticides are made up of  
37 the total concentration of the OC pesticides: aldrin, dieldrin, endrin, heptachlor,  
38 heptachlor epoxide, chlordane (total), hexachlorocyclohexane (total) including  
39 Lindane (gamma-BHC), alpha-BHC, endosulfan (total), and toxaphene. These  
40 pesticides have similar chemical properties to DDT and are also persistent in the  
41 environment.

42 Transport of OC pesticides into streams and rivers is primarily from agriculture  
43 runoff (CVRWQCB 2011). Other potential point sources of OC pesticides

1 include storm sewer discharges and historic spills. Non-point sources can include  
 2 areas of previous residential applications, open space and channel erosion, and  
 3 some background sources through wet and dry atmospheric deposition. Most OC  
 4 pesticides were previously deposited on terrestrial soils, thus erosion and transport  
 5 of contaminated sediments continue to contribute to detectable levels in stream  
 6 bed sediment (CVRWQCB 2010b).

7 OC pesticides have historically been used as insecticides, fungicides and  
 8 antimicrobial chemicals in residential and agricultural pest control (CVRWQCB  
 9 2010b). Most were banned in the mid-1970s, and fish tissue concentrations  
 10 declined rapidly since the ban through the mid-1980s (Greenfield et al., 2004);  
 11 however, they continue to be detected in fish tissue, the water column, and  
 12 sediment in the Central Valley.

### 13 **6.3.1.7.3 Pyrethroid Pesticides**

14 Pyrethroids (e.g., bifenthrin, permethrin, cypermethrin) are synthetic insecticides  
 15 used in agriculture and households. The Surface Water Ambient Monitoring  
 16 Program (SWAMP) studies indicate that the replacement of organophosphate  
 17 pesticides by pyrethroids has resulted in an increased contribution of pyrethroids  
 18 to ambient water and sediment toxicity (Anderson et al. 2011) In the water  
 19 column, toxicity to the water flea *Ceriodaphnia dubia* (*C. dubia*) is caused by  
 20 organophosphate and pyrethroid pesticides. Pyrethroids are also the major  
 21 chemical class of concern in urban storm water, as indicated by the highly  
 22 sensitive amphipod *Hyalella azteca* (*H. azteca*) which is highly sensitive to  
 23 pyrethroids (Weston and Lydy 2010). Non-polar organic compounds, especially  
 24 herbicides, and the herbicide Diuron have been identified as causes of algal  
 25 toxicity in the Central Valley. Of the pyrethroid pesticides, bifenthrin is of major  
 26 concern (Markiewicz et al. 2012).

27 Sediment criteria are also under development for pyrethroids that may inform  
 28 waterbody impairment evaluations (SWRCB 2014b). With regard to sediment, as  
 29 indicated by *H. azteca*, the majority of toxicity has been attributed to pyrethroids,  
 30 particularly in urban areas (Markiewicz et al. 2012).

### 31 **6.3.1.7.4 Other Pesticides**

32 Diuron (3-(3,4-dichlorophenyl)-1,1-dimethylurea or DCMU) was introduced in  
 33 1954 and is currently is one of the most-used herbicides in California  
 34 (CVRWQCB 2012b). It is an herbicide that inhibits photosynthesis and is  
 35 targeted on controlling annual broadleaf and grassy weeds. EPA has not  
 36 developed a WQC specific to Diuron but a TMDL in development will include  
 37 the development of WQO for Diuron in the Central Valley.

### 38 **6.3.1.7.5 General Pesticide Regulations**

39 In addition to the existing water quality objectives and FCGs for pesticides in the  
 40 study area, a Basin Plan Amendment for the Sacramento and San Joaquin River  
 41 watersheds and the Delta is in progress to address those pesticides which currently  
 42 impact or could potentially impact aquatic life uses in surface waters. The Basin

1 Plan Amendment will include the establishment of numeric water quality  
2 objectives for these selected pesticides. By addressing a greater grouping of  
3 pesticides than those included in the current Section 303(d) impaired water body  
4 list, the Basin Plan Amendment will help prevent the increased use of those  
5 pesticides not included on the 303(d) list (CVRWQCB 2006a).

6 **6.3.1.8 Polychlorinated Biphenyls (PCBs)**

7 Polychlorinated biphenyls, a group of synthetic organic chemicals, is a constituent  
8 of concern throughout California including the Sacramento River region  
9 (Sacramento River, Feather River, and American River), the Sacramento-San  
10 Joaquin River Delta, Suisun Bay, Carquinez Strait, and San Pablo Bay (SWRCB  
11 2011a). PCBs cause harmful environmental effects and also pose a risk to human  
12 health (ATSDR 2000).

13 PCBs are mixtures of a variety of individual chlorinated biphenyl components,  
14 known as congeners. In the United States, many of these mixtures were sold  
15 under the trade name Aroclor, manufactured from 1930 to 1977 primarily for use  
16 as coolants and lubricants in transformers, capacitors, and other electrical  
17 equipment. Although manufacture was banned in 1979, PCBs continue to cause  
18 environmental degradation because they are environmentally persistent, easily  
19 redistributed between air, water and soil, and tend to accumulate and biomagnify  
20 in the food chain (ATSDR 2000, OEHHA 2008).

21 The “weathering” of PCBs is a process by which the composition of Aroclor  
22 mixtures undergo differential partitioning, degradation, and biotransformation.  
23 This results in differential environmental persistence and bioaccumulation of the  
24 mixtures, where these increase with the degree of chlorination of new mixtures.  
25 (OEHHA 2008). The biphenyls with more chlorine atoms tend to be heavier and  
26 remain close to the source of contamination, whereas those with fewer chlorine  
27 atoms are easily transported in the atmosphere. Atmospheric deposition is the  
28 primary source of PCBs to surface waters, although redissolution of sediment-  
29 bound PCBs also contributes to surface water contamination. PCBs leave the  
30 water column through sorption to suspended solids, volatilization from water  
31 surfaces, and concentration in plants and animals (ATSDR 2000).

32 PCBs cannot be distinctly assessed for health effects, as their toxicity is  
33 determined by the interactions of individual congeners and by the interactions of  
34 PCBs with other structurally related chemicals, including those combined with or  
35 used in the production of PCBs. However, several general health effects of PCB  
36 exposure have been identified. When PCBs are absorbed, they are distributed  
37 throughout the body and accumulate in lipid-rich tissues, including the liver, skin  
38 tissue, and breast milk. They can also be transferred across the placenta to the  
39 fetus. Studies have linked oral exposure to cancer and to adverse neurological,  
40 reproductive, and developmental effects. The International Agency for Research  
41 on Cancer has thus listed PCBs as probable human carcinogens, and OEHHA has  
42 administratively listed PCBs on the Proposition 65 list of chemicals known to the  
43 State of California to cause cancer (OEHHA 2008).

### 1 **6.3.2 Trinity River Region**

2 The Trinity River Region includes the area in Trinity County along the Trinity  
3 River from Trinity Lake to the confluence with the Klamath River; and in  
4 Humboldt and Del Norte counties along the Klamath River from the confluence  
5 with the Trinity River to the Pacific Ocean.

6 This water quality analysis includes Trinity Lake, Lewiston Lake, Trinity River  
7 downstream of Lewiston Dam, and the Klamath River from its confluence with  
8 the Trinity River to the Pacific Ocean. The analysis does not include Trinity  
9 River upstream of Trinity Lake, the South Fork of the Trinity River, or the  
10 Klamath River upstream of Trinity River, because these areas are not affected by  
11 changes in CVP operations.

12 Several water quality requirements affect the Klamath River and Trinity River  
13 basins. Beneficial uses and water quality objectives provided by the NCRWQCB  
14 and the Hoopa Valley Tribal Environmental Protection Agency (Hoopa Valley  
15 TEPA) are described below, as well as relevant TMDLs. The Yurok Tribe Basin  
16 Plan for the Yurok Indian Reservation and the Resighini Rancheria Tribal Water  
17 Quality Ordinance also regulate portions of the Trinity and Klamath Rivers that  
18 flow into and through the reservations; however, because they have not yet been  
19 approved by the USEPA, their objectives are not described in detail here. Oregon  
20 water quality requirements also affect the water quality of the Klamath River  
21 which originates in Oregon. However, this chapter only discusses the  
22 requirements within the Trinity and lower Klamath River Basins.

#### 23 **6.3.2.1 Beneficial Uses**

24 Beneficial uses for all water bodies in the study area are determined by the  
25 NCRWQCB and the Hoopa Valley TEPA (Table 6.2). In addition to the  
26 beneficial uses listed in the Trinity and Klamath River basins, the North Coast  
27 Basin Plan notes that recreational use (i.e., water contact recreation [REC-1] and  
28 non-contact water recreation [REC-2]) occurs in all hydrologic units of the  
29 Klamath River Basin, with Trinity River being one of the rivers receiving the  
30 largest levels of recreational use (NCRWQCB 2011). Fish and wildlife reside in  
31 virtually all of the surface waters within the North Coast Region (NCRWQCB  
32 2011). These species include several that are designated as rare, threatened and  
33 endangered. Trinity Dam also provides the beneficial use of hydroelectric power  
34 (i.e., POW).

#### 35 **6.3.2.2 Constituents of Concern**

36 The constituents of concern that are currently not in compliance with existing  
37 water quality standards and for which TMDLs are adopted or are in development  
38 are summarized in Table 6.1 and discussed below.

##### 39 **6.3.2.2.1 Water Temperature**

40 The majority of the Trinity and Klamath Rivers are not listed on the 303(d) list  
41 approved by the USEPA in 2010 as impaired by water temperature. However, the  
42 hydrologic area of the South Fork Trinity River and the lower hydrologic area of

1 the Klamath River (Klamath Glen HSA) are listed for elevated water temperatures  
 2 adversely affecting the cold freshwater habitat (SWRCB 2011c-h).

3 The Trinity River and lower Klamath River watersheds must maintain water  
 4 temperatures to protect and support resident and seasonal fish species habitats.  
 5 The North Coast Basin Plan designates narrative and numeric water temperature  
 6 objectives applicable to surface waters in the Trinity River and the lower Klamath  
 7 River basins. Other objectives and criteria specific to each region are specified  
 8 below.

9 *Trinity River*

10 The South Fork Trinity River flows from its headwaters to the confluence with  
 11 the mainstem of the Trinity River. It then flows into the lower Klamath River and  
 12 out to the Pacific Ocean. Elevated water temperatures in the South Fork Trinity  
 13 River can be attributed to the loss of shade trees due to habitat modification, range  
 14 grazing, removal of riparian vegetation, streambank modification and  
 15 destabilization, and water diversions (SWRCB 2011d). This reach supports  
 16 steelhead, Chinook Salmon, and Coho Salmon (below Grouse Creek) (USDAFS  
 17 2014). The mainstem of the Trinity River also supports steelhead, Coho Salmon,  
 18 and Chinook Salmon.

19 Water temperature objectives, summarized in Table 6.5, were set forth in the  
 20 North Coast Basin Plan specifically applicable to the Trinity River, from  
 21 Lewiston Dam to Douglas City and to the confluence with the North Fork Trinity  
 22 River. These criteria are reach dependent, and vary seasonally. They were  
 23 specifically developed to enhance the productivity of Trinity River Fish Hatchery,  
 24 specifically for salmon and steelhead trout populations (NCRWQCB 2011).

25 **Table 6.5 Water Quality Objectives for Temperature in the Trinity River**

Period	Daily Average Temperature Not to Exceed	Trinity River Reach
July 1 – September 14	60° F	Lewiston Dam to Douglas City Bridge
September 15 – October 1	56° F	Lewiston Dam to Douglas City Bridge
October 1 – December 31	56° F	Lewiston Dam to confluence of North Fork Trinity River

26 Source: NCRWQCB 2011

27 *Hoopa Valley Indian Reservation*

28 Natural causes of temperature exceedances, such as unusually excessive ambient  
 29 air temperatures coupled with flows, intended to protect aquatic habitat specified  
 30 in the Trinity River Flow Evaluation report (TRFE), will not be considered to  
 31 violate the water quality objectives stated in the Hoopa Valley Indian Reservation  
 32 Basin Plan.

33 Temperature objectives for the Trinity River as it passes through the Hoopa  
 34 Valley Reservation vary seasonally and are precipitation dependent (Table 6.6).

1 The water quality objectives are based on temperature-flow relationships that  
 2 maintain TRFE flow regimes and protect adult salmonids holding and spawning.  
 3 The objectives are also consistent with the temperature standards specified in the  
 4 NCRWQCB Basin Plan (Hoopa Valley TEPA 2008).

5 **Table 6.6 Trinity River Temperature Criteria for the Hoopa Valley Indian**  
 6 **Reservation**

Dates	Running 7-Day Average Temperature not to Exceed <sup>1,2</sup>	
	Extremely Wet, Wet and Normal Water Years	Dry and Critically Dry Water Years
May 23 – June 4	59° F	62.6° F
June 5 – July 9	62.6° F	68° F
July 10 – September 14	72.0° F	74.0° F <sup>3</sup>
September 15 – October 31	66.0° F	66.0° F
November 1 – May 22	55.4° F	59.0° F

7 Source: Adapted from Hoopa Valley TEPA 2008

8 1 Temperature standards will be monitored at the Weitchpec temperature monitoring  
 9 station operated and maintained by Reclamation.

10 2 Temperature standard violations will be determined if more than ten percent of seven-  
 11 day running averages exceed the standard, to be determined by the number of days  
 12 exceeded for that seasonal period (i.e., for June 16 – September 14, a 91 day period, ten  
 13 percent exceedance will equate to nine days).

14 3 For the seasonal period of June 16 – September 14, temperatures on the mainstem  
 15 Trinity River at the Weitchpec gauging station were used to determine running seven-day  
 16 averages.

17 The Hoopa Valley TEPA established a goal of attaining a temperature of 21° C  
 18 (69.8° F) during the July 10 – September 14 period within five years of the  
 19 adoption of these standards (Hoopa Valley TEPA 2008). If monitoring reveals  
 20 that temperatures continue to increase, the Hoopa Valley TEPA will employ  
 21 adaptive management strategies until temperatures begin to decrease

22 In addition to the seasonal water temperature criteria, the Hoopa Valley TEPA has  
 23 established varying criteria for each life stage of salmonids (Table 6.7).

1 **Table 6.7 Tributary Temperature Criteria for the Hoopa Valley Indian Reservation**

Dates	Maximum Weekly Average Temperature (MWAT) <sup>1,2</sup>		Applicable Salmonid Life Stage(s) <sup>3</sup>
	Extremely Wet, Wet and Normal Water Years	Dry and Critically Dry Water Years	
May 23 – June 4	55.4° F	57.2° F	Adult holding; coho incubation and emergence; spawning; smoltification
June 5 – Jul 9	60.8° F	62.6° F	Adult holding; peak temperatures timeframe according to Hoopa Tribal data
July 10 – September 14	64.4° F	68.0° F	Adult holding
September 15 – October 31	57.2° F	60.8° F	Adult holding; spawning
November 1 – May 22	50.0° F	53.6° F	Adult incubation and emergence (including coho); smoltification; spawning

2 Source: Adapted from Hoopa Valley TEPA 2008

3 1 The MWAT is defined as the highest 7-day moving average of equally spaced water  
 4 temperature measurements for a given time period. In this application, the time period is  
 5 the duration of the existing salmonids life stage. For the MWAT objective, temperatures  
 6 may not exceed the numeric objective for every 7-day period during the given life stage.

7 2 Applicable where a given species and life stage time period exist, and when and where  
 8 the species and life stage time period existed historically, and have the potential to exist  
 9 again.

10 3 Adult migration and juvenile rearing are considered all year life stages.

11 Water temperature data for Trinity River between 2001 and 2012 show seasonal  
 12 trends and the warming effect of ambient conditions at the downstream location  
 13 (Table 6.8 and Figure 6.1). Compliance locations for water quality monitoring  
 14 along the Trinity River are shown in Figure 6.2.

2 Temperatures in the Trinity River within the Reservation boundary will be  
 3 monitored based on water-year type as established by the TRFE and determined  
 4 by the Bureau of Reclamation.

5 Activities that increase water temperatures must comply with Tribal and Federal  
 6 anti-degradation policies. The responsible party must not increase water  
 7 temperatures, even if caused by their actions coupled with natural factors (Hoopa  
 8 Valley TEPA 2008). In some streams, the numeric objectives may not be  
 9 attainable due to site specific limitations. If this is the case, and provided that the  
 10 stream has been restored to its full site potential; and the salmonid population is at  
 11 a level consistent with the National Marine Fisheries Service (NMFS) concept of  
 12 a ‘Viable Salmonid Population’(McElhany et al. 2000), then the Hoopa Valley  
 13 TEPA may not be applicable.

14 **6.3.2.2.2 Mercury**

15 Trinity Lake and the upper hydrologic area of the East Fork Trinity River are two  
 16 water bodies in the North Coast that were placed on the Section 303(d) list,  
 17 approved by USEPA in 2010 (SWRCB 2011a), as impaired due to mercury.  
 18 Mercury in Trinity Lake can be attributed to atmospheric deposition, natural  
 19 sources, resource extractions, and other unknown sources (SWRCB 2011b).  
 20 Significant mercury contamination is likely due to historical gold and mercury  
 21 mining activities along the East Fork Trinity River at the inactive Altoona  
 22 Mercury Mine (May et al. 2004).

23 The commercial or recreational collection of fish, shellfish, or organisms was  
 24 deemed impaired since fish tissue exceeded USEPA’s recommended Fish Tissue  
 25 Residue Criteria for human health of 0.3 mg of methylmercury (wet weight) per  
 26 kg of fish tissue (SWRCB 2011b-g). This criterion is based on the consumption-  
 27 weighted rate of 0.0175 kg of total fish and shellfish per day. Fourteen out of  
 28 fifty seven fish tissue samples from fish in the North and the East Fork of the lake  
 29 in September 2001 and 2002 exceeded this fish tissue criterion. Composite fish  
 30 tissue samples that exceeded the criterion were from White Catfish, Smallmouth  
 31 Bass, and Chinook Salmon.

32 For the protection of marine aquatic life, water quality objectives for mercury  
 33 were set for discharges within the area specified in the North Coast Region Water  
 34 Quality Control Board Basin Plan as follows (NCRWQCB 2011).

- 35 • Six-Month Median: 0.04 µg/l
- 36 • Daily Maximum: 0.16 µg/l
- 37 • Instantaneous Maximum: 0.4 µg/l (conservative estimate for chronic toxicity)

1 In an effort to meet the water quality standards in Trinity Lake and the East Fork  
 2 of Trinity River, a TMDL is expected to be completed by 2019. An approach for  
 3 calculating effluent limitations was established in the NCRWQCB Basin Plan  
 4 (NCRWQCB 2011).

5 **6.3.2.2.3 Nutrients**

6 The lower Klamath River was placed on the 303(d) list approved by the USEPA  
 7 in 2010 for being impaired by nutrients (SWRCB 2011a). Nutrient levels in the  
 8 Klamath Estuary may cease to be a limiting factor and can promote levels of algal  
 9 growth that cause a nuisance or adversely affect beneficial uses when excess  
 10 growth is not consumed by animals or exported by flows (DOI and DFG 2012).

11 The Klamath River receives the greatest nutrient loading from the Upper Klamath  
 12 basin, comprising approximately 40 percent of its total contaminant load  
 13 (NCRWQCB 2010). Tributaries to the Klamath River are the greatest  
 14 contributors of the remaining nutrient loads, with the Trinity River contributing  
 15 the most.

16 The Hoopa Valley TEPA also designates water quality objectives to address  
 17 contamination by nutrients (Table 6.9).

18 **Table 6.9 Specific Use Water Quality Criteria for Waters of the Hoopa Valley Indian**  
 19 **Reservation**

Contaminant	Trinity River	Klamath River
Maximum Annual Periphyton Biomass	–	150 mg chlorophyll a/m <sup>2</sup> of streambed area
pH	MUN-designated waters: 5.0 – 9.0 All other designated uses: 7.0 – 8.5	7.0 – 8.5
Total Nitrogen <sup>1</sup>	–	0.2 mg/l
Total Phosphorus <sup>1</sup>		0.035 mg/l
Microcystis aeruginosa cell density	–	< 5,000 cells/mL for drinking water < 40,000 cells/mL for recreational water
Microcystin toxin concentration		< 1 µg/l total microcystins for drinking water < 8 µg/l total microcystins for recreational water
Total potentially toxigenic blue-green algal species <sup>2</sup>		< 100,000 cells/mL for recreational water

Contaminant	Trinity River	Klamath River
Cyanobacterial scums		There shall be no presence of cyanobacterial scums

1 Source: Hoopa Valley TEPA 2008

2 1 There should be at least two samples per 30-day period. If total nitrogen and total  
 3 phosphorus standards are not achievable due to natural conditions, then the standards  
 4 shall instead be the natural conditions for total nitrogen and total phosphorus. Through  
 5 consultation, the ongoing TMDL process for the Klamath River is expected to further  
 6 define these natural conditions.

7 2 Includes: Anabaena, Microcystis, Planktothrix, Nostoc, Coelsphaerium, Anabaenopsis,  
 8 Aphanizomenon, Gloeotrichia, and Oscillatoria.

9 In addition to the water quality criteria established by the Hoopa Valley TEPA  
 10 (2008), the 2010 *Klamath River TMDLs Addressing Temperature, Dissolved*  
 11 *Oxygen, Nutrient, and Microcystin Impairments in California* provides TMDLs  
 12 for nutrients which address elevated pH levels (DOI and DFG 2012). Nutrient  
 13 targets include numeric targets for total phosphorus (TP), total nitrogen (TN)  
 14 (NCRWQCB 2010).

15 The Klamath River nutrient TMDLs are in the process of being implemented by  
 16 the NCRWQCB and other affiliated agencies, including the SWRCB, the USEPA,  
 17 Reclamation, the USFWS, the Oregon Department of Environmental Quality,  
 18 responsible for implementation of the Klamath TMDLs in Oregon, and other  
 19 state, federal, and private agencies with operations that affect the Klamath River  
 20 (NCRWQCB 2010).

21 **6.3.2.2.4 Organic Matter**

22 The lower Klamath River was placed on the 303(d) list approved by the USEPA  
 23 in 2010 for impairment due to organic enrichment (SWRCB 2011a).

24 The Klamath River has several natural sources of organic matter. The river  
 25 originates from the Upper Klamath Lake, which is a naturally shallow, eutrophic  
 26 lake, with high levels of organic matter (algae), including nitrogen fixing blue-  
 27 green algae (NCRWQCB 2010). Other sources of organic matter include runoff  
 28 from agricultural lands (i.e., irrigation tailwater, storm runoff, subsurface  
 29 drainage, and animal waste), flow regulations/modification, industrial point  
 30 sources, and municipal point sources (SWRCB 2011).

31 To protect the beneficial uses of the lower Klamath River, including cold  
 32 freshwater habitat, a TMDL was established in 2010 for organic matter and other  
 33 constituents. The TMDL equals 143,019 pounds of Carbonaceous Biochemical  
 34 Oxygen Demand (CBOD) per day from the Klamath River (NCRWQCB 2011h).  
 35 The average organic matter (measured as CBOD) loads from all other Klamath  
 36 River tributaries are sufficient to meet other related objectives, including  
 37 dissolved oxygen and biostimulatory substances objectives, in the Klamath River  
 38 (NCRWQCB 2010). The dissolved oxygen objectives are the primary targets  
 39 associated with organic matter as well as nutrients. Organic matter allocations

1 were also established for the Klamath River below Salmon River, and the major  
 2 tributaries to the Klamath, including Trinity River.  
 3 Implementation actions and other objectives were established to ensure the  
 4 TMDL is met to protect the beneficial uses of the Klamath River and other water  
 5 bodies downstream. The North Coast Basin Plan states that a water quality study  
 6 will be completed to identify actions for monitoring, evaluating, and  
 7 implementing any necessary actions to address organic matter loading so that the  
 8 TMDL will be met (NCRWQCB 2011).

9 **6.3.2.2.5 Dissolved Oxygen**

10 The lower Klamath River was placed on the 303(d) list approved by the USEPA  
 11 in 2010 for low dissolved oxygen (SWRCB 2011a).

12 Sources that contribute to low dissolved oxygen include sources of organic  
 13 enrichment, specified in the previous section; water temperature; and salinity,  
 14 explained further in Section 6.3.2.6. Other sources that contribute to low  
 15 dissolved oxygen are runoff from roads and agriculture that can transport  
 16 nutrients into water bodies and lower dissolved oxygen through biostimulatory  
 17 effects (NCRWQCB 2010). Over-enrichment and growth of algae and aquatic  
 18 plants can produce oxygen during the day through photosynthesis but those same  
 19 plants can deplete dissolved oxygen at night.

20 To protect the beneficial uses of the lower Klamath River, including the cold  
 21 freshwater habitat, water quality objectives were established in the North Coast  
 22 Basin Plan (2010) and the Hoopa Valley TEPA (2008) for dissolved oxygen in  
 23 the Klamath River and its major tributary, the Trinity River (Table 6.10 and  
 24 Table 6.11) (NCRWQCB 2011). Site Specific Objectives (SSOs) for dissolved  
 25 oxygen were calculated as part of TMDLs developed by the NCRWQCB (2011),  
 26 and have been incorporated into the North Coast Basin Plan (2011) (Table 6.12).  
 27 For those waters without location-specific dissolved oxygen criteria, dissolved  
 28 oxygen shall not be reduced below minimum levels, shown in Table 6.13, at any  
 29 time to protect beneficial uses.

30 **Table 6.10 Water Quality Objectives for Dissolved Oxygen in Trinity and Lower**  
 31 **Klamath**

Water body	Dissolved Oxygen (mg/l)	
	Minimum	50% Lower Limit <sup>1</sup>
Trinity Lake and Lewiston Reservoir	7.0	10.0
Lower Trinity River	8.0	10.0
Lower Trinity Area Streams	9.0	10.0
Lower Klamath River Area Streams	8.0	10.0

32 Source: NCRWQCB 2011

1 1: 50 percent lower limit represents the 50 percentile values of the monthly means for a  
 2 calendar year. 50 percent or more of the monthly means must be greater than or equal  
 3 to the lower limit.

4 **Table 6.11 Specific Use Water Quality Criteria for Waters of the Hoopa Valley Indian**  
 5 **Reservation**

Contaminant	Trinity River	Klamath River
Minimum Water Column Dissolved Oxygen Concentration	11.0 mg/l	SPWN-designated waters <sup>1</sup> : 11.0 mg/l <sup>2</sup> COLD-designated waters: 8.0 mg/l <sup>2</sup>
Minimum Inter-gravel Dissolved Oxygen Concentration	8.0 mg/l	SPWN-designated waters <sup>1</sup> : 8.0 mg/l <sup>2</sup>

6 Source: Hoopa Valley TEPA 2008

7 1 Whenever spawning occurs, has occurred in the past or has potential to occur.

8 2 7-day moving average of the daily minimum DO. If dissolved oxygen standards are not  
 9 achievable due to natural conditions, the COLD and SPWN standard shall instead be  
 10 dissolved oxygen concentrations equivalent to 90 percent saturation under natural  
 11 receiving water temperatures.

12 **Table 6.12 Site Specific Objectives for Dissolved Oxygen in the Klamath River<sup>1</sup>**

Location <sup>2</sup>	Percent Dissolved Oxygen Saturation Based On Natural Receiving Water Temperatures <sup>3</sup>	Time Period
Downstream of Hoopa-California Boundary to Turwar	85	June 1 through August 31
	90	September 1 through May 31
Upper and Middle Estuary	80	August 1 through August 31
	85	September 1 through October 31 and June 1 through July 31
	90	November 1 through May 31
Lower Estuary	For the protection of estuarine habitat (EST), the dissolved oxygen content of the Lower Klamath estuary shall not be depressed to levels adversely affecting beneficial uses as a result of controllable water quality factors.	

13 Source: NCRWQCB 2011

1 1 States may establish site specific objectives equal to natural background (USEPA  
 2 1986a. Ambient Water Quality Criteria for Dissolved Oxygen, EPA 440/5-86-033; USEPA  
 3 Memo from Tudor T. Davies, Director of Office of Science and Technology, USEPA  
 4 Washington, D.C. dated November 5, 1997). For aquatic life uses, where the natural  
 5 background condition for a specific parameter is documented, by definition that condition  
 6 is sufficient to support the level of aquatic life expected to occur naturally at the site  
 7 absent any interference by humans (Davies 1997). These dissolved oxygen objectives  
 8 are derived from the T1BSR run of the Klamath TMDL model and described in Tetra  
 9 Tech, December 23, 2009 Modeling Scenarios: Klamath River Model for TMDL  
 10 Development (Tetra Tech and WR and TMDL Center 2009). They represent natural  
 11 dissolved oxygen background conditions due only to non-anthropogenic sources and a  
 12 natural flow regime.

13 2 These objectives apply to the maximum extent allowed by law. To the extent that the  
 14 State lacks jurisdiction, the Site Specific Dissolved Oxygen Objectives for the Mainstem  
 15 Klamath River are extended as a recommendation to the applicable regulatory authority.

16 3 Corresponding dissolved oxygen concentrations are calculated as daily minima, based  
 17 on site-specific barometric pressure, site-specific salinity, and natural receiving water  
 18 temperatures as estimated by the T1BSR run of the Klamath TMDL model and described  
 19 in Tetra Tech, December 23, 2009 (Tetra Tech and WR and TMDL Center 2009).  
 20 Modeling Scenarios: Klamath River Model for TMDL Development. The estimates of  
 21 natural receiving water temperatures used in these calculations may be updated as new  
 22 data or method(s) become available. After opportunity for public comment, any update or  
 23 improvements to the estimate of natural receiving water temperature must be reviewed  
 24 and approved by Executive Officer before being used for this purpose.

25 **Table 6.13 Water Quality Objectives for Dissolved Oxygen for Specified Beneficial**  
 26 **Uses**

Beneficial Use Designation	Minimum Dissolved Oxygen Limit (mg/l)
WARM, MAR, or SAL	5.0
COLD	6.0
SPWN	7.0
SPWN – during critical spawning and egg incubation periods	9.0
Klamath River Water Column <sup>1</sup> SPWN-designated waters <sup>2</sup> : COLD-designated waters:	11.0 mg/l <sup>3</sup> 8.0 mg/l <sup>3</sup>
Klamath River Inter Gravel <sup>1</sup> SPWN-designated waters <sup>2</sup> :	8.0 mg/l <sup>3</sup>

27 Source: NCRWQCB 2011

28 1 Hoopa Valley TEPA (2008)

29 2 Whenever spawning occurs, has occurred in the past or has potential to occur.

30 3 7-day moving average of the daily minimum DO. If dissolved oxygen standards are not  
 31 achievable due to natural conditions, the COLD and SPWN standard shall instead be

1 dissolved oxygen concentrations equivalent to 90 percent saturation under natural  
2 receiving water temperatures.

3 The 2010 *Klamath River TMDLs Addressing Temperature, Dissolved Oxygen,*  
4 *Nutrient, and Microcystin Impairments in California* provide numerical targets for  
5 dissolved oxygen and other constituents (NCRWQCB 2010). Site specific  
6 objectives for dissolved oxygen were proposed in this TMDL and adopted into the  
7 North Coast Basin Plan (Table 6.29). The dissolved oxygen objectives are the  
8 primary targets associated with nutrient and organic matter, with additional  
9 dissolved oxygen-related TMDLs prescribed for total phosphorus (TP), total  
10 nitrogen (TN) and organic matter (CBOD) loading, and numerical targets  
11 provided for benthic algae biomass, suspended algae chlorophyll-a, *microcystis*  
12 *aeruginosa*, and microcystin toxin discussed in their corresponding sections.

13 Plans to monitor dissolved oxygen and other constituents in the Klamath River  
14 below Trinity River, near Turwar, and the Klamath River Estuary were  
15 established in Chapter 7 of the Klamath River TMDLs to further protect the  
16 beneficial uses of the Trinity and lower Klamath Rivers (NCRWQCB 2010). The  
17 TMDL also includes a proposal to revise SSOs for dissolved oxygen in the  
18 Klamath River.

#### 19 **6.3.2.2.6 Sedimentation and Siltation**

20 Sedimentation and siltation are not caused by operation of the CVP. However,  
21 the lower Klamath River and Trinity River were placed on the 303(d) list  
22 approved in 2010 as impaired by sedimentation and siltation (SWRCB 2011a).

##### 23 *Trinity River*

24 Disturbance of sediment and silt is a natural part of stream ecosystems, which can  
25 contribute to fluctuating salmonid populations in response to fine sediment  
26 embedded in spawning gravels. However, human activities have resulted in an  
27 increased severity and frequency of habitat disturbance (TRRP and NCRWQCB  
28 2009). In the Mainstem Trinity River, sediment loading can be attributed to  
29 runoff from areas of active or past mining, timber harvest, and road-related  
30 activities. Natural sources, such as landsliding, bank erosion, and soil creep,  
31 contribute the greatest sediment loads each year (NCRWQCB 2008). Future  
32 point sources of sedimentation into the Trinity River Basin, including CalTrans  
33 facilities and construction sites larger than five acres have to meet discharge  
34 requirements pursuant to California's NPDES general permit for construction site  
35 runoff (USEPA 2001f).

36 The primary adverse impacts of excess sedimentation are those affecting the  
37 spawning habitat for anadromous salmonids (TRRP and NCRWQCB 2009). The  
38 main affected beneficial uses include commercial or sport fishing, cold fresh  
39 water habitat, migration of aquatic organisms, spawning, reproduction, and/or  
40 early development; and rare, threatened and endangered species. Recreation in  
41 the Trinity River Basin, such as boating, fishing, camping, swimming,  
42 sightseeing, and hiking, is also potentially affected because sedimentation can  
43 affect the water clarity and water quality (USEPA 2001f). Water quality

1 objectives for sedimentation and siltation were established in the North Coast  
2 Basin Plan.

3 Turbidity criteria for all waters within the Hoopa Valley Indian Reservation are  
4 also under development (Hoopa Valley TEPA 2008).

5 In addition to these water quality objectives, the North Coast Basin Plan also  
6 prohibits the discharge of soil, silt, bark, sawdust, or other organic and earthen  
7 material from any logging, construction, or associated activity into any stream or  
8 watercourse in quantities harmful to beneficial uses, and the placing or disposal of  
9 such materials in locations where they can pass into any stream or watercourse in  
10 quantities harmful to beneficial uses (NCRWQCB 2011).

11 Sediment loading in the mainstem Trinity River exceeds applicable water quality  
12 standards, and is being addressed by the Trinity River TMDL for sediment,  
13 approved by the USEPA in December 2001 (SWRCB 2011b-g, USEPA 2001f).  
14 Assimilation capacity for sediment loading was determined for this TMDL and  
15 the percent reduction of managed sediment discharge required to meet the TMDL  
16 is provided for each subarea. These allocations are adequate to protect aquatic  
17 habitat, and are expected to be evaluated on a ten year rolling basis (USEPA  
18 2001f).

19 *Lower Klamath River*

20 The Klamath River downstream of Weitchpec has also been included on the  
21 303(d) list for contamination from sedimentation and siltation, due to exceedances  
22 of the sediment water quality criteria, and long-term sedimentation and siltation  
23 influxes (SWRCB 2011h).

24 Major sources of sediment discharge in the lower Klamath River are from  
25 ongoing logging and runoff from major storm events. According to reports cited  
26 by the SWRCB, water quality in runoff from timber harvest in all lower Klamath  
27 watersheds exceed cumulative effect thresholds (SWRCB 2011h).

28 *The Long Range Plan for the Klamath River Basin Fishery Conservation Area*  
29 *Restoration Program* (1986 to 2006) emphasizes sedimentation in the lower  
30 Klamath Basin, and notes that the sediment is creating problems with fish passage  
31 and stream bed stability (Klamath River Basin Fisheries Task Force 1991). The  
32 near extinction of the eulachon indicated problems with sediment supply, size and  
33 bed load movement, and that aggradations in salmon spawning reaches are  
34 expected to persist for decades (SWRCB 2011h). Increased sediment loads also  
35 result from the widening of stream channels, through processes like bank erosion,  
36 and with the related reduction of riparian shade can contribute to elevated stream  
37 temperatures (NCRWQCB 2010). The North Coast Basin Plan includes the  
38 TMDLs for the region, which include those that address sedimentation and  
39 siltation (NCRWQCB 2011).

1     **6.3.3     Central Valley Region**

2     **6.3.3.1     Sacramento Valley**

3     Major watersheds within the Sacramento Valley that could be affected by CVP  
4     and SWP operations include the Sacramento River, Feather River, and the lower  
5     American River watersheds.

6     This water quality analysis section focuses on Shasta Lake, Keswick Reservoir,  
7     Whiskeytown Lake, Spring Creek and Clear Creek; the Sacramento River from  
8     Shasta Lake to the Delta (near Freeport); the Feather River below Lake Oroville;  
9     American River below Lake Natoma; and Yolo Bypass.

10    Beneficial uses for the Sacramento Valley, as defined in the Central Valley Basin  
11    Plan, are summarized in Table 6.2. The constituents of concern that are currently  
12    not in compliance with existing water quality standards and for which TMDLs are  
13    adopted or are in development in this region are summarized in Table 6.1.

14    **6.3.3.1.1    Sacramento River from Shasta Lake to Verona**

15    Water quality in the upper Sacramento River is influenced by releases from  
16    Shasta Lake and diversions from Trinity Lake. Annual and seasonal flows in the  
17    Sacramento River watershed are highly variable from year to year, as described in  
18    Chapter 5, Surface Water Resources and Water Supplies. These variations in  
19    flow are a source of variability in water quality in the Sacramento drainage.

20    The water quality constituents that are currently not in compliance with existing  
21    water quality standards and for which TMDLs are adopted or are in development  
22    in this region are: mercury, PCBs, unknown toxicity and multiple pesticides.  
23    Chlorpyrifos and diazinon have been addressed by changes to the Basin Plan,  
24    cadmium, copper, zinc have been addressed by a TMDL, and temperature is also  
25    closely monitored.

26    *Water Temperature*

27    The Sacramento River was not placed on the 303(d) list approved by the USEPA  
28    in 2010 as impaired by water temperature (SWRCB 2011a). However, water  
29    bodies in the Upper Sacramento River watershed support the beneficial uses of  
30    both warm and cold fresh water habitat, which require that the water bodies  
31    maintain water temperatures suitable for multiple fish species (CVRWQCB  
32    2011). Water quality objectives have been established by the SWRCB for  
33    Sacramento River, as summarized in Table 6.14 and Appendix 3A, No Action  
34    Alternative: Central Valley Project and State Water Project Operations.  
35    Compliance locations in the upper Sacramento River basin are shown in  
36    Figure 6.2. Performance measures to meet temperature requirements are included  
37    in the 2009 NMFS BO, as described in Appendix 3A, No Action Alternative:  
38    Central Valley Project and State Water Project Operations.

1 **Table 6.14 Water Quality Objectives for Temperature in the Sacramento River**

Applicable Water Bodies	Objective
Sacramento River from Keswick Dam to Hamilton City	> 56° F
Sacramento River from Hamilton City to the I Street Bridge (during periods when temperature increases will be detrimental to the fishery)	> 68° F

2 Source: CVRWQCB 2011

3 Table 6.15 and Figure 6.3 depict monthly water temperature data at selected  
 4 compliance locations in the Sacramento River between 2001 and 2012.

5 **Table 6.15 Monthly Average of Water Temperatures Recorded at Sacramento River**  
 6 **Compliance Locations in °F**

1 Source: Reclamation 2013b

2 *Mercury*

3 The USEPA approved a new decision to place Shasta Lake, Whiskeytown Lake,  
 4 Clear Creek, and the Sacramento River from Cottonwood Creek to Red Bluff, on  
 5 the Section 303(d) list in 2010 for mercury contamination (SWRCB 2011a). The  
 6 Sacramento River from Red Bluff to Knights Landing has been on the 303(d) list  
 7 for mercury prior to the final decision in 2010. Mercury is not a constituent of  
 8 concern for the Sacramento River between Shasta Dam and the Cottonwood  
 9 Creek.

10 Mercury in the Sacramento River Basin can be attributed to resource extraction as  
 11 described in Section 6.3.2 (SWRCB 2011i-l). Significant gold mining activity  
 12 took place within the Whiskeytown watershed, lands inundated by Whiskeytown  
 13 Reservoir, in the Clear Creek watershed between Whiskeytown Reservoir, the  
 14 confluence with the Sacramento River, and within the Sacramento River  
 15 watershed.

16 A 2008 CALFED report tabulates methylmercury concentrations in the  
 17 Sacramento River from Redding (0.3ng/l) to Freeport (0.11 ng/l) from 2003 to  
 18 2006 (Foe et al. 2008). For the 2010 listing, composite fish tissue samples were  
 19 collected from Shasta Lake, Whiskeytown Lake, Clear Creek, and the Sacramento  
 20 River from Cottonwood Creek to Knights Landing. The commercial or  
 21 recreational collection of fish, shellfish, or organisms were deemed impaired since  
 22 fish tissue exceeded USEPA’s recommended Fish Tissue Residue Criteria for  
 23 human health of 0.3 mg of methylmercury (wet weight) per kg of fish tissue  
 24 (SWRCB 2011i-l).

25 In an effort to protect the beneficial uses of these water bodies, including the  
 26 protection of aquatic and human health, USEPA has recommended maximum

1 exposure concentrations. In addition, a TMDL is expected to be completed in  
2 2021 to meet the water quality standards in these water bodies (SWRCB 2011i-l).

### 3 *Cadmium, Copper, and Zinc*

4 Shasta Lake where West Squaw Creek enters the lake, Spring Creek (from Iron  
5 Mountain Mine to Keswick Reservoir), and Keswick Reservoir downstream of  
6 Spring Creek were placed on the 303(d) list approved by the USEPA in 2010 for  
7 impairment by cadmium, copper, and zinc (SWRCB 2011a). The Upper  
8 Sacramento River from Keswick Dam to Cottonwood Creek was previously listed  
9 on the 303(d) list for impairment by cadmium, copper, and zinc but was delisted  
10 after a TMDL was completed in 2002 and the SWRCB determined the water  
11 quality standard was met. The elevated levels were primarily the result of acid  
12 mine drainage discharged from inactive mines in the upper Sacramento River  
13 watershed, located upstream of Shasta and Keswick dams (CVRWQCB 2002a).  
14 There are projects underway to clean up many inactive mine sites that discharge  
15 high concentrations of metals (CVRWQCB 2011).

16 Cadmium, copper and zinc contamination in the Sacramento River have been  
17 addressed by the *2002 Upper Sacramento River TMDL for Cadmium, Copper and*  
18 *Zinc*, and by water quality objectives in the Basin Plan (CVRWQCB 2002a).  
19 Although cadmium, copper, and zinc are generally found as mixtures in surface  
20 water, the mixtures tend to be antagonistic – less toxic than when found as  
21 individual components – thus the water quality objectives focus on individual  
22 parameters. Levels of water hardness affect the toxicity of these metals, where  
23 increased hardness decreases toxicity. Thus the water quality objectives at certain  
24 locations are determined using specific levels of water hardness (CVRWQCB  
25 2002a). The TMDL for cadmium, copper, and zinc in Shasta Lake, Spring Creek,  
26 and Keswick Reservoir is expected to be completed in 2020 (SWRCB 2011i,m,n).

### 27 *Pesticides*

28 The Sacramento River from Red Bluff to Knights Landing was placed on the  
29 303(d) list approved by the USEPA in 2010 as impaired by DDT and the Group A  
30 pesticide dieldrin. The Sacramento River from Knights Landing to the Delta was  
31 also placed on the 303(d) list as impaired by chlordane, DDT, and dieldrin  
32 (SWRCB 2011a). Chlordane, DDT, and dieldrin are legacy pesticides and were  
33 discontinued from the early 1970s to the late 1980s.

34 Although these pesticides have been discontinued since the late 1980's, the  
35 narrative water quality objective for toxicity, which applies to single or the  
36 interactive effect of multiple pesticides or substances, and states that “All waters  
37 shall be maintained free of toxic substances in concentrations that produce  
38 detrimental physiological responses in human, plant, animal, or aquatic life” has  
39 not been met. Fish concentrations of DDT collected in 2005 exceeded the Total  
40 DDT OEHHA screening value of 21 µg/kg by up to five times, which was used as  
41 a criterion to evaluate the narrative water quality objective by up to five times.  
42 Concentrations of dieldrin were also found to exceed the OEHHA Evaluation  
43 Guideline of 0.46 µg/kg (SWRCB 2011o).

1 To protect the beneficial uses of the Sacramento River and other water bodies  
2 downstream, including the impaired commercial or recreational collection of fish,  
3 shellfish, or organisms, TMDLs for DDT and dieldrin in the Sacramento River  
4 from Red Bluff to Knights Landing are expected to be completed in 2021  
5 (SWRCB 2011o). For the Sacramento River from Knights Landing to the Delta,  
6 TMDLs are expected to be completed in 2021 for DDT and chlordane, and in  
7 2022 for dieldrin.

8 Although the Sacramento River was not placed on the 303(d) list approved by the  
9 USEPA in 2010 for chlorpyrifos and diazinon contamination, these pesticides  
10 have also been of concern in the Sacramento River (SWRCB 2011o, CVRWQCB  
11 2007a). Water quality sampling from 1999 to 2006 revealed concentrations of  
12 both pesticides at levels of concern in the Sacramento and Feather Rivers. In  
13 addition to runoff of applied pesticides into irrigation and storm water runoff into  
14 the Sacramento and Feather Rivers, atmospheric transport of diazinon from the  
15 Central Valley to the Sierra Nevada Mountains has been noted to occur. Of  
16 particular concern were the beneficial uses of Warm and Cold Fresh water  
17 Habitat.

#### 18 *PCBs*

19 The reach of the Sacramento River from Red Bluff to Knights Landing was  
20 placed on the 303(d) list approved by the USEPA in 2010 as impaired by PCBs  
21 (SWRCB 2011a). According to the *Final California 2010 Integrated Report*  
22 (303(d)/305(b) Report) Supporting Information, sources of PCBs in Sacramento  
23 River are unknown (SWRCB 2011o). PCBs, a group of synthetic organic  
24 chemicals, were manufactured from 1930 to 1977 and were banned in 1979.  
25 However, these organic pollutants persistent in the environment (ATSDR 2000).

26 The OEHHA Fish Contaminant Goal of total PCBs in fish is 3.6 ppb (or 3.6 ng/g)  
27 (SWRCB 2011o). Fish tissue samples collected in August and October 2005  
28 exhibited significant exceedances. Six composite samples were analyzed for 48  
29 individual PCB congeners and four Aroclor mixtures, with the four exceedances  
30 reported as 102.499 ng/g in channel catfish at Colusa, 9.151 ng/g in channel  
31 catfish at Grimes, 6.504 ng/g in Sacramento sucker at Colusa, and 5.767 ng/g in  
32 Sacramento sucker at Woodson Bridge.

