**Chapter 10****1 Terrestrial Biological Resources****2 10.1 Introduction**

3 This chapter describes terrestrial biological resources in the study area; and  
4 potential changes that could occur as a result of implementing the alternatives  
5 evaluated in this Environmental Impact Statement (EIS). Implementation of the  
6 alternatives could affect terrestrial biological resources through potential changes  
7 in operation of the Central Valley Project (CVP) and State Water Project (SWP)  
8 and ecosystem restoration.

**9 10.2 Regulatory Environment and Compliance  
10 Requirements**

11 Potential actions that could be implemented under the alternatives evaluated in  
12 this EIS could affect terrestrial biological resources in areas: along the shorelines  
13 and in the waters of reservoirs that store CVP and SWP water supplies, along  
14 rivers and waterways (including bypasses) impacted by changes in the operations  
15 of CVP or SWP reservoirs, within agricultural areas served by CVP and SWP  
16 water supplies, and modified to provide wetland habitat. Actions located on  
17 public agency lands; or implemented, funded, or approved by Federal and state  
18 agencies would need to be compliant with appropriate Federal and state agency  
19 policies and regulations, as summarized in Chapter 4, Approach to  
20 Environmental Analyses.

**21 10.3 Affected Environment**

22 This section describes terrestrial biological resources that could potentially be  
23 affected by implementing the alternatives considered in this EIS. Changes in  
24 terrestrial biological resources due to changes in CVP and SWP operations may  
25 occur in the Trinity River, Central Valley, San Francisco Bay Area, Central Coast,  
26 and Southern California regions.

27 Terrestrial biological resources occur throughout the study area. However, the  
28 analysis in this EIS is focused on terrestrial biological resources that could be  
29 directly or indirectly affected by the implementation of the alternatives analyzed  
30 in this EIS. The areas that could be affected are related to specific areas: 1) along  
31 the shorelines of reservoirs that store CVP and SWP water supplies, 2) along  
32 rivers downstream of CVP or SWP reservoirs, 3) areas with wetland habitat  
33 restoration in the Yolo Bypass and Suisun Marsh, 4) wildlife refuges that receive  
34 CVP water supplies, 5) riparian corridors within the Delta, and 6) within  
35 agricultural acreage that is irrigated with CVP and SWP water supplies.

1 Therefore, the following description of the affected environment is limited to  
2 these areas.

3 **10.3.1 Overview of Species with Special Status**

4 Species with special status are defined as species that are legally protected or  
5 otherwise considered sensitive by Federal, state, or local resource agencies,  
6 including:

- 7 • Species listed by the Federal government as threatened or endangered,
- 8 • Species listed by the State of California as threatened, endangered, or rare  
9 (rare status is for plants only),
- 10 • Species that are formally proposed for Federal listing or are candidates for  
11 Federal listing as threatened or endangered,
- 12 • Species that are candidates for State listing as threatened or endangered,
- 13 • Species that meet the definitions of rare, threatened, or endangered under  
14 California Environmental Quality Act,
- 15 • Species identified by the U.S. Fish and Wildlife Service (USFWS) as Birds of  
16 Conservation Concern,
- 17 • Species considered sensitive by the U.S. Bureau of Land Management (BLM)  
18 or U.S. Forest Service (USFS),
- 19 • Species identified by California Department of Fish and Wildlife (CDFW) as  
20 species of special concern, species designated by California statute as fully  
21 protected (e.g., California Fish and Game Code, sections 3511 [birds],  
22 4700 [mammals], and 5050 [reptiles and amphibians] and 5515 [fish]) or bird  
23 species on the CDFW Watch List, and
- 24 • Species, subspecies, and varieties of plants considered by CDFW and  
25 California Native Plant Society (CNPS) to be rare, threatened, or endangered  
26 in California. The CNPS Inventory of Rare and Endangered Plants of  
27 California assigns California Rare Plant Ranks (CRPR) categories for plant  
28 species of concern. Only plant species in CRPR categories 1 and 2 are  
29 considered special status plant species in this document:
  - 30 – CRPR 1A—Plants presumed to be extinct in California.
  - 31 – CRPR 1B—Plants that are rare, threatened, or endangered in California  
32 and elsewhere.
  - 33 – CRPR 2—Plants that are rare, threatened, or endangered in California but  
34 more common elsewhere.

35 A listing of wildlife and plant species with special status that occur or may occur  
36 in portions of the study area and are affected by the long-term coordinated  
37 operation of the CVP and SWP is provided in Appendix 10A. Relevant  
38 documents used to assemble these resource lists include the list of Federal  
39 endangered and threatened species that occur in or may be affected by projects in

1 the counties within the study area generated on-line from the USFWS Sacramento  
2 Fish and Wildlife Office.

3 To supplement the U.S. Fish and Wildlife lists, the California Natural Diversity  
4 Database (CNDDDB) was queried (DFG 2012) for regions where recent  
5 documentation was lacking. This included the Stanislaus River corridor between  
6 New Melones Dam and the San Joaquin River confluence, and the Trinity River  
7 Region, including Trinity Lake, Lewiston Reservoir, Whiskeytown Lake, and  
8 Clear Creek between Carr Powerhouse and the Sacramento River confluence.

### 9 **10.3.1.1 Critical Habitat**

10 Critical habitat refers to areas designated by the USFWS for the conservation of  
11 species listed as threatened or endangered under the Endangered Species Act of  
12 1973, as amended through the 108<sup>th</sup> Congress (ESA). When a species is proposed  
13 for listing under the ESA, the USFWS considers whether there are certain areas  
14 essential to the conservation of the species. Critical habitat is defined in  
15 Section 3, Provision 5 of the ESA as follows.

16 *(5)(A) The term “critical habitat” for a threatened or endangered species*  
17 *means -*

18 *(i) the specific areas within the geographical area occupied by*  
19 *a species at the time it is listed in accordance with the Act, on*  
20 *which are found those physical or biological features*  
21 *(I) essential to the conservation of the species, and (II) which*  
22 *may require special management considerations or protection;*  
23 *and*

24 *(ii) specific areas outside the geographical area occupied by a*  
25 *species at the time it is listed in accordance with the provisions*  
26 *of section 4 of this Act, upon a determination by the Secretary*  
27 *that such areas are essential for the conservation of the*  
28 *species.*

29 Any Federal action (permit, license, or funding) in critical habitat requires that  
30 Federal agency to consult with the USFWS where the action has potential to  
31 adversely modify the habitat for terrestrial species.

32 The federally listed wildlife and plant species considered in this EIS that have  
33 designated critical habitat areas that could be affected by modification of CVP  
34 and SWP operations are presented in Table 10.1 below. There are occurrences of  
35 critical habitat of other species not included in Table 10.1 or other locations of  
36 critical habitat of the species listed in Table 10.1 which are not included below  
37 because those occurrences are not located within the CVP or SWP service areas  
38 or in areas that could be affected by modification of CVP and SWP operations,  
39 such as lands located at high elevations within national forests where CVP and  
40 SWP water is not delivered.

1  
2**Table 10.1 Terrestrial Species with Designated Critical Habitat in Portions of the Study Area that Could Be Affected by Changes in CVP and SWP Operations**

<b>Species</b>	<b>Regions*</b>	<b>Counties</b>
Least Bell's Vireo	Central Coast and Southern California	Riverside, San Bernardino, San Diego, Santa Barbara, Ventura
Buena Vista Lake Shrew	Central Valley	Kern
Fresno Kangaroo Rat	Central Valley	Fresno
California Tiger Salamander	Central Valley	Alameda, Kern, Kings, Madera, Merced, San Benito, San Joaquin, Santa Barbara, Solano, Stanislaus, Tulare, Yolo
California Red-legged Frog	Central Valley, San Francisco Bay Area, Central Coast, Southern California	Alameda, Butte, Contra Costa, El Dorado, Kern, Kings, Los Angeles, Merced, Nevada, Placer, San Benito, San Joaquin, Santa Barbara, Santa Clara, Solano, Stanislaus, Ventura, Yuba
Alameda Whipsnake	Central Valley and San Francisco Bay Area	Alameda, San Joaquin, Santa Clara
Valley Elderberry Longhorn Beetle	Central Valley	Sacramento
Conservancy Fairy Shrimp	Central Valley	Butte, Merced, Solano, Stanislaus, Tehama, Ventura
Longhorn Fairy Shrimp	Central Valley	Alameda, Contra Costa, Merced
Vernal Pool Fairy Shrimp	Central Valley and San Francisco Bay Area	Alameda, Butte, Contra Costa, Fresno, Glenn, Madera, Merced, Placer, Sacramento, San Benito, San Joaquin, Santa Barbara, Shasta, Solano, Stanislaus, Tehama, Tulare, Ventura, Yuba
Vernal Pool Tadpole Shrimp	Central Valley	Alameda, Colusa, Kings, Madera, Merced, Sacramento, Shasta, Solano, Stanislaus, Tehama, Tulare, Yolo, Yuba
Butte County Meadowfoam	Central Valley	Butte, Tehama
Colusa Grass	Central Valley	Merced, Stanislaus, Yolo
Hairy Orcutt Grass	Central Valley	Butte, Fresno, Madera, Merced, Stanislaus, Tehama
San Joaquin Hairy Orcutt Grass	Central Valley	Fresno, Madera, Merced, Tulare
Slender Orcutt Grass	Central Valley	Plumas, Sacramento, Shasta, Tehama

Species	Regions*	Counties
Sacramento Orcutt Grass	Central Valley	Sacramento
Solano Grass	Central Valley	Yolo
Contra Costa Goldfields	Central Valley	Solano
Contra Costa Wallflower	Central Valley and San Francisco Bay Area	Contra Costa, Sacramento
Fleshy Owl's-Clover	Central Valley	Madera, Merced, Sacramento, San Joaquin, Stanislaus
Greene's Tuctoria	Central Valley	Madera, Merced, Shasta, Stanislaus, Tehama
Hoover's Spurge	Central Valley	Butte, Merced, Tehama, Tulare
Keck's Checker-Mallow	Central Valley	Fresno
Soft Bird's-Beak	Central Valley and San Francisco Bay Area	Contra Costa, Solano
Suisun Thistle	Central Valley	Solano

1 Source: USFWS 2014a - 2014aj

2 Note:

3 \* Only includes critical habitat within lands served by CVP or SWP water or in areas that  
 4 could be affected by modification of CVP and SWP operations. Therefore, does not  
 5 include lands where CVP and SWP water is not delivered or not affected by CVP and  
 6 SWP operations.

### 7 **10.3.2 Trinity River Region**

8 The Trinity River Region includes the area along the Trinity River from Trinity  
 9 Lake to the confluence with the Klamath River; and along the lower Klamath  
 10 River from the confluence with the Trinity River to the Pacific Ocean. The  
 11 Trinity River Region includes Trinity Lake, Lewiston Reservoir, the Trinity River  
 12 between Lewiston Reservoir and the confluence with the Klamath River, and  
 13 along the lower Klamath River.

14 The Trinity River includes the mainstem, North Fork Trinity River, South Fork  
 15 Trinity River, New River, and numerous smaller streams (NCRWQCB et al.  
 16 2009; USFWS et al. 1999). The mainstem of the Trinity River flows 170 miles to  
 17 the west from the headwaters to the confluence with the Klamath River. As  
 18 described in Chapter 5, Surface Water Resources and Water Supplies, the CVP  
 19 Trinity Lake and Lewiston Reservoir are located upstream of the confluences of  
 20 the Trinity River and the North Fork, South Fork, and New River. Flows on the  
 21 North Fork, South Fork, and New River are not affected by CVP facilities. The  
 22 Trinity River flows approximately 112 miles from Lewiston Reservoir to the  
 23 Klamath River through Trinity and Humboldt counties and the Hoopa Indian  
 24 Reservation within Trinity and Humboldt counties. The Trinity River is the  
 25 largest tributary to the Klamath River (DOI and DFG 2012).

1 The lower Klamath River flows 43.5 miles from the confluence with the Trinity  
2 River to the Pacific Ocean (USFWS et al. 1999). Downstream of the Trinity  
3 River confluence, the Klamath River flows through Humboldt and Del Norte  
4 counties and through the Hoopa Indian Reservation, Yurok Indian Reservation,  
5 and Resighini Indian Reservation within Humboldt and Del Norte counties (DOI  
6 and DFG 2012). There are no dams located in the Klamath River watershed  
7 downstream of the confluence with the Trinity River. The Klamath River estuary  
8 extends from approximately 5 miles upstream of the Pacific Ocean. This area is  
9 generally under tidal effects and salt water can occur up to 4 miles from the  
10 coastline during high tides in summer and fall when Klamath River flows are low.

11 As described in subsection 10.3.2, Overview of Species with Special Status, a  
12 listing of wildlife and plant species with special status that occur or may occur in  
13 portions of the study area affected by the long-term coordinated operation of the  
14 CVP and SWP is provided in Appendix 10A.

#### 15 **10.3.2.1 Trinity Lake and Lewiston Reservoir**

16 The dominant vegetation community in the Trinity River watershed upstream of  
17 Trinity Lake and Lewiston Reservoir includes mixed conifer, with ponderosa  
18 pine, sugar pine, and Douglas-fir as the dominant species. Some south-facing  
19 slopes are dominated by oak and brush. Mixed hardwood communities occur at  
20 lower elevations, and include species such as madrone, big-leaf maple, and a  
21 variety of oaks. The shrub community at lower elevations includes a number of  
22 chaparral species such as manzanita, bitterbrush, and deerbrush. South-facing  
23 slopes around Trinity Lake contain shrub fields that provide winter range for the  
24 Weaverville deer herd (USFS 2005; STNF 2014)

25 Along the margins of Trinity Lake and Lewiston Reservoir, vegetation is  
26 consistent with species associated with a reservoir environment and standing  
27 water, including floating species, rooted aquatic species, and emergent wetland  
28 species. Emergent wetland and riparian vegetation is constrained by fluctuating  
29 water levels and steep banks (NCRWQCB et al. 2009; USFWS et al. 1999).

30 The reservoirs attract resting and foraging waterfowl and other species that favor  
31 standing or slow moving water. Impounded water in the reservoirs also provides  
32 foraging habitat for eagles and other raptors that prey on fish (e.g., ospreys) and  
33 waterfowl.

34 Recently, ten pairs of mating bald eagles were observed at Trinity Lake and three  
35 pairs at Lewiston Lake (USFS 2012).

#### 36 **10.3.2.2 Trinity River from Lewiston Reservoir to Klamath River**

37 Current terrestrial habitat along the Trinity River is different than habitat prior to  
38 construction of Trinity and Lewiston dams. The ongoing Trinity River  
39 Restoration Program is restoring portions of the habitat. The following  
40 description reflects recent habitat changes along the mainstem of the Trinity River  
41 between Lewiston Reservoir and the confluence of the Klamath River.

#### 1 **10.3.2.2.1 Trinity River Restoration Program**

2 The hydrologic and geomorphic changes following construction of the Trinity and  
3 Lewiston dams changed the character of the river channel substantially and  
4 allowed riparian vegetation to encroach on areas that had previously been scoured  
5 by flood flows (USFWS et al. 1999). This resulted in the formation of a riparian  
6 berm that armored and anchored the river banks and prevented meandering of the  
7 river channel. The berm reduced the potential for encroachment and maturation  
8 of woody vegetation along the stabilized channel. In addition, the extent of  
9 wetlands probably declined following dam construction due, in part, to reduced  
10 flows and elimination of river meanders.

11 The ongoing Trinity River Restoration Program includes specific minimum  
12 instream flows, as described in Chapter 5, Surface Water Resources and Water  
13 Supplies; mechanical channel rehabilitation; fine and coarse sediment  
14 management; watershed restoration; infrastructure improvement; and adaptive  
15 management components (NCRWQCB et al. 2009; USFWS et al. 1999). The  
16 mechanical channel rehabilitation includes removal of fossilized riparian berms  
17 that had been anchored by extensive woody vegetation root systems and  
18 consolidated sand deposits, and thereby, had confined the river. Following  
19 removal of the berms, the areas had been re-vegetated to support native  
20 vegetation, re-establish alternate point bars, and re-establish complex fish habitat  
21 similar to conditions prior to construction of the dams. Sediment management  
22 activities include introduction of coarse sediment at locations to support spawning  
23 and other aquatic life stages; and relocation of sand outside of the floodway. In  
24 areas closer to Lewiston Dam with limited gravel supply, gravel/cobble point bars  
25 are being rebuilt to increase gravel storage and improve channel dynamics.  
26 Riparian vegetation planted on the restored floodplains and flows will be  
27 managed to encourage natural riparian growth on the floodplain and limit  
28 encroachment on the newly formed gravel bars. Improvement projects have been  
29 completed and others are under construction or in the planning phases. The  
30 restoration actions are occurring between Lewiston Dam and the North Fork.

#### 31 **10.3.2.2.2 Terrestrial Habitat**

32 Between the North Fork and the South Fork, the Trinity River channel is  
33 restricted by steep canyon walls that limit riparian vegetation to a narrow band  
34 (NCRWQCB et al. 2009; USFWS et al. 1999). Between the South Fork and the  
35 confluence with the Klamath River, there are confined reaches with little riparian  
36 vegetation, alternating with vegetation similar to the pre-dam conditions in the  
37 upper reach below Lewiston dam.

38 Many wildlife species that inhabited river and riparian habitats prior to dam  
39 construction still occur along the Trinity River. Species that prefer early-  
40 successional stages or require greater riverine structural diversity are likely to be  
41 less abundant under current conditions (NCRWQCB et al. 2009; USFWS et al.  
42 1999). For example, western pond turtle declined since completion of the dams in  
43 response to diminishing instream habitat. In contrast, species such as northern

1 goshawk and black salamander that favor mature, late-successional riparian  
2 habitats increased with more upland habitat along the riparian corridor.

3 Current habitats along the Trinity River include annual grassland, fresh emergent  
4 wetland, montane riparian, valley-foothill riparian, and riverine habitats  
5 (NCRWQCB et al. 2009, 2013). The annual grassland species include grasses  
6 (e.g., wild oat, soft brome, ripgut brome, cheatgrass, and barley); forbs  
7 (e.g., broadleaf filaree, California poppy, true clover, and bur clover); and native  
8 perennial species (e.g., Creeping Wildrye). The annual grassland habitat supports  
9 Mourning Dove, Savannah Sparrow, White-Crowned Sparrow, American Kestrel,  
10 Red-Tailed Hawk, coyote, California Ground Squirrel, Botta's Pocket Gopher,  
11 California Kangaroo Rat, Deer Mouse, Gopher Snake, Western Fence Lizard,  
12 Western Skink, Western Rattlesnake, and Yellow-Bellied Racer. The fresh  
13 emergent wetland species occur along the backwater areas, depressions, and along  
14 the river edges, including American Tule, Narrow-Leaved Cattail, Dense Sedge,  
15 Perennial Ryegrass, Himalayan Blackberry, and Narrow-Leaved Willow.  
16 Wildlife species along the fresh emergent wetland include Western Toad, Pacific  
17 Chorus Frog, Bullfrog, Green Heron, Mallard, and Red-Winged Blackbird. The  
18 montane riparian habitat adjacent to the river include trees, including bigleaf  
19 maple, white alder, oregon ash, black cottonwood, and Goodding's black willow;  
20 and understory species, including mugwort, virgin's bower, American dogwood,  
21 oregon golden-aster, dalmatian toadflax, white sweet clover, musk monkeyflower,  
22 straggly gooseberry, California grape, and California blackberry. The valley-  
23 foothill riparian habitat occur along alluvial fans, slightly dissected terraces, and  
24 floodplains; and include cottonwood, California sycamore, valley oak, white  
25 alder, boxelder, Oregon ash, wild grape, wild rose, California blackberry, blue  
26 elderberry, poison oak, buttonbush, willow, sedge, rushes, grasses, and miner's  
27 lettuce. Riparian woodlands along the montane riparian habitat support breeding,  
28 foraging, and roosting habitat for tree swallow, bushtit, White-Breasted Nuthatch,  
29 Nuttall's Woodpecker, Downy Woodpecker, Spotted Towhee, and Song Sparrow;  
30 cover for amphibians, including Western Toad and Pacific Chorus Frog; and  
31 habitat for deer mouse, raccoon, and Virginia Opossum. The riverine habitat  
32 supports amphibians and reptiles, including Western Toad, Pacific Chorus Frog,  
33 bullfrog, and Western Pond Turtle; birds, including mallard, Great Blue Heron,  
34 Osprey, and Belted Kingfisher; and mammals, including river otter, beaver, Big  
35 Brown Bat, and Yuma Myotis (bat).

36 The lands upslope of the Trinity River are characterized by mixed chaparral,  
37 montane hardwood-conifer, blue oak-foothill pine, foothill pine, and Klamath  
38 mixed conifer (NCRWQCB et al. 2009, 2013). The trees include Pacific  
39 madrone, bigleaf maple, canyon live oak, black oak, blue oak, ponderosa pine,  
40 Douglas fir, and incense cedar. Shrubs include greenleaf manzanita, buckbrush,  
41 cascara, snowberry, and poison oak. Underlying herbaceous vegetation includes  
42 ripgut brome, blue wild rye, silver bush lupine, purple sanicle, false hedge-  
43 parsley, The habitats support numerous birds, including Northern Flicker,  
44 Stellar's Jay, Hairy Woodpecker, Acorn Woodpecker, Wrentit, Bewick's Wren,  
45 California Quail, Mountain Quail, Blue Grouse, Sharp-Shinned Hawk, Red-Tailed  
46 Hawk, and Great Horned Owl; mammals including Black-Tailed Deer, Gray Fox,

1 coyote, Black-Tailed Jackrabbit, Raccoon, Virginia Opossum, Spotted Skunk,  
 2 Gray Squirrel, Allen's Chipmunk, Deer Mouse, and Pallid Bat; and reptiles and  
 3 amphibians, including California Kingsnake, Western Rattlesnake, Sharp-Tailed  
 4 Snake, Western Fence Lizard, Southern Alligator Lizard, and Ensatina.

5 Inundation of lands by Trinity Lake, Lewiston Reservoir, and Whiskeytown Lake  
 6 inundated approximately 20,500 acres of habitat for an estimated 8,500 black-  
 7 tailed deer (USFWS 1975). The CDFW established a deer herd management plan  
 8 for the Critical Winter Range for the Weaverville deer herd. A portion of the  
 9 winter range is located along the Trinity River (NCRWQCB et al. 2009).

### 10 **10.3.2.3 Lower Klamath River Watershed from Trinity River to the** 11 **Pacific Ocean**

12 The Klamath River from the confluence with the Trinity River to the Pacific  
 13 Ocean is characterized by a forested river canyon with riparian vegetation  
 14 occurring along the channel. There is a greater diversity of riparian vegetation  
 15 along the lower Klamath River below the mouth of the Trinity River, partly as a  
 16 result of a more natural hydrograph on the Klamath River than exists on the  
 17 Trinity River. Plant species composition changes as the Klamath River nears the  
 18 Pacific Ocean; because the river slows, temperatures increase, and the tides  
 19 affect salinity.

20 Grazing, timber harvest, and roads have degraded riparian conditions along the  
 21 lower Klamath River (Yurok Tribe 2000). Riparian areas are dominated by  
 22 deciduous trees including red alder. Red alder is a typical hardwood in riparian  
 23 zones, tanoak is a typical hardwood on mid to upper slopes, and Pacific madrone  
 24 occurs in small stands on drier sites (Green Diamond Resource Company 2006).

25 The broad lower Klamath River meanders within the floodplain and supports  
 26 wetland habitats similar to those that existed pre-dam along the Trinity River.  
 27 Wetland habitats along the lower Klamath River are dominated by cattails, tules,  
 28 and a variety of rushes and sedges. As the river nears the ocean, salt-tolerant  
 29 plants such as cord grass and pickleweed increase in abundance as the salinity  
 30 increases (USFWS et al. 1999). Wildlife species in the lower Klamath River  
 31 watershed are similar to those found in the Trinity River watershed.

### 32 **10.3.3 Central Valley Region**

33 The Central Valley Region extends from above Shasta Lake to the Tehachapi  
 34 Mountains, and includes the Sacramento Valley, San Joaquin Valley, Delta, and  
 35 Suisun Marsh.

36 The Central Valley Region includes portions of the Sacramento Valley and San  
 37 Joaquin Valley; including the Delta, Suisun Marsh, and the Yolo Bypass. The  
 38 areas where terrestrial biological resources could potentially be affected include  
 39 the fluctuation zones associated with reservoirs; river margins influenced by the  
 40 magnitude, duration, and frequency of flows; and agricultural lands and refuges  
 41 served by CVP and SWP water supplies.

1 The Central Valley Region is predominantly made up of lowlands and plains  
2 surrounded by foothills and tall mountains of the Coast Ranges to the west, the  
3 Cascade Range to the north, the Sierra Nevada Mountains to the east, and the  
4 Tehachapi Mountains to the south. Communities of various sizes and an  
5 extensive network of roadways are located throughout the valley.

6 Land use within the Sacramento Valley and San Joaquin Valley is dominated by  
7 agriculture and urban development. Grassland and oak woodland habitats occur  
8 in the foothills, particularly in the mid-elevation eastern margin of the Sacramento  
9 and San Joaquin valleys. Coniferous forests, mixed hardwood/coniferous forests,  
10 and oak woodlands generally represent the dominant vegetation surrounding CVP  
11 and SWP reservoirs. Riparian vegetation is generally constrained to narrow  
12 ribbons immediately adjacent to creeks and rivers. Many of the wetlands and  
13 riparian areas that once occurred in the Central Valley have been eliminated as a  
14 consequence of land use conversion to agriculture and urbanization.

### 15 **10.3.3.1 Overview of Terrestrial Communities**

16 This section describes the terrestrial communities in the Central Valley Region  
17 that could be affected directly or indirectly by operations of the CVP and SWP.  
18 These communities are broadly described for lakes/reservoirs (including open  
19 water and drawdown areas); rivers (including open water and riparian and  
20 floodplain areas); wetlands; and agricultural lands that could be affected by  
21 changes in water deliveries and ecosystem restoration activities. Other  
22 communities are described for areas that could be affected by restoration activities  
23 related to the proposed action and alternatives.

#### 24 **10.3.3.1.1 Lake/Reservoir Communities**

25 Reservoirs that store CVP and SWP water supplies provide habitat used by some  
26 terrestrial species, either within the open water area of the reservoirs or along the  
27 margins and in the drawdown areas.

##### 28 *Open Water Areas*

29 As described in Chapter 5, Surface Water Resources and Water Supplies, water  
30 surface elevations in reservoirs that store CVP and SWP water supplies change  
31 seasonally and annually due to hydrologic and operational variables. The open  
32 water areas of these reservoirs are used as foraging and resting sites by waterfowl  
33 and other birds, and by semi-aquatic mammals such as river otter and beaver.  
34 Bald Eagles and Ospreys nest in forests at the margins of these reservoirs, and  
35 frequently use the reservoirs to forage for fish.

##### 36 *Margin and Drawdown Areas*

37 The CVP and SWP reservoirs in the Central Valley are generally located in  
38 canyons where the surrounding slopes are dominated by upland vegetation such  
39 as woodland, forest, and chaparral. The water surface elevations in these  
40 reservoirs fluctuate within the inundation area, as described in Chapter 5, Surface  
41 Water Resources and Water Supplies, between maximum allowed storage  
42 elevations and minimum elevations defined by the lowest elevation on the intake  
43 structure. Along the water surface edge of the inundation area, the soils are

1 usually shallow. Soil is frequently lost to wave action and periodic inundation,  
 2 followed by severe desiccation when the water elevation declines, which  
 3 generally results in a barren drawdown zone around the perimeter of the  
 4 reservoirs. Natural regeneration of vegetation within the drawdown zone is  
 5 generally prevented by the timing of seed release when reservoir levels are high in  
 6 the spring, lack of sediment replenishment necessary for seedling establishment in  
 7 the spring, and high temperatures combined with low soil moisture levels of  
 8 exposed soils in the summer.

9 Lack of vegetative cover within the drawdown zone can limit wildlife use of this  
 10 area. Rapidly rising reservoir levels can potentially result in direct mortality of  
 11 some sedentary wildlife species or life stages within the drawdown zone of  
 12 reservoirs. As reservoir levels drop, energy expenditures can increase for  
 13 piscivorous (fish-eating) birds foraging in the reservoirs as these species must  
 14 travel greater distances to forage (DWR 2004a).

### 15 **10.3.3.1.2 Riverine Communities**

16 The rivers and streams influenced by the long-term coordinated operation of the  
 17 CVP and SWP support habitats for plants and wildlife. The primary components  
 18 of the riverine environment that support plants and wildlife, including open water  
 19 areas and adjacent riparian and floodplain communities (including bypasses that  
 20 are inundated at high flows), are described below.

#### 21 *Open Water Areas*

22 The riverine environment downstream of reservoirs is managed generally for  
 23 water supply and flood control purposes. As such, the extent of open water in the  
 24 rivers varies somewhat predictably, although not substantially, within and among  
 25 years. In the wetter years when bypasses and floodplains are inundated, vast  
 26 areas of open water become available during the flood season, generally in the  
 27 late winter and early spring. Open water portions of riverine systems provide  
 28 foraging habitat for fish eating birds and waterfowl. Gull, Tern, Osprey, and Bald  
 29 Eagle forage over open water. Near shore and shoreline areas provide foraging  
 30 habitat for birds such as waterfowl, heron, egret, shorebirds, and belted kingfisher.  
 31 Many species of insectivorous birds such as swallows, swifts, and flycatchers  
 32 forage over open water areas of lakes and streams. Mammals known to associate  
 33 with open water and shoreline habitats include river otter, American mink,  
 34 muskrat, and beaver.

#### 35 *Riparian and Floodplain Areas*

36 The riparian and floodplain communities that could be affected by CVP and SWP  
 37 operations refers primarily to the vegetation and associated wildlife community  
 38 supported and influenced by proximity to the waterway, including areas  
 39 frequently flooded by rising water levels in the rivers (floodplains). The extent of  
 40 riparian vegetation within the Central Valley has been reduced over time due to a  
 41 variety of actions, including local, state, and Federal construction and operation of  
 42 flood control facilities isolated historic floodplains; agricultural and land use  
 43 development that occurred following development of flood control projects;  
 44 regulation of flows from dams that has reduced the magnitude and frequency of

1 larger flow events, increased recession rates, and increased summertime flows;  
2 and construction and maintenance of active ship channels by the U.S. Army Corps  
3 of Engineers (USACE) (DWR 2012). Currently, levee and bank protection  
4 structures associated with the flood protection system are present along more than  
5 2,600 miles of rivers in the Central Valley, including the Delta (DWR 2009a).

6 Characteristic riparian tree species in the Central Valley include willows,  
7 cottonwoods, California sycamore, and valley oaks. Typical understory plants  
8 include elderberry, blackberries, and poison oak. On the valley floor in the deep  
9 alluvial soils, the structure and species composition of the plant communities  
10 change with distance from the river, with the denser stands of willow and  
11 cottonwood at the water's edge transitioning into stands of valley oaks on the less  
12 frequently inundated terraces. In other areas, the riparian zone does not support a  
13 canopy of large trees and instead is dominated by shrub species (sometime  
14 referred to as riparian scrub).

15 Riparian and floodplain vegetation supports wildlife habitats because of its high  
16 floristic and structural diversity, high biomass and high food abundance, and  
17 proximity to water. In addition to providing breeding, foraging, and roosting  
18 habitat for an array of animals, riparian and floodplain vegetation also provides  
19 movement corridors for some species, connecting a variety of habitats throughout  
20 the region. The Sacramento and San Joaquin valleys lack substantial areas of  
21 natural habitat that support native biodiversity or corridors between the areas of  
22 natural habitat; therefore, riparian and floodplain corridors play a critical role in  
23 connecting wildlife among the few remaining natural areas (CalTrans and  
24 DFG 2010).

25 Typical wildlife species associated with the riparian and floodplain communities  
26 include mammals such as striped skunk, raccoon, and gray fox. Riparian bird  
27 species include Red-Shouldered Hawk, Wood Duck, Great Blue Heron, Black-  
28 Crowned Night Heron, and many neotropical migratory birds, including Yellow  
29 Warbler and Western Yellow-Billed Cuckoo. Amphibians and reptiles include  
30 Pacific Tree Frog, Pacific Gopher Snake, Garter Snake, and Western Pond Turtle.  
31 Special status species that associate with riparian and floodplain habitats include  
32 Bank Swallow (state listed), Western Yellow-Billed Cuckoo (Federally and state  
33 listed), and the Valley Elderberry Longhorn Beetle (Federally listed).

34 River flows and associated hydrologic and geomorphic processes are important  
35 for maintaining riparian and floodplain ecosystems. Most aspects of a flow  
36 regime (e.g., the magnitude, frequency, timing, duration, and sediment load)  
37 affect a variety of riparian and floodplain habitat processes. Two processes that  
38 create riparian and floodplain ecosystems are disturbance and plant recruitment.  
39 The interaction of these processes across the landscape is primarily responsible  
40 for the pattern and distribution of riparian and floodplain habitat structure and  
41 condition, and for the composition and abundance of riparian-associated species.

42 High flow events and associated scour, deposition, and prolonged inundation can  
43 create exposed substrate for plant establishment or openings in existing riparian  
44 and floodplain communities. Early successional species, like cottonwoods and

1 willows that recruit into these openings, become more abundant in the landscape  
2 as vegetation grows within disturbed areas. As a result, structural and species  
3 diversity within riparian and floodplain vegetation could increase, as could overall  
4 wildlife habitat values. Without disturbance, larger trees and species less tolerant  
5 of frequent disturbance begin to dominate riparian woodlands.

6 The recruitment of cottonwoods and willows especially depends on geomorphic  
7 processes that create bare mineral soil through erosion and deposition of sediment  
8 along river channels and on floodplains, and on flow events that result in  
9 floodplain inundation. Receding flood flows that expose moist mineral soil create  
10 ideal conditions for germination of cottonwood and willow seedlings. After  
11 germination occurs, the water surface must decline gradually to enable seedling  
12 establishment. Riparian and floodplain communities also undergo natural  
13 disturbance cycles when flood flows remove streamside vegetation and  
14 redistribute sediments and seeds, thereby maintaining habitat diversity for  
15 terrestrial species that associate with riparian and floodplain corridors.

16 Both prolonged drought and prolonged inundation, however, can lead to plant  
17 death and loss of riparian plants (Kozlowski and Pallardy 2002). Riparian plants  
18 have high moisture requirements during the active growing season (spring  
19 through fall), and dry soil conditions can reduce growth and injure or kill plants.  
20 On the other hand, prolonged inundation creates anaerobic conditions that, during  
21 the active growing season, also can reduce growth, injure, or kill plants.

22 The continuation of riparian and floodplain communities is anticipated to change  
23 along levees within the federally authorized levee systems that have maintenance  
24 agreements with the USACE (including Delta levees along the Sacramento and  
25 San Joaquin rivers) and other levees that are eligible for the federal Rehabilitation  
26 and Inspection Program (Public Law 84-99). As described in Section 3.3.2.2 of  
27 Chapter 3, Description of Alternatives, the vegetation management policies of the  
28 USACE were changed in 2009 and 2010. Historically, the USACE allowed brush  
29 and small trees to be located on the waterside of federal flood management  
30 project levees if the vegetation would preserve, protect, and/or enhance natural  
31 resources, and/or protect rights of Native Americans, while maintaining the  
32 safety, structural integrity, and functionality of the levee (DWR 2011). After  
33 Hurricane Katrina in 2005, the USACE issued a policy and draft policy guidance  
34 to remove substantial vegetation from these levees throughout the nation (USACE  
35 2009). In 2010, the USACE issued a draft policy guidance letter, *Draft Process  
36 for Requesting a Variance from Vegetation Standards for Levees and  
37 Floodwalls—75 Federal Register 6364-68* (USACE 2010) that included  
38 procedures for State and local agencies to request variances on a site-specific  
39 basis. DWR has been in negotiations with USACE to remove vegetation on the  
40 upper third of the waterside slope, top, and landside of the levees, and continue to  
41 allow vegetation on the lower two-thirds of the waterside slope of the levee and  
42 along benches above the water surface (DSC 2011). The effects of these changes  
43 have not become widespread at this time. Future conditions under these  
44 requirements are further described under the description of the No Action

1 Alternative in this chapter (see Section 10.4.2.1.3, Changes in River and Delta  
2 Floodplains).

### 3 **10.3.3.1.3 Wetlands, Marshes, and Wet Meadows**

4 Wetlands in the Central Valley can be characterized as perennial or seasonal with  
5 perennial wetlands further classified as tidal or non-tidal. Natural, non-tidal  
6 perennial wetlands are scattered along the Sacramento and San Joaquin rivers,  
7 typically in areas with slow moving backwaters. Management of wetlands,  
8 marshes, and wet meadows can include irrigation of open areas to support native  
9 herbaceous plants or cultivated species; periodic or continuous flooding to  
10 provide feeding and roosting sites for many wetland-associated birds; and either  
11 limited or no tilling or disturbance of the managed areas.

12 Managed seasonal wetlands on the west side of the Sacramento River generally  
13 occur between Willows and Dunnigan along the Colusa Basin Drain. Substantial  
14 portions of these managed wetland habitats occur at the flood bypasses, including  
15 the Yolo Bypass Wildlife Area and Fremont Weir, as a part of the Sacramento  
16 National Wildlife Refuge Complex, and around the Thermalito Afterbay  
17 (Reclamation 2010a). Both tidal and nontidal, perennial wetlands are found in the  
18 Delta and Suisun Marsh.

#### 19 *Perennial Non-tidal (Freshwater) Wetlands and Marshes*

20 In the Sacramento and San Joaquin valleys and foothills, perennial non-tidal  
21 wetland habitats include freshwater emergent wetlands and wet meadows.  
22 Freshwater emergent wetlands, or marshes, are dominated by large, perennial  
23 herbaceous plants, particularly tules and cattails, which are generally restricted to  
24 shallow water. In marshes, vegetation structure and the number of species are  
25 strongly influenced by disturbance, changes in water levels, and the range of  
26 elevations present at a site. Wet meadows are similar to perennial freshwater  
27 wetlands in many regards; however, they are dominated by a greater variety of  
28 perennial plants such as rushes, sedges, and grasses than are found in freshwater  
29 wetlands. Perennial freshwater wetlands also provide ecological functions related  
30 to water quality and hydrology. These areas generally qualify as jurisdictional  
31 wetlands subject to U.S. Army Corps of Engineers jurisdiction under Sections 401  
32 and 404 of the federal Clean Water Act.

33 Perennial freshwater wetlands are among the most productive wildlife habitat in  
34 California (CDFW 1988a). In the Sacramento and San Joaquin valleys and  
35 foothills, these wetlands support several sensitive amphibians, reptiles, birds, and  
36 mammals. Perennial freshwater wetlands also provide food, cover, and water for  
37 numerous species of wildlife. Wetlands in the Sacramento and San Joaquin  
38 valleys and foothills are especially important to migratory birds and wintering  
39 waterfowl.

#### 40 *Seasonal Wetlands*

41 Natural seasonal wetlands occur in topographic depressions and swales that are  
42 seasonally saturated and exhibit hydric soils that support hydrophytic plant  
43 species. Natural seasonal wetlands are generally dominated by hydrophytic plants

1 during the winter and spring months. Characteristic plant species in seasonal  
 2 wetlands consist of both native and nonnative species. Native species include  
 3 coyote thistle, toad rush, hyssop loosestrife, and foothill meadowfoam. Natural  
 4 seasonal wetlands provide food, cover, and water for numerous common and  
 5 special status species of wildlife that rely on wetlands for all or part of their life  
 6 cycle. Like perennial wetlands, seasonal wetlands have been substantially  
 7 reduced from their historical extent.

8 Numerous managed seasonal wetlands occur within the Sacramento Colusa,  
 9 Sutter, Tisdale, and Yolo Bypasses and around the Thermalito Afterbay  
 10 (Reclamation 2010a).

11 Managed marsh areas are intentionally flooded and managed during specific  
 12 seasonal periods to enhance habitat values for specific wildlife species (CALFED  
 13 2000). Managed marsh areas are distributed largely in the northern, central, and  
 14 western portions of the Delta, as well as in Suisun Marsh and the Yolo Bypass,  
 15 Stone Lakes National Wildlife Refuge, Cosumnes River Preserve, and  
 16 Suisun Marsh.

#### 17 *Perennial Tidal Wetlands and Open Water*

18 In the Central Valley, tidal wetlands and open water are primarily found in the  
 19 Delta and Suisun Marsh. Tidal wetlands are influenced by tidal movement of salt  
 20 water from San Francisco Bay and inflow of freshwater from the Delta and  
 21 smaller local watersheds. Tidal open water in the Delta is mainly freshwater  
 22 habitat, with brackish and saline conditions occurring in the western Delta at  
 23 times of high tides and low flows into the western Delta. It is freshwater in the  
 24 Yolo Bypass and mainly brackish and saline in Suisun Marsh. Tidal mudflats  
 25 occur as mostly unvegetated sediment deposits in the intertidal zone between the  
 26 tidal wetland communities at its upper edge and the tidal perennial aquatic  
 27 community at its lower edge. Tidal brackish wetlands exist from near Collinsville  
 28 westward to the Carquinez Strait. Suisun Marsh is the largest contiguous brackish  
 29 water marsh remaining on the North America west coast (Reclamation et al.  
 30 2011). Tidal freshwater marshes occur at the shallow, slow-moving or stagnant  
 31 edges of freshwater waterways in the intertidal zone and are subject to frequent  
 32 long duration flooding.

33 Salinity levels vary throughout the year and are influenced largely by inflow from  
 34 the Delta (Reclamation et al. 2011). Tidal water in the Delta is mainly freshwater,  
 35 with brackish and saline conditions occurring in the western Delta at times of high  
 36 tides and low flows into the western Delta. Tidal marshes associated with the  
 37 lower Yolo Bypass are freshwater, whereas they are mainly brackish and saline in  
 38 Suisun Marsh where tidal brackish marshes exist from near Collinsville westward  
 39 to the Carquinez Strait.

#### 40 **10.3.3.1.4 Agricultural Lands**

41 Agricultural land uses and farming practices in the Central Valley provide  
 42 habitats and resources for a variety of terrestrial species, including several Federal  
 43 and state special status species. Agricultural lands are primarily found within the

1 Sacramento and San Joaquin valleys on the rich alluvial soils of the riverine  
2 floodplains. The distribution of seasonal crops varies annually and seasonally,  
3 depending on market forces and crop-rotation patterns. Some of the principal  
4 crop types and their value to wildlife are described below.

5 Crops in the Sacramento and San Joaquin valleys include grain and seed crops  
6 (e.g., barley and wheat), forage crops (e.g., hay and alfalfa), row crops  
7 (e.g., tomatoes, lettuce, sugar beets), cotton, orchards (e.g., almonds, walnuts,  
8 peaches, plums), and vineyards. There are also areas of irrigated pastureland  
9 throughout the Sacramento and San Joaquin valleys.

10 Grain and seed crops include wheat, barley, corn, and other annual grasses that  
11 are grown in dense stands. Most of the value for wildlife occurs during the early  
12 growing period because the later dense growth makes it difficult for wildlife to  
13 move through these fields. Following harvesting, waste grain is available to  
14 waterfowl and other birds, such as sandhill crane. Row crop and silage fields  
15 generally provide lesser value to wildlife than native cover types, but can support  
16 abundant populations of small mammals, such as California vole and western  
17 harvest mouse. These species attract predators such as snakes and raptors. Other  
18 reptile and bird species prey on the abundant insect populations found in row crop  
19 and silage fields.

20 Species generally associated with field and row crops include the Red-Winged  
21 Blackbird, Western Meadowlark, California Vole, Black-Tailed Jackrabbit,  
22 Western Harvest Mouse, Botta's Pocket Gopher, Raccoon, Striped Skunk, and  
23 Virginia Opossum. Croplands also provide foraging habitat for many raptors  
24 including Swainson's Hawk, Northern Harrier, Red-Tailed Hawk, and  
25 White-Tailed Kite.

26 Alfalfa is irrigated and intensively mowed such that vegetation structure varies  
27 with the growing, harvesting, and fallowing cycle. As a result, alfalfa supports  
28 some of the highest biodiversity amongst crops in California, second only to rice  
29 in agricultural habitat biodiversity (Hartman and Kyle 2010), with many species  
30 using alfalfa to forage, nest, rest, and hide. A wide range of species, including  
31 songbirds, swallows, bats, and many types of waterfowl and migratory birds feed  
32 on insects in alfalfa fields. Mammals such as gophers, mice, and rabbits feed  
33 directly on alfalfa. Larger herbivorous mammals, such as deer, antelope, and elk,  
34 frequent alfalfa fields, especially during dry or cold seasons. Hawks, eagles,  
35 migratory birds, coyotes, and mountain lions feed on the birds and rodents that  
36 feed on the alfalfa. Scavengers such as coyotes and vultures feed on carrion  
37 (Putnam et al. 2001).

38 Rice cultivation is also widespread in the Sacramento Valley. Rice fields provide  
39 surrogate wetland habitats and many wetland wildlife species use rice fields,  
40 especially waterfowl and shorebirds, and wading birds that forage on aquatic  
41 invertebrates and vertebrates such as crayfish and small fish. Foraging  
42 opportunities are provided by fish that become entrained in the irrigation canals  
43 that supply water to the rice fields and the crayfish that are found along canal  
44 banks and berms of the rice fields. Other wildlife species that use flooded rice

1 fields include Giant Garter Snake and bullfrog. Ring-necked pheasant and  
2 Sandhill Cranes among others forage on post-harvest waste grain. The practice of  
3 flooding rice fields in winter to allow for decomposition of rice stubble, as  
4 opposed to burning, enhances the wildlife value of rice fields. Winter flooding  
5 provides loafing and foraging opportunities for a variety of birds, including  
6 waterfowl, cranes, herons, and egrets.

7 Orchards and vineyards, typically dominated by a single tree species, are grown in  
8 fertile areas that once supported diverse and productive habitats for wildlife.

9 Orchards and vineyards generally provide relatively low wildlife value; however,  
10 some species of birds and mammals have adapted to orchard and vineyard  
11 habitats. Many have become "agricultural pests" which result in crop losses.

12 Deer and rabbits browse on the trees while other wildlife such as squirrels and  
13 numerous birds feed on fruit or nuts. Cover crops grown under the trees provide a  
14 food source for wildlife that feed on seeds or herbaceous vegetation. Wildlife

15 species reported to feed on nuts (almonds and walnuts) include Northern Flicker,  
16 Western Scrub-Jay, American Crow, Plain Titmouse, Brewer's Blackbird, House  
17 Finch, Gray Squirrel and California Ground Squirrel (DFG 1999a, 1999b, 1999c).

18 Other fruit crops such as apples, cherries, figs, pears and prunes are also eaten by  
19 these same species and others such as Band-Tailed Pigeon, Yellow-Billed

20 Magpie, Western Bluebird, American Robin, Varied Thrush, Northern

21 Mockingbird, Cedar Waxwing, Yellow-Rumped Warbler, Black-Headed

22 Grosbeak, Bullock's Oriole, Desert Cottontail, Gray Squirrel, coyote, black bear,

23 raccoon, and Mule Deer. Evergreen orchards (citrus, olives, avocado) do not

24 provide the food for wildlife that many of the deciduous fruit and nut trees

25 provide. Mourning Dove and California Quail use orchard habitats for cover and

26 nesting sites. Carnivores such as fox, bobcat, and coyote frequently use avocado

27 orchards (Nogeire et al. 2013). Irrigated pastures are managed grasslands with a

28 low structure of native herbaceous plants, cultivated species, or a mixture of both.

29 Pastures are not typically tilled or disturbed frequently and provide breeding

30 opportunities for ground-nesting birds, including waterfowl, Ring-Necked

31 Pheasant, and Sandhill Crane if adequate residual vegetation is present. Flood

32 irrigation of pastures provides feeding and roosting sites for many wetland-

33 associated birds, including shorebirds, wading birds, gulls, waterfowl, and raptors.

34 Large mammals such as deer, and elk graze in pastures when there is adequate

35 escape cover adjacent to the open pasture. Burrowing species using irrigated

36 pastures include California Ground Squirrel, Pocket Gophers, and Burrowing

37 Owls. Pastures provide foraging habitat for grassland-foraging wildlife, such as

38 coyote and fox, and raptors like the Northern Harrier, American Kestrel, and

39 Red-Tailed Hawk.

40 In addition to the crop lands, the network of irrigation canals, drains, and

41 reservoirs that convey water in the agricultural areas provide habitat for many

42 species of wildlife, including species with special status. These conveyance

43 features, particularly those that contain water throughout the growing season,

44 typically support some of the plants and animals characteristic of riverine systems

45 and riparian areas. While water flows through many of these facilities

46 intermittently, these features can provide habitat for species, such as Giant Garter

1 Snake. Giant Garter Snake is frequently associated with the water conveyance  
2 systems that support rice cultivation.

### 3 **10.3.3.1.5 Invasive Species**

4 Invasive plants and wildlife are species that are not native to the region, persist  
5 without human assistance, and have serious impacts on the environment. They  
6 are termed “invasive” because they displace native species and alter habitat  
7 functions and values. Many invasive plant species are considered “noxious  
8 weeds” by governmental agencies such as the U.S. Department of Agriculture and  
9 California Department of Food and Agriculture. Numerous invasive plants have  
10 been introduced into the study area, and many have become established. The  
11 California Invasive Plant Council maintains a list of species that have been  
12 designated as invasive in California (CalIPC 2006).

13 According to the California Department of Fish and Wildlife’s aquatic invasive  
14 species management plan (DFG 2008), invasive species threaten the diversity or  
15 abundance of native species through competition for resources, predation,  
16 parasitism, hybridization with native populations, introduction of pathogens, or  
17 physical or chemical alteration of the invaded habitat. Unlike the native riparian  
18 flora, many invasive riparian species do not provide the food, shelter, and other  
19 habitat components on which many native fish and wildlife species depend. In  
20 addition to the ability to degrade wildlife habitat, many of these invasive trees and  
21 shrubs have the potential to harm human health and the economy by adversely  
22 affecting the ecosystem, flood protection systems, water delivery, recreation, and  
23 agriculture.

24 Changes in CVP and SWP operations would affect the wetted edges at CVP and  
25 SWP reservoirs, reservoirs that store CVP and SWP water supplies, and along the  
26 rivers downstream of the CVP and SWP reservoirs. Therefore, only those  
27 invasive plant species that are associated with the margins at these waterways  
28 would be likely to cause adverse effects on terrestrial biological resources.  
29 Examples of these species include tree-of-heaven, giant reed, purple loosestrife,  
30 perennial pepperweed, tamarisk, and red sesbania. In addition to the potential  
31 effects caused by changed water operations, invasive species have the potential to  
32 be introduced as part of construction of habitat restoration, or to colonize areas  
33 disturbed by restoration construction activities (e.g., yellow star thistle, perennial  
34 pepperweed, Spanish broom, Himalaya blackberry).

### 35 **10.3.3.2 Sacramento Valley**

36 The Sacramento Valley portion of the Central Valley Region considered in this  
37 EIS includes Shasta Lake, Keswick Reservoir, and the Sacramento River from  
38 Keswick Reservoir to the Delta. The Sacramento Valley also includes the lower  
39 Yuba River and the middle and lower portions of the Feather River and American  
40 River watersheds that are influenced by CVP and SWP operations, respectively.

41 Historically, the Sacramento Valley contained a mosaic of riverine, wetland, and  
42 riparian communities with terrestrial habitats consisting of perennial grassland  
43 and oak woodlands. With development of the Sacramento Valley, native habitats

1 were converted to cultivated fields, pastures, residences, water impoundments,  
2 and flood-control structures. As a result, native habitats generally are restricted in  
3 their distribution and size and are highly fragmented.

4 A listing of wildlife and plant species with special status that occur or may occur  
5 in portions of the study area affected by the long-term coordinated operation of  
6 the CVP and SWP is provided in Appendix 10A.

7 The USFWS has approved a habitat conservation plan for the Natomas  
8 Basin/Metropolitan Air Park near Sacramento. Six other habitat conservation  
9 plans are being prepared in the Sacramento Valley, including programs for Butte  
10 County, Yuba-Sutter counties, Placer County, Yolo County, South Sacramento  
11 County, and Solano County.

#### 12 **10.3.3.2.1 Shasta Lake and Keswick Reservoir**

13 The area in which Shasta Lake is situated is characterized by a variety of  
14 vegetation and wildlife habitats typical of transitional mixed woodland and low-  
15 elevation forest habitats (Reclamation 2013a). The majority of vegetation  
16 communities and wildlife habitats around Shasta Lake are tree-dominated, and  
17 include upland forests with associated mixed chaparral, riparian forests, and  
18 woodlands. Other wildlife habitats around the lake include annual grasslands and  
19 barren areas. Montane riparian, the dominant riparian vegetation type at and near  
20 Shasta Lake, also occurs as thin stringers and patches along most stream corridors  
21 tributary to Shasta Lake.

22 Wildlife species around Shasta Lake are those typically associated with  
23 tree-dominated habitats and chaparral (Reclamation 2013a). Mammals in these  
24 habitats include deer, rabbits, chipmunks, and squirrels. Mature trees provide  
25 nesting habitat for raptors such as the bald eagle and osprey. Hollow trees and  
26 logs provide denning sites for mammals such as the coyote and skunks, and  
27 cavities in mature trees are used by cavity-dwelling species such as the Acorn  
28 Woodpecker and California Myotis. Many amphibians and reptiles, including  
29 *Ensatina*, Western Skink, and Western Fence Lizard, inhabit the detrital layer of  
30 moist areas. Snakes, including the Western Rattlesnake and Sharp-Tailed Snake,  
31 also are found in these habitats.

32 Recently, 38 pairs of mating Bald Eagles were observed at Shasta Lake  
33 (USFS 2012).

34 Terrestrial resources around Keswick Reservoir are similar to those found at  
35 lower elevations around Shasta Lake. Otters, Gray Fox, coyote, bobcat, Osprey,  
36 and turtles occur along the Keswick Reservoir reach of the Sacramento River  
37 (BLM 2006). Historically, vegetation in this area of the watershed was harvested  
38 to provide fuel for mining smelters. Chaparral habitat, dominated by manzanita  
39 with intermittent oak, pine, and fir trees occur on the foothills above the reservoir.  
40 As described in Chapter 5, Surface Water Resources and Water Supplies, water  
41 elevations in Keswick Reservoir are relatively stable throughout the year.

1 **10.3.3.2.2 Whiskeytown Lake and Clear Creek**

2 Riparian communities within the Whiskeytown Unit of the Whiskeytown-Shasta-  
3 Trinity National Recreation Area, which includes Whiskeytown Reservoir,  
4 include the following species: grey pine, willow, white alder, dogwoods, Oregon  
5 ash, bigleaf maple, and Fremont and black cottonwood. Wild grape is also very  
6 common; other riparian shrubs include snowberry, California blackberry, toyon,  
7 buckeye, and button willow. Flowering herbaceous plants, cattails, sedges,  
8 rushes, and ferns make up the riparian understory. The riparian habitats are  
9 generally vigorous and well-vegetated, especially in the most favorable locations,  
10 such as canyons and stream bottoms (NPS 1999).

11 Riparian vegetation is limited to a narrow band along the channel margins in the  
12 confined canyon reaches of Clear Creek between Whiskeytown Dam and Clear  
13 Creek Bridge, where the alluvial section of the creek begins. Downstream of  
14 Clear Creek Bridge, where the valley widens, the channel becomes predominately  
15 alluvial, and floodplains and terraces allow riparian vegetation to be more  
16 extensive (CBDA 2004).

17 Fresh emergent wetlands occur throughout the entire reach of lower Clear Creek  
18 from Whiskeytown Dam to the Sacramento River. These wetlands are more  
19 prominent in the reach below Clear Creek Road Bridge where soils are deeper and  
20 the valley becomes wider and is subject to periodic flooding. Valley-foothill  
21 riparian is found primarily in the lower reaches of lower Clear Creek from Clear  
22 Creek Road Bridge to the Sacramento River. In addition, smaller linear patches  
23 occur scattered throughout the system up to Whiskeytown Dam (BLM and  
24 NPS 2008).

25 Due to the diversity of habitats present within the watershed, the areas adjacent to  
26 Whiskeytown Lake and lower Clear Creek support a diverse assemblage of  
27 wildlife species. More than 200 vertebrate species are known to occur within the  
28 Whiskeytown Unit of the Whiskeytown-Shasta-Trinity National Recreation Area,  
29 including at least 35 mammal species, 150 bird species, and 25 reptile and  
30 amphibian species (NPS 2014).