33 To protect the beneficial uses of the Sacramento River, including the impaired  
34 beneficial use of commercial and sport fishing, a TMDL is expected to be  
35 completed in 2021 (SWRCB 2011o).

#### 36 *Unknown Toxicity*

37 The Sacramento River from Keswick Reservoir to Knights Landing was placed  
38 on the 303(d) list as impaired for unknown toxicity (SWRCB 2011a).

39 Results of survival, growth, and reproductive toxicity tests performed from 1998  
40 to 2007 showed an increase in mortality and a reduction in growth and  
41 reproduction in *C. dubia*, the Fathead Minnow *Pimephales promelas* (*P.*  
42 *promelas*) and the alga *Pseudokirchneriella subcapitata* (*P. subcapitata*, formerly  
43 known as *Selenastrum capricornutum*) (SWRCB 2011, o-q). Observations

1 violated the narrative toxicity objective found in the Sacramento – San Joaquin  
 2 River Basin Plan, which states that all waters shall be maintained free of toxic  
 3 substances in concentrations that produce detrimental physiological responses in  
 4 human, plant, or aquatic life (CVRWQCB 2011). This objective applies  
 5 regardless of whether the toxicity is caused by a single substance or the  
 6 interactive effect of multiple substances. Further research is being conducted on  
 7 the causes of toxicity in the Sacramento River. The TMDL for unknown toxicity  
 8 in the Upper Sacramento River is expected to be completed in 2019 (SWRCB  
 9 2011i,o-q).

10 A 2012 SWAMP report summarized the occurrences and causes of toxicity in the  
 11 Central Valley (Markiewicz et al.2012). The SWRCB’s Surface Water Ambient  
 12 Monitoring Program (SWAMP) defines toxicity as a statistically significant  
 13 adverse impact on standard aquatic test organisms in laboratory exposures. In  
 14 order to assess the causes of toxicity in California waterways, SWAMP testing  
 15 uses laboratory test organisms as surrogates for aquatic species in the  
 16 environment (Anderson et al.2011).

17 Sediment toxicity was noted to be higher in urban areas including Sacramento,  
 18 Yuba City, Redding, and Antioch, while sediments from agricultural areas were  
 19 generally non-toxic (Markiewicz et al.2012). Moderate water toxicity was  
 20 observed throughout the agricultural and urban-agricultural areas in the upper  
 21 Sacramento watershed, including in the Colusa Basin, in the vicinity of the Sutter  
 22 Buttes, and along the eastern valley floor between Chico and Lincoln.

23 SWAMP studies indicate that the replacement of organophosphate pesticides by  
 24 pyrethroids has resulted in an increased contribution of pyrethroids to ambient  
 25 water and sediment toxicity (Anderson et al. 2011). With regard to sediment, as  
 26 indicated by *H. azteca*, the majority of toxicity has been attributed to pyrethroids,  
 27 particularly in urban areas (Markiewicz et al. 2012). Of the pyrethroid pesticides,  
 28 bifenthrin is of major concern.

#### 29 **6.3.3.1.2 Sacramento River from Verona to Freeport**

30 The water quality of the lower Sacramento River is influenced by the upstream  
 31 sources discussed above as well as by inflows from the American River and from  
 32 surrounding urban and agricultural runoff. The major water quality constituents  
 33 of concern are described below. Water temperature is not a major concern in this  
 34 lower reach of the Sacramento River because the vitality of aquatic species in this  
 35 reach are not dependent on temperature.

##### 36 *Mercury*

37 The Sacramento River from Verona to Freeport is on the 303(d) list approved by  
 38 USEPA in 2010 for mercury contamination (SWRCB 2011a).

39 Mercury in this reach of the river can be attributed to waterborne inputs from the  
 40 upper Sacramento River, Feather River, Yuba River, and American River  
 41 (SWRCB 2011q). These major tributaries are also listed as impaired due to  
 42 mercury. As in the Klamath and Trinity River basins, historic mining has resulted  
 43 in significant mercury contamination in the Sacramento River Basin.

1 Flows from the Yuba River are an important source of mercury loading to the  
2 lower Sacramento River. Tailings discharged from gold mines in the Sierra  
3 Nevada mountains during the nineteenth century contained significant amounts of  
4 mercury-laden sediment, due to the use of mercury to extract gold. These  
5 discharges caused the formation of anthropogenic alluvial fans at the base of the  
6 Sierra Nevada, most notably the Yuba Fan. Singer et al. (2013) predicted that  
7 mercury-laden sediment from the original fan deposit will continue to be  
8 transported to the Sacramento River for the next 10,000 years.

9 The Sacramento River is a key source of mercury contamination into the  
10 Sacramento – San Joaquin River Delta. Over 80 percent of total mercury flux to  
11 the Delta can be attributed to the Sacramento River Basin (CVRWQCB 2010a).  
12 The CVRWQCB (2010a) compiled data from 2000 to 2003 and reported an  
13 average of 0.10 ng/l in the Sacramento River at Freeport. Similarly, CALFED  
14 reported that the Sacramento River at Freeport contributed an average of 0.11 ng/l  
15 of methylmercury to the Delta from 2003 to 2006 (Foe et al. 2008).

16 Water samples were collected from the lower Sacramento River and its tributaries  
17 from March 2003 to June 2006 (Foe et al. 2008). For comparison, concentrations  
18 in samples from the upper Sacramento River from Redding to Colusa were lower,  
19 ranging from 0.03 to 0.10 ng/l. Major tributaries to the lower Sacramento River,  
20 including the Feather River (0.05 ng/l), American River (0.06 ng/l), Colusa Basin  
21 Drain (0.21 ng/l), and Yuba River (0.05 ng/l), contributed to the mean  
22 methylmercury concentration of 0.11 ng/l at Freeport in the Sacramento River.

23 The commercial or recreational collection of fish, shellfish, or organisms were  
24 deemed impaired prior to the current 303(d) list approved in 2010 (SWRCB  
25 2011q). However, no new data were available to be assessed for this updated  
26 listing.

27 Table 6.16 presents streambed sediment mercury concentrations from the  
28 Sacramento River and Delta regions in 1995, sampled as part of the National  
29 Water Quality Assessment (NWQA) Program for the Sacramento River Basin  
30 (MacCoy and Domagalski 1999). Limited data for mercury in sediment exist;  
31 however, these data exhibit levels of mercury greatly exceeding the average  
32 amount of mercury found on the earth's surface, of about 0.05 µg/g. The highest  
33 streambed sediment concentrations of mercury were measured downstream from  
34 the Sierra Nevada and Coast Ranges. Within the Sacramento River, sites  
35 downstream of the Feather River had higher concentrations of mercury than  
36 sampled locations upstream of this confluence. The highest reported mercury  
37 concentrations were from the Yuba River, Bear River, Sacramento River at  
38 Verona, and the Feather River which exceeded the threshold effect concentration  
39 (0.18 µg/g), but not the probable effect concentration (1.06 µg/g) reported by  
40 MacDonald et al. (2000).

1 **Table 6.15 Streambed sediment concentrations of mercury in the Sacramento River**  
 2 **and Delta regions**

Water body/Site	Concentration
<b>Feather River sites</b>	
Feather River	0.21 µg/g
Yuba River	0.37 µg/g
Bear River	0.37 µg/g
Feather & Sacramento Rivers Downstream of the confluence at Verona	0.24 µg/g
<b>Sacramento River sites</b>	
Bend Bridge	0.16 µg/g
Freeport	0.14 µg/g
Cache Creek	0.15 µg/g
Arcade Creek	0.13 µg/g
American River	0.16 µg/g

3 Source: MacCoy and Domagalski 1999

4 Reported in bottom material <63 micron fraction dry weight.

5 \* Concentration exceeds the MacDonald et al. (2000) threshold effect concentration (0.18  
 6 µg/g dry weight) but not the probable effect concentration (1.06 µg/g dry weight).

7 In an effort to protect the beneficial uses of the Sacramento River, including the  
 8 impaired commercial and recreational collection of fish, shellfish, or organisms,  
 9 the CVRWQCB (2011) made recommendations for the future reduction of  
 10 mercury contamination. Additionally, the Delta Mercury Control Program  
 11 (MERP 2012) provides potential load allocations for mercury pertaining to the  
 12 Sacramento River and the Yolo Bypass, while the Cache Creek Watershed  
 13 Mercury Program provides load allocations for Cache Creek, Bear Creek, Sulphur  
 14 Creek, and Harley Gulch.

15 *Pesticides*

16 The Sacramento River was placed on the 303(d) list approved by the USEPA in  
 17 2010 as impaired by the pesticides chlordane, DDT, and dieldrin from Knights  
 18 Landing to the Delta. These three pesticides listings were based on the evaluation  
 19 of fish contaminant data from 2005. Chlordane, DDT, and dieldrin are legacy  
 20 pesticides that were discontinued from the early 1970s to the late 1980s.  
 21 However, samples collected in the Sacramento River at the Veterans Bridge in  
 22 September 2005 revealed elevated pesticide concentrations (SWRCB 2011q).

23 A composite sample of carp and a composite sample of channel catfish had total  
 24 chlordane concentrations of 6.72 µg/kg and 10.20 µg/kg, respectively, both  
 25 exceeding OEHHAs (2008) FCG of 5.6 µg/kg for total chlordane in fish tissue  
 26 (SWRCB 2011q).

1 Composite samples of carp and Channel Catfish contained total DDT  
2 concentrations of 59. µg/kg and 109. µg/kg, respectively. These concentrations  
3 exceeded the OEHHAs (2008) FCG of 21 µg/kg (SWRCB 2011q).

4 Composite samples of carp and Channel Catfish contained total dieldrin  
5 concentrations of 0.98 µg/kg and 1.49 µg/kg, respectively, These concentrations  
6 both exceeded the OEHHAs (2008) FCG of 0.46 µg/kg (SWRCB 2011q).

#### 7 *PCBs*

8 The Sacramento River from Knights Landing to the Delta was placed on the  
9 303(d) list approved by the USEPA in 2010 as impaired by PCBs (SWRCB  
10 2011a).

11 According to the Final California 2010 Integrated Report (303(d)/305(b) Report)  
12 Supporting Information, sources of PCBs in this reach of the Sacramento River  
13 are unknown (SWRCB 2011q).

14 The Sacramento River from Knights Landing to the Delta has also been newly  
15 listed as contaminated by PCBs. Three of three composite samples analyzed for  
16 total PCBs in September 2005 exceeded the OEHHA Fish Contaminant Goal for  
17 total PCBs of 3.6 ppb (or 3.6 ng/g), wet weight. The exceeding concentrations  
18 were recorded at 53 ng/g in channel catfish, 6.0 ng/g in Sacramento sucker, and  
19 26 in carp (SWRCB 2011q).

20 A TMDL for PCBs in the Sacramento River from Knights Landing to the Delta is  
21 expected to be completed in 2021 to protect the beneficial uses of the Sacramento  
22 River and downstream waterbodies (SWRCB 2011q).

#### 23 *Dissolved Oxygen*

24 The Sacramento River was not placed on the 303(d) list approved by the USEPA  
25 in 2010 for low dissolved oxygen (SWRCB 2011a).

#### 26 *Salinity, Electrical Conductivity, and Total Dissolved Solids*

27 The Sacramento River was not placed on the 303(d) list approved by the USEPA  
28 in 2010 as impaired by salinity (SWRCB 2011a).

#### 29 *Selenium*

30 Water bodies in the Sacramento River Basin were not listed on the 303(d) list as  
31 impaired by selenium. Waterborne selenium concentrations in the Sacramento  
32 River near Verona are relatively low compared to concentrations in the San  
33 Joaquin River Basin. However, the much larger flow that the Sacramento River  
34 contributes to the Delta, in comparison to the San Joaquin River, results in a  
35 substantial contribution to the mass loading of selenium to the Delta from the  
36 Sacramento River (Cutter and Cutter 2004; SWRCB 2008a). Loads to the Delta  
37 from the Sacramento River were projected to be about half of what the Grasslands  
38 basin was projected to contribute to the San Joaquin River, with subsequent  
39 loading to the Delta from the San Joaquin River dependent on flow (Presser and  
40 Luoma 2006).

41 Data for selenium in fish from the Sacramento River are limited, but Largemouth  
42 Bass were sampled in 1999, 2000, 2005, and 2007 from the lower Sacramento

1 River, San Joaquin River, and Delta by the CVRWQCB. The fillet data and  
 2 whole-body selenium concentrations, estimated using an equation from Saiki et  
 3 al. (1991), were used to evaluate potential human and wildlife health risks (Foe  
 4 2010). Selenium concentrations in fillets and whole bodies of the bass from the  
 5 Sacramento River at Veterans Bridge were well below the draft criteria released  
 6 in May 2014 (11.8 mg/kg for fillets and 8.1 mg/kg for whole body) (USEPA  
 7 2014b).

#### 8 *Unknown Toxicity*

9 The Sacramento River from Knights Landing to the Delta is listed as impaired by  
 10 toxicity due to the results of survival, growth and reproductive toxicity tests  
 11 performed in 2006 and 2007. Observations of increased mortality and reduction  
 12 in growth and reproduction in *C. dubia* and *P. promelas* compared to laboratory  
 13 controls violated the narrative toxicity objective of the Basin Plan. The TMDL  
 14 for toxicity in this reach of the river is expected to be completed in 2019  
 15 (SWRCB 2011q).

#### 16 **6.3.3.1.3 Colusa Basin Drain**

17 The Colusa Basin Drain receives inflow from local creeks and discharge and  
 18 runoff from the Colusa agricultural basin. Under conditions of low water levels,  
 19 it drains by gravity into the Sacramento River at Knights Landing; however, when  
 20 the water levels at Knights Landing are too high for this gravity flow to occur,  
 21 discharge from the Colusa Basin Drain is routed directly to the Yolo Bypass  
 22 through the Ridge Cut canal (USGS 2002). During the non-storm season, flows  
 23 from the Colusa Basin Drain can contribute over ten percent of Sacramento River  
 24 flows at Verona when there are floods in the Colusa Basin, high irrigation  
 25 discharges, and/or low Sacramento River flows (Colusa Basin Drain Steering  
 26 Committee 2005).

27 Beneficial uses designated for the Colusa Basin Drain include agricultural  
 28 irrigation and stock watering, water contact recreation, and warm and cold water  
 29 habitat, migration and spawning for aquatic biota (CVRWQCB 2011). In spite of  
 30 the many uses of the waterway, the Colusa Basin Drain is listed as impaired for  
 31 numerous contaminants. Water quality constituents of concern impact both local  
 32 beneficial uses and the water quality of receiving waterways, including the  
 33 Sacramento River and the Yolo Bypass. Suspended solids, agricultural  
 34 chemicals, heavy metals and organic matter are often present in concentrations  
 35 that exceed those in the Sacramento, Feather, and American Rivers (Colusa Basin  
 36 Drain Steering Committee 2005, SWRCB 2011r, USGS 2002)

#### 37 *Mercury*

38 The Colusa Basin Drain is listed on the 303(d) list for contamination by mercury  
 39 due to multiple exceedances of the USEPA Fish Tissue Residue Criterion for  
 40 methylmercury in fish of 0.3 mg/kg (or 0.3 ppm) for the protection of human  
 41 health (SWRCB 2011r). Samples exceeding the criterion included two of seven  
 42 samples collected at the County Road 99E bridge crossing between 1997 and  
 43 2002 (one carp composite sample with a concentration of 0.41 ppm and one white  
 44 catfish composite sample with concentration of 0.30 ppm) and one of ten samples

1 collected in the Colusa Basin Drain at Abel Road between 1980 and 1988 (one  
2 brown bullhead composite sample with concentration of 0.58 ppm).

3 The Delta mercury TMDL study reported an average concentrations of  
4 methylmercury in the Colusa Basin Drain was reported to be 0.214 ng/l between  
5 2000 and 2003. The Colusa Basin Drain contributed 3.3 percent of total mercury  
6 inputs to the Sacramento Basin between 1984 and 2003 (CVRWQCB 2010a). A  
7 TMDL for the Colusa Basin Drain is expected to be completed in 2021 (SWRCB  
8 2011r).

### 9 *Pesticides*

10 The Colusa Basin Drain is listed as contaminated by the organophosphate  
11 pesticides azinphos-methyl (Guthion), diazinon, DDT and malathion. Azinphos-  
12 methyl and malathion have been included on the 303(d) list since 2006; thus,  
13 supporting information for their listing is not readily available. However,  
14 diazinon has been listed due to samples collected between 1996 and 2000 and  
15 again in 2004 exceeding the CDFW acute criterion of 0.16 µg/l one hour average.  
16 Samples collected in 2004 also exceeded the four day average criterion of 0.10  
17 µg/l. Diazinon was addressed by a 2008 basin plan amendment but has not been  
18 removed from the 303(d) list (SWRCB 2011r).

19 Two of two samples assessed for DDT in the Colusa Basin Drain in 2005 greatly  
20 exceeded the OEHHA 2008 FCG for DDT, of 21 µg/kg of total DDT in fish  
21 tissue. Concentrations of 44.009 µg/kg and 65.903 µg/kg were recorded in  
22 composite samples of white catfish and carp, respectively. The TMDL for DDT  
23 is expected to be completed in 2021 (SWRCB 2011r).

24 The organochlorine pesticide dieldrin, and the Group A pesticides generally, are  
25 included on the 303(d) list for the Colusa Basin Drain (SWRCB 2011r). The  
26 Group A pesticides have been listed since 2006, thus supporting information is  
27 not readily available. Dieldrin is listed due to two of two samples collected in  
28 August 2005 exceeding the OEHHA FCGs for dieldrin of 0.46 µg/kg dieldrin in  
29 fish tissue. One composite sample of white catfish recorded a concentration of  
30 0.7 µg/kg and one composite sample of carp recorded a value of 1.14 µg/kg.  
31 Contamination by organochlorine pesticides in the Colusa Basin Drain will be  
32 addressed by the Central Valley Organochlorine Pesticide TMDL and Basin Plan  
33 Amendment.

34 The carbamate pesticide carbofuran is also included on the 303(d) list for the  
35 Colusa Basin Drain. It has been listed since 2006; thus, supporting information is  
36 not readily available. A TMDL is expected by 2021 (SWRCB 2011r).

### 37 *Dissolved Oxygen*

38 The Colusa Basin Drain was placed on the 303(d) list approved by the USEPA in  
39 2010 for low dissolved oxygen (SWRCB 2011a). According to the Final  
40 California 2010 Integrated Report (303(d)/305(b) Report) Supporting  
41 Information, sources of contributing to the dissolved oxygen impairment in the  
42 Colusa Basin Drain are unknown (SWRCB 2011r).

1 Samples collected from the Colusa Basin Drain (at Maxwell Road, above Knights  
 2 Landing, at Highway 162, and at “Colusa Basin Drain #5”) between September  
 3 2004 and October 2006 and were tested for dissolved oxygen (SWRCB 2011r).  
 4 Thirty of the 73 samples exceeded the general number water quality objectives for  
 5 COLD and SPWN beneficial uses. Five of the samples exceeded the water  
 6 quality objective for WARM beneficial uses.

#### 7 *Other Constituents of Concern*

8 The Colusa Basin Drain is also listed as contaminated by *E. coli*, low dissolved  
 9 oxygen, and unknown toxicity (SWRCB 2011r). Knights Landing Ridge Cut is  
 10 listed as contaminated by boron, low dissolved oxygen, and salinity. A USGS  
 11 study of Yolo Bypass water quality in 2000 also reported that significant  
 12 concentrations of ammonium and dissolved organic carbon in the Yolo Bypass  
 13 were correlated with high concentrations in the Colusa Basin Drain, and that the  
 14 Colusa Basin Drain was a major discharger of sulfate to the Yolo Bypass (USGS  
 15 2002)

#### 16 **6.3.3.1.4 Feather River from Lake Oroville to the Confluence with the** 17 **Sacramento River**

18 Water quality constituents of concern in the Lower Feather River have the  
 19 potential to affect several supported beneficial uses, including municipal and  
 20 agricultural water supply, contact and non-contact water recreation, and fish  
 21 habitat and migration uses, for cold and warm water. The 303(d) listed  
 22 contaminants in this reach of the Feather River.

#### 23 *Water Temperature*

24 The Lower Feather River (downstream of Lake Oroville) is not listed on the  
 25 303(d) list as impaired by water temperature (SWRCB 2011a). However, water  
 26 temperature in the lower Feather River is crucial to maintaining fresh water  
 27 habitat for both warm and cold fresh water fish species in downstream habitats  
 28 (DWR 2007). The SWP operates Lake Oroville and the Thermalito Reservoir  
 29 Complex to meet temperature objectives established through a 1983 agreement  
 30 with California Department of Fish and Wildlife and biological opinions issued  
 31 by NMFS, as described in Appendix 3A, No Action Alternative: Central Valley  
 32 Project and State Water Project Operations. Releases from Lake Oroville  
 33 determine initial river temperatures. Water is released at different depths through  
 34 shutters at the intake structures (DWR 2007). Although Lake Oroville releases  
 35 determine water temperatures initially, atmospheric conditions modify  
 36 downstream river temperatures. Water temperatures vary seasonally and spatially  
 37 between the low flow channel (LFC) and high flow channel (HFC) of the Lower  
 38 Feather River downstream of the fish barrier dam. The LFC is the reach of the  
 39 river between the Fish Barrier Dam and the confluence with the Thermalito  
 40 Afterbay Outlet and it is managed to protect cold water fish species. The HFC is  
 41 the downstream reach of the river, from the Thermalito Afterbay Outlet to the  
 42 confluence with the Sacramento River.

43 Warmer temperatures in the LFC start to appear in March, reaching maximum  
 44 temperatures in July and early August ranging from 61° F upstream of the Feather

1 River Fish Hatchery to 69° F upstream of the Thermalito Afterbay Outlet (DWR  
2 2007a). Cooling of the LFC begins in September, with a minimum temperature  
3 of approximately 45° F occurring in February. At the Feather River Fish  
4 Hatchery, water temperatures are generally compliant with the 1983 Agreement.  
5 Temperatures from 2002 to 2004 were in compliance 95 percent of the time,  
6 exceeding requirements for 23 days during an extended warm period in fall 2002,  
7 and dropping below requirements for 13 days during the warm summer months.  
8 Water temperatures at Robinson Riffle are almost always met when the fish  
9 hatchery temperatures are met. Agricultural temperature requests cannot always  
10 be satisfied due to the requirements of the fish species and the fluctuating  
11 meteorological conditions.

12 Temperatures in the HFC are influenced by releases from the Thermalito Afterbay  
13 and flow contributions from Honcut Creek, the Yuba River, and the Bear River  
14 from April through October (DWR 2007). Except for during high flows from the  
15 Thermalito Afterbay (occurring frequently in July and August), releases in the  
16 warm season generally raise the water temperature. Honcut and Bear River  
17 inflows tend to increase downstream temperatures as well, while flows from the  
18 Yuba River tend to cool downstream temperatures during the warmer months.

19 Warming water temperatures appear in the HFC starting in March, with maximum  
20 temperatures occurring in July and August, ranging from 71 to 77° F (DWR  
21 2007). In late August, the HFC begins to cool, reaching minimum temperatures of  
22 44 to 45° F by January or February.

23 In addition to effects on fish species, agriculture is potentially affected by changes  
24 in water temperature, because the temperatures of irrigation water can affect crop  
25 growth (DWR 2007). In the Feather River Basin, this is particularly an issue for  
26 rice production. Water contact recreation can also be affected by water  
27 temperatures, as flows in the LFC are managed for cold water species and thus  
28 may be too cold for some water-contact recreation.

### 29 *Mercury*

30 The Lower Feather River is included on the 303(d) list for mercury contamination  
31 (SWRCB 2011a). The listing was made before the 2006 Integrated Report; thus,  
32 the evidence of water quality exceedance is not readily available. It has been  
33 noted, however, that the Feather River has relatively large mercury loadings and  
34 high mercury concentrations in suspended sediment, contributing significantly to  
35 mercury loading to the Delta. The Feather River transports much of the mercury  
36 to the Sacramento River that was released in the Sierra Nevada Mountains during  
37 gold mining operations (CVRWQCB 2010a).

38 FERC relicensing studies indicate that mercury consistently exceeds USEPA  
39 guidelines in most fish species and locations, and that biomagnification appears to  
40 have caused elevated mercury levels in fish (DWR 2007). A beneficial effect of  
41 Lake Oroville is the capture of contaminated sediments, preventing their further  
42 transport downstream.

43 In the Sacramento – San Joaquin Delta Estuary TMDL for methylmercury, the  
44 CVRWQCB (2010a) recommends that the Feather River be targeted for mercury

1 reduction during initial efforts focusing on the watersheds that export the largest  
2 volumes of highly mercury-contaminated sediment to the Delta.

### 3 *Pesticides*

4 The Feather River below Lake Oroville is listed as contaminated for chlorpyrifos.  
5 Samples collected during storm events at the Feather River near Nicolaus in 2004  
6 exceeded the California DFG Hazard Assessment Criteria of 25 ng/l over a one  
7 hour average. The TMDL for chlorpyrifos in the Feather River is expected to be  
8 completed in 2019 (SWRCB 2011t).

9 Group A Pesticides have also been detected in exceedance of water quality  
10 criteria (SWRCB 2011t). Data collected for organochlorine pesticide  
11 contamination in the Feather River between 2000 and 2009 as part of the NPDES  
12 permit program did not indicate exceedances of CTR criteria, but did show  
13 detections in all samples in the water column. Channel catfish tissue samples  
14 from the Feather River at Highway 99 between 1978 and 2008 exhibited high  
15 concentrations of DDT and dieldrin. These water quality and fish tissue data were  
16 presented as part of supplemental documents in the process to develop a basin  
17 plan amendment to address organochlorine pesticides in Central Valley water  
18 bodies. This basin plan amendment is currently in development and will include  
19 organochlorine pesticides in the Feather River (CVRWQCB 2010c).

### 20 *PCBs*

21 The Lower Feather River was placed on the 303(d) list approved by the USEPA  
22 in 2010 as impaired by PCBs (SWRCB 2011a).

23 According to the *Final California 2010 Integrated Report (303(d)/305(b) Report)*  
24 *Supporting Information*, sources of PCBs in the Feather River are unknown  
25 (SWRCB 2011t). However, The Draft Environmental Impact Report for the  
26 FERC relicensing notes that PCBs have been detected in all fish and crayfish  
27 species from all sampled water bodies. Aroclors were also detected in at least  
28 some fish in all water bodies, as well as in crayfish in the Feather River  
29 downstream from the State Route 70 bridge (DWR 2007). PCBs have been  
30 released into the Feather River watershed from several activities. Two events in  
31 the 1980s resulted in PCB contamination in the watershed: oil containing PCBs  
32 was applied to a dirt road and entered the Ponderosa Reservoir in surface runoff,  
33 and PCBs contaminated soil and water at Belden Forebay due to a landslide  
34 which damaged powerhouses. Some remediation was performed in response to  
35 these events.

36 The same narrative water quality objective and evaluation criteria of 3.6 ng/g that  
37 was used as guidance to place the Sacramento River on the 303(d) list was also  
38 used to evaluate the Feather River. Composite samples of Largemouth Bass and  
39 crayfish collected in 2002 and 2003 showed high exceedances of the FCG.  
40 Upstream of the Thermalito Afterbay Outlet, a composite sample of Largemouth  
41 Bass had a concentration of 15.6 ng/g total PCBs, wet weight. Downstream of the  
42 outlet, the concentration of total PCBs in two composite samples of Largemouth  
43 Bass were 11.2 and 15.0 ng/g. Downstream of the Highway 70 Bridge, the

1 concentration of total PCBs in a composite sample of crayfish was 56 ng/g  
2 (SWRCB 2011t)

3 An additional study performed in 2003 and 2004 also revealed high exceedances  
4 of the OEHHA FCG for PCBs. Concentrations of total PCBs in composite  
5 samples of hardhead and pikeminnow were 26 ng/g and 31 ng/g wet weight,  
6 respectively. All samples were analyzed for 48 individual PCB congeners and  
7 two Aroclor mixtures (SWRCB 2011t)

8 A TMDL for PCBs in the Lower Feather River is expected to be completed in  
9 2021 to protect the beneficial uses of the Feather River and other water bodies  
10 downstream (SWRCB 2011t).

#### 11 *Other Constituents of Concern*

12 The Lower Feather River is listed as impaired by unknown toxicity due to  
13 significant exceedances of the toxicity criteria outlined by the CVRWQCB  
14 (SWRCB 2011t, CVRWQCB 2011). Water samples were tested with *C. dubia*,  
15 *P. promelas*, and *P. subcapitata* for survival, growth and/or reproductive toxicity  
16 between 1998 and 2007. Of 212 samples tested with *C. dubia* for survival and/or  
17 reproductive toxicity, 85 exceeded the narrative toxicity objective. Of 34 samples  
18 tested with *P. promelas* for survival and/or growth toxicity, seven exceeded the  
19 objective. Of 23 samples tested with *P. subcapitata*, none exceeded the objective.  
20 Samples in violation of the toxicity objective were collected in the Feather River  
21 at Nicolaus; in the Thermalito Diversion Pool; downstream from the Feather  
22 River Hatchery; upstream and downstream from the Thermalito Afterbay Outlet;  
23 downstream from the Sewage Commission Oroville Region (SCOR) Outlet; and  
24 downstream from the FERC Project 2100 project boundary.

#### 25 **6.3.3.1.5 American River below Lake Natoma**

26 The lower American River flows for 23 miles from Nimbus Dam to its confluence  
27 with the Sacramento River. Water quality in this reach of the river is influenced  
28 by releases from upstream reservoirs, including Lake Natoma and Folsom Lake.  
29 In general, the runoff that flows into Folsom Reservoir and Lake Natoma,  
30 upstream of the lower American River, is of high quality (Wallace, Roberts, and  
31 Todd et al. 2003). Water quality parameters measured in Folsom Reservoir,  
32 upstream of the lower American River, include pH, turbidity, dissolved oxygen  
33 (DO), total organic carbon (TOC), nutrients (nitrogen and phosphorus), electrical  
34 conductivity, total dissolved solids (TDS), and fecal coliform.

#### 35 *Water Temperature*

36 The lower American River is not listed on the 303(d) list as impaired by water  
37 temperature (SWRCB 2011a). The lower American River supports warm and  
38 cold fresh water habitat beneficial uses, as well as migration and spawning uses.  
39 In particular, in-stream rearing of juvenile steelhead requires certain water  
40 temperatures which are targeted through water temperature objectives  
41 (CVRWQCB 2011, NMFS 2009).

1 The CVP operates Folsom Lake to meet temperature objectives, as described in  
 2 Appendix 3A, No Action Alternative: Central Valley Project and State Water  
 3 Project Operations.

#### 4 *Mercury*

5 The American River from Nimbus Dam to the confluence with the Sacramento  
 6 River was listed on the 303(d) list for mercury contamination in 2010, due to  
 7 exceedances of OEHHA's guidance tissue levels for mercury (SWRCB 2011u).  
 8 The major source of mercury to the lower American River is mercury lost during  
 9 historic mining activities that is now distributed downstream.

10 The American River contributes mercury to the Sacramento River, and thus the  
 11 Delta, due to its relatively large mercury loadings and high mercury  
 12 concentrations in suspended sediment (CVRWQCB 2010a). Like the Feather  
 13 River, the lower American River is recommended for initial mercury reduction  
 14 efforts as part of the Sacramento – San Joaquin Delta Estuary TMDL for  
 15 Methylmercury. In addition to load allocations recommended as part of the Delta  
 16 TMDL for methylmercury, mercury contamination in the American River and its  
 17 reservoirs will be addressed as part of the statewide water quality control program  
 18 for mercury (SWRCB 2014a).

#### 19 *PCBs*

20 The lower American River was placed on the 303(d) list approved by the USEPA  
 21 in 2010 as impaired by PCBs (SWRCB 2011a).

22 Composite samples of white catfish and Sacramento sucker collected in the  
 23 American River at Discovery Park were analyzed for 48 individual PCB  
 24 congeners and three Aroclor mixtures (SWRCB 2011u). The total PCBs recorded  
 25 in the White Catfish and Sacramento Sucker were 3.934 ng/g and 44.094 ng/g,  
 26 respectively. An additional Sacramento Sucker composite sample collected at  
 27 Nimbus Dam did not exceed the OEHHA goal.

28 A TMDL for PCBs in the lower American River is expected to be completed in  
 29 2021 to protect the beneficial uses of the American River and other water bodies  
 30 downstream (SWRCB 2011u).

#### 31 *Unknown Toxicity*

32 The lower American River is listed as impaired by unknown toxicity. Toxicity  
 33 has been indicated for vertebrates and invertebrates from samples collected at  
 34 Discovery Park, using survival, growth, and reproduction toxicity tests with *C.*  
 35 *dubia* and *P. promelas*. These tests, conducted between 1998 and 2007, exhibited  
 36 significant increases in mortality and reductions in growth and reproduction in the  
 37 test organisms (SWRCB 2011u). The TMDL is expected to be completed in 2021  
 38 (SWRCB 2011u).

#### 39 **6.3.3.1.6 Yolo Bypass**

40 The Yolo Bypass supports a variety of beneficial uses, including agricultural  
 41 supply, recreational uses, and spawning, migration and habitat use. The Yolo  
 42 Bypass is used for agriculture in times of low flow, and discharges to the San

1 Francisco Bay-Delta contribute to drinking water supplies. The Yolo Bypass also  
2 supports seasonal fish and bird populations when it is inundated, and resident fish  
3 species in its perennial channel. Water quality in the Yolo Bypass is of great  
4 importance because of the in-Bypass water uses and its effects on receiving  
5 waters downstream (CVRWQCB 2011, Sommer et al. 2001)

6 *Mercury*

7 The Yolo Bypass contributes a significant amount of methylmercury and total  
8 mercury to the Delta. While the Sacramento River is the primary tributary source  
9 of mercury to the Delta in dry years, mercury loading from the Yolo Bypass  
10 increases in wet years and is comparable to that of the Sacramento River.

11 Although only two thirds of the Yolo Bypass floodplain lie within the legal Delta,  
12 the entire floodplain was evaluated as part of the Sacramento – San Joaquin Delta  
13 Estuary TMDL for Methylmercury (Delta Methylmercury TMDL) (CVRWQCB  
14 2010a). Compounding the issue of mercury contamination in the Yolo Bypass,  
15 the USGS study noted that the Bypass has conditions conducive to the production  
16 of methylmercury, including stagnant waters and marshes with an abundance of  
17 sulfate and organic carbon (USGS 2002).

18 A major source of mercury to the Yolo Bypass is Cache Creek. Mercury mine  
19 wastes have contributed relatively large mercury loading and high mercury  
20 concentrations in suspended sediment, making this area a priority for mercury  
21 reduction as part of the Delta Methylmercury TMDL (CVRWQCB 2010a).  
22 Elevated methylmercury concentrations in the Colusa Basin Drain are also a  
23 concern (USGS 2002).

24 The Cache Creek Settling Basin (CCSB) captures sediment and mercury  
25 transported by Cache Creek; however, any sediment that is not captured is  
26 transported to the Yolo Bypass (approximately half of the sediment transported by  
27 Cache Creek). The CTR mercury criterion of 0.050 µg/l for drinking water is  
28 exceeded in outflow from the CCSB (and possibly in other tributaries to Yolo  
29 Bypass), thus it is anticipated that when the Yolo Bypass is dominated by flows  
30 from Cache Creek, it also exceeds the CTR criterion (CVRWQCB 2010a).

31 The Delta Methylmercury TMDL recommends reducing mercury loads entering  
32 the CCSB, and regularly excavating the sediment accumulating in the CCSB, in  
33 order to increase its effectiveness and prevent its filling and thus cessation of  
34 sediment and mercury deposition. Additional reductions in mercury loading to  
35 Cache Creek will be achieved through the existing mercury TMDL in the  
36 watershed, which includes measures for mine remediation, erosion control in  
37 mercury-enriched areas, and the removal of floodplain sediments containing  
38 mercury (CVRWQCB 2010a).

39 In addition to efforts targeting mercury loading reductions in Cache Creek, the  
40 TMDL includes methylmercury and total mercury load and waste load allocations  
41 for agricultural drainage, tributary inputs and NDPES facilities in the Yolo  
42 Bypass to enable reductions in mercury contamination in water and fish  
43 (CVRWQCB 2010a).

1 *Agricultural Runoff*

2 The City of Woodland developed a water quality management plan for the Yolo  
3 Bypass which included water quality testing to identify pollutants of concern.  
4 Water quality was monitored within the Yolo Bypass and in its major tributaries,  
5 at the locations where they enter the Bypass. The study indicated that the highest  
6 concentrations of several contaminants were found in tributaries receiving  
7 predominantly agricultural discharge: the Willow Slough Bypass; Knights  
8 Landing Ridge Cut, which drains the Colusa Basin Drain; and for some  
9 contaminants, the Z Drain (City of Woodland 2005). Although the Yolo Basin is  
10 not included as a water body on the 303(d) list, the Tule Canal is listed as  
11 contaminated by several of these agricultural by-products, including boron,  
12 salinity, E. coli and fecal coliform. These contaminants will be addressed by  
13 TMDLs expected to be completed in 2021 (SWRCB 2011w).

14 Pesticides are of major concern in the agricultural drains tributary to the Yolo  
15 Bypass. DDE, a degradation product of the organochlorine pesticide DDT, was  
16 detected in the water column in agricultural drains and in Putah Creek sediment.  
17 The organophosphate pesticide chlorpyrifos was detected in excess of the  
18 concurrent DFG criterion of 0.009 µg/l in four samples, while diazinon was not  
19 reported in excess of its criterion. The carbamate pesticides diuron and methomyl  
20 were detected, but did not exceed their applicable criteria. Pyrethroids were not  
21 monitored, but were noted to be of increasing concern in the Yolo Bypass as in  
22 the rest of the Central Valley (City of Woodland 2005).

23 **6.3.3.2 San Joaquin Valley**

24 Water quality conditions in the San Joaquin River are described for locations that  
25 would be influenced by implementation of Alternatives 1 through 5, including  
26 Stanislaus River near Caswell Park in the vicinity of the confluence with the San  
27 Joaquin River; San Joaquin River near Vernalis, and San Joaquin River near  
28 Buckley Cove and Stockton

29 **6.3.3.2.1 San Joaquin River**

30 Water quality concerns in the San Joaquin River near Vernalis are primarily  
31 salinity, boron, and selenium which are influenced by low flows due to upstream  
32 diversions and water use and agricultural return flows.

33 *Water Temperature*

34 The reach of the San Joaquin River from Merced River to Stanislaus River was  
35 placed on the Section 303(d) list per the partial approval by USEPA in 2010 and  
36 the final approval in 2011 (SWRCB 2011a).

37 According to the *Final California 2010 Integrated Report* (303(d) list/305(b)  
38 Report) Supporting Information, water temperature concerns in San Joaquin River  
39 from Merced River to Stanislaus River are attributed to unknown sources  
40 (SWRCB 2011x,y). However, declines in fish populations, particularly salmon  
41 and steelhead trout, have been linked to increases in water temperatures and  
42 suggestions have been made that the population declines may be a result of

1 watershed changes from the construction of dams, water diversions, mining, and  
2 harvest (NMFS 2009).

3 USEPA (2011) evaluated salmonid migration and spawning temperatures to  
4 assess the water quality of the San Joaquin River. Recommended water  
5 temperature criteria for salmon and steelhead trout life stages are presented in  
6 Table 6.16. San Joaquin River temperatures from the Merced River to the  
7 Stanislaus River in 1996-2007 exceeded USEPA’s recommendations, thus  
8 impairing the cold freshwater habitat.

9 **Table 6.16 San Joaquin River Maximum Temperature Criteria and Recommended**  
10 **Uses for Summer**

Applicable to:	Criteria:
Chinook Salmon Adult Migration	64 °F
Chinook Salmon Spawning	55 °F
Chinook Salmon Smoltification and Juvenile Rearing	61 °F
Steelhead Trout Summer Rearing	64 °F

11 Source: SWRCB 2011x,y; USEPA 2003

12 TMDLs for the lower reaches in the San Joaquin River (Merced to Tuolumne and  
13 Tuolumne to Stanislaus) are expected to be completed in 2021 in an effort to  
14 further protect the beneficial uses of this water body (SWRCB 2011).

15 *Selenium*

16 San Joaquin River from Mud Slough to Merced River was placed on the Section  
17 303(d) list in 2010 for selenium contamination per the list approved by USEPA  
18 (SWRCB 2011a). Other water bodies that drain to the San Joaquin River  
19 upstream of this reach and are listed as impaired by selenium contamination on  
20 the 303(d) list include Mendota Pool, Panoche Creek from Silver Creek to  
21 Belmont Avenue, Agatha Canal, Grasslands Marshes, Mud Slough (North,  
22 downstream of San Luis Drain), and Salt Slough (upstream from confluence with  
23 San Joaquin River).

24 TMDLs for selenium were approved by the USEPA for the San Joaquin River  
25 (Mud Slough to Merced River) (in 2002), Grasslands Marshes (in 2000), Agatha  
26 Canal (in 2000), and Mud Slough (north, downstream of San Luis Drain) (in  
27 2002) (SWRCB 2011z-ac). A TMDL is expected to be completed for Panoche  
28 Creek in 2019 and another for Mendota Pool in 2021. Water quality objectives  
29 defined in the Basin Plan for the Sacramento River basin and the San Joaquin  
30 River basin are shown in Table 6.17 (CVRWQCB 2011).

1 **Table 6.17 Water Quality Objectives for Selenium in the San Joaquin River**  
 2 **Region, mg/l**

Objective	Applies to:
0.012 (maximum concentration)	San Joaquin River, mouth of the Merced River to Vernalis
0.005 (4-day average)	
0.020 (maximum concentration)	Mud Slough (north), and the San Joaquin River from Sack Dam to the mouth of Merced River
0.005 (4-day average)	
0.020 (maximum concentration)	Salt Slough and constructed and re-constructed water supply channels in the Grassland watershed*
0.002 (monthly mean)	

3 Source: CVRWQCB 2011

4 \*Applies to channels identified in Appendix 40 of the CVRWQCB (2011) Basin Plan

5 The drainage area for the Grasslands Bypass Project is a major but decreasing  
 6 source of selenium to the San Joaquin River. Selenium from subsurface  
 7 agricultural drainage waters originating in the Drainage Area was historically  
 8 transported through the Grassland Marshes through tributaries such as Mud  
 9 Slough and Salt Slough (CVRWQCB 2001). Efforts to decrease the selenium  
 10 loading to the San Joaquin River include the Grassland Bypass Project, discussed  
 11 in more detail below, which has decreased selenium loading by an average of  
 12 55 percent from the Grasslands Drainage Area in comparison to pre-Grassland  
 13 Bypass Project conditions (1986-1996 to 1997-2011) (GBPOC 2013). In the San  
 14 Joaquin River below the Merced River, selenium concentrations decreased from  
 15 an average of 4.1 µg/l during pre-project conditions (1986 to 1996) to 2 µg/l  
 16 (1997 to 2011). The continued operation of the Grassland Bypass Project is  
 17 expected to achieve the CVRWQCB Basin Plan objectives for the San Joaquin  
 18 Valley (Reclamation & SLDMWA 2009).

19 Largemouth Bass were sampled during 1999, 2000, 2005, and 2007 from the San  
 20 Joaquin River, lower Sacramento River, and Delta by the CVRWQCB (Foe  
 21 2010). The samples were analyzed as fillets to evaluate potential human health  
 22 risks, and whole-body selenium concentrations were estimated using an equation  
 23 from Saiki et al. (1991) to evaluate risks to wildlife. The data do not exceed the  
 24 draft water quality criteria released by the USEPA in May 2014.

25 The draft discharge requirements released by the CVRWQCB in 2014 were  
 26 created in an effort to meet the water quality objective for the San Joaquin River.  
 27 In 2010, the CVRWQCB and SWRCB approved amendments (Resolution 2010-  
 28 0046) to the Basin Plan for the Sacramento River and San Joaquin River Basins to  
 29 address selenium control in the San Joaquin River basin as related to the  
 30 Grassland Bypass Project (which is described below) (CVRWQCB 2010g,  
 31 SWRCB 2010b).

1 Other relevant requirements/actions to meet the water quality objectives for the  
2 San Joaquin River, in addition to release of the draft waste discharge requirements  
3 by the CVRWQCB (2010g), include the following:

4 • The Basin Plan amendments (CVRWQCB 2010g, SWRCB 2010b) modify the  
5 compliance time schedule for discharges regulated under waste discharge  
6 requirements to meet the selenium objective or comply with a prohibition of  
7 discharge of agricultural subsurface drainage to Mud Slough (north), a  
8 tributary to the San Joaquin River, in Merced County. For Mud Slough  
9 (north) and the San Joaquin River from the Mud Slough confluence to the  
10 mouth of the Merced River:

11 – The interim performance goal is 15 µg/l (monthly mean) by  
12 December 31, 2015 (adds to Table 6.46), and

13 – The water quality objective to be achieved by December 31, 2019, is  
14 5 µg/l (4-day average).

15 An extensive water quality and biological monitoring program was implemented  
16 in conjunction with the Grassland Bypass Project, and reports are issued  
17 periodically through the San Francisco Estuary Institute (e.g., SFEI 2011).

#### 18 *Electrical Conductivity and Salinity*

19 Grasslands Marshes, North Mud Slough (downstream of San Luis Dam), Salt  
20 Slough (upstream from confluence with San Joaquin River), and San Joaquin  
21 River (Bear Creek to Vernalis) are water bodies in the Central Valley that were  
22 placed on the Section 303(d) list approved by the USEPA in 2010 as impaired by  
23 electrical conductivity (SWRCB 2011a). Salinity, which is linked to electrical  
24 conductivity, is a major concern for water quality in the San Joaquin Valley  
25 (CVRWQCB 2011). The RWQCB has adopted a TMDL for the San Joaquin  
26 River upstream of Vernalis for salt and boron.

27 Elevated electrical conductivity in Grasslands Marshes, North Mud Slough  
28 (downstream of San Luis Dam), Salt Slough (upstream from confluence with San  
29 Joaquin River), and San Joaquin River (Bear Creek to Vernalis) can be attributed  
30 to agriculture (SWRCB 2011x-aa,ac-af). Likewise, high salinity in the San  
31 Joaquin River near Vernalis has been linked to the discharge of water from  
32 agricultural practices (CALFED 2007). Saline water from agricultural return flow  
33 is added to the southern Delta by the San Joaquin River whereupon a portion is  
34 pumped by the export pumps back to the farms that eventually drain back to the  
35 river, exacerbating the problem of salinity control and salt buildup in the San  
36 Joaquin Valley.

37 To protect the beneficial uses of these water bodies, including agricultural supply,  
38 and municipal and domestic supply, particularly for San Joaquin River from Bear  
39 Creek to Mud Slough, water quality objectives were established in the SWRCB  
40 (2006a) Basin Plan for the San Francisco Bay/Sacramento-San Joaquin Delta  
41 Estuary (Table 6.18).

1 **Table 6.18 SWRCB Water quality objectives for electrical conductivity in the San**  
 2 **Joaquin River (Airport Way Bridge, Vernalis)**

Time Period	Water Quality Objective <sup>1</sup>
April 1 to August 31	0.7 mmhos (700 $\mu$ S/cm)
September 1 to March 31	1.0 mmhos (1000 $\mu$ S/cm)

3 Source: SWRCB 2006a

4 1 Maximum 30-day running average of mean daily

5 Several samples from San Joaquin River (Bear Creek to Vernalis) between  
 6 October 1995 and February 2007 exceeded the SWRCB Basin Plan's water  
 7 quality objective for electrical conductivity in the San Joaquin River (SWRCB  
 8 2011 x-aa,ac-af). Samples were collected from San Joaquin River at Lander  
 9 Avenue, Fremont Ford, Patterson Fishing Access, Hills Ferry Bridge, and Crows  
 10 Landing. Guidelines for evaluating Grasslands Marshes, North Mud Slough, and  
 11 Salt Slough are not available because the listing was made prior to 2006.

12 The record of monthly average electrical conductivity (EC) readings for recent  
 13 years for the San Joaquin River at Vernalis is shown in Figure 6.4. Salinity in the  
 14 lower San Joaquin River as observed at Vernalis often exceeds the water quality  
 15 objective for individual records during summer months. The highest salt  
 16 concentrations emanate from Mud and Salt sloughs, while less saline water  
 17 provides dilution from the Merced River (CALFED 2007). Note the marked  
 18 increase in salinity during dry months and dry years at Vernalis, ranging from  
 19 midwinter lows near 100  $\mu$ mhos/cm up to summer high values near 1000  
 20  $\mu$ mhos/cm.

21 A TMDL is expected to be completed in 2019, with the exception of San Joaquin  
 22 River from Tuolumne to Stanislaus River which is expected to be completed in  
 23 2021 (SWRCB 2011 x-aa,ac-af). In addition, the Board has implemented the  
 24 comprehensive salt management program, known as CV-SALTS (Central Valley  
 25 Salinity Alternatives for Long Term Sustainability), to develop salt control  
 26 strategies for the San Joaquin and the entire Central Valley watershed  
 27 (CVRWQCB 2011, 2010h). The San Joaquin River Water Quality Improvement  
 28 Program (SJRIP) was designed to address issues of chronically saline water,  
 29 reuse, treatment options, and the development of salt-tolerant crops for this area  
 30 of the valley, as part of the Grasslands Bypass Project.

### 31 *Mercury*

32 Mercury is a constituent of concern for the San Joaquin River from Bear Creek to  
 33 the Delta boundary, and was placed on the 303(d) list in 2010 (SWRCB 2011a).  
 34 San Joaquin River from Friant Dam to Bear Creek was not included on the 303(d)  
 35 list for mercury contamination.

36 Mercury in this reach of the San Joaquin can be attributed to resource extraction.  
 37 Significant gold mining took place along the major tributaries of the San Joaquin  
 38 River, including Merced River, Tuolumne River, Stanislaus River, and Cosumnes  
 39 River in the San Joaquin River basin (CVRWQCB 2010a).

1 Mercury and enhanced mercury methylation can affect the beneficial uses of the  
2 San Joaquin River and receiving waters downstream. At the Delta boundary in  
3 Vernalis, the waterborne methylmercury concentration in the San Joaquin River  
4 from 2003 to 2006 ranged from 0.10-0.75 ng/l with an average of 0.19 ng/l (Foe  
5 et al. 2008). The average fish tissue mercury concentration in Largemouth Bass  
6 from Vernalis in 2000 was 0.68 mg/kg (wet weight) (CVRWQCB 2010a). This  
7 fish tissue concentration exceeds the USEPA wet weight methylmercury fish  
8 tissue criterion (0.3 mg/kg) for the protection of human health.

9 To further protect the health of humans and wildlife, the Sacramento-San Joaquin  
10 Delta TMDL specified narrative and more stringent numeric water quality  
11 objectives for the more bioavailable and more toxic form of methylmercury  
12 (CVRWQCB 2011). The TMDL for the Sacramento-San Joaquin Delta  
13 (CVRWQCB 2010a), which is applicable to the Delta, Yolo Bypass, and their  
14 waterways, includes the reach of the San Joaquin River from Bear Creek to the  
15 Delta boundary.

### 16 *Pesticides*

17 The San Joaquin River (all segments from Mendota Pool to Vernalis), North Mud  
18 Slough (downstream of San Luis Drain), and Salt Slough (upstream from  
19 confluence with San Joaquin River) were placed on the Section 303(d) list  
20 approved by the USEPA in 2010 as impaired by pesticides (SWRCB 2011a).  
21 North Mud Slough is listed as impaired by “pesticides”; Salt Slough by  
22 chlorpyrifos and prometryn, and San Joaquin River by OP pesticides (chlorpyrifos  
23 and diazinon), OC pesticides (DDT, DDE, Group A Pesticides, including  
24 toxaphene), alpha.-BHC, and diuron. Impairment listings vary between reaches  
25 of the San Joaquin River. Several other small tributaries to the San Joaquin River  
26 from the west are also 303(d) listed as impaired by pesticides (i.e., Mud Slough  
27 North (upstream and downstream of San Luis drain).

28 Pesticides in North Mud Slough, Salt Slough, and the San Joaquin River can be  
29 attributed to runoff from agriculture, with the exception of the alpha-BHC in the  
30 San Joaquin River (from Merced to Tuolumne) and toxaphene in the San Joaquin  
31 River (from Stanislaus to the Vernalis) whose sources are unknown (SWRCB  
32 2011x-z,ac-ag).

### 33 *Boron*

34 The lower San Joaquin River upstream of Vernalis is listed as impaired due to  
35 elevated concentrations of boron (CVRWQCB 2002b, 2007c). A draft  
36 Amendment to the Basin Plan for the Sacramento River and San Joaquin River  
37 Basins for the control of Salt and Boron discharges into the lower San Joaquin  
38 River (resolution R5-2004-0108) (CVRWQCB 2007c) describes a pending  
39 TMDL and establishes Waste Load Allocations to meet boron water quality  
40 objectives near Vernalis (at the Airport Way Bridge).

41 Mean salinity in the lower San Joaquin River at Vernalis has doubled since the  
42 1940s while boron and other trace elements have also increased to concentrations  
43 that exceed the water quality criteria of 750 µg/l. These criteria were established  
44 to be protective of sensitive crops under long-term irrigation (USEPA 1986b).

1 Water quality improves in the San Joaquin River downstream of confluences with  
2 the Merced, Tuolumne, and Stanislaus rivers.

3 Most of the boron load to the Delta comes from the lower San Joaquin River as a  
4 result of surface and subsurface agricultural discharges (CVRWQCB 2007c) on  
5 soils overlying old marine deposits and from groundwater (Hoffman 2010h,  
6 CALFED 2000). Major boron contributions come from Salt and Mud sloughs to  
7 the lower river (CVRWQCB 2002b). Point sources contribute very little of the  
8 salt and boron loads to the San Joaquin River (CVRWQCB 2007c).

9 Boron concentrations in surface water from two surface water sources in the  
10 lower San Joaquin River are variable, and range from 100 to over 1000 µg/l  
11 (Hoffman 2010). Effluent from subsurface drains in the New Jerusalem Drainage  
12 District have also been reported up to 4200 µg/l (Hoffman 2010). These  
13 concentrations at times exceed the water quality criteria and thresholds for  
14 sensitive crops (i.e., bean tolerance threshold is 750 to 1000 µg/l).

15 The collaborative effort by stakeholders and regulators is developing  
16 comprehensive management programs that will lead to attainment of water-  
17 quality objectives for salinity and boron. This program, CV-SALTS, is scheduled  
18 to be completed by 2016 and may lead to a basin plan amendment that will  
19 support the protection of beneficial uses.

#### 20 *Arsenic*

21 The San Joaquin River from Bear Creek to Mud Slough was placed on the 303(d)  
22 list approved by the USEPA in 2010 for impairment by arsenic (SWRCB 2011a).  
23 Arsenic can cause adverse dermal, cardiovascular, respiratory, gastrointestinal,  
24 and neurological effects, and can cause cancer (ATSDR 2007). A TMDL  
25 addressing impairment due to arsenic is expected to be complete in 2021 to protect  
26 the beneficial uses of this reach of the San Joaquin River, including the municipal  
27 and domestic supply (SWRCB 2011ae).

#### 28 *Bacteria*

29 San Joaquin River (Bear Creek to Merced River; Stanislaus River to Delta  
30 Boundary) and Salt Slough (upstream from confluence with San Joaquin River) is  
31 a water body in the Central Valley that were placed on the Section 303(d) list  
32 approved by the USEPA in 2010 as impaired by *E. coli* (SWRCB 2011a).

#### 33 *Invasive Species*

34 San Joaquin River (Friant Dam to Mendota Pool) is a water body in the Central  
35 Valley that was placed on the Section 303(d) list approved by the USEPA in 2010  
36 as impaired by invasive species (SWRCB 2011a).

37 A TMDL for invasive species is expected to be completed in 2019 in an effort to  
38 meet the narrative water quality objective in San Joaquin River (Friant Dam to  
39 Mendota Pool).

1 **6.3.3.2.2 Stanislaus River**

2 *Water Temperature*

3 The lower Stanislaus River was placed on the 303(d) list per the partial approval  
4 by USEPA in 2010 and the final approval in 2011 (SWRCB 2011a). The  
5 Stanislaus River supports warm and cold fresh water habitat for aquatic species  
6 such as steelhead.

7 According to the *Final California 2010 Integrated Report* (303(d) list/305(b)  
8 Report) Supporting Information, water temperature concerns are attributed to  
9 unknown sources (SWRCB 2011). Future climate conditions that are warmer or  
10 drier or both will further restrict the extent of suitable habitat for steelhead  
11 (NMFS 2009).

12 USEPA recommended water temperature criteria for different salmon and  
13 steelhead trout life stages. Data from 1991 to 2007 exceeded USEPA's criteria  
14 and thus impairing the cold freshwater habitat. The 2009 NMFS BO also includes  
15 temperature objectives for the Stanislaus River, as described in Appendix 3A, No  
16 Action Alternative: Central Valley Project and State Water Project Operations.

17 *Mercury*

18 Lower Stanislaus River is a water body in the Central Valley that was placed on  
19 the Section 303(d) list approved by the USEPA in 2010 as impaired by mercury  
20 (SWRCB 2011a).

21 Mercury has impaired the beneficial use of the commercial or recreational  
22 collection of fish, shellfish, or organisms (SWRCB 2011aj-al). The lower  
23 Stanislaus River was evaluated prior to 2006, so the evidence for the list is not  
24 readily available. However, the total methylmercury concentration in the  
25 Stanislaus River at Caswell State Park from 2003 to 2006 was 0.12 ng/l (Foe et al.  
26 2008). Concentrations of methylmercury in Largemouth Bass, carp, Channel  
27 Catfish, and White Catfish tissue samples from the Stanislaus River between 1999  
28 and 2000 exceeded the USEPA methylmercury fish tissue criterion (0.3 mg/kg  
29 wet weight) for the protection of human health (Shilling 2003).

30 In an effort to protect the beneficial uses of these water bodies mentioned above,  
31 and including the commercial and recreational collection of fish, shellfish, or  
32 organisms beneficial use, TMDLs are expected to be completed between 2019 to  
33 2021 to meet the water quality standards in these water bodies (CVRWQCB  
34 2011).

35 *Pesticides*

36 Lower Stanislaus River was placed on the Section 303(d) list approved by the  
37 USEPA in 2010 as impaired by pesticides (chlorpyrifos, diazinon, Group A  
38 Pesticides) (SWRCB 2011a). OP pesticides (e.g., diazinon and chlorpyrifos) and  
39 OC pesticides (e.g., Group A Pesticides) are primarily transported to streams and  
40 rivers in runoff from agriculture (CVRWQCB 2011). Sources and descriptions of  
41 the listed pesticides are discussed further in Section 6.3.2.7.

1 *Other Constituents of Concern*

2 Lower Stanislaus River was placed on the Section 303(d) list approved by the  
3 USEPA in 2010 as impaired by unknown toxicity (SWRCB 2011a).

4 To protect the beneficial uses of Lower Stanislaus River, a narrative water quality  
5 objective, which addresses *E. coli*, was established in the CVRWQCB (2011)  
6 Basin Plan.

7 A TMDL is expected to be complete in 2021 in an effort to meet the water quality  
8 standards in the lower Stanislaus River.

9 **6.3.3.3 Sacramento-San Joaquin River Delta**

10 Water quality conditions in the Sacramento and San Joaquin River in the Delta  
11 are described in this subsection against criteria to protect the beneficial uses as  
12 summarized in Table 6.2. The constituents of concern that are currently not in  
13 compliance with existing water quality standards and for which TMDLs are  
14 adopted or are in development in this region are summarized in Table 6.1.

15 **6.3.3.3.1 Salinity**

16 Delta waterways were placed on the Section 303(d) List approved by the USEPA  
17 in 2010 as impaired by electrical conductivity (SWRCB 2011a). Electrical  
18 conductivity is linked to salinity and salinity is of particular concern in the tidally-  
19 influenced Delta (CVRWQCB 2011, CALFED 2007).

20 Electrical conductivity in Delta waterways (export area, northwestern portion,  
21 southern portion, western portion) can be attributed to runoff from agricultural  
22 practices (SWRCB 2011at-aw). Salinity in the Delta can vary significantly  
23 depending on several factors including hydrology, water operations, and Delta  
24 hydrodynamics (Jassby et al. 1995). Hydrology and upstream water operations  
25 influence the Delta inflows, which in turn influences the balance with the highly  
26 saline seawater intrusion. Various upstream watershed sources determine the  
27 quality of the Delta inflows, in addition to the in-Delta sources such as  
28 agricultural returns, natural leaching, municipal and industrial discharges that  
29 influence the Delta salinity conditions. Operation of various Delta gates and  
30 barriers, pumping rates of various diversions and volume of the open water bodies  
31 are the other key factors that influence the Delta hydrodynamics and salinity  
32 transport in the Delta.

33 The CVP and SWP are operated to achieve salinity objectives in the Delta, as  
34 described in detail in Appendix 3A, No Action Alternative: Central Valley Project  
35 and State Water Project Operations.

36 Water quality objectives for electrical conductivity were established in the  
37 SWRCB (2006a) Basin Plan to protect the beneficial uses of these Delta  
38 waterways, including agricultural supply. Objectives are specific to the western  
39 Delta, interior Delta, southern Delta and export area, as well as for inflows and  
40 outflows to the delta from other water bodies. Compliance locations in the Delta  
41 are shown in Figure 6.5.

1 The patterns of EC and salinity in the Delta over time and space follow  
2 predictable patterns, under the strong influence of higher saline water from the  
3 San Joaquin and less saline water from the Sacramento and Eastside streams in an  
4 ever-changing balance with tidal influence upstream from Suisun Bay and the  
5 losses from south Delta pumping. The record of monthly average EC readings for  
6 recent years at five sites throughout the Delta shows the pattern of increasing  
7 average EC in the western Delta, as shown in Figures 6.6 through 6.8. The  
8 highest salinity occurs in the late summer months when the flows from the  
9 Sacramento and San Joaquin rivers are the lowest, and sea water intrusion occurs.  
10 The lower Sacramento River at Collinsville experiences strong tidal influence  
11 during dry periods (EC above 8000  $\mu\text{mhos/cm}$ ) but is flushed with fresh water  
12 during winter flows. Historical salinity discharged from the CVP Jones Pumping  
13 Plant into the Delta Mendota Canal is summarized in Figure 6.9.  
14 Salinity objectives for the southern Delta are now under review by the SWRCB  
15 (SWRCB 2008b).

#### 16 **6.3.3.3.2 Mercury**

17 Mercury is a constituent of concern for the Sacramento-San Joaquin River Delta,  
18 which was placed on the 303(d) list in 2010 (SWRCB 2011a). In 2008, the San  
19 Francisco Bay Mercury TMDL was approved by the USEPA and the  
20 implementation plan is expected to attain the water quality standard 20 years after  
21 the approval (SFB RWQCB 2006). In 2010, the RWQCB approved amendments  
22 to the Basin Plan for the Sacramento River and San Joaquin River Basins to  
23 include the Sacramento-San Joaquin Delta Methylmercury TMDL (CVRWQCB  
24 2011). The TMDL was created to control methylmercury and total mercury in the  
25 Sacramento-San Joaquin River Delta Estuary, which is applicable to the Delta,  
26 Yolo Bypass, and their waterways (CVRWQCB 2010a). The waterways include  
27 the major tributaries to the Delta, the Sacramento River, eastside streams, and the  
28 San Joaquin River. Fish tissue and waterborne mercury concentration data for  
29 these water bodies are summarized in Tables 6.19 and 6.20.

1 **Table 6.19 Fish and Waterborne Methylmercury (as Total Mercury) Concentrations**  
 2 **by Delta Subarea**

1 For the protection of the beneficial uses of the Sacramento – San Joaquin Delta,  
 2 water quality objectives were specified in the San Francisco Bay Mercury TMDL  
 3 (Table 6.21) and the Sacramento-San Joaquin Delta Methylmercury TMDL  
 4 (Table 6.22).

5 **Table 6.21 Water Quality Objectives for Total Mercury in the Delta within the San**  
 6 **Francisco Bay Region<sup>1</sup>**

For the protection of human health	0.2 mg/kg wet weight mercury in fish tissue <sup>2</sup>
For the protection of aquatic organisms and wildlife	0.03 mg Hg/kg in fish <sup>3</sup>
1-hour average	2.1 µg/l, in water

7 Source: SFB RWQCB 2013

8 1 Water quality objectives are applicable to Sacramento/San Joaquin River Delta (within  
 9 the San Francisco Bay region as specified in the SFB RWQCB Basin Plan, 2013), Suisun  
 10 Bay, Carquinez Strait, and San Pablo Bay.

11 2 measured in the edible portion of trophic level 3 and trophic level 4 fish

12 3 measured in whole fish 3-5 cm in length

13 **Table 6.22 Water Quality Objectives for total mercury in the Delta within the Central**  
 14 **Valley**

Water body	Wet Weight Methylmercury Concentration of Fish Tissue (mg/kg wet weight)	
	Trophic Level 3 Fish	Trophic Level 4 Fish
Cache Creek, North Fork Cache Creek, and Bear Creek	0.12	0.23
Harley Gulch	0.05 <sup>1</sup>	–
Sacramento-San Joaquin Delta <sup>2</sup> and Yolo Bypass	0.08 <sup>3</sup> , 0.03 <sup>4</sup>	0.24 <sup>3</sup> , 0.03 <sup>4</sup>

15 Source: CVRWQCB 2011

16 1 Applies to whole fish of trophic levels 2 and 3.

17 2 Applies to the 146 Sacramento-San Joaquin Delta and Yolo Bypass waterways listed in  
 18 Appendix 43 of the Basin Plan for the Sacramento River and San Joaquin River Basins.

19 3 Applies to fish of total length 150-500 mm.

20 4 Applies to whole fish less than 50 mm in length.

21 Methylation processes in the Delta are enhanced by environmental characteristics  
 22 such as the source of inorganic mercury, nutrient enrichment, dissolved oxygen in  
 23 the water column, sediment organic content and grain size, water residence time  
 24 and sediment accumulation, periodic drying and wetting, and fish species and age

1 structure (Alpers et al. 2008). The mercury-laden sediment that accumulates in  
2 the Delta as a result of waterborne loading is subject to methylation (Heim et al.  
3 2007). Waterborne methylmercury in the Delta may be a more significant factor  
4 to bioaccumulation in fish than mercury-laden sediment that is subject to  
5 methylation (Melwani et al. 2009). Another factor affecting bioaccumulation in  
6 fish may be dissolved organic carbon (DOC). Laboratory studies have shown  
7 mercury uptake is much higher in water with lower DOC (as might be expected  
8 from the tributaries versus the interior Delta) (Pickhardt et al. 2006).

9 Mercury exposure and methylation can affect the beneficial uses of the  
10 Sacramento-San Joaquin Delta, and receiving waters downstream such as the  
11 Suisun Bay, Carquinez Strait, San Pablo Bay, and San Francisco Bay. To protect  
12 the beneficial uses of the water body a narrative water quality objective was  
13 specified, in addition to numeric water quality objectives, stating that surface  
14 waters are to "...be maintained free of toxic substances in concentrations that are  
15 toxic to or that produce detrimental physiological responses to human, plant,  
16 animal, and aquatic life" (CVRWQCB 2011).

17 In an effort to meet the water quality objectives, the CVRWQCB plans to  
18 continue monitoring metals in the Delta and control mass emissions from inactive  
19 or abandoned mines and other significant sources (CVRWQCB 2011). The  
20 ongoing interest in controlling mercury in fish in the Delta has spawned the  
21 Mercury Exposure Reduction Program (MERP), developed by the CVRWQCB,  
22 with the goal of pooling the resources of mercury dischargers to develop  
23 reduction programs and a better understanding of mercury bioaccumulation in  
24 Delta fish (MERP 2012). The MERP is designed to build on previous CALFED  
25 efforts. MERP was included as part of an amendment to the Sacramento River  
26 and San Joaquin River Basins Basin Plan in 2011 (CVRWQCB 2011), and is  
27 applicable to people eating one meal of trophic level 3 or 4 fish per week (32  
28 g/day) from the Delta and Yolo Bypass, as well as their waterways. The two-  
29 phase program was put into effect October 20, 2011 and will be completed in  
30 2030. Phase 1 consists of implementing programs to minimize pollution,  
31 implementing interim mass limits for point sources, and controlling potentially  
32 methylated sediment-bound mercury in the Delta and Yolo Bypass. Phase 1 also  
33 includes developing a program to control mercury in tributaries upstream. Plans  
34 for Phase 2 include implementing control programs and monitoring compliance.  
35 In addition to the Delta Control Mercury Program, the CVRWQCB designated  
36 load and waste load allocations for point sources within and to the Delta as  
37 specified in the Basin Plan.

#### 38 **6.3.3.3 Selenium**

39 Selenium is a constituent of concern for the Sacramento-San Joaquin River Delta  
40 and the Delta was placed on the 303(d) list in 2010 (SWRCB 2011a). Selenium  
41 criteria were promulgated for all San Francisco Bay and Delta waters in the NTR  
42 (SFB RWQCB 2011a). Although the entire San Francisco Bay is listed as  
43 impaired by selenium, the TMDL for the San Francisco Bay focuses on the North  
44 San Francisco Bay (North Bay, defined to include a portion of the Delta, Suisun  
45 Bay, Carquinez Strait, San Pablo Bay, and the Central Bay) because sources there

1 are substantially different from sources in the South San Francisco Bay (South  
 2 Bay) (Lucas and Stewart 2007). The NTR criteria specifically apply to San  
 3 Francisco Bay upstream to and including Suisun Bay and the Delta. The NTR  
 4 values are 5.0 µg/l (4-day average) and 20 µg/l (1-hour average).

5 Selenium concentrations in whole-body fish and in bird eggs are most useful for  
 6 evaluating risks to fish and bird wildlife receptors (Skorupa and Ohlendorf 1991;  
 7 DOI 1998; Ohlendorf 2003). Analyses of dietary items (such as benthic  
 8 [sediment-associated] or water-column invertebrates) can be used for evaluating  
 9 risks through dietary exposure, although with less certainty than when using  
 10 concentrations measured in fish or wildlife receptors. The USEPA (2014b)  
 11 released draft water quality criteria for public comment in May 2014 for selenium  
 12 in fish tissue; they include 15.2 mg/kg in egg/ovary, 8.1 mg/kg whole body, or  
 13 11.8 mg/kg muscle (skinless, boneless fillet).

14 A large number of fish tissue samples were collected from the Sacramento and  
 15 San Joaquin River watersheds and the Delta between 2000 and 2007 (Foe 2010).  
 16 As part of the Strategic Workplan for Activities in the San Francisco  
 17 Bay/Sacramento–San Joaquin Delta Estuary (SWRCB 2008a), archived  
 18 Largemouth Bass samples were analyzed for selenium to investigate possible  
 19 sources of selenium being bioaccumulated in bass in the Delta and whether  
 20 selenium concentrations in bass were above recommended criteria for the  
 21 protection of human and wildlife health (Foe 2010). Results of this study are the  
 22 most relevant biota data from the Delta, and they are summarized in Table 6.23 to  
 23 compare to tissue guidelines.

24 **Table 6.23 Selenium Concentrations in Largemouth Bass**

Site	Number of Samples	Selenium Concentrations in Fish Fillets (mg/kg, wet weight)			Selenium Concentrations in Whole-Body Fish (mg/kg, dry weight)			Years
		Min.	Max.	Mean	Min.	Max.	Mean

Discovery Bay	3	0.32	0.41	0.37	1.5	1.7	1.6	2005
Whiskey Slough	2	0.35	0.47	0.41	1.6	1.9	1.7	2005

1 Source: Foe 2010

2 Notes: Means are geometric means.

3 Max. = maximum, mg/kg = milligrams per kilogram, Min. = minimum.

4 a. Near Clarksburg.

5 Average selenium concentrations varied slightly in Largemouth Bass caught in  
6 the Sacramento River between Veterans Bridge and Rio Vista in 2005, as well as  
7 on the San Joaquin River between Fremont Ford and Vernalis (Foe 2010). These  
8 concentrations also varied slightly among years (2000, 2005, and 2007) in the  
9 Sacramento River at Rio Vista and in the San Joaquin River at Vernalis. The lack  
10 of a significant difference in bioavailable selenium between the two river systems  
11 was unexpected because the San Joaquin River is considered a significant source  
12 of selenium to the Delta. Selenium concentrations in the Largemouth Bass were  
13 compared to criteria recommended for the protection of human health (based on  
14 fillets; 2 mg/kg, wet weight) and fish and wildlife health (based on whole-body  
15 fish; concern threshold of 4–9 mg/kg, dry weight) (Foe 2010). Geometric means  
16 and maximum concentrations (Table 6.23) did not exceed the draft criteria.

17 Sporadic sampling of selenium has been conducted at a few locations in the Delta.  
18 Five major sources, shown in Table 6.24, are Sacramento River, Yolo Bypass,  
19 Eastside Delta Tributaries, San Joaquin River, and Martinez/Suisun Bay. Total  
20 selenium concentrations in Sacramento and San Joaquin river surface waters just  
21 upstream of Mallard Island (near the western limit of the Delta [Regional  
22 Monitoring Program stations BG20 and BG30, respectively]) are considered more  
23 representative of generalized Delta concentrations than of the individual rivers  
24 (SWRCB 2008a). Total and dissolved selenium concentrations were somewhat  
25 lower at those locations during low flow in a dry year (<0.1 µg/l in August 2001)  
26 than during high flow (>0.1 µg/l in February 2001) (SWRCB 2008a). Cutter and  
27 Cutter (2004) reported similar flow-related patterns for those locations. The  
28 maximum selenium concentration found in the Delta was 2 µg/l at an Old/Middle  
29 River location in the south subarea of the Delta. Except for that location, the  
30 available data show geometric mean concentrations well below 1 µg/l.

1 **Table 6.24 Selenium Concentrations in Water at Inflow Sources to the Delta**

Source Water <sup>1</sup>	Sacramento River	San Joaquin River	San Francisco Bay	East Side Tributaries <sup>3</sup>	Agriculture in the Delta
Mean <sup>2</sup> (ng/L)	0.10	0.54	0.09	0.1	0.11
Minimum (ng/L)	0.04	0.07	0.03	0.1	0.11
Maximum (ng/L)	0.23	1.50	0.45	0.1	0.11
75 <sup>th</sup> Percentile (ng/L)	0.11	0.76	0.12	0.1	0.11

3 Survey 2014b,c; San Francisco Estuary Institute 2014b; Lucas and Stewart 2007

4 1 Dissolved selenium concentration.

5 2 Geometric mean.

6 3 Dissolved selenium concentration in Mokelumne, Calaveras, and Cosumnes Rivers is  
7 assumed to be 0.1 µg/L because of lack of available data and lack of sources that would  
8 be expected to result in concentrations greater than 0.1 µg/L

9 In efforts to address the selenium in the Delta and water bodies downstream, the  
10 SFB RWQCB is conducting a new TMDL project to address selenium toxicity in

1 the North Bay (SFB RWQCB 2011, 2013). The North Bay selenium TMDL will  
2 identify and characterize selenium sources to the North Bay and the processes that  
3 control the uptake of selenium by fish and wildlife. The TMDL will quantify  
4 selenium loads, develop and assign waste load and load allocations among  
5 sources, and include an implementation plan designed to achieve the TMDL and  
6 protect beneficial uses.

7 USEPA's Action Plan for Water Quality Challenges in the San Francisco  
8 Bay/Sacramento-San Joaquin Estuary (USEPA 2012a) identifies selenium as one  
9 of seven priority items for action. The plan indicated that USEPA will draft new  
10 site-specific numeric selenium criteria by December 2012 to protect aquatic and  
11 terrestrial species dependent on the aquatic habitats of the Bay Delta Estuary.  
12 More stringent selenium water quality criteria will require actions that decrease  
13 allowable concentrations of selenium in surface waters of the Bay Delta Estuary  
14 and may set allowable levels of selenium in the tissue of fish and wildlife.  
15 Following the development of the Bay Delta selenium criteria, USEPA plans to  
16 develop site-specific criteria for other parts of California, including the San  
17 Joaquin Valley watershed (USEPA 2012a). USEPA also is engaged in other  
18 efforts to minimize selenium discharges to the San Joaquin River and the Bay  
19 Delta Estuary, including the Grasslands Bypass Project and the North San  
20 Francisco Bay TMDL.

#### 21 **6.3.3.3.4 PCBs**

22 The Sacramento-San Joaquin River Delta was placed on the 303(d) list approved  
23 by the USEPA in 2010 as impaired by PCBs (SWRCB 2011a). A TMDL for  
24 PCBs in the Sacramento River from Knights Landing to the Delta is expected to  
25 be completed in 2021 to protect the beneficial uses of the Sacramento River and  
26 other water bodies downstream (SWRCB 2011ax).

#### 27 **6.3.3.3.5 Pesticides**

28 Sacramento-San Joaquin River Delta (central, eastern, northern, northwestern,  
29 southern, western portions, the export area, and the Stockton Ship Channel) were  
30 placed on the Section 303(d) List approved by the USEPA in 2010 as impaired by  
31 pesticides (chlorpyrifos, DDT, Diazinon, Group A Pesticides, Chlordane,  
32 Dieldrin, Dioxin, and Furan and Dioxin compounds) (SWRCB 2011a).

33 Samples were collected from Sacramento River at Rio Vista, near Hood along the  
34 Sacramento/Yolo County line, San Joaquin River at Highway 4 and Antioch,  
35 1 1/2 miles upstream from the Mossdale launch ramp, and other locations north  
36 portion of the Delta waterways (SWRCB 2011at-bb).

37 In an effort to meet the water quality standards in Sacramento-San Joaquin River  
38 Delta, TMDLs are expected to be complete in 2019 with the exception of the  
39 TMDL for chlorpyrifos and diazinon. A Delta Diazinon and Chlorpyrifos TMDL  
40 Project was approved in 2007.

1 **6.3.3.3.6 Nutrients**

2 The Sacramento-San Joaquin River Delta was not placed on the 303(d) list  
3 approved by USEPA in 2010 as impaired by nutrients (SWRCB 2011a).  
4 However, nutrients are a cause of concern in the Delta (e.g., CVRWQCB 2010j)  
5 and have been the subject of discussion. A decline in pelagic fish species in the  
6 Delta, known as the pelagic organism decline (POD), including the endangered  
7 California Delta smelt, may be related to bottom-up effects from nutrients among  
8 other drivers (Baxter et al. 2010; Sommer et al. 2007). However, unlike most  
9 waterbodies where nutrients cause too much primary production, the problem  
10 affecting beneficial uses in parts of the Delta is too little primary production to  
11 support fish populations. Nutrient effects are also dependent on flow and other  
12 factors (e.g., temperature, turbidity, and invasive species) that are potentially  
13 associated with the POD. Specific hypotheses for an association between  
14 nutrients and the POD are that ammonium (a dominant form of nitrogen in the  
15 Delta and Suisun Bay, inhibits the uptake of nitrate which is a better fuel for algae  
16 blooms (Dugdale et al. 2007) and that changes in nutrient forms and ratios have  
17 caused a shift in the food web (Glibert et al. 2011). Alternatively, causes of the  
18 POD may be related to reduced phosphorus that has become a limiting factor for  
19 primary production (Van Nieuwenhuysse 2007), or that invasive clam  
20 consumption of algae have made this food source unavailable to zooplankton and  
21 fish since their introduction in the mid-1980s (Lucas and Thompson 2012;  
22 Kimmerer et al. 1994).

23 The Delta is a major source of anthropogenic ammonium loading to the Suisun  
24 Bay, which exchanges nutrients with Suisun Marsh, an estuarine habitat impaired  
25 by nutrients (Senn et al. 2014, Tetra Tech Inc. and WWR 2013). Primary sources  
26 of nutrients are erosion, agricultural runoff, urban runoff, and treated effluent.  
27 The Sacramento Regional Wastewater Treatment Plant (SRWTP) is the largest  
28 major point source of ammonium in the Delta, contributing 90 percent of  
29 ammonium in the river from 1986 to 2005 (Jassby 2008). Nitrogen inputs to the  
30 Delta will change as SRWTP's current NPDES permit (NO. CA0077682)  
31 includes effluent limits for nitrogen that require the addition of nitrification and  
32 denitrification treatment by 2020. Another source of ammonium loading has  
33 already changed as the Stockton Regional Wastewater Control Facility, which  
34 discharges to the San Joaquin River began implementing nitrification and  
35 denitrification treatment in 2007 (SWRCB 2012b).

36 Nutrients, primarily nitrogen and phosphorous, may trigger excessive growth of  
37 algae or toxic blue-green cyanobacteria. However, within the Delta, it is  
38 generally recognized that nutrients are too high in concentration to be limiting (as  
39 compared to light, for example) (Jassby et al. 2002). The secondary effects of  
40 nutrient enrichment and oxygen depletion are most often found in the central and  
41 southern Delta near Stockton rather than the Sacramento River.

#### 1 **6.3.3.3.7 Dissolved Oxygen**

2 The Stockton Ship Channel in the Delta waterways was placed on the  
3 Section 303(d) list approved by the USEPA in 2010 as impaired by dissolved  
4 oxygen (SWRCB 2011a).

5 Low dissolved oxygen is of concern in the central and southern Delta because of  
6 enhanced treated effluent loading from Stockton, agricultural runoff, and reduced  
7 flushing of dead-end channels. Middle River, Old River, and the Stockton Deep  
8 Water Ship Channel are listed as impaired due to dissolved oxygen depletion,  
9 with dissolved oxygen concentrations criteria set at 6 mg/L minimum for the San  
10 Joaquin River between Turner Cut and Stockton between September 1 and  
11 November 30 (SWRCB 2011a, SWRCB 2006a). Loading from the Stockton  
12 Regional Wastewater Control Facility had the greatest effect in reducing DO, with  
13 hydrologic flushing (as related to upstream river flows, upstream discharges of  
14 materials that increase biological oxygen demand), geometrical cross-sections of  
15 the channels, temperature, and phytoplankton being less important (Jassby and  
16 Niewenhuyse 2005). Following recent upgrades to the Stockton Regional  
17 Wastewater Control Facility in 2006, less oxygen demand constituents have been  
18 discharged into the channels.

19 A TMDL addressing impairment due to dissolved oxygen was approved by the  
20 USEPA in 2007 to meet the water quality standards in the Stockton Ship Channel.

#### 21 **6.3.3.3.8 Organics and Pathogens**

22 The Stockton Ship Channel in the Delta waterways was placed on the Section  
23 303(d) list approved by the USEPA in 2010 as impaired by organic enrichment  
24 and pathogens (SWRCB 2011a).

25 The Delta as a source of drinking water is impaired through the presence of  
26 disinfection byproducts from treated wastewater effluent and the interactions with  
27 bromide and dissolved organic carbon, which may produce potentially harmful  
28 disinfection byproducts such as the carcinogenic trihalomethanes and haloacetic  
29 acid (Healey et al. 2008). Bromide and organic carbon are natural chemical  
30 constituents of the estuarine ecosystem but they exacerbate drinking water quality  
31 impairment through discharges, agriculture drainage, or water management, when  
32 combined with disinfectants during water treatment processes. Changes to flow  
33 or use patterns or discharges to the Delta must be examined for their potential  
34 effects to concentrations of these disinfection byproduct precursors and  
35 compounds.

36 Pathogens are another potential concern impairing the Delta for drinking water  
37 use. Giardia and Cryptosporidium are common protozoans found in urban runoff  
38 and sometimes found to be in exceedance of drinking water standards in the Delta  
39 (SWRCB 2007). A TMDL addressing impairment due to pathogens was  
40 approved by the USEPA in 2008 to meet the water quality standards in the  
41 Stockton Ship Channel.

1 **6.3.3.3.9 Invasive Species**

2 Sacramento-San Joaquin River Delta (central, eastern, northern, northwestern,  
3 southern, western portions, the export area, and the Stockton Ship Channel) was  
4 placed on the Section 303(d) list approved by the USEPA in 2010 as impaired by  
5 invasive species (SWRCB 2011a).

6 A TMDL addressing impairment due to invasive species is expected to be  
7 completed in 2019 in an effort to meet the water quality standards in Sacramento-  
8 San Joaquin River Delta (central, eastern, northern, northwestern, southern,  
9 western portions, the export area, and the Stockton Ship Channel).

10 **6.3.3.3.10 Unknown Toxicity**

11 Sacramento-San Joaquin River Delta (central, eastern, northern, northwestern,  
12 southern, western portions, the export area, and the Stockton Ship Channel) were  
13 placed on the Section 303(d) list approved by the USEPA in 2010 as impaired by  
14 unknown toxicity (SWRCB 2011a).

15 A TMDL is expected to be completed in 2019 to protect the beneficial uses of  
16 Sacramento-San Joaquin River Delta and its waterways, including impaired warm  
17 fresh water habitat.

18 **6.3.3.4 Suisun Bay and Suisun Marsh**

19 Suisun Bay and Suisun Marsh are located in transition zones between upstream  
20 fresh water inputs and tidal saline flux from San Francisco Bay. Beneficial uses  
21 of these areas are summarized in Table 6.2. Constituents of concern are  
22 summarized in Table 6.1.

23 Historically, the chlorophyll maxima were found to coincide with the mixing  
24 (entrapment) zone but recent alterations by invasive species of benthic grazing  
25 clams has greatly altered the Suisun Bay food web and these historical patterns  
26 (Kimmerer 2004; Jassby et al. 2002). Although turbidity remains high and  
27 limiting to primary productivity in Suisun Bay, there has been a long term trend  
28 toward increased water clarity. Suisun Bay has low retention time, low salinity  
29 (average of 5.8 ppt), low nutrients, and high particulate matter and light  
30 attenuation (Cloern and Jassby 2012).

31 **6.3.3.4.1 Salinity**

32 The Suisun Marsh Wetlands was placed on the 303(d) list approved by the  
33 USEPA in 2010 for impairment by salinity. The wetlands are also impaired by  
34 TDS and chlorides (SWRCB 2011a).

35 In an effort to protect the beneficial uses, including estuarine habitat, narrative  
36 and numeric objectives were specified by the SWRCB in Decision 1641. The  
37 CVP and SWP are operated to achieve salinity objectives in the Delta, as  
38 described in detail in Appendix 3A, No Action Alternative: Central Valley Project  
39 and State Water Project Operations.

40 The salinity objective in Suisun Bay, X2, which is the location, as measured in  
41 kilometers upstream from the Golden Gate bridge, of the 2 ppt isohaline (2.64

1 mS/cm) was established as part of the Water Quality Control Plan of 1995  
 2 (SWRCB 1995). X2 is a constantly fluctuating position in the continuum  
 3 between the Delta fresh water (salinity less than 2 ppt) upstream and San  
 4 Francisco Bay tidal influence, downstream (salinity greater than 2 ppt).

5 **6.3.3.4.2 Mercury**

6 Mercury is a constituent of concern for Suisun Bay and Suisun Marsh, which  
 7 were placed on the 303(d) list in 2010 (SWRCB 2011a). For the Suisun Bay, a  
 8 TMDL was specified in the San Francisco Bay Mercury TMDL (SFB RWQCB  
 9 2013), which was approved by the USEPA in February 2008 and the  
 10 implementation plan is expected to attain the water quality standard 20 years after  
 11 the approval. For the Suisun Marsh, a TMDL was specified in the Sacramento-  
 12 San Joaquin Delta Methylmercury TMDL (CVRWQCB 2010a) and was  
 13 completed in September 2012 (SFB RWQCB 2012a).

14 Water quality objectives for Suisun Bay are specified in the San Francisco Bay  
 15 Mercury TMDL (SFB RWQCB 2013). Suisun Marsh standards, as specified in  
 16 Suisun Marsh TMDL, are shown in Table 6.25 (SFB RWQCB 2012a). There are  
 17 future plans to adopt the Suisun Bay standards for the Suisun Marsh as well as  
 18 implementation plans to improve the water quality in Suisun Marsh.

19 **Table 6.25 Water Quality Objectives for Total Mercury in Suisun Marsh**

For the Protection of Marine and Freshwater Aquatic Life	4-day average (adverse effects from acute toxicity <sup>1</sup> )	0.25 µg/l
	1-hour average (adverse effects from chronic toxicity)	2.1 µg/l

20 Source: SFB RWQCB 2012a

21 1 Applicable to marine aquatic life, where salinity is greater than 10 parts per thousand.  
 22 The same objectives apply to freshwater aquatic life because the marine objective is  
 23 more stringent.

24 **6.3.3.4.3 Selenium**

25 Although the Suisun Marsh Wetlands is not identified as an impaired water body  
 26 for selenium contamination on the 303(d) list in 2010, selenium is identified as a  
 27 cause for impairment for the adjacent water body, Suisun Bay (SWRCB 2011a).

28 The impairment of Suisun Bay by selenium can be attributed to exotic species as  
 29 well as discharge from industrial point sources and natural sources (SWRCB  
 30 2011bd). *Corbula (Potamocorbula) amurensis*, a species of clam that is an  
 31 important food source for sturgeon and certain ducks, is a bioaccumulator for  
 32 selenium (Beckon and Maurer 2008). This exotic species was first discovered in  
 33 Suisun Bay in 1986 and became very common by 1990 from San Pablo Bay  
 34 through Suisun Bay (Cohen 2011). Industrial point sources, such as oil refineries,  
 35 discharge waste containing selenium to the Suisun Bay (SFB RWQCB 2011).

36 To best protect the most susceptible fish, white sturgeon, from selenium toxicity,  
 37 a TMDL for Selenium in the North San Francisco Bay, defined to include also a  
 38 portion of the Delta, Suisun Bay, Carquinez Strait, San Pablo Bay, and the Central

1 Bay, is being completed and a Preliminary Project Report was released in 2011  
2 (SFB RWQCB 2011). A range of concentrations for selenium in fish tissue from  
3 6.0 to 8.1 µg/g dry weight was proposed as a numeric target. This range is based  
4 on the minimal effects of selenium in whole-body freshwater fish and the  
5 10 percent effect level concentration.

#### 6 **6.3.3.4.4 Nutrients**

7 Suisun Marsh is a water body in the San Francisco Bay that was placed on the  
8 Section 303(d) list approved by USEPA in 2010 as impaired by nutrients  
9 (SWRCB 2011a).

10 According to the Final California 2010 Integrated Report (303(d) list/305(b)  
11 Report) Supporting Information, nutrients in Suisun Marsh can be attributed to  
12 flow regulation/modification and urban runoff/storm sewers (SWRCB 2011bc).  
13 More specific sources of nutrients to Suisun Marsh include agricultural, urban,  
14 and livestock grazing drainage through tributaries, the Sacramento River and San  
15 Joaquin River through the Sacramento-San Joaquin River Delta, nutrient  
16 exchange with Suisun Bay, atmospheric deposition, and discharge from the  
17 Fairfield Suisun Sewer District wastewater treatment plant (Tetra Tech Inc. and  
18 WWR 2013).

19 Concentrations of ammonia from 2000-2011, in the receiving waters from  
20 Boynton, Peytonia, Sheldrake and Chadbourne Sloughs (0-0.4 mg/l), as well as in  
21 Suisun Slough (0-0.3mg/l), exceeded the maximum water quality objective  
22 concentration for ammonia (Tetra Tech Inc. and WWR 2013). Elevated  
23 concentrations of chlorophyll-a, in comparison to concentrations at reference sites  
24 at Mallard, suggest possible impairments by nutrients. Other possible  
25 impairments of the narrative criteria by nutrients were suggested resulting in  
26 excess algal growth in wetlands, elevated organic carbon, and impacts on  
27 dissolved oxygen and mercury methylation.

#### 28 **6.3.3.4.5 Dissolved Oxygen**

29 Suisun Marsh Wetlands were placed on the 303(d) list approved by the USEPA in  
30 2010 for dissolved oxygen impairment (SWRCB 2011a). Insufficient dissolved  
31 oxygen can alter the well-being of the estuarine habitat, fish spawning, warm  
32 freshwater habitat, and wildlife habitat (SFB RWQCB 2013).

33 Flow regulation and modification, as well as urban runoff and storm sewers  
34 dictate the dissolved oxygen levels in the marsh (SWRCB 2011bc). Specific  
35 oxygen demanding sources that cause low dissolved oxygen levels are “grazed  
36 open areas, nutrient-enriched wastewater discharge from Fairfield-Suisun Sewer  
37 District, wastes from boats in Suisun City marina, and tidal marshes,” in addition  
38 to tides, delta outflow, agricultural drainage from surrounding watersheds and  
39 urban areas, and managed wetlands (Tetra Tech, Inc. and WWR 2013). Slough  
40 size and hydrology also influenced the low dissolved oxygen conditions in Suisun  
41 Marsh Wetlands (Siegel et al. 2010).

1 Low dissolved oxygen levels in exceedances of water quality objectives between  
 2 2000 and 2011 in Suisun Slough, Montezuma Slough, and Goodyear Slough are  
 3 presented in Table 6.26 (Tetra Tech, Inc. and WWR 2013).

4 **Table 6.26 Percentage of Observations Exceeding Water Quality Objectives for**  
 5 **Dissolved Oxygen**

Location	WQO Exceedances	
	7 mg/l	< 80% Saturation <sup>1</sup>
Suisun Slough	10 – 40%	2%
Montezuma Slough	< 10%	60 – 68%
Goodyear, Peytonia, and Boynton Sloughs	> 50%	73 – 94% <sup>2</sup>

6 Source: Tetra Tech, Inc. and WWR2013

7 <sup>1</sup> 3-month median above 80 percent dissolved oxygen saturation

8 <sup>2</sup> Lower Goodyear Slough exceeded the 3-month media above 80 percent dissolved  
 9 oxygen saturation 48.1 percent of the time

10 To further protect the beneficial uses of the Suisun Marsh Wetlands from low  
 11 dissolved oxygen concentrations, water quality objectives more representative of  
 12 natural conditions are currently being developed (Tetra Tech, Inc. and WWR  
 13 2013). A TMDL for Suisun Creek, a tributary of Suisun Marsh Wetlands that is  
 14 impaired by low dissolved oxygen, is expected to be completed in 2021 (SWRCB  
 15 2011bc).