31 **10.3.3.2.3 Sacramento River: Keswick Reservoir to the Delta**

32 Release of flows from Shasta Dam changed the pre-dam flow patterns from high  
33 flows in the mid-spring during snow melt to high flows in the summer months, as  
34 described in Chapter 5, Surface Water Resources and Water Supplies.  
35 Consequently, in most years, the current flow regime precludes or substantially  
36 reduces opportunities for establishment of cottonwoods and willows; and the  
37 structure and composition of riparian vegetation has undergone change  
38 (Roberts et al. 2002). The extent of early-successional riparian communities  
39 (e.g., cottonwood forest) has been decreasing, while the extent of mid-  
40 successional communities (e.g., mixed riparian forest) has been increasing.  
41 Generally, these effects diminish with distance downstream because of the  
42 influence of inflows from tributaries, diversions, and flood bypasses  
43 (Reclamation 2013a).

1 Much of the Sacramento River from Shasta Dam to Redding is deeply entrenched  
 2 in bedrock, which precludes development of extensive areas of riparian vegetation  
 3 (Reclamation 2013a). The upper banks along these steep-sided, bedrock-  
 4 constrained segments of the upper Sacramento River are characterized primarily  
 5 by upland communities, including woodlands and chaparral. Outside the river  
 6 corridor, other vegetation communities along the upper Sacramento River include  
 7 riparian scrub, annual grassland, and agricultural lands.

8 The river corridor between Redding and Red Bluff once supported extensive areas  
 9 of riparian vegetation (Reclamation 2013a). Agricultural and residential  
 10 development has permanently removed much of the native and natural habitat.  
 11 Riparian vegetation now occupies only a small portion of floodplains. Willow  
 12 and blackberry scrub and cottonwood- and willow-dominated riparian  
 13 communities are still present along active channels and on the lower flood  
 14 terraces, whereas valley oak–dominated communities occur on higher flood  
 15 terraces. Although riparian woodlands along the upper Sacramento River  
 16 typically occur in narrow or discontinuous patches, they provide value for wildlife  
 17 and support both common and special status species of birds, mammals, reptiles,  
 18 amphibians, and invertebrates.

19 Portions of the adjacent land along the Sacramento River from Red Bluff to  
 20 Hamilton City include substantial remnants of the pre-European Sacramento  
 21 Valley historical riparian forest (Reclamation 2013a). Along the Sacramento  
 22 River below Red Bluff, riparian vegetation is characterized by narrow linear  
 23 stands of trees and shrubs, in single- to multiple-story canopies. These patches of  
 24 riparian vegetation may be on or at the toe of levees. Riparian communities in  
 25 this region include woodlands and riparian scrub.

26 From Red Bluff to Colusa, the Sacramento River contains point bars, islands, high  
 27 and low terraces, instream woody cover, and early-successional riparian plant  
 28 growth, reflecting river meander and erosional processes (Reclamation 2013a).  
 29 Major physiographic features include floodplains, basins, terraces, active and  
 30 remnant channels, and oxbow sloughs. These features sustain a diverse riparian  
 31 community and support a wide range of wildlife species including raptors,  
 32 waterfowl, and migratory and resident avian species, plus a variety of mammals,  
 33 amphibians, and reptiles that inhabit both aquatic and upland habitats.

34 Downstream of Colusa, the Sacramento River channel changes from a dynamic  
 35 and active meandering one to a confined, narrow channel (Reclamation 2013a).  
 36 Surrounding agricultural lands encroach directly adjacent to the levees, which  
 37 have cut the river off from most of its riparian corridor, especially on the eastern  
 38 side of the river. Most of the levees in this reach are lined with riprap, allowing  
 39 the river no erodible substrate and limiting the extent of riparian vegetation and  
 40 riparian wildlife habitat.

#### 41 **10.3.3.2.4 Feather River**

42 Antelope Lake, Lake Davis, and Frenchman Lake located in the Upper Feather  
 43 River; Lake Oroville and Thermalito Forebay and Afterbay; and the lower Feather  
 44 River are located within areas in the Feather River watershed that could be

1 affected by changes in CVP and/or SWP operations. Downstream of Lake  
2 Oroville, the basin extends south and includes the drainage of the Yuba and  
3 Bear Rivers.

4 *Upper Feather River Lakes*

5 The Upper Feather River Lakes, including Antelope Lake, Lake Davis, and  
6 Frenchman Lake, are SWP facilities on the upper Feather River upstream of Lake  
7 Oroville. These lakes are part of the Plumas National Forest and provide habitat  
8 for raptor nesting and wintering areas, waterfowl nesting area, and deer  
9 movement area (DWR 2013a; Plumas County 2012). Deer movement and  
10 fawning areas also occur around Lake Davis.

11 *Lake Oroville and Thermalito Complex*

12 Lake Oroville is situated in the foothills on the western slope of the Sierra Nevada  
13 Mountains, about a mile downstream of the confluence of its major tributaries.  
14 Below the dam, a portion of the river flow is diverted at the Thermalito Diversion  
15 Dam and routed to the Thermalito Forebay, which is an offstream reservoir with a  
16 surface area up to 630 acres (DWR 2007a, 2007b). Downstream of the forebay,  
17 water is stored in Thermalito Afterbay (up to 4,300 surface acres), which among  
18 other purposes serves as a warming basin for agricultural water.

19 The majority of vegetation around Lake Oroville consists of a variety of native  
20 vegetation associations, including mixed oak woodlands, foothill pine/mixed oak  
21 woodlands, and oak/pine woodlands with a mosaic of chaparral (DWR 2004a,  
22 2007a). Open areas within the woodlands consist of annual grassland species.  
23 Native riparian habitats are restricted to narrow strips along tributaries, consisting  
24 mostly of alder, willow, and occasional cottonwood and sycamore. There is  
25 minimum wetland vegetation around Lake Oroville, and most is associated with  
26 seeps and springs that are a natural part of the landscape above the high water  
27 line. Emergent wetlands are generally absent within the drawdown zone of Lake  
28 Oroville.

29 Lack of vegetative cover within the drawdown zone severely limits wildlife use of  
30 this area. Thirty-six wildlife species were detected using habitats within the  
31 drawdown zone on at least one occasion during field surveys (DWR 2004a).  
32 Several of these species may use habitats within the drawdown zone for  
33 reproduction including Belted Kingfisher, Canada Goose, Canyon Wren,  
34 American Dipper, killdeer, mallard, Common Merganser, and Northern  
35 Rough-Winged Swallow.

36 Riparian vegetation occurs around the north shore of Thermalito Forebay as a thin  
37 strip of mixed riparian species (mostly willows), with an understory of emergent  
38 wetland vegetation. Cottonwoods and willows occur in scattered areas around the  
39 high water surface elevation of Thermalito Afterbay shoreline (FERC 2007).  
40 Emergent wetlands ranging from thin strips to more extensive areas are found  
41 around Thermalito Forebay and Thermalito Afterbay. Waterfowl brood ponds  
42 constructed in inlets of Thermalito Afterbay support emergent vegetation along  
43 much of their shores.

1 Species observed within the wetland margin of Thermalito Afterbay include Barn  
 2 Swallow, Black Phoebe, White-Tailed Kite, Black-Tailed Jackrabbit,  
 3 Brown-Headed Cowbird, bullfrog, Common Garter Snake, Common  
 4 Yellowthroat, Gopher Snake, Northern Harrier, Pacific tree Frog, raccoon,  
 5 red-Winged Blackbird, Ring-Necked Pheasant, Short-Eared Owl, Striped Skunk,  
 6 Tree Swallow, Virginia Opossum, and Violet-Green Swallow (DWR 2004a).

7 In contrast to the drawdown area around the margin of Lake Oroville, the  
 8 drawdown zone of Thermalito Afterbay supports a richer wildlife community and  
 9 greater habitat diversity. Survey data collected as part of the relicensing process  
 10 indicate that exposed mudflats seasonally provide habitat for a variety of  
 11 migratory waterbirds including Black-Necked Stilt, Black Tern, California Gull,  
 12 Caspian Tern, Forster's Tern, Greater Yellowlegs, Least Sandpiper, Long-Billed  
 13 Dowitcher, Ring-Billed Gull, Semipalmated Sandpiper, Spotted Sandpiper, and  
 14 White-Faced Ibis. Wading birds and other waterfowl have been observed on the  
 15 mudflats as well as shallow flooded areas (DWR 2004a). Potentially suitable  
 16 Giant Garter Snake habitat is present along portions of the afterbay and forebay  
 17 margins. The existing waterfowl brood ponds provide a refuge for Giant Garter  
 18 Snakes during periods of afterbay drawdown.

19 Several invasive plant species are found around Lake Oroville and downstream in  
 20 and around the Thermalito Complex. Invasive species associated with riparian  
 21 and wetland areas include purple loosestrife, giant reed, tree-of-heaven, and red  
 22 sesbania. About 85 of the roughly 900 acres of wetlands and riparian areas along  
 23 the margin of Thermalito Afterbay contain varying densities of purple loosestrife  
 24 (DWR 2007a). Purple loosestrife adversely affects native vegetation.

#### 25 *Feather River from Oroville Complex to the Sacramento River*

26 The Feather River from Oroville Dam to the confluence with the Sacramento  
 27 River supports stands of riparian vegetation, which have been restricted over time  
 28 by flood control levees and land clearing for agriculture and urbanization. As a  
 29 consequence, the vegetation generally occurs in a narrow zone along much of the  
 30 river in this reach. However, remnant riparian forest exist in areas where wide  
 31 meander bends persist, such as at Abbott Lake and O'Connor Lake near the Lake  
 32 of the Woods State Recreation Area (DWR 2004b). This area contains mixed  
 33 riparian forests, including Fremont cottonwood, willow, boxelder, alder, and  
 34 Oregon ash. The riparian strip along the river is bordered mostly by agricultural  
 35 fields. Downstream of Yuba City near the confluence with the Sacramento River,  
 36 valley oak and cottonwood riparian stands becomes more common.

37 As described above for the Sacramento River, riparian areas provide value for  
 38 wildlife and support a wide range of species of birds, mammals, reptiles,  
 39 amphibians, and invertebrates.

#### 40 **10.3.3.2.5 Yuba River**

41 Portions of the Yuba River watershed along the North Yuba River between New  
 42 Bullards Bar Reservoir and Englebright Lake and along the Lower Yuba River

1 between Englebright Lake and the Feather River could be affected by operation of  
2 the Lower Yuba River Water Accord (DWR et al. 2007b).

3 New Bullards Bar Dam and Reservoir are owned and operated by the Yuba  
4 County Water Agency to provide flood control, water storage, and hydroelectric  
5 generation. The Harry L. Englebright Dam and Reservoir were constructed by  
6 the California Debris Commission downstream of New Bullards Bar Reservoir to  
7 trap and store sediment from historical hydraulic mining sites in the upper  
8 watershed, and to provide recreation and hydroelectric generation opportunities  
9 (USACE 2013). Following decommissioning of the California Debris  
10 Commission in 1986, administration of Englebright Dam and Reservoir (Lake)  
11 was assumed by the USACE. Portions of the watershed along the Middle Yuba  
12 River between New Bullards Bar Reservoir and Englebright Reservoir are within  
13 the Plumas and Tahoe national forests.

14 Vegetation communities adjacent to New Bullards Bar Reservoir include oak  
15 woodlands, mixed conifer, and montane hardwood habitats which include live  
16 oak, blue oak, foothill pine, California wild rose, and lupine (DWR et al. 2007).  
17 The shoreline is generally barren. Bald Eagles have been observed near New  
18 Bullards Bar Reservoir; and California Red-legged Frogs have been reported in a  
19 tributary to the reservoir, Oregon Creek.

20 Vegetation communities at Englebright Reservoir are generally blue oak  
21 woodland and montane chaparral with small areas of mixed chaparral and live oak  
22 woodland (Yuba County 2011).

23 Vegetation along the lower Yuba River downstream of Englebright Dam is  
24 characterized by a number of vegetation types including grasslands, woodlands,  
25 and chaparral (USACE 2014). Within the Narrows, a steep gorge in the  
26 Yuba River immediately below Englebright Dam, there is little vegetation; small,  
27 isolated clumps of willow, mulefat, and other riparian species are widely scattered  
28 along the mostly barren, rocky banks. Downstream of the Narrows, there are  
29 extensive piles of cobble and gravel left from past gold and gravel mining  
30 operations. Here there are narrow strips of riparian vegetation consisting of  
31 Fremont cottonwood, willow, boxelder, and elderberry shrub. As described above  
32 for the Sacramento River, these communities support a wide range of similar  
33 wildlife species including raptors, waterfowl, and migratory and resident avian  
34 species, plus a variety of mammals, amphibians, and reptiles that inhabit both  
35 aquatic and upland habitats.

#### 36 **10.3.3.2.6 Bear River**

37 The Bear River flows into the Feather River downstream of the confluence with  
38 the Yuba River. As described in Chapter 5, Surface Water Resources and Water  
39 Supplies, the Bear River includes Nevada Irrigation District's Rollins and Combie  
40 reservoirs along the upper and middle reaches of the Bear River, and South Sutter  
41 Water District's Camp Far West Reservoir along the lower reach of the Bear  
42 River (FERC 2013; NID 2005).

1 Vegetation communities near the reservoirs and along the Bear River from  
 2 Rollins Reservoir to the confluence with the Feather River occur in bands based  
 3 on elevations (FERC 2013; NID 2005). Gray pine, ponderosa pine, hardwoods,  
 4 and chaparral shrubs occur at the higher elevations with black cottonwood, white  
 5 alder, and valley oak in the riparian zones. Incense cedar, Douglas fir, white fir,  
 6 madrone, sugar pine, Brewer's oak, whiteleaf manzanita, greenleaf manzanita,  
 7 wedgeleaf ceanothus, deerbrush, and poison oak at mid-elevations with white  
 8 alders, maple, and willow along the riparian areas.

#### 9 **10.3.3.2.7 American River**

10 The American River watershed encompasses approximately 2,100 square miles  
 11 (Reclamation et al. 2006). The North, Middle, and South forks of the American  
 12 River converge upstream of Folsom Lake. Lake Natoma is located downstream  
 13 of Folsom Lake. Water continues to flow between Nimbus Dam and the  
 14 confluence with the Sacramento River, as described in Chapter 5, Surface Water  
 15 Resources and Water Supplies.

#### 16 *Folsom Lake and Lake Natoma*

17 Folsom Lake, formed by Folsom Dam, has a surface area of about 11,500 acres,  
 18 and 75 miles of shoreline (Reclamation 2005a). Lake Natoma, which serves as an  
 19 afterbay downstream of Folsom Dam, has about 540 acres of surface area.

20 Vegetation communities associated with Folsom Lake include oak woodland and  
 21 annual grassland. The oak woodland habitat is located on the upland banks and  
 22 slopes of the reservoir, and is dominated by live oak, blue oak, and foothill pine  
 23 with several species of understory shrubs and forbs. Annual grasslands occur  
 24 around the reservoir, primarily at the southern end.

25 The oak woodlands and annual grasslands around the reservoir support a variety  
 26 of birds. A number of raptors, including red-tailed hawk, Cooper's hawk, great  
 27 horned owl, and long-eared owl use oak woodlands for nesting, foraging, and  
 28 roosting. Mammal species likely to occur in woodland habitats include deer,  
 29 coyote, bobcat, fox, Virginia Opossum, raccoon, rabbits, squirrels, and a variety  
 30 of rodents. Amphibians and reptiles that may be found in oak woodlands include  
 31 California Newt, Pacific Tree Frog, Western Fence Lizard, Gopher Snake,  
 32 Common Kingsnake, and Western Rattlesnake. The adjacent grasslands are used  
 33 by various bird species for foraging, including White-Crowned Sparrow, Lesser  
 34 Goldfinch, Western Meadowlark, and several raptor species. Migratory  
 35 waterfowl also are known to feed and rest in the grasslands associated with the  
 36 north fork of Folsom Reservoir.

37 Seasonal wetland communities occur both inside and outside of the area  
 38 influenced by the reservoir. These communities are exposed to wetland  
 39 hydrology for a limited period of time and may not meet all criteria for wetlands.  
 40 Within the reservoir drawdown zone, this seasonal vegetation is frequently  
 41 inundated and may receive overland flow from upland areas. Outside of the  
 42 drawdown zone, seasonally wet areas receive water from seeps, drainages, and  
 43 precipitation (Reclamation et al. 2006). Small areas of permanent freshwater

1 marsh are found at the toe of the Mormon Island Auxiliary Dam. Water birds and  
2 other wildlife depend on the freshwater marshes in these areas for foraging and/or  
3 rearing habitat. These species include Pacific Tree Frog, Western Toad, Common  
4 Garter Snake, beaver, raccoon, and muskrat.

5 Folsom Lake is surrounded by a relatively barren drawdown zone due to annual  
6 fluctuations in water elevations. The majority of this zone is devoid of  
7 vegetation, although scattered stands of woody vegetation occur in some areas of  
8 the drawdown zone (Reclamation et al. 2006). The only contiguous riparian  
9 vegetation occurs along Sweetwater Creek at the southern end of the reservoir.

10 Between Folsom Dam and Lake Natoma, the river channel is narrower and  
11 flanked by steep, rocky cliffs (Reclamation 2005a). The land along the river  
12 includes wooded canyon areas, sheer bluffs, and dredge tailings from the gold  
13 mining era. Within Lake Natoma, the open water is bordered by narrow bands of  
14 riparian woodland. Patches of permanent freshwater marsh exist in shallow coves  
15 that are inundated when water rises in Lake Natoma (Reclamation 2005a).

16 *Lower American River between Lake Natoma and Confluence with the*  
17 *Sacramento River*

18 Downstream of Lake Natoma, the lower American River flows to the confluence  
19 with the Sacramento River. In the upper reaches of the lower American River, the  
20 river channel is controlled by natural bluffs and terraces. Levees have been  
21 constructed along the northern and southern banks for approximately 13 miles  
22 upstream of the confluence with the Sacramento River (Reclamation et al. 2006).

23 Most of the lower American River is encompassed by the American River  
24 Parkway, which preserves what remains of the historic riparian zone  
25 (Reclamation et al. 2006). Vegetation communities along the lower  
26 American River downstream of Nimbus Dam include freshwater emergent  
27 wetland, riparian forest and scrub. Oak woodland and annual grassland are  
28 present in the upper, drier areas farther away from the river. The current  
29 distribution and structure of riparian communities along the river reflects the  
30 human-induced changes caused by activities such as gravel extraction, dam  
31 construction and operations, and levee construction and maintenance, as well as  
32 by both historical and ongoing streamflow and sediment regimes, and  
33 channel dynamics.

34 In general, willow and alder tend to occupy areas within the active channel of the  
35 river that are repeatedly disturbed by river flows, with cottonwood-willow  
36 thickets occupying the narrow belts along the active river channel (Reclamation et  
37 al. 2006). Typical species in these thickets include Fremont cottonwood, willow,  
38 poison oak, wild grape, blackberry, northern California black walnut, and  
39 white alder.

40 Cottonwood forest is found on the steep, moist banks along much of the river  
41 corridor (Reclamation et al. 2006). Valley oak woodlands occur on upper terraces  
42 where fine sediment and adequate soil moisture provide a long growing season.  
43 Live oak woodland occurs on the more arid and gravelly terraces that are isolated  
44 from the fluvial dynamics and moisture of the river. Annual grassland occurs in

1 areas that have been disturbed by human activity and can be found in many areas  
2 within the river corridor.

3 The cottonwood-dominated riparian forest and areas associated with backwater  
4 and off-river ponds are highest in wildlife diversity and species richness relative  
5 to other river corridor habitats (Reclamation et al. 2006). More than 220 species  
6 of birds have been recorded along the lower American River and more than  
7 60 species are known to nest in the riparian habitats. Typical species that can be  
8 found along the river include Great Blue Heron, Mallard, Red-Tailed Hawk,  
9 American Kestrel, California Quail, Killdeer, Belted Kingfisher, Western  
10 Scrub-Jay, Swallows, and American Robin. Additionally, more than 30 species  
11 of mammals reside along the river, including skunk, rabbit, raccoon, squirrel,  
12 vole, muskrat, deer, fox, and coyote. Reptiles and amphibians that occupy  
13 riparian habitats along the river include Western Toad, Pacific Tree Frog,  
14 bullfrog, Western Pond Turtle, Western Fence Lizard, Common Garter Snake,  
15 and Gopher Snake (Reclamation 2005a).

16 Backwater areas and off-river ponds are located throughout the length of the river,  
17 but occur predominantly at the Sacramento Bar, Arden Bar, Rossmoor Bar, and  
18 between Watt Avenue and Howe Avenue (Reclamation 2005a; Reclamation et al.  
19 2006). Plant species that dominate these backwater areas include various species  
20 of willow, sedge, cattail, bulrush, and rush. Riparian vegetation around these  
21 ponded areas is composed of mixed-age willow, alder, and cottonwood. These  
22 backwater ponds may be connected to the river by surface water during high  
23 winter flood flows and by groundwater during other times of the year. Wildlife  
24 species typical of these areas include: Pied-Billed Grebe, American Bittern, Green  
25 Heron, Common Merganser, White-Tailed Kite, Wood Duck, Yellow Warbler,  
26 Warbling Vireo, Dusky-Footed Woodrat, Western Gray Squirrel, Pacific Tree  
27 Frog, and Western Toad.

28 Several non-native weed populations are rapidly expanding in the riparian  
29 vegetation of the lower American River (County of Sacramento 2008). In  
30 particular, red sesbania is expanding along shorelines of streams and ponds, along  
31 with other invasive species such as Chinese tallowtree, giant reed, pampasgrass,  
32 Spanish broom, Himalayan blackberry, and tamarisk, which can rapidly colonize  
33 exposed bar surfaces and stream banks.

#### 34 **10.3.3.2.8 Agricultural Lands in the Sacramento Valley**

35 The study area in the Sacramento Valley includes Shasta, Plumas, Tehama,  
36 Glenn, Colusa, Butte, Sutter, Yuba, Nevada, Placer, El Dorado, Sacramento,  
37 Yolo, and Solano counties. As described in Chapter 12, Agricultural Resources,  
38 field and forage crops dominate the irrigated acreage in Sacramento Valley with  
39 over 1.4 million acres irrigated. Rice, irrigated pasture, and hay are the largest  
40 acreages. Second to field and forage crops are orchard and vine crops, making up  
41 roughly 21 percent of the total acreage. Almonds and walnuts are the largest  
42 acreages in this category. In total, the Sacramento Valley contains nearly two  
43 million agricultural acres. Typical terrestrial resources of these crops are  
44 described in subsection 10.3.4.1.4, Agricultural Lands.

1 **10.3.3.2.9 Wildlife Refuges in the Sacramento Valley**

2 The Sacramento Valley supported three major landscape types: wetlands,  
3 grassland-prairies, and riparian woodlands (Reclamation et al 2001a). These  
4 habitats were hydrologically and biologically linked to the river systems. Prior to  
5 their containment by the construction of dams and levees, the major rivers  
6 meandered, forming oxbows and riparian habitat. Winter floods would inundate  
7 and scour areas along these rivers, creating marshes and early-succession riparian  
8 scrub. Expanses of seasonal wetlands were also created by winter flooding.  
9 These seasonal wetlands formed habitat for overwintering and migrating  
10 waterfowl. Habitat areas such as wetlands are now intensively managed to  
11 support a wide range of birds and other wildlife within small and fragmented  
12 areas. Remnant wetlands and agricultural lands in the Central Valley support  
13 approximately 60 percent of the waterfowl wintering in the Pacific Flyway region  
14 (includes Alaska, Arizona, California, Idaho, Nevada, Oregon, Utah, Washington,  
15 and portions of Colorado, Montana, New Mexico, and Wyoming west of the  
16 Continental Divide [PFC 2014]). In addition, another 20 percent of the Pacific  
17 Flyway population passes through the Central Valley, using the wetlands for  
18 foraging and resting on their migratory passage through the region. The  
19 Sacramento Valley provides winter habitat for 44 percent of the Pacific Flyway  
20 waterfowl. The wetland and associated habitat are also important to several  
21 federally listed and proposed species, and other special status species such as the  
22 American Peregrine Falcon, Bald Eagle, Aleutian Canada Goose, Giant Garter  
23 Snake, and California Tiger Salamander.

24 The Sacramento National Wildlife Refuge (NWR) Complex is composed of five  
25 national wildlife refuges (Sacramento, Delevan, Colusa, Sutter and Sacramento  
26 River NWRs) and three state wildlife management areas (Willow Creek-Lurline,  
27 Butte Sink and North Central Valley Wildlife Management Areas) (USFWS  
28 2013a). The refuges of the Sacramento NWR Complex contain permanent ponds,  
29 seasonal wetlands, irrigated moist soil impoundments, and uplands (Reclamation  
30 et al 2001). Gray Lodge Wildlife Area is located adjacent to the Butte Sink, an  
31 overflow area of Butte Creek and the Sacramento River. It consists of seasonal  
32 wetlands and upland areas with permanent wetland and riparian habitats (DFG  
33 2011a). The Gray Lodge Wildlife Area supports permanent and seasonal  
34 wetlands, crops, and pasture (Reclamation et al. 2001).

35 Seasonally flooded marsh is the most prevalent and diverse of the wetland habitat  
36 types (Reclamation et al 2001). Wetland units managed as seasonally flooded  
37 marsh are typically flooded from early September through mid-April. Their  
38 diversity is the product of a variety of water depths that result in an array of  
39 vegetative species that, in combination, provide habitat for the greatest number of  
40 wildlife species throughout the course of a year. Through the fall and winter,  
41 seasonally flooded marshes are used by a wide range of waterfowl and smaller  
42 numbers of egret, heron, ibis, and grebe, to name a few. In addition, raptors take  
43 advantage of the water bird prey base. Water is removed in the spring; therefore,  
44 shorebirds use the shallow depth and exposed mudflats on their northern  
45 migration.

1 Moist soil impoundments, or seasonally flooded impoundments, are similar to  
2 seasonally flooded marshes (Reclamation et al 2001). Moist soil impoundments  
3 are typically irrigated during the summer to bolster plant growth and to enhance  
4 seed production. Irrigation is usually performed in mid-summer to increase plant  
5 biomass and seed production of watergrass, sprangletop, and smartweed plants.  
6 During these irrigation periods, these units are often used by locally nesting  
7 colonial water birds (egrets, herons).

8 Permanent ponds and summer water provide wetland habitat for year-round and  
9 summer resident species (Reclamation et al 2001). Permanent ponds remain  
10 flooded throughout the year, while units managed for summer water are flooded  
11 through June or July. Characterized by both emergent and submergent aquatic  
12 plants, permanent ponds and summer water units provide brood and molting areas  
13 for waterfowl, secure roosting and nesting sites for wading birds and other over-  
14 water nesters, and feeding areas for species like cormorants and pelicans.  
15 Permanent wetland habitats are also important to a number of special status  
16 species, such as the Giant Garter Snake, White-Faced Ibis, and Tricolored  
17 Blackbird.

18 Valley-foothill riparian habitats are found along low- to mid-elevation streams  
19 and waterways (Reclamation et al. 2001). Riparian habitats provide nesting,  
20 roosting, and feeding areas for passerines, raptors, herons, egrets, waterfowl, and  
21 small mammals. These areas also provide corridors for resident and migratory  
22 wildlife. Riparian woodland habitats are characterized by even-aged, broad-  
23 leafed, deciduous trees with open canopies that reflect flood-mediated episodic  
24 events. Cottonwood, willow, alder, and oak are typical trees found in riparian  
25 woodlands. Riparian scrub habitats are described as streamside thickets  
26 dominated by one or more willow species, as well as other fast-growing shrubs  
27 and vines.

### 28 **10.3.3.3 San Joaquin Valley**

29 The San Joaquin Valley portion of the Central Valley Region considered in this  
30 EIS includes the San Joaquin River from Millerton Lake to the Delta; lower  
31 Stanislaus River from New Melones Reservoir to the confluence with the San  
32 Joaquin River; San Luis Reservoir; and agricultural areas and wildlife refuges that  
33 use CVP and SWP water supplies.

34 Historically, the San Joaquin Valley was a large floodplain that supported vast  
35 expanses of permanent and seasonal marshes, lakes, and riparian areas. Almost  
36 70 percent of the valley has been converted to irrigated agriculture (Reclamation  
37 2005b). Relict stands of alkali desert scrub are widely scattered throughout the  
38 San Joaquin Valley, but are generally found in the Tulare Basin in the southern  
39 San Joaquin Valley. Annual and perennial grasslands occur throughout the San  
40 Joaquin Valley, mostly on level plains and the gently rolling foothills at  
41 elevations immediately higher than the patches of alkali desert scrub. Ruderal  
42 vegetation is typically associated with road and utility rights-of-way, borders of  
43 fields, ditches, and abandoned fields.

1 As described in subsection 10.3.2, Overview of Species with Special Status, A  
2 listing of wildlife and plant species with special status that occur or may occur in  
3 portions of the study area affected by the long-term coordinated operation of the  
4 CVP and SWP is provided in Appendix 10A.

5 The USFWS has approved a habitat conservation plan for San Joaquin County  
6 Multi-species Habitat Conservation and Open Space Plan, Kern Water Bank, and  
7 the Metropolitan Bakersfield.

#### 8 **10.3.3.3.1 San Joaquin River**

9 Potential changes in CVP and SWP operations could affect terrestrial resources  
10 associated with the San Joaquin River from Millerton Lake to the Delta.

##### 11 *Millerton Lake*

12 Millerton Lake on the San Joaquin River is located in the western foothills of the  
13 Sierra Nevada Mountains in an area that ranges from grasslands and rolling hills  
14 near Friant Dam, to steep, craggy slopes in the upper reaches of the lake.

15 Vegetation around Millerton Lake consists of a number of terrestrial  
16 communities, including annual grassland, oak woodland, foothill pine oak  
17 woodland, and chaparral (Reclamation 2011; Reclamation and State Parks 2010).

18 The most dominant vegetation community near the water edge is the nonnative  
19 grassland with blue oak woodland on the slopes above the lake and mixed riparian  
20 woodlands along drainages to the lake (Reclamation 2011; Reclamation and State  
21 Parks 2010). The dominant grassland species include broad-leaf filaree,  
22 fiddleneck, Heermann tarweed, vinegar weed, and ripgut brome, soft chess,  
23 zorro grass. The blue oak woodland also includes gray pine, buck brush, bush  
24 lupine, holly-leaf redberry, and hoary coffeeberry. The mixed riparian woodland  
25 species include interior live oak and gray pine with red willow, Fremont  
26 cottonwood, California buckeye, edible fig, and Oregon ash with an understory of  
27 California grape, button bush, Himalayan blackberry, sedges, and nonnative  
28 spearmint. Aquatic plants occur along the drainages where the water is relatively  
29 stagnant including mosquito fern, common duckweed, dotted duckmeat,  
30 punctuate smartweed, tall flat sedge, and broad-leaf cattail. Much of the shoreline  
31 is barren or characterized by nonnative grasslands with weedy species, such as  
32 Bermuda grass and cocklebur, and sporadic Goodding's black willow.

33 Mule Deer, California Quail, wild turkey, and feral pig, all of which are game  
34 species, occur in the area around Millerton Lake (Reclamation 2011; Reclamation  
35 and State Parks 2010). The region provides winter range and migratory routes for  
36 the San Joaquin deer herd. A number of special status bat species have potential  
37 to occur in the area, and suitable roost sites may be found throughout the area.  
38 Other special status species that may occur in the area include the ringtail,  
39 American badger, and San Joaquin pocket mouse.

40 A relatively diverse community of reptile and amphibian species exists in and  
41 around Millerton Lake (Reclamation 2011; Reclamation and State Parks 2010).  
42 The presence of the nonnative bullfrog has changed, and continues to dramatically  
43 alter, the extant reptile and amphibian community through predation and because

1 of its ability to out-compete native species. The Western Pond Turtle is known to  
2 occur around the lake. The California Tiger Salamander has also been reported.  
3 Limited areas of potential breeding habitat for California tiger salamander,  
4 primarily stock ponds dominated by nonnative species, have been identified in the  
5 San Joaquin River gorge upstream of the lake.

6 Bald eagles use roost trees near open water for foraging and are known to winter  
7 around Millerton Lake (Reclamation 2011; Reclamation and State Parks 2010).  
8 Several species associated with riparian habitats, including the least Bell's vireo  
9 and willow flycatcher, occurred historically around the lake, but have not been  
10 recently documented. A number of nonnative birds, including European Starling  
11 and Brown-Headed Cowbird, influence the native bird community through  
12 competition and nest parasitism.

13 A number of rare and listed plant species are known to occur around Millerton  
14 Lake and the upper San Joaquin River (Reclamation 2011; Reclamation and State  
15 Parks 2010). These include Ewan's larkspur, Michael's piperia, tree anemone,  
16 and Madera leptosiphon. Two plant species which serve as hosts for special  
17 status invertebrates, the elderberry and California pipevine, are also known to  
18 occur in the area. California pipevine is the obligate host plant for the pipevine  
19 swallowtail, a butterfly species and the elderberry shrub is the host plant of the  
20 Valley Elderberry Longhorn Beetle.

#### 21 *San Joaquin River from Friant Dam to the Confluence with the Merced River*

22 A multilayered riparian forest dominated by cottonwoods occurs on the active low  
23 floodplain of the San Joaquin River along with older stands of cottonwood-  
24 dominated riparian forest in areas that were formerly active floodplains prior to  
25 the completion of Friant Dam and associated diversion channels, and the resulting  
26 reduction in river flow (DWR and Reclamation 2002; Reclamation and DWR  
27 2011). Other areas on the low floodplain are dominated by willow, with  
28 occasional scattered cottonwood, ash, or white alder. California buttonbush is  
29 often present and may even dominate the riverbank for stretches.

30 The intermediate terrace of the floodplain of the San Joaquin River is primarily a  
31 mixed-species riparian forest (DWR and Reclamation 2002; Reclamation and  
32 DWR 2011). Species dominance in this mixed riparian forest depends on site  
33 conditions, such as availability of groundwater and frequency of flooding.  
34 Typical dominant trees in the overstory and midstory include Fremont  
35 cottonwood, boxelder, Goodding's black willow, Oregon ash, and California  
36 sycamore. Immediately along the water's edge, white alder occurs in the upper  
37 reaches of the San Joaquin River. Typical shrubs include red willow, arroyo  
38 willow, and California buttonbush.

39 Tree-dominated habitats with an open-to-closed canopy are typically found on the  
40 higher portions of the floodplain (DWR and Reclamation 2002; Reclamation and  
41 DWR 2011). These areas are exposed to less flood-related disturbance than areas  
42 lower on the floodplain. Valley oak is the dominant tree species while California  
43 sycamore, Oregon ash, and Fremont cottonwood are present in small numbers.

1 Typical understory species include creeping wild rye, California wild rose,  
2 Himalayan blackberry, California wild grape, and California blackberry.

3 Dense stands of willow shrubs frequently occur within the active floodplain of the  
4 river in areas subject to more frequent scouring flows and often occupy stable  
5 sand and gravel point bars immediately above the active channel (DWR and  
6 Reclamation 2002; Reclamation and DWR 2011). Dominant species include  
7 sandbar willow, arroyo willow, and red willow. Occasional emergent Fremont  
8 cottonwood may also be present.

9 Other areas have vegetation consisting of woody shrubs and herbaceous species  
10 dominated by different species depending on river reach. Some areas are  
11 dominated by mugwort, together with stinging nettle and various tall weedy  
12 herbs. Other areas are dominated either by blackberry (usually the introduced  
13 Himalayan blackberry) or wild rose in dense thickets, with or without scattered  
14 small emergent willows.

15 Areas with fine-textured, rich alluvium located outside the active channels but in  
16 areas that are subject to periodic flooding contain a shrub-dominated community  
17 characterized by widely spaced blue elderberry shrubs (DWR and Reclamation  
18 2002; Reclamation and DWR 2011). The herbaceous understory is typically  
19 dominated by nonnative grasses and forbs that are characteristic of annual  
20 grassland communities, including ripgut brome, foxtail fescue, foxtail barley,  
21 red-stemmed filaree, and horseweed.

22 Emergent wetlands typically occur in the river bottom immediately adjacent to the  
23 low-flow channel (DWR and Reclamation 2002; Reclamation and DWR 2011).  
24 Backwaters and sloughs where water is present through much of the year support  
25 emergent marsh vegetation, such as tule and cattails. More ephemeral wetlands,  
26 especially along the margins of the river and in swales adjacent to the river,  
27 support native and nonnative herbaceous species.

28 Prevalent invasive species found in this portion of the San Joaquin River corridor  
29 include red sesbania, tamarisk, giant reed, Chinese tallow, Tree-of-heaven, and  
30 perennial pepperweed (Reclamation and DWR 2011). Water hyacinth, water  
31 milfoil, Parrot's feather, curly-leaf pondweed, and sponge plant occur within the  
32 streams, especially in areas with slow or ponded water.

33 The riparian forest trees and understory provide habitat for raptors, cavity-nesting  
34 birds, and songbirds, including Red-Tailed Hawk, Red-Shouldered Hawk,  
35 Swainson's Hawk, White-Tailed Hawk, Downy Woodpecker, Wood Duck,  
36 Northern Flicker, Ash-Throated Flycatcher, Pacific-Slope Flycatcher, Olive Sided  
37 Flycatcher, Tree Swallow, Oak Titmouse, White-Breasted Nuthatch, Western  
38 Wood-Pewee, Warbling Vireo, Orange-Crowned Warbler, Yellow Warbler,  
39 Bullock's Oriole, and Spotted Towhee (DWR and Reclamation 2002;  
40 Reclamation and DWR 2011). Western Wood-Pewee, Bushtit, Bewick's Wren,  
41 Lazuli Bunting, Blue Grosbeak, and American Goldfinch inhabit the riparian  
42 scrub vegetation. Song Sparrow, Common Yellowthroat, Marsh Wren, and  
43 Red-Winged Blackbird inhabit the emergent wetlands. Coyote, River Otter,  
44 raccoon, Desert Cottontail, and Striped Skunk occur in the riparian forest and

1 shrub communities. Shorebirds, such as Killdeer; Mallard Duck; California Vole;  
 2 Common Muskrat; Norway Rat; Pacific Chorus Frog; Western Pond Turtle; and  
 3 Western Terrestrial Garter Snake occur near the river.

#### 4 *San Joaquin River from Merced River to the Delta*

5 Downstream of the Merced River confluence, vegetation and wildlife resources  
 6 along the San Joaquin River are similar to the upstream reaches described above  
 7 (DWR and Reclamation 2002; Reclamation and DWR 2011). The reach of the  
 8 San Joaquin River immediately downstream of the Merced River is more incised  
 9 than areas further downstream and has a less developed riparian area with less  
 10 understory vegetation. Between the Merced River and the Delta, agricultural land  
 11 use has encroached on the riparian areas, leaving only a narrow band of riparian  
 12 habitat. Near the confluence with tributary rivers, in cutoff oxbows, and in the  
 13 San Joaquin River NWR, there are more extensive riparian habitat areas.  
 14 Remnant cattail-dominated marshes and tules occur in these areas.

15 Wildlife species are similar to those found in the reaches upstream of the Merced  
 16 River described above (DWR and Reclamation 2002; Reclamation and  
 17 DWR 2011).

#### 18 **10.3.3.3.2 Stanislaus River**

19 The upper Stanislaus River watershed has a drainage area of approximately  
 20 980 square miles (Reclamation 2010b). The North, Middle, and South forks of  
 21 the Stanislaus River converge upstream of the CVP New Melones Reservoir.  
 22 Water from New Melones Reservoir flows into Tulloch Reservoir. Downstream  
 23 of Tulloch Reservoir, the Stanislaus River flows to Goodwin Dam and then  
 24 approximately 40 miles to the confluence with the San Joaquin River.

#### 25 *New Melones Reservoir*

26 Several broad categories of vegetation have been described in other studies  
 27 around the New Melones Reservoir, including blue oak woodland and blue  
 28 oak-foothill pine woodland, grasslands, chaparral, wetlands, and serpentine-based  
 29 communities (Reclamation 2010b). The montane hardwood and montane  
 30 hardwood-conifer woodlands occur at higher elevations substantially above the  
 31 reservoir open water, especially along the eastern portion of the New Melones  
 32 Reservoir; and are not anticipated to be affected by changes in CVP and  
 33 SWP operations.

34 Blue oak woodland vegetation occurs in the western and southwestern portion of  
 35 New Melones Reservoir, especially on rocky slopes and along riparian corridors  
 36 (Reclamation 2010b). Oak trees that are established along the shoreline during  
 37 drier periods are frequently killed when the reservoir fills to the maximum  
 38 elevation. The blue oak woodland community also includes ponderosa pine,  
 39 California buckeye, manzanita, ceanothus, yerba santa, foothill pine, scrub oak,  
 40 black oak, valley oak, interior live oak, coffeeberry, redberry, holly-leaved cherry,  
 41 and needlegrass. The blue oak-foothill pine woodland occurs at higher elevations  
 42 along the western and southern areas of the New Melones Reservoir, and includes  
 43 understory species, including poison oak, woodland star, sugar cup, shooting star,

1 Chinese house, and gooseberry. The oak woodland supports woodpecker,  
2 mourning doves, wild turkey, California quail, mule deer, black-tailed deer,  
3 western grey squirrel, gray fox, raccoon, feral pig, striped skunk, mountain lion,  
4 and bobcat. The transition chaparral zones between the oak woodlands and  
5 grasslands support California Thrasher, quail, wrentit, bobcat, Deer Mouse, feral  
6 pig, and Fence Lizard.

7 Annual grasslands occur along adjacent plains and foothills on the western and  
8 southern portions of New Melones Reservoir (Reclamation 2010b). The annual  
9 plant species, including wild oats, soft chess, ripgut, fiddleneck, longbeak stork's  
10 bill, and redstem stork's bill. Perennial grass species include triple-awned grass,  
11 wheat grass, bent grass, wild-rye, melic grass, needle-grass, and muhly. The area  
12 also includes foothill pine, blue oak, California poppy, and lupines. Grasslands  
13 support Meadowlark, Horned Lark, sparrow, quail, mouse, and vole. Raptors that  
14 forage in the grasslands include White-Tailed Kite, Northern Harrier, Great  
15 Horned Owl, Red-Tailed Hawk, and Swainson's Hawk.

16 Little riparian vegetation exists along the shoreline of New Melones Reservoir  
17 because fluctuating water levels limit the establishment of riparian vegetation  
18 (Reclamation 2010b). Riparian vegetation is generally found in the upstream  
19 reaches of some of the perennial drainages that flow into the reservoir. Wetland  
20 vegetation is found in some locations along the edges of the lake and in moist  
21 canyons. There are many riparian communities, seeps, and wet meadows in the  
22 upper reaches of streams that are tributaries of the lake. Species in the valley and  
23 foothill riparian woodlands include boxelder, Fremont cottonwood, willows,  
24 white alder, and big-leaf maple. The wet meadow species include short-hair  
25 sedge, gentian-aster, few-flowered spikerush, carpet clover, bentgrass, pull-up  
26 muhly, beaked sedge, Nebraska sedge, Kentucky bluegrass, longstalk clover, and  
27 tufted hairgrass.

28 The open water of New Melones Lake, along with associated shoreline  
29 vegetation, provides foraging and resting habitat for a variety of waterfowl and  
30 shorebirds (Reclamation 2010b). Several fish-eating bird species, such as grebe,  
31 forage in the open water; other species, such as ducks, herons, and egrets, dabble  
32 along the shoreline foraging on seeds and small fish in shallow areas. Trees along  
33 the shoreline provide nesting areas for osprey. Riparian areas along larger  
34 tributaries to New Melones Reservoir provide food, cover, water, and nesting  
35 habitat for a variety of wildlife species and serve as travel corridors for species  
36 such as black-tailed deer.

37 Limestone caves are located in portions of the upper reaches of New Melones  
38 Reservoir, especially along the Stanislaus River (Reclamation 2010b). Bats use  
39 the caves for roosting and breeding. A type of rare spider, New Melones  
40 harvestman, was transplanted from caves that were to be inundated through the  
41 filling of New Melones Reservoir into neighboring caves.

#### 42 *Tulloch Reservoir*

43 Many vegetation community types characteristic of the New Melones Reservoir  
44 and other portions of the Sierra foothills are found around Tulloch Reservoir,

1 including blue oak woodland, chaparral, grassland, various tree-shrub  
 2 communities dominated by pines, and grasslands (Tri-Dam Project 2008). The  
 3 elderberry shrub (*Sambucus* species) occurs at multiple locations around the  
 4 reservoir and may provide habitat for the Valley Elderberry Longhorn Beetle. A  
 5 number of nonnative weedy species have been documented around the reservoir  
 6 including Himalayan blackberry, red brome, tree-of-heaven, slenderflower thistle,  
 7 yellow star thistle, pampas grass, Bermuda grass, and the aquatic parrot's feather.  
 8 The vegetation along the water edge is affected by daily and seasonal water  
 9 elevation variability. Wildlife supported by the vegetative community are similar  
 10 to wildlife communities near New Melones Reservoir as well as Western Pond  
 11 Turtle, bat, river otter, and mink (Goodwin Power 2013).

#### 12 *Goodwin Dam*

13 Downstream of Tulloch Dam, the Stanislaus River flows to Goodwin Dam, and  
 14 then continues approximately 40 miles to the confluence with the San Joaquin  
 15 River. Goodwin Dam serves as a diversion dam for Oakdale Irrigation District,  
 16 South San Joaquin Irrigation District, and Stockton East Water District, as  
 17 described in Chapter 5, Surface Water Resources and Water Supplies (Tri-Dam  
 18 Project 2003, 2007). The Goodwin Dam impounds 502 acre-feet of water along  
 19 the Stanislaus River approximately 1.6 miles downstream of Tulloch Dam and  
 20 8.3 miles downstream of New Melones Dam. Water surface elevations are  
 21 relatively constant upstream of Goodwin Dam.

22 The vegetation communities in this area of the Stanislaus River are similar to the  
 23 vegetation near Tulloch Dam, including hardwood and oak woodlands with blue  
 24 oak, interior live oak, gray pine, California buckeye, toyon, tree of heaven, and  
 25 California black walnut (Tri-Dam 2003). Near the Stanislaus River, the  
 26 vegetation is characterized by riparian woodland with cottonwood, willows, white  
 27 alder, blue elderberry, and Himalayan berry. Some low-gradient areas along the  
 28 shoreline of Goodwin Lake, especially in coves, support small patches of  
 29 emergent aquatic vegetation such as bulrush and cattail (Goodwin Power 2013).  
 30 Wildlife occurrences are similar to conditions near Tulloch Reservoir.

#### 31 *Stanislaus River from Goodwin Dam to the Confluence with the San Joaquin* 32 *River*

33 From Goodwin Dam to Knight's Ferry, the Stanislaus River flows through a  
 34 bedrock canyon with nearly vertical walls and rock outcrops (DFG 1995). The  
 35 riparian edge includes valley foothill riparian vegetation in a very narrow band for  
 36 the entire length of this reach. This habitat is characterized by a canopy layer of  
 37 cottonwood, California sycamore, and valley oak. Subcanopy cover trees are  
 38 white alder, boxelder, and Oregon ash. Typical understory shrub layer plants  
 39 include wild grape, wild rose, California blackberry, elderberry, button brush, and  
 40 willow. The herbaceous layer consists of sedges, rushes, grasses, miner's lettuce,  
 41 poison-hemlock, and stinging nettle.

42 From Knights Ferry to the Orange Blossom Bridge, located to the east of the City  
 43 of Oakdale, the valley foothill riparian habitat continues along the river (DFG  
 44 1995). Further away from the river, vegetation is dominated by blue oak-digger

1 pine woodland and shrub, including California redbud, California buckeye,  
2 ceanothus, manzanita, poison oak, and grasslands. Vernal pools and vernal pool  
3 complexes are found within adjacent grasslands.

4 Downstream of the Orange Blossom Bridge, the riparian corridor is virtually  
5 nonexistent in some areas with agricultural land uses extending into the riparian  
6 corridor (DFG 1995). In a few areas the riparian corridor is wide, such as within  
7 Caswell Memorial State Park. The major habitats include valley foothill riparian  
8 along the Stanislaus River with annual grasslands and fresh emergent wetlands  
9 amount the agricultural and urban developments.

#### 10 **10.3.3.3.3 San Luis Reservoir Complex**

11 The San Luis Reservoir complex, consisting of San Luis Reservoir, O'Neill  
12 Forebay, and Los Banos Creek Reservoir, is located in northwestern San Joaquin  
13 Valley and is part of the water storage and delivery system for the CVP and SWP.  
14 The area is located within several vegetative communities (Reclamation and State  
15 Parks 2013). The northern and western portion of the San Luis Reservoir is  
16 located within the coastal foothills with blue oak-foothill pine woodlands. The  
17 O'Neill Forebay and parts of Los Banos Creek Reservoir are located within the  
18 San Joaquin Valley with valley oak habitat.

19 The vegetation around the San Luis Reservoir complex and wildlife management  
20 areas consists of riparian woodlands, blue oak woodlands and savanna, coast live  
21 oak woodland, ornamental trees, California sagebrush scrub, grasslands, wetlands,  
22 alkali sink scrub, and nonnative and weedy plant communities (Reclamation and  
23 State Parks 2013). The riparian woodland and wetland communities occur at the  
24 edge of the reservoirs and along watercourses. The San Luis Wildlife Area also  
25 contains blue oak woodland, blue oak savanna, coast live oak woodland, and  
26 California sycamore riparian woodland. California sagebrush scrub occurs on  
27 hillsides above and to the west of Los Banos Creek Reservoir. Iodine bush scrub  
28 occurs at Salt Spring, a tributary to Los Banos Creek Reservoir. Native purple  
29 needlegrass occurs throughout the complex.

30 Along the shorelines, riparian vegetation remains in an early successional stage  
31 because either the extreme fluctuation of the water level inundates the vegetation  
32 or the vegetation does not receive enough water during the dry season  
33 (Reclamation and State Parks 2013). Areas at the edges of O'Neill Forebay and  
34 Los Banos Creek Reservoir appear to be slowly changing to riparian vegetation.

35 A herd of more than 200 tule elk occurs towards the western shoreline of San Luis  
36 Reservoir within and near Pacheco State Park (Reclamation and State Park 2013).  
37 The herd moves down towards the water edge within the reservoir inundation area  
38 when the water elevation is low. Another herd of approximately 60 individuals  
39 occur around B.F. Sisk Dam which forms San Luis Reservoir; and approximately  
40 70 tule elk occur throughout other areas in the complex.

#### 41 **10.3.3.3.4 Agricultural Lands in the San Joaquin Valley**

42 The study area in the San Joaquin Valley includes the counties of Stanislaus,  
43 Merced, Madera, San Joaquin, Fresno, Kings, Tulare, and Kern counties. As

1 described in Chapter 12, Agricultural Resources, field and forage crops dominate  
2 the irrigated acreage in the San Joaquin Valley with over 5.5 million agricultural  
3 acres. Hay, cotton, and silage are the largest acreages. Second to field and forage  
4 crops are orchards and vineyards, making up roughly 35 percent of total acreage.  
5 Almonds and grapes are the largest acreages in this category.

6 Typical terrestrial resources of these crops are described in subsection 10.3.4.1.4,  
7 Agricultural Lands. In the grassland and pasture areas, areas not dominated by  
8 crops include nonnative grasses, foxtail barley, and forbs (Reclamation and DWR  
9 2011). The grassland and pasture support Northern Harrier, Ring-Necked  
10 Pheasant, Mourning Dove, Burrowing Owl, Loggerhead Shrike, Deer Mouse,  
11 California Vole, California Ground Squirrel, Botta's Pocket Gopher, American  
12 Badger, coyote, Western Toad, Western Fence Lizard, Western Racer, and  
13 Gopher Snake. The cropland provides foraging areas for raptors and supports  
14 Ground Squirrel, American Crow, Brewer's Blackbird, and European Starling.

### 15 **10.3.3.3.5 Wildlife Refuges in the San Joaquin Valley**

16 The San Joaquin Valley historically supported three major landscape types:  
17 wetlands, grassland-prairies, and riparian woodlands (Reclamation et al 2001b).  
18 These habitats were hydrologically and biologically linked to the river systems.  
19 Prior to their containment by the construction of dams and levees, the major rivers  
20 meandered, forming oxbows and riparian habitat. Winter floods would inundate  
21 and scour areas along these rivers, creating marshes and early-succession riparian  
22 scrub. Expanses of seasonal wetlands were also created by winter flooding.  
23 These seasonal wetlands formed habitat for overwintering and migrating  
24 waterfowl. Habitat areas such as wetlands are now intensively managed to  
25 support a wide range of birds and other wildlife within small and fragmented  
26 areas. Remnant wetlands and agricultural lands in the Central Valley support  
27 approximately 60 percent of the waterfowl wintering in the Pacific Flyway region.  
28 In addition, another 20 percent of the Pacific Flyway population passes through  
29 the Central Valley, using the wetlands for foraging and resting on their migratory  
30 passage through the region. The Sacramento Valley provides winter habitat for  
31 44 percent of the Pacific Flyway waterfowl. The wetland and associated habitat  
32 are also important to several federally listed and proposed species, and other  
33 special status species such as the American Peregrine Falcon, Bald Eagle,  
34 Aleutian Canada Goose, Giant Garter Snake, and California Tiger Salamander.

35 CVP water supplies are provided to the San Luis NWR Complex which includes  
36 the Merced NWR, San Luis NWR (including the San Luis Unit, West Bear Creek  
37 Unit, East Bear Creek Unit, Freitas Unit, Blue Goose Unit, and Kesterson Unit),  
38 and Grasslands Wildlife Management Area (Reclamation 2012; USFWS 2012b,  
39 2013b). The San Luis NWR Complex also includes the San Joaquin River NWR  
40 which is influenced by CVP operations; however, this refuge does not specifically  
41 receive CVP water under a contract. CVP water supplies are also provided to the  
42 Los Banos Wildlife Area; Volta Wildlife Area; Mendota Wildlife Area; and North  
43 Grasslands Wildlife Area (including China Island Unit and Salt Slough Unit)  
44 (Reclamation 2012b). In the southern San Joaquin Valley, the Kern and Pixley  
45 NWRs provide wildlife viewing opportunities.

1 *San Luis National Wildlife Refuge Complex*

2 The San Luis NWR Complex includes wetlands, riparian forests, native  
3 grasslands, and vernal pools (USFWS 2012a, 2012b). The refuge is a major  
4 wintering ground and migratory stopover point for a wide range of waterfowl,  
5 shorebirds, and other waterbirds. The refuge is host to significant assemblages of  
6 birds, mammals, reptiles, amphibians, insects, and plants, some of which, such as  
7 the California Tiger Salamander and San Joaquin Kit Fox, are endangered  
8 species. Riparian woodlands occur along rivers and sloughs with willow,  
9 cottonwood, and oak to support egrets, herons, cormorants, raptors, and songbirds  
10 (USFWS 2012b). Wetlands occur on over 25 percent of the San Luis NWR  
11 Complex lands and provide nesting habitat for coots, grebes, blackbirds, bitterns,  
12 ibis, and marsh wrens; and seasonal wetlands for ducks, geese, shorebirds, and  
13 other waterbirds. Grasslands occur on over 70 percent of the lands, including the  
14 native creeping wild Rye and alkali sacaton, to support elk, Black-Tailed Deer,  
15 Desert Cottontail Rabbit, Black-Tailed Jackrabbit, voles, and songbirds. Vernal  
16 pools occur in some areas during the spring, especially in the Kesterson NWR and  
17 West Bear Creek Unit. Artificial dens and other habitat structures have been  
18 constructed on the refuge, including nest boxes for songbirds, owls, and wood  
19 ducks; and dens for kit foxes (USFWS 2012a).

20 *San Luis National Wildlife Refuge*

21 The San Luis NWR contains approximately 26,800 acres of wetlands, riparian  
22 forests, native grasslands, and vernal pools (USFWS 2012c). Saline and alkaline  
23 conditions on portions of the upland habitat support a rich botanical community of  
24 native bunchgrasses, native and nonnative annual grasses, forbs, and native  
25 shrubs. Wintering habitat is provided for numerous waterbirds, including green-  
26 winged teal, northern shoveler, mallard, gadwall, wigeon, cinnamon teal, northern  
27 pintail, ring-necked, canvasback, and ruddy ducks; snow, Ross', and white-  
28 fronted geese. Shorebirds include sandpipers and plovers. Tule elk occur in the  
29 upland habitats.