16 **6.3.3.4.6 Organics**

17 Suisun Marsh was placed on the 303(d) list approved by USEPA in 2010 for  
 18 organic enrichment (SWRCB 2011a). Organic enrichment enhances microbial  
 19 production and activity, such as the methylation of mercury, and the  
 20 decomposition of organic matter can cause low dissolved oxygen levels (Tetra  
 21 Tech, Inc. and WWR 2013).

22 **6.3.3.4.7 Pesticides**

23 Suisun Bay, and other water bodies in the San Francisco Bay area including  
 24 Carquinez Strait and San Pablo Bay were placed on the Section 303(d) list for  
 25 pesticides (chlordane, DDT, dieldrin) contamination per the list approved by  
 26 USEPA in 2010 (SWRCB 2011a). However, according to the 2013 Regional  
 27 Monitoring Program Report, pesticides (chlordane, DDT, and dieldrin) in the  
 28 estuary are being considered for delisting (SFEI 2013).

29 A TMDL for the Diazinon and Pesticide-related Toxicity in Urban Creeks was  
 30 added as an amendment to the Basin Plan and was approved by the USEPA in  
 31 2007 (SFB RWQCB 2005).

1     **6.3.3.4.8   PCBs**

2     Suisun Bay, and several other water bodies within San Francisco Bay area  
3     including Carquinez Strait and San Pablo Bay, were placed on the Section 303(d)  
4     list for the contamination of PCBs per the list approved by USEPA in 2010  
5     (SWRCB 2011a). The following is applicable to all water bodies specified in the  
6     San Francisco Bay PCBs TMDL, including Suisun Bay, Carquinez Strait, and San  
7     Pablo Bay (SFB RWQCB 2013).

8     A TMDL was approved by the USEPA in 2010. The TMDL allows 10 kilograms  
9     of PCBs to be discharged to San Francisco Bay per year (SFB RWQCB 2013). It  
10    is projected that this load allocation will be achieved in 20 years with  
11    implementation of plans and actions for external and internal sources, such as  
12    municipal and industrial dischargers, as stated in the San Francisco Bay TMDL.

13    **6.3.3.4.9   Other Constituents of Concern**

14    Suisun Bay was placed on the Section 303(d) list for invasive species  
15    contamination per the list approved by USEPA in 2010 (SWRCB 2011a).

16    Invasive species in Suisun Bay can be attributed to ballast water, fresh or salt  
17    water placed on a ship for stability (SWRCB 2011bd). *Corbula (Potamocorbula)*  
18    *amurensis*, a native clam of southern China estuaries, was discovered in Suisun  
19    Bay in 1986 and was introduced to San Pablo Bay shortly after (USFWS and  
20    NSGCP 1995). This species of clam is important as a food source for sturgeon,  
21    diving ducks, etc. and consequently a bioaccumulator of selenium (USFWS  
22    2008). Other species introduced to the Suisun Bay are reported in the  
23    *Nonindigenous Aquatic Species in a United States Estuary: A Case Study of the*  
24    *Biological Invasions of the San Francisco Bay and Delta* (USFWS and NSGCP  
25    1995).

26    Invasive species can affect the beneficial uses of Suisun Bay, as listed in Table  
27    6.2, including estuarine habitat. For the protection of marine aquatic life, a  
28    TMDL is expected to be completed in 2019.

29    Other contaminants in the Suisun Bay include furan compounds and dioxin  
30    compounds. These contaminants were placed on Section 303(d) list per the list  
31    approved by USEPA in 2010 (SWRCB 2011bd).

32    **6.3.4       Delta Water Quality Issues for CVP and SWP Water Users**

33    The designated beneficial uses and constituents of concern for the study area and  
34    for each RWQCB region are described in Section 6.3.1, Beneficial Uses of  
35    Surface Waters in the Study Area. In this section, the beneficial uses of water  
36    from the Delta are generalized and categorized by purpose of use into those  
37    associated with municipal and industrial, agricultural, groundwater recharge, and  
38    recycling and blending uses.

39    **6.3.4.1     Municipal and Industrial Uses**

40    The Delta is a source of drinking water supply to over 25 million people, or sixty  
41    percent of the state population. The CVP and SWP water users that use water  
42    from the Delta as a source of potable water supply for municipal and industrial

1 uses have two main water quality concerns: protection, preservation, and  
2 improvement of source water quality; and capability of treatment processes to  
3 meet stringent drinking water quality regulatory requirements. To protect public  
4 health and safety, water providers apply a multi-barrier approach: seek the highest  
5 quality source water available, protect and preserve the source water quality to  
6 ensure non-degradation, operate and periodically upgrade drinking water  
7 treatment processes, and maintain safe distribution systems.

8 The Delta, as a drinking water source, is compromised by high levels of naturally  
9 occurring and manmade constituents of concern. Some of the naturally occurring  
10 constituents, such as organic carbon and nutrients, are necessary components of  
11 the Delta ecosystem. Salinity, another natural constituent, is inherent with the  
12 tidal cycles of the estuary. Other anthropogenic constituents such as pathogens  
13 and contaminants are results of point and non-point source discharges into the  
14 Delta.

15 Water containing organic carbon reacts with chlorine, commonly used as a  
16 disinfectant in drinking water treatment processes, to form disinfection  
17 byproducts (DBP) such as trihalomethanes and haloacetic acids. Delta waters  
18 contain high levels of both dissolved organic compounds and bromide, increasing  
19 the formation of DBP. Use of chloramines for disinfection would reduce the  
20 production of DBP, but chloramination can lead to the formation of carcinogenic  
21 N-nitrosamines, including N-nitrosodimethylamine (NDMA). These interactions  
22 complicate the design of drinking water treatment processes and create the  
23 necessity to balance and trade off disinfection effectiveness with DBP creation.  
24 Balance and tradeoffs are also necessary between source water quality protection  
25 and ecosystem restoration actions that could increase the levels of organic carbon.

26 The Water Quality Control Plan for the Sacramento River and San Joaquin River  
27 Basins (Basin Plan) designated drinking water municipal and domestic supply  
28 beneficial use for most waters in the Central Valley, including the Delta. It  
29 includes narrative objectives for chemical constituents, taste and odor, sediment,  
30 suspended material, and toxicity, and numeric objectives for chemical  
31 constituents and salinity. The Basin Plan incorporates by reference the primary  
32 and secondary maximum contaminant levels specified in Title 22 of the California  
33 Code of Regulations for waters designated for municipal uses.

34 Through the triennial review process, stakeholders prioritized the need for a  
35 drinking water policy and identified a number of drinking water constituents of  
36 concern including: salt (including bromide), nutrients, organic carbon and  
37 pathogens such as *Cryptosporidium* and *Giardia*.

38 In 2013, the Central Valley RWQCB adopted Resolution No. R5-2013-0098, an  
39 amendment to the Basin Plan to establish a drinking water policy for surface  
40 waters of the Delta and its upstream tributaries. The amendment was approved by  
41 the SWRCB in the same year, and approved by the Office of Administrative Law  
42 and US EPA in 2014.

43 The Amendment modifies the water quality objectives of the Basin Plan to add a  
44 narrative water quality objective for *Cryptosporidium* and *Giardia*, and clarifies

1 that existing narrative objective for chemical constituents includes drinking water  
2 chemical constituents of concern, such as organic carbon. The Amendment also  
3 establishes a Drinking Water Policy to maintain high quality of water, anti-  
4 degradation, application of water quality objectives, implementation of toxics  
5 standards for inland surface waters, enclosed bays, and estuaries, and continued  
6 coordinated monitoring, assessment, and reporting of identified drinking water  
7 constituents of concern.

#### 8 **6.3.4.1.1 Organic Carbon**

9 Delta water is high in dissolved and suspended organic carbon, due to the high  
10 peat soil composition and estuarine environment. Organic carbon combines with  
11 disinfectants in drinking water treatment processes to produce DBP that are  
12 harmful to human health. In a 1998 study and a 2003 update, expert panels for  
13 the California Urban Water Agencies recommended that TOC in the Delta source  
14 water should not exceed 3.0 mg/L, in order for Delta-dependent water agencies to  
15 be able to meet treated drinking water regulatory requirements. This  
16 recommendation was based on an analysis of the various existing and planned  
17 treatment processes, residual (distribution systems) disinfection requirements, as  
18 well as the interaction among TOC and other DBP precursors.

19 In the 2013-14 Basin Plan amendment, indicates that the state waters shall not  
20 contain chemical constituents in concentrations that adversely affect beneficial  
21 uses, and that this includes drinking water chemical constituents of concern, such  
22 as organic carbon.

#### 23 **6.3.4.1.2 Bromide and Other Disinfection By-product (DBP) Precursors**

24 Bromide is a naturally occurring constituent in waters subjected to tidal influences  
25 such as the Delta. It reacts with ozone, a disinfectant often used for inactivation  
26 or removal of *Cryptosporidium* and for controlling taste and odor issues, to form  
27 bromate which is a regulated DBP for its cancer-causing potential. The  
28 combination of TOC and bromide in Delta waters poses an especially challenging  
29 scenario for treatment processes in balancing the need for microbiological  
30 removal and minimizing the formation of organically-based brominated DBP.  
31 The 1998/2003 expert panels for California Urban Water Agencies recommended  
32 that bromide levels should not exceed 50 µg/L in order for Delta-dependent water  
33 agencies to be able to meet treated water regulatory requirements.

#### 34 **6.3.4.1.3 Nutrients and Other Discharges**

35 Municipal discharges and agricultural return flows into the Sacramento and San  
36 Joaquin river watersheds and the Delta contribute pollutants and constituents of  
37 concern that could potentially degrade water quality.

38 Nutrients such as nitrogen and phosphorus originate from natural sources and  
39 from anthropogenic sources including point and non-point source discharges.  
40 Although nutrients are necessary for a healthy ecosystem, over enrichment of  
41 nitrogen and phosphorus can contribute to eutrophication and toxicity.  
42 Eutrophication also results in elevated levels of TOC, a DBP precursor.

1 In August 2015, USEPA published revisions to the federal Water Quality  
 2 Standards Regulations required the state to develop implementation methods to  
 3 conduct analyses if ongoing or future projects would degrade high quality waters.  
 4 The regulations require analysis of a range of non-degrading or less-degrading  
 5 alternatives and make a finding that degradation is necessary to accommodate  
 6 important social or economic development in the area where the waters are  
 7 located.

8 The SWRCB's Policy with Respect to Maintaining High Quality of Water in  
 9 California (Resolution No. 68-16) incorporates the federal antidegradation policy  
 10 and restricts reductions in water quality even if beneficial uses are protected. The  
 11 Drinking Water Policy in the 2013-14 Basin Plan amendment stated that drinking  
 12 water constituents of concern shall continue to be considered when waste  
 13 discharge facilities conduct antidegradation analyses. The 2013-14 Drinking  
 14 Water Policy also requires the RWQCBs to consider the necessity for inclusion of  
 15 monitoring of organic carbon, salinity, and nutrients for waste discharge permit  
 16 renewals if the facilities are located near drinking water intakes, if a concentration  
 17 load has significantly increased, and the importance of the data submitted by the  
 18 discharger to management decisions to protect drinking water.

#### 19 **6.3.4.1.4 Pathogens and Emerging Contaminants**

20 Point and non-point source discharges into Delta waters have the potential to  
 21 introduce and elevate the levels of pathogens and other contaminants.  
 22 *Cryptosporidium* and *Giardia* are two main pathogens of concern that are the  
 23 focus of drinking water regulatory requirements promulgated by USEPA. In  
 24 addition, other contaminants of emerging concern, particularly pharmaceuticals  
 25 and personal care products, have been widely distributed and persistent in the  
 26 environment. These chemicals bio-accumulate and cause endocrine disruption.

27 The 2013-14 Basin Plan amendment includes a narrative water quality objective  
 28 for *Cryptosporidium* and *Giardia* within the Sacramento-San Joaquin Delta and  
 29 its tributaries below the first major dams. Compliance with this objective will be  
 30 assessed at existing and new public water system intakes to maintain existing  
 31 levels of pathogens at public water system intakes.

32 The Basin Plan amendment also includes support of a one-time special study to  
 33 characterize ambient levels of *Cryptosporidium*, to better understand the  
 34 relationship between source loading and ambient *Cryptosporidium* concentrations,  
 35 and to better understand the movement of *Cryptosporidium* through the system.

#### 36 **6.3.4.1.5 Salinity and TDS**

37 Salinity is commonly measured in units of EC or TDS. Salinity standards, in the  
 38 form of chloride objectives, have been established in the Basin Plan to protect the  
 39 various beneficial uses. The most restrictive is the 150 mg/L chloride objective  
 40 for Contra Costa Canal and the City of Antioch intake. The objective was  
 41 originally established to protect an industrial manufacturing facility that has since  
 42 closed. In terms of drinking water, bromide is the most critical component of  
 43 salinity that impacts drinking water treatment processes. No standards have been

1 set for bromide, although there is a MCL for the disinfection byproduct bromate.  
2 Secondary MCLs for TDS (500 mg/L), chloride (250 mg/L), and sulfate (250  
3 mg/L) have been set to address cosmetic or aesthetic effects such as staining,  
4 mineral deposits, taste, odor, and color. The CV-SALTS Executive Committee is  
5 currently considering potential revisions to water quality objectives for secondary  
6 MCL, as part of the developing Salt and Nitrate Management Plan for the Central  
7 Valley.

8 Salinity also affects non-potable uses such as industrial processes, irrigation,  
9 groundwater recharge, and recycling. High salinity waters may render them  
10 infeasible for certain industrial processes, or reduce the efficiency by reducing the  
11 number of recirculation cycles. Impacts of salinity on irrigation, groundwater  
12 recharge, and recycling are discussed in the following subsections.

13 Changes in operation of the CVP and SWP could exacerbate salinity and bromide  
14 problems, through changes in allowable export pumping windows during the year  
15 and for different year types, as well as the operation of the Delta Cross-Channel  
16 gates, as described in Appendix 3A, No Action Alternative: Central Valley  
17 Project and State Water Project Operations.

#### 18 **6.3.4.2 Agricultural Uses**

19 The main water quality issues related to agricultural use of Delta exported  
20 supplies are salinity and drainage, as discussed in the following subsections.

##### 21 **6.3.4.2.1 Salinity, Sodium, and Toxicity**

22 Delta waters are high in salinity due to tidal influence and upstream discharges.  
23 High salinity in irrigation water inhibits water and nutrients intake by plants,  
24 resulting in yield reduction. Saline conditions could be a result of high salinity  
25 source water used for direct irrigation, or saline soil water due to saline water  
26 accumulation and poor drainage. Plant uptake of water through osmo-regulation  
27 is restricted when the soil water salinity is greater than the internal salinity of the  
28 plant. Water with a TDS above 1,500 to 2,600 mg/L (EC greater than 2.25 to 4  
29 mmho/cm) is generally considered problematic for irrigation use on crops with  
30 low or medium salt tolerance.

31 Irrigation water containing high levels of sodium is of special concern because of  
32 its potential to create a sodium hazard in the soil. Sodium hazard, expressed as  
33 sodium adsorption ratio, is the phenomenon when sodium is adsorbed and  
34 becomes attached to soil particles, rendering the soil hard and compact when dry  
35 and increasingly impervious to water penetration. Fine textured soils high in clay  
36 content are most vulnerable to the sodium hazard.

37 High salinity in irrigation water could also result in plant toxicity due to  
38 accumulation of ions in the leaves. The most common ions which cause toxicity  
39 are chloride, sodium, and boron. Boron is particularly troublesome because  
40 toxicity can occur in very low concentrations, despite the fact that boron is an  
41 essential plant nutrient. Boron can also accumulate in the soil.

1 Sulfate salts affect sensitive crops by limiting the uptake of calcium and  
2 increasing the adsorption of sodium and potassium, upsetting the cationic balance  
3 within the plant. High concentrations of potassium may introduce a magnesium  
4 deficiency and iron chlorosis.

5 Different crops have different toleration for salinity, with forage crops being the  
6 most resistant and fruit crops being the most sensitive. Crops are also most  
7 sensitive to salinity during seed germination, and more tolerant during later  
8 growth stages. Changes in salinity of Delta waters due to seasonal fluctuations or  
9 different year types may affect crops, depending on the timing within the growth  
10 cycle. To protect salt sensitive crops during the irrigation season, the EC overall  
11 objectives in the San Joaquin River and the interior southern Delta are generally  
12 at 0.7 mS/cm (700  $\mu$ S/cm) during the irrigation season (April to August) and at  
13 1.0 mS/cm for the remainder of the year.

14 Generally, salinity in groundwater is higher than surface water in the San Joaquin  
15 Valley. Changing from irrigating with surface water to groundwater, due to  
16 shortages of CVP and/or SWP water supplies, could exacerbate salinity issues.

#### 17 **6.3.4.2.2 Agricultural Drainage**

18 The Central Valley RWQCB initiated the Irrigated Lands Regulatory Program  
19 (ILRP) in 2003 to prevent agricultural runoff containing pesticides, fertilizers,  
20 salts, pathogens, and sediment from impairing surface waters. Waste discharge  
21 requirements were subsequently developed and adopted to address irrigated  
22 agricultural discharges throughout the Central Valley, in order to protect both  
23 surface water and groundwater for all beneficial uses. The waste discharge  
24 requirements replaced pre-2003 waivers and previous interim regulatory  
25 requirements under a Conditional Waiver of Waste Discharge Requirements. All  
26 commercial irrigated lands, including nurseries and managed wetlands, are  
27 required to obtain regulatory coverage by joining a coalition group, or obtaining  
28 coverage as an individual grower under general waste discharge requirements, or  
29 obtaining an individual permit.

30 The recently adopted waste discharge requirements have been expanded to  
31 include discharges to groundwater, in order to address the critical need to protect  
32 this drinking water source from contaminants such as nitrate that are associated  
33 with fertilizer application. The waste discharge requirements are tailored to  
34 known threats to water quality and specific geographic areas or commodities.

35 According to the Central Valley RWQCB, there are about 35,000 growers in the  
36 Central Valley and nearly 5 million acres of land that are part of water quality  
37 coalition groups. The coalition groups conduct water quality monitoring and  
38 analysis, perform vulnerability assessments, prepare regional plans to address  
39 water quality problems, determine the effectiveness of management actions, and  
40 perform education and outreach to growers. Coalitions are required to prepare  
41 Water Quality Management Plans anytime water quality objectives have been  
42 exceeded more than once in three years. The growers are required to implement  
43 management practices to protect surface and groundwater, especially in areas  
44 where monitoring has identified problems associated with irrigated agriculture

1 such as the pesticides chlorpyrifos and diazinon, indicators of pathogens such as  
2 *e. coli*, or nitrates. Growers are required to conduct farm evaluations to determine  
3 the effectiveness of farm practices in protecting water quality. Nutrient  
4 management is a key element for all growers. A certified nitrogen management  
5 plan is required for growers in areas where groundwater is known to be severely  
6 impacted by nitrates, pesticides or other constituents associated with agriculture.

#### 7 **6.3.4.3 Groundwater Recharge Uses**

8 In addition to direct use for municipal, industrial, and agricultural purposes, some  
9 of the CVP and SWP water from the Delta is used for groundwater recharge  
10 purposes through direct application or indirect potable recharge by blending with  
11 recycled water. The quality of the applied water could affect hydrogeological  
12 properties of the aquifer, or impair the quality of groundwater for subsequent use.

13 Hydrogeological properties of the aquifer could be affected by precipitation  
14 reactions between the recharge water and native soil material or groundwater,  
15 causing mechanical blockage of aquifer pores. Ion exchange reactions could  
16 adversely affect the shrink/swell properties of some clays present in an aquifer.  
17 Sodium adsorption is particularly of concern due to the high salinity of Delta  
18 water.

19 Chemical and microbial contaminants in the recharge water could build up in the  
20 aquifer and impair the subsequent use of the groundwater. Secondarily treated  
21 domestic wastewaters and many industrial wastewaters, urban stormwater  
22 drainage, agricultural and rural stormwater runoff, and irrigation return waters  
23 contain high concentrations of a wide variety of inorganic and organic, dissolved,  
24 particulate, and colloidal contaminants that can adversely impact groundwater and  
25 aquifer quality. Nonconventional and emergent contaminants in pharmaceuticals  
26 and body care products may not have been removed through conventional  
27 secondary treatment. Furthermore, chloramination of wastewater effluents  
28 especially during water reuse processes could create NDMA, a known carcinogen.  
29 For some CVP and SWP water users, the CVP and/or SWP water supplies are  
30 used to dilute some of these potential contaminants to protect groundwater  
31 quality.

#### 32 **6.3.4.4 Water Recycling Use**

33 Salinity in Delta waters reduces the utility of the water for reuse or blending  
34 purposes by CVP and SWP water users. A higher salinity source water  
35 exacerbates the increase in salinity from use and reuse, reducing the applicability  
36 of the recycled water for non-potable purposes such as landscape and agricultural  
37 irrigation or industrial cooling and reuse. Residential use of water could add 200  
38 to 300 mg/L of TDS to the wastewater stream. Conventional wastewater  
39 treatment processes are designed to remove suspended solids but not dissolved  
40 solids. Depending on the TDS levels of the source water, the TDS levels in  
41 recycled water could reach beyond the threshold of market acceptance for  
42 irrigation. TDS removal or demineralization would require an advanced  
43 treatment process and add to the cost of recycling.

#### 1 **6.3.4.5 Blending Use**

2 Some SWP water users in Southern California rely on Delta water exported from  
3 the SWP to blend with the higher TDS water from the Colorado River. Water  
4 imported through the Colorado River Aqueduct has an average TDS of 650 mg/L,  
5 and has exceeded 900 mg/L during drought events. Delta water imported through  
6 the SWP has a lower TDS by comparison, with an average TDS of 250 to 325  
7 mg/L. The real time TDS levels fluctuate significantly due to variations in  
8 hydrology, tidal cycles, and project operations. Article 19 of the SWP long-term  
9 water supply contracts contains a water quality objective for TDS of below 440  
10 ppm for monthly averages, and below 220 ppm for 10-year averages. These  
11 objectives were set in the 1960s when SWP deliveries were thought to be more  
12 assured. Metropolitan Water District of Southern California has used these SWP  
13 delivered water quality objectives to set a salinity-by-blending objective of 500  
14 mg/L for its blended supply. Reduced SWP deliveries would pose challenges in  
15 meeting this blending objective.

#### 16 **6.3.4.6 San Luis Reservoir Low-Point Issues**

17 As described in Chapter 5, Surface Water Resources and Water Supplies, the San  
18 Luis Reservoir provides off-stream storage for CVP water used by Santa Clara  
19 Valley Water District and San Benito County Water District. These districts  
20 withdraw their CVP supplies from the Upper Pacheco Intake at the San Luis  
21 Reservoir. This supply is at risk when water elevations in San Luis Reservoir  
22 reach very low levels during late summer and early fall. High temperatures  
23 combined with low water levels foster algae growth to as much as 35 feet thick on  
24 the water surface. Algae captured in the intake and conveyed to the CVP water  
25 users is not suitable for municipal water treatment or agricultural drip irrigation  
26 systems. As water levels continue to drop below the level of the intake, water  
27 supply to these CVP water users ceases.

28 The Santa Clara Valley Water District has partnered with Reclamation and the  
29 San Luis and Delta-Mendota Water Authority to complete the San Luis Low Point  
30 Improvement Project. The project purpose is to identify a feasible alternative that  
31 will address the uncertainty of CVP delivery schedules and the water supply  
32 reliability problems associated with the low-point issues.

#### 33 **6.3.5 Drought Impacts on Water Quality**

34 California is currently in the fourth consecutive year of a severe drought, with  
35 precipitation way below average and record high temperatures. The availability  
36 of water supplies throughout the state have declined substantially as described in  
37 Section 5.3.4, Surface Water Resources and Water Supplies during Droughts. In  
38 addition, there are chronic and significant shortages in supplies and historically  
39 low groundwater levels, as described in Chapter 7, Groundwater Resources and  
40 Groundwater Quality. Drought conditions affect many Delta water quality  
41 constituents, including changes in temperatures and dissolved oxygen conditions  
42 in the lower San Joaquin River, temperature in the Sacramento River, and salinity  
43 in the Delta.

1     **6.3.5.1     Water Quality Conditions in the Lower San Joaquin River**

2     The San Joaquin River watershed in particular has experienced severely dry  
3     conditions, with water year 2012 classified as dry and water years 2013-2015  
4     classified as critically dry. Lack of precipitation has resulted in historically low  
5     reservoir storage levels, creating significant concerns about low flows, high  
6     temperatures, low dissolved oxygen conditions and other factors that have  
7     significant effects on steelhead and fall-run Chinook Salmon.

8     As described in Section 5.3.4, Surface Water Resources and Water Supplies  
9     during Droughts, Reclamation and DWR filed a Temporary Urgency Change  
10    Petition (TUCP) with the SWRCB on January 23, 2015, seeking to make changes  
11    to their water right permits and license for the CVP and SWP. The TUCP sought  
12    changes to D-1641 requirements on flow-dependent and operational water quality  
13    objectives. The TUCP was approved in part on February 3, 2015, subject to  
14    conditions, and modified on March 5, 2015 and April 6, 2015. Reclamation  
15    submitted a request on May 21, 2015 to modify and renew the TUCP Order,  
16    which was approved on July 3, 2015 and modified on August 4, 2015 with  
17    changes effective through November 30, 2015.

18    The August 4, 2015 Order conditionally approved a change to Reclamation's  
19    water rights to modify the Stanislaus River dissolved oxygen requirement from  
20    7.0 mg/L to 5.0 mg/L at and below Ripon on the Stanislaus River. It also  
21    included other conditions, including the development, coordinated  
22    implementation, evaluation, and update of operations plans that would affect  
23    flows, temperatures and dissolved oxygen conditions, to ensure that the change  
24    can be made without unreasonable effects on fish, wildlife, or other instream  
25    beneficial uses, and to ensure that the change is in the public interest.

26    **6.3.5.2     Temperature Conditions in the Lower San Joaquin River**

27    Reclamation files an annual Sacramento River Temperature Management Plan to  
28    guide the release of water from Shasta Lake in order to maintain downstream  
29    water temperatures to protect the fisheries during the higher temperature months  
30    of summer and fall. In 2014, temperature targets were not achieved in the upper  
31    reaches of the Sacramento River late in the fall, despite Reclamation's efforts.

32    In early 2015, Reclamation developed a release plan in conjunction with DWR,  
33    USFWS, NMFS, CDFW, SWRCB, and others to meet the CVP authorized  
34    purposes and regulatory requirements to the extent possible. The plan was  
35    submitted and provisionally approved by the SWRCB on May 14, 2015. On May  
36    29, 2015, Reclamation informed the SWRCB that the proposed temperature target  
37    will unlikely be met, due to faulty equipment used to obtain temperature data for  
38    modeling. The SWRCB suspended the plan in June while Reclamation developed  
39    and submitted a revised Temperature Plan on June 25, 2015. On July 1, 2015,  
40    NMFS provided conditional concurrence with the revised plan. On July 7, 2015,  
41    the SWRCB conditionally approved the June 25, 2015 plan, placing numerous  
42    monitoring, consultation, and update requirements on Reclamation, as well as  
43    correlating the Temperature Plan with conditions in the July 3, 2015 approved  
44    TUCP filed by Reclamation and DWR.

### 1 **6.3.5.3 Delta Salinity Conditions**

2 As described in Section 5.3.4, Surface Water Resources and Water Supplies  
3 during Droughts, in early 2015, as a result of very low precipitation and  
4 diminished reservoir storage, DWR planned and installed an emergency drought  
5 barrier on West False River in the Delta to help repel salt water intrusion into the  
6 central Delta and to minimize the amount of upstream reservoir releases. The  
7 barrier installation was completed in early June. Removal began on September 8,  
8 2015 and must be completed by mid-November to provide capacity for wet  
9 weather flows in the winter season and to comply with fisheries protection  
10 requirements.

11 In June and July 2015, some of the salinity objectives were not met, despite the  
12 drought barrier and other project operations to mitigate for the effects of the  
13 severe drought. Exceedances were reported by Reclamation and DWR at: the  
14 South Delta agricultural objective at San Joaquin River near Brandt Bridge  
15 compliance station, the two western Delta agricultural objectives of 14-day  
16 running average EC values at Sacramento River at Three Mile Slough and San  
17 Joaquin River at Jersey Point, and the 30-day running average EC value at Old  
18 River near Middle River.

19 Salinity in CVP and SWP water supplies has increased since the onset of the  
20 drought.

### 21 **6.3.5.4 Municipal and Industrial Water Users Responses to Drought-** 22 **related Water Quality Impacts**

23 With low surface water runoff, increased temperature, and concentrated nutrient  
24 levels due to the drought, algae growth in surface water proliferated, leading to  
25 increased turbidity, taste and odor issues, as well as increased potential for algal  
26 cyanotoxins from the blue-green algae, *Microcystis*. Urban water agencies that  
27 have alternative supply sources use blending, coupled with changes in treatment  
28 processes such as increased use of ozone, to address the taste and odor issues.  
29 Some of the larger urban agencies are participating in studies to investigate  
30 alternative treatment processes to address algal toxin issues. Other studies raised  
31 concern with respect to changes in pH due to low flows and their effects on  
32 toxicity and bioaccumulation of ionizable contaminants. The Metropolitan Water  
33 District of Southern California announced plans to apply copper sulfate to treat  
34 algae at Lake Skinner, Lake Mathews, and Diamond Valley Lake in accordance  
35 with its NPDES permit.

36 Many urban water agencies accelerated their investments in recycled water  
37 development during the current drought. Most notably, a lot of these investments  
38 are focused on advanced treatment processes for indirect, as well as direct,  
39 potable reuse. For example, the Santa Clara Valley Water District began  
40 operations of the 8 million gallon/day Silicon Valley Advanced Water  
41 Purification Center in 2014, to test and demonstrate its advanced treatment  
42 processes in producing highly purified recycled water that meets drinking water  
43 standards. Advanced treated recycled water has historically been used to blend  
44 with tertiary-treated recycled water to reduce the level of total dissolved solids for

1 expanded industrial and irrigation use, thereby offsetting potable demand during  
 2 droughts.

### 3 **6.4 Impact Analysis**

4 This section describes the potential mechanisms and analytical methods for  
 5 change in surface water quality; results of the impact analysis; potential  
 6 mitigation measures; and cumulative effects.

#### 7 **6.4.1 Potential Mechanisms for Change and Analytical Methods**

8 As described in Chapter 4, Approach to Environmental Analysis, the impact  
 9 analysis considers changes in surface water quality conditions related to changes  
 10 in CVP and SWP operations under the alternatives as compared to the No Action  
 11 Alternative and Second Basis of Comparison.

12 Changes in CVP and SWP operations under the alternatives as compared to the  
 13 No Action Alternative and Second Basis of Comparison could result in changes to  
 14 surface water quality due to changes in river flows and surface water deliveries.  
 15 Based on the discussion above, the following water quality changes are further  
 16 analyzed in the Evaluation of Alternatives section.

17 As described in Section 6.3 Affected Environment, there are numerous  
 18 constituents of concern that have been identified in the study area. These  
 19 components are not all critical in each region and may not be all affected by  
 20 changes in CVP and SWP operations considered in the alternatives of this EIS.  
 21 The groups of constituents that could be affected by implementation of the  
 22 alternatives has been identified through consideration of constituents of concern  
 23 described in Section 6.3, Affected Environment, and the anticipated  
 24 implementation of TMDLs by 2030. These constituents were grouped into major  
 25 categories, as shown in Table 6.27. The constituents that already have approved  
 26 TMDLs in certain regions are not further analyzed for those regions, as it is  
 27 expected that the TMDL will be implemented by 2030. A complete list of  
 28 TMDLs and the anticipated completion dates is provided in Table 6.1.

29 **Table 6.27 List of Surface Water Quality Constituents Considered for this Analysis**

<b>Constituent/Parameter Group</b>	<b>Individual Constituents/Parameters</b>
Water Temperature	Water Temperature
Salinity Indicators	EC, TDS, Chloride, Bromide, Delta X2
Nutrients	Nitrate, phosphorus
Mercury	Mercury, methylmercury
Selenium	Selenium
Dissolved Oxygen	Dissolved Oxygen
Other Constituents	Pesticides, PCBs, DOC/TOC, Boron, Trace Metals, Pathogens, TSS, Turbidity, Unknown Toxicity

1 Each constituent group is further discussed below, to determine whether changes  
2 would occur due to implementation of the alternatives.

### 3 **6.4.1.1 Changes in Water Temperature**

4 Changes in CVP and SWP operations would change water temperatures in rivers  
5 downstream of CVP and SWP reservoirs. Changes in water temperatures are  
6 presented in Appendix 6B, Surface Water Temperature Modeling. However, the  
7 effects of change in temperature are related to the changes on aquatic habitat.  
8 Therefore, analysis of changes in temperature is presented in Chapter 9, Fish and  
9 Aquatic Resources.

### 10 **6.4.1.2 Changes in Salinity**

11 Changes in salinity due to changes in CVP and SWP operations would be focused  
12 in the Delta. Salinity indicators generally considered in this analysis include  
13 electrical conductivity, total dissolved solids, chloride, bromide, and X2.

14 The DSM2, a one-dimensional hydrodynamic and water quality simulation  
15 model, is used to evaluate changes in salinity (as represented by EC) in the Delta  
16 and at the CVP/SWP export locations. CalSim II outputs are used to evaluate  
17 changes in location of X2 in the Delta.

### 18 **6.4.1.3 Changes in Mercury/Methylmercury Concentrations**

19 Changes in CVP and SWP operations under the alternatives could affect mercury  
20 concentrations in the Delta and Suisun Marsh. The changes in CVP and SWP  
21 operations would not affect mercury concentrations in the tributaries to the  
22 Sacramento and San Joaquin rivers.

23 A modeling framework is used to evaluate changes in methylmercury  
24 concentrations in the Delta reaches and qualitatively estimate mercury  
25 concentration changes at the San Luis Reservoir and O'Neill Forebay.

26 The methylmercury impacts analysis uses CalSim II, DSM2, and the Central  
27 Valley Regional Water Quality Control Board Total Maximum Daily Load model  
28 (RWQCB model) to assess and quantify effects of the alternatives on the long-  
29 term operations and the environment, as described in Appendix 6C,  
30 Methylmercury Model Documentation.

31 The QUAL module of DSM2 is used to simulate source water finger printing  
32 which can determine the relative contributions of water sources to the volume at  
33 any specified location. DSM2 water quality and volumetric fingerprinting results  
34 are used to assess changes in concentration of methylmercury in Delta waters.  
35 CalSim II, DSM2 (water), and the RWQCB model (fish tissue) are used in  
36 sequence to estimate the effects of CVP and SWP operations on water and fish  
37 tissue quality in the Delta.

### 38 **6.4.1.4 Changes in Selenium Concentrations**

39 Changes in CVP and SWP operations under the alternatives could affect selenium  
40 concentrations in the San Joaquin River, Delta, and Suisun Marsh. Selenium also

1 is of a concern in the Southern California Region because the use of water  
2 supplies from both the Delta and the Colorado River.

3 A suite of modeling tools is used to evaluate changes in selenium concentrations  
4 in the Delta reaches and in the San Francisco Bay, based on the western Delta  
5 model outputs. The selenium impacts analysis uses CalSim II, DSM2, and Delta-  
6 specific selenium bioaccumulation modeling to assess and quantify effects of the  
7 alternatives on the long-term operations and the environment. Appendix 6D,  
8 Selenium Model Documentation, provides information about the development  
9 and calibration of a Delta-wide bioaccumulation model for selenium in fish, use  
10 of outputs from that model to estimate bioaccumulation in bird eggs and fish  
11 fillets, and modeling of selenium bioaccumulation in sturgeon living in the  
12 western Delta using inputs from other models. Modeling assumptions for the  
13 selenium analysis are also provided in that appendix.

14 The selenium impact analysis focuses on evaluation of changes to selenium  
15 concentrations in tissues that affect the health of fish as well as wildlife and  
16 humans consuming fish in the Delta.

17 CalSim II, DSM2, and bioaccumulation modeling are used in sequence to  
18 estimate the effects of CVP and SWP operations on water quality relative to  
19 selenium in the Delta. The DSM2-QUAL module simulates one-dimensional  
20 source tracking in the Delta. Results from DSM2 are multiplied by source  
21 concentrations to determine annual average waterborne selenium concentrations  
22 in the Delta for all year types. Output from the DSM2-QUAL model (expressed  
23 as percent inflow from different sources) is used in combination with the available  
24 measured waterborne selenium concentrations to model concentrations of  
25 selenium at locations throughout the Delta. These modeled waterborne selenium  
26 concentrations are used in the relationship model to estimate bioaccumulation of  
27 selenium in whole-body fish and in bird eggs.

#### 28 **6.4.1.5 Changes in Nutrient Concentrations**

29 Nutrients generally considered in this analysis include nitrate and phosphorus.  
30 The two main anthropogenic sources of these constituents are urban point sources  
31 (wastewater effluent), and agricultural non-point sources (agricultural runoff and  
32 return flows of fertilizers mixed in irrigation water). By 2030, wastewater  
33 treatment plants that discharge into the Sacramento and San Joaquin rivers  
34 watersheds and the Delta that are currently implementing nutrient removal  
35 projects will have completed those projects. Agricultural non-point source  
36 discharges are regulated under the Long-Term Irrigated Lands Regulatory  
37 Program (ILRP) Waste Discharge Requirements, which mandate monitoring of  
38 nutrients in the major agricultural reaches and the implementation of Best  
39 Management Practices to reduce nutrient discharges to streams, and controlling  
40 fertilizer application and management. Since nutrient loadings would be managed  
41 through regulatory processes by 2030, it is anticipated that nutrient conditions  
42 would be similar under the No Action Alternative, Alternatives 1 through 5, and  
43 the Second Basis of Comparison. Therefore, changes in nutrients are not  
44 evaluated in this EIS.

1     **6.4.1.6     Changes in Dissolved Oxygen Concentrations**

2     Dissolved oxygen has been found to be a parameter of concern primarily in the  
3     lower Klamath River, Sacramento-San Joaquin River Delta, and the Suisun  
4     Marsh. By 2030, it is anticipated that TMDLs would be implemented to address  
5     the dissolved oxygen issues. Since dissolved oxygen conditions would be  
6     managed through regulatory processes by 2030, it is anticipated that dissolved  
7     oxygen conditions would similar under the No Action Alternative, Alternatives 1  
8     through 5, and the Second Basis of Comparison. Therefore, changes in dissolved  
9     oxygen are not evaluated in this EIS.

10    **6.4.1.7     Changes in Other Constituents**

11    Conditions for other water quality constituents are expected to be similar under  
12    the No Action Alternative, Alternatives 1 through 5, and the Second Basis of  
13    Comparison because critical factors that affect the sources, transport mechanisms  
14    or chemical transformations are not expected to be affected by changes in CVP  
15    and SWP operations. Therefore, changes in the other constituents are not  
16    analyzed in this EIS.

17    **6.4.1.8     Effects Related to Water Transfers**

18    Historically water transfer programs have been developed on an annual basis.  
19    The demand for water transfers is dependent upon the availability of water  
20    supplies to meet water demands. Water transfer transactions have increased over  
21    time as CVP and SWP water supply availability decreased, especially during drier  
22    water years.

23    Parties seeking water transfers generally acquire water from sellers who have  
24    available surface water who can make the water available through releasing  
25    previously stored water, pump groundwater instead of using surface water  
26    (groundwater substitution); crop idling; or substituting crops that uses less water  
27    in order to reduce normal consumptive use of surface water.

28    Water transfers using CVP and SWP Delta pumping plants and south of Delta  
29    canals generally occur when there is unused capacity in these facilities. These  
30    conditions generally occur in drier water year types when the flows from  
31    upstream reservoirs plus unregulated flows are adequate to meet the Sacramento  
32    Valley water demands and the reduced CVP and SWP export allocations. In non-  
33    wet years, the CVP and SWP water allocations would be less than full contract  
34    amounts; therefore, capacity may be available in the CVP and SWP conveyance  
35    facilities to move water from other sources.

36    Projecting future water quality conditions related to water transfer activities is  
37    difficult because of the wide variability in sources of transfer water, conveyance,  
38    and recipients involved in each specific water transfer action. Use of the transfer  
39    water would change each year due to changing hydrological conditions, CVP and  
40    SWP water availability, specific local agency operations, and local cropping  
41    patterns. Reclamation recently prepared a long-term regional water transfer  
42    environmental document which evaluated potential changes in conditions related  
43    to water transfer actions (Reclamation 2014c). Results from this analysis were

1 used to inform the impact assessment of potential effects of water transfers under  
2 the alternatives as compared to the No Action Alternative and the Second Basis of  
3 Comparison.

#### 4 **6.4.2 Conditions in Year 2030 without Implementation of** 5 **Alternatives 1 through 5**

6 This EIS includes two bases of comparison, as described in Chapter 3,  
7 Description of Alternatives: the No Action Alternative and the Second Basis of  
8 Comparison. Both of these bases are evaluated at 2030 conditions. Changes that  
9 would occur over the next 15 years without implementation of the alternatives are  
10 not analyzed in this EIS. Changes to water quality that are assumed to occur by  
11 2030 under the No Action Alternative and the Second Basis of Comparison are  
12 summarized in this section and included in all alternatives. Many of the changed  
13 conditions would occur in the same manner under both the No Action Alternative  
14 and the Second Basis of Comparison.

##### 15 **6.4.2.1 Common Changes in Conditions under the No Action Alternative** 16 **and Second Basis of Comparison**

17 Conditions in 2030 would be different than existing conditions due to:

- 18 • Climate change and sea level rise
- 19 • General plan development throughout California, including increased water  
20 demands in portions of Sacramento Valley
- 21 • Implementation of reasonable and foreseeable water resources management  
22 projects to provide water supplies

##### 23 **6.4.2.1.1 Effects due to Climate Change and Sea Level Rise**

24 It is anticipated that climate change would result in more short-duration high-  
25 rainfall events and less snowpack runoff in the winter and early spring months.  
26 The reservoirs would be full more frequently by the end of April or May by 2030  
27 than in recent historical conditions. However, as the water is released in the  
28 spring, there would be less snowpack to refill the reservoirs. This condition  
29 would reduce reservoir storage and available water supplies, including water  
30 supplies released to maintain freshwater conditions in the western Delta and at the  
31 CVP and SWP Delta intakes. Ambient temperatures are also expected to  
32 increase. Therefore, water temperatures in the CVP and SWP reservoirs and in  
33 the rivers downstream of the reservoirs are expected to increase by 2030 under the  
34 No Action Alternative as compared to recent historical conditions.

##### 35 **6.4.2.1.2 Effects due to Reasonable and Foreseeable Projects and Programs**

36 Under the No Action Alternative and the Second Basis of Comparison, land uses  
37 in 2030 would occur in accordance with adopted general plans. Development  
38 under the general plans would change water quality, especially near municipal  
39 areas.

40 The No Action Alternative and the Second Basis of Comparison assumes  
41 completion of water resources management and environmental restoration

1 projects that would have occurred without implementation of Alternatives 1  
2 through 5, including regional and local recycling projects, surface water and  
3 groundwater storage projects, conveyance improvement projects, and desalination  
4 projects, as described in Chapter 3, Description of Alternatives. The No Action  
5 Alternative and the Second Basis of Comparison also assumes implementation of  
6 actions included in the 2008 U.S. Fish and Wildlife Service (USFWS) Biological  
7 Opinion (BO) and 2009 National Marine Fisheries Service (NMFS) BO that  
8 would have been implemented without the BOs by 2030, as described in Chapter  
9 3, Description of Alternatives. These projects would include several projects that  
10 could affect surface water quality in beneficial and adverse manners, including  
11 restoration of more than 10,000 acres of intertidal and associated subtidal  
12 wetlands in Suisun Marsh and Cache Slough; and at least 17,000 to 20,000 acres  
13 of seasonal floodplain restoration in Yolo Bypass.

14 The reasonable and foreseeable projects also would include issuance and  
15 implementation of TMDL programs and other programs to improve water quality,  
16 including those that address salinity, mercury, and selenium.

#### 17 *Potential Changes in Salinity Indicators*

18 In the Central Valley, changes in salinity under the No Action Alternative and the  
19 Second Basis of Comparison as compared to recent historical conditions are  
20 anticipated primarily to occur in the Delta. The salinity in the Delta is anticipated  
21 to increase with projected sea level rise; and therefore, the region of the Delta  
22 influenced by daily tidal fluctuations will increase, and the increased tidal mixing  
23 may result in salt transport further upstream. The average water depth in the  
24 Delta will increase, allowing for increased gravitational circulation and upstream  
25 transport of salinity further into the Delta. The increased salinity potentially will  
26 decrease the flexibility to meet regulatory requirements at compliance locations,  
27 municipal and industrial water intakes, and export facilities.

#### 28 *Potential Changes in Mercury Concentrations*

29 In the Central Valley, mercury concentrations in the Sacramento River watershed  
30 would be similar under the No Action Alternative and the Second Basis of  
31 Comparison as compared to recent historical conditions. Programs would be  
32 implemented to reduce the sources of mercury into water bodies by 2030;  
33 however, the results of those programs are not anticipated to change mercury  
34 concentrations prior to 2030.

35 Changes in mercury in the Yolo Bypass are also anticipated under the No Action  
36 Alternative and the Second Basis of Comparison as floodplain restoration is  
37 implemented, as compared to recent historical conditions.

38 Under the No Action Alternative and the Second Basis of Comparison, it is  
39 anticipated that mercury concentrations in fish tissue within the Delta will be  
40 either similar or greater than recent historical conditions. Phase 1 of the Delta  
41 Mercury Program mandated by the CVRWQCB is currently being completed to  
42 protect people eating one meal per week of larger fish from the Delta, including  
43 Largemouth Bass. This program also would reduce wildlife exposure to excess  
44 mercury. Phase 1 is focused on studies and pilot projects to develop and evaluate

1 management practices to control methylmercury from mercury sources in the  
2 Delta and Yolo Bypass; and to reduce total mercury loading to the San Francisco  
3 Bay. Following completion of Phase 1 in 2019, Phase 2 will be implemented  
4 through 2030. Phase 2 will focus on methylmercury control programs and  
5 reduction programs for total inorganic mercury. Due to the length of these studies  
6 and limited time for implementation of recommendations, it is not anticipated that  
7 changes in methylmercury or total mercury concentrations in fish tissue would be  
8 reduced by 2030 under the No Action Alternative and the Second Basis of  
9 Comparison as compared to recent historical conditions.

10 The No Action Alternative and the Second Basis of Comparison include the same  
11 projected tidal wetland and floodplain restoration within or adjacent to the Delta.  
12 These projects considered in the No Action Alternative and the Second Basis of  
13 Comparison have undergone environmental compliance and include methods to  
14 reduce mercury loading. For example, in Suisun Marsh, tidal wetland restoration  
15 activities will include cooperation with regional monitoring and research efforts,  
16 and sediment and fish monitoring. The collected information would be used  
17 adaptively to correct long-term construction and management plans and activities  
18 associated with tidal wetland restoration (Reclamation et al. 2011).

19 *Potential Changes in Selenium Concentrations*

20 Selenium is a constituent of concern in the San Joaquin Valley and the Delta, and  
21 TMDLs have been adopted for the San Joaquin River from Mud Slough to  
22 Merced River, Grasslands Marshes, Agatha Canal, and Mud Slough. It is  
23 assumed that water quality concerns for selenium in those reaches will be  
24 addressed before 2030. TMDLs are anticipated prior to 2030 for Panoche Creek  
25 and Mendota Pool. However, it is assumed that these TMDLs for water quality  
26 issues related to selenium may not be fully implemented by 2030.

27 It is expected that a TMDL may be developed separately for the Delta. To  
28 increase the database for evaluation of constituents of concern in the Delta, a large  
29 number of fish tissue samples were collected from the Sacramento and San  
30 Joaquin River watersheds and the Delta between 2000 and 2007 for selenium  
31 analysis. As part of the Strategic Workplan for Activities in the San Francisco  
32 Bay/Sacramento–San Joaquin Delta Estuary (State Water Resources Control  
33 Board 2008b), archived Largemouth Bass samples were analyzed for selenium to  
34 determine the primary source of the selenium being bioaccumulated in bass in the  
35 Delta and whether selenium concentrations in bass were above recommended  
36 criteria for the protection of human and wildlife health (Foe 2010). There were  
37 no differences in selenium concentrations in Largemouth Bass caught in the  
38 Sacramento River at Rio Vista and in the San Joaquin River at Vernalis in 2000,  
39 2005, and 2007. However, because the TMDL is not yet under development, it is  
40 assumed that it would not be in place by 2030 under the No Action Alternative  
41 and the Second Basis of Comparison.

42 Reclamation is actively engaged with the Grassland Area Farmers who discharge  
43 subsurface agricultural drainage waters through the Grassland Bypass Project,  
44 which is a significant source of selenium to the San Joaquin River and to the  
45 Delta. Reclamation and the Grassland Area Farmers are continuing to reduce the

1 amount of agricultural drainage water produced in the Grassland Drainage Area,  
 2 preventing the discharge of this water into local Grassland wetland water supply  
 3 channels, and improving the quality of water in the San Joaquin River. The  
 4 Grassland Bypass Project is based upon an agreement between Reclamation and  
 5 the San Luis and Delta-Mendota Water Authority to use a 28-mile segment of the  
 6 San Luis Drain to convey agricultural subsurface drainage water from the  
 7 Grassland Drainage Area to Mud Slough (North), a tributary of the San Joaquin  
 8 River. An extensive monitoring program (e.g., San Francisco Estuary Institute  
 9 [SFEI] 2013) continues to document the effectiveness of actions such as source  
 10 control and other measures being taken by the Grassland Area Farmers. These  
 11 actions by the Grassland Area Farmers are described in Chapter 2 of SFEI (2013).  
 12 Briefly, these activities have included the Grassland Bypass Project and the San  
 13 Joaquin River Improvement Project, formation of a regional drainage entity,  
 14 newsletters and other communication with the farmers, a monitoring program,  
 15 using State Revolving Fund loans for improved irrigation systems, installing and  
 16 using drainage recycling systems to mix subsurface drainage water with irrigation  
 17 supplies under strict limits, tiered water pricing and a tradable loads programs.

### 18 **6.4.3 Evaluation of Alternatives**

19 Alternatives 1 through 5 have been compared to the No Action Alternative; and  
 20 the No Action Alternative and Alternatives 1 through 5 have been compared to  
 21 the Second Basis of Comparison.

22 During review of the numerical modeling analyses used in this EIS, an error was  
 23 determined in the CalSim II model assumptions related to the Stanislaus River  
 24 operations for the Second Basis of Comparison, Alternative 1, and Alternative 4  
 25 model runs. Appendix 5C includes a comparison of the CalSim II model run  
 26 results presented in this chapter and CalSim II model run results with the error  
 27 corrected. Appendix 5C also includes a discussion of changes in the comparison  
 28 of groundwater conditions for the following alternative analyses.

- 29 • No Action Alternative compared to the Second Basis of Comparison
- 30 • Alternative 1 compared to the No Action Alternative
- 31 • Alternative 3 compared to the Second Basis of Comparison
- 32 • Alternative 5 compared to the Second Basis of Comparison.

#### 33 **6.4.3.1 No Action Alternative**

34 The No Action Alternative is compared to the Second Basis of Comparison.

##### 35 **6.4.3.1.1 Potential Changes in Salinity Indicators**

36 Salinity in the Sacramento River at Emmaton would be lower in September  
 37 through January, higher in June, and similar in all other months over long-term  
 38 average conditions under the No Action Alternative as compared to the Second  
 39 Basis of Comparison, as summarized in Appendix 6E, Table 6E.2.4.

40 Salinity in the San Joaquin River at Vernalis would be lower in April and  
 41 October, and higher in all other months under the No Action Alternative as

1 compared to the Second Basis of Comparison, as summarized in Appendix 6E,  
2 Table 6E.15.4.

3 Salinity in the San Joaquin River at Jersey Point would be lower in September  
4 through January, higher in June, and similar in all other months, for long-term  
5 average conditions under the No Action Alternative as compared to the Second  
6 Basis of Comparison, as summarized in Appendix 6E, Table 6E.3.4.

7 Salinity in the western Delta at Port Chicago, Chipps Island, and Collinsville  
8 would be substantially lower in September through January, moderately lower  
9 February through May, higher in June, and similar in all other months, for long-  
10 term average conditions under the No Action Alternative as compared to the  
11 Second Basis of Comparison, as summarized in Appendix 6E, Table 6E.6.4,  
12 6E.4.4, and 6E.2.4.

13 Salinity at the CVP Contra Costa Canal and Jones pumping plants and the SWP  
14 Banks Pumping Plant intakes in the Delta would be lower in September through  
15 January, and higher in all other months for long-term average conditions under  
16 the No Action Alternative as compared to the Second Basis of Comparison, as  
17 summarized in Appendix 6E, Tables 6.E.11.4, 6E.7.4, and 6E.8.4. Salinity at the  
18 Contra Costa Water District Old River and Middle River intakes also would be  
19 lower in September through January, and higher in all other months for long-term  
20 average conditions under the No Action Alternative as compared to the Second  
21 Basis of Comparison, as summarized in Appendix 6E, Tables 6E.12.4 and  
22 6E.13.4. Changes in salinity at the intakes would influence the salinity in water  
23 delivered in the San Joaquin Valley which could influence salinity in water bodies  
24 that receive agricultural return flows from CVP and SWP water users. Chloride  
25 and bromide concentrations at the intakes are expected to change in a similar  
26 manner to other salinity indicators.

27 Another indication of salinity is the measurement of X2. X2 decreases with  
28 increases in Delta outflow as freshwater from the Central Valley flows towards  
29 San Francisco Bay. Under the No Action Alternative, Delta outflow would  
30 increase and X2 would move towards the west as compared to the Second Basis  
31 of Comparison, as shown in Table C.16.4 and Figures C.16.1.1 through C.16.1.8  
32 and C.16.2.1 through C.16.2.8 in Appendix 5A, Section C, CalSim II and DSM2  
33 Modeling Results. X2 distances would be lower in September through May, and  
34 similar in all other months in long-term average conditions under the No Action  
35 Alternative as compared to the Second Basis of Comparison.

36 **6.4.3.1.2 Potential Changes in Mercury Concentrations**

37 Changes in mercury from the rivers result in changes in mercury concentrations in  
38 fish used for human consumption in the Delta, including Largemouth Bass, as  
39 summarized in Tables 6.28 and 6.29 for long-term average conditions and dry and  
40 critical dry years, respectively. All values exceed the threshold of 0.24 milligram/  
41 kilogram wet weight (mg/kg ww) for mercury.

1 **Table 6.28 Changes in Mercury Concentrations 350-millimeter Largemouth Bass**  
 2 **over the Long-term Average Conditions under the No Action Alternative as**  
 3 **Compared to the Second Basis of Comparison**

<b>Delta Location</b>	<b>No Action Alternative (mg/kg ww)</b>	<b>Second Basis of Comparison (mg/kg ww)</b>	<b>Changes</b>
San Joaquin River at Stockton	1.00	0.99	0.1%
San Joaquin River at Turner Cut	0.89	0.87	3%
San Joaquin River at San Andreas Landing	0.59	0.58	3%
San Joaquin River at Jersey Point	0.57	0.54	5%
Victoria Canal	0.85	0.82	4%
Sacramento River at Emmaton	0.50	0.49	2%
San Joaquin River at Antioch	0.50	0.47	7%
Montezuma Slough at Hunter Cut and Beldon's Landing (Suisun Marsh)	0.35	0.32	7%
SWP Barker Slough Pumping Plant Intake	0.56	0.56	1%
CVP Contra Costa Pumping Plant Intake	0.73	0.68	6%
SWP Banks Pumping Plant Intake	0.79	0.75	5%
CVP Jones Pumping Plant Intake	0.83	0.79	3%

4 Notes:

5 Long-term values calculated using 1976-1991 results from DSM2 model. Dry and critical  
 6 dry years values calculated using 1987-1991 results from DSM2 model.

7 Concentrations greater than 0.24 mg/kg ww Hg exceed CVRWQCB threshold

8 mg/kg – milligram/kilogram; ww – wet weight

1 **Table 6.29 Changes in Mercury Concentrations 350-millimeter Largemouth Bass in**  
 2 **Dry and Critical Dry Years under the No Action Alternative as Compared to the**  
 3 **Second Basis of Comparison**

<b>Delta Location</b>	<b>No Action Alternative (mg/kg ww)</b>	<b>Second Basis of Comparison (mg/kg ww)</b>	<b>Changes</b>
San Joaquin River at Stockton	1.06	1.06	0.3%
San Joaquin River at Turner Cut	0.84	0.81	4%
San Joaquin River at San Andreas Landing	0.54	0.53	3%
San Joaquin River at Jersey Point	0.52	0.50	4%
Victoria Canal	0.82	0.76	7%
Sacramento River at Emmaton	0.48	0.47	2%
San Joaquin River at Antioch	0.43	0.41	5%
Montezuma Slough at Hunter Cut and Beldon's Landing (Suisun Marsh)	0.28	0.26	5%
SWP Barker Slough Pumping Plant Intake	0.59	0.57	2%
CVP Contra Costa Pumping Plant Intake	0.67	0.62	8%
SWP Banks Pumping Plant Intake	0.75	0.69	8%
CVP Jones Pumping Plant Intake	0.82	0.77	7%

4 Notes:

5 Long-term values calculated using 1976-1991 results from DSM2 model. Dry and critical  
 6 dry years values calculated using 1987-1991 results from DSM2 model.

7 Concentrations greater than 0.24 mg/kg ww Hg exceed CVRWQCB threshold

8 mg/kg – milligram/kilogram; ww – wet weight

### 6.4.3.1.3 Potential Changes in Selenium Concentrations

It is anticipated that the selenium loadings would be similar under the No Action Alternative and the Second Basis of Comparison; and that selenium concentrations in the San Joaquin River also would be similar.

Selenium in the water column at various locations in the Delta under No Action Alternative and the Second Basis of Comparison are shown in Appendix 6D, Selenium Model Documentation. Selenium in the water column at the three western Delta locations under No Action Alternative would be identical to conditions under the Second Basis of Comparison, as shown in Appendix 6D, Table 6D.16. Selenium in the water column would be below the NTR criterion of 5 µg/L for the San Francisco Bay. Similarly, they would be below the draft USEPA (2014b) criterion for lentic aquatic systems (1.3 µg/L).

In the western Delta and at the Barker Slough Pumping Plant intake, the selenium would be similar (within 5 percent change) under the No Action Alternative and the Second Basis of Comparison.

Selenium at the Contra Costa Pumping Plant intake would be similar under the No Action Alternative and Second Basis of Comparison, as shown in Table 6D.9 of Appendix 6D. Selenium at the Jones and Banks pumping plant intakes under the No Action Alternative would be slightly higher than Second Basis of Comparison, as shown in Appendix 6D, Table 6D.9.

Estimated selenium concentration in biota (whole-body fish, bird eggs [invertebrate diet], bird eggs [fish diet], and fish fillets) at all locations in the Delta under the No Action Alternative would be similar as under the Second Basis of Comparison, as shown in Appendix 6D, Table 6D.10. As shown in Appendix 6D, Table 6D.13, Exceedance Quotients (EQs) computed with respect to the applicable benchmarks show that selenium concentrations in biota under the No Action Alternative would be below the thresholds identified for ecological risk.

For sturgeon in the western Delta, modeling also suggests that whole-body concentrations would be similar under the No Action Alternative and the Second Basis of Comparison (Appendix 6D, Table 6D.17), and the EQs would be similar (Appendix 6D, Table 6D.18). Low Toxicity Threshold EQs for selenium concentrations in sturgeon in the western Delta would remain under 1.0 for long-term average conditions, and slightly exceed 1.0 (indicating a higher probability for adverse effects) for drought years at the three western Delta locations under both the No Action Alternative and the Second Basis of Comparison (Table 6D.18 of Appendix 6D). Estimated EQs for High Toxicity Threshold at all locations are less than 1.0 under all hydrologic conditions.

### 6.4.3.1.4 Effects Related to Cross Delta Water Transfers

Potential effects to water quality could be similar to those identified in a recent environmental analysis conducted by Reclamation for long-term water transfers from the Sacramento to San Joaquin valleys (Reclamation 2014c). Potential effects to water quality were identified as:

- 1 • Potential for sediment and other constituents to be transported from crop idled  
2 lands into adjacent water bodies.
- 3 • Water transfer practices could change reservoir storage or stream flow  
4 patterns in a manner that would affect water quality, including upstream  
5 temperatures and Delta water quality.
- 6 • Use of transferred water could increase drainage flows in the purchaser's  
7 service areas.

8 The analysis indicated that these potential impacts would not be substantial  
9 because the amount of land subject to crop changes in the seller's and purchaser's  
10 service areas would be within the historical range of irrigated lands and crop idled  
11 lands. The groundwater substitution practices would be implemented with  
12 monitoring and mitigation programs to avoid long-term adverse impacts,  
13 including impacts to water quality. The water transfers would not be allowed to  
14 occur if the program harmed other water users or the environment, including  
15 changes to water quality in the rivers or the Delta. Therefore, water quality  
16 conditions would be similar with and without the water transfers.

17 Under the No Action Alternative, the timing of cross Delta water transfers would  
18 be limited to July through September and include annual volumetric limits, in  
19 accordance with the 2008 USFWS BO and 2009 NMFS BO. Under the Second  
20 Basis of Comparison, water could be transferred throughout the year without an  
21 annual volumetric limit. Overall, the potential for cross Delta water transfers  
22 would be less under the No Action Alternative than under the Second Basis of  
23 Comparison.

#### 24 **6.4.3.2 Alternative 1**

25 As described in Chapter 3, Description of Alternatives, Alternative 1 is identical  
26 to the Second Basis of Comparison. As described in Chapter 4, Approach to  
27 Environmental Analysis, Alternative 1 is compared to the No Action Alternative  
28 and the Second Basis of Comparison. However, because water quality factors  
29 under Alternative 1 are identical to water quality factors under the Second Basis  
30 of Comparison; Alternative 1 is only compared to the No Action Alternative.

##### 31 **6.4.3.2.1 Alternative 1 Compared to the No Action Alternative**

###### 32 *Potential Changes in Salinity Indicators*

33 Salinity in the Sacramento River at Emmaton would be higher in September  
34 through January, lower in June, and similar in all other months over long-term  
35 average conditions under Alternative 1 as compared to the No Action Alternative,  
36 as summarized in Appendix 6E, Table 6E.2.1.

37 Salinity in the San Joaquin River at Vernalis would be higher in April and  
38 October, lower in May through June, lower in November through February and  
39 similar in March and July through September and higher in all other months under  
40 Alternative 1 as compared to the No Action Alternative, as summarized in  
41 Appendix 6E, Table 6E.15.1.

1 Salinity in the San Joaquin River at Jersey Point would be higher in September  
2 through January, lower in June, and similar in all other months, for long-term  
3 average conditions under Alternative 1 as compared to the No Action Alternative,  
4 as summarized in Appendix 6E, Table 6E.3.1.

5 Salinity in the Delta at Port Chicago, Chipps Island, and Collinsville would be  
6 higher in September through January, moderately higher February through May,  
7 lower in June, and similar in all other months, for long-term average conditions  
8 under Alternative 1 as compared to the No Action Alternative, as summarized in  
9 Appendix 6E, Tables 6E.6.1, 6E.4.1, and 6E.2.1.

10 Salinity at the CVP Contra Costa Canal and Jones pumping plants and the SWP  
11 Banks Pumping Plant intakes in the Delta would be higher in September through  
12 January, and lower in all other months for long-term average conditions under  
13 Alternative 1 as compared to the No Action Alternative, as summarized in  
14 Appendix 6E, Tables 6E.11.1, 6E.7.1, and 6E.8.1. Salinity at the Contra Costa  
15 Water District Old River and Middle River intakes also would be higher in  
16 September through January, and lower in all other months, for long-term average  
17 conditions under Alternative 1 as compared to the No Action Alternative, as  
18 summarized in Appendix 6E, Tables 6E.12.1 and 6E.13.1. Changes in salinity at  
19 the intakes would influence the salinity in water delivered in the San Joaquin  
20 Valley which could influence salinity in water bodies that receive agricultural  
21 return flows from CVP and SWP water users. Chloride and bromide  
22 concentrations at the intakes are expected to change in a similar manner to other  
23 salinity indicators.

24 X2 decreases with increases in Delta outflow as freshwater from the Central  
25 Valley flows towards San Francisco Bay. Under Alternative 1, Delta outflow  
26 would decrease and X2 would move towards the east as compared to the No  
27 Action Alternative, as shown in Table C.16.1 and Figures C.16.1.1 through  
28 C.16.1.8 and C.16.2.1 through C.16.2.8 in Appendix 5A, Section C, CalSim II  
29 and DSM2 Modeling Results. X2 distances would be higher in September  
30 through May, and similar in all other months in long-term average conditions  
31 under Alternative 1 as compared to the No Action Alternative.

### 32 *Potential Changes in Mercury Concentrations*

33 Changes in mercury from the rivers result in changes in mercury concentrations in  
34 fish used for human consumption in the Delta, including Largemouth Bass, as  
35 summarized in Tables 6.30 and 6.31 for long-term average conditions and dry and  
36 critical dry years, respectively. All values exceed the threshold of 0.24 milligram/  
37 kilogram wet weight (mg/kg ww) for mercury.

1 **Table 6.30 Changes in Mercury Concentrations 350-millimeter Largemouth Bass**  
 2 **over the Long-term Average Conditions under Alternative 1 as Compared to the No**  
 3 **Action Alternative**

<b>Delta Location</b>	<b>Alternative 1 (mg/kg ww)</b>	<b>No Action Alternative (mg/kg ww)</b>	<b>Changes</b>
San Joaquin River at Stockton	0.99	1.00	0%
San Joaquin River at Turner Cut	0.87	0.89	-3%
San Joaquin River at San Andreas Landing	0.58	0.59	-3%
San Joaquin River at Jersey Point	0.54	0.57	-4%
Victoria Canal	0.82	0.85	-4%
Sacramento River at Emmaton	0.49	0.50	-2%
San Joaquin River at Antioch	0.47	0.50	-6%
Montezuma Slough at Hunter Cut and Beldon's Landing (Suisun Marsh)	0.32	0.35	-6%
SWP Barker Slough Pumping Plant Intake	0.56	0.56	0%
CVP Contra Costa Pumping Plant Intake	0.68	0.73	-6%
SWP Banks Pumping Plant Intake	0.75	0.79	-5%
CVP Jones Pumping Plant Intake	0.79	0.83	-4%

4 Notes:

5 Long-term values calculated using 1976-1991 results from DSM2 model. Dry and critical  
 6 dry years values calculated using 1987-1991 results from DSM2 model.

7 Concentrations greater than 0.24 mg/kg ww Hg exceed CVRWQCB threshold

8 mg/kg – milligram/kilogram; ww – wet weight

1 **Table 6.31 Changes in Mercury Concentrations 350-millimeter Largemouth Bass in**  
 2 **Dry and Critical Dry Years under the Alternative 1 as Compared to the No Action**  
 3 **Alternative**

<b>Delta Location</b>	<b>Alternative 1 (mg/kg ww)</b>	<b>No Action Alternative (mg/kg ww)</b>	<b>Changes</b>
San Joaquin River at Stockton	1.06	1.06	0%
San Joaquin River at Turner Cut	0.81	0.84	-4%
San Joaquin River at San Andreas Landing	0.53	0.54	-3%
San Joaquin River at Jersey Point	0.50	0.52	-4%
Victoria Canal	0.76	0.82	-6%
Sacramento River at Emmaton	0.47	0.48	-2%
San Joaquin River at Antioch	0.41	0.43	-5%
Montezuma Slough at Hunter Cut and Beldon's Landing (Suisun Marsh)	0.26	0.28	-5%
SWP Barker Slough Pumping Plant Intake	0.57	0.59	-2%
CVP Contra Costa Pumping Plant Intake	0.62	0.67	-7%
SWP Banks Pumping Plant Intake	0.69	0.75	-8%
CVP Jones Pumping Plant Intake	0.77	0.82	-6%

4 Notes:

5 Long-term values calculated using 1976-1991 results from DSM2 model. Dry and critical  
 6 dry years values calculated using 1987-1991 results from DSM2 model.

7 Concentrations greater than 0.24 mg/kg ww Hg exceed CVRWQCB threshold

8 mg/kg – milligram/kilogram; ww – wet weight

1 *Potential Changes in Selenium Concentrations*

2 It is anticipated that the selenium loadings would be similar under Alternative 1 as  
3 compared to the No Action Alternative; and that selenium concentrations in the  
4 San Joaquin River also would be similar.

5 Selenium in the water column at various locations in the Delta under Alternative 1  
6 as compared to the No Action Alternative are shown in Appendix 6D, Selenium  
7 Model Documentation. Selenium in the water column at the three western Delta  
8 locations under Alternative 1 would be identical to conditions under the No  
9 Action Alternative, as shown in Appendix 6D, Table 6D.16. Selenium in the  
10 water column would be below the NTR criterion of 5 µg/L for the San Francisco  
11 Bay. Similarly, they would be below the draft USEPA (2014b) criterion for lentic  
12 aquatic systems (1.3 µg/L).

13 In the western Delta and at the Barker Slough Pumping Plant intake, selenium in  
14 the water column would be similar under Alternative 1 as compared to the No  
15 Action Alternative.

16 Selenium at the Contra Costa Pumping Plant intake would be similar under  
17 Alternative 1 as compared to the No Action Alternative, as shown in Table 6D.9  
18 of Appendix 6D. Selenium at the Jones and Banks pumping plant intakes under  
19 Alternative 1 would be lower than under the No Action Alternative, as shown in  
20 Appendix 6D, Table 6D.9.

21 Estimated selenium concentration in biota (whole-body fish, bird eggs  
22 [invertebrate diet], bird eggs [fish diet], and fish fillets) at all locations in the  
23 Delta under Alternative 1 would be similar as under the No Action Alternative, as  
24 shown in Appendix 6D, Table 6D.10. As shown in Appendix 6D, Table 6D.13,  
25 EQs computed with respect to the applicable benchmarks show that selenium  
26 concentrations in biota under Alternative 1 would be below the thresholds  
27 identified for ecological risk.

28 For sturgeon in the western Delta, modeling also suggests that whole-body  
29 concentrations would be similar under Alternative 1 and the No Action  
30 Alternative (Appendix 6D, Table 6D.17), and the EQs would be similar  
31 (Appendix 6D, Table 6D.18). Low Toxicity Threshold EQs for selenium  
32 concentrations in sturgeon in the western Delta would remain under 1.0 for long-  
33 term average conditions, and slightly exceed 1.0 (indicating a higher probability  
34 for adverse effects) for drought years at the three western Delta locations under  
35 Alternative 1 and the No Action Alternative (Table 6D.18 of Appendix 6D).  
36 Estimated EQs for High Toxicity Threshold at all locations are less than 1.0 under  
37 all hydrologic conditions.

38 *Effects Related to Cross Delta Water Transfers*

39 Potential effects to water quality could be similar to those identified in a recent  
40 environmental analysis conducted by Reclamation for long-term water transfers  
41 from the Sacramento to San Joaquin valleys (Reclamation 2014c) as described  
42 above under the No Action Alternative compared to the Second Basis of  
43 Comparison. For the purposes of this EIS, it is anticipated that similar conditions

1 would occur during implementation of cross Delta water transfers under  
 2 Alternative 1 and the No Action Alternative, and that impacts on water quality  
 3 would not be substantial in the seller's service area due to implementation  
 4 requirements of the transfer programs.

5 Under Alternative 1, water could be transferred throughout the year without an  
 6 annual volumetric limit. Under the No Action Alternative, the timing of cross  
 7 Delta water transfers would be limited to July through September and include  
 8 annual volumetric limits, in accordance with the 2008 USFWS BO and 2009  
 9 NMFS BO. Overall, the potential for cross Delta water transfers would be  
 10 increased under Alternative 1 as compared to the No Action Alternative.

#### 11 **6.4.3.2.2 Alternative 1 Compared to the Second Basis of Comparison**

12 Alternative 1 is identical to the Second Basis of Comparison.

#### 13 **6.4.3.3 Alternative 2**

14 The CVP and SWP operations under Alternative 2 are identical to the CVP and  
 15 SWP operations under the No Action Alternative; therefore, Alternative 2 is only  
 16 compared to the Second Basis of Comparison.

#### 17 **6.4.3.3.1 Alternative 2 Compared to the Second Basis of Comparison**

18 The CVP and SWP operations under Alternative 2 are identical to the CVP and  
 19 SWP operations under the No Action Alternative. Therefore, changes to surface  
 20 water quality under Alternatives 2 as compared to the Second Basis of  
 21 Comparison would be the same as the impacts described in Section 6.4.3.1, No  
 22 Action Alternative.

#### 23 **6.4.3.4 Alternative 3**

24 As described in Chapter 3, Description of Alternatives, CVP and SWP operations  
 25 under Alternative 3 are similar to the Second Basis of Comparison and  
 26 Alternative 1 with modified Old and Middle River flow criteria. As described in  
 27 Chapter 4, Approach to Environmental Analysis, Alternative 3 is compared to the  
 28 No Action Alternative and the Second Basis of Comparison.

#### 29 **6.4.3.4.1 Alternative 3 Compared to the No Action Alternative**

##### 30 *Potential Changes in Salinity Indicators*

31 Salinity in the Sacramento River at Emmaton would be higher in September  
 32 through January, lower in June, and similar in all other months over long-term  
 33 average conditions under Alternative 3 as compared to the No Action Alternative,  
 34 as summarized in Appendix 6E, Table 6E.2.2.

35 Salinity in the San Joaquin River at Vernalis would be higher in February through  
 36 July and in October, lower in November through December, and similar in other  
 37 months under Alternative 3 as compared to the No Action Alternative, as  
 38 summarized in Appendix 6E, Table 6E.15.2.

39 Salinity in the San Joaquin River at Jersey Point would be higher in September  
 40 through January, lower in June, and similar in all other months, for long-term

1 average conditions under Alternative 3 as compared to the No Action Alternative,  
2 as summarized in Appendix 6E, Table 6E.3.2.

3 Salinity in the Delta at Port Chicago, Chippis Island, and Collinsville would be  
4 higher in September through December, moderately higher January and April, and  
5 similar in all other months, for long-term average conditions under Alternative 3  
6 as compared to the No Action Alternative, as summarized in Appendix 6E,  
7 Tables 6E.6.2, 6E.4.2, and 6E.2.2.

8 Salinity at the CVP Jones Pumping Plant and the SWP Banks Pumping Plant  
9 intakes in the Delta would be higher in September through January, and lower or  
10 similar in all other months for long-term average conditions under Alternative 3  
11 as compared to the No Action Alternative, as summarized in Appendix 6E, Table  
12 6E.7.2 and Table 6E.8.2. Salinity at the CVP Contra Costa Canal Pumping Plant  
13 and at the Contra Costa Water District Old River and Middle River intakes would  
14 be higher in September through January, lower in February through June, and  
15 similar in July and August for long-term average conditions under Alternative 3  
16 as compared to the No Action Alternative, as summarized in Appendix 6E,  
17 Tables 6E.11.2, 6E.12.2, and 6E.13.2. Changes in salinity at the intakes would  
18 influence the salinity in water delivered in the San Joaquin Valley which could  
19 influence salinity in water bodies that receive agricultural return flows from CVP  
20 and SWP water users. Chloride and bromide concentrations at the intakes are  
21 expected to change in a similar manner to other salinity indicators.

22 X2 decreases with increases in Delta outflow as freshwater from the Central  
23 Valley flows towards San Francisco Bay. Under Alternative 3, Delta outflow  
24 would decrease and X2 would move towards the east as compared to the No  
25 Action Alternative, as shown in Table C.16.2 and Figures C.16.1.1 through  
26 C.16.1.8 and C.16.2.1 through C.16.2.8 in Appendix 5A, Section C, CalSim II  
27 and DSM2 Modeling Results. X2 distances would be higher in September  
28 through December and in April and May, and similar in all other months in long-  
29 term average conditions under Alternative 3 as compared to the No Action  
30 Alternative.

### 31 *Potential Changes in Mercury Concentrations*

32 Changes in mercury from the rivers result in changes in mercury concentrations in  
33 fish used for human consumption in the Delta, including Largemouth Bass, as  
34 summarized in Tables 6.32 and 6.33 for long-term average conditions and dry and  
35 critical dry years, respectively. All values exceed the threshold of 0.24  
36 milligram/kilogram wet weight (mg/kg ww) for mercury.

1 **Table 6.32 Changes in Mercury Concentrations 350-millimeter Largemouth Bass**  
 2 **over the Long-term Average Conditions under Alternative 3 as Compared to the No**  
 3 **Action Alternative**

<b>Delta Location</b>	<b>Alternative 3 (mg/kg ww)</b>	<b>No Action Alternative (mg/kg ww)</b>	<b>Changes</b>
San Joaquin River at Stockton	1.00	1.00	1%
San Joaquin River at Turner Cut	0.88	0.89	-2%
San Joaquin River at San Andreas Landing	0.58	0.59	-3%
San Joaquin River at Jersey Point	0.55	0.57	-4%
Victoria Canal	0.83	0.85	-2%
Sacramento River at Emmaton	0.49	0.50	-2%
San Joaquin River at Antioch	0.48	0.50	-6%
Montezuma Slough at Hunter Cut and Beldon's Landing (Suisun Marsh)	0.33	0.35	-6%
SWP Barker Slough Pumping Plant Intake	0.56	0.56	0%
CVP Contra Costa Pumping Plant Intake	0.69	0.73	-5%
SWP Banks Pumping Plant Intake	0.77	0.79	-3%
CVP Jones Pumping Plant Intake	0.81	0.83	-3%

4 Notes:

5 Long-term values calculated using 1976-1991 results from DSM2 model. Dry and critical  
 6 dry years values calculated using 1987-1991 results from DSM2 model.

7 Concentrations greater than 0.24 mg/kg ww Hg exceed CVRWQCB threshold

8 mg/kg – milligram/kilogram; ww – wet weight

1 **Table 6.33 Changes in Mercury Concentrations 350-millimeter Largemouth Bass in**  
 2 **Dry and Critical Dry Years under the Alternative 3 as Compared to the No Action**  
 3 **Alternative**

<b>Delta Location</b>	<b>Alternative 3 (mg/kg ww)</b>	<b>No Action Alternative (mg/kg ww)</b>	<b>Changes</b>
San Joaquin River at Stockton	1.07	1.06	1%
San Joaquin River at Turner Cut	0.82	0.84	-3%
San Joaquin River at San Andreas Landing	0.53	0.54	-2%
San Joaquin River at Jersey Point	0.51	0.52	-2%
Victoria Canal	0.79	0.82	-3%
Sacramento River at Emmaton	0.47	0.48	-1%
San Joaquin River at Antioch	0.42	0.43	-3%
Montezuma Slough at Hunter Cut and Beldon's Landing (Suisun Marsh)	0.27	0.28	-3%
SWP Barker Slough Pumping Plant Intake	0.58	0.59	-1%
CVP Contra Costa Pumping Plant Intake	0.64	0.67	-4%
SWP Banks Pumping Plant Intake	0.72	0.75	-4%
CVP Jones Pumping Plant Intake	0.80	0.82	-3%

4 Notes:

5 Long-term values calculated using 1976-1991 results from DSM2 model. Dry and critical  
 6 dry years values calculated using 1987-1991 results from DSM2 model.

7 Concentrations greater than 0.24 mg/kg ww Hg exceed CVRWQCB threshold

8 mg/kg – milligram/kilogram; ww – wet weight

1 *Potential Changes in Selenium Concentrations*

2 It is anticipated that the selenium loadings would be similar under Alternative 3 as  
3 compared to the No Action Alternative; and that selenium concentrations in the  
4 San Joaquin River also would be similar.

5 Selenium in the water column at various locations in the Delta under Alternative 3  
6 as compared to the No Action Alternative are shown in Appendix 6D, Selenium  
7 Model Documentation. Selenium in the water column at the three western Delta  
8 locations under Alternative 3 would be similar to conditions under the No Action  
9 Alternative, as shown in Appendix 6D, Table 6D.9. Selenium in the water  
10 column would be below the NTR criterion of 5 µg/L for the San Francisco Bay.  
11 Similarly, they would be below the draft USEPA (2014b) criterion for lentic  
12 aquatic systems (1.3 µg/L).

13 In the western Delta and at the Barker Slough Pumping Plant intake, selenium in  
14 the water column would be similar under Alternative 3 as compared to the No  
15 Action Alternative.

16 Selenium at the Contra Costa Pumping Plant intake would be similar under  
17 Alternative 3 as compared to the No Action Alternative, as shown in Table 6D.9  
18 of Appendix 6D. Selenium at the Jones and Banks pumping plant intakes under  
19 Alternative 3 would be lower than under the No Action Alternative, as shown in  
20 Appendix 6D, Table 6D.9.

21 Estimated selenium concentration in biota (whole-body fish, bird eggs  
22 [invertebrate diet], bird eggs [fish diet], and fish fillets) at all locations in the  
23 Delta under Alternative 3 would be similar as under the No Action Alternative, as  
24 shown in Appendix 6D, Table 6D.10. As shown in Appendix 6D, Table 6D.14,  
25 EQs computed with respect to the applicable benchmarks show that selenium  
26 concentrations in biota under Alternative 3 would be below the thresholds  
27 identified for ecological risk.

28 For sturgeon in the western Delta, modeling also suggests that whole-body  
29 concentrations would be similar under Alternative 3 and the No Action  
30 Alternative (Appendix 6D, Table 6D.17), and the EQs would be similar  
31 (Appendix 6D, Table 6D.18). Low Toxicity Threshold EQs for selenium  
32 concentrations in sturgeon in the western Delta would remain under 1.0 for long-  
33 term average conditions, and slightly exceed 1.0 (indicating a higher probability  
34 for adverse effects) for drought years at the three western Delta locations under  
35 Alternative 3 and the No Action Alternative (Table 6D.18 of Appendix 6D).  
36 Estimated EQs for High Toxicity Threshold at all locations are less than 1.0 under  
37 all hydrologic conditions.

38 *Effects Related to Cross Delta Water Transfers*

39 Potential effects to water quality could be similar to those identified in a recent  
40 environmental analysis conducted by Reclamation for long-term water transfers  
41 from the Sacramento to San Joaquin valleys (Reclamation 2014c) as described  
42 above under the No Action Alternative compared to the Second Basis of  
43 Comparison. For the purposes of this EIS, it is anticipated that similar conditions

1 would occur during implementation of cross Delta water transfers under  
2 Alternative 3 and the No Action Alternative, and that impacts on water quality  
3 would not be substantial in the seller's service area due to implementation  
4 requirements of the transfer programs.

5 Under Alternative 3, water could be transferred throughout the year without an  
6 annual volumetric limit. Under the No Action Alternative, the timing of cross  
7 Delta water transfers would be limited to July through September and include  
8 annual volumetric limits, in accordance with the 2008 USFWS BO and 2009  
9 NMFS BO. Overall, the potential for cross Delta water transfers would be  
10 increased under Alternative 3 as compared to the No Action Alternative.

#### 11 **6.4.3.4.2 Alternative 3 Compared to the Second Basis of Comparison**

##### 12 *Potential Changes in Salinity Indicators*

13 Salinity in the Sacramento River at Emmaton would be higher in October through  
14 November and June, lower in December through March and July through  
15 September, and similar in April and May over long-term average conditions under  
16 Alternative 3 as compared to the Second Basis of Comparison, as summarized in  
17 Appendix 6E, Table 6E.2.5.

18 Salinity in the San Joaquin River at Vernalis would be higher in November  
19 through March and May through June, and similar in all other months under  
20 Alternative 3 as compared to the Second Basis of Comparison, as summarized in  
21 Appendix 6E, Table 6E.15.5.

22 Salinity in the San Joaquin River at Jersey Point would be higher in October  
23 through November and June through August, lower in December through March  
24 and September, and similar in April and May for long-term average conditions  
25 under Alternative 3 as compared to the Second Basis of Comparison, as  
26 summarized in Appendix 6E, Table 6E.3.5.

27 Salinity in the western Delta at Port Chicago, Chipps Island, and Collinsville  
28 would be lower in December through April and July through September, higher in  
29 May and June, and similar in all other months, for long-term average conditions  
30 under Alternative 3 as compared to the Second Basis of Comparison, as  
31 summarized in Appendix 6E, Tables 6E.6.5, 6E.4.5, and 6E.2.5.

32 Salinity at the CVP Contra Costa Canal intake would be lower in December  
33 through February, as summarized in Appendix 6E, Table 6E.11.5. Salinity at  
34 Jones Pumping Plant and the SWP Banks Pumping Plant intakes in the Delta  
35 would be higher in January through May, lower in June, and similar in all other  
36 months for long-term average conditions under Alternative 3 as compared to the  
37 Second Basis of Comparison, as summarized in Appendix 6E, Table 6E.7.5 and  
38 Table 6E.8.5. Salinity at the Contra Costa Water District Old River and Middle  
39 River intakes also would be higher in January through April, lower in May and  
40 June, and similar in all other months, for long-term average conditions under  
41 Alternative 3 as compared to the Second Basis of Comparison, as summarized in  
42 Appendix 6E, Tables 6E.12.5 and 6E.13.5. Changes in salinity at the intakes  
43 would influence the salinity in water delivered in the San Joaquin Valley which

1 could influence salinity in water bodies that receive agricultural return flows from  
2 CVP and SWP water users.

3 X2 decreases with increases in Delta outflow as freshwater from the Central  
4 Valley flows towards San Francisco Bay. Under Alternative 3, Delta outflow  
5 generally would increase and X2 would move towards the west as compared to  
6 the Second Basis of Comparison, as shown in Table C.16.5 and Figures C.16.1.1  
7 through C.16.1.8 and C.16.2.1 through C.16.2.8 in Appendix 5A, Section C,  
8 CalSim II and DSM2 Modeling Results. X2 distances would be lower (towards  
9 the west) in December through April and July through September, higher in May  
10 and June (towards the east), and similar in all other months in long-term average  
11 conditions under Alternative 3 as compared to the Second Basis of Comparison.

#### 12 *Potential Changes in Mercury Concentrations*

13 Changes in flows in the rivers result in similar changes to erosional inputs and  
14 resuspension of both inorganic and methylmercury fractions. Changes in mercury  
15 from the rivers result in changes in mercury concentrations in fish used for human  
16 consumption in the Delta, including Largemouth Bass, as summarized in Tables  
17 6.34 and 6.35 for long-term average conditions and dry and critical dry years,  
18 respectively. All values exceed the threshold of 0.24 milligram/kilogram wet  
19 weight (mg/kg ww) for mercury.

1 **Table 6.34 Changes in Mercury Concentrations 350-millimeter Largemouth Bass**  
 2 **over the Long-term Average Conditions under Alternative 3 as Compared to the**  
 3 **Second Basis of Comparison**

<b>Delta Location</b>	<b>Alternative 3 (mg/kg ww)</b>	<b>Second Basis of Comparison (mg/kg ww)</b>	<b>Changes</b>
San Joaquin River at Stockton	1.00	0.99	1%
San Joaquin River at Turner Cut	0.88	0.87	1%
San Joaquin River at San Andreas Landing	0.58	0.58	0%
San Joaquin River at Jersey Point	0.55	0.54	1%
Victoria Canal	0.83	0.82	2%
Sacramento River at Emmaton	0.49	0.49	0%
San Joaquin River at Antioch	0.48	0.47	1%
Montezuma Slough at Hunter Cut and Beldon's Landing (Suisun Marsh)	0.33	0.32	1%
SWP Barker Slough Pumping Plant Intake	0.56	0.56	0%
CVP Contra Costa Pumping Plant Intake	0.69	0.68	1%
SWP Banks Pumping Plant Intake	0.77	0.75	2%
CVP Jones Pumping Plant Intake	0.81	0.79	2%

4 Notes:

5 Long-term values calculated using 1976-1991 results from DSM2 model. Dry and critical  
 6 dry years values calculated using 1987-1991 results from DSM2 model.

7 Concentrations greater than 0.24 mg/kg ww Hg exceed CVRWQCB threshold

8 mg/kg – milligram/kilogram; ww – wet weight

1 **Table 6.35 Changes in Mercury Concentrations 350-millimeter Largemouth Bass in**  
 2 **Dry and Critical Dry Years under Alternative 3 as Compared to the Second Basis of**  
 3 **Comparison**

<b>Delta Location</b>	<b>Alternative 3 (mg/kg ww)</b>	<b>Second Basis of Comparison (mg/kg ww)</b>	<b>Changes</b>
San Joaquin River at Stockton	1.07	1.06	1%
San Joaquin River at Turner Cut	0.82	0.81	1%
San Joaquin River at San Andreas Landing	0.53	0.53	1%
San Joaquin River at Jersey Point	0.51	0.50	2%
Victoria Canal	0.79	0.76	3%
Sacramento River at Emmaton	0.47	0.47	0%
San Joaquin River at Antioch	0.42	0.41	2%
Montezuma Slough at Hunter Cut and Beldon's Landing (Suisun Marsh)	0.27	0.26	2%
SWP Barker Slough Pumping Plant Intake	0.58	0.57	2%
CVP Contra Costa Pumping Plant Intake	0.64	0.62	4%
SWP Banks Pumping Plant Intake	0.72	0.69	4%
CVP Jones Pumping Plant Intake	0.80	0.77	4%

4 Notes:

5 Long-term values calculated using 1976-1991 results from DSM2 model. Dry and critical  
 6 dry years values calculated using 1987-1991 results from DSM2 model.

7 Concentrations greater than 0.24 mg/kg ww Hg exceed CVRWQCB threshold

8 mg/kg – milligram/kilogram; ww – wet weight

1 *Potential Changes in Selenium Concentrations*

2 It is anticipated that the selenium loadings would be similar under Alternative 3  
3 and the Second Basis of Comparison; and that selenium concentrations in the San  
4 Joaquin River also would be similar.

5 Selenium in the water column at various locations in the Delta under Alternative 3  
6 and the Second Basis of Comparison are shown in Appendix 6D, Selenium Model  
7 Documentation. Selenium in the water column at the three western Delta  
8 locations under Alternative 3 would be identical to conditions under the Second  
9 Basis of Comparison, as shown in Appendix 6D, Table 6D.16. Selenium in the  
10 water column would be below the NTR criterion of 5 µg/L for the San Francisco  
11 Bay. Similarly, they would be below the draft USEPA (2014b) criterion for lentic  
12 aquatic systems (1.3 µg/L).

13 In the western Delta and at the Barker Slough Pumping Plant intake, the selenium  
14 would be similar under Alternative 3 and the Second Basis of Comparison.

15 Selenium at the Contra Costa Pumping Plant and Banks Pumping Plant intakes  
16 would be similar under Alternative 3 and Second Basis of Comparison, as shown  
17 in Appendix 6D, Table 6D.9. Selenium at the Jones Pumping Plant intake under  
18 Alternative 3 would be slightly higher than Second Basis of Comparison, as  
19 shown in Appendix 6D, Table 6D.9.

20 Estimated selenium concentration in biota (whole-body fish, bird eggs  
21 [invertebrate diet], bird eggs [fish diet], and fish fillets) at all locations in the  
22 Delta under Alternative 3 would be similar as under the Second Basis of  
23 Comparison, as shown in Appendix 6D, Table 6D.11. As shown in Appendix 6D,  
24 Table 6D.14, EQs computed with respect to the applicable benchmarks show that  
25 selenium concentrations in biota under Alternative 3 would be below the  
26 thresholds identified for ecological risk.

27 For sturgeon in the western Delta, modeling also suggests that whole-body  
28 concentrations would be similar under Alternative 3 and the Second Basis of  
29 Comparison (Appendix 6D, Table 6D.17), and the EQs would be similar  
30 (Appendix 6D, Table 6D.18). Low Toxicity Threshold EQs for selenium  
31 concentrations in sturgeon in the western Delta would remain under 1.0 for long-  
32 term average conditions, and slightly exceed 1.0 (indicating a higher probability  
33 for adverse effects) for drought years at the three western Delta locations under  
34 both Alternative 3 and Second Basis of Comparison (Table 6D.18 of Appendix  
35 6D). Estimated EQs for High Toxicity Threshold at all locations are less than 1.0  
36 under all hydrologic conditions.

37 *Effects Related to Cross Delta Water Transfers*

38 Potential effects to water quality could be similar to those identified in a recent  
39 environmental analysis conducted by Reclamation for long-term water transfers  
40 from the Sacramento to San Joaquin valleys (Reclamation 2014c) as described  
41 above under the No Action Alternative compared to the Second Basis of  
42 Comparison. For the purposes of this EIS, it is anticipated that similar conditions  
43 would occur during implementation of cross Delta water transfers under

1 Alternative 3 and the Second Basis of Comparison, and that impacts on water  
 2 quality would not be substantial in the seller's service area due to implementation  
 3 requirements of the transfer programs.

4 Under Alternative 3 and the Second Basis of Comparison, water could be  
 5 transferred throughout the year without an annual volumetric limit. Overall, the  
 6 potential for cross Delta water transfers would be similar under Alternative 3 and  
 7 the Second Basis of Comparison.