30 *Merced National Wildlife Refuge*

31 The Merced NWR contains approximately 10,250 acres of wetlands, native  
32 grasslands, vernal pools and riparian areas (USFWS 2012d). In addition to  
33 providing breeding habitat for Swainson's Hawk, Tricolored Blackbird, Marsh  
34 Wren, and Burrowing Owl; the refuge is host to the largest wintering populations  
35 along the Pacific flyway of Lesser Sandhill Crane and Ross' Goose. Mammals  
36 such as coyote, Ground Squirrel, rabbit, and beaver are found year-round. Vernal  
37 pools are a component of the refuge and are home to many species of vernal pool  
38 plants and invertebrates as well as the California Tiger Salamander. Merced  
39 NWR also includes approximately 300 acres of cultivated corn and winter wheat  
40 crops and more than 500 acres of irrigated pasture for wildlife.

41 *San Joaquin River National Wildlife Refuge*

42 The San Joaquin River NWR encompasses approximately 7,000 acres located  
43 where Tuolumne, Stanislaus, and San Joaquin rivers join, creating a mix of  
44 habitats for terrestrial wildlife and plant species. Initially established to protect

1 and manage habitat for the Aleutian Cackling Goose, the refuge is currently  
2 managed to provide habitat for migratory birds and endangered wildlife species  
3 (USFWS 2012e, 2012f). The refuge includes a mosaic of valley oak riparian  
4 forest, riverine and slough habitats, seasonal and permanent wetlands, vernal  
5 pools, natural uplands, and agricultural fields. Over 500,000 native trees and  
6 shrubs such as willow, cottonwood, oak, blackberry, and rose have been planted  
7 across 2,200 acres of river floodplain within the refuge, creating the largest block  
8 of contiguous riparian woodland in the San Joaquin Valley. Endangered riparian  
9 brush rabbits have been re-introduced to this restored habitat from captive-reared  
10 populations. These woodlands also support a diversity of breeding songbirds  
11 including grosbeak, oriole, flycatcher, warbler, and Least Bell's Vireo; and a  
12 heron/egret rookery. The refuge also provides winter and migration habitat for  
13 Lesser Sandhill Cranes, Greater Sandhill Cranes, Snow Geese, Ross' Geese, and  
14 White-Fronted Goose.

15 Several nonnative invasive plants influence the quality of wildlife habitat on the  
16 refuge including yellow star thistle, perennial pepperweed, poison hemlock,  
17 Russian thistle, milk thistle, and bull thistle. According to the Comprehensive  
18 Conservation Plan for the refuge (USFWS 2006), infestations are greatest in  
19 fallow agricultural fields, roadsides, canal banks, and undergrazed pastures, as  
20 well as other disturbed sites. Perennial pepperweed is established throughout the  
21 riparian areas of the refuge and stands of giant reed are scattered along the banks  
22 of the San Joaquin River. Infestations of water hyacinth seasonally disrupt water  
23 delivery and create impenetrable surfaces in the streams, sloughs, oxbows,  
24 and canals.

#### 25 *Grasslands Wildlife Management Area*

26 The Grasslands Wildlife Management Area is composed entirely of privately  
27 owned lands with perpetual conservation easements to preserve wetland and  
28 grassland habitats, and wildlife-friendly agricultural lands along the San Joaquin  
29 River (GRCD 2014; USFWS 2013c). The Grassland Resource Conservation  
30 District, located within the western portion of the Wildlife Management Area,  
31 contains approximately 75,000 acres of private wetlands and associated  
32 grasslands, and over 30,000 acres of federal National Wildlife Refuges and State  
33 Wildlife Management Area. The area constitutes 30 percent of the remaining  
34 wetland habitat in the Central Valley and is a major wintering ground for  
35 migratory waterfowl and shorebirds of the Pacific Flyway.

36 Grassland Resource Conservation District provides habitat for waterfowl,  
37 shorebirds, wading birds, songbirds, raptors, and other wildlife species (GRCD  
38 2014; USFWS 2013c). The Grassland Resource Conservation District  
39 specifically manages a program to encourage production of natural food plants  
40 (such as swamp grass, smartweed, and watergrass). Habitats include seasonally  
41 flooded wetlands, moist soil impoundments, permanent wetland, irrigated pasture,  
42 and croplands.

1 *Los Banos Wildlife Area*

2 The Los Banos Wildlife Area, located approximately 4 miles northeast of Los  
3 Banos, contains more than 6,200 acres in the San Joaquin River floodplain and is  
4 dominated by seasonal wetlands (CDFW 2014a; Reclamation 2001b). Permanent  
5 and semi-permanent wetlands are also present, along with areas of riparian  
6 vegetation. The Los Banos Wildlife Area also supports native and nonnative  
7 grasslands. Irrigated pasture and croplands are maintained to provide food,  
8 resting, and nesting habitat for waterfowl and other wildlife. Western Pond  
9 Turtle, raccoon, Striped Skunk, beaver, muskrat, and mink; as well as over  
10 200 species of waterfowl, shore birds, upland game birds, and song birds occur  
11 seasonally throughout the area. Seasonal marshes provide habitat for a wide  
12 range of waterbirds, upland birds, and seasonal migrants, including American  
13 bittern, snowy egret, killdeer, American avocet, wood duck, and mallard.

14 *Volta Wildlife Area*

15 The Volta Wildlife Area consists of approximately 2,900 acres. The Wildlife  
16 Area is partially in the Grassland Resource Conservation District (CDFW 2014b;  
17 Reclamation et al. 2001b). The Wildlife Area supports permanent and seasonal  
18 wetlands and valley alkali shrub. Irrigated pasture and crops are grown to provide  
19 food and nesting cover for migratory waterfowl. Beaver, coyote, cottontail, and  
20 150 species of birds, including a wide range of waterfowl and shorebirds, are  
21 found on the Volta Wildlife Area.

22 *Mendota Wildlife Area*

23 The Mendota Wildlife Area contains more than 12,000 acres of flatlands and  
24 floodplain (Huddleston 2001; Reclamation et al. 2001b). The Mendota Wildlife  
25 Area has been managed primarily to provide seasonal wetland habitat. Water is  
26 used to irrigate natural food crops, such as swamp grass, alkali bulrush,  
27 smartweed, and millet, and to flood seasonal and semi-permanent wetlands.  
28 Small grains, corn, and pasture are also irrigated in the upland areas. The  
29 Wildlife Area has significant white-faced ibis and great-blue heron rookeries.  
30 Shorebirds, songbirds, raptors, waterfowl, and wading birds use the wetlands  
31 habitat. Mammals that use the refuge include coyote, muskrat, beaver, mink,  
32 raccoon, weasel, Black-Tailed jackrabbit, Cottontail Rabbit, Spotted Skunk,  
33 Striped Skunks, and Ground Squirrel.

34 *North Grasslands Wildlife Area*

35 The North Grasslands Wildlife Area includes the China Island, Salt Slough, and  
36 Galdwall units which encompass 7,069 acres of wetlands, riparian habitat, and  
37 uplands (CDFW 2014c). Restoration and enhancement actions have focused on  
38 increasing seasonal wetlands, permanent and semi-permanent wetlands, and  
39 riparian habitat on the unit, including habitat for the Swainson's hawk and  
40 sandhill crane.

41 The China Island Unit of the North Grasslands Wildlife Area borders the San  
42 Joaquin River southwest of the confluence with the Merced River (DFG 2011b).  
43 The Salt Slough Unit is located on the west side of Salt Slough, adjacent to the  
44 San Luis NWR Complex and Los Banos Wildlife Area. Before its acquisition,

1 the unit consisted mainly of irrigated pasture and was managed as a cattle ranch  
2 (DFG 2011c). Habitat on both units includes permanent wetlands that are flooded  
3 continuously; semi-permanent wetlands that are flooded in the spring and  
4 summer; moist soil vegetation to produce seeds and sustain invertebrates,  
5 including swamp timothy, watergrass, and smartweed; seasonal wetlands to  
6 provided flooded areas in the fall for waterfowl; riparian habitat, nesting habitat  
7 for resident breeding birds, including Short-Eared Owl, Northern Harrier, ducks,  
8 and pheasants; upland foraging areas; and pasture which provides late winter and  
9 early spring habitat for geese, and other habitat areas for sandhill crane,  
10 pheasants, and raptors.

#### 11 *Kern National Wildlife Refuge Complex*

12 The Kern NWR Complex consists of the Kern NWR and Pixley NWR (USFWS  
13 2013d). The Kern NWR contains approximately 11,249 acres including seasonal  
14 marsh; moist soil units; and uplands (e.g., grasslands, alkali playa, and valley sink  
15 scrub) (USFWS 2013e). Wetlands on the refuge are seasonal in nature. Fall  
16 flooding begins in mid-August, with a peak in flooded marsh habitat by January.  
17 This habitat is maintained through February, after which the wetland areas are  
18 slowly drained. Selected units are irrigated during late spring and early summer  
19 to encourage plants to grow, to provide food for wintering and migrating birds the  
20 following fall (USFWS 2013e). The refuge is the largest wetland area in the  
21 Southern San Joaquin Valley and plays a vital role in the Pacific Flyway for  
22 migrating waterfowl, shorebirds, and songbirds. Uplands occupy the northeastern  
23 and northwestern portions of the refuge, used by threatened and endangered  
24 species, such as San Joaquin Kit Fox, Tipton Kangaroo Rat, and Blunt-Nosed  
25 Leopard Lizard. Artificial dens have been built for endangered San Joaquin Kit  
26 Foxes and artificial burrows have been provided for Burrowing Owls.

27 The Pixley NWR contains 6,389 acres of grasslands, vernal pools, and playas  
28 along the historic Tulare Lake boundaries (USFWS 2014ak). The refuge includes  
29 approximately 300 acres of managed wetlands for waterfowl and shorebirds. San  
30 Joaquin Kit Fox, Blunt-Nosed Leopard Lizard, and Tipton Kangaroo rat use the  
31 upland areas. Vernal pools also occur on the refuge.

#### 32 **10.3.3.4 Delta, Suisun Marsh, and Yolo Bypass**

33 Historically, the natural Delta system was formed by water inflows from upstream  
34 tributaries in the Delta watershed and outflow to Suisun Bay and San Francisco  
35 Bay (SFEI 2012). Upstream of the Delta, during high Sacramento River flows,  
36 water spilled into the geologic formation known as the Yolo Basin which extends  
37 from Knights Landing Ridge upstream of the confluence between the Sacramento  
38 and Feather rivers to the confluence of Cache Slough and the Sacramento River in  
39 the Delta upstream of Rio Vista and Suisun Marsh. The Delta and Suisun Marsh  
40 have a complex web of channels and islands and is located at the confluence  
41 of the Sacramento and San Joaquin rivers. As described below in  
42 subsection 10.3.4.4.1, Yolo Bypass, is a 59,280-acre floodway through the Yolo  
43 Basin that was constructed as part of the Sacramento River Flood Control Project  
44 to protect the cities of Sacramento and West Sacramento and the north Delta from  
45 extreme flood events.

1 The Delta (as legally defined in the Johnston-Baker-Andal-Boatwright Delta  
2 Protection Act of 1992 [California Water Code section 12220]) covers  
3 737,358 acres, including 4,278 acres of the Suisun Marsh and 16,762 acres of the  
4 Yolo Bypass. Individually, the overall Delta, Suisun Marsh, and Yolo Bypass  
5 extend over 737,358 acres, 106,511 acres, and 59,280 acres, respectively. In total,  
6 the Delta, Suisun Marsh, and Yolo Bypass constitute a natural floodplain that  
7 covers approximately 882,200 acres and drains approximately 40 percent of the  
8 state (DWR 2009a).

9 As described in subsection 10.3.2, Overview of Species with Special Status, A  
10 listing of wildlife and plant species with special status that occur or may occur in  
11 portions of the study area affected by the long-term coordinated operation of the  
12 CVP and SWP is provided in Appendix 10A.

#### 13 **10.3.3.4.1 Delta and Suisun Marsh**

14 The Delta overlies the western portions of the Sacramento River and San Joaquin  
15 River watersheds. The Delta is a network of islands, channels, and marshland at  
16 the confluence of the Sacramento and San Joaquin rivers. Major rivers entering  
17 the Delta are the Sacramento River flowing from the north, the San Joaquin River  
18 flowing from the south, and eastside tributaries (Cosumnes, Mokelumne, and  
19 Calaveras rivers). Suisun Marsh is a tidally influenced brackish marsh located  
20 about 35 miles northeast of San Francisco in southern Solano County. It is a  
21 critical part of the San Francisco Bay/Sacramento–San Joaquin Delta (Bay-Delta)  
22 estuary ecosystem. The Delta, together with Suisun Marsh and greater San  
23 Francisco Bay, make up the largest estuary on the west coast of North and South  
24 America (DWR 2009a).

25 The Delta was once composed of extensive freshwater and brackish marshes, with  
26 tules and cattails, broad riparian thickets of scrub willows, buttonwillow, and  
27 native brambles. In addition, there were extensive riparian forests of Fremont  
28 cottonwood, valley oak, Oregon ash, boxelder, white alder, and Goodding’s black  
29 willow. Upland, non-riparian stands of valley oak and coast live oak occurred in  
30 a mosaic with seasonally flooded herbaceous vegetation, including vernal pools  
31 and alkali wetlands (SFEI 2012).

32 Substantial areas of the Delta and Suisun Marsh have been modified by  
33 agricultural, urban and suburban, and recreational land uses (Reclamation et al.  
34 2011; SFEI 2012). Over the past 150 years, levees were constructed in the Delta  
35 and Suisun Marsh to provide lands for agricultural, municipal, industrial, and  
36 recreational land uses. The remaining natural vegetation is fragmented, and  
37 largely restricted to the edges of waterways, flooded islands, and small protected  
38 areas such as parks, wildlife areas, and nature reserves (Hickson and Keeler-Wolf  
39 2007). A substantial portion of the emergent wetlands exists as thin strips along  
40 the margins of constructed levees (SFEI 2012). Current habitat along the Delta  
41 waterways includes seasonal wetlands, tidal wetlands, managed wetlands, riparian  
42 forests, and riparian scrub.

43 Seasonal wetlands historically had occurred along the riparian corridor at  
44 elevations that were inundated during high flow events. Many of the levees were

1 constructed along the riparian corridor edges; and therefore, historic seasonal  
2 wetlands were substantially modified (SFEI 2012). Adjacent areas of perennial  
3 wetlands on the water-side of the riparian corridor were modified as levees were  
4 constructed and channels enlarged. In many of these areas the perennial wetlands  
5 were replaced by seasonal wetlands. The vegetation of seasonal wetlands is  
6 typically composed of wetland generalist species that occur in frequently  
7 disturbed sites such as hyssop loosestrife, cocklebur, dallis grass, Bermuda grass,  
8 barnyard grass, and Italian ryegrass.

9 Alkali-related habitats occur near salt-influenced seasonal and perennial wetlands.  
10 Alkali seasonal wetlands occur on fine-textured soils that contain relatively high  
11 concentrations of dissolved salts. These types of soils are typically found at the  
12 historical locations of seasonal ponds in the Yolo Basin in and around the CDFW  
13 Tule Ranch Preserve, and upland in seasonal drainages that receive salts in runoff  
14 from upslope salt-bearing bedrock such as areas near Suisun Marsh and the  
15 Clifton Court Forebay. Alkali wetlands include saltgrass, alkali weed, saltbush,  
16 alkali heath, and iodine bush. Small stands of alkali sink scrub (also known as  
17 valley sink scrub) are characterized by iodine bush.

18 Tidal wetlands consist of tidal brackish wetlands that occur either as relatively  
19 substantial tracts of complex tidal wetlands, or in narrow bands of fringing tidal  
20 wetlands (Siegel et al. 2010a). Fringing tidal marsh exists along the outboard side  
21 exterior levees and generally has formed since diking for managed wetlands  
22 began. Fringing tidal wetlands vary in size and vegetation composition, exhibit  
23 less geomorphic complexity, and have a low area-to-edge ratio. Fringing marshes  
24 lack connection with the upland transition, are often found in small, discontinuous  
25 segments, and can limit movement of terrestrial marsh species.

26 Plant zones in complex tidal wetlands are influenced by inundation regime and  
27 salinity. Tidal wetlands can be divided into three zones: low marsh, middle  
28 marsh, and high marsh (Reclamation et al. 2011). The low tidal wetland zone is  
29 tidally inundated once or twice per day. At the lowest elevations, vegetation is  
30 inhibited by frequent, prolonged, often deep inundation and by disturbance by  
31 waves or currents. The dominant plant species are bulrushes. Other species  
32 occurring in the low tidal wetland zone are pickleweed, lowclub rush, common  
33 reed, and cattails. The low tidal wetland zone provides foraging habitat for  
34 waterfowl and shorebirds, California Ridgway's Rail, California Black Rail, and  
35 other wading birds.

36 The middle tidal wetland zone is tidally inundated at least once per day; there is  
37 relatively little cover and no refuge from higher tides, which completely flood the  
38 vegetation of the middle marsh. The dominant plant species are pickleweed,  
39 saltgrass, and bulrush. Other species occurring in the middle tidal marsh are  
40 fleshy jaumea, sea milkwort, rushes, salt marsh dodder, alkali heath, cattail,  
41 sneezeweed, and marsh gumplant (Siegel et al. 2010b). The middle tidal wetland  
42 zone provides foraging habitat for salt marsh harvest mouse and Suisun shrew, as  
43 well as common and special status bird species, including waterfowl and  
44 shorebirds, California Ridgway's Rail, California Black Rail, and other wading

1 birds. This zone also provides nesting and foraging habitat for Suisun Song  
2 Sparrow and Salt Marsh Common Yellowthroat (Reclamation et al. 2011).

3 The high tidal wetland zone receives intermittent inundation during the monthly  
4 tidal cycle, with the higher elevations being inundated during only the highest  
5 tides. Historically, the high marsh was an expansive transitional zone between the  
6 tidal wetlands and adjacent uplands. The high marsh and associated upland  
7 transition zone have been significantly affected by land use changes  
8 (e.g., managed wetlands, agriculture). The dominant plants are native species,  
9 such as saltgrass, pickleweed, and Baltic rush, and nonnative species, including  
10 perennial pepperweed, poison hemlock, and fennel. Other species occurring in  
11 the high tidal marsh are saltmarsh dodder, fleshy jaumea, seaside arrowgrass,  
12 alkali heath, brass button, and rabbitsfoot grass.

13 The high tidal marsh provides habitat for special status plants, including Suisun  
14 Marsh aster, Soft bird's beak, and Suisun thistle (Siegel et al. 2010b). The high  
15 marsh zone provides foraging and nesting habitat for waterfowl, shorebirds,  
16 California Ridgway's Rail, California Black Rail, and other birds. It also provides  
17 foraging and nesting habitat for special status species such as Salt Marsh Harvest  
18 Mouse and Suisun Shrew and provides escape cover for Salt Marsh Harvest  
19 Mouse, and Suisun Shrew during periods when the middle and lower portions of  
20 the high tidal wetland zone are inundated (Reclamation et al. 2011).

21 Managed wetlands are primarily located within the Suisun Marsh, Cache Slough,  
22 and near the confluence of the Mokelumne and Sacramento rivers within the  
23 historical limits of the high tidal marsh and adjacent uplands that were diked and  
24 leveled for agricultural purposes and later managed to enhance habitat values for  
25 specific wildlife species (CALFED 2000). Diked managed wetlands and uplands  
26 are the most typical land cover type in the Suisun Marsh area. Managed wetlands  
27 are considered seasonal wetlands because they may be flooded and drained  
28 several times throughout the year. Watergrass and smartweed are typically the  
29 dominant species in managed wetlands that use fresher water. Bulrush, cattail,  
30 and tule are the dominant species in managed wetlands that employ late  
31 drawdown management. Pickleweed, fat hen, and brass buttons are typical in the  
32 higher elevations of the managed wetlands. In marshes with higher soil salinity,  
33 pickleweed, saltgrass, and other salt-tolerant species are dominant. Managed  
34 wetlands are managed specifically as habitat for wintering waterfowl species,  
35 including Northern Pintail, Mallard, American Wigeon, Green-Winged Teal,  
36 Northern Shoveler, Gadwall, Cinnamon Teal, Ruddy, and Canvasback ducks;  
37 White-Fronted Goose, and Canada Goose. Some wetlands are also managed for  
38 breeding waterfowl, especially mallard.

39 Riparian forest areas (excluding willow-dominated riparian habitats) are still  
40 present in some portions of the Delta along many of the major and minor  
41 waterways, oxbows, and levees (CALFED 2000). Riparian forest and woodland  
42 communities dominated by tree species are mostly limited to narrow bands along  
43 sloughs, channels, rivers, and other freshwater features throughout the Delta.  
44 Isolated patches of riparian vegetation are also found on the interior of reclaimed  
45 Delta islands, along drainage channels, along pond margins, and in abandoned,

1 low-lying fields. Cottonwoods and willows, Oregon ash, boxelder, and California  
 2 sycamore, are the most typical riparian trees in central California. Valley oak and  
 3 black walnut are typical in riparian areas in the Delta. Riparian trees are used for  
 4 nesting, foraging, and protective cover by many bird species and riparian canopies  
 5 provide nesting and foraging habitat for a variety of mammals. Understory shrubs  
 6 provide cover for ground-nesting birds that forage among the vegetation and  
 7 leaf litter.

8 Riparian scrub in the Delta and Suisun Marsh consists of woody riparian shrubs in  
 9 dense thickets (SFEI 2012). Riparian scrub thickets are usually associated with  
 10 higher, sloping, better drained edges of marshes or topographic high areas, such  
 11 as levee remnants and elevated flood deposits; and along shorelines of ponds or  
 12 banks of channels in tidal or non-tidal freshwater habitats. Plant species may  
 13 include willow, blackberry, buttonbush, mulefat, and other shrub species.  
 14 Willow-dominated habitat types appear to be increasing in extent in recent years;  
 15 and willows line many miles of artificial levees where waterways historically had  
 16 flowed into freshwater emergent wetland. Nonnative Himalayan blackberry  
 17 thickets are a typical element of riparian scrub communities along levees and  
 18 throughout pastures in the levees. Willow thickets provide habitat for a wide  
 19 range of wildlife species, including the Song Sparrow, Lazuli Bunting, and Valley  
 20 Elderberry Longhorn Beetle.

#### 21 **10.3.3.4.2 Yolo Bypass**

22 The Yolo Bypass is a 59,280-acre floodway through the natural-overflow of the  
 23 Yolo Basin on the west side of the Sacramento River (DWR 2012). As described  
 24 in Chapter 5, Surface Water Resources and Water Supplies, the Yolo Bypass  
 25 generally extends north to south from Fremont Weir along the Sacramento River  
 26 (near Verona) to upstream of Rio Vista along the Sacramento River in the Delta.  
 27 The bypass, part of the Sacramento River Flood Control Project, conveys  
 28 floodwaters around the Sacramento River near the cities of Sacramento and West  
 29 Sacramento. The bypass is utilized as a flood bypass approximately once every  
 30 3 years, generally during the period from November to April. Land use in the  
 31 Yolo Bypass is generally restricted to specific agriculture, managed wetlands, and  
 32 vegetation communities to ensure that floodway function is maintained (CALFED  
 33 et al. 2001; USFWS 2002). Agricultural crops include corn, tomatoes, melons,  
 34 safflower, and rice within the northern bypass; and corn, milo, safflower, beans,  
 35 tomatoes, and sudan grass in the southern bypass. Waterfowl hunting areas are  
 36 generally located in the southern bypass, and include rice fields, permanent open  
 37 water, or a mixture of water and upland habitat. The USACE has developed  
 38 criteria for managing emergent vegetation (e.g., cattails and bulrushes) in the  
 39 Yolo Bypass to maintain flood capacity, including no more than 5 percent of the  
 40 vegetation in seasonal wetlands can be emergent wetlands; no more than  
 41 50 percent of the vegetation in permanent wetlands can be emergent wetlands;  
 42 and riparian vegetation can only occur in specified areas to maintain flood  
 43 capacity (DFG and Yolo Basin Foundation 2008).

44 The Yolo Bypass supports several major terrestrial vegetation types, including  
 45 riparian woodland, valley oak woodland, open water, and wetland. Historically,

1 riparian woodland and freshwater wetland were the dominant habitat types in the  
2 Yolo Basin (CALFED et al. 2001; USFWS 2002). Currently, riparian woodland  
3 and associated riparian scrub habitats are primarily found adjacent to Green's  
4 Lake, Putah Creek, and along the East Toe Drain within the Yolo Bypass Wildlife  
5 Area. Riparian woodland is a tree-dominated community found adjacent to  
6 riparian scrub on older river terraces where flooding frequency and duration is  
7 less. Riparian woodlands include Fremont cottonwood, valley oak, sycamore,  
8 willow, eucalyptus, giant reed, and black oak. The understory is typically sparse  
9 in this community with limited areas of California grape, blackberry, poison oak,  
10 mugwort, grasses, and forbs. The woodland canopy provides habitat for hawks,  
11 owls, American Crow, Great Egret, Great Blue Heron, Red-Tailed Kite, Yellow-  
12 Rumped Warbler, Black Phoebe, woodpecker, Wood Duck, bat, and raccoon.

13 Riparian scrub is a shrub-dominated community typically found along stream  
14 margins and in the streambed, on gravel bars and similar formations (CALFED et  
15 al. 2001; USFWS 2002). This community is typically dominated by  
16 phreatophytes (i.e., deep-rooted plants that obtain their water from the water table  
17 or the layer of soil just above it), such as willows, and other plants representative  
18 of early- to mid-successional stage vegetation communities within riparian areas  
19 in the Central Valley. The species include alder, elderberry, cottonwood, wild  
20 rose, blackberry, and boxelder. This habitat supports Black-Crowned Night  
21 Heron, Snowy Egret, Belted Kingfisher, Black Phoebe, Swallow, and bat.  
22 Riparian scrub habitat frequently occurs adjacent to nonwoody riparian habitat,  
23 including false bamboo, cocklebur, weedy annual grasses, sedges, rushes,  
24 mustard, sweet clover, thistle, and other weedy species. The nonwoody riparian  
25 habitat supports Savannah Sparrow, House Finch, American Goldfinch,  
26 California Ground Squirrel, Gopher Snake, and pond turtle.

27 Remnants of valley oak woodlands and savanna occur on floodplain terraces in  
28 fragmented areas, including downstream of Fremont Weir and along the southern  
29 portion of the Toe Drain (CALFED et al. 2001). The habitat also includes  
30 sycamore, black walnut, wild grape, poison oak, elderberry, blackberry, grass,  
31 and sedge.

32 Depending on the duration of inundation, local soil factors, site history, and other  
33 characteristics, seasonal wetlands typically are dominated by species  
34 characteristic of one of three natural wetland communities: freshwater marshes,  
35 alkali marshes, or freshwater seasonal (often disturbed) wetlands (CALFED et al.  
36 2001). Freshwater marsh communities are typically found in areas subjected to  
37 prolonged flooding during the winter months, and frequently do not dry down  
38 until early summer. Permanent open water is found throughout the Yolo Bypass,  
39 including Gray's Bend near Fremont Weir, Green's Lake near Interstate 80, ponds  
40 in the Yolo Bypass Wildlife Area, along Cache and Prospect sloughs, and within  
41 canals and drainage ditches. The wetlands support duck breeding habitat; and  
42 habitat for many lifestages of grebe, ibis, heron, egret, bittern, coot, rails, raptors,  
43 muskrat, raccoon, opossum, beaver, Ring-Necked Pheasant, garter snake, Pacific  
44 Tree Frog, and bullfrog.

1 Managed wetlands in the Yolo Bypass occur near Fremont Weir, in the  
2 16,770-acre Yolo Bypass Wildlife Area, and within and near Cache Slough. The  
3 managed wetlands are generally flooded in the fall, with standing water  
4 maintained continuously throughout the winter until drawdown occurs in the  
5 following spring (CALFED et al. 2001; DFG and Yolo Basin Foundation 2008).  
6 A primary objective of seasonal wetland management is to provide an abundance  
7 and diversity of seeds, aquatic invertebrates, and other foods for wintering  
8 waterfowl and other wildlife. The wetlands also are managed to control the extent  
9 of tules and cattails; and more recently, water hyacinth. A portion of the managed  
10 wetlands occur within rice fields which are flooded in the winter to provide  
11 waterfowl habitat for feeding and resting habitats. A variety of annual plants  
12 germinate on the exposed mudflats of seasonal wetlands during the spring draw  
13 down, including swamp timothy, watergrass, smartweed, and cocklebur. These  
14 plants are then managed through the timing, duration or absence of summer  
15 irrigation. The mudflats support sandpiper, plover, avocet, stilt, and other  
16 shorebirds.

17 Managed semi-permanent wetlands, commonly referred to as “brood ponds,” are  
18 flooded during the spring and summer, but may experience a 2 to 6 month dry  
19 period each year. These semi-permanent wetlands provide breeding ducks,  
20 ducklings, and other wetland wildlife with protection from predators and  
21 abundant invertebrate food supplies (DFG and Yolo Basin Foundation 2008).  
22 Permanent wetlands remain flooded throughout the year. Due to year-round  
23 flooding, permanent wetlands support a diverse, but usually not abundant,  
24 population of invertebrates. Permanent managed wetlands provide deep water  
25 habitat for diving ducks, such as Ruddy Duck, Scaup, and Goldeneye; and other  
26 water birds, including Pied-Billed Grebe, coot, and moorhen. They often have  
27 dense emergent cover on their edges that is the preferred breeding habitat for  
28 Marsh Wren and Red-Winged Blackbird; and roosting habitat for Black-Crowned  
29 Night Heron, White-Faced Ibis, and egret.

30 The managed wetlands are operated by private hunting clubs; private conservation  
31 entities, including conservation banks; and the Federal and state governments  
32 (CALFED et al. 2001). Some of the hunting clubs have implemented wetland  
33 management agreements with CDFW under the State Presley Program or Wetland  
34 Easement Program to coordinate the timing and patterns of flooding, drawdowns,  
35 irrigation, soil disturbance, and maintenance of brood habitat. The patterns may  
36 be adjusted annually to respond to specific wildlife and hydrologic needs. A  
37 similar program focused on providing spring habitat for breeding is provided by  
38 the Federal Waterbank Program.

39 Habitat in the Yolo Bypass is affected by periodic flooding (CALFED et al.  
40 2001). Following a flood, roads, canals, and ditches may need to be excavated;  
41 debris needs to be removed from habitat, and water delivery facilities may need to  
42 be repaired. Flooding also disrupts nesting and resting activities of birds. During  
43 floods, hunting activities are diminished or ceased.

1     **10.3.3.4.3 Agricultural Lands in the Delta, Suisun Marsh, and Yolo Bypass**

2     Major crops and cover types in agricultural production in the Delta and Suisun  
3     Marsh include small grains (wheat and barley), field crops (corn, sorghum, and  
4     safflower), truck crops (tomato and sugar beet), forage crops (hay and alfalfa),  
5     pastures, orchards, and vineyards. The distribution of seasonal crops varies  
6     annually, depending on crop rotation patterns and market forces. In many areas,  
7     cropping practices result in monotypic stands of vegetation for the growing  
8     season and bare ground in fall and winter. Some farmland is more intensively  
9     managed to provide wildlife habitat in addition to crops. Regular maintenance of  
10    fallow fields, roads, ditches, and levee slopes can reduce the establishment of  
11    ruderal vegetation or native plant communities.

12    Agriculture has been present in the Yolo Bypass since the seasonal wetlands and  
13    perennial marsh and riparian areas were first converted to farms in the mid-1800s.  
14    For many years, grazing was the primary use of agricultural lands in the Yolo  
15    Bypass. In the latter part of the 20th century, irrigation systems were developed  
16    and fields were engineered for the production of row crops (DFG and Yolo Basin  
17    Foundation 2008). Periodic flooding of the bypass limits the types of crops that  
18    can be grown. The Yolo Bypass Wildlife Area utilizes agriculture to manage  
19    habitats while providing income for the management and operation of the  
20    property. Working with local farmers, the Yolo Bypass Wildlife Area provides  
21    fields of milo, corn, and Sudan grass specifically for wildlife forage. Rice is  
22    grown, harvested, and flooded to provide food for thousands of waterfowl. Corn  
23    fields are harvested to provide forage for geese and cranes. Crops such as  
24    safflower are cultivated and mowed to provide seed for upland species such as  
25    Ring-Necked Pheasant and Mourning Dove. Row and truck crops are grown  
26    across the northern half of the Yolo Bypass Wildlife Area. The primary crops  
27    grown include rice, corn, millet, milo, safflower, sunflower, and tomatoes. These  
28    crops are cultivated during the summer months. From fall to spring, some farmed  
29    areas are fallowed and flooded to provide forage for wildlife as well as seasonal  
30    wetland habitat. An extensive area at the southern end of the wildlife area is used  
31    for grazing cattle. Cattle are brought onto the Yolo Bypass Wildlife Area in mid-  
32    spring or early summer after the threat of flooding has passed and are removed by  
33    January. Forage is provided in irrigated pasture, uplands within the bypass and  
34    the annual grassland-vernal pool complex. Alfalfa is only grown in the western  
35    portion of the bypass south of Interstate 80, along with a variety of row crops that  
36    are grown in this region (Yolo County 2013).

37    **10.3.3.4.4 Wildlife Refuges in the Delta, Suisun Marsh, and Yolo Bypass**

38    A number of wildlife areas that could be affected by changes in long-term  
39    operations of CVP and SWP are located in the Delta, Suisun Marsh, and Yolo  
40    Bypass. Conditions in the Yolo Bypass, including the Yolo Bypass Wildlife  
41    Area, are described above and not repeated in this subsection.

42    *Stone Lakes National Wildlife Refuge*

43    The Stone Lakes NWR is located in the Beach-Stone Lakes Basin about 10 miles  
44    south of the city of Sacramento. It was established in 1994 and the refuge area is

1 approximately 18,000 acres, of which about 9,000 acres is in a core refuge area  
2 owned by the USFWS and an approximately 9,000-acres “Cooperative Wildlife  
3 Management Area” where the USFWS seeks to enter into cooperative agreements  
4 or purchase conservation easements from willing landowners. The USFWS  
5 actively manages around 6,000 acres on the refuge (USFWS 2007).

6 The refuge vegetative communities include agricultural lands, open water,  
7 perennial freshwater wetlands, cottonwood-willow riparian, irrigated pasture and  
8 wet meadow, managed permanent and seasonal wetland, orchards, riparian scrub,  
9 upland forest, valley oak riparian woodland, vernal pool, and grasslands that  
10 facilitate wildlife movement and help compensate for habitat fragmentation and  
11 buffers the effects of urbanization on agricultural lands in the Delta region  
12 (USFWS 2007).

13 The diverse vegetation provides habitat for a wide ranges of mammals, birds,  
14 reptiles, and amphibians similar to those described for other sections of the  
15 Sacramento Valley (USFWS 2007). The grasslands, pastures, woodlands support  
16 White-Faced Ibis, Geese, Black-Bellied Plover, Great Blue Heron, Great Egret,  
17 Greater Sand Hill Crane, Northern Harrier, White-Tailed Kite, Red-Shouldered  
18 Hawk, Swainson’s Hawk, Great Horned Owl, Barn Owl, Bald Eagle, Golden  
19 Eagle, American Kestrel, Prairie Falcon, Tree Swallow, Barn Swallow, Cliff  
20 Swallow, songbirds, and birds that use the grasslands, including killdeer, Ring-  
21 Necked Pheasant, Burrowing Owl, Mourning Dove, Brewer’s Blackbird, and  
22 Turkey Vulture. The waterfowl species include Tundra Swan, White-Fronted  
23 Goose, Snow Goose, Canada Goose, Mallard, Northern Pintail, Northern  
24 Shoveler, Cinnamon Teal, Green-Winged Teal, Wood, and Ruddy ducks. The  
25 wetland areas also support Common Yellowthroat, Red-Winged Blackbird, Marsh  
26 Wren, coot, Cormorant, and American White Pelican. Other wildlife species on  
27 this refuge include coyote, Deer Mouse, Pocket Gopher, Black Tailed Hare,  
28 California Vole, California Ground Squirrel, Pacific Tree Frog, bullfrog, pond  
29 turtle, Pond Slider Turtle, Western Fence Lizard, Western Terrestrial Garter  
30 Snake, Gopher Snake, Common Garter Snake, California King Snake, and  
31 Western Toad.

32 The riparian cottonwood forests include Fremont cottonwood, Gooding’s willow,  
33 California grape, California boxelder, California blackberry, white-stemmed  
34 raspberry, buttonbush, and blue elderberry. The mixed riparian forest includes  
35 valley oak with vegetation similar to the riparian cottonwood forest but at lower  
36 densities. The valley oak riparian forest is dominated by valley oak, Oregon ash,  
37 California sycamore, and California black walnut with an understory of grasses,  
38 vines, and shrubs, including California blackberry and wild rose. The perennial  
39 wetlands include cattails, tules, cottonwood, willows, sedges, and rushes with  
40 areas of watergrass, smartweed, and swamp timothy that also occur in seasonal  
41 wetlands. The riparian vegetation provides vast amounts of insects, perches, and  
42 cover to support the wide range of bird species, the valley oak woodlands provide  
43 acorns, insects, and perch and nesting sites. The wetland sites provide foraging  
44 opportunities for waterbirds and upland species.

1 *Miner Slough Wildlife Area*

2 The Miner Slough Wildlife Area within the Delta is about 10 miles north of Rio  
3 Vista at the junction of Miner and Cache sloughs and is accessed by boat (CDFW  
4 2014d). The 37-acre Wildlife Area includes approximately 10 acres of tidal  
5 wetlands which become a narrow peninsula extending from Prospect Island at low  
6 tide. The riparian vegetation of willow, cottonwood, tules, and blackberry  
7 support a wide range of wildlife species including beaver, black-crowned night  
8 heron, and waterfowl.

9 *Decker Island Wildlife Area*

10 Decker Island is a 648-acre island located about 20 feet above sea level  
11 surrounded by the Sacramento River and Horseshoe Bend in the Delta just south  
12 of Rio Vista (DWR 2003; Philipp 2005). The island was created between 1917  
13 and 1937 as part of the actions to implement the Sacramento Deep Water Ship  
14 Channel, as described in Chapter 5, Surface Water Resources and Water Supplies.  
15 CDFW owns the northernmost 33 acres of Decker Island and has been working  
16 with the California Department of Water Resources (DWR) to reestablish and  
17 enhance wetland and upland habitats. The vegetation includes shallow water  
18 channels lined with thick stands of tules, sedges, willow, and alder. Many  
19 mammal species have been observed, including river otter, mink, beaver, coyote,  
20 mice, and voles. Various species of raptors, waterfowl, songbirds, and shorebirds  
21 have also been observed. Amphibians and reptiles such as Pacific Tree Frog,  
22 Western Fence Lizard, and Gopher Snake have been seen. Invasive plants such as  
23 perennial pepperweed, yellow star thistle, water hyacinth, Brazilian water weed  
24 and *Egeria* continue to pose a threat to restoration efforts.

25 *Lower Sherman Island Wildlife Area*

26 The Lower Sherman Island Wildlife Area occupies roughly 3,100 acres, primarily  
27 marsh and open water, at the confluence of the Sacramento and San Joaquin  
28 Rivers in the western Delta (DFG 2007). Riparian vegetation is characterized by  
29 narrow linear strips of trees and shrubs, in single-to multiple story canopies.  
30 Riparian vegetation primarily occurs along the historic levees above elevations  
31 that support tidal marsh. Native woody plant species occurring in the riparian  
32 strip include Fremont cottonwood, willow, red alder, and California wild rose.  
33 The invasive nonnative, Himalayan blackberry infests many of these areas.  
34 Marsh vegetation includes both emergent marsh and areas of floating aquatic  
35 vegetation. Most emergent marsh is dominated by bulrush, cattail, and common  
36 reed. In the northwestern portion of Lower Sherman Island, there is also upper  
37 elevation marsh dominated by pickleweed and saltgrass. Grasslands are  
38 dominated by annual grasses, but also include many perennial species that are  
39 also typical in seasonal wetlands. Pampas grass and perennial pepperweed,  
40 two invasive nonnative species are also found in the grassland areas.

41 At the Lower Sherman Island Wildlife Area, habitat exists for a wide variety of  
42 wildlife species, including numerous bird species, mammals, reptiles, and  
43 amphibians (DFG 2007). Many of the bird species that occur in the wildlife area  
44 are migratory and are there only, or primarily, during the fall and winter months.  
45 Wintering birds include waterfowl, shorebirds, wading birds, and raptors. Other

1 groups that utilize the wildlife area seasonally include upland game species,  
2 cavity-nesting birds, and neotropical migratory birds. Typical mammal species  
3 found in the upland grassland and disturbed areas of the wildlife area include  
4 Striped Skunk, raccoon, squirrel, voles, Pocket Gopher, feral cats, fox, and  
5 coyote. Muskrat and beaver may be found in the marsh vegetation. Typical  
6 reptiles and amphibians include Western Fence Lizard, snake, frog, and toad.

#### 7 *Rhode Island Wildlife Area*

8 Rhode Island Wildlife Area is a 67-acre island, located in Contra Costa County  
9 that is managed by CDFW (CDFW 2014e). The vegetation along the perimeter of  
10 the island includes alder, willow, blackberry, and tule. The interior open water  
11 areas include marsh vegetation of tule and cattail. The island provides habitat for  
12 river otters, beaver, muskrat, and many species of birds including Great Blue  
13 Heron; Black-Crowned Night Heron; egrets; and Mallard, Cinnamon Teal, and  
14 Wood ducks.

#### 15 *White Slough Wildlife Area*

16 The White Slough Wildlife Area, west of Lodi and north of Stockton, is an  
17 880-acre area refuge with open water, freshwater marsh, grassland/upland area,  
18 and riparian habitats (CDFW 2014f). The area supports upland game birds such  
19 as Ring-Necked Pheasant, California Quail, Mourning Dove, and a range of  
20 waterfowl species similar to those described for the Delta and Yolo Bypass.

#### 21 *Hill Slough Wildlife Area*

22 Hill Slough Wildlife Area, located in the northern part of Suisun Marsh, is  
23 operated by CDFW and contains 1,723 acres of saltwater tidal marsh, managed  
24 marshes, slough, and upland grassland (CDFW 2014g). The area supports a wide  
25 variety of waterfowl, including Northern Pintail, Mallard, Northern Shoveler, and  
26 Green-Winged Teal ducks; and American wigeon. Ferruginous Hawks and  
27 Rough-Legged Hawks winter in the area while year-round residents such as  
28 Golden Eagle, Northern Harrier, and Red-Tailed Hawk which forage over the  
29 ponds and upland areas. Mammals including raccoon, jackrabbit, and voles are  
30 found here and are preyed upon by the coyotes that hunt and live in the wildlife  
31 area.

#### 32 *Grizzly Island Wildlife Area*

33 Grizzly Island Wildlife Area is administered by CDFW and consists  
34 approximately 15,300 acres of tidal wetlands and managed marshes within Suisun  
35 Marsh (CDFW 2014h, 2014i). The CDFW manages waterways to create more  
36 than 8,500 acres of seasonal ponds containing alkali bulrush and fat-hen. Grizzly  
37 Island Wildlife Area includes habitats that support Northern Pintail Duck, Green-  
38 Winged Teal Duck, American Widgeon, Tule Goose, egret, Great Blue Heron,  
39 Snowy Egret, Black-Crowned Night Heron, Yellowthroat, Marsh Wren, Suisun  
40 Song Sparrow, American White Pelican, Ferruginous Hawk, Sharp-Shinned  
41 Hawk, white Tailed Kite, Red-Tailed Hawk, Prairie Falcon, Peregrine Falcon,  
42 Northern Harrier, and Short-Eared Owl. The Grizzly Island Wildlife Area also  
43 supports mammals, including Plush River Otter and Tule Elk.

1 *Point Edith Wildlife Area*

2 Point Edith Wildlife Area is located in Contra Costa County, approximately  
3 2.5 miles east of Martinez. The Point Edith Wildlife Area includes approximately  
4 760 acres of marshes which is accessed by boat. The habitat includes open water  
5 and tidal wetlands that support waterfowl, including coot and moorhen (CDFW  
6 2014j).

7 *Fremont Weir Wildlife Area*

8 The Fremont Weir Wildlife Area is located within the Yolo Bypass from the  
9 Sacramento River to downstream of the Fremont Weir. During high flows, water  
10 from the Sacramento River flows into the Yolo Bypass over the Fremont Weir as  
11 part of the Sacramento River Flood Control Project, as described in Chapter 5,  
12 Surface Water Resources and Water Supplies. The 1,461-acre refuge includes  
13 valley oak, willow, cottonwood, brush, and weedy vegetation (CDFW 2014k).  
14 The area supports pheasant, Valley Quail, Mourning Dove, a range of waterfowl  
15 species similar to those described for the Yolo Bypass, Cottontail Rabbit, and  
16 jackrabbit.

17 *Sacramento Bypass Wildlife Area*

18 The Sacramento Bypass Wildlife Area is located along a channel that connects the  
19 Sacramento River to the Yolo Bypass. During high flows, water from the  
20 Sacramento River flows into the Yolo Bypass through the Sacramento Bypass as  
21 part of the Sacramento River Flood Control Project, as described in Chapter 5,  
22 Surface Water Resources and Water Supplies. The 360-acre refuge includes  
23 valley oak, willow, cottonwood, and weedy vegetation (CDFW 2014l). The area  
24 supports raptors, songbirds, pheasant, Mourning Dove, and a range of mammal  
25 species similar to those described for the Yolo Bypass.

26 *Calhoun Cut Ecological Reserve*

27 The Calhoun Cut Ecological Reserve is located within the Cache Slough area and  
28 is only accessed by boat through Lindsay Slough (CDFW 2014m). Vegetation in  
29 Calhoun Cut includes grasslands, marshes, and riparian vegetation (Witham and  
30 Karacfelas 1994). The grasslands include native purple needlegrass grasslands  
31 and vernal pools.

32 **10.3.4 San Francisco Bay Area Region**

33 The San Francisco Bay Area Region includes portions of Contra Costa, Alameda,  
34 Santa Clara, San Benito, and Napa counties that are within the CVP and SWP  
35 service areas. The CVP and SWP water supplies are used in the San Francisco  
36 Bay Region by Contra Costa Water District, East Bay Municipal Utility District,  
37 Zone 7 Water Agency, Alameda County Water District, Santa Clara Valley Water  
38 District, San Benito County Flood Control and Water Conservation District, and  
39 Napa County Flood Control and Water Conservation District. The majority of the  
40 CVP and SWP water uses in the San Francisco Bay Area Region are for  
41 municipal and industrial land uses. Agricultural areas that use CVP and SWP  
42 water are located within coastal valleys, especially within the Livermore-Amador

1 valleys of Alameda County, southern Santa Clara County, and northern San  
2 Benito County.

3 Many of these agencies store the CVP and/or SWP water supplies in surface  
4 water reservoirs, including CVP Contra Loma and San Justo reservoirs; the SWP  
5 Bethany Reservoir and Lake Del Valle; the Contra Costa Water District Los  
6 Vaqueros Reservoir; and the East Bay Municipal Utility District Upper San  
7 Leandro, San Pablo, Briones, and Lafayette reservoirs and Lake Chabot. CVP  
8 and SWP are generally not stored in reservoirs within Santa Clara County  
9 (SCVWD 2010). Operation of the reservoirs is dependent upon the volume of  
10 CVP and/or SWP water blended with other water supplies used by these agencies.  
11 Surface water streams are not used to convey the water from the CVP and/or SWP  
12 facilities to the reservoirs. As described in subsection 10.3.2, Overview of  
13 Species with Special Status, A listing of wildlife and plant species with special  
14 status that occur or may occur in portions of the study area affected by the long-  
15 term coordinated operation of the CVP and SWP is provided in Appendix 10A.

16 The USFWS has approved two habitat conservation plans in the areas served by  
17 CVP and SWP water supplies, including the East Contra Costa County Habitat  
18 Conservation Plan/Natural Community Conservation Plan and the Santa Clara  
19 Valley Habitat Plan (ECCCHCPA 2006; Reclamation et al. 2009; Santa Clara  
20 County et al. 2012).

#### 21 **10.3.4.1 Central Valley Project Reservoirs**

22 The CVP reservoirs in the San Francisco Bay Area Region include Contra Loma  
23 and San Justo reservoirs.

##### 24 **10.3.4.1.1 Contra Loma Reservoir**

25 The Contra Loma Reservoir is a CVP facility in Contra Costa County that  
26 provides offstream storage along the Contra Costa Canal, as described in  
27 Chapter 5, Surface Water Resources and Water Supplies. The 80-acre reservoir is  
28 part of 661-acre Contra Loma Regional Park and Antioch Community Park  
29 (Reclamation 2014a). The Contra Loma Reservoir area includes open space and  
30 recreation facilities. In the open space, vegetative communities include  
31 grasslands, blue oak woodland, valley foothill riparian, fresh emergent wetlands,  
32 riverine, and open water communities. The annual grasslands include smooth  
33 brome, slender wild oats, Italian ryegrass, yellow star thistle, white-stem filaree,  
34 and mouse-ear chickweed. Valley foothill riparian occurs along intermittent  
35 streams and includes valley oaks, cottonwoods, red willows, Himalayan  
36 blackberry, poison oak, and mulefat. The riverine and fresh emergent wetland  
37 communities include ryegrass, curly dock, hyssop, loosestrife, Baltic rush,  
38 flowering quillwort, cattails, rushes, dallis grass, nutsedge, and cocklebur.  
39 Watermilfoil occurs along portions of the shoreline. Recreation areas include  
40 urban trees with Oregon ash, black walnut, Fremont cottonwood, blue oak, valley  
41 oak, interior live oak, fig, and eucalyptus. East Bay Regional Parks District has  
42 initiated restoration actions to improve native grasslands and riparian and provide  
43 habitat for quail.

1 Wildlife in the grasslands areas include Burrowing Owl, Horned Lark, Western  
2 Meadowlark, Turkey Vulture, Northern Harrier, American Kestrel, White-Tailed  
3 Kite, Red-Tailed Hawk, Brewer’s Blackbird, Mourning Dove, Western Fence  
4 Lizard, Common Garter Snake, Western Rattlesnake, Black-Tailed Jackrabbit,  
5 California Ground Squirrel, Botta’s Pocket Gopher, Western Harvest Mouse,  
6 California Vole, American Badger, Mule Deer, and coyote (Reclamation 2014a).  
7 The valley foothill riparian and blue oak woodland vegetation support a wide  
8 range of birds including Northern Flicker, Yellow Warbler, Acorn Woodpeckers,  
9 Western Scrub Jay, White-Tailed kite, Cooper’s Hawk, Red-Shouldered Hawk,  
10 American Kestrel, Great Horned Owl, Song Sparrow, Black Phoebe, European  
11 Starling, Western Bluebird, and Tree Swallow. The valley foothill riparian and  
12 blue oak woodland vegetation also support Pacific Tree Frog, Red-legged Frog,  
13 Sharp-Tailed Snake, California Alligator Lizard, Common Garter Snake, Mule  
14 Deer, Raccoon, Coyote, Striped Skunk, Deer Mouse, Harvest Mouse, Dusky-  
15 Footed Woodrat, and Gray Fox. Riverine and wetlands, and open water support  
16 Brewer’s Blackbird, Red-Winged Blackbird, Brown-Headed Cowbird, Great Blue  
17 Heron, Great Egret, ducks, American Coot, Common Merganser, Double-Crested  
18 Cormorant, American Wigeon, Canada Goose, Western Grebe, and gull; Pacific  
19 Tree Frog, Red-legged Frog, Bullfrog, California Tiger Salamander, Western  
20 Pond Turtle, Western Toad, and Garter Snake; Deer Mouse, California Vole,  
21 Long-Tailed Weasel, and other mammals that use the adjacent woodlands  
22 and grasslands.

23 **10.3.4.1.2 San Justo Reservoir**

24 The San Justo Reservoir is a CVP facility in San Benito County that provides  
25 offstream storage as part of the San Felipe Division, as described in Chapter 5,  
26 Surface Water Resources and Water Supplies. The reservoir is surrounded by  
27 steep hills with recreational facilities on the northeast side reservoir and  
28 intermittent streams, wetlands, and open water downslope of the reservoir  
29 (SBCWD 2012). Adjacent land uses are dominated by irrigated row crops,  
30 orchards, and rangeland. Vegetation and wildlife resources of the reservoir area  
31 are consistent with grasslands vegetation on uplands.

32 **10.3.4.2 State Water Project Reservoirs**

33 Bethany Reservoir, Patterson Reservoir, and Lake Del Valle are SWP facilities  
34 associated with the South Bay Aqueduct in Alameda County, as described in  
35 Chapter 5, Surface Water Resources and Water Supplies.

36 Vegetative communities around Bethany Reservoir are characterized by nonnative  
37 grasses with several areas of woodland habitat (DWR 2014). The grassland  
38 habitat includes slender oat, ripgut brome, soft chess, wild barley, Italian ryegrass,  
39 black mustard, bull thistle, redstem filaree, dissected geranium, English plantain,  
40 and tumble mustard; and forbs, including sweet fennel, Great Valley gumweed,  
41 Mediterranean linseed, and Ithuriel’s spear. The woodland habitat includes white  
42 ironbark, Casuarina, and Bishop pine. Coyote bush occurs along the water edge.  
43 The grasslands provide habitat for Mourning Dove, Western Scrub-Jay, Finches,  
44 Sparrows, Owls, Hawks, California Ground Squirrel, Black-Tailed Jackrabbit,

1 Audubon's Cottontail, Botta's Pocket Gopher, California vole, mice, frogs, toads,  
2 salamanders, snakes, lizards, and turtles. The woodlands support Red-Tailed  
3 Hawk, Osprey, Owls, Black Phoebe, Bullock's Oriole, Yellow Warbler,  
4 amphibians and reptiles, and coyote. Emergent vegetation does not occur along  
5 the shoreline at Bethany Reservoir (DWR 2005).

6 Patterson Reservoir is a small, 100-acre-foot, SWP reservoir located along the  
7 South Bay Aqueduct between Bethany Reservoir and Lake Del Valle. Vegetation  
8 around Patterson Reservoir is characterized by grasslands and upland habitat.  
9 Red-legged Frog has been observed in the vicinity of Patterson Reservoir (DWR  
10 2014).

11 Lake Del Valle is a 77,100 acre-foot SWP facility located along the South Bay  
12 Aqueduct (DWR 2001). Vegetation around Lake Del Valle includes grasslands,  
13 chaparral, shrub, oak woodland, and riparian and freshwater habitats (EBRPD  
14 1996, 2001, 2012, 2013). The grasslands include nonnative grasses and native  
15 perennial bunchgrass. The nonnative grasslands include grasses such as wild  
16 oats, bromes, ryegrass, wild barley, silver hairgrass, and dogtail grass; forbs,  
17 including filaree, clover, and plantain; and lupine, yarrow, and soap plant. Native  
18 grasses include annual and perennial fescues, needlegrass, wild ryes, junegrass,  
19 and California brome. The coastal scrub and chaparral vegetation includes  
20 coyote brush-scrub, California sagebrush, manzanita, black sage, cream bush,  
21 California coffeeberry, yerba santa, blackberry, bush monkeyflower, and poison  
22 oak. The oak woodlands and riparian woodlands include coast live oak, black  
23 oak, valley oak, scrub oak, California bay, and California buckeye. Mixed  
24 deciduous riparian woodlands occur along perennial streams, including white  
25 alder, big-leaf maple, western sycamore, willow, and Fremont cottonwood.  
26 Along springs and seeps, the vegetation includes rabbitsfoot grass, saltgrass,  
27 bentgrasses, rushes, tules, sedges, horsetails, and cattail, buttercup, brass-button,  
28 mint, duckweed, pondweed, and ferns.

#### 29 **10.3.4.3 Contra Costa Water District Los Vaqueros Reservoir**

30 Los Vaqueros Reservoir is a Contra Costa Water District offstream storage  
31 facility in Contra Costa County, as described in Chapter 5, Surface Water  
32 Resources and Water Supplies. The area around the Los Vaqueros reservoir  
33 includes grasslands, upland scrub, valley and foothill woodlands, freshwater  
34 wetlands, and open water habitats (Reclamation et al. 2009). The grasslands  
35 include perennial and alkali habitats with wild oats, ripgut brome, yellow star  
36 thistle, fescue, filaree, mustard, fiddleneck, lupine, popcorn flower, and California  
37 poppy. The grasslands support Northern Harrier, Burrowing Owl, Western  
38 Meadowlark, California Horned Lark, Turkey Vulture, Red-Tailed Hawk,  
39 American Kestrel, White-Tailed Kite, Western Fence Lizard, Common Garter  
40 Snake, Western Rattlesnake, California Tiger Salamander, Western Harvest  
41 Mouse, California Ground Squirrel, Black-Tailed Jackrabbit, Black-Tailed Deer,  
42 and San Joaquin Kit Fox.

43 The upland scrub habitat is dominated by evergreen chaparral species and coastal  
44 scrub, including chamise, California sagebrush, black sage, poison oak, bush

1 monkeyflower, and California buckwheat underlain by annual grasses and purple  
2 needlegrass (Reclamation et al. 2009). This habitat supports California Quail,  
3 Western Scrub-Jay, Bushtit, California Thrasher, Spotted Towhee, Sage Sparrow,  
4 Western Fence Lizard, Common Garter Snake, Common King Snake, Western  
5 Rattlesnake, California Mouse, Deer Mouse, and feral pig.

6 The valley and foothill woodlands and riparian woodlands includes willow,  
7 Fremont cottonwood, valley oak, sycamore, black walnut, California buckeye,  
8 Mexican elderberry, and Himalayan blackberry which occur along much of  
9 Kellogg Creek (Reclamation et al. 2009). This habitat supports many birds,  
10 reptiles, amphibians, and mammals, including red-legged frog. The freshwater  
11 emergent habitat includes meadows with wetland species and stream channels.  
12 The vegetation includes tules, bulrushes, and cattail. Wildlife that occurs in this  
13 area include Marsh Wren, Common Yellowthroat, Red-Winged Blackbird, Red-  
14 legged Frog, and Western Pond Turtle. The open water habitat of the Los  
15 Vaqueros Reservoir provides forage, winter, and brood habitat for Canada Goose;  
16 American Wigeon; Wood., Gadwall, Mallard, Northern Shoveler, Northern  
17 Pintail, Green-Winged Teal, Canvasback, Redhead, Ring-Necked, Greater Scaup,  
18 Lesser Scaup, Bufflehead, Common Goldeneye, Hooded Merganser, Common  
19 Merganser, and Ruddy ducks; and other habitat values for grebe, sandpiper,  
20 pelican, cormorant, egret, heron, and gull.

#### 21 **10.3.4.4 East Bay Municipal Utility District Reservoirs**

22 The East Bay Municipal Utility District reservoirs in Alameda and Contra Costa  
23 County used to store water within and near the East Bay Municipal Utility District  
24 service area include Briones Reservoir, San Pablo Reservoir, Lafayette Reservoir,  
25 Upper San Leandro Reservoir, and Lake Chabot. Water stored in these reservoirs  
26 includes water from local watersheds, the Mokelumne River watershed, and  
27 CVP water supplies, as described in Chapter 5, Surface Water Resources and  
28 Water Supplies.

29 The Briones Reservoir watershed is characterized by grasslands, chaparral,  
30 coastal scrub, oak and bay woodlands, riparian, and freshwater wetlands  
31 (EBMUD 1999; EBRPD 1996, 2001, 2013). The San Pablo Reservoir watershed  
32 is characterized by grasslands, hardwood forest, coastal scrub, Monterey pine  
33 planted along the reservoir shoreline, riparian woodland, and eucalyptus. The  
34 Lafayette Reservoir watershed is characterized by grasslands, oak and bay  
35 woodland, and coastal scrub. The Upper San Leandro Reservoir watershed  
36 includes grasslands, chamise-black sage chaparral, coastal scrub, oak and bay  
37 woodland, redwood forest, knobcone forest with a dense manzanita understory,  
38 and an 18-acre freshwater marsh. The Lake Chabot watershed includes  
39 grasslands, coastal scrub, oak and bay woodland, and riparian and freshwater  
40 vegetation.

41 The grasslands vegetative communities generally include nonnative grasses and  
42 native perennial bunchgrass (EBMUD 1999; EBRPD 1996, 2001). The nonnative  
43 grasslands include grasses such as wild oat, bromegrass, ryegrass, wild barley,  
44 bluegrass, silver hairgrass, and dogtail grass; forbs, including filaree, bur clover,

1 clovers, owls clover, cat's ear, and English plantain; and brodiaeas, lupine,  
 2 mariposa lilies, mule's ear, yarrow, farewell to spring, and soap plant. Native  
 3 grasses include annual and perennial fescues, needlegrass, wild rye, California  
 4 oatgrass, junegrass, bluegrass, squirreltail, meadow barley, and California  
 5 bromegrass. Grasslands are used by wildlife similar to those described for other  
 6 San Francisco Bay Area reservoirs, including hawks, owls, shrikes, swallows,  
 7 turkey vulture, reptiles, coyote, fox, bobcat, and mice.

8 The coastal scrub and chaparral vegetation includes coyote brush-scrub,  
 9 California sagebrush, bitter cherry scrub, manzanita, chamise-black sage, cream  
 10 bush, California coffeeberry, wild lilac, yerba santa, blackberry, bush  
 11 monkeyflower, and poison oak (EBMUD 1999; EBRPD 1996, 2001). The  
 12 woodlands include native and nonnative plants. The native redwood and  
 13 knobcone pine forests are located at Upper San Leandro Reservoir and provide  
 14 unique habitat. Nonnative eucalyptus and Monterey pine forests occur at San  
 15 Pablo Reservoir and Lake Chabot. The eucalyptus trees provide specific habitat  
 16 for hummingbird, Bald Eagle, Great Blue Heron, and Great Egret. The oak and  
 17 bay woodlands and oak savannas include coast live oak, black oak, valley oak,  
 18 blue oak, interior live oak, canyon live oak, California bay, California buckeye,  
 19 and madrone.

20 Mixed deciduous riparian woodland occur along perennial streams, including  
 21 white alder, big-leaf maple, western sycamore, Fremont cottonwood, and black  
 22 cottonwood that supports frogs, newts, and other amphibians; coast live oak,  
 23 California bay, and willow woodlands on steep slopes along intermittent streams;  
 24 and willow riparian scrub along perennial and intermittent streams (EBMUD  
 25 1999; EBRPD 1996, 2001). Along springs and seeps, the vegetation includes  
 26 grasses, includes rabbitsfoot grass, saltgrass, bentgrasses, rushes, tules, sedges,  
 27 horsetails, and cattail; and forbs includes buttercup, watercress, stinging nettle,  
 28 brass-buttons, mints, duckweed, and pondweed.

### 29 **10.3.5 Central Coast Region**

30 The Central Coast Region includes portions of San Luis Obispo and Santa  
 31 Barbara counties served by the SWP. The SWP water is provided to the Central  
 32 Coast Region by the Central Coast Water Authority (CCWA 2013). The facilities  
 33 divert water from the SWP California Aqueduct at Devil's Den and convey the  
 34 water to a water treatment plant at Polonto Pass. The treated water is conveyed to  
 35 municipal water users in San Luis Obispo and Santa Barbara counties to reduce  
 36 groundwater overdraft in these areas. Water is delivered to southern Santa  
 37 Barbara County communities through Cachuma Lake.

38 As described in subsection 10.3.2, Overview of Species with Special Status, A  
 39 listing of wildlife and plant species with special status that occur or may occur in  
 40 portions of the study area affected by the long-term coordinated operation of the  
 41 CVP and SWP is provided in Appendix 10A.

1     **10.3.5.1 Cachuma Lake**

2 Cachuma Lake is a facility owned and operated by Reclamation in Santa Barbara  
3 County, as described in Chapter 5, Surface Water Resources and Water Supplies.  
4 The Cachuma Lake watershed is located in the Coast Range and extends into the  
5 Los Padres National Forest. The primary habitats include hardwood woodland,  
6 chaparral, coastal sage scrub, nonnative grassland, and riparian woodland and  
7 scrub (Reclamation 2010c). The hardwood woodlands includes oak woodland,  
8 oak savannah, and pine woodland with blue oak, coast live oak, gray pine, skunk  
9 brush, and poison oak. The chaparral and coastal sage scrub includes mountain  
10 mahogany, greenbark ceonothus, blue oak, interior live oak, scrub oak, holly leaf  
11 redberry, buck brush, toyon, chaparral mallow, chamise, California sage brush,  
12 purple sage, deer weed, and coyote brush-scrub with understory of grasses and  
13 forbs. Birds that use the hardwood woodlands and savannah include Turkey  
14 Vulture; raptors including Red-Tailed Hawk and Bald Eagle; woodpecker,  
15 California Quail, Rufous-Crowned Sparrow, wren, California Thrasher, and  
16 Spotted Towhee. Nonnative grasslands are dominated by rip-gut brome and dove  
17 weed. Native grasses include purple needlegrass, blue-eyed grass, Johnny-jump-  
18 up, Chinese houses, rusty popcorn flower, slender cottonseed, forget-me-not,  
19 lupine, mountain dandelion, checkerbloom, narrow-leaved milkweed, fleabane,  
20 vinegar weed, California milkweed, and verbena.

21 Riparian habitat along streams and stream terraces include arroyo willow, red  
22 willow, yellow willow, black willow, sycamore, oak, cottonwood, Pacific  
23 blackberry, California rose, poison oak, elderberry, mulefat, California goldenrod,  
24 California brome, black mustard, mugwort, clover, stinging nettle, red brome, and  
25 California buckwheat (Reclamation 2010c). Habitat near the shoreline of  
26 Cachuma Lake includes willows, tamarisk, cattail, mulefat, and mugwort.  
27 Disturbed lands around the lake are characterized by weedy species, including  
28 yellow star thistle, Spanish broom, tamarisk, giant reed, pampas grass, scotch  
29 broom, veldt grass, perennial pepperweed, red brome, fennel, and cheatgrass.  
30 Marginal vegetation, reedy marshes, and riparian woodland support killdeer,  
31 spotted Sandpiper, Red-Winged Blackbird, Common Yellowthroat, Song  
32 Sparrow, Marsh Wren, Warbling Vireo, Yellow Warbler, Yellow-Breasted Chat,  
33 and Brown-Headed Cowbird. The open water of Cachuma Lake supports diving  
34 birds, including diving duck, American Coot, Pied-Billed Grebe, Western Grebe,  
35 Clark's Grebe, Double-Crested Cormorant, Heron, Egret, pelican, Osprey, and  
36 Bald Eagle. Amphibians and reptiles that occur near Cachuma Lake include  
37 Monterey Salamander, California Slender Salamander, Western Spadefoot,  
38 California Toad, Pacific Tree Frog, Bullfrog, Red-legged Frog, Yellow-Legged  
39 Frog, Southwestern Pond Turtle, Western Skink, and Southern Alligator Lizard.  
40 Mammals which depend upon habitat near Cachuma Lake include bat, hare,  
41 rabbit, pika, bear, coyote, fox, weasel, raccoon, cats, chipmunk, squirrel, marmot,  
42 shrew, mice, rat, mule deer, and feral pig.

43     **10.3.6 Southern California Region**

44 The Southern California Region includes portions of Ventura, Los Angeles,  
45 Orange, San Diego, Riverside, and San Bernardino counties served by the SWP.

1 The SWP water supplies generally are conveyed to Southern California  
 2 municipal, industrial, and agricultural water users in canals and pipelines. There  
 3 are six SWP reservoirs along the main canal, West Branch, and East Branch of the  
 4 California Aqueduct and many other reservoirs owned and operated by regional  
 5 and local agencies. The Metropolitan Water District of Southern California's  
 6 Diamond Valley Lake and Lake Skinner primarily store water from the SWP.  
 7 Other reservoirs store SWP water, including United Water Conservation District's  
 8 Lake Piru; City of Escondido's Dixon Lake; City of San Diego's San Vicente  
 9 Reservoir and Lower Otay Reservoir; Helix Water District's Lake Jennings; and  
 10 Sweetwater Authority's Sweetwater Reservoir.

11 As described in subsection 10.3.2, Overview of Species with Special Status, A  
 12 listing of wildlife and plant species with special status that occur or may occur in  
 13 portions of the study area affected by the long-term coordinated operation of the  
 14 CVP and SWP is provided in Appendix 10A.

15 The USFWS has approved several habitat conservation plans in the Southern  
 16 California Region within areas served by CVP and SWP water, including the  
 17 following plans (County of Orange 1996; Riverside County 2003; Riverside  
 18 County Habitat Conservation Agency 2014; SDCWA and USFWS 2010;  
 19 San Diego County 2014a, 2014b, 2015; SANDAG 2003; CVAG 2007).

- 20 • County of Orange Central and Coastal Subregion Natural Community  
 21 Conservation Plan and Habitat Conservation Plan.
- 22 • Western Riverside County Multiple Species Conservation Plan.
- 23 • Habitat Conservation Plan for the Stephen's Kangaroo Rat in Western  
 24 Riverside County which is administered by the Riverside County Habitat  
 25 Conservation Agency for Riverside County and the cities of Corona, Hemet,  
 26 Lake Elsinore, Menifee, Moreno Valley, Murrieta, Perris, Riverside,  
 27 Temecula, and Vail Lake, and which includes areas around Diamond Valley  
 28 Lake and Lake Skinner.
- 29 • San Diego County Water Authority Subregional Natural Community  
 30 Conservation Plan/Habitat Conservation Plan (NCCP/HCP).
- 31 • San Diego County Multiple Species Conservation Plan including the initial  
 32 area which includes the lands served by the City of San Diego Wastewater  
 33 Sewer System; future North County Plan expansion (extends from the areas  
 34 near the cities of Oceanside, Encinitas, San Marcos, Vista, and Escondido to  
 35 the Cleveland National Forest and Riverside County boundary), and  
 36 remaining land within the county (including lands from Alpine east to the  
 37 Imperial and Riverside counties boundaries).
- 38 • Multiple Habitat Conservation Program for the cities of Carlsbad, Encinitas,  
 39 Escondido, Oceanside, San Marcos, Solana Beach, and Vista.
- 40 • Coachella Valley Multiple Species Habitat Conservation Plan.

1     **10.3.6.1   State Water Project Reservoirs**

2     The SWP reservoirs include Quail Lake, Pyramid Lake, and Castaic Lake in Los  
3     Angeles County; Silverwood Lake and Crafton Hills Reservoir in San Bernardino  
4     County; and Lake Perris in Riverside County, as described in Chapter 5, Surface  
5     Water Resources and Water Supplies.

6     Quail Lake was formed by seismic activity on the San Andres Fault and enlarged  
7     by the Department of Water Resources (DWR) as part of the West Branch of the  
8     SWP (DWR 1997). Quail Lake is bordered by the Tehachapi and Liebre  
9     Mountains. The area is characterized by cottonwood and oak woodlands that  
10    support Crested Sparrow, Red-Winged Blackbird, Golden Eagle, Red-Tailed  
11    Hawk, fox, coyote, deer, squirrel, and Pronghorn Antelope. The open water  
12    habitat support Canada Geese, egrets and Blue Herons

13    Pyramid Lake is located in the Angeles and Los Padres National Forests, as  
14    described in Chapter 15, Recreation Resources. Upland areas around Pyramid  
15    Lake are assumed to be similar to upland areas around Middle Piru Creek  
16    downstream of Pyramid Dam (DWR 2004c). The vegetative communities  
17    include coastal sage scrub and chaparral with oak woodlands and nonnative  
18    grasslands. Water is released from Pyramid Lake to provide habitat flows in Piru  
19    Creek, including flows to support habitat for the Arroyo Toad.

20    Terrestrial resources for Castaic Lake include coastal scrub, red shank-chamise  
21    chaparral, and chaparral scrub (DWR 2007b). Castaic Lagoon is located  
22    immediately downstream of Castaic Dam and is surrounded by coastal scrub.  
23    Vegetation includes pines, eucalyptus, and nonnative and native grasses. The  
24    habitat is used by Western Grebe, Canada Goose, Mallard Duck, gull, American  
25    Coot, Bald Eagle, and Western Mastiff Bat.

26    Silverwood Lake is located in the San Bernardino National Forest and surrounded  
27    by the Silverwood Lake State Recreation Area at the edge of the Mojave Desert  
28    and at the base of the San Bernardino Mountains. The area contains a wide  
29    variety of vegetative communities including live oak and scrub oak woodlands,  
30    ponderosa pine and Douglas-fir forests, mixed scrub, chaparral, and riparian  
31    hardwood (State Parks 2006, 2009). Chamise, interior live oak, manzanita,  
32    mountain mahogany, and ceanothus are found along the shoreline and willow,  
33    alders, and sycamores grow along area streams. The forest, chaparral, and  
34    riparian woodland habitats support a wide variety of small mammals, reptiles, and  
35    amphibians including rabbit, squirrel, woodrat, Western Fence Lizard,  
36    Rattlesnake, Pacific Tree Frog, California Toad, coyote, Mule Deer, bobcat,  
37    beaver, and skunk. The open water supports Great Blue Heron, Western Grebe,  
38    Avocet, Egret, Canada Goose, and ducks. A number of raptors are found around  
39    the lake including Bald Eagle, Osprey, owls, Cooper's Hawk, and Red-Tailed  
40    hawk.

41    The Crafton Hills Reservoir area includes 4.5 acres of open water and 1.9 acres of  
42    open space (DWR 2009b). The open space is characterized by chaparral scrub  
43    and grass species, including chamise, golden yarrow, hoaryleaf ceanothus,  
44    brittlebush, California sagebush, California buckwheat, deerweed, black sage,

1 purple needlegrass, heartleaf penstemon, ripgut grass, soft chess, foxtail chess,  
 2 wild oat, Italian thistle, tocalote, short-pod mustard, and wild oat. The area is  
 3 used by Mallard Duck, Killdeer, Red-Tailed Hawk, Cassin's Kingbird, and  
 4 Wrentit; California Toad, Pacific Tree Frog, Western Fence Lizard, Common  
 5 Side-Blotched Lizard, and California Kingsnake; and Desert Cottontail, Desert  
 6 Woodrat, coyote, raccoon, and bobcat.

7 Lake Perris is located adjacent to the cities of Moreno Valley and Perris and the  
 8 Perris Fairgrounds which includes a motor sports complex (DWR 2010a). Lake  
 9 Perris is located within the Lake Perris State Recreation Area which provides  
 10 extensive recreational opportunities, as described in Chapter 15, Recreation  
 11 Resources. The open space areas are characterized by willow and sage scrub,  
 12 willow and eucalyptus woodland, and nonnative grassland. The scrub areas  
 13 include California sagebrush, lemonadeberry, sugarbush, yellow bush penstemon,  
 14 coyote brush, Mexican elderberry, sweetbush, boxthorn, tall prickly-pear,  
 15 California buckwheat, red brome, bur ragweed, California aster, ripgut brome,  
 16 sticky monkeyflower, prickly sow thistle, and Russian thistle. The willow  
 17 woodland includes Goodding's black willow, red willow, narrow leaved willow,  
 18 Fremont's cottonwood, California sycamore, gooseberry, mulefat, tarragon,  
 19 curley dock, ragweed, southwestern spinyrush, and bromes. Eucalyptus  
 20 woodland includes eucalyptus underlain by nonnative grassland. Nonnative  
 21 grasslands includes soft chess, wild oat, foxtail barley, mustard, sweet fennel,  
 22 California sagebrush, and California buckwheat. Habitat has been restored within  
 23 the grasslands to provide habitat for the Stephen's Kangaroo Rat. Mourning  
 24 Dove, Anna's Hummingbird, raven, California Kingsnake, Raccoon, Black-Tailed  
 25 Deer, Striped Skunk, coyote, and bobcat use the shoreline. The woodland is used  
 26 by Ash-Throated Flycatcher, Western Kingbird, Least Bell's Vireo, House Wren,  
 27 California Towhee, Spotted Towhee, Black-Headed Grosbeak, Blue Grosbeak,  
 28 Song Sparrow, Bullock's Oriole, House Finch, Lesser Goldfinch, Nuttall's  
 29 Woodpecker, Red-Tailed Hawk, Red-Shouldered Hawk, Cooper's Hawk,  
 30 Cottontail Rabbit, Black-Tailed Jackrabbit, raccoon, and Long-Tailed Weasel.  
 31 The scrub supports California Quail, Greater Roadrunner, White-Throated Swift,  
 32 Rock Wren, California Towhee, Western Fence Lizard, Gopher Snake, Red  
 33 Diamond Rattlesnake, Southern Pacific Rattlesnake, Side Blotched Lizard,  
 34 Granite Spiny Lizard, Coastal Western Whiptail, Black-Tailed Jackrabbit, bobcat,  
 35 coyote, and rodents.

### 36 **10.3.6.2 Non-SWP Reservoirs in Riverside County**

37 Non-SWP reservoirs in Riverside County that store SWP water include Diamond  
 38 Valley Lake and Lake Skinner that are owned and operated by Metropolitan  
 39 Water District of Southern California, and Vail Lake that is owned and operated  
 40 by Rancho California Water District, as described in Chapter 5, Surface Water  
 41 Resources and Water Supplies.

42 Diamond Valley Lake is located adjacent to the City of Hemet along the northern  
 43 boundary, and adjacent to pasture and dairies along the eastern and western  
 44 boundaries (City of Hemet 2012). Sage scrub and nonnative grasslands occur  
 45 between the lake and the City of Hemet. Chaparral with sage scrub occur along

1 the southern boundary of the lake. Riversidean sage scrub includes California  
2 sagebrush, flat top buckwheat, black sage, and California encelia. Wildlife  
3 movement corridors occur around Diamond Valley Lake. Open space around  
4 Lake Skinner is also characterized by grassland and sage scrub vegetation  
5 (USFWS 2004).

6 Diamond Valley Lake and Lake Skinner are located within the Southwestern  
7 Riverside County Multi-Species Reserve, an area of 11,000 acres surrounding and  
8 connecting Diamond Valley Lake and Lake Skinner through the Dr. Roy Shipley  
9 Reserve (MWD 2014). At least eight types of habitat are found in the reserve, but  
10 coastal sage scrub, nonnative grassland, and chaparral are dominant. There are  
11 smaller areas of coast live oak woodland, willow scrub with live oak, and  
12 cottonwood-willow riparian forests. The reserve is home to the California  
13 Gnatcatcher, Bell's Sage Sparrow, San Diego Horned Lizard, Payson's  
14 Jewelflower, and Parry's Spineflower.

15 Areas around Vail Lake support habitat for Bald Eagle, Golden Eagle, and Great  
16 Blue Heron (RCWD 2015).

#### 17 **10.3.6.3 Non-SWP Reservoir in Ventura County**

18 Lake Piru, located in Ventura County, is used to store SWP water by United  
19 Water Conservation District, as described in Chapter 5, Surface Water Resources  
20 and Water Supplies (UWCD 1999, 2014). The area surrounding the lake is  
21 characterized by chaparral on the hills and coast live oak woodlands along the  
22 stream channels.

#### 23 **10.3.6.4 Non-SWP Reservoirs in San Diego County**

24 Reservoirs in San Diego County that are used to store SWP water include the City  
25 of Escondido Dixon Lake; City of San Diego San Vicente, El Capitan, Lower  
26 Otay, and Lake Hodges reservoirs; Lake Jennings owned by Helix Water District;  
27 and Sweetwater Reservoir owned by Sweetwater Authority.

28 Dixon Lake is located in the hills above the City of Escondido within the  
29 Escondido Multiple Habitat Conservation Plan area (City of Escondido 2012).  
30 Habitat around Lake Dixon is characterized by coastal sage scrub and chaparral.  
31 The coastal sage scrub includes California sagebrush, flat-top buckwheat, white  
32 sage, laurel sumac, black sage, California encelia, San Diego County viguiera,  
33 goldenbush, coast prickly-pear, and lemonadeberry and sugarbush. Chaparral  
34 includes chamise, scrub oak, toyon, thick-leaf ceanothus, black sage, wild  
35 cucumber, morning glory, saw-toothed goldenbush, and nonnative grasses.

36 The San Vicente Reservoir is characterized by rocky or coarse sand, with  
37 occasional willow trees and mulefat (SDCWA and USACE 2008). The  
38 constantly fluctuating water levels make it difficult for wetland or riparian  
39 vegetation to become established. Much of the shoreline around San Vicente  
40 Reservoir, therefore, is a non-vegetated fringe. Outside of the fringe, the area  
41 around the reservoir is primarily sage scrub with nonnative grassland and coast  
42 live oak woodland. Along the stream channel, vegetation includes southern  
43 willow scrub and live oak riparian forest with chaparral. Submerged aquatic

1 vegetation occurs in an intermittent band surrounding almost the entire reservoir.  
 2 Freshwater marsh vegetation of cattail, bulrush, and sedges occurs between the  
 3 open water and lakeshore fringe. Birds associated with the open water include  
 4 grebe, cormorant, heron, egret, ducks and geese, coot, plover, sandpiper, gull, and  
 5 tern. Other birds associated with open water and riparian habitats include the bald  
 6 eagle, osprey, and kingfisher. The uplands support rabbit, snakes, lizards, ground  
 7 squirrel, pocket gopher, raccoon, mule deer, bats, mice, fox, skunk, bobcat, and  
 8 mountain lion.

9 El Capitan Reservoir is located within Diegan coastal sage scrub with areas of oak  
 10 woodlands and chaparral (San Diego County 2011; SDRWWG 2005; SDRP  
 11 2015). The Lower Otay Reservoir, Lake Hodges, and Lake Jennings are located  
 12 within coastal sage scrub. Sweetwater Reservoir is surrounded by coastal sage  
 13 scrub and chaparral with riparian forest along stream channels.

#### 14 **10.3.6.5 Non-SWP Reservoir in San Bernardino County**

15 Lake Arrowhead, in San Bernardino County, is used to store SWP water by the  
 16 Lake Arrowhead Community Services District (County of San Bernardino 2011;  
 17 LACSD 2014a, 2014b). Lake Arrowhead is located within chaparral, sage scrub,  
 18 oak woodlands, oak and sycamore woodlands, dogwood tree along the lake,  
 19 cottonwood and willow forests along stream channels, Ponderosa pine forests, and  
 20 wetlands. The habitat supports Stellar Jay, blue jay, quail, ducks, western  
 21 Tanager, Northern Tanager, woodpecker, chickadee, Barn Owl, Bald Eagle,  
 22 hawks, rattlesnake, coyote, bobcat, Black Bear, Gray Squirrel, Ground Squirrel,  
 23 chipmunk, raccoon, mountain lion, skunk, and cougar.

## 24 **10.4 Impact Analysis**

25 This section describes the potential mechanisms and analytical methods for  
 26 change in terrestrial resources; results of the impact analysis; potential mitigation  
 27 measures; and cumulative effects.

### 28 **10.4.1 Potential Mechanisms for Change and Analytical Methods**

29 As described in Chapter 4, Approach to Environmental Analysis, the impact  
 30 analysis considers changes in terrestrial resources conditions related to changes in  
 31 CVP and SWP operations under the alternatives as compared to the No Action  
 32 Alternative and Second Basis of Comparison.

33 Changes in CVP and SWP operations under the alternatives as compared to the  
 34 No Action Alternative and Second Basis of Comparison could change surface  
 35 water resources affected by CVP and SWP operations.

#### 36 **10.4.1.1 Changes in CVP and SWP Reservoir Elevations**

37 Changes in surface water elevations at the CVP and SWP reservoirs would  
 38 influence the extent of the drawdown zone (the area of shoreline between the full  
 39 inundation elevation and the water level), which can influence the availability and  
 40 quality of nesting habitat for some ground-nesting birds (e.g., waterfowl) and

1 possibly the prey base for nesting fish-eating raptors (e.g., Bald Eagle and  
2 Osprey) in March through June. The creation of barren zones through reservoir  
3 drawdown can also affect the ability of wildlife species to access water, which  
4 could cause them to be more vulnerable to predation.

5 As described in Chapter 5, Surface Water Resources and Water Supplies, surface  
6 water elevations would be similar in all months and all water year types at Trinity  
7 Lake, Shasta Lake, Lake Oroville, Folsom Lake, and New Melones Reservoir  
8 under Alternatives 1 through 5 as compared to the No Action Alternative and the  
9 Second Basis of Comparison. Surface water elevations would change at San Luis  
10 Reservoir under Alternatives 1 through 5 as compared to the No Action  
11 Alternative and the Second Basis of Comparison. However, it does not appear  
12 that nesting fish-eating raptors or ground-nesting waterfowl use the San Luis  
13 Reservoir shoreline during these nesting lifestages (Reclamation 2013).  
14 Therefore, changes in CVP and SWP operations under the alternatives would  
15 result in similar conditions (within 5 percent change) for terrestrial resources at  
16 CVP and SWP reservoirs; and these factors are not analyzed in this EIS.

#### 17 **10.4.1.2 Changes in Rivers Downstream of the CVP and SWP Reservoirs**

18 Operation of the CVP and SWP would influence flow regimes that renew and  
19 support adjacent riparian and wetland plant and wildlife communities. For  
20 example, certain riparian plants (e.g., willows) require a specific sequence and  
21 timing of flow events to prepare the seedbed and to support germination and  
22 seedling growth in March through May. Changes in flow that support or interfere  
23 with these processes could influence riparian vegetation and its value as wildlife  
24 habitat. The analysis is focused on Trinity, Sacramento, Feather, American, and  
25 Stanislaus rivers because these rivers are used to convey water from the reservoirs  
26 to CVP and SWP water users. Therefore, changes in CVP and SWP operations  
27 could result in substantial changes in flow patterns in these rivers. At other  
28 reservoirs that are used to store CVP and SWP water supplies (e.g., San Luis  
29 Reservoir), the CVP and SWP water are conveyed from the reservoirs in canals or  
30 pipelines. The reservoirs may be operated to provide minimum flows to support  
31 habitat in streams adjacent to these reservoirs; however, changes in CVP and  
32 SWP operations would not affect the minimum instream flow releases.  
33 Therefore, changes in terrestrial resources in these streams is not analyzed in  
34 this EIS.

35 Channel maintenance flows to improve adjacent floodplain habitat conditions  
36 would occur along Clear Creek under the No Action Alternative and Alternatives  
37 2 and 5, to the extent possible. The high-flow, short-duration pulse flows would  
38 be released, if physically possible, from Whiskeytown Lake to mobilize  
39 streambed material in Clear Creek in accordance with the 2009 NMFS Biological  
40 Opinion (BO).

#### 41 **10.4.1.3 Changes in Sacramento, American, and Stanislaus Rivers** 42 **Habitats due to Fish Passage at Dams**

43 Fish passage would be provided under the No Action Alternative and  
44 Alternative 5 around Shasta, Folsom, and New Melones dams. Salmon runs play

1 an important role in the transfer of large quantities of marine-derived nutrients to  
2 adjacent forest ecosystems with substantial effects on plant and wildlife  
3 production. Spawning salmon contribute to the release of nutrients into streams  
4 through normal metabolic processes, release of gametes during spawning, decay  
5 of their carcasses following death, and through consumption of their flesh by  
6 predators and scavengers (Merz and Moyle 2006). Returning fish to the upper  
7 stream segments, fish passage could influence the forest ecosystem and associated  
8 wildlife in the upper watersheds and result in less nutrients along the rivers  
9 downstream of the dams. This analysis would assume that the objectives of the  
10 2009 NMFS BO were achieved by 2030, including implementation of fish  
11 passage at these CVP reservoirs. However, any changes in nutrients in the stream  
12 corridors are expected to be minimal based on information in Merz and Moyle  
13 (2006). Therefore, habitat conditions related to changes in nutrient loading  
14 associated with fish passage actions would be the same under Alternatives 1  
15 through 5 as under the No Action Alternative and the Second Basis of  
16 Comparison. Therefore, this potential change is not analyzed in this EIS.

#### 17 **10.4.1.4 Changes in River and Delta Floodplains**

18 Alternative 4 assumes additional institutional requirements for development  
19 within the floodplain and floodways that would require compliance with  
20 Endangered Species Act in defining floodplain map revisions, allow for  
21 improvements in floodplain management criteria to support natural and beneficial  
22 functions, and prohibit new development and substantial improvements to  
23 existing development within any designated floodway or within 170 feet of the  
24 ordinary high water line of any floodway. However, as described in Chapter 13,  
25 Land Use, in 2030, development along major river corridors in the Central Valley  
26 would continue to be limited by state regulations implemented by the Central  
27 Valley Flood Protection Board and the USACE.

28 Within the Delta, the floodways are further regulated by the Delta Protection  
29 Commission and Delta Stewardship Council to preserve and protect the natural  
30 resources of the Delta; and prevent encroachment into Delta floodways. These  
31 regulations, as implemented in all alternatives and the Second Basis of  
32 Comparison, would prevent development within the Delta floodplains and  
33 floodways and in the Sacramento, Feather, American, and San Joaquin rivers  
34 corridors upstream of the Delta, as described in Chapter 13. Provisions in  
35 Alternative 4 would require additional setbacks along the floodways as compared  
36 to other alternatives and the Second Basis of Comparison. The qualitative  
37 analysis considers the potential changes in habitat due to these changes in  
38 floodplain and floodway development regulations.

39 Another potential change in Delta habitat would occur under Alternative 4,  
40 additional vegetation would remain along the levees in the Delta as compared to  
41 conditions under the other alternatives, the No Action Alternative, and the Second  
42 Basis of Comparison, as described in Chapter 3, Description of Alternatives.  
43 Under Alternatives 1, 2, 3, and 5; the No Action Alternative; and the Second  
44 Basis of Comparison existing vegetation would remain along the Delta levees  
45 until the levees are repaired. Following repairs, vegetation would be removed

1 along the riparian corridor to improve the structural reliability of the levees in  
2 accordance with USACE requirements. It is assumed that by 2030, much of the  
3 vegetation would be removed from the levees due to levee repairs.

4 **10.4.1.5 Changes in Flows over Fremont Weir into the Yolo Bypass**

5 All of the alternatives, including the No Action Alternative and the Second Basis  
6 of Comparison, include operations of an operable gate at Fremont Weir, as  
7 described in Chapter 3, Description of Alternatives. However, the flow patterns  
8 into the Yolo Bypass would change based upon the magnitude of flows in the  
9 Sacramento River at Fremont Weir.

10 **10.4.1.6 Changes in Wetlands Habitat**

11 The No Action Alternative, Alternatives 1 through 5, and Second Basis of  
12 Comparison all include implementation of restoration of more than 10,000 acres  
13 of intertidal and associated subtidal wetlands in Suisun Marsh and Cache Slough;  
14 17,000 to 20,000 acres of seasonal floodplain restoration in the Yolo Bypass; and  
15 continued delivery of refuge water supplies under the Central Valley Project  
16 Improvement Act. There would be no changes in wetlands habitat between  
17 Alternatives 1 through 5 as compared to the No Action Alternative, and the  
18 Second Basis of Comparison. Therefore, changes to wetland habitats are not  
19 analyzed in this EIS.

20 **10.4.1.7 Changes in Delta Habitat**

21 Changes in CVP and SWP operations under the alternatives as compared to the  
22 No Action Alternative and Second Basis of Comparison would change the Delta  
23 salinity which could affect survival of riparian vegetation. The analysis evaluates  
24 changes in salinity by comparing the end of month X2 position.

25 Another potential change in Delta habitat would occur under Alternative 4, due to  
26 additional vegetation along the levees in the Delta as compared to conditions  
27 under the other alternatives, the No Action Alternative, and the Second Basis of  
28 Comparison, as described in Chapter 3, Description of Alternatives.

29 **10.4.1.8 Changes in Irrigated Agricultural Acreage Habitats in Areas that  
30 use CVP and SWP Water**

31 As described in Section 10.3, Affected Environment, agricultural lands provide  
32 considerable value to terrestrial wildlife, which varies with crop type and wildlife  
33 species. Generally, rice production provides high habitat value for some species  
34 because it supports many of the attributes of wetlands. Most notably, flooded rice  
35 fields during the growing season provide foraging and nesting habitat for  
36 waterfowl and shorebirds, as well as habitat for the federally listed Giant Garter  
37 Snake. In the fall and early winter, flooding for rice straw decomposition plays an  
38 important role in providing habitat for migrating waterbirds. Other crops, such as  
39 alfalfa and irrigated pasture, also provide habitat value, primarily because of their  
40 perennial nature and the application of flood irrigation. These crops provide  
41 valuable foraging habitat for species such as the state-listed Swainson's Hawk.  
42 Grain crops provide seasonal value to species such as Greater Sandhill Crane and

1 others, but orchards, vineyards, vegetable, and truck crops generally provide  
2 relatively low habitat value for terrestrial species.

3 Changes in CVP and SWP operations under the alternatives could change the  
4 extent of irrigated acreage and associated habitats over the long-term average  
5 condition and in dry and critical dry years as compared to the No Action  
6 Alternative and Second Basis of Comparison, as described in Chapter 12,  
7 Agricultural Resources. However, irrigated acreage under Alternatives 1  
8 through 5 would be similar (within 5 percent change) to irrigated acreage under  
9 the No Action Alternative and the Second Basis of Comparison. Therefore, there  
10 would be no change in terrestrial habitat at the irrigated acreage; and this factor is  
11 not analyzed in this EIS.

#### 12 **10.4.1.9 Effects due to Cross Delta Water Transfers**

13 Historically water transfer programs have been developed on an annual basis.  
14 The demand for water transfers is dependent upon the availability of water  
15 supplies to meet water demands. Water transfer transactions have increased over  
16 time as CVP and SWP water supply availability has decreased, especially during  
17 drier water years.

18 Parties seeking water transfers generally acquire water from sellers who have  
19 available surface water and who can make the water available through releasing  
20 previously stored water, pumping groundwater instead of using surface water  
21 (groundwater substitution); idling crops; or substituting crops that uses less water  
22 in order to reduce normal consumptive use of surface water.

23 Water transfers using CVP and SWP Delta pumping plants and south of Delta  
24 canals generally occur when there is unused capacity in these facilities. These  
25 conditions generally occur during drier water year types when the flows from  
26 upstream reservoirs plus unregulated flows are adequate to meet the Sacramento  
27 Valley water demands and the CVP and SWP export allocations. In non-wet  
28 years, the CVP and SWP water allocations would be less than full contract  
29 amounts; therefore, capacity may be available in the CVP and SWP conveyance  
30 facilities to move water from other sources.

31 Projecting future terrestrial resources conditions related to water transfer activities  
32 is difficult because specific water transfer actions required to make the water  
33 available, convey the water, and/or use the water would change each year due to  
34 changing hydrological conditions, CVP and SWP water availability, specific local  
35 agency operations, and local cropping patterns. Reclamation recently prepared a  
36 long-term regional water transfer environmental document which evaluated  
37 potential changes in conditions related to water transfer actions (Reclamation  
38 2014d). Results from this analysis were used to inform the impact assessment of  
39 potential effects of water transfers under the alternatives as compared to the No  
40 Action Alternative and the Second Basis of Comparison.

1 **10.4.2 Conditions in Year 2030 without Implementation of**  
2 **Alternatives 1 through 5**

3 This EIS includes two bases of comparison, as described in Chapter 3,  
4 Description of Alternatives: the No Action Alternative and the Second Basis of  
5 Comparison. Both of these bases are evaluated at 2030 conditions.

6 Changes that would occur over the next 15 years without implementation of the  
7 alternatives are not analyzed in this EIS. However, the changes to terrestrial  
8 resources that are assumed to occur by 2030 under the No Action Alternative and  
9 the Second Basis of Comparison are summarized in this section. Many of the  
10 changed conditions would occur in the same manner under both the No Action  
11 Alternative and the Second Basis of Comparison.

12 **10.4.2.1 Common Changes in Conditions under the No Action**  
13 **Alternative and Second Basis of Comparison**

14 Conditions in 2030 would be different than existing conditions due to:

- 15 • Climate change and sea level rise
- 16 • General plan development throughout California, including increased water  
17 demands in portions of Sacramento Valley.
- 18 • Implementation of reasonable and foreseeable water resources management  
19 projects to provide water supplies, including general plan development, future  
20 water management and supply projects, and river and Delta floodplain  
21 development.

22 **10.4.2.1.1 Climate Change and Sea Level Rise**

23 It is anticipated that climate change would result in more short-duration high-  
24 rainfall events and less snowpack in the winter and early spring months. The  
25 reservoirs would be full more frequently by the end of April or May by 2030 than  
26 in recent historical conditions. However, as the water is released in the spring,  
27 there would be less snowpack to refill the reservoirs. This condition would  
28 reduce reservoir storage and available water supplies to downstream uses in the  
29 summer. The reduced end of September storage also would reduce the ability to  
30 release stored water to downstream regional reservoirs. These conditions would  
31 occur for all reservoirs in the California foothills and mountains, including non-  
32 CVP and SWP reservoirs.

33 These changes would result in a decline of the long-term average CVP and SWP  
34 water supply deliveries by 2030 as compared to recent historical long-term  
35 average deliveries under the No Action Alternative and the Second Basis of  
36 Comparison. However, the CVP and SWP water deliveries would be less under  
37 the No Action Alternative as compared to the Second Basis of Comparison, as  
38 described in Chapter 5, Surface Water Resources and Water Supplies, which  
39 could result in more crop idling.

40 The Delta estuarine habitat is complex due to the freshwater-saltwater interface  
41 that supports numerous terrestrial species that require freshwater conditions  
42 primarily in the winter and spring and may withstand periods of higher salinity in

1 the late summer and fall months. Climate change and sea level rise and CVP and  
 2 SWP operations would change the location of the freshwater-saltwater interface in  
 3 the Delta which would affect the survivability of vegetation within that area,  
 4 especially in the western Delta and Suisun Marsh. Operations of the CVP and  
 5 SWP would continue to maintain freshwater conditions in the spring in  
 6 accordance with the State Water Resources Control Board Decision 1641.  
 7 However, higher salinity conditions would occur in the summer months and in the  
 8 fall of drier years which would affect the types of riparian vegetation in the  
 9 western Delta and in Suisun Marsh under the No Action Alternative and Second  
 10 Basis of Comparison in 2030 as compared to recent historical conditions.

#### 11 **10.4.2.1.2 Reasonable and Foreseeable Projects and Programs**

12 Under the No Action Alternative and the Second Basis of Comparison, land uses  
 13 in 2030 would occur in accordance with adopted general plans. Development  
 14 under the general plans would change terrestrial resources, especially near  
 15 municipal areas.

16 The No Action Alternative and the Second Basis of Comparison assumes  
 17 completion of water resources management and environmental restoration  
 18 projects that would have occurred without implementation of Alternatives 1  
 19 through 5, including regional and local recycling projects, surface water and  
 20 groundwater storage projects, conveyance improvement projects, and desalination  
 21 projects, as described in Chapter 3, Description of Alternatives. The No Action  
 22 Alternative and the Second Basis of Comparison also assumes implementation of  
 23 actions included in the 2008 U.S. Fish and Wildlife Service (USFWS) Biological  
 24 Opinion (BO) and 2009 National Marine Fisheries Service (NMFS) BO that  
 25 would have been implemented without the BOs by 2030, as described in  
 26 Chapter 3, Description of Alternatives. These projects would include several  
 27 projects that would affect terrestrial resources, including:

- 28 • Habitat Restoration includes restoration of more than 10,000 acres of  
 29 intertidal and associated subtidal wetlands in Suisun Marsh and Cache Slough;  
 30 and at least 17,000 to 20,000 acres of seasonal floodplain restoration in Yolo  
 31 Bypass.
- 32 • Sacramento River, American River, and Clear Creek Spawning Gravel  
 33 Augmentation.
- 34 • Battle Creek Restoration.
- 35 • Lower American River Flow Management Standard.

#### 36 **10.4.2.1.3 Changes in River and Delta Floodplains**

37 It is assumed that under the No Action Alternative and the Second Basis of  
 38 Comparison, the State of California would continue to implement flood  
 39 management projects to reduce flood risks along the Sacramento and San Joaquin  
 40 rivers and in the Delta (DWR 2013b). These programs would be implemented in  
 41 a manner that would be coordinated with opportunities to restore or maintain the  
 42 function of natural systems with consideration of future conditions with climate

1 change and sea level rise. However, terrestrial resources would be changed by  
2 2030 as compared to recent historical conditions.

3 Terrestrial resources along Delta levees also would be affected through  
4 implementation of USACE policies for vegetation on levees. Historically, the  
5 USACE has allowed brush and small trees to be located on the waterside of  
6 federal flood management project levees if the vegetation would preserve, protect,  
7 and/or enhance natural resources, and/or protect rights of Native Americans,  
8 while maintaining the safety, structural integrity, and functionality of the levee  
9 (DWR 2011). After Hurricane Katrina in 2005, the USACE issued a policy and  
10 draft policy guidance to remove substantial vegetation from these levees  
11 throughout the nation (USACE 2009). This policy requires federally authorized  
12 levee systems that have maintenance agreements with the USACE (including  
13 Delta levees along the Sacramento and San Joaquin rivers) and other levees that  
14 are eligible for the federal Rehabilitation and Inspection Program (Public  
15 Law 84-99) to remove vegetation in the following manner.

- 16 • Removal of all vegetation from the upper third of the waterside slope of the  
17 levee, the top of the levee, landside slope of the levee, or within 15 feet of the  
18 toe of the levee on the landside (“toe” is where the levee slope meets the  
19 ground surfaces).
- 20 • Removal of all vegetation over 2 inches in diameter on the lower two-thirds of  
21 the waterside slope of the levee and within 15 feet of the toe of the levee on  
22 the waterside along benches above the water surface.

23 In 2010, the USACE issued a draft policy guidance letter, *Draft Process for*  
24 *Requesting a Variance from Vegetation Standards for Levees and Floodwalls—*  
25 *75 Federal Register 6364-68* (USACE 2010) that included procedures for State  
26 and local agencies to request variances on a site-specific basis. DWR has been in  
27 negotiations with USACE to remove vegetation on the upper third of the  
28 waterside slope, top, and landside of the levees, and continue to allow vegetation  
29 on the lower two-thirds of the waterside slope of the levee and along benches  
30 above the water surface (DSC 2011). By 2030, it is anticipated that much of the  
31 existing vegetation on the upper third of the waterside slopes, tops, landside  
32 slopes, and within 15 feet of the landside toe of the levees would be removed.

33 By 2030 under the No Action Alternative and the Second Basis of Comparison,  
34 development along major river corridors in the Central Valley would continue to  
35 be limited by state regulations implemented by the Central Valley Flood  
36 Protection Board and the USACE. Within the Delta, the floodways would  
37 continue to be regulated by the Delta Protection Commission and Delta  
38 Stewardship Council to preserve and protect the natural resources of the Delta;  
39 and prevent encroachment into Delta floodways. These requirements would  
40 prevent development within the Delta floodplains and floodways and in the  
41 Sacramento, Feather, American, and San Joaquin rivers corridors upstream of  
42 the Delta.

1 **10.4.3 Evaluation of Alternatives**

2 As described in Chapter 4, Approach to Environmental Analysis, Alternatives 1  
3 through 5 have been compared to the No Action Alternative; and the No Action  
4 Alternative and Alternatives 1 through 5 have been compared to the Second Basis  
5 of Comparison.

6 **10.4.3.1 No Action Alternative**

7 As described in Chapter 4, Approach to Environmental Analysis, the No Action  
8 Alternative is compared to the Second Basis of Comparison.

9 **10.4.3.1.1 Trinity River Region**

10 *Changes in Rivers Downstream of CVP and SWP Reservoirs*

11 River flows in Trinity River downstream of Lewiston Dam in the critical period  
12 for terrestrial resources of March through May would be similar under the No  
13 Action Alternative and the Second Basis of Comparison, as described in  
14 Chapter 5, Surface Water Resources and Water Supplies. Therefore, terrestrial  
15 resources habitat conditions along the Trinity River and lower Klamath River  
16 riparian corridors would be similar under the No Action Alternative and Second  
17 Basis of Comparison.

18 **10.4.3.1.2 Central Valley Region**

19 *Changes in Rivers Downstream of CVP and SWP Reservoirs*

20 Flows in the spring months would be similar in the Sacramento River at Keswick  
21 and Freeport and American River downstream of Nimbus Dam; increased flows  
22 in the Stanislaus River downstream of Goodwin Dam (over 100 percent); and  
23 reduced in the Feather River downstream of Thermalito Complex (25 to  
24 30 percent) under the No Action Alternative as compared to the Second Basis of  
25 Comparison. This analysis does not include site specific evaluation of all  
26 terrestrial resources along these riparian corridors. However, the changes in flows  
27 are indicative of the potential for change in the terrestrial resources. Therefore,  
28 under the No Action Alternative as compared to the Second Basis of Comparison,  
29 the potential for similar or improved terrestrial resources would occur along the  
30 Sacramento, American, and Stanislaus rivers; and the potential for reduced  
31 terrestrial resources would occur along the Feather River.

32 Monthly Clear Creek flows under the No Action Alternative as compared to the  
33 Second Basis of Comparison are identical except in May. In May, under the No  
34 Action Alternative, flows are up to 40.7 percent higher than under the Second  
35 Basis of Comparison in accordance with the 2009 NMFS BO. Terrestrial  
36 resources habitat in the floodplains of lower Clear Creek would be slightly  
37 improved under the No Action Alternative as compared to the Second Basis of  
38 Comparison.

39 *Potential Effects on Special Status Species*

40 Habitat changes along the riparian corridors related to changes in spring flows  
41 that support riparian vegetation recruitment would affect numerous bird species  
42 that use the riparian corridor, including Black Tern, Least Bell's Vireo, Least

1 Bittern, Swainson's Hawk, Tricolored Blackbird, Western Yellow-billed Cuckoo,  
2 White-tailed Kite, Yellow Warbler, Ringtail, Western Pond Turtle, Valley  
3 Elderberry Longhorn Beetle, and Delta Button-celery. Potential adverse effects  
4 could occur to these species due to reduced flows in the spring months on the  
5 Feather River.

6 *Changes in River and Delta Floodplains*

7 It is assumed that under the No Action Alternative and the Second Basis of  
8 Comparison, the State of California would continue to implement flood  
9 management projects to reduce flood risks along the Sacramento and San Joaquin  
10 rivers and in the Delta with consideration for opportunities to restore or maintain  
11 the function of natural ecosystems. The related terrestrial habitat conditions  
12 would be similar under the No Action Alternative and the Second Basis of  
13 Comparison.

14 *Changes in Flows over Fremont Weir into the Yolo Bypass*

15 Flows from the Sacramento River into the Yolo Bypass at Fremont Weir are  
16 similar under the No Action Alternative and the Second Basis of Comparison;  
17 therefore, terrestrial habitat could be similar.

18 *Changes in Delta Habitat due to Changes in Water Quality*

19 Under the No Action Alternative, the freshwater interface would be similar to  
20 conditions under the Second Basis of Comparison in all months in below normal,  
21 dry, and critical dry years; and from January through August in wet and above  
22 normal years. In the fall months in wet years, the X2 location would be 9 to  
23 14 kilometers towards the west in September through December under the No  
24 Action Alternative as compared to the Second Basis of Comparison.

25 *Potential Effects on Special Status Species*

26 Lower Delta salinity under the No Action Alternative as compared to the Second  
27 Basis of Comparison would improve habitat for Bolander's Water Hemlock,  
28 Delta Button-celery, Delta Tule Pea, Mason's Lilaeopsis, Soft Birds-beak, Suisun  
29 Marsh Aster, Salt Marsh Harvest Mouse, and Suisun Shrew.

30 *Effects Related to Cross Delta Water Transfers*

31 Potential effects to terrestrial resources could be similar to those identified in a  
32 recent environmental analysis conducted by Reclamation for long-term water  
33 transfers from the Sacramento to San Joaquin valleys (Reclamation 2014d).  
34 Potential effects to terrestrial resources were identified as changes in stream flows  
35 due declining groundwater levels along streams due to the use of groundwater  
36 substitution to provide transfer water. The analysis indicated that these potential  
37 impacts would not be substantial due to the inclusion of a monitoring and  
38 mitigation program.

39 Under the No Action Alternative, the timing of cross Delta water transfers would  
40 be limited to July through September and include annual volumetric limits, in  
41 accordance with the 2008 USFWS BO and 2009 NMFS BO. Under the Second  
42 Basis of Comparison, water could be transferred throughout the year without an  
43 annual volumetric limit. Overall, the potential for cross Delta water transfers

1 would be less under the No Action Alternative than under the Second Basis of  
2 Comparison.

### 3 **10.4.3.2 Alternative 1**

4 Alternative 1 is identical to the Second Basis of Comparison. As described in  
5 Chapter 4, Approach to Environmental Analysis, Alternative 1 is compared to the  
6 No Action Alternative and the Second Basis of Comparison. However, because  
7 water resource conditions under Alternative 1 are identical to water resource  
8 conditions under the Second Basis of Comparison; Alternative 1 is only compared  
9 to the No Action Alternative.

#### 10 **10.4.3.2.1 Alternative 1 Compared to the No Action Alternative**

##### 11 *Trinity River Region*

##### 12 *Changes in Rivers Downstream of CVP and SWP Reservoirs*

13 River flows in Trinity River downstream of Lewiston Dam in the critical period  
14 for terrestrial resources of March through May would be similar under  
15 Alternative 1 and the No Action Alternative. Therefore, terrestrial resources  
16 habitat conditions along the Trinity River and lower Klamath River riparian  
17 corridors would be similar under Alternative 1 as compared to the No Action  
18 Alternative.

##### 19 *Central Valley Region*

##### 20 *Changes in Rivers Downstream of CVP and SWP Reservoirs*

21 Flows in the spring months would be similar in the Sacramento River at Keswick  
22 and Freeport and American River downstream of Nimbus Dam; increased in the  
23 Feather River downstream of Thermalito Complex (35 percent); and reduced  
24 flows in the Stanislaus River downstream of Goodwin Dam (60 percent) under  
25 Alternative 1 as compared to the No Action Alternative. This analysis does not  
26 include site specific evaluation of all terrestrial resources along these riparian  
27 corridors. However, the changes in flows are indicative of the potential for  
28 change in the terrestrial resources. Therefore, under Alternative 1 as compared to  
29 the No Action Alternative, the potential for similar or improved terrestrial  
30 resources would occur along the Sacramento, American, and Feather rivers; and  
31 the potential for reduced terrestrial resources would occur along the  
32 Stanislaus River.

33 Monthly Clear Creek flows under Alternative 1 as compared to the No Action  
34 Alternative are identical except in May. In May, under Alternative 1, flows are  
35 up to 29 percent lower as compared to the No Action Alternative. Terrestrial  
36 resources habitat in the floodplains of lower Clear Creek could be decreased  
37 under Alternative 1 as compared to the No Action Alternative.

##### 38 *Potential Effects on Special Status Species*

39 Habitat changes along the riparian corridors related to changes in spring flows  
40 that support riparian vegetation recruitment would affect numerous bird species  
41 that use the riparian corridor, including Black Tern, Least Bell's Vireo, Least  
42 Bittern, Swainson's Hawk, Tricolored Blackbird, Western Yellow-billed Cuckoo,

1 White-tailed Kite, Yellow Warbler, Ringtail, Western Pond Turtle, Valley  
2 Elderberry Longhorn Beetle, and Delta Button-celery. Potential adverse effects  
3 could occur to these species due to reduced flows in the spring months on the  
4 Stanislaus River.

5 *Changes in River and Delta Floodplains*

6 It is assumed that under Alternative 1 and the No Action Alternative, the State of  
7 California would continue to implement flood management projects to reduce  
8 flood risks along the Sacramento and San Joaquin rivers and in the Delta with  
9 consideration for opportunities to restore or maintain the function of natural  
10 ecosystems. The related terrestrial habitat conditions that would occur due to  
11 implementation of the flood management projects would be the same under  
12 Alternative 1 and the No Action Alternative.

13 *Changes in Flows over Fremont Weir into the Yolo Bypass*

14 Flows from the Sacramento River into the Yolo Bypass at Fremont Weir would  
15 be similar or higher under Alternative 1 as compared to the No Action  
16 Alternative; therefore, terrestrial habitat could be similar or increased depending  
17 upon the flow pattern.