#### 8 **6.4.3.5 Alternative 4**

9 Water quality under Alternative 4 would be identical to the conditions under the  
 10 Second Basis of Comparison; therefore, Alternative 4 is only compared to the No  
 11 Action Alternative.

##### 12 **6.4.3.5.1 Alternative 4 Compared to the No Action Alternative**

13 The CVP and SWP operations under Alternative 4 are identical to the CVP and  
 14 SWP operations under the Second Basis of Comparison and Alternative 1.  
 15 Therefore, changes in water quality under Alternative 4 as compared to the No  
 16 Action Alternative would be the same as the impacts described in  
 17 Section 12.4.3.2.1, Alternative 1 Compared to the No Action Alternative.

#### 18 **6.4.3.6 Alternative 5**

19 As described in Chapter 3, Description of Alternatives, CVP and SWP operations  
 20 under Alternative 5 are similar to the No Action Alternative with modified Old  
 21 and Middle River flow criteria and New Melones Reservoir operations. As  
 22 described in Chapter 4, Approach to Environmental Analysis, Alternative 5 is  
 23 compared to the No Action Alternative and the Second Basis of Comparison.

##### 24 **6.4.3.6.1 Alternative 5 Compared to the No Action Alternative**

###### 25 *Potential Changes in Salinity Indicators*

26 Salinity in the Sacramento River at Emmaton would be lower in May through  
 27 September, and similar in all other months over long-term average conditions  
 28 under Alternative 5 as compared to the No Action Alternative, as summarized in  
 29 Appendix 6E, Table 6E.2.3.

30 Salinity in the San Joaquin River at Vernalis would be lower in April and May,  
 31 and similar in all other months under Alternative 5 as compared to the No Action  
 32 Alternative, as summarized in Appendix 6E, Table 6E.15.3.

33 Salinity in the San Joaquin River at Jersey Point would be lower in December  
 34 through February, higher in June through August, and similar in all other months,  
 35 for long-term average conditions under Alternative 5 as compared to the No  
 36 Action Alternative, as summarized in Appendix 6E, Table 6E.3.3.

37 Salinity in the Delta at Port Chicago, Chipps Island, and Collinsville would be  
 38 lower in April through June, and similar in all other months, for long-term  
 39 average conditions under Alternative 5 as compared to the No Action Alternative,  
 40 as summarized in Appendix 6E, Tables 6E.6.3, 6E.4.3, and 6E.2.3.

1 Salinity at the Jones pumping plants and the SWP Banks Pumping Plant intakes in  
2 the Delta would be lower in May and slightly higher in June through September,  
3 and similar in all other months for long-term average conditions under Alternative  
4 5 as compared to the No Action Alternative, as summarized in Appendix 6E,  
5 Table 6E.7.3 and Table 6E.8.3. Salinity at the CVP Contra Costa Canal intake  
6 and at the Contra Costa Water District Old River and Middle River intakes also  
7 would be higher in April through September, and similar in all other months, for  
8 long-term average conditions under Alternative 5 as compared to the No Action  
9 Alternative, as summarized in Appendix 6E, Tables 6E.11.3, 6E.12.3, and  
10 6E.13.3. Changes in salinity at the intakes would influence the salinity in water  
11 delivered in the San Joaquin Valley which could influence salinity in water bodies  
12 that receive agricultural return flows from CVP and SWP water users. Chloride  
13 and bromide concentrations at the intakes are expected to change in a similar  
14 manner to other salinity indicators.

15 X2 decreases with increases in Delta outflow as freshwater from the Central  
16 Valley flows towards San Francisco Bay. Under Alternative 5, Delta outflow  
17 would increase and X2 would move towards the west as compared to the No  
18 Action Alternative, as shown in Table C.16.3 and Figures C.16.1.1 through  
19 C.16.1.8 and C.16.2.1 through C.16.2.8 in Appendix 5A, Section C, CalSim II  
20 and DSM2 Modeling Results. X2 distances would be lower (towards the west) in  
21 April and May, and similar in all other months in long-term average conditions  
22 under Alternative 5 as compared to the No Action Alternative.

### 23 *Potential Changes in Mercury Concentrations*

24 Changes in flows in the rivers result in similar changes in erosional inputs and  
25 resuspension of both inorganic and methylmercury fractions. Changes in mercury  
26 from the rivers results in changes in mercury concentrations in fish used for  
27 human consumption in the Delta, including Largemouth Bass, as summarized in  
28 Tables 6.36 and 6.37 for long-term average conditions and dry and critical dry  
29 years, respectively. All values exceed the threshold of 0.24 milligram/kilogram  
30 wet weight (mg/kg ww) for mercury.

1 **Table 6.36 Changes in Mercury Concentrations 350-millimeter Largemouth Bass**  
 2 **over the Long-term Average Conditions under Alternative 5 as Compared to the No**  
 3 **Action Alternative**

<b>Delta Location</b>	<b>Alternative 5 (mg/kg ww)</b>	<b>No Action Alternative (mg/kg ww)</b>	<b>Changes</b>
San Joaquin River at Stockton	1.00	1.00	0%
San Joaquin River at Turner Cut	0.89	0.89	0%
San Joaquin River at San Andreas Landing	0.55	0.59	1%
San Joaquin River at Jersey Point	0.57	0.57	1%
Victoria Canal	0.85	0.85	0%
Sacramento River at Emmaton	0.50	0.50	0%
San Joaquin River at Antioch	0.51	0.50	1%
Montezuma Slough at Hunter Cut and Beldon's Landing (Suisun Marsh)	0.35	0.35	1%
SWP Barker Slough Pumping Plant Intake	0.56	0.56	0%
CVP Contra Costa Pumping Plant Intake	0.74	0.73	2%
SWP Banks Pumping Plant Intake	0.79	0.79	0%
CVP Jones Pumping Plant Intake	0.83	0.83	0%

4 Notes:

5 Long-term values calculated using 1976-1991 results from DSM2 model. Dry and critical  
 6 dry years values calculated using 1987-1991 results from DSM2 model.

7 Concentrations greater than 0.24 mg/kg ww Hg exceed CVRWQCB threshold

8 mg/kg – milligram/kilogram; ww – wet weight

1 **Table 6.37 Changes in Mercury Concentrations 350-millimeter Largemouth Bass in**  
 2 **Dry and Critical Dry Years under the Alternative 5 as Compared to the No Action**  
 3 **Alternative**

<b>Delta Location</b>	<b>Alternative 5 (mg/kg ww)</b>	<b>No Action Alternative (mg/kg ww)</b>	<b>Changes</b>
San Joaquin River at Stockton	1.05	1.06	0%
San Joaquin River at Turner Cut	0.85	0.84	1%
San Joaquin River at San Andreas Landing	0.55	0.54	2%
San Joaquin River at Jersey Point	0.53	0.52	2%
Victoria Canal	0.82	0.82	0%
Sacramento River at Emmaton	0.49	0.48	1%
San Joaquin River at Antioch	0.44	0.43	2%
Montezuma Slough at Hunter Cut and Beldon's Landing (Suisun Marsh)	0.28	0.28	0%
SWP Barker Slough Pumping Plant Intake	0.58	0.59	0%
CVP Contra Costa Pumping Plant Intake	0.70	0.67	5%
SWP Banks Pumping Plant Intake	0.74	0.75	-1%
CVP Jones Pumping Plant Intake	0.82	0.82	1%

4 Notes:

5 Long-term values calculated using 1976-1991 results from DSM2 model. Dry and critical  
 6 dry years values calculated using 1987-1991 results from DSM2 model.

7 Concentrations greater than 0.24 mg/kg ww Hg exceed CVRWQCB threshold

8 mg/kg – milligram/kilogram; ww – wet weight

1 *Potential Changes in Selenium Concentrations*

2 It is anticipated that the selenium loadings would be similar under Alternative 5 as  
3 compared to the No Action Alternative; and that selenium concentrations in the  
4 San Joaquin River also would be similar.

5 Selenium in the water column at various locations in the Delta under Alternative 5  
6 as compared to the No Action Alternative are shown in Appendix 6D, Selenium  
7 Model Documentation. Selenium in the water column at the three western Delta  
8 locations under Alternative 5 would be similar to conditions under the No Action  
9 Alternative, as shown in Appendix 6D, Table 6D.16. Selenium in the water  
10 column would be below the NTR criterion of 5 µg/L for the San Francisco Bay.  
11 Similarly, they would be below the draft USEPA (2014b) criterion for lentic  
12 aquatic systems (1.3 µg/L).

13 In the western Delta and at the Barker Slough Pumping Plant intake, selenium in  
14 the water column would be similar under Alternative 5 as compared to the No  
15 Action Alternative.

16 Selenium at the Contra Costa Pumping Plant and Banks Pumping Plant intakes  
17 would be higher under Alternative 5 as compared to the No Action Alternative, as  
18 shown in Table 6D.9 of Appendix 6D. Selenium at the Jones Pumping Plant  
19 intake under Alternative 5 would be similar to conditions under the No Action  
20 Alternative, as shown in Appendix 6D, Table 6D.9.

21 Estimated selenium concentration in biota (whole-body fish, bird eggs  
22 [invertebrate diet], bird eggs [fish diet], and fish fillets) at all locations in the  
23 Delta under Alternative 5 would be similar as under the No Action Alternative, as  
24 shown in Appendix 6D, Table 6D.12. As shown in Appendix 6D, Table 6D.15,  
25 Exceedance Quotients (EQs) computed with respect to the applicable benchmarks  
26 show that selenium concentrations in biota under Alternative 5 would be below  
27 the thresholds identified for ecological risk.

28 For sturgeon in the western Delta, modeling also suggests that whole-body  
29 concentrations would be higher under Alternative 5 than under the No Action  
30 Alternative (Appendix 6D, Table 6D.17), and the EQs would be similar  
31 (Appendix 6D, Table 6D.18). Low Toxicity Threshold EQs for selenium  
32 concentrations in sturgeon in the western Delta would remain under 1.0 for long-  
33 term average conditions, and slightly exceed 1.0 (indicating a higher probability  
34 for adverse effects) for drought years at the three western Delta locations under  
35 Alternative 5 and the No Action Alternative (Table 6D.18 of Appendix 6D).  
36 Estimated EQs for High Toxicity Threshold at all locations are less than 1.0 under  
37 all hydrologic conditions.

38 *Effects Related to Cross Delta Water Transfers*

39 Potential effects to water quality could be similar to those identified in a recent  
40 environmental analysis conducted by Reclamation for long-term water transfers  
41 from the Sacramento to San Joaquin valleys (Reclamation 2014c) as described  
42 above under the No Action Alternative compared to the Second Basis of  
43 Comparison. For the purposes of this EIS, it is anticipated that similar conditions

1 would occur during implementation of cross Delta water transfers under  
2 Alternative 5 and the No Action Alternative, and that impacts on water quality  
3 would not be substantial in the seller's service area due to implementation  
4 requirements of the transfer programs.  
5 Under Alternative 5 and the No Action Alternative, the timing of cross Delta  
6 water transfers would be limited to July through September and include annual  
7 volumetric limits, in accordance with the 2008 USFWS BO and 2009 NMFS BO.  
8 Overall, the potential for cross Delta water transfers would be similar under  
9 Alternative 5 and the No Action Alternative.

#### 10 **6.4.3.6.2 Alternative 5 Compared to the Second Basis of Comparison**

##### 11 *Potential Changes in Salinity Indicators*

12 Salinity in the Sacramento River at Emmaton would be lower in September  
13 through January, higher in June, and similar in all other months over long-term  
14 average conditions under Alternative 5 as compared to the Second Basis of  
15 Comparison, as summarized in Appendix 6E, Table 6E.2.6.

16 Salinity in the San Joaquin River at Vernalis would be lower in April through  
17 May and October, higher in November through March, and similar in all other  
18 months under Alternative 5 as compared to the Second Basis of Comparison, as  
19 summarized in Appendix 6E, Table 6E.15.6.

20 Salinity in the San Joaquin River at Jersey Point would be lower in September  
21 through January, higher in July and August, and similar in all other months for  
22 long-term average conditions under Alternative 5 as compared to the Second  
23 Basis of Comparison, as summarized in Appendix 6E, Table 6E.3.6.

24 Salinity in the western Delta at Port Chicago, Chipps Island, and Collinsville  
25 would be lower in all months for long-term average conditions under Alternative  
26 5 as compared to the Second Basis of Comparison, as summarized in Appendix  
27 6E, Tables 6E.6.6, 6E.4.6, and 6E.2.6.

28 Salinity at Jones Pumping Plant and the SWP Banks Pumping Plant intakes in the  
29 Delta would be lower in September through January, and higher in all other  
30 months for long-term average conditions under Alternative 5 as compared to the  
31 Second Basis of Comparison, as summarized in Appendix 6E, Table 6E.7.6 and  
32 Table 6E.8.6. Salinity at the CVP Contra Costa Canal intake and the Contra  
33 Costa Water District Old River and Middle River intakes also would be lower in  
34 September through January and higher in February through August for long-term  
35 average conditions under Alternative 5 as compared to the Second Basis of  
36 Comparison, as summarized in Appendix 6E, Tables 6E.11.6, 6E.12.6, and  
37 6E.13.6. Changes in salinity at the intakes would influence the salinity in water  
38 delivered in the San Joaquin Valley which could influence salinity in water bodies  
39 that receive agricultural return flows from CVP and SWP water users.

40 X2 decreases with increases in Delta outflow as freshwater from the Central  
41 Valley flows towards San Francisco Bay. Under Alternative 5, Delta outflow  
42 generally would increase and X2 would move towards the west, especially in  
43 September through May, as compared to the Second Basis of Comparison, as

1 shown in in Table C.16.6 and Figures C.16.1.1 through C.16.1.8 and C.16.2.1  
2 through C.16.2.8 in Appendix 5A, Section C, CalSim II and DSM2 Modeling  
3 Results.

4 *Potential Changes in Mercury Concentrations*

5 Changes in mercury from the rivers result in changes in mercury concentrations in  
6 fish used for human consumption in the Delta, including Largemouth Bass, as  
7 summarized in Tables 6.38 and 6.39 for long-term average conditions and dry and  
8 critical dry years, respectively. All values exceed the threshold of 0.24  
9 milligram/kilogram wet weight (mg/kg ww) for mercury.

1 **Table 6.38 Changes in Mercury Concentrations 350-millimeter Largemouth Bass**  
 2 **over the Long-term Average Conditions under Alternative 5 as Compared to the**  
 3 **Second Basis of Comparison**

<b>Delta Location</b>	<b>Alternative 5 (mg/kg ww)</b>	<b>Second Basis of Comparison (mg/kg ww)</b>	<b>Changes</b>
San Joaquin River at Stockton	1.00	0.99	0%
San Joaquin River at Turner Cut	0.89	0.87	3%
San Joaquin River at San Andreas Landing	0.55	0.58	4%
San Joaquin River at Jersey Point	0.57	0.54	5%
Victoria Canal	0.85	0.82	4%
Sacramento River at Emmaton	0.50	0.49	3%
San Joaquin River at Antioch	0.51	0.47	7%
Montezuma Slough at Hunter Cut and Beldon's Landing (Suisun Marsh)	0.35	0.32	7%
SWP Barker Slough Pumping Plant Intake	0.56	0.56	1%
CVP Contra Costa Pumping Plant Intake	0.74	0.68	8%
SWP Banks Pumping Plant Intake	0.79	0.75	5%
CVP Jones Pumping Plant Intake	0.83	0.79	5%

4 Notes:

5 Long-term values calculated using 1976-1991 results from DSM2 model. Dry and critical  
 6 dry years values calculated using 1987-1991 results from DSM2 model.

7 Concentrations greater than 0.24 mg/kg ww Hg exceed CVRWQCB threshold

8 mg/kg – milligram/kilogram; ww – wet weight

 2 **Dry and Critical Dry Years under Alternative 5 as Compared to the Second Basis of**  
 3 **Comparison**

<b>Delta Location</b>	<b>Alternative 5 (mg/kg ww)</b>	<b>Second Basis of Comparison (mg/kg ww)</b>	<b>Changes</b>
San Joaquin River at Stockton	1.05	1.06	0%
San Joaquin River at Turner Cut	0.85	0.81	4%
San Joaquin River at San Andreas Landing	0.55	0.53	4%
San Joaquin River at Jersey Point	0.53	0.50	5%
Victoria Canal	0.82	0.76	7%
Sacramento River at Emmaton	0.49	0.47	3%
San Joaquin River at Antioch	0.44	0.41	7%
Montezuma Slough at Hunter Cut and Beldon's Landing (Suisun Marsh)	0.28	0.26	7%
SWP Barker Slough Pumping Plant Intake	0.58	0.57	2%
CVP Contra Costa Pumping Plant Intake	0.70	0.62	13%
SWP Banks Pumping Plant Intake	0.74	0.69	7%
CVP Jones Pumping Plant Intake	0.82	0.77	7%

4 Notes:

5 Long-term values calculated using 1976-1991 results from DSM2 model. Dry and critical  
 6 dry years values calculated using 1987-1991 results from DSM2 model.

7 Concentrations greater than 0.24 mg/kg ww Hg exceed CVRWQCB threshold

8 mg/kg – milligram/kilogram; ww – wet weight

1 *Potential Changes in Selenium Concentrations*

2 It is anticipated that the selenium loadings would be similar under Alternative 5  
3 and the Second Basis of Comparison; and that selenium concentrations in the San  
4 Joaquin River also would be similar.

5 In the Delta, selenium concentrations are related to the movement of flows from  
6 the San Joaquin River and the accumulation in certain areas of the Delta due to  
7 tidal flow patterns.

8 Selenium in the water column at various locations in the Delta under Alternative 5  
9 and the Second Basis of Comparison are shown in Appendix 6D, Selenium Model  
10 Documentation. Selenium in the water column at the three western Delta  
11 locations under Alternative 5 would be similar to conditions under the Second  
12 Basis of Comparison, as shown in Appendix 6D, Table 6D.16. Selenium in the  
13 water column would be below the NTR criterion of 5 µg/L for the San Francisco  
14 Bay. Similarly, they would be below the draft USEPA (2014b) criterion for lentic  
15 aquatic systems (1.3 µg/L).

16 In the western Delta and at the Barker Slough Pumping Plant intake, the selenium  
17 would be similar under Alternative 5 and the Second Basis of Comparison. There  
18 would be small increases in selenium along the Sacramento River at Emmaton  
19 under Alternative 5 as compared to the Second Basis of Comparison.

20 Selenium at the Contra Costa Pumping Plant, Jones Pumping Plant, and Banks  
21 Pumping Plant intakes would be higher under Alternative 5 than Second Basis of  
22 Comparison, as shown in Appendix 6D, Table 6D.9.

23 Estimated selenium concentration in biota (whole-body fish, bird eggs  
24 [invertebrate diet], bird eggs [fish diet], and fish fillets) at all locations in the  
25 Delta under Alternative 5 would be similar as under the Second Basis of  
26 Comparison, as shown in Appendix 6D, Table 6D.12. As shown in Appendix 6D,  
27 Table 6D.13, EQs computed with respect to the applicable benchmarks show that  
28 selenium concentrations in biota under Alternative 5 would be below the  
29 thresholds identified for ecological risk.

30 For sturgeon in the western Delta, modeling also suggests that whole-body  
31 concentrations would be higher under Alternative 5 than the Second Basis of  
32 Comparison (Appendix 6D, Table 6D.17), and the EQs would be similar  
33 (Appendix 6D, Table 6D.18). Low Toxicity Threshold EQs for selenium  
34 concentrations in sturgeon in the western Delta would remain under 1.0 for long-  
35 term average conditions, and slightly exceed 1.0 (indicating a higher probability  
36 for adverse effects) for drought years at the three western Delta locations under  
37 both Alternative 5 and Second Basis of Comparison (Table 6D.18 of  
38 Appendix 6D). Estimated EQs for High Toxicity Threshold at all locations are  
39 less than 1.0 under all hydrologic conditions.

40 *Effects Related to Cross Delta Water Transfers*

41 Potential effects to water quality could be similar to those identified in a recent  
42 environmental analysis conducted by Reclamation for long-term water transfers  
43 from the Sacramento to San Joaquin valleys (Reclamation 2014c) as described

1 above under the No Action Alternative compared to the Second Basis of  
2 Comparison. For the purposes of this EIS, it is anticipated that similar conditions  
3 would occur during implementation of cross Delta water transfers under  
4 Alternative 5 and the Second Basis of Comparison, and that impacts on water  
5 quality would not be substantial in the seller's service area due to implementation  
6 requirements of the transfer programs.

7 Under Alternative 5, the timing of cross Delta water transfers would be limited to  
8 July through September and include annual volumetric limits, in accordance with  
9 the 2008 USFWS BO and 2009 NMFS BO. Under the Second Basis of  
10 Comparison, water could be transferred throughout the year without an annual  
11 volumetric limit. Overall, the potential for cross Delta water transfers would be  
12 reduced under Alternative 5 as compared to the Second Basis of Comparison.

#### 13 **6.4.3.7 Summary of Environmental Consequences**

14 The results of the environmental consequences of implementation of Alternatives  
15 1 through 5 as compared to the No Action Alternative and the Second Basis of  
16 Comparison are presented in Tables 6.40 and 6.41.

17 It should be noted that since concentrations of nutrients, dissolved oxygen, and  
18 other constituents of current concern (except salinity, mercury, and selenium)  
19 would be managed through regulatory processes by 2030, it is assumed that  
20 concentrations of these constituents would be similar under the No Action  
21 Alternative, Alternatives 1 through 5, and the Second Basis of Comparison, as  
22 described in Section 6.4.1., Potential Mechanisms of Change and Analytical  
23 Methods.

24 Environmental effects associated with changes in water temperatures are related  
25 to impacts on biological resources (as described in Chapter 9, Fish and Aquatic  
26 Resources. Therefore, the, potential impacts of the action alternatives related to  
27 changes in water temperature, including changes resulting from including  
28 reasonably and foreseeable actions are presented in Chapter 9.

29  
30

1

**Table 6.40 Comparison of Alternatives 1 through 5 to No Action Alternative**

Alternative	Potential Change	Consideration for Mitigation Measures
Alternative 1	<p>Salinity increases near Emmaton in almost all months (5 to 377 percent), particularly in September, October and November of wet and above normal years; decreases in June except for June of critical years; and is similar in wet and above normal of spring months (February through May); and dry and critical years of August and September.</p> <p>Salinity increases near Antioch (5 to 265 percent) in almost all months except it decreases in June of wet, above normal, and below normal years ( 7 to 14 percent) and when it is similar in February, March, and April of wet years, July and August, and September of below normal, dry and critically dry years.</p> <p>Salinity increases near CVP and SWP intakes (6 to 36 percent) in October, November, and December (and January for only SWP), decreases (5 to 22 percent) in February through June, and is similar in other months.</p> <p>Salinity increases near Contra Costa Water District intakes (8 to 65 percent) in October through January and September of wet and above normal years, decreases (5 to 32 percent) March through May and June of wet, above normal, and below normal years, and is similar in other months. Changes in Contra Costa Water District intakes are different for each location. Please refer to Appendix 6E for a detailed summary of the changes in salinity.</p> <p>Salinity increases (5 to 96 percent) near Port Chicago October through February, April, March of below normal, dry, and critically dry years, and September of wet and above normal years; and is similar in other months.</p> <p>Similar mercury concentrations in Largemouth Bass in most of the Delta; and a 6 percent decrease near Rock Slough, San Joaquin River at Antioch, and Montezuma Slough over the long-term conditions.</p> <p>Similar selenium concentrations in whole body fish, bird eggs, and fish fillets.</p>	<p>Coordination of CVP and SWP operations between Reclamation, DWR, USFWS, and NMFS to reduce salinity near the CVP, SWP, Contra Costa Water District, and Antioch intakes and near Emmaton.</p>

Alternative	Potential Change	Consideration for Mitigation Measures
Alternative 2	Water quality conditions would be the same as under the No Action Alternative.	None needed
Alternative 3	<p>Salinity increases near Emmaton (7 to 378 percent) October through January and September of wet and above normal years, in September, October and November of wet and above normal years; decreases (7 and 8 percent) in June of above normal years and September of below normal years, and is similar in all other months.</p> <p>Salinity increases near Antioch (6 to 262 percent) in almost all months except it is similar in March, July, August, below normal, dry, and critically dry years of September, and wet, above normal, and dry years of February.</p> <p>Salinity increases near CVP intakes (6 to 29 percent) in October, November, and December, decreases (5 to 13 percent) in June, and is similar in other months.</p> <p>Salinity increases near SWP intakes (5 to 41 percent) in October, November, December, and January, decreases (5 to 19 percent) in April through June, and is similar in other months.</p> <p>Salinity increases near Contra Costa Water District intakes (6 to 76 percent) in October through December, January of above normal, below normal, and dry years, and September of wet and above normal years; decreases (5 to 34 percent) April through June; and is similar in other months.</p> <p>Salinity increases (6 to 95 percent) near Port Chicago October through January, April, and May, June and September of wet and above normal years; and is similar in other months.</p> <p>Similar mercury concentrations in Largemouth Bass in most of the Delta; and a 6 percent decrease near San Joaquin River at Antioch and Montezuma Slough over the long-term conditions.</p> <p>Similar selenium concentrations in whole body fish, bird eggs, and fish fillets.</p>	Coordination of CVP and SWP operations between Reclamation, DWR, USFWS, and NMFS to reduce salinity near the CVP, SWP, Contra Costa Water District, and Antioch intakes.
Alternative 4	Same effects as described for Alternative 1 compared to the No Action Alternative.	None needed
Alternative 5		None needed

Alternative	Potential Change	Consideration for Mitigation Measures
	<p>Salinity near Emmaton is similar in all months except it increases (6 and 8 percent) January and February and decreases (6 to 15 percent) in April through June of critically dry years.</p> <p>Salinity decreases (9 to 20 percent) near Antioch in April and May of below normal, dry, and critically dry years and June of critically dry years; increases (7 percent) in February of critically dry years; and is similar in all other months.</p> <p>Salinity is similar near CVP and SWP intakes in most months, and increases (8 to 12 percent) in June of dry and critically dry years.</p> <p>Salinity increases near Contra Costa Water District intakes (6 to 40 percent) in April, May, and June of below normal, dry, and critical years; and is similar in other months. Changes in Contra Costa Water District intakes are different for each location. Please refer to Appendix 6E for a detailed summary of the changes in salinity.</p> <p>Salinity near Port Chicago is similar in all months except it decreases (5 to 8 percent) in April and May of dry and critical years.</p> <p>Similar mercury concentrations in Largemouth Bass throughout the Delta.</p> <p>Similar selenium concentrations in whole body fish, bird eggs, and fish fillets.</p>	

1 Notes:

2 1 In general, D-1641 Delta salinity standards are met in all alternatives except for few dry  
3 and critical years where there is no stored fresh water available for release The  
4 differences in salinity between alternatives mostly point to results of other operations  
5 beyond meeting the D-1641 salinity standards; such as whether or not reservoirs are  
6 releasing to meet 2008 USFWS Biological Opinion Action 4 (Fall X2), Delta Cross  
7 Channel operations, or whether or not south Delta exports are allowed in a particular  
8 month. As a result, changes in salinity for each location in Delta shows wide month to  
9 month variation between alternatives. Please refer to Appendix 6E for detailed  
10 comparison of salinity between the alternatives.

11 2 Due to the limitations and uncertainty in the CalSim II monthly model and other  
12 analytical tools, incremental differences of 5 percent or less between alternatives and the  
13 Second Basis of Comparison are considered to be “similar.”

1 **Table 6.41 Comparison of No Action Alternative and Alternatives 1 through 5 to**  
 2 **Second Basis of Comparison**

<b>Alternative</b>	<b>Potential Change</b>	<b>Consideration for Mitigation Measures</b>
No Action Alternative	<p>Salinity decreases near Emmaton in almost all months (5 to 79 percent), particularly in September, October and November of wet and above normal years; increases (9 to 21 percent) in June except for June of critical years; and is similar in wet and above normal of spring months (February through May); and dry and critical years of August and September.</p> <p>Salinity decreases near Antioch (5 to 73 percent) in almost all months except it increases (7 to 16 percent) in June of wet, above normal, and below normal years; and is similar in February, March, and April of wet years, July and August, and September of below normal, dry and critically dry years.</p> <p>Salinity decreases near CVP and SWP intakes (6 to 28 percent) in October, November, and December (and January for only SWP), increases (5 to 23 percent) in February through June, and is similar in other months.</p> <p>Salinity decreases near Contra Costa Water District intakes (7 to 42 percent) in October through January and September of wet and above normal years, increases (5 to 47 percent) March through May and June of wet, above normal, and below normal years, and is similar in other months. Changes in Contra Costa Water District intakes are different for each location. Please refer to Appendix 6E for a detailed summary of the changes in salinity.</p> <p>Salinity decreases (6 to 49 percent) near Port Chicago October through May, and September of wet and above normal years; and is similar in other months.</p> <p>Similar mercury concentrations in Largemouth Bass in the most of the Delta; and a 7 percent increase near Rock Slough, San Joaquin River at Antioch, and Montezuma Slough over the long-term conditions.</p> <p>Similar selenium concentrations in whole body fish, bird eggs, and fish fillets.</p>	Not considered for this comparison.

<b>Alternative</b>	<b>Potential Change</b>	<b>Consideration for Mitigation Measures</b>
Alternative 1	No effects on public health issues.	Not considered for this comparison.
Alternative 2	Same effects as described for No Action Alternative as compared to the Second Basis of Comparison.	Not considered for this comparison.
Alternative 3	<p>Salinity increases near Emmaton (5 to 35 percent) in June except for critically dry years; decreases (5 to 24 percent) in December and January of above normal years, January through March and July through September of below normal years, January, February, and July of dry years, and March of critically dry years; and it is similar in all other months.</p> <p>Salinity increases near Antioch (8 to 20 percent) in June except critically dry years and in May of wet years; decreases (7 to 40 percent) in January through April, and is similar in all other months.</p> <p>Salinity is similar near CVP and SWP intakes except for increase (5 to 23 percent) mostly in February through May of dry and critically dry years.</p> <p>Salinity increases near Contra Costa Water District intakes (5 to 16 percent) in March and April of dry and critically dry years; decreases (5 to 23 percent) in December, January and February of dry and critically dry years; and is similar in other months. Changes in Contra Costa Water District intakes are different for each location. Please refer to Appendix 6E for a detailed summary of the changes in salinity.</p> <p>Salinity decreases (5 to 25 percent) near Port Chicago January through March; increases (7 to 9 percent) in June of wet, above normal, and below normal years; and is similar in other months.</p> <p>Similar mercury concentrations in Largemouth Bass throughout the Delta.</p> <p>Similar selenium concentrations in whole body fish, bird eggs, and fish fillets.</p>	Not considered for this comparison.
Alternative 4	No effects on water quality issues.	Not considered for this comparison.
Alternative 5	Salinity decreases near Emmaton in almost all months (5 to 79 percent), particularly in September, October and November of wet and above normal	Not considered for this comparison.

Alternative	Potential Change	Consideration for Mitigation Measures
	<p>years; increases (7 to 21 percent) in June except for June of critical years; and is similar in wet and above normal of spring months (February through May); and dry and critical years of August and September.</p> <p>Salinity decreases near Antioch (5 to 73 percent) in almost all months except it increases (7 to 14 percent) in June of wet, above normal, and below normal years; and is similar in February, March, and April of wet years, July and August, and September of below normal, dry and critically dry years.</p> <p>Salinity decreases near CVP and SWP intakes (5 to 28 percent) in October, November, and December (and January for only SWP), increases (5 to 26 percent) in February through June, and is similar in other months.</p> <p>Salinity decreases near Contra Costa Water District intakes (7 to 41 percent) in October through January and September of wet and above normal years, increases (5 to 63 percent) March through June, and is similar in other months. Changes in Contra Costa Water District intakes are different for each location. Please refer to Appendix 6E for a detailed summary of the changes in salinity.</p> <p>Salinity decreases (5 to 49 percent) near Port Chicago October through May, and September of wet and above normal years; and is similar in other months.</p> <p>Similar mercury concentrations in Largemouth Bass in the most of the Delta; and a 7 percent increase near Rock Slough, San Joaquin River at Antioch, and Montezuma Slough over the long-term conditions.</p> <p>Similar selenium concentrations in whole body fish, bird eggs, and fish filets.</p>	

1 Notes:

2 1 In general, D-1641 Delta salinity standards are met in all alternatives except for few dry  
3 and critical years where there is no stored fresh water available for release. The  
4 differences in salinity between alternatives mostly point to results of other operations  
5 beyond meeting the D-1641 salinity standards; such as whether or not reservoirs are  
6 releasing to meet 2008 USFWS Biological Opinion Action 4 (Fall X2), Delta Cross  
7 Channel operations, or whether or not south Delta exports are allowed in a particular  
8 month. As a result, changes in salinity for each location in Delta shows wide month to

1 month variation between alternatives. Please refer to Appendix 6E for detailed  
2 comparison of salinity between the alternatives.

3 2 Due to the limitations and uncertainty in the CalSim II monthly model and other  
4 analytical tools, incremental differences of 5 percent or less between alternatives and the  
5 Second Basis of Comparison are considered to be “similar.”

#### 6 **6.4.3.8 Potential Mitigation Measures**

7 Mitigation measures are presented in this section to avoid, minimize, rectify,  
8 reduce, eliminate, or compensate for adverse environmental effects of  
9 Alternatives 1 through 5 as compared to the No Action Alternative. Mitigation  
10 measures were not included to address adverse impacts under the alternatives as  
11 compared to the Second Basis of Comparison because this analysis was included  
12 in this EIS for information purposes only.

13 Environmental effects associated with changes in water temperatures are related  
14 to impacts on biological resources (as described in Chapter 9, Fish and Aquatic  
15 Resources. Therefore, mitigation measures related to changes in temperatures as  
16 compared to the No Action Alternative conditions are presented in Chapter 9.

#### 17 **6.4.3.8.1 Salinity Water Quality Conditions**

18 Implementation of Alternatives 1 through 5 would not result in adverse impacts to  
19 mercury and selenium concentrations as compared to the No Action Alternative.  
20 Therefore, no mitigation measures are required for these constituents.

21 Implementation of Alternatives 1, 3, and 4 would result in adverse impacts to  
22 salinity concentrations as compared to the No Action Alternative. A potential  
23 mitigation measure to reduce these effects would be:

- 24 • Coordination of CVP and SWP operations between Reclamation, DWR,  
25 USFWS, and NMFS to reduce salinity near the CVP, SWP, Contra Costa  
26 Water District, and Antioch intakes.

27 Under the No Action Alternative and Alternatives 1 through 5, it is anticipated  
28 that the ongoing real-time decision making meetings between Reclamation,  
29 DWR, USFWS, and NMFS would continue in a manner similar to that described  
30 in Section 3A.3 of Appendix 3A, No Action Alternative: Central Valley Project  
31 and State Water Project Operations. Under this mitigation measure, a specific  
32 agenda item would be added to the groups’ actions to reduce salinity impacts on  
33 the beneficial uses in the Delta. Potential changes could be to modify intake  
34 operations in accordance with real-time flows, observations related to fish  
35 presence, and real-time water quality observations.

#### 36 **6.4.3.9 Cumulative Effects Analysis**

37 As described in Chapter 3, the cumulative effects analysis considers projects,  
38 programs, and policies that are not speculative; and are based upon known or  
39 reasonably foreseeable long-range plans, regulations, operating agreements, or  
40 other information that establishes them as reasonably foreseeable.

1 The cumulative effects analysis Alternatives 1 through 5 for Water Quality are  
 2 summarized in Table 6.42.

3 **Table 6.42 Summary of Cumulative Effects on Water Quality of Alternatives 1**  
 4 **through 5 as Compared to the No Action Alternative**

Scenarios	Actions	Cumulative Effects of Actions
<p>Past &amp; Present, and Future Actions included in the No Action Alternative and in All Alternatives in Year 2030</p>	<p>Consistent with Affected Environment conditions plus:</p> <p>Actions in the 2008 USFWS BO and 2009 NMFS BO that Would Have Occurred without implementation of the BOs, as described in Section 3.3.1.2 (of Chapter 3, Descriptions of Alternatives), including climate change and sea level rise</p> <p>Actions not included in the 2008 USFWS BO and 2009 NMFS BO that would have occurred without implementation of the BOs, as described in Section 3.3.1.3 (of Chapter 3, Descriptions of Alternatives):</p> <ul style="list-style-type: none"> <li>- Implementation of Federal and state policies and programs, including Clean Water Act (e.g., Total Maximum Daily Loads); Safe Drinking Water Act; Clean Air Act; and flood management programs</li> <li>- Trinity River Restoration Program.</li> <li>- Central Valley Project Improvement Act programs</li> <li>- Iron Mountain Mine Superfund Site</li> <li>- Dutch Slough Tidal Marsh Restoration</li> <li>- Suisun Marsh Habitat Management, Preservation, and Restoration Plan Implementation</li> <li>- Tidal Wetland Restoration: Yolo Ranch, Northern Liberty Island Fish Restoration Project, Prospect Island Restoration Project, and Calhoun Cut/Lindsey Slough Tidal Habitat Restoration Project</li> <li>- San Joaquin River Restoration Program</li> <li>- Stockton Deep Water Ship Channel Dissolved Oxygen Project</li> <li>- Grasslands Bypass Project</li> <li>- Central Valley Salinity Alternatives for Long-Term Sustainability (CV-SALTS)</li> <li>- Future water supply projects, including water recycling, desalination, groundwater banks and wellfields, and conveyance facilities</li> </ul>	<p><u>These effects would be the same in all alternatives.</u></p> <p>Climate change and sea level rise area anticipated to increase salinity in the Delta and expand the region of the Delta influenced by tidal fluctuations.</p> <p>Water quality programs to reduce nutrient loadings from wastewater treatment plant effluent and other point source discharges under the TMDLs would be fully implemented by 2020; and it is anticipated that nutrient concentrations would be reduced by 2030.</p> <p>Programs to meet TMDLs related to dissolved oxygen, pesticides, mercury, selenium, and other constituents of concern are anticipated to be fully defined and implemented in the early 2020s to reduce, but not necessarily meet TMDL objectives, by 2030. These programs include projects to reduce effects of agricultural drainage.</p> <p>Tidal restoration programs would change salinity gradients in the Delta, including increased salinity in the western and central Delta, depending upon the location of the tidal restoration lands. Estuarine tidal restoration could reduce constituents from runoff of adjacent upland areas, depending upon the location of the restored lands.</p>

Chapter 6: Surface Water Quality

Scenarios	Actions	Cumulative Effects of Actions
	(projects with completed environmental documents)	
Future Actions considered as Cumulative Effects Actions in All Alternatives in Year 2030	<p>Actions as described in Section 3.5 (of Chapter 3, Descriptions of Alternatives):</p> <ul style="list-style-type: none"> <li>- Bay-Delta Water Quality Control Plan Update</li> <li>- FERC Relicensing Projects</li> <li>- Bay Delta Conservation Plan (including the California WaterFix alternative)</li> <li>- EcoRestore</li> <li>- Irrigated Lands Regulatory Program</li> <li>- San Luis Reservoir Low Point Improvement Project</li> <li>- <i>Westlands Water District v. United States Settlement</i></li> <li>- Future water supply projects, including water recycling, desalination, groundwater banks and wellfields, and conveyance facilities (projects that did not have completed environmental documents during preparation of the EIS)</li> </ul>	<p><u>These effects would be the same in all alternatives.</u></p> <p>Some of the future reasonably foreseeable actions are anticipated to reduce water quality issues, including Bay-Delta Water Quality Control Plan Update, FERC Relicensing Projects, agricultural drainage programs, and San Luis Reservoir Low Point Improvement Project.</p> <p>Future reasonably foreseeable actions related to tidal restoration projects could increase salinity and mercury water quality issues.</p>
No Action Alternative with Associated Cumulative Effects Actions in Year 2030	Full implementation of the 2008 USFWS BO and 2009 NMFS BO	<p>Implementation of No Action Alternative would result in increased salinity in the western and central Delta due to climate change and sea level rise.</p> <p>Numerous projects would be implemented by 2030 to reduce water quality issues related to nutrients, agricultural drainage, and other discharges of constituents of concern by 2030.</p> <p>Depending upon the location of tidal restoration lands, salinity in the No Action Alternative could increase in the western and interior Delta.</p>
Alternatives 1 and 4 with Associated Cumulative Effects Actions in Year 2030	No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant)	<p>Implementation of Alternatives 1 and 4 with reasonably foreseeable actions would increase salinity in the western and interior Delta as compared to the No Action Alternative with these added actions. Other water quality conditions under Alternatives 1 through 4 with reasonably foreseeable actions would be similar to conditions under the No Action Alternative with the added actions.</p>

Scenarios	Actions	Cumulative Effects of Actions
Alternative 2 with Associated Cumulative Effects Actions in Year 2030	<p>Full implementation of the 2008 USFWS BO and 2009 NMFS BO CVP and SWP operational actions</p> <p>No implementation of structural improvements or other actions that require further study to develop a more detailed action description.</p>	Implementation of Alternative 2 with reasonably foreseeable actions would result in the same conditions as under the No Action Alternative with the added actions.
Alternative 3 with Associated Cumulative Effects Actions in Year 2030	<p>No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant)</p> <p>Slight increase in positive Old and Middle River flows in the winter and spring months</p>	Implementation of Alternative 3 with reasonably foreseeable actions would increase salinity in the western and interior Delta as compared to the No Action Alternative with the added actions. Other water quality conditions under Alternative 3 with reasonably foreseeable actions would be similar to conditions under the No Action Alternative with the added actions.
Alternative 5 with Associated Cumulative Effects Actions in Year 2030	<p>Full implementation of the 2008 USFWS BO and 2009 NMFS BO</p> <p>Positive Old and Middle River flows and increased Delta outflow in spring months</p>	Implementation of Alternative 5 with reasonably foreseeable actions would result in similar salinity conditions as compared to the No Action Alternative with the added actions. Other water quality conditions under Alternative 5 with with reasonably foreseeable actions would be similar to conditions under the No Action Alternative with the added actions.

**Chapter 7**

1 **Groundwater Resources and**  
2 **Groundwater Quality**

3 **7.1 Introduction**

4 This chapter describes groundwater resources and groundwater quality in the  
5 study area, and potential changes that could occur as a result of implementing the  
6 alternatives evaluated in this Environmental Impact Statement (EIS).  
7 Implementation of the alternatives could affect groundwater resources through  
8 potential changes in operation of the Central Valley Project (CVP) and State  
9 Water Project (SWP) and ecosystem restoration.

10 **7.2 Regulatory Environment and Compliance**  
11 **Requirements**

12 Potential actions that could be implemented under the alternatives evaluated in  
13 this EIS could affect groundwater resources in the areas along the rivers impacted  
14 by changes in the operations of CVP or SWP reservoirs and in the vicinity of and  
15 lands served by CVP and SWP water supplies. Groundwater basins that may be  
16 affected by implementation of the alternatives are in the Trinity River Region,  
17 Central Valley Region, San Francisco Bay Area Region, Central Coast Region,  
18 and Southern California Region.

19 Actions located on public agency lands or implemented, funded, or approved by  
20 Federal and state agencies would need to be compliant with appropriate Federal  
21 and state agency policies and regulations, as summarized in Chapter 4, Approach  
22 to Environmental Analyses.

23 Several of the state policies and regulations described in Chapter 4 have resulted  
24 in specific institutional and operational conditions in California groundwater  
25 basins, including the basin adjudication process, California Statewide  
26 Groundwater Elevation Monitoring Program (CASGEM), California Sustainable  
27 Groundwater Management Act (SGMA), and local groundwater management  
28 ordinances, as summarized below.

29 **7.2.1 Groundwater Basin Adjudication**

30 Basin adjudications are determined through court decisions or pre-court mediation  
31 on litigation that determines the groundwater rights of all the groundwater users  
32 overlying the basins. The court identifies the extractors or well owners and the  
33 amount of groundwater those well owners are allowed to extract, and appoints a  
34 Watermaster whose role is to ensure that the basin is managed in accordance with  
35 the court's decree. The Watermaster must report periodically to the court. There  
36 are currently 23 adjudicated groundwater basins in California, most of which are

- 1 located in Southern California. Table 7.1 lists the adjudicated groundwater basins
- 2 located in the study area.

3 **Table 7.1 Adjudicated Groundwater Basins in the Study Area**

<b>Basin Name</b>	<b>Date of Final Court Decision</b>	<b>County</b>
Antelope Valley Groundwater Basin	Under way	Kern and Los Angeles
Beaumont – Upper Santa Ana Groundwater Basin	2004	Riverside
Brite Groundwater Basin	1970	Kern
Central Subbasin of the Coastal Plain of Los Angeles Basin	1965	Los Angeles
Chino Subbasin of the Upper Santa Ana Valley Basin	1978	Riverside and San Bernardino
Cucamonga Subbasin of the Upper Santa Ana Valley Basin	1978	San Bernardino
Cummings Valley Groundwater Basin	1972	Kern
Goleta Groundwater Basin	1989	Santa Barbara
San Jacinto Groundwater Basin	2013	Riverside
Los Osos Valley Groundwater Basin	Under way	San Luis Obispo
Mojave Basin Area (Lower Mojave River Valley, Middle Mojave River Valley, Upper Mojave River Valley, El Mirage Valley, and Lucerne Valley groundwater basins)	1996	San Bernardino
San Gabriel Valley Groundwater Basin – excluding Raymond Groundwater Basin	1973	Los Angeles
San Gabriel Valley Groundwater Basin – Puente Narrows	1985	Los Angeles
Raymond Groundwater Basin	1944	Los Angeles
Rialto-Colton Subbasin of the Upper Santa Ana Valley Basin	1961	San Bernardino
Santa Margarita River Watershed – Santa Margarita Valley, Temecula Valley, and Cahuilla Valley groundwater basins	1966*	Riverside and San Diego
Santa Maria Valley Groundwater Basin	2008	San Luis Obispo and Santa Barbara
Santa Paula Subbasin of the Santa Clara River Valley Groundwater Basin	1996	Ventura
Six Basins Area in upper Santa Ana Valley	1998	Los Angeles and San Bernardino
Tehachapi Valley West Basin and Tehachapi Valley East Basin	1973	Kern

Basin Name	Date of Final Court Decision	County
Upper Los Angeles River Area– San Fernando Valley Groundwater Basin	1979	Los Angeles
Warren Valley Groundwater Basin	1977	San Bernardino
West Coast Subbasin of the Coastal Plain of Los Angeles Basin	1961	Los Angeles
Western San Bernardino – Upper Santa Ana Groundwater Basin	1969	San Bernardino

1 Sources: DWR 2003a, 2014a; LOCSD 2013

2 Note:

3 \* Santa Margarita Watershed Adjudication addresses both groundwater and surface  
 4 water if water contributes to Santa Margarita River and its tributaries flows (SMRW 2014).  
 5 The agreements include interlocutory judgements for Murrieta-Temecula Groundwater  
 6 Basin that describes non-Indian water rights subject to court jurisdiction, land and water  
 7 rights not subject to court jurisdiction, reserved water rights for the Pechanga  
 8 Reservation, and appropriative storage and diversion rights in conjunction with use of  
 9 groundwater by the Vail Company.