18 *Changes in Delta Habitat due to Changes in Water Quality*

19 Under Alternative 1, the freshwater interface would be similar to conditions under  
20 the No Action Alternative in all months in below normal, dry, and critical dry  
21 years; and from January through August in wet and above normal years. In the  
22 fall months in wet years, the X2 location would be 9 to 14 kilometers towards the  
23 east in September through December under Alternative 1 as compared to the No  
24 Action Alternative. This could adversely affect terrestrial species that have  
25 acclimated to freshwater conditions.

26 *Potential Effects on Special Status Species*

27 Higher Delta salinity under Alternative 1 as compared to the No Action  
28 Alternative would reduce habitat conditions for Bolander's Water Hemlock, Delta  
29 Button-celery, Delta Tule Pea, Mason's Lilaeopsis, Soft Birds-beak, Suisun  
30 Marsh Aster, Salt Marsh Harvest Mouse, and Suisun Shrew.

31 *Effects Related to Cross Delta Water Transfers*

32 Potential effects to terrestrial resources could be similar to those identified in a  
33 recent environmental analysis conducted by Reclamation for long-term water  
34 transfers from the Sacramento to San Joaquin valleys (Reclamation 2014d).  
35 Potential effects to terrestrial resources were identified as changes in stream flows  
36 due declining groundwater levels along streams due to the use of groundwater  
37 substitution to provide transfer water. The analysis indicated that these potential  
38 impacts would not be substantial due to the inclusion of a monitoring and  
39 mitigation program.

40 Under Alternative 1, water could be transferred throughout the year without an  
41 annual volumetric limit. Under the No Action Alternative, the timing of cross  
42 Delta water transfers would be limited to July through September and include  
43 annual volumetric limits, in accordance with the 2008 USFWS BO and 2009

1 NMFS BO. Overall, the potential for cross Delta water transfers would be greater  
2 under Alternative 1 as compared to the No Action Alternative.

### 3 **10.4.3.2.2 Alternative 1 Compared to the Second Basis of Comparison**

4 Alternative 1 is identical to the Second Basis of Comparison.

### 5 **10.4.3.3 Alternative 2**

6 The CVP and SWP operations under Alternative 2 are identical to the CVP and  
7 SWP operations under the No Action Alternative; therefore, Alternative 2 is only  
8 compared to the Second Basis of Comparison.

### 9 **10.4.3.3.1 Alternative 2 Compared to the Second Basis of Comparison**

10 The CVP and SWP operations under Alternative 2 are identical to the CVP and  
11 SWP operations under the No Action Alternative. Therefore, changes in  
12 terrestrial resources under Alternative 2 as compared to the Second Basis of  
13 Comparison would be the same as the impacts described in Section 10.4.3.1, No  
14 Action Alternative.

### 15 **10.4.3.4 Alternative 3**

16 As described in Chapter 3, Description of Alternatives, CVP and SWP operations  
17 under Alternative 3 are similar to the Second Basis of Comparison with modified  
18 Old and Middle River flow criteria and New Melones Reservoir operations. As  
19 described in Chapter 4, Approach to Environmental Analysis, Alternative 3 is  
20 compared to the No Action Alternative and the Second Basis of Comparison.

### 21 **10.4.3.4.1 Alternative 3 Compared to the No Action Alternative**

#### 22 *Trinity River Region*

#### 23 *Changes in Rivers Downstream of CVP and SWP Reservoirs*

24 River flows in Trinity River downstream of Lewiston Dam in the critical period  
25 for terrestrial resources of March through May would be similar under  
26 Alternative conditions along the Trinity River and lower Klamath River  
27 riparian corridors would be similar under Alternative 3 as compared to the  
28 No Action Alternative.

#### 29 *Central Valley Region*

#### 30 *Changes in Rivers Downstream of CVP and SWP Reservoirs*

31 Flows in the spring months would be similar in the Sacramento River at Keswick  
32 and Freeport and American River downstream of Nimbus Dam; increased in the  
33 Feather River downstream of Thermalito Complex (25 to 35 percent); and  
34 reduced flows in the Stanislaus River downstream of Goodwin Dam (60 percent)  
35 under Alternative 3 as compared to the No Action Alternative. This analysis does  
36 not include site specific evaluation of all terrestrial resources along these riparian  
37 corridors. However, the changes in flows are indicative of the potential for  
38 change in the terrestrial resources. Therefore, under Alternative 3 as compared to  
39 the No Action Alternative, the potential for similar or improved terrestrial  
40 resources would occur along the Sacramento, American, and Feather rivers; and

1 the potential for reduced terrestrial resources would occur along the  
2 Stanislaus River.

3 Monthly Clear Creek flows under Alternative 3 as compared to the No Action  
4 Alternative are identical except in May. In May, under Alternative 3, flows are  
5 up to 29 percent lower as compared to the No Action Alternative. Terrestrial  
6 resources habitat in the floodplains of lower Clear Creek would be decreased  
7 under Alternative 3 as compared to the No Action Alternative.

8 *Potential Effects on Special Status Species*

9 Habitat changes along the riparian corridors related to changes in spring flows  
10 that support riparian vegetation recruitment would affect numerous bird species  
11 that use the riparian corridor, including Black Tern, Least Bell's Vireo, Least  
12 Bittern, Swainson's Hawk, Tricolored Blackbird, Western Yellow-billed Cuckoo,  
13 White-tailed Kite, Yellow Warbler, Ringtail, Western Pond Turtle, Valley  
14 Elderberry Longhorn Beetle, and Delta Button-celery. Potential adverse effects  
15 could occur to these species due to reduced flows in the spring months on the  
16 Stanislaus River.

17 *Changes in River and Delta Floodplains*

18 It is assumed that under Alternative 3 and the No Action Alternative, the State of  
19 California would continue to implement flood management projects to reduce  
20 flood risks along the Sacramento and San Joaquin rivers and in the Delta with  
21 consideration for opportunities to restore or maintain the function of natural  
22 ecosystems. The related terrestrial habitat that would occur due to  
23 implementation of the flood management projects would be the same under  
24 Alternative 3 and the No Action Alternative.

25 *Changes in Flows over Fremont Weir into the Yolo Bypass*

26 Flows from the Sacramento River into the Yolo Bypass at Fremont Weir would  
27 be similar or higher (10 to 30 percent) under Alternative 3 as compared to the No  
28 Action Alternative. Terrestrial habitat could be similar or increased due to the  
29 flow patterns.

30 *Changes in Delta Habitat due to Changes in Water Quality*

31 Under Alternative 3, the freshwater interface would be similar to conditions under  
32 the No Action Alternative in all months in below normal, dry, and critical dry  
33 years; and from January through August in wet and above normal years. In the  
34 fall months in wet years, the X2 location would be 9 to 14 kilometers towards the  
35 east in September through December under Alternative 3 as compared to the No  
36 Action Alternative.

37 *Potential Effects on Special Status Species*

38 Higher Delta salinity under Alternative 3 as compared to the No Action  
39 Alternative would reduce habitat conditions for Bolander's Water Hemlock, Delta  
40 Button-celery, Delta Tule Pea, Mason's Lilaeopsis, Soft Birds-beak, Suisun  
41 Marsh Aster, Salt Marsh Harvest Mouse, and Suisun Shrew.

1        *Effects Related to Cross Delta Water Transfers*

2 Potential effects to terrestrial resources could be similar to those identified in a  
 3 recent environmental analysis conducted by Reclamation for long-term water  
 4 transfers from the Sacramento to San Joaquin valleys (Reclamation 2014d).  
 5 Potential effects to terrestrial resources were identified as changes in stream flows  
 6 due declining groundwater levels along streams due to the use of groundwater  
 7 substitution to provide transfer water. The analysis indicated that these potential  
 8 impacts would not be substantial due to the inclusion of a monitoring and  
 9 mitigation program.

10 Under Alternative 3, water could be transferred throughout the year without an  
 11 annual volumetric limit. Under the No Action Alternative, the timing of cross  
 12 Delta water transfers would be limited to July through September and include  
 13 annual volumetric limits, in accordance with the 2008 USFWS BO and 2009  
 14 NMFS BO. Overall, the potential for cross Delta water transfers would be greater  
 15 under Alternative 3 as compared to the No Action Alternative.

16    **10.4.3.4.2 Alternative 3 Compared to the Second Basis of Comparison**

17    *Trinity River Region*

18        *Changes in Rivers Downstream of CVP and SWP Reservoirs*

19 River flows in Trinity River downstream of Lewiston Dam in the critical period  
 20 for terrestrial resources of March through May would be similar under  
 21 Alternative 3 and the Second Basis of Comparison. Therefore, terrestrial  
 22 resources habitat conditions along the Trinity River and lower Klamath River  
 23 riparian corridors would be similar under Alternative 3 as compared to the Second  
 24 Basis of Comparison.

25    *Central Valley Region*

26        *Changes in Rivers Downstream of CVP and SWP Reservoirs*

27 Flows in the spring months would be similar in the Sacramento River at Keswick  
 28 and Freeport, Feather River downstream of Thermalito Complex, and American  
 29 River downstream of Nimbus Dam; and reduced flows in the Stanislaus River  
 30 downstream of Goodwin Dam (6 to 52 percent, depending upon water year type)  
 31 under Alternative 3 as compared to the Second Basis of Comparison. This  
 32 analysis does not include site specific evaluation of all terrestrial resources along  
 33 these riparian corridors. However, the changes in flows are indicative of the  
 34 potential for change in the terrestrial resources. Therefore, under Alternative 3 as  
 35 compared to the Second Basis of Comparison, the potential for similar terrestrial  
 36 resources habitat would occur along the Sacramento, American, and Feather  
 37 rivers; and the potential for reduced terrestrial resources would occur along the  
 38 Stanislaus River.

39 Monthly Clear Creek flows under Alternative 3 as compared to the Second Basis  
 40 of Comparison are identical under Alternative 3; therefore, terrestrial resources  
 41 habitat in the floodplains of lower Clear Creek would be similar under  
 42 Alternative 3 as compared to the Second Basis of Comparison.

1            *Potential Effects on Special Status Species*

2    Habitat changes along the riparian corridors related to changes in spring flows  
3    that support riparian vegetation recruitment would affect numerous bird species  
4    that use the riparian corridor, including Black Tern, Least Bell's Vireo, Least  
5    Bittern, Swainson's Hawk, Tricolored Blackbird, Western Yellow-billed Cuckoo,  
6    White-tailed Kite, Yellow Warbler, Ringtail, Western Pond Turtle, Valley  
7    Elderberry Longhorn Beetle, and Delta Button-celery. Potential adverse effects  
8    could occur to these species due to reduced flows in the spring months on the  
9    Stanislaus River.

10          *Changes in River and Delta Floodplains*

11    It is assumed that under Alternative 3 and the Second Basis of Comparison, the  
12    State of California would continue to implement flood management projects to  
13    reduce flood risks along the Sacramento and San Joaquin rivers and in the Delta  
14    with consideration for opportunities to restore or maintain the function of natural  
15    ecosystems. The related terrestrial habitat conditions that would occur due to  
16    implementation of the flood management projects would be the same under  
17    Alternative 3 and the Second Basis of Comparison.

18          *Changes in Flows over Fremont Weir into the Yolo Bypass*

19    Flows from the Sacramento River into the Yolo Bypass at Fremont Weir and  
20    associated terrestrial habitat would be similar under Alternative 3 as compared to  
21    the Second Basis of Comparison.

22          *Changes in Delta Habitat due to Changes in Water Quality*

23    Under Alternative 3, the freshwater-saltwater interface would be similar to  
24    conditions under the Second Basis of Comparison in all months and in all water  
25    year types.

26          *Potential Effects on Special Status Species*

27    Delta salinity under Alternative 3 as compared to the Second Basis of Comparison  
28    would result in similar habitat conditions for Bolander's Water Hemlock, Delta  
29    Button-celery, Delta Tule Pea, Mason's Lilaepsis, Soft Birds-beak, Suisun  
30    Marsh Aster, Salt Marsh Harvest Mouse, and Suisun Shrew.

31          *Effects Related to Cross Delta Water Transfers*

32    Potential effects to terrestrial resources could be similar to those identified in a  
33    recent environmental analysis conducted by Reclamation for long-term water  
34    transfers from the Sacramento to San Joaquin valleys (Reclamation 2014d).  
35    Potential effects to terrestrial resources were identified as changes in stream flows  
36    due declining groundwater levels along streams due to the use of groundwater  
37    substitution to provide transfer water. The analysis indicated that these potential  
38    impacts would not be substantial due to the inclusion of a monitoring and  
39    mitigation program.

40    Under Alternative 3 and the Second Basis of Comparison, water could be  
41    transferred throughout the year without an annual volumetric limit. Overall, the  
42    potential for cross Delta water transfers would be similar under Alternative 3 as  
43    compared to the Second Basis of Comparison.

1    **10.4.3.5   Alternative 4**

2    The CVP and SWP operations under Alternative 4 are identical to the CVP and  
3    SWP operations under the Second Basis of Comparison and Alternative 1.  
4    Alternative 4 also includes additional institutional requirements for development  
5    within the floodplain and floodways, including the following items.

- 6    • Compliance with Endangered Species Act in defining floodplain map  
7    revisions.
- 8    • Improvements in floodplain management criteria to support natural and  
9    beneficial functions.
- 10   • Prohibition of new development and substantial improvements to existing  
11   development within any designated floodway or within 170 feet of the  
12   ordinary high water line of any floodway.
- 13   • Modification of USACE requirements to remove vegetation along portions of  
14   the waterside of levees, as described in Section 10.4.3.1, No Action  
15   Alternative.

16   Alternative 4 is compared to the No Action Alternative and the Second Basis of  
17   Comparison.

18   **10.4.3.5.1   Alternative 4 Compared to the No Action Alternative**

19   These actions would not change CVP and SWP operations; and would only affect  
20   the Changes in River and Delta Floodplains. Therefore, changes in terrestrial  
21   resources due to changes in CVP and SWP under Alternative 4 as compared to the  
22   No Action Alternative would be the same as the impacts described in  
23   Section 10.4.3.2.1, Alternative 1 Compared to the No Action Alternative.

24    *Changes in River and Delta Floodplains*

25   It is assumed that under the No Action Alternative, the State of California would  
26   continue to implement flood management projects to reduce flood risks along the  
27   Sacramento and San Joaquin rivers and in the Delta with consideration for  
28   opportunities to restore or maintain the function of natural ecosystems. The  
29   USACE policies for vegetation on levees would be implemented; and by 2030,  
30   much of the vegetation along Delta channels would have been removed.

31   Under Alternative 4, implementation of institutional provisions would result in  
32   development of the floodplains and floodways, especially in the Delta, that would  
33   be similar to development under the No Action Alternative. Under the No Action  
34   Alternative, as described in Chapter 13, Land Use, development along major river  
35   corridors in the Central Valley would be limited by state regulations implemented  
36   by the Central Valley Flood Protection Board and the USACE. Within the Delta,  
37   the floodways are further regulated by the Delta Protection Commission and Delta  
38   Stewardship Council to preserve and protect the natural resources of the Delta;  
39   and prevent encroachment into Delta floodways. These regulations would  
40   prevent development within the Delta floodplains and floodways and in the  
41   Sacramento, Feather, American, and San Joaquin rivers corridors upstream of the  
42   Delta. Under Alternative 4, development would be prevented within 170 feet

1 from the ordinary high water line of any floodway. This setback area could  
2 provide opportunities to establish vegetative corridors.

3 Under Alternative 4 and the No Action Alternative, vegetation management along  
4 the Delta levees would include removal of all vegetation from the upper third of  
5 the waterside slope of the levee, the top of the levee, landside slope of the levee,  
6 and within 15 feet on the landside of the toe of the levee (“toe” is where the levee  
7 slope meets the ground surfaces). Under Alternative 4, vegetation could be  
8 maintained on the lower two-thirds of the waterside slope of the levee and within  
9 15 feet of the toe of the levee on the waterside along benches above the water  
10 surface. This would provide shaded riverine aquatic habitat and riparian  
11 vegetation along many of the Delta channels as compared to the No Action  
12 Alternative.

13 Overall, Alternative 4 would result in increased vegetation along the riparian  
14 corridors related to recruitment of riparian vegetation in the Delta watershed as  
15 compared to the No Action Alternative.

#### 16 **10.4.3.5.2 Alternative 4 Compared to the Second Basis of Comparison**

17 The changes in river and Delta floodplain actions would not change CVP and  
18 SWP operations which would be identical under Alternative 4 and under the  
19 Second Basis of Comparison.

##### 20 *Changes in River and Delta Floodplains*

21 It is assumed that under the Second Basis of Comparison, the State of California  
22 would continue to implement flood management projects to reduce flood risks  
23 along the Sacramento and San Joaquin rivers and in the Delta with consideration  
24 for opportunities to restore or maintain the function of natural ecosystems. The  
25 USACE policies for vegetation on levees would be implemented; and by 2030,  
26 much of the vegetation along Delta channels would have been removed.

27 Under Alternative 4, implementation of institutional provisions would result in  
28 development of the floodplains and floodways, especially in the Delta, that would  
29 be similar to development under the Second Basis of Comparison. Under the  
30 Second Basis of Comparison, as described in Chapter 13, Land Use, development  
31 along major river corridors in the Central Valley would be limited by state  
32 regulations implemented by the Central Valley Flood Protection Board and the  
33 USACE. Within the Delta, the floodways are further regulated by the Delta  
34 Protection Commission and Delta Stewardship Council to preserve and protect the  
35 natural resources of the Delta; and prevent encroachment into Delta floodways.  
36 These regulations would prevent development within the Delta floodplains and  
37 floodways and in the Sacramento, Feather, American, and San Joaquin rivers  
38 corridors upstream of the Delta. Under Alternative 4, development would be  
39 prevented within 170 feet from the ordinary high water line of any floodway.  
40 This setback area could provide opportunities to establish vegetative corridors.

41 Under Alternative 4 and the Second Basis of Comparison, vegetation  
42 management along the Delta levees would include removal of all vegetation from  
43 the upper third of the waterside slope of the levee, the top of the levee, landside

1 slope of the levee, and within 15 feet on the landside of the toe of the levee (“toe”  
 2 is where the levee slope meets the ground surfaces). Under Alternative 4,  
 3 vegetation could be maintained on the lower two-thirds of the waterside slope of  
 4 the levee and within 15 feet of the toe of the levee on the waterside along benches  
 5 above the water surface. This would provide shaded riverine aquatic habitat and  
 6 riparian vegetation along many of the Delta channels as compared to the Second  
 7 Basis of Comparison.

8 Overall, Alternative 4 would result in increased terrestrial resources along the  
 9 riparian corridors related to recruitment of riparian vegetation in the Delta  
 10 watershed as compared to the Second Basis of Comparison.

#### 11 **10.4.3.6 Alternative 5**

12 As described in Chapter 3, Description of Alternatives, CVP and SWP operations  
 13 under Alternative 5 are similar to the No Action Alternative with modified Old  
 14 and Middle River flow criteria and New Melones Reservoir operations. As  
 15 described in Chapter 4, Approach to Environmental Analysis, Alternative 5 is  
 16 compared to the No Action Alternative and the Second Basis of Comparison.

#### 17 **10.4.3.6.1 Alternative 5 Compared to the No Action Alternative**

##### 18 *Trinity River Region*

##### 19 *Changes in Rivers Downstream of CVP and SWP Reservoirs*

20 River flows in Trinity River downstream of Lewiston Dam in the critical period  
 21 for terrestrial resources of March through May would be similar under  
 22 Alternative 5 and the No Action Alternative. Therefore, terrestrial resources  
 23 habitat conditions along the Trinity River and lower Klamath River riparian  
 24 corridors would be similar under Alternative 5 as compared to the No  
 25 Action Alternative.

##### 26 *Central Valley Region*

##### 27 *Changes in Rivers Downstream of CVP and SWP Reservoirs*

28 Flows in the spring months would be similar in the Sacramento River at Keswick  
 29 and Freeport, Feather River downstream of Thermalito Complex, American River  
 30 downstream of Nimbus Dam; and flows in the Stanislaus River downstream of  
 31 Goodwin Dam would increase 22 to 40 percent in some spring months and 8 to  
 32 18 percent in other spring months, depending upon water year type under  
 33 Alternative 5 as compared to the No Action Alternative. This analysis does not  
 34 include site specific evaluation of all terrestrial resources along these riparian  
 35 corridors. However, the changes in flows are indicative of the potential for  
 36 change in the terrestrial resources. Therefore, under Alternative 5 as compared to  
 37 the No Action Alternative, the potential for similar or improved terrestrial  
 38 resources habitat would occur along the Sacramento, Feather, and American  
 39 rivers; and the potential for both increased and reduced terrestrial resources  
 40 habitat would occur along the Stanislaus River.

41 Monthly Clear Creek flows would be identical under Alternative 5 as compared to  
 42 the No Action Alternative; therefore, terrestrial resources habitat in the

1 floodplains of lower Clear Creek would be similar under Alternative 5 as  
2 compared to the Second Basis of Comparison.

3 *Potential Effects on Special Status Species*

4 Habitat changes along the riparian corridors related to changes in spring flows  
5 that support riparian vegetation recruitment would affect numerous bird species  
6 that use the riparian corridor, including Black Tern, Least Bell's Vireo, Least  
7 Bittern, Swainson's Hawk, Tricolored Blackbird, Western Yellow-billed Cuckoo,  
8 White-tailed Kite, Yellow Warbler, Ringtail, Western Pond Turtle, Valley  
9 Elderberry Longhorn Beetle, and Delta Button-celery. Potential adverse effects  
10 could occur to these species due to reduced flows in the spring months on the  
11 Stanislaus River.

12 *Changes in River and Delta Floodplains*

13 It is assumed that under Alternative 5 and the No Action Alternative, the State of  
14 California would continue to implement flood management projects to reduce  
15 flood risks along the Sacramento and San Joaquin rivers and in the Delta with  
16 consideration for opportunities to restore or maintain the function of natural  
17 ecosystems. The related terrestrial habitat conditions that would occur due to  
18 implementation of the flood management projects would be the same under  
19 Alternative 5 and the No Action Alternative.

20 *Changes in Flows over Fremont Weir into the Yolo Bypass*

21 Flows from the Sacramento River into the Yolo Bypass at Fremont Weir and  
22 associated terrestrial habitat would be similar under Alternative 5 as compared to  
23 the No Action Alternative.

24 *Changes in Delta Habitat due to Changes in Water Quality*

25 Under Alternative 5, the freshwater interface would be similar to conditions under  
26 the No Action Alternative in all months and in all water year types.

27 *Potential Effects on Special Status Species*

28 Similar Delta salinity under Alternative 5 as compared to the No Action  
29 Alternative would result in similar habitat conditions for Bolander's Water  
30 Hemlock, Delta Button-celery, Delta Tule Pea, Mason's Lilaeopsis, Soft Birds-  
31 beak, Suisun Marsh Aster, Salt Marsh Harvest Mouse, and Suisun Shrew.

32 *Effects Related to Cross Delta Water Transfers*

33 Potential effects to terrestrial resources could be similar to those identified in a  
34 recent environmental analysis conducted by Reclamation for long-term water  
35 transfers from the Sacramento to San Joaquin valleys (Reclamation 2014d).  
36 Potential effects to terrestrial resources were identified as changes in stream flows  
37 due declining groundwater levels along streams due to the use of groundwater  
38 substitution to provide transfer water. The analysis indicated that these potential  
39 impacts would not be substantial due to the inclusion of a monitoring and  
40 mitigation program.

41 Under Alternative 5 and the No Action Alternative, the timing of cross Delta  
42 water transfers would be limited to July through September and include annual

1 volumetric limits, in accordance with the 2008 USFWS BO and 2009 NMFS BO.  
 2 Overall, the potential for cross Delta water transfers would be similar under  
 3 Alternative 5 as compared to the No Action Alternative.

#### 4 **10.4.3.6.2 Alternative 5 Compared to the Second Basis of Comparison**

##### 5 *Trinity River Region*

##### 6 *Changes in Rivers Downstream of CVP and SWP Reservoirs*

7 River flows in Trinity River downstream of Lewiston Dam in the critical period  
 8 for terrestrial resources of March through May would be similar under  
 9 Alternative 5 and the Second Basis of Comparison. Therefore, terrestrial  
 10 resources habitat conditions along the Trinity River and lower Klamath River  
 11 riparian corridors would be similar under Alternative 5 as compared to the Second  
 12 Basis of Comparison.

##### 13 *Central Valley Region*

##### 14 *Changes in Rivers Downstream of CVP and SWP Reservoirs*

15 Flows in the spring months would be similar in the American River downstream  
 16 of Nimbus Dam; increased flows in the Stanislaus River downstream of Goodwin  
 17 Dam (over 100 percent); and reduced in the Sacramento River at Keswick and  
 18 Freeport and Feather River downstream of Thermalito Complex (8 to 13 percent  
 19 and 25 to 45 percent, respectively) under Alternative 5 as compared to the Second  
 20 Basis of Comparison. This analysis does not include site specific evaluation of all  
 21 terrestrial resources along these riparian corridors. However, the changes in flows  
 22 are indicative of the potential for change in the terrestrial resources. Therefore,  
 23 under Alternative 5 as compared to the Second Basis of Comparison, the potential  
 24 for similar or improved terrestrial resources habitat would occur along the  
 25 American and Stanislaus rivers; and the potential for reduced terrestrial resources  
 26 habitat would occur along the Sacramento and Feather rivers.

27 Monthly Clear Creek flows under Alternative 5 as compared to the Second Basis  
 28 of Comparison are identical except in May. In May, under Alternative 5, flows  
 29 are up to 40.7 percent higher than under the Second Basis of Comparison in  
 30 accordance with the 2009 NMFS BO. Terrestrial resources habitat in the  
 31 floodplains of lower Clear Creek would be improved under Alternative 5 as  
 32 compared to the Second Basis of Comparison.

##### 33 *Potential Effects on Special Status Species*

34 Habitat changes along the riparian corridors related to changes in spring flows  
 35 that support riparian vegetation recruitment would affect numerous bird species  
 36 that use the riparian corridor, including Black Tern, Least Bell's Vireo, Least  
 37 Bittern, Swainson's Hawk, Tricolored Blackbird, Western Yellow-billed Cuckoo,  
 38 White-tailed Kite, Yellow Warbler, Ringtail, Western Pond Turtle, Valley  
 39 Elderberry Longhorn Beetle, and Delta Button-celery. Potential adverse effects  
 40 could occur to these species due to reduced flows in the spring months on the  
 41 Sacramento and Feather rivers.

1            *Changes in River and Delta Floodplains*

2    It is assumed that under Alternative 5 and the Second Basis of Comparison, the  
3    State of California would continue to implement flood management projects to  
4    reduce flood risks along the Sacramento and San Joaquin rivers and in the Delta  
5    with consideration for opportunities to restore or maintain the function of natural  
6    ecosystems. The related terrestrial habitat conditions that would occur due to  
7    implementation of the flood management projects would be the same under  
8    Alternative 5 and the Second Basis of Comparison.

9            *Changes in Flows over Fremont Weir into the Yolo Bypass*

10   Flows from the Sacramento River into the Yolo Bypass at Fremont Weir would  
11   similar or lower (24 percent) under Alternative 5 as compared to the Second Basis  
12   of Comparison. The decrease in the extent of flow inundation in the Yolo Bypass  
13   could cause degradation of terrestrial habitat as compared to the Second Basis of  
14   Comparison.

15           *Changes in Delta Habitat due to Changes in Water Quality*

16   Under Alternative 5, the freshwater interface would be similar to conditions under  
17   the Second Basis of Comparison in all months in below normal, dry, and critical  
18   dry years; and from January through August in wet and above normal years. In  
19   the fall months in wet years, the X2 location would be 9 to 14 kilometers towards  
20   the west in September through December under Alternative 5 as compared to the  
21   Second Basis of Comparison.

22           *Potential Effects on Special Status Species*

23   Lower Delta salinity under Alternative 5 as compared to the Second Basis of  
24   Comparison would improve habitat conditions for Bolander's Water Hemlock,  
25   Delta Button-celery, Delta Tule Pea, Mason's Lilaepsis, Soft Birds-beak, Suisun  
26   Marsh Aster, Salt Marsh Harvest Mouse, and Suisun Shrew.

27           *Effects Related to Cross Delta Water Transfers*

28   Potential effects to terrestrial resources could be similar to those identified in a  
29   recent environmental analysis conducted by Reclamation for long-term water  
30   transfers from the Sacramento to San Joaquin valleys (Reclamation 2014d).  
31   Potential effects to terrestrial resources were identified as changes in stream flows  
32   due declining groundwater levels along streams due to the use of groundwater  
33   substitution to provide transfer water. The analysis indicated that these potential  
34   impacts would not be substantial due to the inclusion of a monitoring and  
35   mitigation program.

36   Under Alternative 5, the timing of cross Delta water transfers would be limited to  
37   July through September and include annual volumetric limits, in accordance with  
38   the 2008 USFWS BO and 2009 NMFS BO. Under Second Basis of Comparison,  
39   water could be transferred throughout the year without an annual volumetric limit.  
40   Overall, the potential for cross Delta water transfers would be less under  
41   Alternative 5 as compared to the Second Basis of Comparison.

1 **10.4.3.7 Summary of Environmental Consequences**

2 The results of the environmental consequences of implementation of  
 3 Alternatives 1 through 5 as compared to the No Action Alternative and the  
 4 Second Basis of Comparison are presented in Tables 10.2 and 10.3.

5 **Table 10.2 Comparison of Alternatives 1 through 5 to No Action Alternative**

Alternative	Potential Change	Consideration for Mitigation Measures
Alternative 1	<p>Similar or increased flows along Trinity, Sacramento, American, and Feather rivers in the spring to support riparian terrestrial habitat. Reduced flows along the Stanislaus River in the spring; therefore, could be reduced terrestrial habitat conditions.</p> <p>Similar terrestrial conditions in Yolo Bypass related to water that flows from the Sacramento River at the Fremont Weir.</p> <p>Increased salt water habitat in the western Delta in the fall months of wet and above normal water years could adversely affect species that have acclimated to freshwater conditions.</p>	<p>No mitigation measures identified at this time to reduce flow reduction impacts on the Stanislaus River, and adverse impacts due to increased salinity in the western Delta in the fall months of wet and above normal water year types.</p>
Alternative 2	No effects on terrestrial resources.	None needed
Alternative 3	<p>Similar or increased flows along Trinity, Sacramento, American, and Feather rivers in the spring to support riparian terrestrial habitat. Reduced flows along the Stanislaus River in the spring; therefore, could be reduced terrestrial habitat conditions.</p> <p>Similar or improved terrestrial conditions in Yolo Bypass related to water that flows from the Sacramento River at the Fremont Weir.</p> <p>Increased salt water habitat in the western Delta in the fall months of wet and above normal water years could adversely affect species that have acclimated to freshwater conditions.</p>	<p>No mitigation measures identified at this time to reduce flow reduction impacts on the Stanislaus River, and adverse impacts due to increased salinity in the western Delta in the fall months of wet and above normal water year types.</p>
Alternative 4	<p>Same effects as described for Alternative 1 compared to the No Action Alternative; except for increased terrestrial vegetation along the riparian corridors related to recruitment of riparian vegetation.</p>	<p>No mitigation measures identified at this time to reduce flow reduction impacts on the Stanislaus River, and adverse impacts due to increased salinity in the western Delta in the fall months of wet and above normal water year types.</p>

Chapter 10: Terrestrial Biological Resources

<b>Alternative</b>	<b>Potential Change</b>	<b>Consideration for Mitigation Measures</b>
Alternative 5	<p>Similar flows along Trinity, Sacramento, American, and Feather rivers in the spring to support riparian terrestrial habitat. Increased flows along the Stanislaus River in the spring; therefore, could be improved terrestrial habitat conditions.</p> <p>Similar terrestrial conditions in Yolo Bypass related to water that flows from the Sacramento River at the Fremont Weir.</p> <p>Similar freshwater and salt water habitats.</p>	None needed.

Note: Due to the limitations and uncertainty in the CalSim II monthly model and other analytical tools, incremental differences of 5 percent or less between alternatives and the No Action Alternative are considered to be “similar.”

1 **Table 10.3 Comparison of No Action Alternative and Alternatives 1 through 5 to**  
 2 **Second Basis of Comparison**

<b>Alternative</b>	<b>Potential Change</b>	<b>Consideration for Mitigation Measures</b>
No Action Alternative	<p>Similar or increased flows along Trinity, Sacramento, American, and Stanislaus rivers in the spring to support riparian terrestrial habitat. Reduced flows along the Feather River in the spring; therefore, could be reduced terrestrial habitat conditions.</p> <p>Similar terrestrial conditions in Yolo Bypass related to water that flows from the Sacramento River at the Fremont Weir.</p> <p>Increased freshwater habitat in the western Delta.</p>	Not considered for this comparison.
Alternative 1	No effects on terrestrial resources.	Not considered for this comparison.
Alternative 2	Same effects as described for No Action Alternative as compared to the Second Basis of Comparison.	Not considered for this comparison.
Alternative 3	<p>Similar or increased flows along Trinity, Sacramento, American, and Feather rivers in the spring to support riparian terrestrial habitat. Reduced flows along the Stanislaus River in the spring; therefore, could be reduced terrestrial habitat conditions.</p> <p>Similar terrestrial conditions in Yolo Bypass related to water that flows from the Sacramento River at the Fremont Weir.</p> <p>Similar freshwater and salt water habitats.</p>	Not considered for this comparison.
Alternative 4	Similar effects except for increased terrestrial vegetation along the riparian corridors related to recruitment of riparian vegetation.	Not considered for this comparison.

Alternative	Potential Change	Consideration for Mitigation Measures
Alternative 5	<p>Similar or increased flows along Trinity, American, and Stanislaus rivers in the spring to support riparian terrestrial habitat. Reduced flows along the Sacramento and Feather rivers in the spring; therefore, could be reduced terrestrial habitat conditions.</p> <p>Similar or decreased terrestrial conditions in Yolo Bypass related to similar or lower water that flows from the Sacramento River at the Fremont Weir.</p> <p>Increased freshwater habitat in the western Delta.</p>	Not considered for this comparison.

Note: Due to the limitations and uncertainty in the CalSim II monthly model and other analytical tools, incremental differences of 5 percent or less between alternatives and the No Action Alternative are considered to be “similar.”

1     **10.4.3.8 Potential Mitigation Measures**

2 Mitigation measures are included in EISs to avoid, minimize, rectify, reduce,  
3 eliminate, or compensate for adverse environmental effects of alternatives as  
4 compared to the No Action Alternative. Mitigation measures are not included in  
5 this EIS to address adverse impacts under the alternatives as compared to the  
6 Second Basis of Comparison because this analysis was included in this EIS for  
7 information purposes only.

8 Changes in CVP and SWP operations under Alternatives 1, 3, and 4 as compared  
9 to the No Action Alternative would result in adverse changes in terrestrial  
10 resources along Stanislaus River when spring flows are less than under the No  
11 Action Alternative; and when the salinity increases in the western Delta.

12 However, mitigation measures have not been identified at this time to reduce the  
13 adverse effects of flow reductions in the spring on the Stanislaus River and of  
14 increased salinity in the western Delta in the fall months of wet and above normal  
15 water year types under Alternatives 1, 3, and 4.

16     **10.4.3.9 Cumulative Effects Analysis**

17 As described in Chapter 3, the cumulative effects analysis considers projects,  
18 programs, and policies that are not speculative; and are based upon known or  
19 reasonably foreseeable long-range plans, regulations, operating agreements, or  
20 other information that establishes them as reasonably foreseeable.

21 The cumulative effects analysis Alternatives 1 through 5 for Terrestrial Resources  
22 are summarized in Table 10.4.

1 **Table 10.4 Summary of Cumulative Effects on Terrestrial Resources of Alternatives**  
 2 **1 through 5 as Compared to the No Action Alternative**

Scenarios	Actions	Cumulative Effects of Actions
<p>Past &amp; Present, and Future Actions Included in the No Action Alternative and in All Alternatives in Year 2030</p>	<p>Consistent with Affected Environment conditions plus:</p> <p>Actions in the 2008 USFWS BO and 2009 NMFS BO that would have occurred without implementation of the BOs, as described in Section 3.3.1.2 (of Chapter 3, Descriptions of Alternatives) including climate change and sea level rise</p> <p>Actions not included in the 2008 USFWS BO and 2009 NMFS BO that would have occurred without implementation of the BOs, as described in Section 3.3.1.3 (of Chapter 3, Descriptions of Alternatives):</p> <ul style="list-style-type: none"> <li>- Implementation of Federal and state policies and programs, including Clean Water Act (e.g., Total Maximum Daily Loads); Safe Drinking Water Act; Clean Air Act; and flood management programs</li> <li>- General plans for 2030.</li> <li>- Trinity River Restoration Program.</li> <li>- Central Valley Project Improvement Act programs</li> <li>- Folsom Dam Water Control Manual Update</li> <li>- FERC Relicensing for the Middle Fork of the American River Project</li> <li>- San Joaquin River Restoration Program</li> <li>- Contra Loma Recreation Resource Management Plan</li> <li>- San Luis Reservoir State Recreation Area Resource Management Plan/General Plan</li> </ul>	<p><u>These effects would be the same under all alternatives.</u></p> <p>Climate change and sea level rise and development under the general plans are anticipated to reduce carryover storage in reservoirs and changes in stream flow patterns in a manner that would change shoreline, riparian, and floodplain habitat.</p> <p>Other actions, including restoration projects, FERC relicensing projects, and some future projects to improve water quality and/or habitat are anticipated to improve shoreline, riparian, and floodplain habitat.</p>
<p>Future Actions Considered as Cumulative Effects Actions in All Alternatives in Year 2030</p>	<p>Actions as described in Section 3.5 (of Chapter 3, Descriptions of Alternatives):</p> <ul style="list-style-type: none"> <li>- Bay-Delta Water Quality Control Plan Update</li> <li>- FERC Relicensing Projects</li> <li>- Bay Delta Conservation Plan (including the California WaterFix alternative)</li> <li>- Shasta Lake Water Resources, North-of-the-Delta Offstream Storage, Los Vaqueros Reservoir Expansion Phase 2, and Upper San Joaquin River Basin Storage Investigations</li> <li>- El Dorado Water and Power Authority Supplemental Water Rights Project</li> <li>- Semitropic Water Storage District Delta Wetlands</li> <li>- North Bay Aqueduct Alternative Intake</li> <li>- Irrigated Lands Regulatory Program</li> </ul>	<p><u>These effects would be the same under all alternatives.</u></p> <p>Some of the future reasonably foreseeable actions to improve water quality and FERC Relicensing projects would improve shoreline, riparian, and floodplain habitat.</p> <p>Other future reasonably foreseeable actions, such as expanded or new reservoirs, would reduce some types of terrestrial habitat and increase other types of terrestrial habitat within the reservoir area.</p>

Scenarios	Actions	Cumulative Effects of Actions
<p>No Action Alternative with Associated Cumulative Effects Actions in Year 2030</p>	<p>Full implementation of the 2008 USFWS BO and 2009 NMFS BO</p> <p>Full implementation of the USACE vegetation standards for levees</p>	<p>Implementation of No Action Alternative with future reasonably foreseeable actions would result in changes in stream flows and levee vegetation policies that would result in changes to related terrestrial resources as compared to conditions prior to the BOs.</p> <p>Reduced riparian habitat along levees within the federally authorized levee systems that have maintenance agreements with the USACE as compared to recent conditions.</p>
<p>Alternative 1 with Associated Cumulative Effects Actions in Year 2030</p>	<p>No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant)</p> <p>Full implementation of the USACE vegetation standards for levees</p>	<p>Implementation of Alternative 1 with future reasonably foreseeable actions would result in changes in stream flows along the Stanislaus River in all water year types, and in salinity in the western Delta fall months of wet and above normal water year types that could result in adverse terrestrial conditions as compared to the No Action Alternative with the added actions.</p> <p>Similar riparian habitat along levees within the federally authorized levee systems that have maintenance agreements with the USACE as compared to the No Action Alternative with the added actions.</p>
<p>Alternative 2 with Associated Cumulative Effects Actions in Year 2030</p>	<p>Full implementation of the 2008 USFWS BO and 2009 NMFS BO CVP and SWP operational actions</p> <p>No implementation of structural improvements or other actions that require further study to develop a more detailed action description.</p> <p>Full implementation of the USACE vegetation standards for levees</p>	<p>Implementation of Alternative 2 with future reasonably foreseeable actions for terrestrial resources would be the same as for the No Action Alternative with the added actions.</p>

Chapter 10: Terrestrial Biological Resources

Scenarios	Actions	Cumulative Effects of Actions
<p>Alternative 3 with Associated Cumulative Effects Actions in Year 2030</p>	<p>No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant)</p> <p>Slight increase in positive Old and Middle River flows in the winter and spring months</p> <p>Full implementation of the USACE vegetation standards for levees</p>	<p>Implementation of Alternative 3 with future reasonably foreseeable action would result in changes in stream flows along the Stanislaus River in all water year types, and in salinity in the western Delta fall months of wet and above normal water year types that could result in adverse terrestrial conditions as compared to the No Action Alternative with the added actions.</p> <p>Similar riparian habitat along levees within the federally authorized levee systems that have maintenance agreements with the USACE as compared to the No Action Alternative with the added actions.</p>
<p>Alternative 4 with Associated Cumulative Effects Actions in Year 2030</p>	<p>No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant)</p> <p>No implementation of the USACE vegetation standards for levees</p>	<p>Implementation of Alternative 4 with future reasonably foreseeable actions would result in changes in stream flows along the Stanislaus River in all water year types, and in salinity in the western Delta fall months of wet and above normal water year types that could result in adverse terrestrial conditions as compared to the No Action Alternative with the added actions.</p> <p>Implementation of Alternative 4 also would result in increased riparian habitat along effected levees</p> <p>Increased riparian habitat along levees within the federally authorized levee systems that have maintenance agreements with the USACE as compared to the No Action Alternative with the added actions.</p>
<p>Alternative 5 with Associated Cumulative Effects Actions in Year 20530</p>	<p>Full implementation of the 2008 USFWS BO and 2009 NMFS BO</p> <p>Positive Old and Middle River flows and increased Delta outflow in spring months</p> <p>Full implementation of the USACE vegetation standards for levees</p>	<p>Implementation of Alternative 5 with future reasonably foreseeable actions for terrestrial resources would be similar as under the No Action Alternative with the added actions.</p>

**Chapter 11****1 Geology and Soils Resources****2 11.1 Introduction**

3 This chapter describes the geology and soils resources in the project area; and  
4 potential changes that could occur as a result of implementing the alternatives  
5 evaluated in this Environmental Impact Statement (EIS). Implementation of  
6 alternatives could affect geology and soils resources through potential changes in  
7 operation of the Central Valley Project (CVP) and State Water Project (SWP).

**8 11.2 Regulatory Environment and Compliance  
9 Requirements**

10 Potential actions that could be implemented under the alternatives evaluated in  
11 this EIS could affect reservoirs, streams, and lands served by CVP and SWP  
12 water supplies located on lands affected by seismic, landslide, and liquefaction  
13 hazards; subsidence; and unstable soils. Actions located on public agency lands;  
14 or implemented, funded, or approved by Federal and state agencies would need to  
15 be compliant with appropriate Federal and state agency policies and regulations,  
16 as summarized in Chapter 4, Approach to Environmental Analysis.

**17 11.3 Affected Environment**

18 This section describes the geological, regional seismic, and soils characteristics  
19 and subsidence potential that could be potentially affected by the implementation  
20 of the alternatives considered in this EIS. Changes in soils characteristics due to  
21 changes in CVP and SWP operations may occur in the Trinity River, Central  
22 Valley, San Francisco Bay Area, and Central Coast and Southern California  
23 regions. Geomorphic provinces in California are shown on Figure 11.1.

**24 11.3.1 Trinity River Region**

25 The Trinity River Region includes the area in Trinity County along the Trinity  
26 River from Trinity Lake to the confluence with the Klamath River; and in  
27 Humboldt and Del Norte counties along the Klamath River from the confluence  
28 with the Trinity River to the Pacific Ocean.

**29 11.3.1.1 Geologic Setting**

30 The Trinity River Region is located within the southwest area of the Klamath  
31 Mountains Geomorphic Province and the northwest area of the Coast Ranges  
32 Geomorphic Province, as defined by the U.S. Geological Survey (USGS)  
33 geomorphic provinces (CGS 2002a). The Klamath Mountains Geomorphic  
34 Province covers approximately 12,000 square miles of northwestern California

1 between the Coast Range on the west and the Cascade Range on the east and is  
2 considered to be a northern extension of the Sierra Nevada (CGS 2002a,  
3 Reclamation 1997).

4 The Klamath Mountains trend mostly northward. The province is primarily  
5 formed by the eastern Klamath Mountain belt, central metamorphic belt, the  
6 western Paleozoic and Triassic, and the western Jurassic belt. Rocks in this  
7 province include Paleozoic meta-sedimentary and meta-volcanic rocks, Mesozoic  
8 igneous rocks, Ordovician to Jurassic aged marine deposits in the Klamath belt,  
9 Paleozoic hornblend, mica schists and ultramafic rocks in the central  
10 metamorphic belt and slightly metamorphosed sedimentary and volcanic rocks in  
11 the western Jurassic, Paleozoic, and Triassic belt (Reclamation 1997).

12 The Trinity River watershed is located within the Klamath Mountain Geomorphic  
13 Province. Although the Trinity River watershed includes portions of both the  
14 Coast Ranges Province and the Klamath Mountains Province, the Trinity River  
15 riverbed is underlain by rocks of the Klamath Mountains Province  
16 (NCRWQCB et al. 2009). The Klamath Mountains Province formations  
17 generally dip towards the east and are exposed along the riverbed. Downstream  
18 of Lewiston Dam to Deadwood Creek, the area is underlain by the Eastern  
19 Klamath Terrane of the Klamath Mountains Province. The rocks in this area are  
20 primarily Copley Greenstone, metamorphosed volcanic sequence with  
21 intermediate and mafic volcanic rocks; and Bragdon formation, metamorphosed  
22 sedimentary formation with gneiss and amphibolite. Along the Trinity River  
23 between Lewiston Dam and Douglas City, outcrops of the Weaverville Formation  
24 occur. The Weaverville Formation, a series of nonmarine deposits, includes  
25 weakly consolidated mudstone, sandstone, and conglomerate of clays matrix and  
26 sparse beds of tuff. Downstream of Douglas City, the Trinity River is underlain  
27 by the Northfork and Hayfork terranes. The Northfork Terrane near Douglas City  
28 includes silicious tuff, chert, mafic volcanic rock, phyllite, and limestone  
29 sandstone and pebble conglomerate with serpentine intrusions. As the riverbed  
30 extends towards the Klamath River, the geologic formation extends into the  
31 Hayfork Terrane that consists of metamorphic and meta-volcanic rock. Terraces  
32 of sand and gravel from glacial erosion along the Trinity River flanks near  
33 Lewiston Dam contribute sediment into Trinity River.

34 The Trinity River flows into the Klamath River near Weitchpec. Downstream of  
35 the Weitchpec, the Klamath River flows to the Pacific Ocean through the Coast  
36 Ranges Geomorphic Province. The geology along the Klamath River in the Coast  
37 Ranges Geomorphic Province is characterized by the Eastern Belt of the  
38 Franciscan Complex and portions of the Central Belt of this complex. The  
39 Franciscan Complex consists of sandstone with some shale, chert, limestone,  
40 conglomerate, serpentine, and blueschist. The Eastern Belt is composed of schist  
41 and meta-sedimentary rocks with minor amounts of shale, chert, and  
42 conglomerate. The Central Belt is primarily composed of an argillite-matrix  
43 m $\acute{e}$ lange with slabs of greenstone, serpentine, graywacke, chert, high-grade  
44 metamorphics, and limestone.

1     **11.3.1.2 Regional Seismicity**

2     The areas along the Trinity River have been categorized as regions that are distant  
3     from known, active faults and generally would experience infrequent, low levels  
4     of shaking. However, infrequent earthquakes with stronger shaking could occur  
5     (CGS 2008). The closest areas to the Trinity River with known seismic active  
6     areas capable of producing an earthquake with a magnitude of 8.5 or greater are  
7     the northern San Andreas Fault Zone and the Cascadia Subduction Zone which  
8     are approximately 62 and 124 miles away, respectively (NCRWQCB et al. 2009).

9     The areas along the lower Klamath River downstream of the confluence with the  
10    Trinity River have a slightly higher potential for greater ground shaking than  
11    areas along the Trinity River (CGS 2008). The lower Klamath River is closer  
12    than the Trinity River to the offshore Cascadia Subduction Zone, which runs  
13    offshore of Humboldt and Del Norte counties and Oregon and Washington states.  
14    The Klamath River is approximately 30 to 40 miles from the Trinidad Fault,  
15    which extends from the area near Trinidad northwest to the coast near Trinidad  
16    State Beach. The Trinidad Fault is potentially capable of generating an  
17    earthquake with a moment magnitude of 7.3 (Humboldt County 2012).

18    The San Andreas Fault, under the Pacific Ocean in a northwestern direction from  
19    the Humboldt and Del Norte counties, is where the Pacific Plate moves towards  
20    the northwest relative to North America (Humboldt County 2012). The Cascadia  
21    Subduction Zone, located under the Pacific Ocean offshore from Cape Mendocino  
22    in southwest Humboldt County to Vancouver Island in British Columbia, has  
23    produced numerous earthquakes with magnitudes greater than 8. The Cascadia  
24    Subduction Zone is where the Gorda Plate and the associated Juan de Fuca Plate  
25    descend under the North American Plate.

26    **11.3.1.3 Regional Volcanic Potential**

27    Active centers of volcanic activity occur in the vicinity of Mount Shasta, located  
28    near the northeastern edge of the Trinity River Region. Mount Shasta is located  
29    about 45 miles north of Shasta Lake. Over the past 10,000 years, Mount Shasta  
30    erupted about once every 800 years. During the past 4,500 years, Mount Shasta  
31    erupted about once every 600 years with the most recent eruption in 1786. Lava  
32    flows, dome, and mudflows occurred during the eruptions (Reclamation 2013a).

33    **11.3.1.4 Soil Characteristics**

34    Soils in the southern region of the Klamath Mountain Geomorphic Province,  
35    where the Trinity River is located, are generally composed of gravelly loam with  
36    some alluvial areas with dredge tailings, river wash, and xerofluvents  
37    (NCRWQCB et al. 2009).

38    Soils along the lower Klamath River are generally composed of gravelly clay  
39    loam and gravelly sandy loam with sand and gravels within the alluvial deposits  
40    (DOI and DFG 2012). Alluvial deposits (river gravels) and dredge tailings  
41    provide important spawning habitat for salmon and steelhead.

42    **11.3.1.5 Subsidence**

43    Land subsidence is not a major occurrence in the Trinity River Region.

1 **11.3.2 Central Valley Region**

2 The Central Valley Region extends from above Shasta Lake to the Tehachapi  
3 Mountains, and includes the Sacramento Valley, San Joaquin Valley, Delta, and  
4 Suisun Marsh.

5 **11.3.2.1 Geologic Setting**

6 The Central Valley Region is bounded by the Klamath Mountains, Cascade  
7 Range, Great Valley, Coast Ranges, and Sierra Nevada geomorphic provinces  
8 (CGS 2002a).

9 The Klamath Mountains Geomorphic Province was described in subsection  
10 11.3.2, Trinity River Region. The Cascade Range Geomorphic Province consists  
11 of volcanic rocks of the Miocene to Pleistocene age. Several volcanoes within the  
12 Cascade Range Geomorphic Province and the Central Valley Region include  
13 Mount Shasta and Lassen Peak (Reclamation 2013a).

14 The Great Valley Geomorphic Province is an approximately 400 mile long,  
15 50 mile wide valley that extends from the northwest to the southeast between the  
16 Sierra Nevada and Coast Ranges geomorphic provinces. The faulted and folded  
17 sediments of the Coast Range extend eastward beneath most of the Central  
18 Valley; and the igneous and metamorphic rocks of the Sierra Nevada extend  
19 westward beneath the eastern Central Valley (Reclamation 1997). The valley  
20 floor is an alluvial plain of sediments that have been deposited since the Jurassic  
21 age (CGS 2002a). Below these deposits are Cretaceous Great Valley Sequence  
22 shales and sandstones and upper Jurassic bedrock of metamorphic and igneous  
23 rocks associated in the east with the Sierra Nevada and in the west with the Coast  
24 Ranges (DWR 2007). Sediments deposited along the submarine fans within the  
25 Great Valley Geomorphic Province include mudstones, sandstones, and  
26 conglomerates from the Klamath Mountains and Sierra Nevada geomorphic  
27 provinces.

28 The valley floor in the Great Valley Geomorphic Province includes dissected  
29 uplands, low alluvial fans and plains, river floodplains and channels, and overflow  
30 lands and lake bottoms. The dissected uplands include consolidated and  
31 unconsolidated Tertiary and Quaternary continental deposits. The alluvial fans  
32 along the western boundary include poorly sorted fine sand, silt, and clay. The  
33 alluvial fans along the eastern boundary consist of well sorted gravel and sand  
34 along major tributaries, and poorly sorted materials along intermittent streams.  
35 River and floodplains primarily consist of coarse sands and fine silts. The lake  
36 bottoms primarily occur in the in the southern San Joaquin Valley and composed  
37 of clay layers (Reclamation 1997).

38 The Sierra Nevada Geomorphic Province along the eastern boundary of the Great  
39 Valley Geomorphic Province is composed of pre-Tertiary igneous and  
40 metamorphic rocks. The Sierra Nevada Geomorphic Province is an uplifted fault  
41 block nearly 400 miles long with a series of metamorphic rock on the east and  
42 deep river cuts on a gentle slope, which disappears under sediments of the Central  
43 Valley on the west. Gold-bearing veins are present in the northwest trending

1 Mother Lode metamorphic bedrock. The province is bordered by the Cascade  
 2 Range on the north (Placer County 2007).

3 The Coast Ranges Geomorphic Province is composed of pre-Tertiary and Tertiary  
 4 semiconsolidated to consolidated marine sedimentary rocks. The Coast Ranges  
 5 Province is characterized by active uplift related to the San Andreas Fault and  
 6 plate boundary system tectonics. The province extends westward toward the  
 7 coastline and eastward toward the Great Valley Geomorphic Province. Rocks in  
 8 this region include mafic and ultramafic rock associated with the Coast Range  
 9 ophiolite, and Miocene volcanic rocks (Sonoma Volcanics) and marine and  
 10 terrestrial sedimentary from the Cretaceous to the Neogene period (Reclamation  
 11 et al. 2010).

### 12 **11.3.2.1.1 Sacramento Valley Geological Setting**

13 Major watersheds within the Sacramento Valley that could be affected by CVP  
 14 and SWP operations include the Sacramento River, Feather River, and the Lower  
 15 American River watersheds.

#### 16 *Sacramento River Watershed Geological Setting*

17 The Sacramento River flows from Shasta Lake to the Delta. The area along the  
 18 Sacramento River from Shasta Lake to downstream of Red Bluff is characterized  
 19 by loosely consolidated deposits of Pliocene and or Pleistocene age sandstone,  
 20 shale, and gravel. Downstream of Red Bluff to the Delta, the river flows through  
 21 Quaternary age alluvium, lake, playa, and terrace deposits that are unconsolidated  
 22 or poorly consolidated with outcrops of resistant, cemented alluvial units such as  
 23 the Modesto and Riverbank formations (CALFED 2000).

24 The active river channel maintains roughly constant dimensions as it migrates  
 25 across the floodplain within the limits of the meander belt which is constrained  
 26 only by outcrops of resistant units or artificial bank protection. Sediment loads in  
 27 the tributary streams and lower reaches of the Sacramento River occur due to past  
 28 and current land use practices on the tributary streams.

#### 29 *Feather River Watershed Geological Setting*

30 Portions of the Feather River watershed analyzed in this EIS extend from  
 31 Antelope Lake, Lake Davis, and Frenchman Lake upstream of Lake Oroville,  
 32 through Lake Oroville and the Thermalito Reservoir complex, and along the  
 33 Feather River to the confluence with the Sacramento River. The Yuba and Bear  
 34 rivers are the major tributaries to the Feather River downstream of Thermalito  
 35 Dam.

36 The Feather River watershed upstream of Thermalito Dam is located in the  
 37 Cascade Range Geomorphic Province and the metamorphic belt of the Sierra  
 38 Nevada Geomorphic Province. The lower watershed downstream of Thermalito  
 39 Dam is located in the Great Valley Geomorphic Province.

40 West of Lake Oroville, scattered sedimentary and volcanic deposits cover the  
 41 older bedrock, including (from oldest to youngest) the marine Chico formation  
 42 from the upper Cretaceous; the auriferous gravels and mostly non-marine Ione

1 formation of the Eocene Epoch; the extrusive volcanic Lovejoy basalt of the late  
2 Oligocene to early Miocene; and volcanic flows and volcanoclastic rocks of the  
3 Tuscan formation of the late Pliocene. Late Tertiary and Quaternary units in this  
4 area include alluvial terrace and fan deposits of the Plio-Pleistocene Laguna  
5 formation, the Riverbank and Modesto formations of the Pleistocene, riverbed  
6 sediments of the Holocene, and historical dredge and mine tailings from  
7 20th century mining activities (DWR 2007).

8 Alluvium deposits occur in active channels of the Feather, Bear, and Yuba rivers  
9 and tributary streams. These deposits contain clay, silt, sand, gravel, cobbles, and  
10 boulders in various layers and mixtures. Historical upstream hydraulic mining  
11 significantly increased the sediment covering the lower Feather River riverbed  
12 with a thick deposit of fine clay-rich, light yellow-brown slickens (i.e., powdery  
13 matter from a quartz mill or residue from hydraulic mining). More recent  
14 floodplain deposits cover these slickens in the banks along most of the Feather  
15 River. Cobbles and coarse gravel dredge tailings constitute most of the banks,  
16 slowing the bank erosion process between the cities of Oroville and Gridley. The  
17 river is wide and shallow, with low sinuosity and a sand bed between Honcut Creek  
18 and the mouth of the Feather River.

#### 19 *American River Watershed Geological Setting*

20 The Folsom Lake area is located within the Sierra Nevada and the Great Valley  
21 Geomorphic Province at the confluence of the North and South Forks of the  
22 American River. The Folsom Lake region primarily consists of rolling hills and  
23 upland plateaus between major river canyons. Three major geologic divisions  
24 within the area include a north-northwest trending belt of metamorphic rocks,  
25 granitic plutons that have intruded and obliterated some of the metamorphic belt,  
26 and deposits of volcanic ash, debris flows, and alluvial fans that are relatively flat  
27 lying. These deposits overlie older rocks (Reclamation et al. 2006).

28 Igneous, metamorphic, and sedimentary rock types are present within the Folsom  
29 Lake area. Major rock divisions are ultramafic intrusive rocks, metamorphic  
30 rocks, granodiorite intrusive rocks, and volcanic mud flows and alluvial deposits.  
31 Ultramafic rocks are most common on Flagstaff Mountain (Hill) on the Folsom  
32 Reservoir Peninsula located on a peninsula between the North Fork American  
33 River and South Fork American River. This rock division may contain trace  
34 amounts of serpentine minerals, chromite, minor nickel, talc, and naturally  
35 occurring asbestos (Reclamation et al. 2006).

36 Metamorphic rocks are found in a north-northwest trending band primarily on the  
37 eastern portions of the Folsom Lake area through most of the peninsula between  
38 the North Fork American River and South Fork American River (CGS 2010).

39 The Metamorphic rocks are mainly composed of Copperhill Volcanics  
40 (metamorphosed basaltic breccia, pillow lava, and ash) and Ultramafic rocks, two  
41 formations that may contain trace amounts of naturally occurring asbestos  
42 (Reclamation et al. 2006).

43 Granodiorite intrusive rocks occur in the Rocklin Pluton on both sides of Folsom  
44 Lake extending to Lake Natoma, and the Penryn Pluton upstream of the Rocklin

1 Pluton. Granodiorite intrusive rocks are composed of a coarse-grained crystalline  
2 matrix with slightly more iron and magnesium-bearing minerals and less quartz  
3 than granite. Of the granodiorite, the feldspar and hornblend are less resistant  
4 than the quartz crystals and easily weathers. When weathering occurs, the  
5 remaining feldspars separate from the quartz resulting in decomposed granite  
6 (Reclamation et al. 2006).

7 Volcanic mud flows and alluvial deposits are present downstream of Folsom Lake  
8 in the southwest corner of two major formations, the Mehrten and Laguna  
9 Formation. The Mehrten Formation contains volcanic conglomerate, sandstone,  
10 and siltstone; all derived from andesitic sources and portions are gravels deposited  
11 by ancestral streams. The Laguna Formation, deposited predominately as debris  
12 flow on the Mehrten Formation, is a sequence of gravel, sand and silt derived  
13 from granitic sources (Reclamation et al. 2006).

14 The area along the American River downstream of Folsom Lake and Nimbus  
15 Reservoir is located in the Great Valley Geomorphic Province. The area includes  
16 several geomorphic land types including dissected uplands and low foothills, low  
17 alluvial fans and plains, and river floodplains and channels. The dissected  
18 uplands consist of consolidated and unconsolidated continental deposits of  
19 Tertiary and Quaternary that have been slightly folded and faulted (Reclamation  
20 2005).

21 The alluvial fans and plains consist of unconsolidated continental deposits that  
22 extend from the edges of the valleys toward the valley floor (Reclamation 2005).  
23 The alluvial plains in the American River watershed include older Quaternary  
24 deposits (Sacramento County 2010). River flood plains and channels lay along  
25 the American River and smaller streams that flow into the Sacramento River  
26 south of the American River. Some floodplains are well-defined, where rivers are  
27 incised into their alluvial fans. These deposits tend to be coarse and sandy in the  
28 channels and finer and silty in the floodplains (Reclamation 2005; Sacramento  
29 County 2010).

### 30 **11.3.2.1.2 Delta Geological Setting**

31 The Delta is a northwest-trending structural basin, separating the primarily  
32 granitic rock of the Sierra Nevada from the primarily Franciscan Formation rock  
33 of the California Coast Range (CWDD 1981). The Delta is a basin within the  
34 Great Valley Geomorphic Province that is filled with a 3- to 6-mile thick layer of  
35 sediment deposited by streams originating in the Sierra Nevada, Coast Ranges,  
36 and South Cascade Range. Surficial geologic units throughout the Delta include  
37 peat and organic soils, alluvium, levee and channel deposits, dune sand deposits,  
38 older alluvium, and bedrock.

39 The historical delta at the confluence of the Sacramento River and San Joaquin  
40 River is referred to as the Sacramento–San Joaquin Delta, or Delta. The Delta is a  
41 flat-lying river delta that evolved at the inland margin of the San Francisco Bay  
42 Estuary as two overlapping and coalescing geomorphic units: the Sacramento  
43 River Delta to the north and the San Joaquin River Delta to the south. During  
44 large river-flood events, silts and sands were deposited adjacent to the river

1 channel, formed as a tidal marsh with few natural levees, and was dominated by  
2 tidal flows, allowing for landward accumulation of sediment behind the bedrock  
3 barrier at the Carquinez Strait. The sediment formed marshlands, which consisted  
4 of approximately 100 islands that were surrounded by hundreds of miles of  
5 channels. Generally, mineral soils formed near the channels during flood  
6 conditions and organic soils formed on marsh island interiors as plant residues  
7 accumulated faster than they could decompose (Weir 1949).

8 In the past, because the San Joaquin River Delta had less well-defined levees than  
9 under current conditions, sediments were deposited more uniformly across the  
10 floodplain during high water, creating an extensive tule marsh with many small,  
11 branching tributary channels. Because of the differential amounts of inorganic  
12 sediment supply, the peat of the San Joaquin River Delta grades northward into  
13 peaty mud and mud toward the natural levees and flood basins of the Sacramento  
14 River Delta (Atwater et al. 1980).

15 The Delta has experienced several cycles of deposition, nondeposition, and  
16 erosion that have resulted in the thick accumulation of poorly consolidated to  
17 unconsolidated sediments overlying the Cretaceous and Tertiary formations since  
18 late Quaternary time. Shlemon and Begg (1975) calculated that the peat and  
19 organic soils in the Delta began to form about 11,000 years ago during an episode  
20 of sea level rise. Tule marshes established on peat and organic soils in many  
21 portions of the Delta. Additional peat and other organic soils formed from  
22 repeated inundation and accumulation of sediment of the tules and other marsh  
23 vegetation.

#### 24 **11.3.2.1.3 Suisun Marsh Geological Setting**

25 The Suisun Marsh area is located within the Coast Ranges Geomorphic Province.  
26 The Suisun Marsh is bounded by the steep Coast Range on the west and by the  
27 rolling Montezuma Hills on the east. The Montezuma Hills consist of uplifted  
28 Pleistocene sedimentary layers with active Holocene age alluvium in stream  
29 drainages that divide the uplift. Low-lying flat areas of the marshland are covered  
30 by Holocene age Bay Mud deposits. The topographically higher central portions  
31 of Grizzly Island in the marshlands north of the Suisun Bay are formed by the  
32 Potrero Hills. These hills primarily consist of folded and faulted Eocene marine  
33 sedimentary rocks and late Pleistocene alluvial fan deposits  
34 (Reclamation et al. 2010).

#### 35 **11.3.2.1.4 San Joaquin Valley Geological Setting**

36 The San Joaquin Valley is located within the southern half of the Great Valley  
37 Geomorphic Province. The 250-mile-long and 50-to-60-mile-wide valley lies  
38 between the Coast Ranges on the west, the Sierra Nevada on the east, and extends  
39 northwestward to the Delta near the City of Stockton. The San Joaquin Valley is  
40 the southern portion of a large, northwest-to-southeast-trending asymmetric  
41 trough filled with up to six vertical miles of Jurassic to Holocene age sediments.  
42 The trough is primarily made up of Tertiary and Quaternary continental rocks,  
43 and deposits, which become separated by lacustrine, marsh, and floodplain

1 deposits of varying thicknesses. The continental deposits, which include the  
2 Mehrten, Kern River, Laguna, San Joaquin, Tulare, Tehama, Turlock, Riverbank,  
3 and Modesto formations, form the San Joaquin Valley aquifer (Ferriz 2001,  
4 Reclamation et al. 2011, Reclamation 2009).

5 Dissected uplands, low alluvial fans and plains, river floodplains and channels,  
6 and overflow lands and lake bottoms are the several geomorphic land types within  
7 the San Joaquin Valley. Dissected uplands consist of slightly folded and faulted,  
8 consolidated and unconsolidated, Tertiary and Quaternary age continental  
9 deposits. The alluvial fans and plains, which cover most of the valley floor,  
10 consist of unconsolidated continental deposits that extend from the edges of the  
11 valleys toward the valley floor. In general, alluvial sediments of the western and  
12 southern parts of the San Joaquin Valley tend to have lower permeability than  
13 deposits on the eastern side. River floodplains and channels lie along the major  
14 rivers and are well-defined where rivers incise their alluvial fans. Typically, these  
15 deposits are coarse and sandy in the channels and finer and silty in the floodplains  
16 (Reclamation et al. 2011).

17 Lake bottoms of overflow lands in the San Joaquin Valley include historic beds of  
18 Tulare Lake, Buena Vista Lake, and Kern Lake as well as other less defined areas  
19 in the valley trough. Near the valley trough, fluvial deposits of the east and west  
20 sides grade into fine-grained deposits. The largest lake deposits in the Central  
21 Valley are found beneath the Tulare Lake bed where up to 3,600 feet of lacustrine  
22 and marsh deposits form the Tulare Formation. This formation is composed of  
23 widespread clay layers, the most extensive being the Cocoran Clay member which  
24 also is found in the western and southern portions of the San Joaquin Valley. The  
25 Cocoran Clay member is a confining layer that separates the upper semi-confined  
26 to unconfined aquifer from the lower confined aquifer (Reclamation 1997).

27 The valley floor and foothills portions of the San Joaquin Valley and San Joaquin  
28 River area, and the Stanislaus River watershed could be affected by CVP and  
29 SWP operations. The Stanislaus River watershed originates in the Sierra Nevada  
30 Geomorphic Province, including the area with New Melones Reservoir, and  
31 extends into the Great Valley Geomorphic Province. New Melones Reservoir is  
32 oriented along a northwest trend that is produced by the Foothill Metamorphic  
33 Belt in the Sierra Nevada Geomorphic Province (Reclamation 2010). The area is  
34 underlain by Cenozoic sedimentary rocks which dip towards the southwest and  
35 overlies the Cretaceous sedimentary rocks of the Great Valley sequence and older  
36 metamorphic basement rocks along the edges of the Sierra Nevada. Tertiary  
37 sedimentary formations were deposited along the Stanislaus River from an area  
38 east of Knights Ferry to Oakdale (CGS 1977). The oldest Tertiary geologic unit,  
39 Eocene Ione Formation, primarily consists of quartz, sandstone, and interbedded  
40 kaolinitic clays with a maximum thickness of about 200 feet near Knights Ferry.  
41 The Oligocene-Miocene Valley Springs Formation of rhyolitic ash, sandy clay,  
42 and gravel deposits overlay the Ione Formation. Andestic flows, lahars, and  
43 volcanic sediments of the Mehrten Formation were deposited by volcanism,  
44 especially from Table Mountain (CGS 1977; Reclamation 2010). Three major  
45 alluvial fan deposits occurred along the Stanislaus River after deposition of the

1 Mehrten Formation, including the Turlock Lake Formation (between Orange  
2 Blossom Road and Oakdale) composed of fine sand and silt with some clay, sand,  
3 and gravel; Riverbank Formation (between Oakdale and Riverbank) composed of  
4 silt and clay; and Modesto Formation (between Riverbank and the confluence  
5 with the San Joaquin River) composed of sand, silt, clay, and gravel.

### 6 **11.3.2.2 Regional Seismicity**

7 Most of the areas in the Central Valley Region have been categorized as regions  
8 that are distant from known, active faults and generally would experience  
9 infrequent, low levels of shaking. However, infrequent earthquakes with stronger  
10 shaking could occur (CGS 2008). Areas within and adjacent to the Delta Region  
11 and along Interstate 5 in the San Joaquin Valley have a higher potential for  
12 stronger ground shaking due to their close proximity to the San Andreas Fault  
13 Zone.

14 The San Andreas Fault Zone is located to the west of the Central Valley Region  
15 along a 150-mile northwest-trending fault zone (Reclamation 2013a). The fault  
16 zone extends from the Gulf of California to Point Reyes where the fault extends  
17 under the Pacific Ocean (CGS 2006). The fault zone is the largest active fault in  
18 California (Reclamation 2005d).

19 In the Sacramento Valley, the major fault zones include the Battle Creek Fault  
20 Zone located to the east of the Sacramento River, Corning Fault that extends from  
21 Red Bluff to Artois parallel to the Corning Canal, Dunnigan Hills Fault located  
22 west of Interstate 5 near Dunnigan, Cleveland Fault located near Oroville, and  
23 Great Valley Fault system along the west side of the Sacramento Valley  
24 (Reclamation 2005a, Reclamation 2013a).

25 The Delta and Suisun Marsh are located in proximity to several major fault  
26 systems, including the San Andreas, Hayward-Rodgers Creek, Calaveras,  
27 Concord-Green Valley, and Greenville faults (DWR et al. 2013a). There are also  
28 many named and unnamed regional faults in the vicinity. The majority of seismic  
29 sources underlying the Delta and Suisun Marsh are “blind” thrusts that are not  
30 expected to rupture to the ground surface during an earthquake. The known blind  
31 thrusts in the Delta and Suisun Marsh area include the Midland, Montezuma Hills,  
32 Thornton Arch, Western Tracy, Midland, and Vernalis faults. Blind thrust faults  
33 with discernible geomorphic expression/trace located at the surface occur near the  
34 southwestern boundary of the Delta include Black Butte and Midway faults. Two  
35 surface crustal fault zones (e.g., areas with localized deformation of geologic  
36 features near the surface) are located within the Suisun Marsh, including the  
37 Pittsburgh-Kirby Hills fault which occurs along an alignment between Fairfield  
38 and Pittsburg, and Concord-Green Valley fault which crosses the western portion  
39 of the Suisun Marsh. The Cordelia fault is a surface crustal fault zone that occurs  
40 near the western boundary of the Suisun Marsh. Since 1800, no earthquakes with  
41 a magnitude greater than 5.0 have been recorded in the Delta or Suisun Marsh.

42 In the San Joaquin Valley, the eastern foothills are characterized by strike-slip  
43 faults that occur because the rock underlying the valley sediment is slowly  
44 moving downward relative to the Sierra Nevada Block to the east. An example of

1 this type of faulting is the Kings Canyon lineament which crosses the valley north  
 2 of Chowchilla and continues nearly to Death Valley in southeastern California  
 3 (Reclamation et al. 2011). Uplift and tilting of the Sierra Nevada block towards  
 4 the west and tilting of the Coast Ranges block to the east appear to be causing  
 5 gradual downward movement of the valley basement rock, in addition to  
 6 subsidence caused by aquifer compaction and soil compaction discussed below.  
 7 The San Joaquin Valley is bounded by the Stockton Fault of the Stockton Arch on  
 8 the north and the Bakersfield Arch on the south. Most of the fault zones in the  
 9 San Joaquin Valley do not appear to be active. However, numerous faults may  
 10 not be known until future seismic events, such as the Nunez reverse fault which  
 11 was not known until the 1983 Coalinga earthquake. In areas adjacent to the San  
 12 Joaquin Valley, the dominant active fault structure is the Great Valley blind thrust  
 13 associated with San Andreas Fault. Other active faults occur along the western  
 14 boundary of the San Joaquin Valley, including the Hayward, Concord-Green  
 15 Valley, Coast Ranges-Sierra Block boundary thrusts, Mount Diablo, Greenville,  
 16 Ortigalita, Rinconada, and Hosgri faults (Reclamation 2005d).

### 17 **11.3.2.3 Regional Volcanic Potential**

18 Active centers of volcanic activity occur in the vicinity of Mount Shasta and  
 19 Lassen Peak in the Central Valley Region. Mount Shasta is located about 45  
 20 miles north of Shasta Lake. Over the past 10,000 years, Mount Shasta erupted  
 21 about once every 800 years. During the past 4,500 years, Mount Shasta erupted  
 22 about once every 600 years with the last eruption in 1786. Lava flows, domes,  
 23 and mudflows occurred during the eruptions (Reclamation 2013a).

24 Lassen Peak, located about 50 miles southeast of Shasta Lake, is a cluster of  
 25 dacitic domes and vents that have formed during eruptions over the past  
 26 250,000 years. The last eruptions were relatively small and occurred between  
 27 1914 and 1917. The most recent large eruption occurred about 1,100 years ago.  
 28 Large eruptions appear to occur about once every 10,000 years (USGS 2000a).

### 29 **11.3.2.4 Soil Characteristics**

30 The Central Valley Region includes the Sacramento Valley, Delta, Suisun Marsh,  
 31 and San Joaquin Valley. The soil characteristics are similar in many aspects in  
 32 the Sacramento and San Joaquin valleys; therefore, the descriptions are combined  
 33 in the following sections.

#### 34 **11.3.2.4.1 Sacramento Valley and San Joaquin Valley Soil Characteristics**

35 The Sacramento Valley and San Joaquin Valley contain terrace land and upland  
 36 soils along the foothills; and alluvial, Aeolian, clayey, and saline/alkaline soils in  
 37 various locations along the valley floors (CALFED 2000, Reclamation 1997).

38 Foothills soils, located on well-drained, hilly-to-mountainous terrain along the  
 39 east side of the Central Valley, form through in-place weathering of the  
 40 underlying rock. Soils in the northern Sacramento Valley near Shasta Lake are  
 41 different than soils along other foothills in the Sacramento and San Joaquin  
 42 valleys. The soils near Shasta Lake are related to the geologic formations of the  
 43 Klamath Mountains, Cascade Ranges, and Sierra Nevada geomorphic provinces.

1 These soils are formed from weathered metavolcanic and metasedimentary rocks  
2 and from intrusions of granitic rocks, serpentine, and basalt. These soils are  
3 generally shallow with numerous areas of gravels, cobbles, and stones; therefore,  
4 they do not have high water-holding capacity or support topsoil productivity for  
5 vegetation (Reclamation 2013a). Soils derived from in-place weathering of  
6 granitic rock, referred to as decomposed granite, are coarse-grained, quartz-rich  
7 and erodible.

8 Upland soils along other foothills in the Sacramento and San Joaquin valleys are  
9 formed from the Sierra Nevada and Coast ranges geomorphic provinces. Along  
10 the western boundary of the Central Valley, the soils primarily are formed from  
11 sedimentary rocks. Along the eastern boundary of the Central Valley, the soils  
12 primarily are formed from igneous and metamorphic rock. The soils include  
13 serpentine soils (which include magnesium, nickel, cobalt, chromium, iron, and  
14 asbestos); sedimentary sandstones; shales; conglomerates; and sandy loam, loam,  
15 and clay loam soils above bedrock (Reclamation 1997, Reclamation et al. 2011,  
16 Reclamation 2013a, DWR 2007). Erosion occurs in the upland soils around  
17 reservoirs and rivers especially downgradient of urban development where paving  
18 increases the peak flow, volume, and velocity of precipitation runoff (GCI 2003).

19 Along the western boundary of the Sacramento Valley and the southeastern  
20 boundary of the San Joaquin Valley, the terrace lands include brownish loam, silt  
21 loam, and/or clayey loam soils. The soils are generally loamy along the  
22 Sacramento Valley terraces, and more clayey along the San Joaquin Valley  
23 terraces. Along the eastern boundaries of Sacramento and San Joaquin valleys,  
24 the terraces are primarily red silica-iron cemented hardpan and clays, sometimes  
25 with calcium carbonate (also known as “lime”) (DWR 2007, Reclamation 1997,  
26 Reclamation 2005b, Reclamation 2012).

27 Surface soils of the Central Valley include alluvial and Aeolian soils. The alluvial  
28 soils include calcic brown and noncalcic brown alluvial soils on deep alluvial fans  
29 and floodplains. The calcic brown soil is primarily made of calcium carbonate  
30 and alkaline (also known as “calcerous” soils). The noncalcic brown soils do not  
31 contain calcium carbonate and are either slightly acidic or neutral in chemical  
32 properties. In the western San Joaquin Valley, light colored calcerous soils occur  
33 with less organic matter than the brown soils (Reclamation 1997).

34 Basin soils occur in the San Joaquin Valley and portions of the Delta. These soils  
35 include organic soils, imperfectly drained soils, and saline alkali soils. The  
36 organic soils are typically dark, acidic, high in organic matter, and generally  
37 include peat. The organic soils occur in the Delta, as discussed below, and along  
38 the lower San Joaquin River adjacent to the Delta. The poorly drained soils  
39 contain dark clays and occur in areas with high groundwater in the San Joaquin  
40 Valley trough and as lake bed deposits (Reclamation et al. 2011). One of the  
41 most substantial stratigraphic features of the San Joaquin Valley and a major  
42 aquitard is the Corcoran Clay, located in the western and central valley  
43 (Galloway et al. 1999). The western boundary of the Corcoran Clay is generally  
44 located along the Delta-Mendota Canal and California Aqueduct (as described in  
45 Chapter 5, Surface Water Resources and Water Supply). The Corcoran Clay

1 generally extends from Mendota Pool area through the center of the valley to the  
 2 Tehachapi Mountains. The depth to the Corcoran Clay varies from 160 feet under  
 3 the Tulare Lake bed to less than a foot near the western edge of the Central  
 4 Valley. The Corcoran Clay comprised of numerous aquitards and coarser  
 5 interbeds.

6 Selenium salts and other salts occur naturally in the western and central San  
 7 Joaquin Valley soils that are derived from marine sedimentary rocks of the Coast  
 8 Ranges. Salts are leached from the soils by applied pre-irrigation and irrigation  
 9 water and collected by a series of drains. The drains also reduce high  
 10 groundwater elevations in areas with shallow clay soils. Reclamation and other  
 11 agencies are implementing programs to reduce salinity issues in the San Joaquin  
 12 Valley that will convey and dispose of drainage water in a manner that would  
 13 protect the surface water and groundwater resources (Reclamation et al. 2011).  
 14 As described in Chapter 12, Agricultural Resources, many portions of the western  
 15 and central San Joaquin Valley are no longer supporting irrigated crops or are  
 16 experiencing low crop yields due to the saline soils.

17 Soils in the eastern San Joaquin Valley come from the Sierra Nevada and contain  
 18 low levels of salt and selenium. Most soils in the western and southern San  
 19 Joaquin Valley are formed from Coast Range marine sediments, and contain  
 20 higher concentrations of salts as well as selenium and molybdenum. Soluble  
 21 selenium moves from soils into drainage water and groundwater, especially  
 22 during agricultural operations to leach salts from the soils. As described in  
 23 Chapter 3, Description of Alternatives, Reclamation and other agencies are  
 24 implementing programs to reduce the discharge of selenium from the San Joaquin  
 25 Valley into receiving waters (Reclamation 2005d, Reclamation et al. 2011,  
 26 Reclamation 2009). Additional information related to concerns with salinity and  
 27 selenium in the San Joaquin Valley is presented in Chapter 6, Surface Water  
 28 Quality, and Chapter 12, Agricultural Resources.

29 Soil wind erosion is related to soil erodibility, wind speeds, soil moisture, surface  
 30 roughness, and vegetative cover. Aeolian soils are more susceptible to wind  
 31 erosion than alluvial soils. Non-irrigated soils that have been disturbed by  
 32 cultivation or other activities throughout the Central Valley are more susceptible  
 33 to wind erosion and subsequent blowing dust than soils with more soil moisture.  
 34 Dust from eroding soils can create hazards due to soil composition (such as  
 35 naturally-occurring asbestos), allergic reactions to dust, adverse impacts to plants  
 36 due to dust, and increased risk of valley fever (as discussed in Chapter 18, Public  
 37 Health) (Reclamation 2005d).

#### 38 **11.3.2.4.2 Delta Soil Characteristics**

39 Soils in the Delta include organic and/or highly organic mineral soils; deltaic soils  
 40 along the Sacramento and San Joaquin rivers; basin rim soils; floodplain and  
 41 stream terrace soils; valley alluvial and low terrace soils; and upland and high  
 42 terrace soils (Reclamation 1997). Basin, deltaic, and organic soils occupy the  
 43 lowest elevation ranges and are often protected by levees. In many areas of the

1 western Delta, the soils contain substantial organic matter and are classified as  
2 peat or muck.

3 Basin rim soils are found along the eastern edges (rims) of the Delta, and are  
4 generally moderately deep or deep mineral soils that are poorly drained to well-  
5 drained and have fine textures in surface horizons. Some areas contain soils with  
6 a hardpan layer in the subsurface (SCS 1992, 1993). Floodplain and stream  
7 terrace soils are mineral soils adjacent to the Sacramento and San Joaquin rivers  
8 and other major tributaries. These soils are typically deep and stratified, with  
9 relatively poor drainage and fine textures. Valley fill, alluvial fan, and low terrace  
10 soils are typically very deep with variable texture and ability to transmit water  
11 ranging from somewhat poorly drained fine sandy loams and silty clay loams to  
12 well-drained silt loams and silty clay loams. Upland and high terrace soils are  
13 generally well-drained ranging in texture from loams to clays and are primarily  
14 formed in material weathered from sandstone, shale, and siltstone, and can occur  
15 on dissected terraces or on mountainous uplands.

16 Soils within the Yolo Bypass area range from clays to silty clay loams and  
17 alluvial soils (CALFED 2001, DFG et al. 2008). The higher clay content soils  
18 occur in the western portion of the basin north of Interstate 80 and in the eastern  
19 portion of the basin south of Interstate 80. The silty clay loams and alluvial soils  
20 occur in the western portion of the basin south of Interstate 80, including soils  
21 within the Yolo Bypass Wildlife Area.

22 Soil erosion by rainfall or flowing water occurs when raindrops detach soil  
23 particles or when flowing water erodes and transports soil material. Sandy  
24 alluvial soils, silty lacustrine soil, and highly organic soil are erodible. Organic  
25 soil (peat) in the Delta is also susceptible to wind erosion (deflation). Clay soils  
26 are erosion resistant.

#### 27 **11.3.2.4.3 Suisun Marsh Soil Characteristics**

28 Soil within the Suisun Bay include the Joice muck, Suisun peaty muck, and  
29 Tamba mucky clay; Reyes silty clay; and Valdez loam (SCS 1977a, Reclamation  
30 et al. 2010). The Joice muck generally is poorly drained organic soils in saline  
31 water areas interspersed with fine-grain sediment. Suisun peaty muck is formed  
32 from dark colored organic soils and plant materials with high permeability. These  
33 soils are generally located in areas with shallow surface water and groundwater;  
34 therefore, surface water tends to accumulate on the surface. Tamba mucky clay  
35 also are poorly drained organic soils formed from alluvial soils and plant  
36 materials that overlays mucky clays. Reyes silty clays are poorly drained soils  
37 formed from alluvium. The upper layers of the silty clays are acidic and saline.  
38 The lower layers are alkaline that become acidic when exposed to air, especially  
39 under wetting-drying conditions in tidal areas. Valdez loam soils are poorly  
40 drained soils formed on alluvial fans.

41 Suisun Marsh soils have a low susceptibility to water and wind erosion  
42 (SCS 1977a, Reclamation et al. 2010).

### 1 **11.3.2.5 Subsidence**

2 Land subsidence occurs for different reasons throughout the Central Valley as  
3 described in the following sections.

#### 4 **11.3.2.5.1 Sacramento and San Joaquin Valley Subsidence**

5 Land subsidence in the Sacramento Valley primarily occurs due to aquifer-system  
6 compaction as groundwater elevations decline; weathering of underlying of some-  
7 types of bedrock, such as limestone; decomposition of organic matter; and natural  
8 compaction of soils (Reclamation 2013a). Historic subsidence of the Sacramento  
9 Valley has been far less than that observed in the San Joaquin Valley. For  
10 example, the range of recent historic subsidence in the Sacramento Valley is  
11 generally less than 10 feet. Historical subsidence in the San Joaquin Valley has  
12 caused changes in land elevations of more than 30 feet.

13 In the 1970s, land subsidence exceeded 1 foot near Zamora; however, additional  
14 subsidence has not been reported since 1973 (Reclamation 2013a). Subsidence  
15 has been reported of two feet near Davis and three to four feet over the last  
16 several decades in the areas north of Woodland and east of Davis and Woodland  
17 (Davis 2007).

18 San Joaquin Valley subsidence primarily occurs when groundwater elevations  
19 decline which reduces water pressure in the soils and results in compressed clay  
20 lenses and subsided land elevations. Other factors that may influence the rate of  
21 subsidence in the San Joaquin Valley is the Sierran uplift, sediment loading and  
22 compressional down-warping or thrust loading from the Coast Ranges, and near  
23 surface compaction (Reclamation et al. 2011). Some of the first reports of land  
24 subsidence in the San Joaquin Valley occurred in 1935 in the area near Delano  
25 (Galloway et al. 1999). By the late 1960s, San Joaquin Valley subsidence had  
26 occurred over 5,212 square miles, or almost 50 percent of the San Joaquin Valley  
27 (Reclamation 2005d). During that period, some areas subsided over 33 vertical  
28 feet since the late 1880s. The rate of subsidence reduced initially following  
29 implementation of CVP and SWP water supplies in the San Joaquin Valley during  
30 the 1970s and 1980s. The rate of subsidence for the next twenty years appeared  
31 to continue at a rate of 0.008 to 0.016 inches/year in recent years (Reclamation et  
32 al. 2011). However, the amount of water available for irrigation from the CVP  
33 and SWP has declined more than 20 to 30 percent since the early 1980s due to  
34 hydrologic, regulatory, and operational concerns, as described in Chapter 1,  
35 Introduction. Due to the reduction in the availability of CVP and SWP water  
36 supplies, many water users have increased groundwater withdrawal. A recent  
37 study by the USGS of subsidence along the CVP Delta-Mendota Canal  
38 (USGS 2013b) reported that in areas where groundwater levels fluctuated  
39 consistently on a seasonal basis but were stable on a long-term basis, the land  
40 elevations also were relatively stable. Subsidence occurred in portions of the  
41 San Joaquin Valley where groundwater elevations below the Corcoran clay and in  
42 the shallow groundwater declined on a long-term basis between 2003 and 2010.  
43 The highest subsidence rates occurred along the Delta Mendota Canal between  
44 Merced and Mendota with subsidence of 0.8 inches to 21 inches between 2003  
45 and 2010.

1 Shallow subsidence, or hydrocompaction, occurs when low density, relatively  
2 dry, fine-grained sediments soften and collapse upon wetting. Historically,  
3 hydrocompaction has been most common along the western margin of the San  
4 Joaquin Valley (Reclamation 2005c). In the southern San Joaquin Valley,  
5 extraction of oil also can result in compaction. Changes in elevation, both  
6 subsidence and uplift, occurred near Coalinga following the 1983 Coalinga  
7 earthquake with uplift up to 1.6 feet and subsidence of 2 inches.

#### 8 **11.3.2.5.2 Delta and Suisun Marsh Subsidence**

9 Land subsidence on the islands in the central and western Delta and Suisun Marsh  
10 may be caused by the elimination of tidal inundation that formed the islands  
11 through sediment deposition and transport, and the oxidation and decay of plant  
12 materials that would compact to form soils. Following construction of levees,  
13 subsidence initially occurred through the mechanical settling of peat as the soil  
14 dried; and then, the dried peat and other soils shrunk (Reclamation et al. 2013,  
15 Drexler et al. 2009). Agricultural burning of peat (which has been discontinued),  
16 wind erosion, oxidation, and leaching of organic material. The rate of subsidence  
17 has declined from a maximum of 1.1 to 4.6 inches/year in the 1950s to less than  
18 0.2 to 1.2 inches/year in the western Delta (Drexler et al. 2009, Rojstaczer et al.  
19 1991). Many of the islands in the western and central Delta have subsided to  
20 elevations that are 10 to nearly 55 feet below sea level (USGS 2000b, Deverel and  
21 Leighton 2010).

22 Recently, the California Department of Water Resources has implemented several  
23 projects to reverse subsidence. The 274-acre Mayberry Farms Duck Club  
24 Subsidence Reversal Project on Sherman Island includes creation of emergent  
25 wetlands ponds and channels through excavation of peat soils, improving of water  
26 movement, and waterfowl habitat. The facility was constructed in 2010 and is  
27 being monitored to determine the effectiveness of subsidence reversal, methyl  
28 mercury management, and carbon sequestration (DWR 2013). The Department of  
29 Water Resources and USGS implemented wetlands restoration for about 15 acres  
30 on Twitchell Island in 1997 (DWR et al. 2013b) to encourage tule and cattail  
31 growth. After the growing season, the decomposed plant material accumulates  
32 and increases the land elevation. Since 1997, elevations have increased at a rate  
33 of 1.3 to 2.2 inches/year.

#### 34 **11.3.3 San Francisco Bay Area Region**

35 The San Francisco Bay Area Region includes portions of Contra Costa, Alameda,  
36 Santa Clara, San Benito, and Napa counties that are within the CVP and SWP  
37 service areas. Portions of Napa County are within the SWP service area that use  
38 water diverted from Barker Slough in the Sacramento River watershed for  
39 portions of Solano and Napa counties. Solano County was discussed under the  
40 Delta area of the Central Valley Region. Napa County is described under the  
41 San Francisco Bay Area Region.

### 1 **11.3.3.1 Geologic Setting**

2 The San Francisco Bay Area Region primarily is located within the Coast Ranges  
3 Geomorphic Province. Eastern Contra Costa and Alameda counties are located in  
4 the Great Valley Geomorphic Province. The Coast Ranges and Great Valley  
5 geomorphic provinces were described in Section 11.3.2, Central Valley Region.  
6 San Francisco Bay is a structural trough formed as a gap in the Coast Range  
7 down-dropped to allow the Sacramento, San Joaquin, Napa, Guadalupe, and  
8 Coyote Rivers to flow into the Pacific Ocean. When the polar ice caps melted  
9 10,000 to 25,000 years ago the ocean filled the inland valleys of the trough and  
10 formed San Francisco Bay, San Pablo Bay, and Suisun Bay (CALFED 2000).  
11 Initially, alluvial sands, silts, and clays filled the bays to form Bay Mud along the  
12 shoreline areas. Sedimentation patterns have changed over the past 150 years due  
13 to development of upstream areas of the watersheds which changed sedimentation  
14 and hydraulic flow patterns, hydraulic mining, and formation of levees and dams.

15 The San Francisco Bay Area is formed from the Salinian block located west of the  
16 San Andreas Fault; Mesozoic Franciscan complex located between the San  
17 Andreas and Hayward faults; and the Great Valley sequence located to the east of  
18 Hayward Fault (WTA 2003). The Salinian block generally is composed of  
19 granitic plutonic rocks probably from the Sierra Nevada Batholith that was  
20 displaced due to movement along the San Andreas Fault. The Franciscan  
21 complex includes deep marine sandstone and shale formed from oceanic crust  
22 with chert and limestone. The Great Valley sequence primarily includes marine  
23 sedimentary rocks.

### 24 **11.3.3.2 Regional Seismicity**

25 Large earthquakes have occurred in the San Francisco Bay Area Region along the  
26 San Andreas, Hayward, Calaveras, Greenville, Antioch, Concord-Green Valley,  
27 Midway, Midland, and Black Butte fault zones over the past 10,000 years. The  
28 San Francisco earthquake of 1906 took place as the result of movement along the  
29 San Andreas Fault. The San Andreas Fault remains active, as does the Hayward  
30 Fault, based on evidence of slippage along both (CALFED 2000).

### 31 **11.3.3.3 Soil Characteristics**

32 The San Francisco Bay Area Region soils include basin floor/basin rim,  
33 floodplain/valley land, terrace, foothill, and mountain soils (CALFED 2000).  
34 Basin floor/basin rim soils are organic-rich saline soils and poorly drained clays,  
35 clay loams, silty clay loams, and muck along the San Francisco Bay shoreline  
36 (SCS 1977b, 1981a; CALFED 2000). Well-drained sands and loamy sands and  
37 poorly-drained silty loams, clay loams, and clays occur on gently sloping alluvial  
38 fans of the San Francisco Bay Area Region that surround the floodplain and  
39 valley lands. Drained loams, silty loams, silty clay loams, and clay loams  
40 interbedded with sedimentary rock and some igneous rock occur in the foothills.  
41 Terrace loams are located along the southeastern edge of the San Francisco Bay  
42 Area Region above the valley land.

1     **11.3.3.4 Subsidence**

2 Subsidence in the San Francisco Bay Area Region primarily occurs in the Santa  
3 Clara Valley of Santa Clara County. The Santa Clara Valley is characterized by a  
4 groundwater aquifer with layers of non-consolidated porous soils interspersed  
5 with clay lenses. Historically, when the groundwater aquifer was in overdraft, the  
6 water pressure in the soils declined which resulted in compressed clay lenses and  
7 subsided land elevations. Between 1940 and 1970, soils near San Francisco Bay  
8 declined to elevations below sea level (SCVWD 2000). Under these conditions,  
9 salt water intrusion and tidal flooding occurred in the tributary streams of  
10 Guadalupe River and Coyote Creek. As of 2000, the land elevation in downtown  
11 San Jose subsided 13 feet since 1915. In 1951, water deliveries from San  
12 Francisco Water Department were initiated (Ingebritsen et al. 1999). In 1965,  
13 SWP deliveries were initiated in Santa Clara County. CVP water deliveries were  
14 initiated in 1987. The CVP and SWP water supplies are used to reduce  
15 groundwater withdrawals when groundwater elevations are low to allow natural  
16 recharge from local surface waters. The CVP and SWP also are used to directly  
17 recharge the groundwater through spreading basins in Santa Clara Valley.

18     **11.3.3.5 Central Coast and Southern California Regions**

19 The Central Coast Region includes portions of San Luis Obispo and Santa  
20 Barbara counties served by the SWP. The Southern California Region includes  
21 portions of Ventura, Los Angeles, Orange, San Diego, Riverside, and San  
22 Bernardino counties served by the SWP.

23 As described in Chapter 4, Approach to Environmental Analysis, the Southern  
24 California Region includes areas affected by operations of the SWP, including the  
25 Coachella Valley in Riverside County. The Coachella Valley Water District  
26 receives water under a SWP entitlement contract; however, SWP water cannot be  
27 conveyed directly to the Coachella Valley due to lack of conveyance facilities.  
28 Therefore, Coachella Valley Water District receives water from the Colorado  
29 River through an exchange agreement with the Metropolitan Water District of  
30 Southern California, as described in Chapter 5, Surface Water Resources and  
31 Water Supplies. The Imperial Valley, located to the southeast of the Southern  
32 California Region, receives irrigation water from the Colorado River through  
33 Reclamation canals; and does not use CVP or SWP water.

34     **11.3.3.6 Geologic Setting**

35 The Central Coast and Southern California Regions are located in the Coast  
36 Ranges, Transverse Ranges, Peninsular Ranges, Colorado Desert, and Mojave  
37 Desert geomorphic provinces (CGS 2002a).

38 The Central Coast Region includes portions of San Luis Obispo and Santa  
39 Barbara counties that use SWP water supplies. These areas are located within the  
40 Coast Ranges and Transverse Ranges geomorphic provinces. The Coast Ranges  
41 Geomorphic Province was described in Section 11.3.2, Central Valley Region.  
42 The Transverse Ranges Geomorphic Province consists of deeply folded and  
43 faulted sedimentary rocks (CGS 2002a, SBCAG 2013). Bedrock along the stream  
44 channels, coastal terraces, and coastal lowlands is overlain by alluvial and terrace

1 deposits; and, in some area, ancient sand dunes. The geomorphic province is  
2 being uplifted at the southern border along San Andreas Fault and compressed at  
3 the northern border along the Coast Ranges Geomorphic Province. Therefore, the  
4 geologic structure of the ridges and valleys are oriented along an east-west  
5 orientation, or in a “transverse” orientation, as compared to the north-south  
6 orientation of the Coast Range.

7 The Southern California Region includes portions of Ventura, Los Angeles,  
8 Orange, San Diego, Riverside, and San Bernardino counties that use SWP water  
9 supplies. These areas are located within the Transverse Ranges, Peninsular  
10 Ranges, Mojave Desert, and Colorado Desert geomorphic provinces. The  
11 Transverse Ranges Geomorphic Province includes Ventura County and portions  
12 of Los Angeles, San Bernardino, and Riverside counties. The Colorado Desert  
13 Geomorphic Province is also known as the Salton Trough where the Pacific and  
14 North American plants are separating.

15 The Peninsular Ranges Geomorphic Province is composed of granitic rock with  
16 metamorphic rocks (CGS 2002a, SCAG 2011, San Diego County 2011). The  
17 geologic structure is similar to the geology of the Sierra Nevada Geomorphic  
18 Province. The faulting of this geomorphic province has resulted in northwest  
19 trending valleys and ridges that extend into the Pacific Ocean to form the Santa  
20 Catalina, Santa Barbara, San Clemente, and San Nicolas islands. The Peninsular  
21 Ranges Geomorphic Province includes Orange County and portions of southern  
22 Los Angeles County, western San Diego County, northwestern San Bernardino  
23 County, and northern Riverside County (including the northern portion of the  
24 Coachella Valley).

25 The Mojave Desert Geomorphic Province is located between the Garlock Fault  
26 along the southern boundary of the Sierra Nevada Geomorphic Province and the  
27 San Andreas Fault (CGS 2002a, SCAG 2011, RCIP 2000). This geomorphic  
28 province includes extensive alluvial basins with non-marine sediments from the  
29 surrounding mountains and foothills; and many isolated ephemeral lakebeds (also  
30 known as “playas”) occur within this region with tributary streams from isolated  
31 mountain ranges. The Mojave Desert Geomorphic Province includes portions of  
32 Kern, Los Angeles, Riverside, and San Bernardino counties.

33 The Colorado Desert Geomorphic Province, or Salton Trough, is characterized by  
34 a geographically-depressed desert that extends northward from the Gulf of  
35 California (located at the mouth of the Colorado River) towards the Mojave  
36 Desert Geomorphic Province where the Pacific and North American plants are  
37 separating (CGS 2002a, SCAG 2011, RCIP 2000, San Diego County 2011).  
38 Large portions of this geomorphic province were formed by the inundation of the  
39 ancient Lake Cahuilla and are filled with sediments several miles thick from the  
40 historic Colorado River overflows and erosion of the Peninsular Ranges uplands.  
41 The Salton Trough is separated from the Gulf of California by a large ridge of  
42 sediment. The Salton Sea occurs within the trough along an ancient playa. The  
43 Colorado Desert Geomorphic Province includes portions of Riverside County in  
44 the Coachella Valley; and portions of San Diego and Imperial counties that are  
45 located outside of the study area.

1     **11.3.3.7 Regional Seismicity**

2     Most of the areas in the Central Coast and Southern California regions are  
3     characterized by active faults that are capable of producing major earthquakes  
4     with substantial ground displacement. The San Andreas Fault Zone extends from  
5     the Gulf of California and extends in a northwest direction throughout the Central  
6     Coast and Southern California regions (CGS 2006).

7     Within portions of San Luis Obispo County that use SWP water supplies, the  
8     Nacimiento Fault also can result in major seismic events (CGS 2006, San Luis  
9     Obispo County 2010a).

10    The northern portions of Santa Barbara County that use SWP water supplies  
11    include Lion’s Head Fault along the Pacific Ocean shoreline to the southwest of  
12    Santa Maria and along the northern boundary of Vandenberg Air Force Base  
13    (CGS 2006, SBCAG 2013). The Big Pine Fault may extend into the Vandenberg  
14    Air Force Base area. Areas near the mouth of the Santa Ynez River and Point  
15    Arguello could be affected by Lompoc Terrace Fault and Santa Ynez-Pacifico  
16    Fault Zone. The Santa Ynez Fault extends across this county and could affect  
17    communities near Santa Ynez. Along the southern coast of Santa Barbara County  
18    from Goleta to Carpinteria, the area includes many active faults, including More  
19    Ranch, Mission Ridge, Arroyo Parida, and Red Mountain faults; and potentially  
20    active faults, including Goleta, Mesa-Rincon, and Carpinteria faults.

21    Portions of Ventura County that use SWP water supplies are located in the  
22    southern portion of the county adjacent to Los Angeles County. Major faults in  
23    this area include the Oak Ridge Fault that extends into the Oxnard Plain along the  
24    south side of the Santa Clara River Valley and may extend into San Fernando  
25    Valley in Los Angeles County; Bailey Fault that extends from the Pacific Ocean  
26    to the Camarillo Fault; Simi-Santa Rosa, Camarillo, and Springville faults in Simi  
27    and Tierra Rejada valleys and near Camarillo; Sycamore Canyon and Boney  
28    Mountain faults that extend from the Pacific Ocean towards Thousand Oaks  
29    (CGS 2006, Ventura County 2011).

30    Los Angeles County major fault zones include Northridge Hills, San Gabriel,  
31    San Fernando, Verduga, Sierra Madre, Raymond, Hollywood, Santa Monica, and  
32    Malibu Coast fault zones; Elysian Park Fold and Thrust Belt in Los Angeles  
33    County; and Newport, Inglewood, Whittier, and Palos Verdes fault zones that  
34    extend into Los Angeles and Orange counties (CGS 2006, Los Angeles 2005).  
35    Recent major seismic events that have occurred in Southern California along  
36    faults in Los Angeles include the 1971 San Fernando, 1987 Whittier Narrows,  
37    1991 Sierra Madre, and 1994 Northridge earthquakes.

38    Riverside and San Bernardino counties are characterized by the San Andreas  
39    Fault Zone that extends from the eastern boundaries of these counties and crosses  
40    to the western side of San Bernardino County (CGS 2006, RCIP 2000, Riverside  
41    County 2000, SCAG 2011, DWR 2009). The San Jacinto Fault Zone also extends  
42    through the center of Riverside County and along the western side of San  
43    Bernardino County. The Elsinore Fault Zone extends along the western sides of  
44    both counties. In San Bernardino County, the Cucamonga Fault extends into

1 Los Angeles County where it intersects with the Sierra Madre and Raymond  
 2 faults. The Garlock and Lockhart fault zones extend into both San Bernardino  
 3 and Kern counties. San Bernardino County also includes several other major fault  
 4 zones, including North Frontal, and Helendale faults.

5 Portions of San Diego County that use SWP water supplies include the Rose  
 6 Canyon Fault Zone located along the Pacific Ocean shoreline and extends into the  
 7 City of San Diego (San Diego County 2011).

#### 8 **11.3.3.8 Soil Characteristics**

9 In the Central Coast Region, areas within San Luis Obispo and Santa Barbara  
 10 counties that use SWP water supplies are located within coastal valleys or along  
 11 the Pacific Ocean shoreline. In San Luis Obispo County, Morro Bay, Pismo  
 12 Beach, and Oceano areas are located along the coast with soils that range from  
 13 sands and loamy sands in areas near the shoreline to shaly loams, clay loams, and  
 14 clays in the terraces and foothills located along the eastern boundaries of these  
 15 communities (SBCAG 2010b, NRCS 2014a, NRCS 2014b). In Santa Barbara  
 16 County, the Santa Maria, Vandenberg Air Force Base, Santa Ynez, Goleta, Santa  
 17 Barbara, and Carpinteria areas are located in alluvial plains, along stream  
 18 channels with alluvium deposits, along the shoreline, or along marine terrace  
 19 deposits above the Pacific Ocean. The soils range from sands, sandy loams,  
 20 loams, shaly loams, and clay loams in the alluvial soils and along the shoreline.  
 21 The terrace deposits include silty clays, clay loams, and clays (NRCS 2014c,  
 22 NRCS 2014d, NRCS 2014e, SCS 1972, SCS 1981b).

23 Southern California Region soils include gravelly loams and gravelly sands,  
 24 sands, sandy loams and loamy sands, and silty loams along the Pacific Coast  
 25 shorelines and on alluvial plains. The mountains and foothills of the region  
 26 include silty loams, cobbly silty loam, gravelly loam, sandy clay loams, clay  
 27 loams, silty clays, and clays (SCAG 2011, UCCE 2014, SCS 1978, SCS 1986,  
 28 SCS 1973). The inland region in Riverside and San Bernardino counties include  
 29 sand to silty clays to cobbles and boulders on the alluvial fans, valley floor,  
 30 terraces, and mountains, and dry lake beds (CVWD 2011).

#### 31 **11.3.3.9 Subsidence**

32 Subsidence in the Central Coast and Southern California regions occur due to soil  
 33 compaction following groundwater withdrawals at rates greater than groundwater  
 34 recharge rates, oil and gas withdrawal, seismic activity, and hydroconsolidation of  
 35 soils along alluvial fans (Los Angeles 2005). The USGS described areas with  
 36 subsidence related to groundwater overdraft in the Central Coast and Southern  
 37 California regions in San Luis Obispo, Santa Barbara, Los Angeles, Riverside,  
 38 and Santa Bernardino counties (USGS 1999, Ventura County 2011, Los Angeles  
 39 2005, RCIP 2000). Many of the areas with subsidence have alluvial  
 40 unconsolidated sands and silty sands with lenses of silt and clayey silt.

41 A recent study by the USGS in the southern Coachella Valley portion of  
 42 Riverside described land subsidence of about 0.5 feet between 1930 and 1996  
 43 (USGS 2013c). Groundwater elevations in this area had declined since the early

1 1920s until 1949 when water from the Colorado River was provided to the area.  
2 This area is served by Coachella Valley Water District; and as described in  
3 Chapter 5, Surface Water Resources and Water Supply, the availability of surface  
4 water has not always been available to this area in recent years. The recent USGS  
5 study indicated that land subsidence of up to approximately 0.4 feet have occurred  
6 at some locations between 1996 and 2005; and possibly greater subsidence at  
7 other locations. A Coachella Valley Water District study indicated that up to  
8 13 inches have occurred in parts of the valley between 1996 and 2005  
9 (CVWD 2011).

## 10 **11.4 Impact Analysis**

11 This section describes the potential mechanisms and analytical methods for  
12 change in soils resources, results of the impact analysis, potential mitigation  
13 measures, and cumulative effects.

### 14 **11.4.1 Potential Mechanisms for Change in Soils Resources**

15 As described in Chapter 4, Approach to Environmental Analysis, the impact  
16 analysis considers changes in soils resources conditions related to changes in CVP  
17 and SWP operations under the alternatives as compared to the No Action  
18 Alternative and Second Basis of Comparison.

19 Changes in CVP and SWP operations under the alternatives as compared to the  
20 No Action Alternative and Second Basis of Comparison could change soil erosion  
21 potential due to crop idling on lands irrigated with CVP and SWP water supplies  
22 and along rivers downstream of CVP and SWP reservoirs, and potential changes  
23 in soils as lands are converted to seasonal floodplain or tidal-influenced wetlands.

#### 24 **11.4.1.1 Changes in Soil Erosion**

25 Changes in CVP and SWP operations under the alternatives could change the  
26 extent of irrigated acreage and the potential for soil erosion on crop idled lands  
27 over the long-term average condition and in dry and critical dry years as  
28 compared to the No Action Alternative and the Second Basis of Comparison.

29 Changes in CVP and SWP operations under the alternatives also could change  
30 peak flows in rivers downstream of CVP and SWP reservoirs in the Trinity River  
31 and Central Valley regions as compared to historical conditions which could lead  
32 to soil erosion during high peak flow events during storms in wet years along the  
33 river banks as compared to the No Action Alternative and the Second Basis of  
34 Comparison. However, as described in Chapter 5, Surface Water Resources and  
35 Water Supplies, the results of the analysis indicate that peak flows would be  
36 within historical range of peak flows in these rivers and would be similar under  
37 Alternatives 1 through 5, No Action Alternative, and Second Basis of  
38 Comparison. Therefore, changes in CVP and SWP operations would not result in  
39 changes to peak flow events that could result in soil erosion along these rivers.  
40 Therefore, these changes are not analyzed in this EIS.

1     **11.4.1.2 Changes in Soils at Restored Wetlands**

2 Restoration of seasonal floodplains and tidally-influenced wetlands would affect  
3 soils resources at the restoration locations. However, these actions would occur in  
4 a similar manner under the No Action Alternative, Alternatives 1 through 5, and  
5 Second Basis of Comparison, as described in Chapter 3, Description of  
6 Alternatives; in addition, the conditions of the soils would be the same under all  
7 of the alternatives and the Second Basis of Comparison. Therefore, these changes  
8 are not analyzed in this EIS.

9     **11.4.1.3 Effects Related to Water Transfers**

10 Historically water transfer programs have been developed on an annual basis.

11 The demand for water transfers is dependent upon the availability of water  
12 supplies to meet water demands. Water transfer transactions have increased over  
13 time as CVP and SWP water supply availability has decreased, especially during  
14 drier water years.

15 Parties seeking water transfers generally acquire water from sellers who have  
16 available surface water who can make the water available through releasing  
17 previously stored water, pump groundwater instead of using surface water  
18 (groundwater substitution), idle crops, or substitute crops that use less water in  
19 order to reduce normal consumptive use of surface water.

20 Water transfers using CVP and SWP Delta pumping plants and south of Delta  
21 canals generally occur when there is unused capacity in these facilities. These  
22 conditions generally occur during drier water year types when the flows from  
23 upstream reservoirs plus unregulated flows are adequate to meet the Sacramento  
24 Valley water demands and the CVP and SWP export allocations. In non-wet  
25 years, the CVP and SWP water allocations would be less than full contract  
26 amounts; therefore, capacity may be available in the CVP and SWP conveyance  
27 facilities to move water from other sources.

28 Projecting future soil conditions related to water transfer activities is difficult  
29 because specific water transfer actions required to make the water available,  
30 convey the water, and/or use the water would change each year due to changing  
31 hydrological conditions, CVP and SWP water availability, specific local agency  
32 operations, and local cropping patterns. Reclamation recently prepared a long-  
33 term regional water transfer environmental document which evaluated potential  
34 changes in surface water conditions related to water transfer actions (Reclamation  
35 2014c). Results from this analysis were used to inform the impact assessment of  
36 potential effects of water transfers under the alternatives as compared to the  
37 No Action Alternative and the Second Basis of Comparison.

38     **11.4.2 Conditions in Year 2030 without Implementation of**  
39     **Alternatives 1 through 5**

40 This EIS includes two bases of comparison, as described in Chapter 3,  
41 Description of Alternatives: the No Action Alternative and the Second Basis of  
42 Comparison. Both of these bases are evaluated at 2030 conditions. Changes that  
43 would occur over the next 15 years without implementation of the alternatives are

1 not analyzed in this EIS. However, the changes to soils resources that are  
2 assumed to occur by 2030 under the No Action Alternative and the Second Basis  
3 of Comparison are summarized in this section. Many of the changed conditions  
4 would occur in the same manner under both the No Action Alternative and the  
5 Second Basis of Comparison.

6 **11.4.2.1 Common Changes in Conditions under the No Action Alternative**  
7 **and Second Basis of Comparison**

8 Conditions in 2030 would be different than existing conditions due to:

- 9
- 10 • Climate change and sea-level rise
  - 11 • General plan development throughout California, including increased water  
12 demands in portions of Sacramento Valley
  - 13 • Implementation of reasonable and foreseeable water resources management  
14 projects to provide water supplies

14 It is anticipated that climate change would result in more short-duration high-  
15 rainfall events and less snowpack in the winter and early spring months. The  
16 reservoirs would be full more frequently by the end of April or May by 2030 than  
17 in recent historical conditions. However, as the water is released in the spring,  
18 there would be less snowpack to refill the reservoirs. This condition would  
19 reduce reservoir storage and available water supplies to downstream uses in the  
20 summer. The reduced end-of-September storage would also reduce the ability to  
21 release stored water to downstream regional reservoirs. These conditions would  
22 occur for all reservoirs in the California foothills and mountains, including non-  
23 CVP and SWP reservoirs.

24 These changes would result in a decline of the long-term average CVP and SWP  
25 water supply deliveries by 2030 as compared to recent historical long-term  
26 average deliveries under the No Action Alternative and the Second Basis of  
27 Comparison. However, the CVP and SWP water deliveries would be less under  
28 the No Action Alternative as compared to the Second Basis of Comparison, as  
29 described in Chapter 5, Surface Water Resources and Water Supplies, which  
30 could result in more crop idling that could be subject to erosion.

31 Under the No Action Alternative and the Second Basis of Comparison, land uses  
32 in 2030 would occur in accordance with adopted general plans. Development  
33 under the general plans would result in disruption of soils resources; however, the  
34 development of general plans includes preparation of environmental  
35 documentation that would identify methods to minimize adverse impacts to soils  
36 resources.

37 Under the No Action Alternative and the Second Basis of Comparison,  
38 development of future water resources management projects by 2030 which  
39 would result in disruption of soils resources. However, the development of these  
40 future programs would include preparation of environmental documentation that  
41 would identify methods to minimize adverse impacts to soils resources.

1 By 2030 under the No Action Alternative and the Second Basis of Comparison, it  
 2 is assumed that ongoing programs would result in restoration of more than  
 3 10,000 acres of intertidal and associated subtidal wetlands in Suisun Marsh and  
 4 Cache Slough; and 17,000 to 20,000 acres of seasonal floodplain restoration in the  
 5 Yolo Bypass.

### 6 **11.4.3 Evaluation of Alternatives**

7 Alternatives 1 through 5 have been compared to the No Action Alternative; and  
 8 the No Action Alternative and Alternatives 1 through 5 have been compared to  
 9 the Second Basis of Comparison. The evaluation of alternatives is focused on  
 10 portions of the Central Valley, San Francisco Bay Area, Central Coast, and  
 11 Southern California regions that use CVP and SWP water for irrigation.

12 During review of the numerical modeling analyses used in this EIS, an error was  
 13 determined in the CalSim II model assumptions related to the Stanislaus River  
 14 operations for the Second Basis of Comparison, Alternative 1, and Alternative 4  
 15 model runs. Appendix 5C includes a comparison of the CalSim II model run  
 16 results presented in this chapter and CalSim II model run results with the error  
 17 corrected. Appendix 5C also includes a discussion of changes in the comparison  
 18 of groundwater conditions for the following alternative analyses.

- 19 • No Action Alternative compared to the Second Basis of Comparison
- 20 • Alternative 1 compared to the No Action Alternative
- 21 • Alternative 3 compared to the Second Basis of Comparison
- 22 • Alternative 5 compared to the Second Basis of Comparison

#### 23 **11.4.3.1 No Action Alternative**

24 The No Action Alternative is compared to the Second Basis of Comparison.

##### 25 **11.4.3.1.1 Central Valley Region**

###### 26 *Potential Changes in Soil Erosion*

27 As described in Chapter 12, Agricultural Resources, the extent of irrigated  
 28 acreage under the No Action Alternative would be similar (within 5 percent) to  
 29 the conditions under the Second Basis of Comparison over long-term conditions  
 30 (throughout the 81-year model simulation period) and during dry and critical dry  
 31 years due to the increased use of groundwater.

###### 32 *Effects Related to Cross Delta Water Transfers*

33 Potential effects to soils resources could be similar to those identified in a recent  
 34 environmental analysis conducted by Reclamation for long-term water transfers  
 35 from the Sacramento to San Joaquin valleys (Reclamation 2014c). Potential  
 36 effects to soils resources were identified as increased erosion and shrinking of  
 37 expansive soils in the seller's service areas if crop idling is used to provide water  
 38 for transfers; and increased potential for shrinking of expansive soils and soil  
 39 movement in areas that use the transferred water. The analysis indicated that  
 40 these potential impacts would not be substantial because farmers manage idle  
 41 fields as part of normal agricultural operations and they would continue to use the  
 42 same practices to avoid erosion impacts. The analysis also indicated that

1 shrinking and soil movement occur as part of normal planting and harvesting  
2 practices and the changes with the water transfer programs would not result in  
3 substantial changes.

4 Under the No Action Alternative, the timing of cross Delta water transfers would  
5 be limited to July through September and include annual volumetric limits, in  
6 accordance with the 2008 U.S. Fish and Wildlife Service (USFWS) Biological  
7 Opinion (BO) and the 2009 National Marine Fisheries Service (NMFS) BO.  
8 Under the Second Basis of Comparison, water could be transferred throughout the  
9 year without an annual volumetric limit. Overall, the potential for cross Delta  
10 water transfers would be less under the No Action Alternative than under the  
11 Second Basis of Comparison.

#### 12 **11.4.3.1.2 San Francisco Bay Area, Central Coast, and Southern California** 13 **Regions**

##### 14 *Potential Changes in Soil Erosion*

15 As described in Chapter 12, Agricultural Resources, the extent of irrigated  
16 acreage under the No Action Alternative is anticipated to be similar as conditions  
17 under the Second Basis of Comparison due to the increased use of groundwater.

#### 18 **11.4.3.2 Alternative 1**

19 Alternative 1 is identical to the Second Basis of Comparison. Alternative 1 is  
20 compared to the No Action Alternative and the Second Basis of Comparison.  
21 However, because CVP and SWP operations conditions under Alternative 1 are  
22 identical to conditions under the Second Basis of Comparison; Alternative 1 is  
23 only compared to the No Action Alternative.

#### 24 **11.4.3.2.1 Alternative 1 Compared to the No Action Alternative**

##### 25 *Central Valley Region*

##### 26 *Potential Changes in Soil Erosion*

27 As described in Chapter 12, Agricultural Resources, the extent of irrigated  
28 acreage under Alternative 1 would be similar to conditions under the No Action  
29 Alternative over long-term conditions and during dry and critical dry years due to  
30 the increased availability of CVP and SWP water supplies.

##### 31 *Effects Related to Cross Delta Water Transfers*

32 Potential effects to soils resources could be similar to those identified in a recent  
33 environmental analysis conducted by Reclamation for long-term water transfers  
34 from the Sacramento to San Joaquin valleys (Reclamation 2014c) as described  
35 above under the No Action Alternative compared to the Second Basis of  
36 Comparison. For the purposes of this EIS, it is anticipated that similar conditions  
37 would occur during implementation of cross Delta water transfers under  
38 Alternative 1 and the No Action Alternative, and that impacts on soils resources  
39 would not be substantial in the seller's service area due to implementation  
40 requirements of the transfer programs.

1 Under Alternative 1, water could be transferred throughout the year without an  
 2 annual volumetric limit. Under the No Action Alternative, the timing of cross  
 3 Delta water transfers would be limited to July through September and include  
 4 annual volumetric limits, in accordance with the 2008 USFWS BO and 2009  
 5 NMFS BO. Overall, the potential for cross Delta water transfers would be  
 6 increased under Alternative 1 as compared to the No Action Alternative.

7 *San Francisco Bay Area, Central Coast, and Southern California Regions*  
 8 *Potential Changes in Soil Erosion*

9 As described in Chapter 12, Agricultural Resources, the extent of irrigated  
 10 acreage under Alternative 1 is anticipated to be similar as conditions under the  
 11 No Action Alternative due to increased availability of CVP and SWP water  
 12 supplies.

13 **11.4.3.2 Alternative 1 Compared to the Second Basis of Comparison**

14 Alternative 1 is identical to the Second Basis of Comparison.

15 **11.4.3.3 Alternative 2**

16 The CVP and SWP operations under Alternative 2 are identical to the CVP and  
 17 SWP operations under the No Action Alternative; therefore, the soils resources  
 18 conditions under Alternative 2 are only compared to the Second Basis of  
 19 Comparison.

20 **11.4.3.3.1 Alternative 2 Compared to the Second Basis of Comparison**

21 Changes to soils resources under Alternative 2 as compared to the Second Basis  
 22 of Comparison would be the same as the impacts described in Section 11.4.3.1,  
 23 No Action Alternative.

24 **11.4.3.4 Alternative 3**

25 The CVP and SWP operations under Alternative 3 are similar to the Second Basis  
 26 of Comparison and Alternative 1 with modified Old and Middle River flow  
 27 criteria.

28 **11.4.3.4.1 Alternative 3 Compared to the No Action Alternative**

29 *Central Valley Region*

30 *Potential Changes in Soil Erosion*

31 As described in Chapter 12, Agricultural Resources, the extent of irrigated  
 32 acreage under Alternative 3 would be similar to the conditions under the No  
 33 Action Alternative over long-term conditions and during dry and critical dry years  
 34 due to the increased availability of CVP and SWP water supplies.

35 *Effects Related to Cross Delta Water Transfers*

36 Potential effects to soils resources could be similar to those identified in a recent  
 37 environmental analysis conducted by Reclamation for long-term water transfers  
 38 from the Sacramento to San Joaquin valleys (Reclamation 2014c) as described  
 39 above under the No Action Alternative compared to the Second Basis of  
 40 Comparison. For the purposes of this EIS, it is anticipated that similar conditions

1 would occur during implementation of cross Delta water transfers under  
2 Alternative 3 and the No Action Alternative, and that impacts on soils resources  
3 would not be substantial in the seller's service area due to implementation  
4 requirements of the transfer programs.

5 Under Alternative 3, water could be transferred throughout the year without an  
6 annual volumetric limit. Under the No Action Alternative, the timing of cross  
7 Delta water transfers would be limited to July through September and include  
8 annual volumetric limits, in accordance with the 2008 USFWS BO and 2009  
9 NMFS BO. Overall, the potential for cross Delta water transfers would be  
10 increased under Alternative 3 as compared to the No Action Alternative.

11 *San Francisco Bay Area, Central Coast, and Southern California Regions*  
12 *Potential Changes in Soil Erosion*

13 As described in Chapter 12, Agricultural Resources, the extent of irrigated  
14 acreage under Alternative 3 is anticipated to be similar to conditions under the  
15 No Action Alternative due to increased availability of CVP and SWP water  
16 supplies.

17 **11.4.3.4.2 Alternative 3 Compared to the Second Basis of Comparison**  
18 *Central Valley Region*

19 *Potential Changes in Soil Erosion*

20 As described in Chapter 12, Agricultural Resources, the extent of irrigated  
21 acreage under Alternative 3 would be similar to the conditions under the Second  
22 Basis of Comparison over long-term conditions and during dry and critical dry  
23 years due to the increased use of groundwater.

24 *Effects Related to Cross Delta Water Transfers*

25 Potential effects to soils resources could be similar to those identified in a recent  
26 environmental analysis conducted by Reclamation for long-term water transfers  
27 from the Sacramento to San Joaquin valleys (Reclamation 2014c) as described  
28 above under the No Action Alternative compared to the Second Basis of  
29 Comparison. For the purposes of this EIS, it is anticipated that similar conditions  
30 would occur during implementation of cross Delta water transfers under  
31 Alternative 3 and the Second Basis of Comparison, and that impacts on soils  
32 resources would not be substantial in the seller's service area due to  
33 implementation requirements of the transfer programs.

34 Under Alternative 3 and the Second Basis of Comparison, water could be  
35 transferred throughout the year without an annual volumetric limit. Overall, the  
36 potential for cross Delta water transfers would be similar under Alternative 3 and  
37 the Second Basis of Comparison.

38 *San Francisco Bay Area, Central Coast, and Southern California Regions*  
39 *Potential Changes in Soil Erosion*

40 As described in Chapter 12, Agricultural Resources, the extent of irrigated  
41 acreage under Alternative 3 is anticipated to be similar to conditions under the  
42 Second Basis of Comparison due to the increased use of groundwater.

1 **11.4.3.5 Alternative 4**

2 Soil resources conditions under Alternative 4 would be identical to the conditions  
3 under the Second Basis of Comparison; therefore, Alternative 4 is only compared  
4 to the No Action Alternative.

5 **11.4.3.5.1 Alternative 4 Compared to the No Action Alternative**

6 The CVP and SWP operations under Alternative 4 are identical to the CVP and  
7 SWP operations under the Second Basis of Comparison and Alternative 1.  
8 Therefore, changes in soil resources conditions under Alternative 4 as compared  
9 to the No Action Alternative would be the same as the impacts described in  
10 Section 11.4.3.2.1, Alternative 1 Compared to the No Action Alternative.

11 **11.4.3.6 Alternative 5**

12 The CVP and SWP operations under Alternative 5 are similar to the No Action  
13 Alternative with modified Old and Middle River flow criteria and New Melones  
14 Reservoir operations.

15 **11.4.3.6.1 Alternative 5 Compared to the No Action Alternative**

16 *Central Valley Region*

17 *Potential Changes in Soil Erosion*

18 As described in Chapter 12, Agricultural Resources, the extent of irrigated  
19 acreage under Alternative 5 would be similar to conditions under the No Action  
20 Alternative over long-term conditions and during dry and critical dry years  
21 because the availability of CVP and SWP water supplies would be similar.

22 *Effects Related to Cross Delta Water Transfers*

23 Potential effects to soils resources could be similar to those identified in a recent  
24 environmental analysis conducted by Reclamation for long-term water transfers  
25 from the Sacramento to San Joaquin valleys (Reclamation 2014c) as described  
26 above under the No Action Alternative compared to the Second Basis of  
27 Comparison. For the purposes of this EIS, it is anticipated that similar conditions  
28 would occur during implementation of cross Delta water transfers under  
29 Alternative 5 and the No Action Alternative, and that impacts on soils resources  
30 would not be substantial in the seller's service area due to implementation  
31 requirements of the transfer programs.

32 Under Alternative 5 and the No Action Alternative, the timing of cross Delta  
33 water transfers would be limited to July through September and include annual  
34 volumetric limits, in accordance with the 2008 USFWS BO and 2009 NMFS BO.  
35 Overall, the potential for cross Delta water transfers would be similar under  
36 Alternative 5 and the No Action Alternative.

37 *San Francisco Bay Area, Central Coast, and Southern California Regions*

38 *Potential Changes in Soil Erosion*

39 As described in Chapter 12, Agricultural Resources, the extent of irrigated  
40 acreage under Alternative 5 is anticipated to be similar as conditions under the  
41 No Action Alternative because CVP and SWP water deliveries would be similar.

1 **11.4.3.6.2 Alternative 5 Compared to the Second Basis of Comparison**

2 *Central Valley Region*

3 *Potential Changes in Soil Erosion*

4 As described in Chapter 12, Agricultural Resources, the extent of irrigated  
 5 acreage under Alternative 5 would be similar to the conditions under the Second  
 6 Basis of Comparison over long-term conditions and during dry and critical dry  
 7 years due to increased use of groundwater.

8 *Effects Related to Cross Delta Water Transfers*

9 Potential effects to soils resources could be similar to those identified in a recent  
 10 environmental analysis conducted by Reclamation for long-term water transfers  
 11 from the Sacramento to San Joaquin valleys (Reclamation 2014c) as described  
 12 above under the No Action Alternative compared to the Second Basis of  
 13 Comparison. For the purposes of this EIS, it is anticipated that similar conditions  
 14 would occur during implementation of cross Delta water transfers under  
 15 Alternative 5 and the Second Basis of Comparison, and that impacts on soils  
 16 resources would not be substantial in the seller’s service area due to  
 17 implementation requirements of the transfer programs.

18 Under Alternative 5, the timing of cross Delta water transfers would be limited to  
 19 July through September and include annual volumetric limits, in accordance with  
 20 the 2008 USFWS BO and 2009 NMFS BO. Under Second Basis of Comparison,  
 21 water could be transferred throughout the year without an annual volumetric limit.  
 22 Overall, the potential for cross Delta water transfers would be less under  
 23 Alternative 5 as compared to the Second Basis of Comparison.

24 *San Francisco Bay Area, Central Coast, and Southern California Regions*

25 *Potential Changes in Soil Erosion*

26 As described in Chapter 12, Agricultural Resources, the extent of irrigated  
 27 acreage under Alternative 5 is anticipated to be similar to conditions under the  
 28 Second Basis of Comparison due to the increased use of groundwater.

29 **11.4.3.7 Summary of Impact Analysis**

30 The results of the environmental consequences of implementation of Alternatives  
 31 1 through 5 as compared to the No Action Alternative and the Second Basis of  
 32 Comparison are presented in Tables 11.1 and 11.2, respectively.

33 **Table 11.1 Comparison of Alternatives 1 through 5 to No Action Alternative**

Alternative	Potential Change	Consideration for Mitigation Measures
Alternative 1	No effects on soils resources	None needed
Alternative 2	No effects on soils resources	None needed
Alternative 3	No effects on soils resources	None needed
Alternative 4	No effects on soils resources	None needed
Alternative 5	No effects on soils resources	None needed

1 **Table 11.2 Comparison of No Action Alternative and Alternatives 1 through 5 to**  
 2 **Second Basis of Comparison**

Alternative	Potential Change	Consideration for Mitigation Measures
No Action Alternative	No effects on soils resources	Not considered for this comparison
Alternative 1	No effects on soils resources	Not considered for this comparison
Alternative 2	No effects on soils resources	Not considered for this comparison
Alternative 3	No effects on soils resources	Not considered for this comparison
Alternative 4	No effects on soils resources	Not considered for this comparison
Alternative 5	No effects on soils resources	Not considered for this comparison

3 **11.4.3.8 Potential Mitigation Measures**

4 Mitigation measures are presented in this section to avoid, minimize, rectify,  
 5 reduce, eliminate, or compensate for adverse environmental effects of  
 6 Alternatives 1 through 5 as compared to the No Action Alternative. Mitigation  
 7 measures were not included to address adverse impacts under the alternatives as  
 8 compared to the Second Basis of Comparison because this analysis was included  
 9 in this EIS for information purposes only.

10 Changes in CVP and SWP operations under Alternatives 1 through 5 as compared  
 11 to the No Action Alternative would not result in changes in soils resources.  
 12 Therefore, there would be no adverse impacts to soils resources as compared to  
 13 the No Action Alternative; and no mitigation measures are required.

14 **11.4.3.9 Cumulative Effects Analysis**

15 As described in Chapter 3, the cumulative effects analysis considers projects,  
 16 programs, and policies that are not speculative; and are based upon known or  
 17 reasonably foreseeable long-range plans, regulations, operating agreements, or  
 18 other information that establishes them as reasonably foreseeable.

19 The cumulative effects analysis for Alternatives 1 through 5 for Geology and  
 20 Soils Resources are summarized in Table 11.3.

21 **Table 11.3 Summary of Cumulative Effects on Geology and Soils Resources with**  
 22 **Implementation of Alternatives 1 through 5 as Compared to the No Action**  
 23 **Alternative**

Scenarios	Actions	Cumulative Effects of Actions
Past & Present, and Future Actions	Consistent with Affected Environment conditions plus:	These effects would be the same under all alternatives.

<b>Scenarios</b>	<b>Actions</b>	<b>Cumulative Effects of Actions</b>
<p>included in the No Action Alternative and in All Alternatives in Year 2030</p>	<p>Actions in the 2008 USFWS BO and 2009 NMFS BO that would have occurred without implementation of the BOs, as described in Section 3.3.1.2 (of Chapter 3, Descriptions of Alternatives) including climate change and sea level rise</p> <p>Actions not included in the 2008 USFWS BO and 2009 NMFS BO that would have occurred without implementation of the BOs, as described in Section 3.3.1.3 (of Chapter 3, Descriptions of Alternatives):</p> <ul style="list-style-type: none"> <li>- Climate Change and Sea Level Rise</li> <li>- Implementation of Federal and state policies and programs, including Clean Water Act (e.g., Total Maximum Daily Loads); Safe Drinking Water Act; Clean Air Act; and flood management programs</li> <li>- General plans for 2030.</li> <li>- Trinity River Restoration Program.</li> <li>- Central Valley Project Improvement Act programs</li> <li>- Folsom Dam Water Control Manual Update</li> <li>- Dutch Slough Tidal Marsh Restoration</li> <li>- Suisun Marsh Habitat Management, Preservation, and Restoration Plan Implementation</li> <li>- Tidal Wetland Restoration: Yolo Ranch, Northern Liberty Island Fish Restoration Project, Prospect Island Restoration Project, and Calhoun Cut/Lindsey Slough Tidal Habitat Restoration Project</li> <li>- San Joaquin River Restoration Program</li> <li>- Grasslands Bypass Project</li> <li>- Central Valley Salinity Alternatives for Long-Term Sustainability (CV-SALTS)</li> <li>- Future water supply projects, including water recycling, desalination, groundwater banks</li> </ul>	<p>Developments under the general plans and future water supply, water quality improvement, and restoration projects could affect soils resources. However, development of these future programs would include preparation of environmental documentation that would identify methods to minimize adverse impacts to soils resources.</p> <p>Some of the future actions would reduce the effects of agricultural drainage and/or reduce salinity in the San Joaquin River and the Delta. These programs would result in a beneficial impact to soils resources.</p>

Scenarios	Actions	Cumulative Effects of Actions
	and wellfields, and conveyance facilities (projects with completed environmental documents)	
<p>Future Actions considered as Cumulative Effects Actions in All Alternatives in Year 2030</p>	<p>Actions as described in Section 3.5 (of Chapter 3, Descriptions of Alternatives):</p> <ul style="list-style-type: none"> <li>- Bay-Delta Water Quality Control Plan Update</li> <li>- FERC Relicensing Projects</li> <li>- Bay Delta Conservation Plan and California WaterFix</li> <li>- Shasta Lake Water Resources, North-of-the-Delta Offstream Storage, Los Vaqueros Reservoir Expansion Phase 2, and Upper San Joaquin River Basin Storage Investigations</li> <li>- El Dorado Water and Power Authority Supplemental Water Rights Project</li> <li>- Semitropic Water Storage District Delta Wetlands</li> <li>- North Bay Aqueduct Alternative Intake</li> <li>- Irrigated Lands Regulatory Program</li> <li>- San Luis Reservoir Low Point Improvement Project</li> <li>- Westlands Water District v. United States Settlement</li> <li>- Future water supply projects, including water recycling, desalination, groundwater banks and wellfields, and conveyance facilities (projects that did not have completed environmental documents during preparation of the EIS)</li> </ul>	<p>These effects would be the same in all alternatives.</p> <p>Developments under the future projects are anticipated to potentially effect soils resources. However, development of these future programs would include preparation of environmental documentation that would identify methods to minimize adverse impacts to soils resources.</p> <p>Some of the future cumulative effects actions would reduce the effects of agricultural drainage and/or reduce salinity in the San Joaquin River and the Delta. These programs would result in a beneficial impact to soils resources.</p>
<p>No Action Alternative with Associated Cumulative Effects Actions in Year 2030</p>	<p>Full implementation of the 2008 USFWS BO and 2009 NMFS BO</p>	<p>Implementation of the No Action Alternative with reasonably foreseeable actions would include developments under general plans and future water supply, water quality improvement, and restoration projects are anticipated to potentially affect soils resources. However,</p>

Scenarios	Actions	Cumulative Effects of Actions
		development of these future programs would include preparation of environmental documentation that would identify methods to minimize adverse impacts to soils resources.
Alternative 1 with Associated Cumulative Effects Actions in Year 2030	No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant)	Implementation of Alternative 1 with reasonably foreseeable actions would result in similar changes as under the No Action Alternative with the added actions.
2 with Associated Cumulative Effects Actions in Year 2030	Full implementation of the 2008 USFWS BO and 2009 NMFS BO CVP and SWP operational actions No implementation of structural improvements or other actions that require further study to develop a more detailed action description.	Implementation of Alternative 2 with reasonably foreseeable actions would result in similar changes as under the No Action Alternative with the added actions.
Alternative 3 with Associated Cumulative Effects Actions in Year 2030	No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant) Slight increase in positive Old and Middle River flows in the winter and spring months	Implementation of Alternative 3 with reasonably foreseeable actions would result in similar changes as under the No Action Alternative with the added actions.
Alternative 4 with Associated Cumulative Effects Actions in Year 2030	No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant)	Implementation of Alternative 4 with reasonably foreseeable actions would result in similar changes as under the No Action Alternative with the added actions.
Alternative 5 with Associated Cumulative Effects Actions in Year 20530	Full implementation of the 2008 USFWS BO and 2009 NMFS BO Positive Old and Middle River flows and increased Delta outflow in spring months	Implementation of Alternative 5 with reasonably foreseeable actions would result in similar changes as under the No Action Alternative with the added actions.

**Chapter 12**

1 **Agricultural Resources**

2 **12.1 Introduction**

3 This chapter describes agricultural resources in the study area, and potential  
4 changes that could occur as a result of implementing the alternatives evaluated in  
5 this Environmental Impact Statement (EIS). Implementation of the alternatives  
6 could affect land use through potential changes in operation of the Central Valley  
7 Project (CVP) and State Water Project (SWP) and ecosystem restoration.  
8 Changes in non-agricultural land use and resources are described in Chapter 13,  
9 Land Use.

10 **12.2 Regulatory Environment and Compliance**  
11 **Requirements**

12 Potential actions that could be implemented under the alternatives evaluated in  
13 this EIS could affect agricultural resources served by CVP and SWP water  
14 supplies. Actions located on public agency lands; or implemented, funded, or  
15 approved by Federal and state agencies would need to be compliant with  
16 appropriate Federal and state agency policies and regulations, as summarized in  
17 Chapter 4, Approach to Environmental Analyses.

18 **12.3 Affected Environment**

19 This section describes agricultural resources that could be potentially affected by  
20 the implementation of the alternatives considered in this EIS. Changes in  
21 agricultural resources due to changes in CVP and SWP operations may occur in  
22 the Trinity River, Central Valley, San Francisco Bay Area, Central Coast, and  
23 Southern California regions. Direct or indirect agricultural resource effects due to  
24 implementation of the alternatives analyzed in this EIS are related to changes in  
25 agricultural land uses due to the availability and reliability of CVP and SWP  
26 water supplies.

27 Changes in agricultural resources can affect agriculture throughout the state. An  
28 overview of California agriculture is presented prior to discussions of agricultural  
29 resources in each of the regions.

30 **12.3.1 Overview of California Agriculture**

31 California agriculture is an important resource that produces over 400 types of  
32 crops. California is the nation’s leading producer of nearly 80 commodities; and  
33 produces more than 99 percent of the nation’s almonds, artichokes, dates, figs,  
34 raisins, kiwifruit, olives, clingstone peaches, pistachios, prunes, pomegranates,

1 and walnuts (USDA-NASS 2012). In 2011, cultivation of 25.4 million acres of  
2 agricultural land contributed about \$43.5 billion to California's economy and  
3 11.6 percent of total agricultural revenues in the United States. This section  
4 provides:

- 5 • Recent trends in California agricultural resources
- 6 • Crop production practices
- 7 • Cropping pattern changes in response to water supply availability
- 8 • Water supply and crop acreage relationships in the San Joaquin Valley

9 **12.3.1.1 Recent Trends in Agricultural Production**

10 The United States Department of Agriculture (USDA) National Agricultural  
11 Statistics Service (NASS) California Field Office publishes annual reports  
12 containing data from County Agricultural Commissioners and periodic statewide  
13 census of agricultural producers. County Agricultural Commissioners' data  
14 covers acres planted, total production, prices, yield per acre, and value of  
15 production across crop groups and counties.

16 From 1960 to 2012, total acreage in production fluctuated between eight and nine  
17 million acres, as summarized in Figure 12.1. Over the last fifteen years, total  
18 acreage has trended down. Most of the variability over time, and the more recent  
19 downward trend, are largely attributable to changes in field and forage crop  
20 acreage. The percentage of field and forage acreage decreased from 77 percent of  
21 total acreage in 1960 to 48 percent in 2012. The proportion of acreage of  
22 permanent crops (e.g. orchards and vine) has steadily increased from 1960 to  
23 2012. Orchard and vine acreage rose from 14 percent of total acreage in 1960 to  
24 38 percent in 2012.

25 From 1960 to 2012, statewide annual value of production rose from \$20 billion  
26 (all values are in 2012 US dollars) to \$45 billion, as summarized in Figure 12.2.  
27 Of the crop categories, orchard and vine values grew the fastest over this period,  
28 from around \$3 billion in annual value of production in 1960 to over \$17 billion  
29 in 2012. This increase may be attributable to both the expansion of acreage  
30 planted, as shown in Figure 12.1, as well as price and yield increases. Orchard  
31 and vine values of production rose from 17 percent of the total statewide value of  
32 production in 1960 to 38 percent in 2012. Other crop categories that have also  
33 experienced an increase in value of production over this time period are:  
34 vegetable, livestock, dairy and poultry, and nursery. Field crops have shown a  
35 downward trend. The percentage from field and forage crops decreased from the  
36 peak of 28 percent of state value of production in 1980 to 11 percent in 2012.  
37 Total value of production is influenced by both the acreage planted each year as  
38 well as market prices and yields.

39 **12.3.1.2 Crop Production Practices**

40 Crop production practices vary by crop and locational differences such as soil,  
41 slope, local climate, and water source and reliability. Production practices  
42 discussed in this subsection include:

- 43 • Crop rotation and fallowing.

- 1 • Crop water use.
- 2 • Crop irrigation methods.
- 3 • Crop responses to water quality.
- 4 • Crop drainage methods.
- 5 • Crop adaptation to changes in water supply availability.

#### 6 **12.3.1.2.1 Crop Rotation and Fallowing**

7 Crop rotation is the planned variation in the crop grown on a given field. Growers  
8 rotate annual crops and some forage crops in order to control plant pests, diseases,  
9 and weeds, and to improve soil structure, microbial diversity, and nutrient and  
10 mineral availability. Growers select a series of crops that are compatible for  
11 rotation that are planned to be grown in a field in a succession of years and plan  
12 their operations schedule and build their on-farm infrastructure (e.g., equipment,  
13 facilities and staffing) to a scale that meets the production needs of those crop  
14 acreage mixes (Baldwin 2006).

15 Field fallowing is the practice of not planting a crop in a field for one or more  
16 growing seasons. Fallowing can be a planned part of the rotation, or may be a  
17 consequence of another event like water supply shortage, flooding, land  
18 improvement, or poor crop prices. Rotations are not fixed, so changes in market  
19 conditions or Federal farm programs can affect crop mix and the pattern and  
20 magnitude of fallowing.

21 Fallowed fields without cover crops can lose topsoil to surface drainage and wind  
22 erosion. Loss of topsoil to erosion reduces land productivity, and can reduce  
23 nearby crop yields and marketability.

#### 24 **12.3.1.2.2 Crop Water Use**

25 Crop irrigation water use depends on crop type, stage of crop growth, soil  
26 moisture profile from winter rains, soil moisture holding capacity (total amount of  
27 water in the soil potentially available to plants), management of plant pests and  
28 diseases, weather conditions (solar radiation, temperature and humidity) and  
29 irrigation water use efficiency. Irrigation water use efficiency can be defined in  
30 different ways. The California Department of Water Resources (DWR) defines  
31 the agronomic water use fraction as the irrigation water beneficially used for  
32 necessary agronomic functions (e.g., transpiration, leaching, frost protection,  
33 germination) divided by the total applied water (DWR 2012). Applied irrigation  
34 water is transpired by plants (crops and weeds), percolates into the groundwater  
35 below the root zone (necessary salt leaching component or over-irrigation loss to  
36 groundwater), evaporates directly from water or soil surfaces, or runs off the field  
37 as surface drainage (Edinger-Marshall and Letey 1997).

38 Reuse of water from fields to irrigate other fields, often multiple times, occurs  
39 throughout California. As a result, relatively low field-level efficiency  
40 (agronomic water use fraction) can result in relatively high efficiency from a  
41 regional or basin perspective (DWR 2013a).

1 **12.3.1.2.3 Crop Irrigation**

2 Agricultural irrigation needs vary by season. In the winter, rainfall refills the soil  
3 moisture profile that was depleted from the crop root zone the previous summer  
4 and fall. If soil moisture is not adequate for planting of annual crops,  
5 pre-irrigation water is applied. Pre-irrigation and early growing season irrigations  
6 generally occur in the time period from March through May. Peak agricultural  
7 irrigation water supply demand generally occurs from the late spring through late  
8 summer. Permanent crops are irrigated post-harvest to refill the root zone. Post-  
9 harvest irrigation of annual crop land is sometimes used to help break down crop  
10 residue and suppress some pests and diseases, especially in rice fields.

11 Irrigation methods vary by area, soil, crop type, and existing facilities. Annual  
12 row crops are often sprinkler irrigated for crop germination and furrow irrigated  
13 for the rest of the season. Permanent crops are typically irrigated with drip,  
14 sprinkler, furrow, border, or flood irrigation methods. Irrigated pasture and  
15 alfalfa are typically irrigated with sprinkler or flood irrigation methods. Rice is  
16 generally irrigated with flood irrigation. Irrigation methods utilized in the Central  
17 Valley include:

- 18 • **Flood and Border Irrigation:** Water is released into a leveled field or block  
19 that is segmented into “checks” with a small berm to contain the water. Water  
20 applied to the check until it is flooded and the water seeps into the ground or  
21 some is allowed to drain off the lower elevation end of the field.
- 22 • **Furrow Irrigation:** Water is released into furrows at the higher side of the  
23 field and flows down to the lower end of the field. To provide adequate water  
24 to the low end of the field, surface irrigation requires that a certain amount of  
25 water be spilled or drained off as tailwater. Recycling the tailwater to the  
26 head of the field or to an adjacent field can significantly increase overall  
27 efficiency. Furrow irrigation is used on annual row crops and on some  
28 vineyards.
- 29 • **Sprinkler Irrigation:** Sprinkler irrigation uses pressurized water through  
30 movable or solid set pipe to a sprinkler. Sprinklers lose some irrigation water  
31 to evaporation in the air before the water reaches the ground. Sprinklers also  
32 apply water to ground that does not have crop roots, and this applied water  
33 goes to surface evaporation, weed transpiration, or percolation to groundwater  
34 leaching. Sprinklers are often used during the germination stage of  
35 vegetables, and can also be used for frost control on orchards, especially  
36 citrus. Sprinkler irrigation can be used on most crops except those for which  
37 direct contact with the water drops could cause fruit cracking, fungal growth,  
38 or other issues.
- 39 • **Surface Drip and Micro-sprinkler Irrigation:** Surface drip and micro-  
40 sprinkler irrigation also use pressurized water that is delivered through  
41 flexible tubes to drip emitters or micro-sprinkler heads. Surface drip irrigation  
42 generally applies water only to the crop root areas. Drip irrigation and  
43 micro-sprinklers are used on most orchards and vineyards.

- 1 • **Subsurface Drip Irrigation:** Subsurface drip irrigation is similar to the drip  
 2 irrigation described above, but the tubing or drip tape is buried a few inches to  
 3 several feet, depending on the crop. Subsurface drip irrigation generally  
 4 applies water only to crop root areas and reduces surface evaporation.  
 5 Subsurface drip is used on some row crops and vineyards.
- 6 Flood and furrow irrigated acreage has declined over time, especially for trees and  
 7 vines by drip and micro-sprinkler irrigation (NCWA 2011). Crops that continue  
 8 to rely upon flood irrigation, such as rice, have improved irrigation efficiency  
 9 through the use of laser leveling of the fields. The use of furrow and flood  
 10 irrigation has declined in California from 67 percent of the total irrigated acreage  
 11 in 1991 to 43 percent in 2010 (DWR 2013a). During this same time period, the  
 12 use of drip, micro-sprinkler, and subsurface drip irrigation increased from  
 13 16 percent of total irrigated acreage in 1991 to 42 percent in 2010.

#### 14 **12.3.1.2.4 Crop Response to Water Quality**

15 Water quality of the surface water streams in the Central Valley is generally very  
 16 suitable for agricultural production with low salinity, neutral acidity/alkalinity  
 17 (i.e., pH), minerals, nutrients, and dissolved metal concentrations that are  
 18 appropriate for agricultural uses. However, groundwater quality varies  
 19 substantially across California, as described in Chapter 7, Groundwater Resources  
 20 and Groundwater Quality.

21 Agricultural production can be affected by high salinity, minerals, and boron in  
 22 the irrigation water and the soils. In the Sacramento Valley, water temperature  
 23 can reduce crop yields; cold water is a particular concern for rice production  
 24 (Roel et al., 2005). Irrigation water can carry debris and biological contaminants  
 25 that affect agricultural operations and the value of crop production (USDA 2006).

26 High salinity concerns occur on agricultural lands receiving CVP and SWP water  
 27 from the Delta. As described in Chapter 6, Surface Water Quality, surface waters  
 28 in the Delta and lower San Joaquin River water frequently are characterized by  
 29 high salinity. These waters are used by agricultural water users in the Delta and  
 30 CVP and SWP water users located within and to the south of the Delta.

31 Evaporation and transpiration of irrigation water cause salts to accumulate in soils  
 32 unless adequate leaching and drainage are provided (Reclamation 2005). High  
 33 water tables with elevated concentrations of salts can draw the salinity vertically  
 34 through the soil by capillary action into the plant root zone and cause damage to  
 35 the plant. Excessive irrigation water salinity and accumulated soil salinity can  
 36 adversely affect soil structure, reduce water infiltration rates, reduce seed  
 37 germination, increase seedling mortality, impede root growth, impede water  
 38 uptake by the plant (from increased osmotic pressure), reduce plant growth rate,  
 39 and reduce yields.

40 All irrigation water adds soluble salts to the soil, including sodium, calcium,  
 41 magnesium, potassium, sulfate, and chlorides (Grattan 2002). Salinity is usually  
 42 measured either in parts per million of total dissolved solids or by electrical  
 43 conductivity (EC). Water salinity of irrigation water is measured as “EC<sub>w</sub>.”

1 Accumulated salts in the soil are measured as “EC<sub>e</sub>.” The strength of the  
 2 electrical conductivity depends upon the water temperature, types of salts, and salt  
 3 concentrations.

4 High salinity can affect the amount of irrigation water applied for crop irrigation  
 5 and necessary soil leaching component (washing soil salts out of the plant root  
 6 zone) compared to the total quantity of irrigation water applied (Reclamation  
 7 2005). Irrigation in the San Joaquin Valley typically includes a salt leaching  
 8 component. The leaching water generally conveys the salts into installed drains  
 9 in the fields or into the groundwater. Therefore, in locations where adequate  
 10 drainage does not exist, continued irrigation with high salinity water has increased  
 11 groundwater salinity, as described in Chapter 7, Groundwater Resources and  
 12 Groundwater Quality.

13 Table 12.1 presents EC<sub>e</sub> and EC<sub>w</sub> values for salinity tolerances of a range of crops  
 14 grown in the Central Valley.

15 **Table 12.1 Salinity Tolerance of Selected Crops (as percent of maximum yield)**

Crops <sup>a, b</sup>	Crop Tolerance based on Soil Salinity (measured as EC <sub>e</sub> )			Crop Tolerance based on Water Salinity (measured as EC <sub>w</sub> )		
	100%	50%	0% <sup>c</sup>	100%	50%	0% <sup>c</sup>
Alfalfa	2.0	8.8	16	1.3	5.9	10
Almond <sup>d</sup>	1.5	4.1	6.8	1.0	2.8	4.5
Apricot <sup>d</sup>	1.6	3.7	5.8	1.1	2.5	3.8
Bean	1.0	3.6	6.3	0.7	2.4	4.2
Corn, sweet	1.7	5.9	10	1.1	3.9	6.7
Cucumber	2.5	6.3	10	1.7	4.2	6.8
Grape <sup>e</sup>	1.5	6.7	12	1.0	4.5	7.9
Peach	1.7	4.1	6.5	1.1	2.7	4.3
Rice (paddy)	3.0	7.2	11	2.0	4.8	7.6
Squash, Zucchini	4.7	10	15	3.1	6.7	10
Sudan Grass	2.8	14	26	1.9	9.6	17
Sugar Beet <sup>e</sup>	7.0	15	24	4.7	10	16
Tomato	2.5	7.6	13	1.7	5.0	8.4

16 Sources: Ayers and Westcot 1994; Grattan 2002; Maas and Hoffman 1977

17 Notes:

18 a. These data should be used as a guide to relative tolerances among crops. Absolute  
 19 tolerances will change based upon climate, soil conditions, and cultural practices.  
 20 Plants will tolerate about 2 deciSiemens per meter (dS/m) higher soil salinity (EC<sub>e</sub>)  
 21 than indicated if soils have high gypsum, however the water salinity (EC<sub>w</sub>) tolerances  
 22 do not change.

23 b. EC<sub>e</sub> is average root zone salinity as measured by electrical conductivity of the  
 24 saturation extract of the soil, and EC<sub>w</sub> is electrical conductivity of the irrigation water,

- 1 both reported in dS/m) at 25°C. The data is based upon a relationship between soil  
 2 salinity and water salinity of  $EC_e = 1.5 EC_w$  with a 15 to 20 percent leaching fraction  
 3 and a 40-30-20-10 percent water use pattern for the upper to lower quarters of the  
 4 root zone.
- 5 c. The zero yield potential or maximum  $EC_e$  indicates the theoretical soil salinity ( $EC_e$ ) at  
 6 which crop growth ceases.
- 7 d. Tolerance evaluations are based on tree growth and not on yield.
- 8 e. For beets, which are more sensitive during germination, the  $EC_e$  should not exceed  
 9 3 dS/m in the seeding area for garden beets and sugar beets.

10 The most sensitive crops are affected when  $EC_e$  values exceed 1 dS/m, and  
 11 include the following crops with threshold values: beans (1.0 dS/m); walnuts  
 12 1.1 dS/m), bulb onions (1.2 dS/m); grapes, peppers and almonds (1.5 dS/m);  
 13 apricots (1.6 dS/m); corn and peaches (1.7 dS/m); alfalfa (2.0 dS/m); and  
 14 cucumbers and tomatoes (2.5 dS/m).

15 In addition to salinity, boron is also a concern in some areas. Dry beans are one  
 16 of the more boron sensitive crops with a threshold value of 0.75 to 1.0 mg/l in the  
 17 soil water within the crop root zone.

#### 18 **12.3.1.2.5 Crop Drainage Methods**

19 Agricultural crop surface and subsurface drainage is important for the suitability  
 20 of agricultural production (DWR 2013a; Reclamation 2005; SJVDIP 1998).  
 21 Drainage of most agricultural fields occurs by a combination of surface drainage  
 22 and subsurface drainage. Poor drainage can lead to crop loss or damage from lack  
 23 of soil oxygen availability for plant roots, pest infestations (e.g., pathogenic root  
 24 fungi, such as *phytothora*), and salt accumulation in the root zone. High water  
 25 tables, high salinity, and poor drainage can limit crop selection and limit the  
 26 ability of farmers to use irrigation water to leach excess salts out of the crop root  
 27 zone.

28 Surface water drainage from agricultural fields is collected in on-farm drainage  
 29 ditches which are typically connected to larger drainage facilities. The drainage  
 30 water either flows by gravity or is pumped into adjacent water bodies. Water  
 31 quality issues related to disposal of surface water drainage can include high  
 32 concentrations of sediment; nutrients from fertilizers; or residual organic carbon  
 33 constituents from herbicides, pesticides, or nematicides. On-farm surface  
 34 drainage systems sometimes include local methods to remove sediment or  
 35 nutrients, such as the inclusion of vegetative strips to remove sediment and  
 36 improve drain water quality (CALFED 2000). During the irrigation season,  
 37 surface drainage water collected from irrigation can be recirculated for subsequent  
 38 irrigation; however, this can lead to a long-term increase in soil salinity  
 39 (DWR 2013a; SJVDIP 1998).

40 Subsurface drainage is used to control groundwater depth to avoid or limit its  
 41 encroachment into the root zone of crops (Panuska 2011). For example in the  
 42 Delta, subsurface and surface drainage is used not only to control groundwater  
 43 depths related to irrigation practices, but also to control groundwater that seeps

1 into the soils from the surface water that surrounds the islands and tracts. Areas  
2 in the western and southern San Joaquin Valley are affected by shallow, saline  
3 groundwater that accumulates due to irrigation; and the shallow groundwater is  
4 underlain by soils with poor drainage (CALFED 2000; DWR 2013a; SJVDP  
5 1990; SJVDIP 1998; WWD 2013a, 2013b). Some areas of northern San Joaquin,  
6 Valley collect and discharge subsurface drainage to the San Joaquin River  
7 (Reclamation, 2013). Areas in the central and southern San Joaquin Valley  
8 manage poor drainage conditions by careful and integrated management of crop  
9 patterns, land retirement, irrigation methods and application rates, and/or drainage  
10 water reuse and blending, (USGS 2008; WRCD 2004).

#### 11 **12.3.1.2.6 Crop Adaptation in Response to Changes in Water Supply** 12 **Availability**

13 Farmers and water suppliers can react to changes in water supply in a range of  
14 ways. Some farmers adapt to variability by maintaining a mix of crops that can  
15 be shifted or fallowed in response to water supply changes. Some farmers have  
16 groundwater wells that can be used to replace surface water in times of shortage.  
17 Short term responses can also include reducing irrigation water application below  
18 what is needed to maintain full crop yield (water stressing). Over the long term,  
19 irrigation systems and management can be changed to apply less water.  
20 Decisions that farmers make in response to changes in water supply affect other  
21 aspects of their operations, and affect the economy of the surrounding  
22 community. For example, crop mix and irrigation methods affect the kinds of  
23 tractors and other equipment used on the farm.

24 Some types of on-farm infrastructure also are specialized for the crops grown  
25 including: grain driers and storage, hullers, fruit sorting and packing, fruit driers,  
26 cotton gins and cold storage plants. Crop-specific equipment, infrastructure, and  
27 marketing agreements may prevent a grower from change crops quickly due to  
28 changes in water supply availability.

29 Input suppliers, equipment dealers, labor force, and processing facilities are also  
30 dependent on, and affected by, cropping decisions. As crop types change, the mix  
31 of these related economic activities also change. This can happen over a period of  
32 time, but is difficult to achieve in the short term.

#### 33 *Response to Variability in CVP and SWP Water Supplies*

34 Water availability provided by the CVP and SWP varies each year based upon  
35 hydrologic conditions and regulatory requirements, as described in Chapter 5,  
36 Surface Water Resources and Water Supplies. The CVP and SWP water supply  
37 allocations are initially announced in the late winter. The allocations can be  
38 revised throughout the spring months as the hydrologic conditions become more  
39 certain. Growers often delay finalizing some of their crop decisions until water  
40 supply allocations are announced as late as April or May. Delays in finalizing  
41 crop decisions also can result in delays in finalizing crop financing and orders to  
42 suppliers (e.g., seed, fertilizer), and contracting with labor suppliers and crop  
43 processors. Responses to variations in water allocations depend on many factors,  
44 including but not limited to: feasibility of alternative water supplies (availability,

1 suitability of water quality, cost); types of crops grown and need for changes in  
 2 equipment, processing, and labor; and long-term crop supply contracts and  
 3 obligations, (WWD 2013a, 2013b). A study of changes that occurred during the  
 4 1986 through 1992 drought indicated that implementation of the changes will  
 5 probably occur over a longer period of time and not necessarily during the water  
 6 supply shortage, especially if groundwater or other surface water supplies can be  
 7 obtained within the growing season (Dale et al. 1998).

8 The effects on the surrounding communities of the variability of CVP and SWP  
 9 water supplies are discussed in Chapter 19, Socioeconomics, and Chapter 21,  
 10 Environmental Justice.

11 Typical responses of a farmer or water supplier to increasing shortage of water  
 12 supplies include the following actions.

- 13 • **Increase the use of groundwater:** Reduction in surface water supplies can  
 14 induce substitution with groundwater using new or existing wells. Water  
 15 supplies are used conjunctively in some areas with groundwater storage so  
 16 that during surface water shortages, water historically used to recharge  
 17 groundwater can be used for applied irrigation uses.
- 18 • **Use alternative/supplemental surface water supplies:** Alternative water  
 19 supplies may include local exchanges or transfers of surface water, water  
 20 transfers/purchases from more distant areas, and/or use of water stored in  
 21 surface water reservoirs or groundwater banks. These all depend on the  
 22 infrastructure to convey the water and the financial ability to pay for the  
 23 alternatives water supplies.
- 24 • **Increased water use efficiency:** Reduced use of irrigation water may be  
 25 achieved by on-farm system and irrigation management improvements, water  
 26 reuse, water source blending, and delivery system improvements. Specific  
 27 on-farm and delivery system improvements can include irrigation scheduling,  
 28 field leveling, application system changes, and conveyance system loss  
 29 reduction such as canal lining, spill reduction, and automation. Some of the  
 30 changes require only management changes, such as irrigation scheduling, and  
 31 can occur within the growing season. Other changes, such as conveyance  
 32 system modifications, require capital investments and generally require  
 33 several years to implement.
- 34 • **Field fallowing or changing to lower-water-use crops:** Fallowing, or  
 35 temporary idling, reduces gross water use by the entire applied water amount,  
 36 and reduces net water use by at least the evapotranspiration of the crop not  
 37 planted. Typically fields with higher water use crops or lower value rotation  
 38 crops would be the first fields to be fallowed. Farmers generally would avoid  
 39 or minimize fallowing permanent crops or crops with long-term obligations  
 40 (e.g., cannery contracts). A farmer receiving a partial allocation of water  
 41 could decide to reduce irrigated acreage and transfer that acreage's water  
 42 allocation to the remaining fields in production or sell the water to other water  
 43 users. A smaller reduction in water use can be achieved by switching from a  
 44 crop using more water to one using less water (Dale et al. 1998). Permanent

- 1 crops, such as trees and vines, that are the least economically viable or that are  
2 approaching the end of their lifespan can be removed or abandoned, and the  
3 land fallowed until adequate water is available. In extreme dry periods, such  
4 as 2014 when there were no deliveries of CVP water to San Joaquin Valley  
5 water supply agencies with CVP water service contracts, permanent crops  
6 were removed because the plants would not survive the stress of no water or  
7 saline groundwater (Fresno Bee 2014).
- 8 • **Stress Irrigation:** Farmers generally try to irrigate to achieve maximum  
9 economic yield. For some permanent crops, severe pruning could reduce  
10 water use, but could reduce yield over multiple years (AgAlert 2010).

11 **12.3.1.3 Cropping Pattern Changes in Response to Water Supply**  
12 **Availability**

13 Conversion of farm lands to other land uses has occurred historically and  
14 continues to occur. Agricultural lands have been converted to different crop  
15 patterns, urban areas, habitat restoration, off-farm infrastructure (e.g., utilities and  
16 transportation), and on-farm infrastructure (e.g., storage, maintenance, and  
17 processing facilities). Crop conversions occur in response to changes in water  
18 supply reliability, changes in market demand for specific crops, and decisions to  
19 convert lands to urban or infrastructure land uses.

20 One method used to indicate changes in California agricultural acreage is related  
21 to a loss of the value of production on “Important Farmland” and “Grazing Land”  
22 acreages, as reported by the California Department of Conservation since 1988  
23 (CDOC 2004). The comparison of the acreage of lands within each category can  
24 be used to identify trends in agricultural land conversions. This information is  
25 provided in the following subsections for the years 2000 and 2010 for counties  
26 within the study area.

27 Another factor to be considered prior to crop conversion is the costs related to  
28 crop establishment. Costs of irrigated crop production include labor, purchased  
29 inputs (e.g., seed, fertilizer, chemicals), custom services, investment in growing  
30 stock, other capital (including machinery and structures), and other overhead  
31 costs.

32 Reliability of water supply can be especially important for maintaining substantial  
33 investments in growing stock of perennial and multi-year crops. Perennial crops  
34 include orchards and vineyards that may have useful lives of 25 years or more.  
35 Multiyear forage crops, such as alfalfa and irrigated pasture, also may be in  
36 production for years. Investment in growing stock may be expressed as the  
37 accumulated costs incurred during the period when the crop is planted and  
38 brought to bearing age, called the establishment period. Establishment costs for  
39 perennial crops can range up to \$15,000 per acre in total costs (including cash  
40 outlays plus noncash and allocated overhead costs). The example establishment  
41 costs provided in Table 12.2 are for the Central Valley, but are generally  
42 representative of establishment costs in other regions.

1 **Table 12.2 Typical Establishment Costs for Some Perennial Crops in the Central**  
 2 **Valley**

Example Crop	Establishment Period (years)	Assumed Life of Stand (years)	Accumulated Total Cost during Establishment (\$ per acre)	University of California Cooperative Extension Cost of Production Study
Alfalfa Hay	1	4	534	Sacramento Valley, 2013
Almonds	4	25	10,117	San Joaquin Valley North, 2011
Irrigated Pasture	1	20	408	Sacramento Valley, 2003
Walnuts	5	25	14,133	San Joaquin Valley North, 2013
Wine Grapes	3	25	18,495	Cabernet Sauvignon, SJ Valley North, 2012

3 Sources: UCCE 2003, 2011, 2012a, 2013a

4 Notes: All costs are converted to 2012 dollar equivalent values using the Gross Domestic  
 5 Product Implicit Price Deflator (USDOC 2014). Assumed stand life is the financial life  
 6 used for the cost and budget analysis. Individual growers may decide to keep stands in  
 7 production longer or to remove them sooner.

8 Farm expenditures are largely spent in the surrounding community in the form of  
 9 input purchases, hired labor, rents paid to landlords, well drilling, and custom  
 10 consulting services. Total labor in the agricultural production sector is discussed  
 11 in relation to the regional economy in Chapter 19, Socioeconomics. Labor hours  
 12 and input purchases vary substantially among crops, as shown in Table 12.3.

13 **Table 12.3 Land Rent, Labor Hours, and Custom Services for Example Crops in the**  
 14 **Central Valley**

Example Crop	Typical Rent (\$ per acre)	Typical Annual Labor (hours per acre)	Custom Services Purchased (\$ per acre)	University of California Cooperative Extension Cost of Production Study
Alfalfa Hay	284	2	368	Sacramento Valley, 2013
Almonds	763	31	828	San Joaquin Valley North, 2011
Corn, Grain	147	3	324	San Joaquin Valley South, 2012
Irrigated Pasture	63	3	159	Sacramento Valley, 2003
Rice	280	5	329	Sacramento Valley, 2012
Walnuts	690	8	1,203	San Joaquin Valley North, 2013
Wheat	246	2	57	San Joaquin Valley South, 2013
Wine Grapes	633	68	505	Cabernet Sauvignon, SJ Valley North, 2012

15 Sources: UCCE 2003, 2011, 2012a, 2012b, 2012c, 2013a, 2013b, 2013c

16 Notes: All costs are converted to 2012 dollar equivalent values using the Gross Domestic  
 17 Product Implicit Price Deflator (USDOC 2014).

1     **12.3.1.4    Water Supply and Crop Acreage Relationships in the San**  
2                    **Joaquin Valley**

3     Most publically-available information on irrigated acreage and crop types is  
4     compiled at the county level, not the water district level. Water availability for  
5     CVP and SWP water is provided at a smaller geographic level, such as a water  
6     supply entity or several adjacent entities. Therefore, it is difficult to analyze the  
7     correlation of water supply availability, irrigated acreage, and crop types.  
8     However, the Westlands Water District does provide more detailed information  
9     related to water availability, irrigated acreage, and crop types in their publically-  
10    available reports, as summarized in this sub-section of Chapter 12. The purpose  
11    of this summary is to describe the relationships between cropping patterns,  
12    irrigation methods, and water supply availability. Due to the increased frequency  
13    of water supply reductions, especially in drier years (as described in Chapter 5,  
14    Surface Water Resources and Water Supplies), the amount of fallowed and  
15    non-harvested lands has increased as a percentage of total lands within Westlands  
16    Water District. The trend observed in Westlands Water District of using  
17    additional groundwater and crop idling land when CVP and SWP water supplies  
18    are reduced; and reducing groundwater use and increasing irrigated acreage when  
19    CVP and SWP become more available occurs throughout the San Joaquin Valley.

20    **12.3.1.4.1      Water Supplies in Westlands Water District**

21    Formed in 1952, Westlands Water District currently serves over 700 farmers  
22    across 604,000 acres located on the west side of Fresno and Kings Counties, as  
23    described in Chapter 5, Surface Water Resources and Water Supplies  
24    (WWD 2013a, 2013b). There are approximately 568,000 irrigable acres in the  
25    district.

26    Westlands Water District began receiving CVP water in 1968. In the first  
27    10 years of operations, irrigation water conveyance facilities were completed and  
28    cropping patterns became established. The CVP water supplies were reduced  
29    during the 1976 to 1977 drought. Crop acreage and water supply information are  
30    available for Westlands Water District from 1978 through 2013 (WWD 2013a,  
31    2014b, 2014c).

32    This time period includes several major happenings and/or changes in the CVP  
33    water supplies, as described in Chapter 5, Surface Water Resources and Water  
34    Supplies, and Chapter 6, Surface Water Quality.

- 35    • In 1978, the CVP water supplies were recovering from the 1976 to  
36      1977 drought.
- 37    • In the late 1980s, high selenium concentrations were detected in subsurface  
38      drainage flows from areas on the west side of the San Joaquin Valley where  
39      naturally occurring selenium deposits are located. Subsequently, farmers in  
40      these areas changed irrigation practices and in some cases, eliminated  
41      irrigation of some lands.
- 42    • Between 1987 and 1992, another drought occurred.

- 1 • In mid-1990s, the CVP water supplies recovered from a six year drought;  
2 however, CVP water supplies available to the district were limited due to  
3 initial restrictions on CVP operations to protect winter-run Chinook salmon  
4 and delta smelt and to provide refuge water supplies in accordance with the  
5 federal Central Valley Project Improvement Act (Public Law 102-575).
- 6 • By 2000, the CVP was initially operated under the requirements of State  
7 Water Resources Control Board Decision 1641 and the federal Central Valley  
8 Project Improvement Act which reduced the long-term availability of CVP  
9 water as compared to the 1980s.
- 10 • In 2007, the CVP operations were modified in accordance with the Interim  
11 Remedial Order issued by the U.S. District Court for the Eastern District of  
12 California in *Natural Resources Defense Council, et al. v. Kempthorne*.
- 13 • In 2009, the CVP operations were modified in accordance with the 2008  
14 U.S. Fish and Wildlife Service and 2009 National Marine Fisheries Services  
15 biological opinions.
- 16 • Between 2007 and 2013, six of the seven years were designated as Below  
17 Normal, Dry, or Critical Dry water years, which reduced CVP water supplies.

18 As CVP water supplies have declined over the past 35 years, Westland Water  
19 District has needed to implement major conservation programs and purchase  
20 water from other CVP and SWP water users and water rights holders.  
21 Concurrently, growers have increased groundwater pumping, as illustrated in  
22 Figure 12.3. Total supply over this time period ranges from a low of  
23 787,554 acre-feet in 2010 to a high of 1,546,883 acre-feet in 1984  
24 (WWD 2013a, 2014a).

#### 25 **12.3.1.4.2 Cropping Patterns in Westlands Water District**

26 In response to varying water supplies and market factors, farmers in Westlands  
27 Water District have changed cropping patterns. In 1978, the predominant crops  
28 were cotton and grain crops, including wheat and barley, with some vegetables,  
29 including tomatoes and cantaloupe, as summarized in Figure 12.4 (WWD 2013a).  
30 Between 1980 and 1996, grain crops were replaced by vegetable crops because  
31 other areas in California that traditionally grew crops were experiencing  
32 urbanization and groundwater shortages, including southern Santa Clara County  
33 and Monterey County (WWD 2008). Planting of permanent crops, including  
34 orchards and grapevines, increased between 1978 and 2013 as the markets factors  
35 became favorable (WWD 2013a, 2014b, 2014c). Total cotton acreage remained  
36 stable between 1978 and 2000, with Acala cotton as the primary crop (WWD No  
37 Date-a, No Date-b). After 2000, the total acreage of cotton declined and the  
38 primary crop was Pima cotton due to higher market price for this crop; however,  
39 cotton prices declined in the early 2000s.

#### 40 **12.3.1.4.3 Irrigation Methods in Westlands Water District**

41 Conversion of the major crops from annual grains to more orchards and vines  
42 resulted in Westlands Water District modifying water conveyance facilities

1 because the water demand patterns changed both in quantities and seasonal timing  
 2 (WWD No Date-c). The change in cropping patterns and the concurrent emphasis  
 3 on water conservation also resulted in changes in irrigation methods within the  
 4 district, as summarized in Table 12.4.

5 **Table 12.4 Irrigation Methods Used in Westlands Water District, as a percentage of**  
 6 **total irrigation methods**

Years	Furrow or Border Strip Irrigation	Sprinkler Irrigation	Drip or Trickle Irrigation	Sprinkler and Furrow Irrigation
1985	63%	21%	1%	15%
1990	43%	16%	3%	38%
1995	36%	15%	6%	43%
2000	30%	13%	13%	44%
2005	23%	10%	33%	34%
2010	11%	11%	67%	22%
2011	13%	12%	65%	22%

7 Source: WWD 2013a

8 These changes represent a major investment by the farmers and are considered in  
 9 the cost of crop establishment costs, a consideration described in above in  
 10 subsection 12.32.3.1, Crop Establishment Costs. The lower-valued grain and  
 11 forage crops generally use furrow or border strip irrigation (WWD 2013a).  
 12 Shallow-rooted vegetables frequently are irrigated with sprinklers or a  
 13 combination of sprinklers and furrow irrigation. Recently, tomatoes for  
 14 fresh-pack have been grown with drip irrigation. New orchard and vines have  
 15 been planted with pressurized drip or trickle irrigation. Other methods, including  
 16 leveling lands with lasers guided by global positioning satellites and aerated  
 17 irrigation to introduce air to plant roots, are used to increase irrigation efficiency  
 18 and improve crop yield (WWD No Date-a).

19 **12.3.1.4.4 Response to Reduced Water Supplies in Westlands Water**  
 20 **District**

21 Westlands Water District acquired over 95,000 acres of land with inadequate  
 22 drainage and the water supplies allocated to these lands are now available for  
 23 other lands in the district (WWD 2008, 2013a, No Date-c). Much of the  
 24 purchased land is leased to farmers for non-irrigated crops, or made available for  
 25 buildings or other economic development, including about 600 acres to the  
 26 U.S. Bureau of Prisons and about 1,250 acres to Pacific Gas & Electric Company  
 27 for solar projects.

28 Frequently, the amount of available surface water is not adequate to meet the  
 29 irrigation water demand. For example in the drier years of 1991, 1992, 2009, and  
 30 2013, groundwater provided more than 50 percent of the irrigation water supply.  
 31 This extensive reliance on groundwater can substantially reduce groundwater

1 elevations, as described in Chapter 7, Groundwater Resources and Groundwater  
2 Quality.

3 The Westlands Water District *Water Management Handbook* discusses that  
4 during droughts, water supplies are reduced and the cost of available water  
5 supplies are generally high due to costs of water transfers and/or implementing  
6 new or expanded groundwater facilities (WWD 2013b). At the farm level,  
7 Westlands' growers use a mix of methods to respond to reduced water supplies:  
8 groundwater pumping, land fallowing, and stress irrigation. The decision to  
9 fallow land or stress crops by applying less than full irrigation depends upon the  
10 crop. Some crops require full irrigation in order to produce a profitable yield, so  
11 stress irrigation is not practical – if water is short, acreage of these crops is  
12 reduced. Other crops may be able to withstand some stress and produce profitable  
13 yield. In the most severe shortage years, such as 2014, even some orchards and  
14 vineyards may be stressed or removed from production. From 1978 through the  
15 late 1990s when the primary crops were grains and cotton, those crops continued  
16 to be grown under stressed conditions and the fallowed and non-harvested land  
17 ranged from 3 to 16 percent of the total land in the district, as summarized in  
18 Figure 12.5 (WWD 2013a, 2014b, 2014c). However, since 2000, over 40 to  
19 55 percent of the total land in the district is planted in high value orchards, vine,  
20 and vegetable crops which cannot sustain stress. Therefore, farmers have  
21 increased the amount of fallowed and non-harvested acres to 10 to 34 percent of  
22 the total land in the district. When permanent orchards and vines are removed  
23 from production, the overall value of production in the district declines for  
24 number of years as the permanent crops require several years to become  
25 established.

### 26 **12.3.2 Trinity River Region**

27 The Trinity River Region includes the area in Trinity County along the Trinity  
28 River from Trinity Lake to the confluence with the Klamath River; and in  
29 Humboldt and Del Norte counties along the Klamath River from the confluence  
30 with the Trinity River to the Pacific Ocean.

31 Agriculture in the Trinity River Region is primarily related to timber products and  
32 cattle ranching which generally do not rely upon irrigation. Small farms and  
33 vineyards are located adjacent to or near the Trinity River rely primarily upon  
34 groundwater that is recharged by precipitation and infiltration from local streams,  
35 as described in Chapter 7, Groundwater Resources and Groundwater Quality. No  
36 lands in Trinity River Region are irrigated with water supplies delivered through  
37 the CVP or SWP.

38 Total value of production and acreage by crop category in the counties that  
39 include portions of the Trinity River Region are listed in Table 12.5.

1 **Table 12.5 Average Annual Agricultural Acreage and Value of Production in Trinity,**  
 2 **Humboldt, and Del Norte Counties from 2007 through 2012**

	<b>Orchards, Vineyards, and Berries</b>	<b>Field and Forage</b>	<b>Livestock, Dairy, Poultry</b>	<b>Nursery, Other</b>	<b>Vegetable</b>	<b>Total</b>
Acreage <sup>a</sup>	114	30,846	N/A	231	–	31,191
Value <sup>b</sup>	\$1.8	\$8.1	\$108.2	\$64.5	\$1.7	\$184

3 Sources: USDA-NASS2008, 2009, 2010, 2011a, 2012a, 2013a

4 Notes:

- 5 a. Not all acreages and/or production values are reported for every crop in every county.  
 6 Therefore the implied value of production per acre may be misleading for some crop  
 7 categories.  
 8 b. Values in million dollars, 2012 basis.

### 9 **12.3.3 Central Valley Region**

10 The Central Valley Region extends from above Shasta Lake to the Tehachapi  
 11 Mountains, and includes the Sacramento Valley and San Joaquin Valley. In this  
 12 chapter, the counties within the Delta and Suisun Marsh area are included in the  
 13 description of the Sacramento and San Joaquin valleys or the San Francisco Bay  
 14 Area Region. The Delta counties of Sacramento, Yolo, and Solano counties are  
 15 included within the Sacramento Valley discussion. Solano County also includes  
 16 the Suisun Marsh. San Joaquin County is included within the San Joaquin Valley  
 17 discussion. Contra Costa County is included within the San Francisco Bay Area  
 18 Region discussion.

19 Central Valley agriculture is highly productive due to favorable climate, adequate  
 20 supplies of good quality irrigation water, and deep, fertile soils. Most of the  
 21 Central Valley receives rainfall in the late fall through the winter months. Very  
 22 little of the annual rainfall occurs during the peak agricultural irrigation season  
 23 which extends from early spring through fall. The seasonality of rainfall in the  
 24 Central Valley is important for agricultural resources, as the timing of  
 25 precipitation does not reliably support dryland (non-irrigated) farming. Lower  
 26 value over-winter non-irrigated crops (e.g., winter wheat) can be grown  
 27 economically in many years but higher value row crops and permanent crops  
 28 require substantial supplemental irrigation (DWR 2009). Irrigation water  
 29 provided by the CVP and SWP, local surface water, and groundwater have  
 30 transformed lands in the Central Valley into some of the most productive and  
 31 diverse agricultural lands in the United States.

#### 32 **12.3.3.1 Sacramento Valley Crop Patterns**

33 The Sacramento Valley includes the counties of Shasta, Plumas, Tehama, Glenn,  
 34 Colusa, Butte, Sutter, Yuba, Nevada, Placer, El Dorado, Sacramento, Yolo, and  
 35 Solano counties. Other counties in Sacramento Valley are not anticipated to be  
 36 affected by changes in CVP and SWP operations, and are not discussed here,  
 37 including: Alpine, Sierra, Lassen, and Amador counties.

1 Field and forage crops dominate the irrigated acreage in Sacramento Valley with  
 2 over 1.4 million acres irrigated and about 38 percent of crop value produced, as  
 3 summarized in Table 12.6. Rice, irrigated pasture, and hay are the largest  
 4 acreages. Second to field and forage are orchard and vine crops, making up  
 5 roughly 21 percent of total acreage, but providing more than 38 percent crop  
 6 value produced. Almonds and walnuts are the largest acreages in this category.  
 7 Crop establishment and production costs are as summarized in Tables 12.2 and  
 8 12.3. In total, the Sacramento Valley contains nearly two million agricultural  
 9 acres generating over four billion dollars per year in value of production.

10 **Table 12.6 Sacramento Valley Average Annual Agricultural Acreage and Value of**  
 11 **Production from 2007 through 2012**

	Orchards, Vineyards, and Berries	Field and Forage	Livestock, Dairy, Poultry	Nursery, Other	Vegetable	Total
Acreage <sup>a</sup>	419,263	1,435,923	N/A	1,658	91,684	1,948,527
Value <sup>b</sup>	\$1,569	\$1,581	\$506	\$135	\$322	\$4,113

12 Sources: USDA-NASS 2008, 2009, 2010, 2011a, 2012a, 2013a

13 Notes:

- 14 a. Not all acreages and/or production values are reported for every crop in every county.  
 15 Therefore the implied value of production per acre may be misleading for some crop  
 16 categories.  
 17 b. Values in million dollars, 2012 basis

18 Most of the counties within the Sacramento Valley have experienced losses in  
 19 Important Farmland between 2000 and 2010, as summarized in Table 12.7.

20 **Table 12.7 Farmland Mapping and Monitoring Program Acreages in the**  
 21 **Sacramento Valley in 2000 and 2010**

County	Total <sup>a</sup>	Important Farmland <sup>b</sup>			Grazing Land		
		2000	2010	Change	2000	2010	Change
Butte	1.08	257,316	237,351	-19,965	264,982	402,999	138,017
Colusa	0.72	565,890	554,695	-11,195	7,526	9,161	1,635
El Dorado	1.1	68,292	64,259	-4,033	203,798	193,883	-9,915
Glenn	0.84	407,906	348,147	-59,759	176,072	226,837	50,765
Nevada	0.64	21,973	25,934	3,961	129,758	116,808	-12,950
Placer	0.96	156,701	132,741	-23,960	23,708	24,193	485
Sacramento	1.1	227,931	211,744	-16,187	168,144	155,822	-12,322
Shasta	2.4	35,349	19,716	-15,633	409,479	414,052	4,573
Solano	0.58	169,934	147,464	-22,470	201,813	209,195	7,382
Sutter	0.39	301,176	285,820	-15,356	50,958	53,538	2,580
Tehama	1.7	244,782	231,592	-13,190	706,027	1,547,951	841,924
Yolo	0.65	409,796	374,534	-35,262	143,365	160,450	17,085
Yuba	0.41	90,173	82,538	-7,635	144,519	141,509	-3,010

1 Sources: Butte County 2010; CDOC 2013; Colusa County 2011; El Dorado County 2003;  
2 Glenn County 1993; Nevada County 1995; Placer County 2011; Sacramento County  
3 2010; Shasta County 2004; Solano County 2008; Sutter County 2010; Tehama County  
4 2008; Yolo County 2009; Yuba County 2011

5 Notes:

6 a. Total acreage of county in million acres

7 b. Includes Prime Farmland, Farmland of Statewide Importance, and Unique Farmland.

8 No data was reported by California Department of Conservation for Plumas County.

9 **12.3.3.2 San Joaquin Valley**

10 The San Joaquin Valley includes the counties of Stanislaus, Merced, Madera,  
11 San Joaquin, Fresno, Kings, Tulare, and Kern counties. Other counties in the San  
12 Joaquin Valley are not anticipated to be affected by changes in CVP and SWP  
13 operations, and are not discussed here, including: Calaveras, Mariposa, and  
14 Tuolumne counties.

15 Field and forage crops are also the largest category in by acreage in this region, as  
16 summarized in Table 12.8. Hay, cotton, and silage have the largest acreage in this  
17 category. Second to field and forage is orchard and vine crops with almost two  
18 million acres, but providing more than three times the value of production.

19 Almonds and grapes are the two largest acreages of orchard and vine crops in the  
20 San Joaquin Valley. Crop establishment and production costs are as summarized  
21 in Tables 12.2 and 12.3. In total, the San Joaquin Valley contains over 5.5 million  
22 irrigated acres, generating over twenty-six billion dollars in value of production.

23 Important differences exist in water supply mix and reliability within the San  
24 Joaquin Valley. The CVP water users that are located on the west side of the  
25 valley and the SWP water users in Kings and Kern counties rely primarily on  
26 surface water conveyed through the Delta and groundwater, as discussed in  
27 Chapter 5, Surface Water Resources and Water Supplies. Agricultural producers  
28 within these CVP water service contractors and SWP entitlement holders are  
29 especially susceptible to large variation in available surface water supplies. The  
30 San Joaquin River Exchange Contractors receive CVP water supplies in exchange  
31 for their water rights on the San Joaquin River; and therefore, have much higher  
32 water supply reliability than CVP water service contractors or SWP entitlement  
33 holders, as described in Chapter 5, Surface Water Resources and Water Supplies.

34 On the east side of the San Joaquin Valley at the base of the Sierra Nevada,  
35 surface water is delivered under senior water rights on streams from the Sierra  
36 Nevada, or by the CVP from Millerton Lake at Friant Dam, as described in  
37 Chapter 5, Surface Water Resources and Water Supplies. The reliability of CVP  
38 water supplies from Friant Dam have generally been similar to or higher than that  
39 of CVP water supplies conveyed through the Delta. However, in 2014, the  
40 allocations were reduced to zero and available water from Friant Dam was  
41 provided to the water rights holders along the San Joaquin River (e.g., San  
42 Joaquin River Exchange Contractors).

1 A number of agricultural areas throughout the valley have no or very low priority  
 2 surface water rights. Growers in these areas rely on groundwater for irrigation  
 3 water.

7 Notes:

8 a. Not all acreages and/or production values are reported for every crop in every county.  
 9 Therefore the implied value of production per acre may be misleading for some crop  
 10 categories.

11 b. Values in million dollars, 2012 basis.

12 Most counties within the San Joaquin Valley Region have experienced losses in  
 13 Important Farmland between 2000 and 2010, as summarized in Table 12.9. The  
 14 acreage of Important Farmland in Kern County grew substantially due to  
 15 reclassification of lands in the foothills of the county.

16 **Table 12.9 Farmland Mapping and Monitoring Program Acreages in the San**

1 **12.3.4 San Francisco Bay Area Region**

2 The San Francisco Bay Area Region includes portions of Napa, Contra Costa,  
3 Alameda, Santa Clara, and San Benito counties that are within the CVP and SWP  
4 service areas.

5 Crops grown in the San Francisco Bay Area Region include berries, vegetables,  
6 orchards, nursery plants, and irrigated and non-irrigated pasture. Permanent crops  
7 (orchards, vineyards, and berries) cover the largest acreage in this region with  
8 around 60,000 acres planted, as summarized in Table 12.10. Field and forage  
9 crops and vegetables also cover substantial acreage. Crop establishment and  
10 production costs are generally similar to those shown in Tables 12.2 and 12.3,  
11 except that land costs and rent may be substantially higher in this region. In total,  
12 the San Francisco Bay Area Region contains about 150,000 acres planted,  
13 creating over one billion dollars per year in value of production.

**12.3.5 Central Coast Region**

The Central Coast Region includes portions of San Luis Obispo and Santa Barbara counties served by the SWP.

Crops grown in this region include orchards and vineyards, berries, vegetables, and irrigated pasture. Permanent crops and vegetables dominate the irrigated acreage in this region, accounting for about eighty percent of both the acres planted and the annual value of production, as summarized in Table 12.12. Crop establishment and production costs are generally similar to those shown in Tables 12.2 and 12.3, except that land costs and rent may be higher in this region. On average, the Central Coast Region contains almost 230,000 acres planted and almost two billion dollars per year in value of production.

**Table 12.12 Central Coast Region Average Annual Agricultural Acreage and Value from 2007 through 2012**

**12.3.6 Southern California Region**

The Southern California Region includes portions of Ventura, Los Angeles, Orange, San Diego, Riverside, and San Bernardino counties served by the SWP.

1 Two crop categories, orchards, vineyards, and berries; and field and forage,  
 2 account for more than three quarters of the irrigated acreage and about sixty  
 3 percent of the annual value of production in the Southern California Region, as  
 4 summarized in Table 12.14). Vegetables account for about one fifth of the  
 5 irrigated acreage and production value. Crop establishment and production costs  
 6 are generally similar to those shown in Tables 12.2 and 12.3, except that land  
 7 costs and rent may be higher in parts of this region. In total, the Southern  
 8 California Region contains almost 380,000 acres irrigated and generates over five  
 9 billion dollars per year in value of production.

## 1 **12.4 Impact Analysis**

2 This section describes the potential mechanisms and analytical methods for  
3 change in agricultural resources; results of the impact analysis; potential  
4 mitigation measures; and cumulative effects.

### 5 **12.4.1 Potential Mechanisms for Change in Agricultural** 6 **Resources**

7 As described in Chapter 4, Approach to Environmental Analysis, the impact  
8 analysis considers changes in agricultural resources related to changes in CVP  
9 and SWP operations under the alternatives as compared to the No Action  
10 Alternative and Second Basis of Comparison.

11 Changes in CVP and SWP operations under the alternatives as compared to the  
12 No Action Alternative and Second Basis of Comparison could change irrigated  
13 acreage and total production value in areas that use CVP and SWP water supplies  
14 under long-term conditions (based upon the 81-year model simulation period) and  
15 dry and critical dry years.

16 This chapter only includes the analysis of economic changes in agricultural  
17 revenues. Chapter 19, Socioeconomics, includes economic changes related to  
18 municipal and industrial water supplies and changes in regional economics.

#### 19 **12.4.1.1 Changes in Irrigated Agricultural Acreage and Total Production** 20 **Value**

21 Changes in CVP and SWP operations under the alternatives could change the  
22 extent of irrigated acreage and total production value over the long-term average  
23 condition and in dry and critical dry years as compared to the No Action  
24 Alternative and Second Basis of Comparison.

25 The results of the impact analysis represents comparison of long-term changes  
26 that would occur between alternatives by 2030. The impact analysis does not  
27 represent short-term responses, especially during one to five years, in response to  
28 emergency flood or drought conditions.

29 Agricultural impacts were evaluated using a regional agricultural production  
30 model developed for large-scale analysis of irrigation water supply and cost  
31 changes. The Statewide Agricultural Production (SWAP) model is a regional  
32 model of irrigated agricultural production and economics that simulates the  
33 decisions of producers (farmers) in 27 agricultural subregions in the Central  
34 Valley Region, as described in Appendix 12A. The model selects the crops, water  
35 supplies, and other inputs that maximize profit subject to constraints on water and  
36 land, and subject to economic conditions regarding prices, yields, and costs.

37 The SWAP model incorporates CVP and SWP water supplies, other local water  
38 supplies represented in the CalSim II model, and groundwater. As conditions  
39 change within a SWAP subregion (e.g., the quantity of available project water  
40 supply declines), the model optimizes production by adjusting the crop mix, water

1 sources and quantities used, and other inputs. The model also follows land when  
2 that appears to be the most cost-effective response to resource conditions.

3 SWAP was used to compare the long-run agricultural economic responses to  
4 potential changes in CVP and SWP irrigation water delivery and to changes in  
5 groundwater conditions associated with the alternatives. Results from the surface  
6 water analysis that used the CalSim II model, as described in Chapter 5, Surface  
7 Water Resources and Water Supplies, were provided as inputs into SWAP  
8 through a standardized data linkage procedure. Results from the groundwater  
9 analysis that used the CVHM model, as described in Chapter 7, Groundwater  
10 Resources and Groundwater Quality, were used to develop changes in pumping  
11 lift in SWAP. SWAP produces estimates of the change in value and costs of  
12 agricultural production.

13 The analysis only reduces groundwater withdrawals based upon an optimization  
14 of agricultural production costs. The analysis does not restrict groundwater  
15 withdrawals based upon groundwater overdraft or groundwater quality conditions.  
16 As described in Chapter 7, Groundwater Resources and Groundwater Quality, the  
17 Sustainable Groundwater Management Act requires preparation of Groundwater  
18 Sustainability Plans (GSPs) by 2020 or 2022 for most of the groundwater basins  
19 in the Central Valley Region. The GSPs will identify methods to implement  
20 measures that will achieve sustainable groundwater operations by 2040 or 2042.  
21 The analysis in this chapter is focused on conditions that would occur in 2030. If  
22 local agencies fully implement GSPs prior to the regulatory deadline, increasing  
23 groundwater use would be less of an option for agricultural water users.  
24 However, to achieve sustainable conditions, some measures could require several  
25 years to design and construct new water supply facilities, and sustainable  
26 groundwater conditions are not required until the 2040s. Therefore, it was  
27 assumed that Central Valley agriculture water users would not reduce  
28 groundwater use by 2030, and that groundwater use would change in response to  
29 changes in CVP and SWP water supplies.

#### 30 **12.4.1.2 Effects Related to Water Transfers**

31 Historically water transfer programs have been developed on an annual basis.  
32 The demand for water transfers is dependent upon the availability of water  
33 supplies to meet water demands. Water transfer transactions have increased over  
34 time as CVP and SWP water supply availability has decreased, especially during  
35 drier water years.

36 Parties seeking water transfers generally acquire water from sellers who have  
37 available surface water who can make the water available through releasing  
38 previously stored water, pump groundwater instead of using surface water  
39 (groundwater substitution); idle crops; or substitute crops that uses less water in  
40 order to reduce normal consumptive use of surface water.

41 Water transfers using CVP and SWP Delta pumping plants and south of Delta  
42 canals generally occur when there is unused capacity in these facilities. These  
43 conditions generally occur in drier water year types when the flows from  
44 upstream reservoirs plus unregulated flows are adequate to meet the Sacramento

1 Valley water demands and the CVP and SWP export allocations. In non-wet  
 2 years, the CVP and SWP water allocations would be less than full contract  
 3 amounts; therefore, capacity may be available in the CVP and SWP conveyance  
 4 facilities to move water from other sources.

5 Projecting future agricultural resources conditions related to water transfer  
 6 activities is difficult because specific water transfer actions required to make the  
 7 water available, convey the water, and/or use the water would change each year  
 8 due to changing hydrological conditions, CVP and SWP water availability,  
 9 specific local agency operations, and local cropping patterns. Reclamation  
 10 recently prepared a long-term regional water transfer environmental document  
 11 which evaluated potential changes in agricultural resources conditions related to  
 12 water transfer actions (Reclamation 2014c). Results from this analysis were used  
 13 to inform the impact assessment of potential effects of water transfers under the  
 14 alternatives as compared to the No Action Alternative and the Second Basis of  
 15 Comparison.

#### 16 **12.4.2 Conditions in Year 2030 without Implementation of** 17 **Alternatives 1 through 5**

18 This EIS includes two bases of comparison, as described in Chapter 3,  
 19 Description of Alternatives: the No Action Alternative and the Second Basis of  
 20 Comparison. Both of these bases are evaluated at 2030 conditions. Changes that  
 21 would occur over the next 15 years without implementation of the alternatives are  
 22 not analyzed in this EIS. However, the changes to agricultural resources that are  
 23 assumed to occur by 2030 under the No Action Alternative and the Second Basis  
 24 of Comparison are summarized in this section. Many of the changed conditions  
 25 would occur in the same manner under both the No Action Alternative and the  
 26 Second Basis of Comparison.

##### 27 **12.4.2.1 Common Changes in Conditions under the No Action Alternative** 28 **and Second Basis of Comparison**

29 Conditions in 2030 would be different than existing conditions due to:

- 30 • Climate change and sea level rise
- 31 • General plan development throughout California, including increased water  
 32 demands in portions of Sacramento Valley
- 33 • Implementation of reasonable and foreseeable water resources management  
 34 projects to provide water supplies

35 It is anticipated that climate change would result in more short-duration  
 36 high-rainfall events and less snowpack in the winter and early spring months. The  
 37 reservoirs would be full more frequently by the end of April or May by 2030 than  
 38 in recent historical conditions. However, as the water is released in the spring,  
 39 there would be less snowpack to refill the reservoirs. These changes would result  
 40 in a decline of the long-term average CVP and SWP water supply deliveries by  
 41 2030 as compared to recent historical long-term average deliveries under the  
 42 No Action Alternative and the Second Basis of Comparison. However, the CVP

1 and SWP water deliveries would be less under the No Action Alternative as  
2 compared to the Second Basis of Comparison, as described in Chapter 5, Surface  
3 Water Resources and Water Supplies, which could result in more crop idling.

4 Under the No Action Alternative and the Second Basis of Comparison, land uses  
5 in 2030 would occur in accordance with adopted general plans. Development  
6 under the general plans would result in disruption of agricultural resources;  
7 however, the development of general plans includes preparation of environmental  
8 documentation that would identify methods to minimize adverse impacts to  
9 agricultural resources.

10 Under the No Action Alternative and the Second Basis of Comparison,  
11 development of future water resources management projects by 2030 which  
12 would result in improved water supply flexibility and availability, including water  
13 supplies for agricultural resources, as described in Chapter 3, Description of  
14 Alternatives.

15 By 2030 under the No Action Alternative and the Second Basis of Comparison, it  
16 is assumed that ongoing programs would result in restoration of more than  
17 10,000 acres of intertidal and associated subtidal wetlands in Suisun Marsh and  
18 Cache Slough; and 17,000 to 20,000 acres of seasonal floodplain restoration in the  
19 Yolo Bypass. The restoration programs could disrupt agricultural resources  
20 depending upon the location of the restoration.

### 21 **12.4.3 Evaluation of Alternatives**

22 Alternatives 1 through 5 have been compared to the No Action Alternative; and  
23 the No Action Alternative and Alternatives 1 through 5 have been compared to  
24 the Second Basis of Comparison.

25 During review of the numerical modeling analyses used in this EIS, an error was  
26 determined in the CalSim II model assumptions related to the Stanislaus River  
27 operations for the Second Basis of Comparison, Alternative 1, and Alternative 4  
28 model runs. Appendix 5C, Revised Second Basis of Comparison, includes a  
29 comparison of the CalSim II model run results presented in this chapter and  
30 CalSim II model run results with the error corrected.

31 Chapter 7, Groundwater Resources and Groundwater Quality, includes a  
32 discussion of changes in the comparison of groundwater conditions for the  
33 following alternative analyses.

- 34 • No Action Alternative compared to the Second Basis of Comparison
- 35 • Alternative 1 compared to the No Action Alternative
- 36 • Alternative 3 compared to the Second Basis of Comparison
- 37 • Alternative 5 compared to the Second Basis of Comparison.

38 The results of the impact analysis represents comparison of long-term changes  
39 that would occur between alternatives by 2030. The impact analysis does not  
40 represent short-term responses, especially during one to five years, in response to  
41 emergency flood or drought conditions.

1 **12.4.3.1 No Action Alternative**

2 The No Action Alternative is compared to the Second Basis of Comparison.

3 **12.4.3.1.1 Trinity River Region**

4 *Potential Changes in Irrigated Agricultural*

5 There are no agricultural lands irrigated with CVP and SWP water supplies in the  
6 Trinity River Region. Therefore, there would be no changes in irrigated lands  
7 under the No Action Alternative as compared to the Second Basis of Comparison.

8 **12.4.3.1.2 Central Valley Region**

9 *Potential Changes in Irrigated Agriculture.*

10 *Sacramento Valley*

11 Results of the SWAP analysis indicated that agricultural crop patterns in the  
12 Sacramento Valley would be similar (less than 5 percent change) under the  
13 No Action Alternative and the Second Basis of Comparison over long-term  
14 average conditions and in dry and critical dry years, as summarized in  
15 Tables 12.16 and 12.17.

16 **Table 12.16 Changes in Sacramento Valley Irrigated Acreage over the Long-term**  
17 **Average Conditions under the No Action Alternative as Compared to the Second**  
18 **Basis of Comparison**

Crops	No Action Alternative (1000s acres)	Second Basis of Comparison (1000s acres)	Changes (1000s acres)
Grain Crops	155	154	1
Rice	548	548	0
Field Crops	59	59	0
Forage Crops	199	200	-1
Vegetables and Truck Crops	119	119	0
Orchards and Vineyards	456	457	0
<b>Total</b>	<b>1,537</b>	<b>1,537</b>	<b>0</b>

19 Notes:

20 Grain crops include corn, dry beans, and grain.

21 Field crops include cotton, grass, hay, safflower, and sugar beets.

22 Forage crops include alfalfa and pasture.

23 **Table 12.17 Changes in Sacramento Valley Irrigated Acreage in Dry and Critical Dry**  
24 **Years under the No Action Alternative as Compared to the Second Basis of**  
25 **Comparison**

Crops	No Action Alternative (1000s acres)	Second Basis of Comparison (1000s acres)	Changes (1000s acres)
Grain Crops	155	155	0
Rice	544	548	-4
Field Crops	59	59	0
Forage Crops	197	198	-1

Crops	No Action Alternative (1000s acres)	Second Basis of Comparison (1000s acres)	Changes (1000s acres)
Vegetables and Truck Crops	119	119	0
Orchards and Vineyards	456	457	-1
<b>Total</b>	<b>1,529</b>	<b>1,536</b>	<b>-7</b>

- 1 Notes:  
 2 Grain crops include corn, dry beans, and grain.  
 3 Field crops include cotton, grass, hay, safflower, and sugar beets.  
 4 Forage crops include alfalfa and pasture.

5 Agricultural production in the Sacramento Valley would be similar (less than  
 6 5 percent change) under the No Action Alternative and the Second Basis of  
 7 Comparison over long-term average conditions and in dry and critical dry years  
 8 due to increased use of groundwater, as summarized in Tables 12.18 and 12.19.

9 **Table 12.18 Changes in Sacramento Valley Agricultural Production over the**  
 10 **Long-term Average Conditions under the No Action Alternative as Compared to the**  
 11 **Second Basis of Comparison**

Crops	No Action Alternative (\$ millions)	Second Basis of Comparison (\$ millions)	Changes (\$ millions)
Grain Crops	150	149	0.8
Rice	1,114	1,115	-0.9
Field Crops	77	77	0.1
Forage Crops	246	246	-0.7
Vegetables and Truck Crops	967	967	0.0
Orchards and Vineyards	3,192	3,193	-0.9
<b>Total</b>	<b>5,745</b>	<b>5,747</b>	<b>-1.6</b>

- 12 Notes:  
 13 Grain crops include corn, dry beans, and grain.  
 14 Field crops include cotton, grass, hay, safflower, and sugar beets.  
 15 Forage crops include alfalfa and pasture.  
 16 All values of production are in 2012 dollar equivalent values.

17 **Table 12.19 Changes in Sacramento Valley Agricultural Production in Dry and**  
 18 **Critical Dry Years under the No Action Alternative as Compared to the Second**  
 19 **Basis of Comparison**

Crops	No Action Alternative (\$ millions)	Second Basis of Comparison (\$ millions)	Changes (\$ millions)
Grain Crops	150	150	-0.5
Rice	1,107	1,114	-7.3

Crops	No Action Alternative (\$ millions)	Second Basis of Comparison (\$ millions)	Changes (\$ millions)
Field Crops	77	77	-0.1
Forage Crops	243	245	-1.4
Vegetables and Truck Crops	967	967	-0.2
Orchards and Vineyards	3,191	3,193	-1.7
<b>Total</b>	<b>5,735</b>	<b>5,746</b>	<b>-11.3</b>

- 1 Notes:
- 2 Grain crops include corn, dry beans, and grain.
- 3 Field crops include cotton, grass, hay, safflower, and sugar beets.
- 4 Forage crops include alfalfa and pasture.
- 5 All values of production are in 2012 dollar equivalent values.

6 *San Joaquin Valley*

7 Results of the SWAP analysis indicated that irrigated acreage in the San Joaquin  
 8 Valley, including the Tulare Lake area, would be similar under the No Action  
 9 Alternative as compared to the Second Basis of Comparison over long-term  
 10 average conditions and in dry and critical dry years, as summarized in  
 11 Tables 12.20 and 12.21.

12 **Table 12.20 Changes in San Joaquin Valley Irrigated Acreage over the Long-term**  
 13 **Average Conditions under the No Action Alternative as Compared to the Second**  
 14 **Basis of Comparison**

Crops	No Action Alternative (1000s acres)	Second Basis of Comparison (1000s acres)	Changes (1000s acres)
Grain Crops	1,024	1,024	0
Rice	17	17	0
Field Crops	828	828	0
Forage Crops	735	735	0
Vegetables and Truck Crops	633	633	0
Orchards and Vineyards	2,156	2,156	0
<b>Total</b>	<b>5,392</b>	<b>5,392</b>	<b>0</b>

- 15 Notes:
- 16 Grain crops include corn, dry beans, and grain.
- 17 Field crops include cotton, grass, hay, safflower, and sugar beets.
- 18 Forage crops include alfalfa and pasture.

1 **Table 12.21 Changes in San Joaquin Valley Irrigated Acreage in Dry and Critical**  
 2 **Dry Years under the No Action Alternative as Compared to the Second Basis of**  
 3 **Comparison**

Crops	No Action Alternative (1000s acres)	Second Basis of Comparison (1000s acres)	Changes (1000s acres)
<b>Grain Crops</b>	1,010	1,024	-14
<b>Rice</b>	17	17	0
<b>Field Crops</b>	827	828	0
<b>Forage Crops</b>	735	735	-1
<b>Vegetables and Truck Crops</b>	633	633	0
<b>Orchards and Vineyards</b>	2,154	2,156	-2
<b>Total</b>	5,375	5,392	-17

4 Notes:

- 5 Grain crops include corn, dry beans, and grain.  
 6 Field crops include cotton, grass, hay, safflower, and sugar beets.  
 7 Forage crops include alfalfa and pasture.

8 Agricultural production in the Sacramento Valley would be similar under the  
 9 No Action Alternative and the Second Basis of Comparison over long-term  
 10 average conditions and in dry and critical dry years due to increased use of  
 11 groundwater, as summarized in Tables 12.22 and 12.23.

12 **Table 12.22 Changes in San Joaquin Valley Agricultural Production over the Long-**  
 13 **term Average Conditions under the No Action Alternative as Compared to the**  
 14 **Second Basis of Comparison**

Crops	No Action Alternative (\$ millions)	Second Basis of Comparison (\$ millions)	Changes (\$ millions)
<b>Grain Crops</b>	1,373	1,373	-0.2
<b>Rice</b>	31	31	0.0
<b>Field Crops</b>	1,436	1,437	-0.4
<b>Forage Crops</b>	1,426	1,426	-0.1

<b>Orchards and Vineyards</b>	16,547	16,547	0.0
<b>Total</b>	25,437	25,438	-0.5

15 Notes:

- 16 Grain crops include corn, dry beans, and grain.  
 17 Field crops include cotton, grass, hay, safflower, and sugar beets.  
 18 Forage crops include alfalfa and pasture.  
 19 All values of production are in 2012 dollar equivalent values.

1 **Table 12.23 Changes in San Joaquin Valley Agricultural Production in Dry and**  
 2 **Critical Dry Years under the No Action Alternative as Compared to the Second**  
 3 **Basis of Comparison**

Crops	No Action Alternative (\$ millions)	Second Basis of Comparison (\$ millions)	Changes (\$ millions)
<b>Grain Crops</b>	1,359	1,373	-14.4
<b>Rice</b>	31	31	0.0
<b>Field Crops</b>	1,436	1,437	-0.9
<b>Forage Crops</b>	1,426	1,426	-0.4
<b>Vegetables and Truck Crops</b>	4,623	4,623	-0.2
<b>Orchards and Vineyards</b>	16,542	16,547	-4.4
<b>Total</b>	25,417	25,437	-20.3

- 4 Notes:  
 5 Grain crops include corn, dry beans, and grain.  
 6 Field crops include cotton, grass, hay, safflower, and sugar beets.  
 7 Forage crops include alfalfa and pasture.  
 8 All values of production are in 2012 dollar equivalent values.

9 *Effects Related to Cross Delta Water Transfers*

10 Potential effects to agricultural resources could be similar to those identified in a  
 11 recent environmental analysis conducted by Reclamation for long-term water  
 12 transfers from the Sacramento to San Joaquin valleys (Reclamation 2014c).  
 13 Potential effects to agricultural resources were identified as reduced cultivation of  
 14 agricultural lands over the term of the transfer in the seller’s service area.  
 15 However, the amount of land effected by the water transfers would be relatively  
 16 small as compared to the total cultivated acreage within a region. Beneficial  
 17 changes would occur related to agricultural resources in the purchaser’s service  
 18 areas. The analysis indicated that these potential impacts would not be  
 19 substantial.

20 Under the No Action Alternative, the timing of cross Delta water transfers would  
 21 be limited to July through September and include annual volumetric limits, in  
 22 accordance with the 2008 USFWS BO and 2009 NMFS BO. Under the Second  
 23 Basis of Comparison, water could be transferred throughout the year without an  
 24 annual volumetric limit. Overall, the potential for cross Delta water transfers  
 25 would be less under the No Action Alternative than under the Second Basis of  
 26 Comparison.

27 **12.4.3.1.3 San Francisco Bay Area, Central Coast, and Southern California**  
 28 **Regions**

29 *Potential Changes in Irrigated Agricultural*

30 It is anticipated that reductions in CVP and SWP water supplies within the  
 31 San Francisco Bay Area, Central Coast, and Southern California regions would

1 not result in reductions in irrigated acreage or land use changes due to the use of  
 2 other water supplies in the same manner that is projected to occur in the Central  
 3 Valley Region.

4 **12.4.3.2 Alternative 1**

5 Alternative 1 is identical to the Second Basis of Comparison. Alternative 1 is  
 6 compared to the No Action Alternative and the Second Basis of Comparison.  
 7 However, because agricultural resource conditions under Alternative 1 are  
 8 identical to agricultural resource conditions under the Second Basis of  
 9 Comparison; Alternative 1 is only compared to the No Action Alternative.

10 **12.4.3.2.1 Alternative 1 Compared to the No Action Alternative**

11 *Trinity River Region*

12 *Potential Changes in Irrigated Agricultural*

13 There are no agricultural lands irrigated with CVP and SWP water supplies in the  
 14 Trinity River Region. Therefore, there would be no changes in irrigated lands  
 15 under Alternative 1 as compared to the No Action Alternative.

16 *Central Valley Region*

17 *Potential Changes in Irrigated Agricultural*

18 *Sacramento Valley*

19 Results of the SWAP analysis indicated that agricultural crop patterns in the  
 20 Sacramento Valley would be similar under Alternative 1 as compared to the No  
 21 Action Alternative over long-term average conditions and in dry and critical dry  
 22 years, as summarized in Tables 12.24 and 12.25.

23 **Table 12.24 Changes in Sacramento Valley Irrigated Acreage over the Long-term**  
 24 **Average Conditions under Alternative 1 as Compared to the No Action Alternative**

Crops	Alternative 1 (1000s acres)	No Action Alternative (1000s acres)	Changes (1000s acres)
<b>Grain Crops</b>	154	155	-1
<b>Rice</b>	549	548	0
<b>Field Crops</b>	59	59	0
<b>Forage Crops</b>	200	199	1
<b>Vegetables and Truck Crops</b>	119	119	0
<b>Orchards and Vineyards</b>	457	456	0
<b>Total</b>	1,537	1,537	0

25 Notes:

26 Grain crops include corn, dry beans, and grain.

27 Field crops include cotton, grass, hay, safflower, and sugar beets.

28 Forage crops include alfalfa and pasture.

1 **Table 12.25 Changes in Sacramento Valley Irrigated Acreage in Dry and Critical Dry**  
 2 **Years under Alternative 1 as Compared to the No Action Alternative**

Crops	Alternative 1 (1000s acres)	No Action Alternative (1000s acres)	Changes (1000s acres)
Grain Crops	155	155	0
Rice	548	544	4
Field Crops	59	59	0
Forage Crops	198	197	1
Vegetables and Truck Crops	119	119	0
Orchards and Vineyards	457	456	1
<b>Total</b>	<b>1,536</b>	<b>1,529</b>	<b>7</b>

- 3 Notes:  
 4 Grain crops include corn, dry beans, and grain.  
 5 Field crops include cotton, grass, hay, safflower, and sugar beets.  
 6 Forage crops include alfalfa and pasture.

7 Agricultural production in the Sacramento Valley would be similar (less than  
 8 5 percent change) under Alternative 1 as compared to the No Action Alternative  
 9 over long-term average conditions and in dry and critical dry years due to reduced  
 10 use of groundwater, as summarized in Tables 12.26 and 12.27.

11 **Table 12.26 Changes in Sacramento Valley Agricultural Production over the**  
 12 **Long-term Average Conditions under Alternative 1 as Compared to the No Action**  
 13 **Alternative**

Crops	Alternative 1 (\$ millions)	No Action Alternative (\$ millions)	Changes (\$ millions)
Grain Crops	149	150	-0.8
Rice	1,115	1,114	0.9
Field Crops	77	77	-0.1
Forage Crops	246	246	0.7
Vegetables and Truck Crops	967	967	0.0
Orchards and Vineyards	3,193	3,192	0.9
<b>Total</b>	<b>5,747</b>	<b>5,745</b>	<b>1.6</b>

- 14 Notes:  
 15 Grain crops include corn, dry beans, and grain.  
 16 Field crops include cotton, grass, hay, safflower, and sugar beets.  
 17 Forage crops include alfalfa and pasture.  
 18 All values of production are in 2012 dollar equivalent values.

1 **Table 12.27 Changes in Sacramento Valley Agricultural Production in Dry and**  
 2 **Critical Dry Years under Alternative 1 as Compared to the No Action Alternative**

Crops	Alternative 1 (\$ millions)	No Action Alternative (\$ millions)	Changes (\$ millions)
<b>Grain Crops</b>	150	150	0.5
<b>Rice</b>	1,114	1,107	7.3
<b>Field Crops</b>	77	77	0.1
<b>Forage Crops</b>	245	243	1.4
<b>Vegetables and Truck Crops</b>	967	967	0.2
<b>Orchards and Vineyards</b>	3,193	3,191	1.7
<b>Total</b>	5,746	5,735	11.3

- 3 Notes:  
 4 Grain crops include corn, dry beans, and grain.  
 5 Field crops include cotton, grass, hay, safflower, and sugar beets.  
 6 Forage crops include alfalfa and pasture.  
 7 All values of production are in 2012 dollar equivalent values.

8 *San Joaquin Valley*

9 Results of the SWAP analysis indicated that irrigated acreage in the San Joaquin  
 10 Valley, including the Tulare Lake area, would be similar under Alternative 1 as  
 11 compared to the No Action Alternative over long-term average conditions and in  
 12 dry and critical dry years, as summarized in Tables 12.28 and 12.29.

13 **Table 12.28 Changes in San Joaquin Valley Irrigated Acreage over the Long-term**  
 14 **Average Conditions under Alternative 1 as Compared to the No Action Alternative**

Crops	Alternative 1 (1000s acres)	No Action Alternative (1000s acres)	Changes (1000s acres)
<b>Grain Crops</b>	1,024	1,024	0
<b>Rice</b>	17	17	0
<b>Field Crops</b>	828	828	0
<b>Forage Crops</b>	735	735	0
<b>Vegetables and Truck Crops</b>	633	633	0
<b>Orchards and Vineyards</b>	2,156	2,156	0
<b>Total</b>	5,392	5,392	0

- 15 Notes:  
 16 Grain crops include corn, dry beans, and grain.  
 17 Field crops include cotton, grass, hay, safflower, and sugar beets.  
 18 Forage crops include alfalfa and pasture.

1 **Table 12.29 Changes in San Joaquin Valley Irrigated Acreage in Dry and Critical**  
 2 **Dry Years under Alternative 1 as Compared to the No Action Alternative**

Crops	Alternative 1 (1000s acres)	No Action Alternative (1000s acres)	Changes (1000s acres)
<b>Grain Crops</b>	1,024	1,010	14
<b>Rice</b>	17	17	0
<b>Field Crops</b>	828	827	0
<b>Forage Crops</b>	735	735	1
<b>Vegetables and Truck Crops</b>	633	633	0
<b>Orchards and Vineyards</b>	2,156	2,154	2
<b>Total</b>	5,392	5,375	17

3 Notes:

4 Grain crops include corn, dry beans, and grain.

5 Field crops include cotton, grass, hay, safflower, and sugar beets.

6 Forage crops include alfalfa and pasture.

7 Agricultural production in the San Joaquin Valley would be similar under  
 8 Alternative 1 as compared to the No Action Alternative over long-term average  
 9 conditions and in dry and critical dry years due to reduced use of groundwater, as  
 10 summarized in Tables 12.30 and 12.31.

11 **Table 12.30 Changes in San Joaquin Valley Agricultural Production over the**  
 12 **Long-term Average Conditions under Alternative 1 as Compared to the No Action**  
 13 **Alternative**

Crops	Alternative 1 (\$ millions)	No Action Alternative (\$ millions)	Changes (\$ millions)
<b>Grain Crops</b>	1,373	1,373	0.2
<b>Rice</b>	31	31	0.0
<b>Field Crops</b>	1,437	1,436	0.4
<b>Forage Crops</b>	1,426	1,426	0.1
<b>Vegetables and Truck Crops</b>	4,623	4,623	-0.1
<b>Orchards and Vineyards</b>	16,547	16,547	0.0
<b>Total</b>	25,438	25,437	0.5

14 Notes:

15 Grain crops include corn, dry beans, and grain.

16 Field crops include cotton, grass, hay, safflower, and sugar beets.

17 Forage crops include alfalfa and pasture.

18 All values of production are in 2012 dollar equivalent values.

1 **Table 12.31 Changes in San Joaquin Valley Agricultural Production in Dry and**  
 2 **Critical Dry Years under Alternative 1 as Compared to the No Action Alternative**

Crops	Alternative 1 (\$ millions)	No Action Alternative (\$ millions)	Changes (\$ millions)
<b>Grain Crops</b>	1,373	1,359	14.4
<b>Rice</b>	31	31	0.0
<b>Field Crops</b>	1,437	1,436	0.9
<b>Forage Crops</b>	1,426	1,426	0.4
<b>Vegetables and Truck Crops</b>	4,623	4,623	0.2
<b>Orchards and Vineyards</b>	16,547	16,542	4.4
<b>Total</b>	25,437	25,417	20.3

- 3 Notes:  
 4 Grain crops include corn, dry beans, and grain.  
 5 Field crops include cotton, grass, hay, safflower, and sugar beets.  
 6 Forage crops include alfalfa and pasture.  
 7 All values of production are in 2012 dollar equivalent values.

8 *Effects Related to Water Transfers*

9 Potential effects to agricultural resources could be similar to those identified in a  
 10 recent environmental analysis conducted by Reclamation for long-term water  
 11 transfers from the Sacramento to San Joaquin valleys (Reclamation 2014c) as  
 12 described above under the No Action Alternative compared to the Second Basis  
 13 of Comparison. For the purposes of this EIS, it is anticipated that similar  
 14 conditions would occur during implementation of cross Delta water transfers  
 15 under Alternative 1 and the No Action Alternative, and that impacts on  
 16 agricultural resources would not be substantial in the seller’s service area due to  
 17 implementation requirements of the transfer programs.

18 Under Alternative 1, water could be transferred throughout the year without an  
 19 annual volumetric limit. Under the No Action Alternative, the timing of cross  
 20 Delta water transfers would be limited to July through September and include  
 21 annual volumetric limits, in accordance with the 2008 USFWS BO and  
 22 2009 NMFS BO. Overall, the potential for cross Delta water transfers would be  
 23 increased under Alternative 1 as compared to the No Action Alternative.

24 *San Francisco Bay Area, Central Coast, and Southern California Regions*

25 *Potential Changes in Irrigated Agricultural*

26 It is anticipated that reductions in CVP and SWP water supplies within the San  
 27 Francisco Bay Area, Central Coast, and Southern California regions would not  
 28 result in reductions in irrigated acreage or land use changes due to the use of other  
 29 water supplies in the same manner that is projected to occur in the Central Valley  
 30 Region.

1 **12.4.3.2.2 Alternative 1 Compared to the Second Basis of Comparison**

2 Alternative 1 is identical to the Second Basis of Comparison.

3 **12.4.3.3 Alternative 2**

4 The agricultural resources under Alternative 2 would be identical to the conditions  
5 under the No Action Alternative; therefore, Alternative 2 is only compared to the  
6 Second Basis of Comparison.

7 **12.4.3.3.1 Alternative 2 Compared to the Second Basis of Comparison**

8 Changes to agricultural resources under Alternative 2 as compared to the Second  
9 Basis of Comparison would be the same as the impacts described in Section  
10 12.4.3.1, No Action Alternative.

11 **12.4.3.4 Alternative 3**

12 The CVP and SWP operations under Alternative 3 are similar to the Second Basis  
13 of Comparison with modified Old and Middle River flow criteria and New  
14 Melones Reservoir operations.

15 **12.4.3.4.1 Alternative 3 Compared to the No Action Alternative**

16 *Trinity River Region*

17 *Potential Changes in Irrigated Agricultural*

18 There are no agricultural lands irrigated with CVP and SWP water supplies in the  
19 Trinity River Region. Therefore, there would be no changes in irrigated lands  
20 under Alternative 3 as compared to the No Action Alternative.

21 *Central Valley Region*

22 *Potential Changes in Irrigated Agricultural*

23 *Sacramento Valley*

24 Results of the SWAP analysis indicated that agricultural crop patterns in the  
25 Sacramento Valley would be similar under Alternative 3 as compared to the No  
26 Action Alternative over long-term average conditions and in dry and critical dry  
27 years, as summarized in Tables 12.32 and 12.33.

28 **Table 12.32 Changes in Sacramento Valley Irrigated Acreage over the Long-term**  
29 **Average Conditions under Alternative 3 as Compared to the No Action Alternative**

<b>Crops</b>	<b>Alternative 3 (1000s acres)</b>	<b>No Action Alternative (1000s acres)</b>	<b>Changes (1000s acres)</b>
<b>Grain Crops</b>	154	155	-1
<b>Rice</b>	548	548	0
<b>Field Crops</b>	59	59	0
<b>Forage Crops</b>	200	199	1
<b>Vegetables and Truck Crops</b>	119	119	0

Crops	Alternative 3 (1000s acres)	No Action Alternative (1000s acres)	Changes (1000s acres)
Orchards and Vineyards	457	456	0
<b>Total</b>	<b>1,537</b>	<b>1,537</b>	<b>0</b>

- 1 Notes:
- 2 Grain crops include corn, dry beans, and grain.
- 3 Field crops include cotton, grass, hay, safflower, and sugar beets.
- 4 Forage crops include alfalfa and pasture.

5 **Table 12.33 Changes in Sacramento Valley Irrigated Acreage in Dry and Critical Dry**  
 6 **Years under Alternative 3 as Compared to the No Action Alternative**

Crops	Alternative 3 (1000s acres)	No Action Alternative (1000s acres)	Changes (1000s acres)
Grain Crops	155	155	0
Rice	547	544	3
Field Crops	59	59	0
Forage Crops	197	197	1
Vegetables and Truck Crops	119	119	0
Orchards and Vineyards	456	456	1
<b>Total</b>	<b>1,533</b>	<b>1,529</b>	<b>4</b>

- 7 Notes:
- 8 Grain crops include corn, dry beans, and grain.
- 9 Field crops include cotton, grass, hay, safflower, and sugar beets.
- 10 Forage crops include alfalfa and pasture.

11 Agricultural production in the Sacramento Valley would be similar under  
 12 Alternative 3 as compared to the No Action Alternative over long-term average  
 13 conditions and in dry and critical dry years due to reduced use of groundwater, as  
 14 summarized in Tables 12.34 and 12.35.

15 **Table 12.34 Changes in