10 **7.2.2 California Statewide Groundwater Elevation**  
 11 **Monitoring Program**

12 Senate Bill X7-6, enacted in November 2009, mandates a statewide groundwater  
 13 elevation monitoring program to track seasonal and long-term trends in  
 14 groundwater elevations in California’s groundwater basins defined in  
 15 Bulletin 118. This amendment to Division 6 of the Water Code, specifically  
 16 Part 2.11 Groundwater Monitoring, requires the collaboration between local  
 17 monitoring entities and California Department of Water Resources (DWR) to  
 18 collect groundwater elevation data. The law requires local agencies to monitor  
 19 and report the groundwater elevation in the basins. To achieve this goal, DWR  
 20 developed the CASGEM Program to establish a permanent, locally-managed  
 21 program of regular and systematic monitoring in all of the state’s alluvial  
 22 groundwater basins.

23 DWR is required to establish a priority schedule for monitoring groundwater  
 24 basins, and to report to the Legislature on the findings from these investigations  
 25 (Water Code section 10920 et. seq). The 2012 CASGEM Status Report to the  
 26 Legislature describes that more than 400 monitoring entities have been identified  
 27 and water level data are being submitted to DWR (DWR 2012). The  
 28 prioritization of basins is to identify, evaluate, and determine the need for  
 29 additional groundwater level monitoring. The prioritization approach includes the  
 30 following eight criteria.

- 31 • Overlying population in the groundwater basin
- 32 • Projected growth of the overlying population
- 33 • Number of public water supply wells

- 1 • Total number of water supply wells
  - 2 • Irrigated acreage overlying the groundwater basin
  - 3 • Reliance on groundwater as the primary source of water by the overlying
  - 4 land uses
  - 5 • Impacts on groundwater, including overdraft, subsidence, saline intrusion, and
  - 6 other water quality degradation
  - 7 • Any other information relevant to the groundwater conditions
- 8 Groundwater basins designations in the study area are described for each basin in
- 9 the following subsection of this chapter (DWR 2014e).

### 10 **7.2.3 Sustainable Groundwater Management Act**

11 In September 2014, the SGMA was enacted. The SGMA establishes a new

12 structure for locally managing California’s groundwater in addition to existing

13 groundwater management provisions established by Assembly Bill (AB)

14 3030 (1992), Senate Bill (SB) 1938 (2002), and AB 359 (2011), as well as

15 SBX7-6 (2009).

16 The SGMA includes the following key elements:

- 17 • Provides for the establishment of a Groundwater Sustainability Agency (GSA)
- 18 by one or more local agencies overlying a designated groundwater basin or
- 19 subbasin identified in DWR Bulletin 118-03
- 20 • Requires all DWR Bulletin 118 groundwater basins found to be of “high” or
- 21 “medium” priorities to prepare Groundwater Sustainability Plans (GSPs)
- 22 • Provides for the proposed revisions, by local agencies, to the boundaries of a
- 23 DWR Bulletin 118 basin, including the establishment of new subbasins
- 24 • Provides authority for DWR to adopt regulations to evaluate GSPs, and
- 25 review the GSPs for compliance every 5 years
- 26 • Requires DWR to establish best management practices and technical measures
- 27 for GSAs to develop and implement GSPs
- 28 • Provides regulatory authority to the State Water Resources Control Board
- 29 (SWRCB) for developing and implementing interim groundwater
- 30 management plans under certain circumstances (such as lack of compliance
- 31 with development of GSPs by GSAs)

32 The SGMA defines sustainable groundwater management as “the management

33 and use of groundwater in a manner that can be maintained during the planning

34 and implementation horizon without causing undesirable results.” Undesirable

35 results are defined as any of the following effects.

- 36 • Chronic lowering of groundwater levels (not including overdraft during a
- 37 drought if a basin is otherwise managed)
- 38 • Significant and unreasonable reduction of groundwater storage

- 1 • Significant and unreasonable seawater intrusion
- 2 • Significant and unreasonable degraded water quality, including the migration
- 3 of contaminant plumes that impair water supplies
- 4 • Significant and unreasonable land subsidence that substantially interferes with
- 5 surface land uses
- 6 • Depletions of interconnected surface water that have significant and
- 7 unreasonable adverse impacts on beneficial uses of the surface water

8 Based on basin priority definitions defined by DWR’s CASGEM program in June  
 9 2014 and confirmed in January 2015, the SGMA requires the formation of GSPs  
 10 by 2020 or 2022. GSPs for medium and high priority basins identified subject to  
 11 critical conditions of overdraft are required by 2022. All other high and medium  
 12 priority basins must complete a GSP by 2020. Updates to CASGEM-defined  
 13 June 2014 designated priorities are possible and can affect GSP deadline  
 14 requirements. Sustainable groundwater operations must be achieved within  
 15 20 years following completion of the GSPs.

16 **7.2.4 Regional and Local Groundwater Ordinances**

17 Many counties within the study area considered in this EIS have adopted or are  
 18 considering groundwater ordinances. The ordinances primarily address well  
 19 installation, groundwater extraction, and export of the groundwater to areas  
 20 outside the basin of origin. Local county groundwater ordinances vary by  
 21 authority, agency, or region but typically involve permitting for well installation,  
 22 and provisions to limit or prevent groundwater overdraft, to regulate transfers, and  
 23 to protect groundwater quality.

24 Table 7.2 provides a list of substantial county groundwater ordinances within the  
 25 study area that could affect groundwater supply availability.

26 **Table 7.2 County Groundwater Ordinances in the Study Area with a Summary of**  
 27 **Regulations**

County	Ordinance Number and Title	Description
Trinity	County Code Title 15: Buildings and Construction, Chapter 15.20: Water wells.	Well standards.
Trinity and Humboldt	Hoopa Valley Tribal Council Title 37: Pollution Discharge Prohibition Ordinance	Regulates surface water and groundwater operations.
Humboldt	County Code Title VI: Water and Sewage, Division 3: Wells.	Well standards.
	Hoopa Valley Tribe: Not identified at this time.	Not applicable.
Del Norte	County Code Title 7: Health and Welfare Chapter 32: Regulations of Wells and Preservation of Groundwater.	Well standards.

Chapter 7: Groundwater Resources and Groundwater Quality

<b>County</b>	<b>Ordinance Number and Title</b>	<b>Description</b>
Shasta	County Code Title 18: Environment 18.08: Groundwater Management.	Requires permit for groundwater extraction for use outside county.
Shasta	County Code Title 8: Health and Safety, 8.56: Water Wells.	Well standards.
Plumas	County Code Title 6: Sanitation and Health, Chapter 8: Water Wells.	Well standards. Groundwater management plans have been adopted in Plumas County, but not in the vicinity of the study area.
Tehama	County Code Title 9: Health and Safety, Chapter 9.40: Aquifer Protection.	Prohibits groundwater from being exported out of county. Requires permit to use groundwater from wells on a parcel on other parcels of land.
Tehama	County Code Title 9: Health and Safety, Chapter 9.42: Well Construction, Rehabilitation, Repair and Destruction.	Well standards.
Glenn	County Code Title 20: Water 20.030: Groundwater Coordinated Resource Management Plan.	Basin Management Objectives and monitoring network to detect changes in groundwater level, quality, land subsidence; and defines acceptable ranges of groundwater levels.
	County Code Title 20: Water, 20.080: Water Well Drilling Permits and Standards.	Well standards.
Colusa	County Code Chapter 43: Groundwater Management.	Requires permit for groundwater extraction for use outside county.
	County Code Chapter 35: Well Standards.	Well standards.
Butte	County Code Chapter 33A: Basin Management.	Basin Management Objectives for: groundwater quality and groundwater levels, and other protections to reduce land subsidence.
	County Code Chapter 23B: Water Wells.	Well standards.
Yuba	County Code Title VII: Health and Sanitation, Chapter 7.03: Water wells.	Well standards.

Chapter 7: Groundwater Resources and Groundwater Quality

<b>County</b>	<b>Ordinance Number and Title</b>	<b>Description</b>
Sutter	County Code Section 700: Health and Sanitation, Chapter 765: Water Wells.	Well standards.
Placer	County Code Chapter 13: Public Services, Article 13.08: Water Wells.	Well standards.
El Dorado	County Code Title 8: Health and Safety, Chapter 8.39: Well Standards.	Well standards. Groundwater management plans have been adopted in El Dorado County, but not in the vicinity of the study area.
Sacramento	County Code Title 6: Health and Sanitation, Chapter 6.28: Wells and Pumps.	Well standards.
Yolo	County Code Title 10: Environment Chapter 7: Groundwater.	Requires permit for groundwater extraction for use outside of the county.
	County Code Title 6: Sanitation and Health, Chapter 8: Water Quality, Article 10: Standards, Criteria, and Regulations of Wells.	Well standards.
Solano	County Code Chapter 13.6: Injection Wells.	Restricts operation of injection wells.
	County Code Chapter 13.10: Well Standards.	Well standards.
Napa	County Code Title 13: Waters, Sewers, and Public Services Chapter 13.15: Groundwater Conservation.	Regulates the use of groundwater.
	County Code Title 13: Waters, Sewers, and Public Services Chapter 13.12: Wells.	Well standards.
San Joaquin	County Code Title 5: Health and Sanitation, Division 4: Wells and Well Drilling.	Well standards.
	County Code Title 5: Health and Sanitation, Division 8: Groundwater.	Requires permit for groundwater use outside of the county.
Stanislaus	County Code Title 9: Health and Safety, Chapter 9.37: Groundwater Mining and Export Prevention.	Regulates groundwater use and prohibits export of water outside of the county (except as noted in the requirements).
	County Code Title 9: Health and Safety, Chapter 9.36: Water Wells.	Well standards.

Chapter 7: Groundwater Resources and Groundwater Quality

<b>County</b>	<b>Ordinance Number and Title</b>	<b>Description</b>
Madera	<p>County Code Title 13: Waters and Sewers, V Groundwater Exportation, Groundwater Banking, and Importation of Foreign Water, for Purposes of Groundwater Banking, to Areas of Madera County which are Outside of Local Water Agencies that Deliver Water to Lands Within their Boundaries.</p> <p>Chapter 13.1: Rules and Regulations Pertaining to Groundwater Banking— Importation of Foreign Water, for the Purpose of Groundwater Banking, to Areas of Madera County which are Outside of Local Water Agencies that Deliver Water to Lands within their Boundaries— Exportation of Groundwater Outside the County.</p>	<p>Regulates development of groundwater banking, including importation of groundwater to be stored in the groundwater bank, and exportation of groundwater for use outside of the county; and prohibits groundwater injection.</p>

Chapter 7: Groundwater Resources and Groundwater Quality

<b>County</b>	<b>Ordinance Number and Title</b>	<b>Description</b>
Santa Clara	Santa Clara Valley Water District Act (California Water Code Appendix, Chapter 60).	Santa Clara Valley Water District is the designated agency to manage water within Santa Clara County, including groundwater management to recharge the basin, conserve water, increase water supply, and prevent waste or diminution of the water supply.
	Santa Clara Valley Water District Well Ordinance 90-1.	Well standards.
San Benito	County Code Title 15: Public Works, Chapter 5.05: Water, Article I: Groundwater Aquifer Protections.	Regulates use of groundwater on non-contiguous parcels with separate owners than parcel with well, injection of groundwater, and operations that could adversely affect other groundwater users or the groundwater aquifer.
	County Code Title 15: Public Works, Chapter 5.05: Water, Article III: Well Standards.	Well standards.
San Luis Obispo	County Code Title 8: Health and Sanitation, Chapter 8.40: Construction, Repair, Modification and Destruction of Wells.	Well standards.
Santa Barbara	County Code Chapter 34A: Wells.	Well standards.
Ventura	County Code Division 4: Public Health, Chapter 8: Water, Article 1: Groundwater Conservation.	Well standards.
Los Angeles	County Code Title 11: Health and Safety, Chapter: 11.38 Water and Sewers, Part 2: Water and Water Wells.	Well standards.
Orange	County Code Title 4: Health and Sanitation and Animal Regulations, Division 5: Water Conservation, Article 3 Construction and Abandonment of Water Wells.	Well standards.

Chapter 7: Groundwater Resources and Groundwater Quality

County	Ordinance Number and Title	Description
San Diego	County Code Title 6: Health and Sanitation, Division 7: Water and Water Supplies, Chapter 4: Wells.	Well standards.
	County Code Title 6: Health and Sanitation, Division 7: Water and Water Supplies, Chapter 7: Groundwater.	Regulates actions for the protection, preservation, and maintenance of groundwater resources.
Riverside	County Code Title 13: Public Services, Chapter 13.20: Water Wells.	Well standards.
San Bernardino	County Code Title 3: Health and Sanitation, Division 3: Environmental Health, Chapter 6: Domestic Water Sources and Systems, Article 3: Water Wells.	Well standards.
	County Code Title 3: Health and Sanitation, Division 3: Environmental Health, Chapter 6: Domestic Water Sources and Systems, Article 5: Desert Groundwater Management.	Regulates groundwater basins not adjudicated by judicial decree; and wells not within the boundaries of the Mojave Water Agency and public water agencies within the Morongo Basin, incorporated areas, or Federal lands. This section does not apply to wells used for existing mining operations, small agricultural operations, small wells, or replacement wells of similar size to abandoned wells. This section does not apply to areas with a groundwater management plan and a memorandum of understanding with the county.

## 1 **7.3 Affected Environment**

2 This section describes groundwater resources that could be potentially affected by  
 3 the implementation of the alternatives considered in this EIS. Changes in  
 4 groundwater resources due to changes in CVP and SWP operations may occur in  
 5 the Trinity River, Central Valley, San Francisco Bay Area, Central Coast, and  
 6 Southern California regions.

7 Groundwater occurs throughout the study area. However, the groundwater  
 8 resources that could be directly or indirectly affected through implementation of  
 9 the alternatives analyzed in this EIS are related to groundwater basins which  
 10 include users of CVP and SWP water supplies that also use groundwater, and  
 11 areas along the rivers downstream of CVP or SWP reservoirs that use  
 12 groundwater supplies. Therefore, the following description of the affected  
 13 environment is limited to these areas and does not include groundwater basins or  
 14 subbasins that area not directly or indirectly affected by changes in CVP and  
 15 SWP operations.

### 16 **7.3.1 Overview of California Groundwater Resources**

17 As described in Chapter 5, Surface Water Resources and Water Supplies,  
 18 groundwater is a vital resource in California. Groundwater supplied about  
 19 37 percent of the state's average agricultural, municipal, and industrial water  
 20 needs between 1998 and 2010, and 40 percent or more during dry and critical  
 21 water years in that period (DWR 2013i). About 20 percent of the nation's  
 22 groundwater demand is supplied from the Central Valley aquifers, making it the  
 23 second-most-pumped aquifer system in the United States (USGS 2009). The  
 24 three Central Valley hydrologic regions (Tulare Lake, San Joaquin River, and  
 25 Sacramento River) account for about 75 percent of the state's average annual  
 26 groundwater use (DWR 2013i).

27 The DWR has delineated 515 distinct groundwater systems throughout the state,  
 28 as described in Bulletin 118-03 (DWR 2003a), that are considered to be the most  
 29 important groundwater basins. These basins and subbasins have various degrees  
 30 of supply reliability considering yield, storage capacity, and water quality, and are  
 31 typically alluvial, or non-consolidated (non-fractured rock) aquifers. Figure 7.1  
 32 shows the statewide occurrence of groundwater in the groundwater basins and  
 33 subbasins identified by DWR as Bulletin 118 basins. A majority of the  
 34 descriptions provided herein are summarized form DWR Bulletin 118 reports.

35 The importance of groundwater as a resource varies regionally. The Central  
 36 Coast has the most reliance on groundwater to meet its local uses, with more than  
 37 80 percent of the agricultural, municipal, and industrial water supplies by  
 38 groundwater in an average year. The central and southern San Joaquin Valley  
 39 (described as the Tulare Lake Area of the San Joaquin Valley Groundwater Basin  
 40 in this chapter) groundwater use, on average, meets about 50 percent of the total  
 41 water supplies. The Sacramento Valley and northern portion of the San Joaquin  
 42 Valley Groundwater Basin use groundwater to meet approximately 30 and  
 43 40 percent of the agricultural, municipal, and industrial water demand,

1 respectively. In the coastal areas of Southern California, groundwater use varies  
2 from less than 10 percent in western San Diego County to between 35 and  
3 50 percent of the agricultural, municipal, and industrial water supplies in counties  
4 along the coast western Ventura, Los Angeles, and Riverside counties and Orange  
5 County, on an annual average basis. In the inland areas of Southern California,  
6 groundwater use varies from approximately 45 to over 90 percent of the  
7 agricultural, municipal, and industrial water supplies (DWR 2013).

8 A comprehensive assessment of overdraft in all of the state's groundwater basins  
9 has not been conducted since Bulletin 118-80 was published in 1980, but  
10 overdraft is estimated at between 1 to 2 million acre-feet annually (DWR 2003a).  
11 In DWR's Bulletin 118-80 (DWR 1980), an assessment of critically overdrafted  
12 basins was conducted, as shown in Figure 7.2. This assessment identified 11  
13 basins in critical condition of overdraft. Based on SGMA requirements, the state  
14 must identify basins subject to critical conditions of overdraft in 2015, publish the  
15 final list in 2016, and use this list in the Bulletin 118 Interim Update 2017. This  
16 revised list is being finalized at the same time as this EIS document is finalized.  
17 This revised draft list added three basins in the EIS study area that are considered  
18 in critical conditions of overdraft (DWR 2015):

- 19 • Merced (5-22.04): Subsidence in El Nido area of 0.6 to 1.0 ft/year
- 20 • Delta-Mendota ((5-22.07): Significant, on-going and irreversible  
21 subsidence
- 22 • Westside (5-22.09): Significant, on-going and irreversible subsidence

23 In the past 20 years, specific groundwater studies have been conducted by  
24 regional water agencies or the U.S. Geological Survey (USGS) to update the  
25 statewide survey conducted by DWR in 1980 (USGS 2000a, 2006, 2008, 2009,  
26 2012, 2014). The results of many of those studies are discussed in the following  
27 subsections of this chapter.

### 28 **7.3.2 Trinity River Region**

29 The Trinity River Region includes the area along the Trinity River from Trinity  
30 Lake to the confluence with the Klamath River; and along the Klamath River  
31 from the confluence with the Trinity River to the Pacific Ocean.

32 Most usable groundwater in the Trinity River Region occurs in widely scattered  
33 alluvium filled valleys, such as those immediately adjacent to the Trinity River.  
34 These valleys contain only small quantities of recoverable groundwater, and,  
35 therefore, are not considered a major source. A number of shallow wells adjacent  
36 to the river provide water for domestic purposes (Reclamation et al. 2006a;  
37 NCRWQCB et al. 2009). Groundwater present in these alluvial valleys is in close  
38 hydraulic connection with the Trinity River and its tributaries. Both groundwater  
39 discharge to surface streams as well as leakage of steam flow to underlying  
40 aquifers are expected to occur at various locations.

41 The Bulletin 118-03 (DWR 2003a, 2004do, 2004dp) identified only two  
42 groundwater basins underlying the Trinity River Region in the Study Area, Hoopa

1 Valley and Lower Klamath River Valley groundwater basins, as shown in  
2 Figure 7.3. These groundwater basins are small, isolated, valley-fill aquifers that  
3 provide a very limited quantity of groundwater to satisfy local domestic,  
4 municipal, and agricultural needs. Groundwater pumped from these aquifer  
5 systems is used strictly for local supply.

6 As described in Chapter 5, Surface Water Resources and Water Supplies, several  
7 communities use infiltration galleries along the Trinity River and the tributaries to  
8 convey surface water to groundwater wells, including the Lewiston Community  
9 Services District, Lewiston Valley Water Company, and Lewiston Park Mutual  
10 Water Company (NCRWQCB et al. 2009).

11 Groundwater within the Hoopa Valley Indian Reservation occurs along alluvial  
12 terraces (Hoopa Valley Tribe 2008). The aquifers are approximately 10 to 80 feet  
13 deep. Some of the shallow wells are productive only during winter and early  
14 spring months.

15 The Lower Klamath River Valley Groundwater Basin extends over 7,030 acres in  
16 Del Norte and Humboldt counties, including areas along the Lower Klamath  
17 River (Reclamation 2010a). Groundwater along the Lower Klamath River occurs  
18 in alluvial fans near the confluences of major tributaries and along terrace and  
19 floodplain deposits adjacent to the river (Yurok Tribe 2012). The aquifers range  
20 in depth from 10 to 80 feet and are used by some members of the community.

21 The Hoopa Valley and Lower Klamath River Valley groundwater basins were  
22 designated by the CASGEM program as very low and low priorities, respectively.

23 Groundwater quality is suitable for many beneficial uses in the region. In other  
24 locations, the groundwater can include naturally occurring metals, including  
25 manganese, cadmium, zinc, and barium (Hoopa Valley Tribe 2008). Other  
26 groundwater quality issues include nitrate contamination (DWR 2013i).

27 Groundwater and surface water contamination is suspected at several former and  
28 existing mill sites that historically used wood treatment chemicals. Discharges of  
29 pentachlorophenol, polychlorodibenzodioxins, and polychlorodibenzofurans have  
30 likely occurred due to the poor containment practices typically used in historical  
31 wood treatment applications. Additional investigation, sampling and monitoring,  
32 and enforcement actions have been limited by the insufficient resources that exist  
33 to address this historical toxic chemical problem (NCRWQCB 2005).

34 **7.3.3 Central Valley Region**

35 The Central Valley Region extends from above Shasta Lake to the Tehachapi  
36 Mountains, and includes the Sacramento Valley, San Joaquin Valley, Delta, and  
37 Suisun Marsh.

38 Groundwater for the Central Valley Region is described in relation to the basins  
39 described by DWR in Bulletin 118-03 (DWR 2003a). The overall area includes  
40 the Sacramento Valley Basin which extends through the Sacramento Valley, and  
41 the San Joaquin Valley Groundwater Basin (including the Tulare Lake Area,  
42 which extends through the San Joaquin Valley). The Delta and Suisun Marsh  
43 area are located partially in the Sacramento Valley Basin and partially in the

1 San Joaquin Valley Groundwater Basin. The Delta and Suisun Marsh area is  
2 described separately because of its distinct characteristics as an estuary at the  
3 confluence of the Sacramento and the San Joaquin rivers.

4 **7.3.3.1 Sacramento Valley**

5 The Sacramento Valley includes the Redding Groundwater Basin and the  
6 Sacramento Valley Groundwater Basin. The Sacramento Valley Groundwater  
7 Basin is one of the largest groundwater basins in the state, and extends from  
8 Redding in the north to the Delta in the south (USGS 2009).

9 Approximately one-third of the Sacramento Valley's urban and agricultural water  
10 needs are met by groundwater (DWR 2003a). The portion of the water diverted  
11 for irrigation but not actually consumed by crops or other vegetation becomes  
12 recharge to the groundwater aquifer or flows back to surface waterways.

13 Overall, the Sacramento Groundwater Basin is approximately balanced with  
14 respect to annual recharge and pumping demand. However, there are several  
15 locations showing early signs of persistent drawdown, suggesting limitations due  
16 to increased groundwater use in dry years. Locations of persistent drawdown  
17 include: Glenn County, areas near Chico in Butte County, northern Sacramento  
18 County, and portions of Yolo County.

19 The water quality of groundwater in the Sacramento Valley is generally good, as  
20 described below for individual basins. Several areas have localized aquifers with  
21 high nitrate, total dissolved solids (TDS) or boron concentrations. High nitrate  
22 concentrations frequently occur due to residuals from agricultural operations or  
23 septic systems. High TDS, a measure of salinity, concentration can be an  
24 indicator of brackish or connate water when it occurs in high concentrations.  
25 High boron concentration usually is associated with naturally occurring deposits.

26 **7.3.3.1.1 Overview of Groundwater Basins in the Sacramento Valley**

27 The Sacramento Valley includes the Redding Groundwater Basin and the  
28 Sacramento Valley Groundwater Basin. The Redding Groundwater Basin is  
29 situated in the extreme northern end of the valley and is a separate, isolated  
30 groundwater basin, but due to similarities in geology and stratigraphy is discussed  
31 as part of the overall Sacramento Valley. It is bordered by the Coast Ranges on  
32 the west, and by the Cascade Range and Sierra Nevada mountains on the east.

33 The Sacramento Valley Groundwater Basin has been divided into 17 subbasins by  
34 DWR, as shown in Figure 7.4, based on groundwater characteristics, surface  
35 water features, and political boundaries (DWR 2003a). However, from a  
36 hydrologic standpoint, these individual groundwater subbasins have a high degree  
37 of hydraulic connection because the rivers do not always act as barriers to  
38 groundwater flow. Therefore, the Sacramento Valley Groundwater Basin  
39 functions primarily as a single laterally extensive alluvial aquifer, rather than  
40 numerous discrete, smaller groundwater subbasins.

41 For discussion purposes, and due to their common characteristics, the Sacramento  
42 Valley is further sub-divided into the Upper Sacramento Valley, the Lower

1 Sacramento Valley West of the Sacramento River, and the Lower Sacramento  
2 Valley East of the Sacramento River.

3 *General Hydrogeology of the Sacramento Valley*

4 Freshwater in the Sacramento Valley Groundwater Basin occurs within the  
5 continental deposits. Hydrogeologic units containing freshwater along the eastern  
6 portion of the basin, primarily occur in the Tuscan and Mehrten formations, and  
7 are derived from the Sierra Nevada. Toward the southeastern portion of the  
8 Sacramento Valley, the Mehrten formation is overlain by sediments of the  
9 Laguna, Riverbank, and Modesto formations, which also originated in the  
10 Sierra Nevada. The primary hydrogeologic unit in the western portion of the  
11 Sacramento Valley is the Tehama formation, which was derived from the Coast  
12 Ranges. In most of the Sacramento Valley, these deeper units are overlain by  
13 younger alluvial and floodplain deposits. Generally, groundwater flows inward  
14 from the edges of the basin toward the Sacramento River, then in a southerly  
15 direction parallel to the river. Depth to groundwater throughout most of the  
16 Sacramento Valley averages about 30 feet below the ground surface, with  
17 shallower depths along the Sacramento River and greater depths along the basin  
18 margins. Wells developed in the sediments of the valley provide excellent supply  
19 to irrigation, municipal, and domestic uses. The deepest elevation of the base of  
20 freshwater in the Sacramento Valley ranges between 400 feet and 3,350 feet  
21 below mean sea level (Berkstresser 1973). The location where the base of  
22 freshwater is the deepest occurs in the Delta near Rio Vista. Near the valley  
23 margins and the Sutter Buttes, the base of freshwater is relatively shallow;  
24 suggesting that the base of freshwater may coincide with bedrock or connate  
25 water trapped in shallower deposits close to the basin margins  
26 (Berkstresser 1973).

27 Today, groundwater levels are generally in balance valley-wide, with pumping  
28 matched by recharge from the various sources annually. Some locales show the  
29 early signs of persistent drawdown, especially in areas where water demands are  
30 met primarily, and in some locales exclusively, by groundwater. These areas  
31 include portions of the far west side of the Sacramento Valley in Glenn County,  
32 portions of Butte County near Chico, in portions of Yolo County, and in the  
33 northern Sacramento County area. The persistent areas of drawdown could be  
34 early signs that the limits of sustainable groundwater use have been reached in  
35 these areas. Due to the drought that started in 2011, surface water supplies have  
36 declined and new wells have been installed. Between January and October 2014,  
37 over 100 water supply wells were drilled in both Shasta and Butte counties  
38 (DWR 2014d).

39 Land subsidence in the Sacramento Valley has resulted from inelastic deformation  
40 (non-recoverable changes) of fine-grained sediments related to groundwater  
41 withdrawal. Areas of subsidence from groundwater level declines have been  
42 measured in the Sacramento Valley at several locations. Subsidence monitoring  
43 was established following several studies in the 1990s that indicated more than  
44 four feet of subsidence since 1954 in some areas, such as in Yolo County  
45 (Ikehara 1994). Initial data from the Yolo County extensometers indicated

1 subsidence in the Zamora area, which has subsequently been confirmed with a  
2 countywide global positioning system network installed in 1999 and monitored in  
3 2002 and 2005. Subsidence up to 0.4 feet occurred between 1999 and 2005 in the  
4 Zamora area (Frame Surveying and Mapping 2006). The Zamora area does not  
5 currently use CVP or SWP water supplies. However, this area was designated as  
6 part of the CVP Sacramento Valley Irrigation Canals service area in the  
7 Reclamation Act of 1950 and as amended in the Reclamation Act of 1980 and  
8 Central Valley Project Improvement Act.

### 9 **7.3.3.1.2 Upper Sacramento Valley**

10 The Upper Sacramento Valley includes the Redding Groundwater Basin and  
11 upper portions of the Sacramento Valley Groundwater Basin (DWR 2003a). The  
12 Redding Groundwater Basin extends from approximately Redding in Shasta  
13 County through the northern portions of Tehama County. The portions of the  
14 Sacramento Valley Groundwater Basin in the Upper Sacramento Valley are  
15 located primarily in Tehama County with small portions extending into Glenn  
16 County near Orland and Butte County near Chico in the south. The geology of  
17 this area is dominated by the Tuscan and Tehama Formations. The hydrology of  
18 this area is dominated by numerous smaller drainages that originate in the Sierra  
19 Nevada, Cascade, and Coast Ranges and drain to the Sacramento River (DWR  
20 2003a).

#### 21 *Hydrogeology and Groundwater Conditions*

22 The Redding Groundwater Basin comprises the northernmost part of the  
23 Sacramento Valley and is bordered by the Klamath Mountains to the north, the  
24 Coast Ranges to the west, the Cascade Mountains to the east, and the Red Bluff  
25 Arch to the south. This basin consists of a sediment-filled, symmetrical,  
26 southward-dipping trough formed by folding of the marine sedimentary basement  
27 rock. These deposits are overlain by a thick sequence of inter-bedded,  
28 continentally-derived, sedimentary, and volcanic deposits of Late Tertiary and  
29 Quaternary age. The primary fresh water-bearing deposits in the basin are the  
30 Pliocene age volcanic deposits of the Tuscan Formation and the Pliocene age  
31 continental deposits of the Tehama Formation (DWR 2003a, 2003b, 2004a,  
32 2004b, 2004c, 2004d, 2004e, 2004f).

33 The Tehama Formation consists of unconsolidated to moderately consolidated  
34 coarse and fine-grained sediments derived from the Coast Ranges to the west.  
35 The Tehama Formation is up to 4,000 feet thick and varies in depth from a few  
36 feet to several hundred feet below the land surface, with depth generally  
37 increasing to the east towards the Sacramento River (DWR 2003a, 2004a, 2004b,  
38 2004c, 2004d, 2004e, 2004f). The Tuscan formation is derived from the Cascade  
39 Range to the east and is primarily composed of volcanoclastic sediments.

40 The Redding Groundwater Basin includes six subbasins: Anderson, Rosewood,  
41 Bowman, Enterprise, Millville, and South Battle Creek (DWR 2003a, 2004a,  
42 2004b, 2004c, 2004d, 2004e, 2004f). The Anderson subbasin is one of the main  
43 groundwater units in the Redding Basin. Groundwater levels in the unconfined  
44 and confined portions of the aquifer system fluctuate annually by 2 to 4 feet

1 during normal precipitation years and up to 10 to 16 feet during drought years  
 2 (DWR 2003b). Between spring 2010 and spring 2014 in the Redding  
 3 Groundwater Basin, recent information indicates that groundwater levels declined  
 4 at multiple wells by up to 10 feet. The groundwater levels in some areas declined  
 5 up to 10 feet between Fall 2013 and Fall 2014 (DWR 2014c, 2014d).

6 Tehama County overlies three subbasins within the Redding Groundwater Basin  
 7 and seven subbasins in the Sacramento Valley Groundwater Basin. The  
 8 Rosewood, South Battle Creek, and Bowman subbasins in the Redding  
 9 Groundwater Basin are located in Tehama County. The Red Bluff, Corning,  
 10 Bend, Antelope, Dye Creek, Los Molinos, and Vina subbasins in the Sacramento  
 11 Valley Groundwater Basin are located in Tehama County (DWR 2004b, 2004c,  
 12 2004f, 2004g, 2004h, 2004i, 2004j, 2004k, 2004l, 2006a). The Corning subbasin  
 13 extends into northern Glenn County near Orland. The Vina subbasin extends into  
 14 northern Butte County near Chico. Groundwater levels in these subbasins show a  
 15 significant seasonal variation due to high groundwater use for irrigation during  
 16 the summer months. Groundwater levels showed significant declines in some  
 17 wells associated with the 1976 to 1977 and 1987 to 1992 drought periods.  
 18 Groundwater levels appeared to recover quickly during subsequent wet years.  
 19 Groundwater levels in the Corning area of Tehama County showed a general  
 20 decline before 1965 due to increased groundwater pumping for agricultural uses.  
 21 Following construction by the CVP of the Tehama-Colusa Canal and the Corning  
 22 Canal, surface water was delivered to these areas and there was a subsequent  
 23 upward trend in groundwater levels following initial operations (Tehama County  
 24 Flood Control and Water Conservation District 1996). Between spring 2010 and  
 25 spring 2014 in the Upper portion of the Sacramento Valley Groundwater Basin,  
 26 recent information indicates that groundwater levels declined at multiple wells  
 27 approximately 2.5 feet to 10 feet (DWR 2014c, 2014d). The groundwater levels  
 28 in some areas declined up to 10 feet between fall 2013 and fall 2014, and in some  
 29 areas more than 10 feet.

30 Groundwater quality in the Redding Groundwater Basin is generally good to  
 31 excellent for most uses. Some areas of poor quality due to high salinity from  
 32 marine sedimentary rock exist at the margins of the basin. Portions of the basin  
 33 are characterized by high boron, iron, manganese, and nitrates in localized areas  
 34 (DWR 2004a, 2004b, 2004c, 2004d, 2004e, 2004f). In general, groundwater in  
 35 the Sacramento Valley Groundwater Basin within Tehama County is of excellent  
 36 quality, with some localized areas with groundwater quality concerns related to  
 37 boron, calcium, chloride, magnesium, nitrate, phosphorous, and TDS (DWR  
 38 2004g, 2004h, 2004i, 2004j, 2004k, 2004l, 2006a). In the vicinity of Antelope,  
 39 east of Red Bluff, historical high nitrates in groundwater occur. Higher boron  
 40 levels have been detected in wells located in the eastern portion of Tehama  
 41 County. High salinity occurs near Salt Creek, which most likely originates from  
 42 the Tuscan Springs, which is a source of high boron and sulfates.

43 The Vina subbasin was designated by the CASGEM program as high priority.  
 44 The Anderson, Enterprise, Bowman, Red Bluff, Corning, Antelope, Dye Creek,  
 45 and Los Molinos subbasins were designated medium priority. The Rosewood,

1 Millville, South Battle Creek, and Bend subbasins were designated very low  
2 priority in the June 2014 CASGEM designation.

3 *Groundwater Use and Management*

4 Tehama County uses groundwater to meet approximately 65 percent of its total  
5 water needs (Tehama County Flood Control and Water Conservation District  
6 2008). Groundwater in the county provides water supply for agricultural,  
7 domestic, environmental, and industrial uses.

8 One of the main users of groundwater in this area is the Anderson-Cottonwood  
9 Irrigation District. Approximately 5 percent of the irrigated acres rely upon  
10 groundwater (DWR 2003b). Groundwater also is the primary water supply for  
11 residences and small scale agricultural operations.

12 **7.3.3.1.3 Lower Sacramento Valley (West of Sacramento River)**

13 The Lower Sacramento Valley area west of the Sacramento River includes  
14 three main groundwater subbasins: Colusa, Yolo, and Solano (DWR 2003a,  
15 2004m, 2004n, 2006b).

16 *Hydrogeology and Groundwater Conditions*

17 *Colusa Subbasin*

18 The Colusa subbasin is bordered by the Coast Ranges to the west, Stony Creek to  
19 the north, Sacramento River to the east, and Cache Creek to the south. The  
20 Colusa subbasin extends primarily in western Glenn and Colusa counties. This  
21 subbasin is composed of continental deposits of late Tertiary age, including the  
22 Tehama and the Tuscan Formations, to Quaternary age, including alluvial and  
23 floodplain deposits as well as Modesto and Riverbank Formations. The Tehama  
24 Formation represents the main water bearing formation for the Colusa subbasin  
25 (DWR 2003b, 2006b). Groundwater levels are fairly stable in this subbasin,  
26 except during droughts, such as in 1976 and 1977 and 1987 to 1992 (DWR  
27 2013a). Groundwater levels in the Colusa subbasin declined in the 2008 drought,  
28 and increased during the wetter periods of 2010 and 2011 to the pre-drought 2008  
29 levels (DWR 2014c, 2014d). Historically, groundwater levels fluctuate by  
30 approximately 5 feet seasonally during normal and dry years (DWR 2006b,  
31 2013a). Recent information indicates that groundwater levels declined at multiple  
32 wells in the Colusa subbasin approximately 10 to 20 feet between spring 2010 and  
33 spring 2014 in southwestern Colusa subbasin (DWR 2014c, 2014d). The  
34 groundwater levels in some areas declined up to 10 feet between fall 2013 and fall  
35 2014, and in some areas more than 10 feet.

36 Groundwater quality for the Colusa subbasin is characterized by moderate to high  
37 TDS; with localized areas of high nitrate and manganese concentrations near the  
38 town of Colusa (DWR 2013a, 2006b). High TDS and boron concentrations have  
39 been observed near Knights Landing. High nitrate levels have been observed near  
40 Arbuckle, Knights Landing, and Willows.

41 The Colusa subbasin was designated by the CASGEM program as medium  
42 priority.

1        *Yolo Subbasin*

2        The Yolo subbasin lies to the south of the Colusa subbasin primarily within Yolo  
3        County. The primary water bearing formations for the Yolo subbasin are the  
4        same as those for the Colusa subbasin. Younger alluvium from flood basin  
5        deposits and stream channel deposits lie above the saturated zone and tend to  
6        provide significant well yields. In general, groundwater levels are stable in this  
7        subbasin, except during periods of drought, and in certain localized pumping  
8        depressions in the vicinity of Davis, Woodland, and Dunnigan and Zamora areas  
9        (DWR 2004m, 2013a). However, between spring 2010 and spring 2014 in the  
10       Yolo subbasin, recent information indicates that groundwater levels declined at  
11       multiple wells at least 10 feet and in some areas up to 20 feet (DWR 2014c,  
12       2014d). The groundwater levels in some areas declined up to 10 feet between fall  
13       2013 and fall 2014, and in some areas more than 10 feet.

14       Groundwater quality is generally good for beneficial uses except for localized  
15       impairments including elevated concentrations of boron in groundwater along  
16       Cache Creek and in the Cache Creek Settling Basin area, elevated levels of  
17       selenium present in the groundwater supplies for the City of Davis, and localized  
18       areas of nitrate contamination (DWR 2004m, 2013a). The cities of Davis and  
19       Woodland, which heavily rely on groundwater supply, lost nine municipal wells  
20       since 2011 due to high nitrate concentrations (YCFWCWCD 2012). Sources of  
21       high nitrate concentrations near these cities have been determined to be primarily  
22       from agricultural and wastewater operations. High salinity levels have also been  
23       reported in some areas that may be related to groundwater use for irrigation which  
24       tends to increase salt concentrations in groundwater.

25       In Yolo County, as much as 4 feet of groundwater withdrawal-related subsidence  
26       has occurred since the 1950s. Groundwater withdrawal-related subsidence has  
27       damaged or reduced the integrity of highways, levees, irrigation canals, and wells  
28       in Yolo County, particularly in the vicinities of Zamora, Knights Landing, and  
29       Woodland (Water Resources Association of Yolo County 2007).

30       The Yolo subbasin was designated by the CASGEM program as high priority.

31       *Solano Subbasin*

32       The Solano subbasin includes most of Solano County, southeastern Yolo County,  
33       and southwestern Sacramento County. In the Solano subbasin, general  
34       groundwater flow directions are from the northwest to the southeast  
35       (DWR 2004n, 2013a). Increasing agricultural and urban development in the  
36       1940s in the Solano subbasin has caused significant groundwater level declines.  
37       Today, groundwater levels are relatively stable but show significant declines  
38       during drought cycles. Groundwater level data also suggest that these declines  
39       tend to recover quickly during subsequent wet years. Between spring 2010 and  
40       spring 2014 in the Solano subbasin, recent information indicates that groundwater  
41       levels declined at multiple wells by at least 10 feet (DWR 2014c, 2014d).

42       Groundwater quality in the Solano subbasin is generally good and is deemed  
43       appropriate for domestic and agricultural use (DWR 2004n, 2013a). However,

1 TDS concentrations are moderately high in the central and southern areas of the  
2 basin with localized areas of high calcium and magnesium.

3 The Solano subbasin was designated by the CASGEM program as medium  
4 priority.

#### 5 *Groundwater Use and Management*

6 Many irrigators on the west side of the Sacramento Valley relied primarily on  
7 groundwater prior to completion of the CVP Tehama-Colusa Canal facilities  
8 which conveyed surface water to portions of Colusa County.

9 In the Colusa subbasin, although surface water is the primary source of water to  
10 meet water supply needs, groundwater is also used to assist in meeting  
11 agricultural, domestic, municipal, and industrial water needs, primarily in areas  
12 outside of established water districts. The Tehama Colusa Canal Authority  
13 service area is also an area of groundwater use in the Colusa subbasin. Although  
14 the Tehama-Colusa Canal Authority delivers surface water to agricultural users  
15 when the CVP water supplies are restricted due to hydrologic conditions, water  
16 users rely upon groundwater to supplement limited surface water supplies.

17 Groundwater is the source of water for municipal and domestic uses in Yolo  
18 County except for the City of West Sacramento, as described in Chapter 5,  
19 Surface Water Resources and Water Supplies. Recently, in normal years,  
20 approximately 40 percent of the irrigation users in Yolo County rely on  
21 groundwater (Yolo County 2009). For the East Yolo South area of the County  
22 (eastern Yolo subbasin), a 2006 study estimated that groundwater supplies  
23 about 80 to 85 percent of the total annual water demand in the county  
24 (YCFCWCD 2012).

25 Within Yolo and Sacramento counties portions of the Solano subbasin,  
26 groundwater is primarily used for domestic and irrigation uses. Within Solano  
27 County, groundwater is used exclusively by most rural residential landowners and  
28 the cities of Rio Vista and Dixon (Solano County 2008). The City of Vacaville  
29 uses groundwater to provide approximately 30 percent of the water supply. Other  
30 communities rely upon surface water, as described in Chapter 5, Surface Water  
31 Resources and Water Supplies. Irrigation users within the Solano Irrigation  
32 District rely upon surface water. All other irrigation users rely upon groundwater.

#### 33 **7.3.3.1.4 Lower Sacramento Valley (East of Sacramento River)**

34 The Lower Sacramento Valley area is located to the east of the Sacramento River,  
35 and includes seven groundwater subbasins: West Butte, East Butte, North Yuba,  
36 South Yuba, Sutter, North American, and South American (DWR 2003a, 2004o,  
37 2004p, 2004q, 2006c, 2006d, 2006e, 2006f).

#### 38 *Hydrogeology and Groundwater Conditions*

39 The aquifer system throughout the Lower Sacramento Valley east of the  
40 Sacramento River is composed of Tertiary to late Quaternary age deposits. The  
41 confined portion of the aquifer system includes the Tertiary-age Tuscan and  
42 Laguna formations. The Tuscan formation consists of volcanic mudflows, tuff

1 breccia, tuffaceous sandstone, and volcanic ash deposits. The Laguna formation  
 2 consists of moderately consolidated and poorly to well cemented interbedded  
 3 alluvial sand, gravel, and silt with a low permeability, overall. The Quaternary  
 4 portion of the aquifer system, typically unconfined, is largely composed of  
 5 unconsolidated gravel, sand, silt, and clay stream channel and alluvial fan  
 6 deposits. South and east of the Sutter Buttes, the deposits contain Pleistocene  
 7 alluvium, which is composed of loosely compacted silts, sands, and gravels that  
 8 are moderately permeable; however, nearly impermeable hardpans and claypans  
 9 also exist in this deposit, which restrict the vertical movement of groundwater  
 10 (DWR 2003a, 2004o, 2004p, 2004q, 2006c, 2006d, 2006e, 2006f).

11 *West and East Butte Subbasins*

12 The West Butte subbasin is located within Butte, Glenn, and Sutter counties. In  
 13 the West Butte subbasin, groundwater levels declined during the 1976 to 1977  
 14 and 1987 to 1992 droughts, followed by a recovery in groundwater levels to  
 15 pre-drought conditions of the early 1980s and 1990s (DWR 2004o, 2013a). A  
 16 comparison of spring-to-spring groundwater levels from the 1950s and 1960s, to  
 17 levels in the early 2000s, indicates about a 10-foot decline in groundwater levels  
 18 in portions of this subbasin. Several groundwater depressions exist in the Chico  
 19 area, due to year-round groundwater extraction for municipal uses. Between  
 20 spring 2010 and spring 2014 in the West Butte subbasin, recent information  
 21 indicates that groundwater levels declined at multiple wells at least 10 feet and in  
 22 some areas up to 20 feet near Chico (DWR 2014c, 2014d). The groundwater  
 23 levels in some areas declined up to 10 feet between fall 2013 and fall 2014.

24 The East Butte subbasin is located with Butte and Sutter counties. In the northern  
 25 portion of the East Butte subbasin, annual groundwater fluctuations in the  
 26 confined and semi-confined aquifer system ranges from 15 to 30 feet during  
 27 normal years (DWR 2004p, 2013a). In the southern part of Butte County,  
 28 groundwater fluctuations for wells constructed in the confined and semi-confined  
 29 aquifer system average 4 feet during normal years and up to 5 feet during drought  
 30 years. Between spring 2010 and spring 2014 in the East Butte subbasin, recent  
 31 information indicates that groundwater levels either increased or declined at  
 32 multiple wells by approximately 2 to 3 feet near Oroville (DWR 2014c, 2014d).

33 High nitrates occur near the Chico area in the West Butte subbasin. There are  
 34 localized areas in the subbasin with high boron, calcium, electrical conductivity  
 35 (EC), and TDS concentrations (DWR 2004 o, 2013a). There are several  
 36 groundwater areas near Chico that historically had high perchloroethylene  
 37 concentrations from industrial sites. Following implementation of groundwater  
 38 treatment, the chemicals have not been detected (Butte County 2010).

39 There are localized high concentrations of calcium, salinity, iron, manganese,  
 40 magnesium, and TDS throughout the East Butte subbasin (DWR 2004p, 2013a).

41 The West Butte subbasin was designated by the CASGEM program as high  
 42 priority. The East Butte subbasin was designated as medium priority.

1        *North and South Yuba Subbasins*

2        The North Yuba subbasin is located within Butte and Yuba counties. The South  
3        Yuba subbasin is located within Yuba County. In the North Yuba and South  
4        Yuba subbasins areas along the Feather River, the groundwater levels have been  
5        generally stable since at least 1960, with some seasonal fluctuations between  
6        spring and summer conditions. Groundwater levels in the central parts of the two  
7        subbasins declined until about 1980, when surface water deliveries were extended  
8        to these areas and groundwater levels started to rise. Hydrographs in the central  
9        portions of the North and South Yuba subbasins also show the effect of  
10       groundwater substitution transfers (during 1991, 1994, 2001, 2002, 2008, and  
11       2009), in the form of reduced groundwater levels followed by recovery to  
12       pre-transfer levels (YCWA 2010). Between spring 2010 and spring 2014 in the  
13       North Yuba and South Yuba subbasins, recent information indicates that  
14       groundwater levels declined at multiple wells by 10 to 20 feet, especially near  
15       Yuba City (DWR 2014c, 2014d). The groundwater levels in some areas declined  
16       up to 10 feet between fall 2013 and fall 2014.

17       Historical water quality data show that in most areas of the North and South Yuba  
18       subbasins, trends of increasing concentrations of calcium, bicarbonate, chloride,  
19       alkalinity, and TDS occur. In general, groundwater salinity increases with  
20       distance from the Yuba River. No groundwater quality impairments were  
21       documented at the DWR monitoring wells in the North Yuba subbasin  
22       (DWR 2006c). High salinity occurred in the Wheatland area of the South Yuba  
23       subbasin within the South Yuba Water District and Brophy Irrigation District  
24       (DWR 2006d; YCWA 2010).

25       The North Yuba and South Yuba subbasins were designated by the CASGEM  
26       program as medium priority.

27       *Sutter Subbasin*

28       The Sutter subbasin is located in Sutter County. In the Sutter subbasin,  
29       groundwater levels have remained relatively constant. The water table is very  
30       shallow and most groundwater levels in the subbasin tend to be within about  
31       10 feet of ground surface (DWR 2006e, 2013a). Between the spring 2010 and  
32       spring 2014 in the Sutter subbasin, recent information indicates that groundwater  
33       levels declined at multiple wells by up to 10 feet (DWR 2014c, 2014d). The  
34       groundwater levels in some areas declined up to 10 feet between fall 2013 and  
35       fall 2014, and in some areas more than 10 feet.

36       Groundwater quality in the western portion of the Sutter subbasin includes areas  
37       with high concentrations of arsenic, boron, calcium magnesium bicarbonate,  
38       chloride, fluoride, iron, manganese, sodium, and TDS. In the southern portion of  
39       the subbasin, groundwater in the upper aquifer system tends to be high in salinity  
40       (DWR 2003b, 2006e).

41       The Sutter subbasin was designated by the CASGEM program as medium  
42       priority.

1        *North American Subbasin*

2        The North American subbasin underlies portions of Sutter, Placer, and  
3        Sacramento Counties, including several dense urban areas. Since at least the  
4        1950s, concentrated groundwater extraction occurred east of downtown  
5        Sacramento, which resulted in a regionally extensive cone of depression.  
6        Drawdown in the wells in this areas have been in excess of 70 feet over the past  
7        60 years (SGA 2008). Water purveyors have constructed facilities to import  
8        surface water to allow groundwater levels to recover from the historic levels of  
9        drawdown. In general, since around the mid-1990s to the late 2000s, water levels  
10       remained stable in the southern portion of the subbasin and in some cases  
11       groundwater levels are continuing to increase slightly in response to increases in  
12       conjunctive use and reductions in pumping near McClellan Air Force Base  
13       (SGA 2014). Groundwater levels in Sutter and northern Placer Counties  
14       generally have remained stable, although some wells in southern Sutter County  
15       have experienced declines (DWR 2006f, 2013a). Overall, groundwater levels are  
16       higher along the eastern portion of the North American subbasin and decline  
17       towards the western portion (Roseville et al. 2007). There is a groundwater  
18       depression in the southern Placer-Sutter counties area near the border with  
19       Sacramento County. Between the spring 2010 and spring 2014 in the North  
20       American subbasin, recent information indicates that groundwater levels declined  
21       at multiple wells by up to 10 feet (DWR 2014c, 2014d). The groundwater levels  
22       were relatively constant between fall 2013 and fall 2014.

23       The area along the Sacramento River extending from Sacramento International  
24       Airport northward to the Bear River contains high levels of arsenic, bicarbonate,  
25       chloride, manganese, sodium, and TDS (DWR 2006f, 2013a). In an area between  
26       Reclamation District 1001 and the Sutter Bypass, high TDS concentrations occur.  
27       There have been three sites within the subbasin with significant groundwater  
28       contamination issues: the former McClellan Air Force Base, the Union Pacific  
29       Railroad Rail Yard in Roseville, and the Aerojet Superfund Site. Mitigation  
30       operations have been initiated for all of these sites. In the deeper portions of the  
31       aquifer, the groundwater geochemistry indicates the occurrence of connate water  
32       from the marine sediments underlying the freshwater aquifer, which mixes with  
33       the fresh water. Water quality concerns due to this type of geology include  
34       elevated levels of arsenic, bicarbonate, boron, chloride, fluoride, iron, manganese,  
35       nitrate, sodium, and TDS (DWR 2003b).

36       The North American subbasin was designated by the CASGEM program as high  
37       priority.

38       *South American Subbasin*

39       The South American subbasin is located within Sacramento County.  
40       Groundwater levels in the South American subbasin have fluctuated over the past  
41       40 years, with the lowest levels occurring during periods of drought. From 1987  
42       to 1995, water levels declined by about 10 to 15 feet and then recovered to levels  
43       close to the mid-80s by 2000. Over the past 60 years, a general lowering of  
44       groundwater levels was caused by intensive use of groundwater in the region.  
45       Areas affected by municipal pumping show a lower groundwater level recovery

1 than other areas (DWR 2004q, 2013a). A large cone of depression is centered in  
2 the southwestern portion of the subbasin. Between the spring 2010 and spring  
3 2014 in the South American subbasin, recent information indicates that  
4 groundwater levels declined at multiple wells by up to 10 feet (DWR 2014c, 2014d).  
5 The groundwater levels were relatively constant between fall 2013 and fall 2014.  
6 The groundwater quality is characterized by low to moderate TDS concentrations  
7 (DWR 2004q, 2013a). Seven sites historically had significant groundwater  
8 contamination, including three Superfund sites near the Sacramento metropolitan  
9 area. These sites are in various stages of cleanup.  
10 The South American subbasin was designated by the CASGEM program as high  
11 priority.

#### 12 *Groundwater Use and Management*

13 In this area, groundwater is used for agricultural, domestic, municipal, and  
14 industrial purposes. Most of the groundwater extraction occurs via privately  
15 owned domestic and agricultural wells.

#### 16 *West and East Butte Subbasins*

17 The primary water source in Butte County is surface water (approximately  
18 70 percent, by volume), and groundwater use accounts for about 30 percent of  
19 total county water use. In Butte County, most of the irrigation users rely upon  
20 surface water and approximately 75 percent of the residential water users rely  
21 upon groundwater (Butte County 2004, 2010).

22 The cities of Chico and Hamilton City are served by groundwater provided by  
23 California Water Service Company (California Water Service Company 2011g).

#### 24 *North and South Yuba Subbasins*

25 The Yuba County Water Agency actively manages surface water and groundwater  
26 conjunctively to prevent groundwater overdraft in the North and South Yuba  
27 subbasins. The majority of water demand in these subbasins is crop water use  
28 from irrigated agriculture (YCWA 2010).

#### 29 *Sutter Subbasin*

30 Agricultural water use in Sutter County is composed, on average, of  
31 approximately 60 percent surface water, 20 percent groundwater, and 20 percent  
32 of land irrigated by both surface water and groundwater. Permanent crops are  
33 predominantly irrigated with groundwater. Groundwater is also used for small  
34 communities and rural domestic uses (Sutter County 2011).

#### 35 *North American Subbasin*

36 Several agencies manage water resources in the North American subbasin: South  
37 Sutter Water District, Placer County Water Agency, Natomas Central Mutual  
38 Water Company, and several urban water purveyors which are part of the  
39 Sacramento Groundwater Authority (SGA), a joint powers authority (SGA 2014).  
40 The northern portion of this subbasin is rural and agricultural, while the southern  
41 portion is urbanized, including the Sacramento Metropolitan area. Many of the  
42 urban agencies in Placer County rely upon surface water for normal operations,

1 and have developed or are planning on developing groundwater for emergency  
 2 situations (Roseville et al. 2007). In the urban area encompassed by SGA, some  
 3 agencies rely entirely on groundwater for their water supply (SGA 2014).

4 Local planning efforts have been implemented in a local groundwater planning  
 5 area known as the American River Basin region. This area encompasses  
 6 Sacramento County and the lower watershed portions of Placer and El Dorado  
 7 counties, and overlies the productive North American and South American  
 8 subbasins. Groundwater is a regionally significant source of water supply, and is  
 9 used as a primary source for many agencies in the region. However, in recent  
 10 years, regional conjunctive use programs have allowed for the optimization of  
 11 water supplies and a decrease in groundwater use has been observed in the past  
 12 5 years (RWA 2013).

13 Since 2000, groundwater extraction decreased in the northeastern portion of the  
 14 North American subbasin as additional surface water supplies were made  
 15 available under conjunctive use operations implemented following the Water  
 16 Forum Agreement in 2000. In 2007, groundwater extraction increased because  
 17 additional surface water was not available due to dry surface water supply  
 18 conditions (SGA 2008, 2011).

19 *South American Subbasin*

20 The South American subbasin lies entirely within Sacramento County and is  
 21 overlain by a majority of urban and densely populated areas. Many of the water  
 22 users in this subbasin use surface water.

23 The main water purveyors that use South American subbasin groundwater include  
 24 the Elk Grove Water District, California-American Water Company, Golden State  
 25 Water Company, and the Sacramento County Water Agency. The entities serve  
 26 the communities of Antelope, Arden, Lincoln Oaks, Parkway, Rosemont, and  
 27 portions of the City of Rancho Cordova (California-American Water Company  
 28 2011; EGWD 2011; Golden State Water Company 2011; Sacramento County  
 29 Water Agency 2011). The majority of groundwater pumping is for agricultural  
 30 uses (SCGA 2010). The South American subbasin also includes portions of the  
 31 area known as the American River Basin, as described above under the North  
 32 American subbasin section.

33 **7.3.3.2 Delta**

34 The Delta overlies the western portion of the area where the Sacramento River  
 35 and San Joaquin River groundwater basins converge, as shown in Figure 7.5.  
 36 The Delta includes the Solano subbasin and the South American subbasin in the  
 37 Sacramento Valley Groundwater Basin (as described above); the Tracy subbasin,  
 38 the Eastern San Joaquin subbasin, and the Cosumnes subbasin in the San Joaquin  
 39 Valley Groundwater Basin (as described in subsequent sections of this chapter for  
 40 the San Joaquin); and the Suisun-Fairfield Valley Basin (as described in  
 41 subsequent sections of this chapter for the San Francisco Bay Area Region).

1 **7.3.3.2.1 Hydrogeology and Groundwater Conditions**

2 In some areas of the western and central Delta floodplain, floodplain deposits  
3 contain organic material (peat) that range in thickness from 0 to 150 feet. Below  
4 the surficial floodplain deposits, unconsolidated non-marine sediments occur, at  
5 depths of a few hundred feet near the Coast Range to nearly 3,000 feet near the  
6 eastern margin of the Sacramento Valley Groundwater Basin. These non-marine  
7 sediments form the major water-bearing formations in the Delta.

8 In general, shallow groundwater conditions and extensive groundwater-surface  
9 water interaction characterize the Delta. Spring runoff generated by melting snow  
10 in the Sierra Nevada increases flows in the Sacramento and San Joaquin rivers  
11 and their tributaries and cause groundwater levels near the rivers to rise. Because  
12 the Delta is a large floodplain and the shallow groundwater is hydraulically  
13 connected to the surface water, changes in river stages affect groundwater levels  
14 and vice versa. Groundwater levels in the central Delta are very shallow, and land  
15 subsidence on several islands has resulted in groundwater levels close to the  
16 ground surface. Maintaining groundwater levels below crop rooting zones is  
17 critical for successful agriculture, especially for islands that lie below sea level.  
18 Many farmers rely on an intricate network of drainage ditches and pumps to  
19 maintain groundwater levels of about 3 to 6 feet below ground surface. The  
20 accumulated agricultural drainage is discharged into adjoining surface water  
21 bodies (USGS 2000a). Without this drainage system, many of the islands would  
22 be subject to extremely high groundwater, bogs, or localized flooding.

23 Groundwater generally flows from the Sierra Nevada in the east toward the  
24 low-lying lands of the Delta to the west. However, a number of pumping  
25 depressions have reversed this trend, and groundwater inflow from the Delta  
26 toward these pumping areas has been observed, primarily in the Stockton area.

27 Subsidence in the Delta is well-documented and a major source of concern for  
28 farming operations. The oxidation of peat soils is the primary mechanism of  
29 subsidence in the Delta, and some areas are located below sea level. Another  
30 mechanism for subsidence is wind erosion. There is a possibility that certain  
31 areas in the Delta could continue to subside 2 to 4 more feet over the next  
32 35 years (DWR 2013i).

33 **7.3.3.2.2 Groundwater Use and Management**

34 Groundwater is used throughout the Delta for domestic and irrigation water  
35 supplies. Irrigation supplies are provided by wells and plant uptake in the root  
36 zone. An accurate accounting of groundwater used in the region is not available  
37 because wells are not metered and there is no method to measure root-zone  
38 irrigation.

39 Groundwater is used for potable water supplies by the Delta communities of  
40 Clarksburg, Courtland, Freeport, Hood, Isleton, Rio Vista, Ryde, and Walnut  
41 Grove. In the rural portions of the Delta, private groundwater wells provide  
42 residential and agricultural water supplies (Sacramento County 2010; Yolo  
43 County 2009; SCWA et al. 2005; Solano County 2008; San Joaquin County 2009;

1 Contra Costa County 2005). In some portions of the Delta, groundwater use is  
2 limited because of low well yields and poor water quality. Shallow groundwater  
3 in the western Delta may be saline due to hydraulic connection with western Delta  
4 waterways that are influenced by sea water intrusion. Shallow groundwater levels  
5 can be detrimental if the groundwater encroaches into the crop root zones.  
6 Therefore, groundwater pumping frequently is used to drain shallow groundwater  
7 and surface water from agricultural fields.

8 **7.3.3.3 Suisun Marsh**

9 To the west, the Suisun Marsh overlies the Suisun–Fairfield Valley subbasin. The  
10 Suisun-Fairfield Groundwater Basin is adjacent to, but hydrogeologically distinct  
11 from, the Sacramento River Groundwater Basin, and is adjacent to Suisun Bay.  
12 This basin is bounded by the Coast Ranges to the north and west and the  
13 Sacramento River Groundwater Basin in the east, as shown in Figure 7.5. It is  
14 separated from the Sacramento River Groundwater Basin by the English Hills.

15 **7.3.3.3.1 Hydrogeology and Groundwater Conditions**

16 In the Suisun-Fairfield Valley Groundwater Basin, freshwater occurs within the  
17 alluvial deposits that overlie the Sonoma volcanics (Travis AFB 1997;  
18 USGS 1960).

19 The overall direction of groundwater flow in the Suisun-Fairfield Valley  
20 Groundwater Basin is from the uplands toward Suisun Marsh (USGS 1960;  
21 Reclamation et al. 2011). Depth to groundwater varies seasonally, with higher  
22 groundwater levels occurring during the rainy season (Solano County 2008).  
23 Prior to implementation of the Solano Project that conveys water into Solano  
24 County from Lake Berryessa as part of the Solano Project and the SWP North  
25 Bay Aqueduct, groundwater depressions were occurring near Fairfield.  
26 Following importation of surface water from the Solano Project and the North  
27 Bay Aqueduct, surface water was used more extensively to reduce the  
28 groundwater overdraft (Solano County 2008; Travis AFB 1997). Few  
29 groundwater monitoring sites exist in the basin, and most are near ongoing  
30 groundwater investigations. Data from these groundwater investigations suggest  
31 that groundwater levels in the basin are generally stable.

32 Groundwater quality issues within the Suisun-Fairfield Valley Groundwater Basin  
33 include high boron, TDS, and volatile organic compound concentrations near  
34 Travis Air Force Base (USGS 1960, 2008). Volatile organic compound plumes at  
35 Travis Air Force Base are largely contained on base, but volatile organic  
36 compound constituents have migrated up to 0.5-mile off base at three sites.  
37 Containment and remediation is occurring at each of these sites (Travis  
38 AFB 2005).

39 The Suisun-Fairfield Valley Groundwater Basin was designated by the CASGEM  
40 program as very low priority.

1 **7.3.3.3.2 Groundwater Use and Management**

2 Information on groundwater supplies in the Suisun-Fairfield Valley Groundwater  
3 Basin is limited. Groundwater was the primary water source for the Suisun-  
4 Fairfield Valley Groundwater Basin, including the cities of Fairfield and Suisun  
5 City, through the 1950s. This groundwater production resulted in local areas of  
6 depressed groundwater levels. As surface water became available, groundwater  
7 use declined. Studies have shown that the basin provides low well yields and  
8 therefore is probably not used as a major water supply (Reclamation et al. 2011).  
9 Many private well owners in the Suisun-Fairfield Valley Groundwater Basin use  
10 groundwater for irrigation. However, due to the brackish quality of the  
11 groundwater, surface water is used for potable water supplies  
12 (Reclamation et al. 2011).

13 **7.3.3.4 San Joaquin Valley**

14 The San Joaquin Valley Groundwater Basin extends from the Sacramento-San  
15 Joaquin Delta in the north to the Tehachapi Mountains in the South. Groundwater  
16 is estimated to provide over 47 percent of the overall water supply in the  
17 San Joaquin Valley, including 70 percent of municipal uses and 43 percent of  
18 irrigation supplies from 2005 through 2010 (DWR 2013i). The San Joaquin  
19 Valley has an average annual precipitation between 5 to 18 inches. Due to the  
20 low amounts of average annual precipitation, limited surface water supply and  
21 extensive agricultural water use, there are areas of significant overdraft that exist  
22 in the San Joaquin Valley Groundwater Basin. Eight subbasins in the San Joaquin  
23 Valley Groundwater Basin were identified in a state of critical overdraft:  
24 Chowchilla, Eastern San Joaquin, Madera, Kings, Kaweah, Tule, Tulare Lake,  
25 and Kern (DWR 1980). Three of these subbasins are on the eastern side of the  
26 San Joaquin River: Eastern San Joaquin, Chowchilla, and Madera. Recent studies  
27 have indicated that overdraft continues to exist in these subbasins (DWR 2013i).  
28 By 1970, over 5,200 square miles of irrigable land had subsided by a minimum of  
29 1 foot. The maximum subsidence occurred near Mendota at almost 30 feet  
30 (9 meters) (Reclamation 2013a). Due to the drought that started in 2011, surface  
31 water supplies have declined and new wells have been constructed. Between  
32 January and October 2014, over 100 wells were drilled in both Kern and Kings  
33 counties, almost 200 in Stanislaus County, almost 250 in Merced County, and  
34 over 350 in both Fresno and Tulare counties (DWR 2014d).

35 The elevation of the base of freshwater in the western and central San Joaquin  
36 Valley ranges from 600 to 800 feet below mean sea level (WWD 2013). This  
37 area has experienced subsidence of up to 28 feet between 1926 and 1970  
38 (USGS 2009). The water quality of the semi-perched aquifer on the western side  
39 of the San Joaquin Valley is impaired with high salinity, selenium, and boron  
40 concentrations. These constituents are from both naturally occurring deposits in  
41 the Coast Ranges to the west and agricultural activities. The chemicals become  
42 trapped in the soil matrix due to the low permeability clay layers close to the  
43 surface. There are also localized areas with high concentrations of naturally  
44 occurring arsenic or selenium.

1 Portions of the San Joaquin Valley Groundwater Basin in the Cosumnes, Tracy,  
2 and Eastern San Joaquin subbasins were designated by the State Water Resources  
3 Control Board in 2000 as Hydrogeologically Vulnerable Areas and Groundwater  
4 Protection Areas based on hydrogeologic permeability. These areas could be  
5 more vulnerable to groundwater quality impairment if applied surface water,  
6 including recycled water, contained high concentrations of constituents of concern  
7 to the beneficial users of the groundwater (CVRWQCB 2014b).

8 **7.3.3.4.1 Northern Portions of the San Joaquin Valley Groundwater Basin**

9 Extending south into the Central Valley from the Delta to the southern extent  
10 marked by the San Joaquin River, DWR has delineated nine subbasins within the  
11 northern portion of the San Joaquin Valley Groundwater Basin based on  
12 groundwater divides, barriers, surface water features, and political boundaries  
13 (DWR 2003a), as shown in Figure 7.6. The Cosumnes, Eastern San Joaquin, and  
14 Tracy subbasins partially underlie the Delta. The Delta-Mendota, Modesto,  
15 Turlock, Merced, Chowchilla, and Madera subbasins are located between the  
16 Delta and the San Joaquin River.

17 The northern portion of the San Joaquin Valley Groundwater Basin is marked by  
18 laterally extensive deposits of thick fine-grained materials deposited in lacustrine  
19 and marsh depositional systems. These units, which can be tens to hundreds of  
20 feet thick, create vertically differentiated aquifer systems within the subbasins.  
21 The Corcoran Clay (or E-Clay), occurs in the Tulare Formation and separates the  
22 alluvial water-bearing formations into confined and unconfined aquifers. The  
23 direction of groundwater flow generally coincides with the primary direction of  
24 surface water flows in the area, which is to the northwest toward the Delta  
25 (DWR 2003a, 2004r, 2004s, 2004t, 2004u, 2006g, 2006h, 2006k). Groundwater  
26 levels fluctuate seasonally and a strong correlation exists between depressed  
27 groundwater levels and periods of drought, when more groundwater is pumped in  
28 the area to support agricultural operations.

29 Water users in the northern portion of the San Joaquin Valley Groundwater Basin  
30 rely upon groundwater, which is used conjunctively with surface water for  
31 agricultural, industrial, and municipal supplies (DWR 2003a). Groundwater is  
32 estimated to account for about 38 percent of the overall water supply in the  
33 northern portion of the San Joaquin Valley Groundwater Basin (DWR 2013i).  
34 Annual groundwater pumping in the northern portion of the San Joaquin Valley  
35 Groundwater Basin accounts for about 19 percent of all groundwater pumped in  
36 the state of California. Groundwater use in the northern portion of the San  
37 Joaquin Valley Groundwater Basin is estimated to average 3.2 million acre-feet  
38 per year between 2005 and 2010.

39 According to the Draft California Water Plan 2013 Update (DWR 2013i), three  
40 planning areas within the northern portion of the San Joaquin Valley Groundwater  
41 Basin rely heavily on groundwater pumping: the Eastern Valley Floor Planning  
42 Area, the Lower Valley Eastside Planning Area, and the Valley West Side  
43 Planning Area. Each of these areas has limited local surface water supplies and

1 uses extensive groundwater pumping for their agricultural water supply  
2 (DWR 2013i).

3 The northern portion of the San Joaquin Valley Groundwater Basin discussion is  
4 divided into two sub-regions: West of the San Joaquin River, and East of the  
5 San Joaquin River, as described below.

6 *West of the San Joaquin River*

7 The Tracy and the Delta-Mendota subbasins are located on the west side of the  
8 San Joaquin River.

9 *Hydrogeology and Groundwater Conditions*

10 Along the western portion of the San Joaquin Valley, the Tulare formation  
11 comprises the primary freshwater aquifer. The Tulare Formation originated as  
12 reworked sediments from the Coast Ranges re-deposited in the San Joaquin  
13 Valley as alluvial fan, flood basin, deltaic (pertaining to a delta) or lacustrine, and  
14 marsh deposits (USGS 1986).

15 *Tracy Subbasin*

16 The Tracy subbasin underlies eastern Contra Costa County and western  
17 San Joaquin County. A large portion of the subbasin is located within the Delta.  
18 In the Tracy subbasin, groundwater generally flows from south to north and  
19 discharges into the San Joaquin River. According to DWR and the San Joaquin  
20 County Flood Control and Water Conservation District, groundwater levels in the  
21 Tracy subbasin have been relatively stable over the past 10 years, apart from  
22 seasonal variations resulting from recharge and pumping (DWR 2006g, 2013b).  
23 Recent information indicates that between the spring 2010 and spring 2014,  
24 groundwater levels declined at some wells in the Tracy subbasin by up to 10 feet  
25 (DWR 2014c, 2014d). The groundwater levels in some areas declined up to  
26 10 feet between fall 2013 and fall 2014, and in some areas more than 10 feet.

27 In the Tracy subbasin, areas of poor water quality exist throughout the area.  
28 Elevated chloride concentrations are found along the western side of the subbasin  
29 near the City of Tracy and along the San Joaquin River. Overall, Delta  
30 groundwater wells in the Tracy subbasin are characterized by high levels of  
31 chloride, TDS, arsenic, and boron (DWR 2006g, 2013b; USGS 2006). The  
32 Central Valley Regional Water Quality Board recently adopted general waste  
33 discharge requirements to protect groundwater, as well as surface water, within  
34 the San Joaquin County and Delta areas, including the Tracy subbasin  
35 (CVRWQCB 2014b). Supporting information recognizes the potential for  
36 groundwater impairment due to the water quality of applied water to crops if the  
37 applied water quality contains high concentrations of constituents of concern.

38 The Tracy subbasin was designated by the CASGEM program as medium  
39 priority.

40 *Delta-Mendota Subbasin*

41 The Delta-Mendota subbasin underlies portions of Stanislaus, Merced, Madera,  
42 and Fresno counties. The geologic units present in the Delta-Mendota subbasin  
43 consist of the Tulare Formation, terrace deposits, alluvium, and flood-basin

1 deposits. Groundwater occurs in three water-bearing zones: the lower zone  
 2 contains confined fresh water in the lower section of the Tulare Formation; the  
 3 upper zone contains confined, semi-confined, and unconfined water in the upper  
 4 section of the Tulare formation; and a shallow zone that contains unconfined  
 5 water (DWR 2006h, 2013b). The groundwater is characterized by moderate to  
 6 extremely high salinity with localized areas of high iron, fluoride, nitrate, and  
 7 boron (DWR 2006h, 2013b).

8 In the Delta-Mendota subbasin, groundwater levels have generally declined by as  
 9 much as 20 feet in the northern portion of the basin near Patterson between 1958  
 10 and 2006. Surface water imports in the early 1970s resulted in decreased  
 11 pumping, and a steady recovery of groundwater levels. However, the lack of  
 12 imported surface water availability during the drought periods of 1976 to 77, 1986  
 13 to 1992, and 2007 to 2009 resulted in increases in groundwater pumping, and  
 14 associated declines in groundwater levels to near-historic lows (USGS 2012).  
 15 Recent information indicates that between the spring 2010 and spring 2014,  
 16 groundwater levels declined at some wells in the Delta-Mendota subbasin by up  
 17 to 20 feet (DWR 2014c, 2014d).

18 In areas adjacent to the Delta-Mendota Canal in this subbasin, extensive  
 19 groundwater withdrawal has caused land subsidence of up to 10 feet in some  
 20 areas. Land subsidence can cause structural damage to the Delta-Mendota Canal  
 21 which has caused operational issues for CVP water delivery. Historical wide-  
 22 spread soil compaction and land subsidence between 1926 and 1970 has caused  
 23 reduced freeboard and flow capacity of the Delta-Mendota Canal, the California  
 24 Aqueduct, other canals, and roadways in the area. To better understand  
 25 subsidence issues near the Delta-Mendota Canal and improve groundwater  
 26 management in the area, the U.S. Geological Survey (USGS) provided and  
 27 evaluated information on groundwater conditions and the potential for additional  
 28 land subsidence in the San Joaquin Valley (USGS 2013a). Results show that at  
 29 least 1.8 feet of subsidence occurred near the San Joaquin River and the Eastside  
 30 Bypass from 2008 to 2010 period, affecting the southern part of the Delta-  
 31 Mendota Canal by about 0.8 inches of subsidence during the same period. It was  
 32 estimated that subsidence rates doubled in 2008 in some areas. The subsidence  
 33 measured was primarily inelastic (or permanent, not reversible, due to the  
 34 compaction of fine-grained material). The area of maximum active subsidence is  
 35 shown to be located southwest of Mendota and extends into the Merced subbasin  
 36 to the south of El Nido. Land subsidence in this area is expected to continue to  
 37 occur due to uncertainties and limitations (especially climate-related changes) in  
 38 surface water supplies to meet irrigation demand and the continuous need to  
 39 supplement water supply with groundwater pumping.

40 *Groundwater Use and Management*

41 In this area, groundwater is used for agricultural, domestic, municipal, and  
 42 industrial purposes.

1            *Tracy Subbasin*

2    The primary water source in Contra Costa County is surface water. Groundwater  
3    is used by individual homes and businesses and the communities of Brentwood,  
4    Bethel Island, Knightsen, Byron and Discovery Bay (Contra Costa County 2005).  
5    The Diablo Water District groundwater blending facility provides water to users  
6    in the City of Oakley by blending groundwater and treated water from Contra  
7    Costa Water District (DWD 2011).  
8    Contra Costa Water District has an agreement with the East Contra Costa  
9    Irrigation District to purchase surplus irrigation water for municipal and industrial  
10   purposes in East Contra Costa Irrigation District’s service area (CCWD 2011).  
11   The agreement includes an option to implement an exchange of surface water for  
12   groundwater that can be used in the Contra Costa Water District service area  
13   when the CVP allocations are less than full contract amounts. This groundwater  
14   exchange water was implemented during the 2007 to 2009 drought.  
15   Groundwater and surface water are used within western San Joaquin County for  
16   agricultural operations and for the cities of Stockton, Lathrop, and Tracy  
17   (San Joaquin 2009). In the 1980s, about 30 percent of the water supplies in  
18   San Joaquin County were based on groundwater (including the Tracy, Cosumnes,  
19   and Eastern San Joaquin subbasins). By 2007, groundwater was used to supply  
20   over 60 percent of water demand in the county.

21           *Delta-Mendota Subbasin*

22   Groundwater is used for agricultural and domestic water supplies in the  
23   Delta-Mendota subbasin (Reclamation and DWR 2011). Groundwater is  
24   primarily used for domestic and industrial water supplies in Stanislaus County,  
25   including for the City of Patterson (Stanislaus County 2010; Patterson 2014). In  
26   the Delta-Mendota subbasin within Merced County, approximately 3 percent of  
27   groundwater withdrawals are used for municipal and industrial purposes  
28   (including uses in the city of Gustine, Los Banos, and Santa Nella), and  
29   97 percent of the groundwater withdrawals are used for agricultural purposes  
30   (Merced County 2012). Most of the portions of Madera County within the  
31   Delta-Mendota subbasin use groundwater for domestic and agricultural uses  
32   (Madera County 2002, 2008). In portions of Western Fresno County within the  
33   Delta-Mendota subbasin, domestic water users rely upon groundwater (including  
34   the cities of Mendota and Firebaugh), and agricultural water users rely upon  
35   surface water and/or groundwater (Mendota 2009; Firebaugh 2015;  
36   Fresno County 2000).

37           *East of the San Joaquin River*

38   The east side of the San Joaquin River is underlain by seven groundwater  
39   subbasins: the Cosumnes, Eastern San Joaquin, Modesto, Turlock, Merced,  
40   Chowchilla, and Madera subbasins. Three of these subbasins are in a critical state  
41   of overdraft: the Chowchilla, Eastern San Joaquin, and Madera (DWR 2013i).

1        *Hydrogeology and Groundwater Conditions*

2 Several of the hydrogeologic units present in the southern Sacramento Valley  
3 extend south into the San Joaquin Valley. Along the eastern boundary of the  
4 Central Valley, the Ione, Mehrten, Riverbank, and Modesto formations are  
5 primarily composed of sediments originating from the Sierra Nevada.  
6 Historically, surface water and groundwater were hydraulically connected in most  
7 areas of the San Joaquin River and its tributaries. This resulted in a significant  
8 quantity of groundwater actively discharging into streams in most of this  
9 watershed. However this condition changed as increased groundwater pumping  
10 in the area lowered groundwater levels and reversed the hydraulic gradient  
11 between the surface water and groundwater systems, resulting in surface water  
12 recharging the underlying aquifer system through streambed seepage. Long-term  
13 groundwater production throughout this basin has lowered groundwater levels  
14 faster than natural recharge rates. Areas where this overdraft has occurred include  
15 eastern San Joaquin County, Merced County, and western Madera County. This  
16 occurs along the San Joaquin River where the riverbed is highly permeable and  
17 river water readily seeps into the underlying aquifer. This condition reduces  
18 groundwater and surface water outflows to the Delta, lowers the water table, and  
19 may increase the potential for land subsidence (USFWS 2012).

20 Generally, the groundwater in the San Joaquin River subbasins east of the San  
21 Joaquin River is of suitable quality for most urban and agricultural uses with only  
22 local impairments. There are localized areas with high concentrations of boron,  
23 chloride, iron, nitrate, TDS, and organic compounds (DWR 2003a, 2004r, 2004s,  
24 2004t, 2004u, 2006i, 2006j, 2006k). The use of groundwater for agricultural  
25 supply is impaired in western Stanislaus and Merced counties due to elevated  
26 boron concentrations. Groundwater use for drinking water supply is also  
27 impaired in the Tracy, Modesto-Turlock, Merced, and Madera areas due to  
28 elevated nitrate concentrations (USFWS 2012).

29 Dibromochloropropane (DBCP), a soil fumigant that was extensively used on  
30 grapes and cotton before it was banned, is prevalent in groundwater near Merced  
31 and Stockton and in the Merced, Modesto, Turlock, Cosumnes, and Eastern San  
32 Joaquin subbasins (CVRWQCB 2011; DWR 2004r; USFWS 2012). Many areas  
33 with high concentrations of DBCP have undergone groundwater remediation, and  
34 the DBCP concentrations are declining.

35 Declining groundwater levels in the subbasins east of the San Joaquin River have  
36 resulted in an area approximately 16-miles long with high salinity due to saltwater  
37 intrusion from the Delta (USFWS 2012).

38        *Cosumnes Subbasin*

39 The Cosumnes subbasin underlies western Amador County, northwestern  
40 Calaveras County, southeastern Sacramento County, and northeastern San  
41 Joaquin County. Groundwater levels in the Cosumnes subbasin have fluctuated  
42 significantly over the past 40 years, with the lowest levels occurring during  
43 periods of drought. From 1987 to 1995, water levels declined by about 10 to  
44 15 feet and then recovered by that same amount through 2000. Areas affected by

1 municipal pumping show a lower magnitude of groundwater level recovery  
2 during this period than in other areas of the subbasin (DWR 2006i, 2013b).  
3 Within the portion of Sacramento County in the Cosumnes subbasin, it is  
4 estimated that the recent average annual decline in groundwater levels has been  
5 approximately 1 foot, with a lower rate of decline in more recent years (South  
6 Area Water Council 2011). Recent information indicates that between the spring  
7 2010 and spring 2014, groundwater levels declined at some wells in the  
8 Cosumnes subbasin by up to 10 feet (DWR 2014c, 2014d).

9 The Cosumnes subbasin contains groundwater of very good quality, with  
10 localized high concentrations of calcium bicarbonate and pesticides  
11 (DWR 2006i, 2013b).

12 The Cosumnes subbasin was designated by the CASGEM program as medium  
13 priority.

#### 14 *Eastern San Joaquin Subbasin*

15 The Eastern San Joaquin subbasin underlies western Calaveras County, a large  
16 portion of San Joaquin County, and a portion of Stanislaus County. Groundwater  
17 levels in the Eastern San Joaquin subbasin have continuously declined in the past  
18 40 years due to groundwater overdraft. Cones of depression are present near  
19 major pumping centers such as the City of Stockton and the City of Lodi  
20 (DWR 2006j, 2013b). Groundwater level declines of up to 100 feet have been  
21 observed in some wells. In the 1990s, groundwater levels were so low that many  
22 wells were inoperable and many groundwater users were obligated to construct  
23 new deeper wells (NSJCGBA 2004). Recent information indicates that between  
24 the spring 2010 and spring 2014, groundwater levels declined at some wells in the  
25 Eastern San Joaquin subbasin by up to 20 feet (DWR 2014c, 2014d).

26 In the Eastern San Joaquin subbasin, the groundwater is characterized with low to  
27 high salinity levels and localized areas of high calcium or magnesium  
28 bicarbonate, salinity, nitrates, pesticides, and organic constituents (DWR 2006j,  
29 2013b). The high groundwater salinity is attributed to poor-quality groundwater  
30 intrusion from the Delta caused by the pumping-induced decline in groundwater  
31 levels, especially in the groundwater underlying the Stockton area since the 1970s  
32 (SJCFCWCD 2008). High chloride concentrations have also been observed in the  
33 Eastern San Joaquin subbasin. Ongoing studies are evaluating the sources of  
34 chloride in groundwater along a line extending from Manteca to north of  
35 Stockton. Initial concern was that long-term overdraft conditions in the eastern  
36 portion of the subbasin were enabling more saline water from the Delta to migrate  
37 inland. Other possible sources include upward movement of deeper saline  
38 formation water and agricultural practices (USGS 2006). In addition, large areas  
39 of groundwater with elevated nitrate concentrations have been observed in several  
40 portions of the subbasin, such as areas southeast of Lodi and south of Stockton  
41 and east of Manteca, and in areas extending towards the San Joaquin-Stanislaus  
42 County line (USFWS 2012).

43 The Eastern San Joaquin subbasin was designated by the CASGEM program as  
44 high priority.

1                    *Modesto Subbasin*

2    The Modesto subbasin underlies northern Stanislaus County. In the Modesto  
3    subbasin, water levels have declined nearly 15 feet on average between 1970 and  
4    2000 (DWR 2004r, 2013b), with the major declines occurring in the eastern  
5    portion of the subbasin. Recent information indicates that between the spring  
6    2010 and spring 2014, groundwater levels declined at some wells in the Modesto  
7    subbasin by up to 20 feet (DWR 2014c, 2014d).

8    The groundwater is characterized by low to high TDS concentrations with  
9    localized areas of boron, chlorides, DBCP, iron, manganese, and nitrate  
10    concentrations (DWR 2004r, 2013b; Stanislaus County 2010).

11    The Modesto subbasin was designated by the CASGEM program as high priority.

12                    *Turlock Subbasin*

13    The Turlock subbasin underlies portions of Stanislaus and Merced counties. In  
14    the Turlock subbasin, water levels declined nearly 7 feet on average from 1970  
15    through 2000 (DWR 2006k, 2013b). Comparison of groundwater contours from  
16    1958 and 2006 shows that historically, groundwater flows occurred from east to  
17    west, toward the San Joaquin River. Groundwater pumping centers to the east of  
18    the City of Turlock have drawn the groundwater toward these cones of  
19    depression, allowing less water to flow toward the San Joaquin River, and  
20    diminishing the discharge of groundwater to the river. Recent information  
21    indicates that between the spring 2010 and spring 2014, groundwater levels  
22    declined at some wells in the Turlock subbasin by up to 20 feet (DWR 2014c,  
23    2014d). The storage capacity of the Turlock subbasin is estimated at about  
24    15,800,000 acre-feet (DWR 2006k, 2013b).

25    The groundwater quality is characterized with low to high concentrations of TDS  
26    and localized high concentrations of boron, chlorides, DBCP, nitrates, and TDS  
27    (DWR 2013b).

28    The Turlock subbasin was designated by the CASGEM program as high priority.

29                    *Merced Subbasin*

30    The Merced subbasin underlies most of Merced County. In the Merced subbasin,  
31    water levels have declined nearly 30 feet on average from 1970 through 2000.  
32    Water level declines have been more severe in the eastern portion of the subbasin  
33    (DWR 2004s, 2013b). The estimated specific yield of the groundwater subbasin  
34    is 9 percent. Recent information indicates that between the spring 2010 and  
35    spring 2014, groundwater levels declined at some wells in the Merced subbasin  
36    by up to 20 feet (DWR 2014c, 2014d).

37    The groundwater quality is characterized by low to high TDS concentrations and  
38    localized areas with high concentrations of chloride, DBCP, iron, and nitrate  
39    (DWR 2004s, 2013b; USFWS 2012).

40    The Merced subbasin was designated by the CASGEM program as high priority.

1                    *Chowchilla Subbasin*

2    The Chowchilla subbasin underlies southwestern Merced County and  
3    northwestern Madera County. In the Chowchilla subbasin, water levels declined  
4    nearly 40 feet on average from 1970 to 2000. Water level declines were more  
5    severe in the eastern portion of the subbasin from 1980 to present, but the western  
6    portion of the subbasin showed the strongest declines before 1980 (DWR 2004t,  
7    2013b). Groundwater recharge in this subbasin is primarily from irrigation water  
8    percolation. Recent information indicates that between the spring 2010 and  
9    spring 2014, groundwater levels declined at some wells in the western Chowchilla  
10   subbasin by up to 10 feet (DWR 2014c, 2014d).

11   There are localized areas with high concentrations of chloride, iron, nitrate, and  
12   hardness (DWR 2004t, 2013b). Organic chemicals were detected in some wells  
13   in the Chowchilla subbasin between 1983 and 2003 (CVRWQCB 2011).

14   The Chowchilla subbasin was designated by the CASGEM program as high  
15   priority.

16                    *Madera Subbasin*

17   The Madera subbasin underlies most of Madera County. In the Madera subbasin,  
18   water levels have declined nearly 40 feet on average from 1970 through 2000.  
19   Water level declines have been more severe in the eastern portion of the subbasin  
20   from 1980 to the present, but the western subbasin showed the strongest declines  
21   before this period (DWR 2004u, 2013b). Recent information indicates that  
22   between the spring 2010 and spring 2014, groundwater levels declined at some  
23   wells in the western Chowchilla subbasin by up to 10 feet (DWR 2014c, 2014d).

24   Groundwater in the Madera subbasin is characterized by low to high TDS and  
25   localized areas with high concentrations of chlorides, iron, nitrates, and hardness  
26   (DWR 2004u, 2013b). Occurrences of organic chemicals have been observed  
27   including DBCP and pesticides (CVRWQCB 2011; DWR 2004u, 2013b).

28   The Madera subbasin was designated by the CASGEM program as high priority.

29                    *Groundwater Use and Management*

30   In this area, groundwater is used for agricultural, domestic, municipal, and  
31   industrial purposes.

32                    *Cosumnes Subbasin*

33   Currently, urban and agricultural water users on the valley floor are reliant on  
34   groundwater for water supply. Water demands in the Cosumnes Subbasin area  
35   are supported by nearly 95 percent groundwater (South Area Water Council  
36   2011). Groundwater and surface water are used for agricultural and domestic  
37   water supplies in the Cosumnes subbasin (CVRWQCB 2011). Groundwater is  
38   used by many agricultural water users and the community of Galt  
39   (CVRWQCB 2011; South Area Water Council 2011).

40   The Central Valley Regional Water Quality Board recently adopted general waste  
41   discharge requirements to protect groundwater, as well as surface water, within  
42   the San Joaquin County and Delta areas, including the Cosumnes subbasin. The

1 new requirements do not address protection of groundwater related to use of  
2 recycled water on crops because those operations would require separate  
3 discharge permits from the Central Valley Regional Water Quality Board and are  
4 not anticipated to be widely used in this area due to availability of recycled water  
5 near farms. However, the supporting information recognizes the potential for  
6 groundwater impairment due to the water quality of applied water to crops if the  
7 applied water quality contains high concentrations of constituents of concern  
8 (CVRWQCB 2014b).

9 *Eastern San Joaquin Subbasin*

10 Groundwater and surface water are used for agricultural and domestic water  
11 supplies in the Eastern San Joaquin subbasin (CVRWQCB 2011). Groundwater  
12 is the major source of water supply for agricultural areas in eastern San Joaquin  
13 County (NSJCGBA 2007). Groundwater is used by many agricultural water users  
14 and the communities of Escalon, Lodi, Manteca, Ripon, and Stockton  
15 (NSJCGBA 2004, 2007). The cities of Manteca and Stockton use both groundwater  
16 and surface water, while Lodi, Escalon, and Ripon primarily use groundwater for  
17 their municipal needs.

18 The City of Stockton uses both surface water and groundwater for its municipal  
19 and industrial water needs. Due to overdraft of the aquifer beneath Stockton, the  
20 city has limited annual groundwater extraction. All of these demands on the finite  
21 groundwater resources available in the basin historically have resulted in annual  
22 groundwater withdrawals in excess of the natural recharge volume in the East San  
23 Joaquin subbasin (DWR 2003a, 2006j). This extensive use of groundwater to  
24 meet local demand results in localized overdraft conditions within the subbasin.

25 The Northeastern San Joaquin County Groundwater Banking Authority is a joint-  
26 powers authority that develops local projects to strengthen water supply reliability  
27 in Eastern San Joaquin County. The Northeastern San Joaquin County  
28 Groundwater Banking Authority facilitated the development and adoption of the  
29 Eastern San Joaquin Groundwater Basin Groundwater Management Plan and  
30 completed an Integrated Regional Water Management Plan (IRWMP). This plan  
31 outlines the requirements for an integrated conjunctive use program that takes into  
32 account the various surface water and groundwater facilities in eastern San  
33 Joaquin County and promotes better groundwater management to meet future  
34 basin demands (NSJCGBA 2004). Conjunctive use refers to the use and  
35 management of the groundwater resource in coordination with surface water  
36 supplies by users overlying the basin. Potential projects that could be  
37 implemented to improve groundwater conditions in the area include urban and  
38 agricultural water use efficiency projects, recycled municipal water projects,  
39 groundwater banking operations, new surface water storage opportunities,  
40 improved conveyance facilities, and utilizing new sources of surface water  
41 (NSJCGBA 2007). Pursuant to the IRWMP, a program-level Environmental  
42 Impact Report identified potential changes to the environmental and mitigation  
43 measures to reduce identified significant adverse impacts (NSJCGBA 2011).

44 The Farmington Groundwater Recharge Program led by Stockton East Water  
45 District, in conjunction with the U.S. Army Corp of Engineers, and other local

1 water agencies, was developed to utilize flood-season and excess irrigation water  
2 supplies in the Eastern San Joaquin groundwater subbasin to recharge the  
3 groundwater aquifer. This program supports replenishment of a critically  
4 overdrafted groundwater basin by recharging an average of 35,000 acre-feet of  
5 water annually into the Eastern San Joaquin subbasin. The program includes  
6 recharge of surface water on 800 to 1,200 acres of land using direct field-  
7 flooding. In addition, the program increases surface water deliveries in-lieu of  
8 groundwater pumping to reduce overdraft (Farmington Program 2012).
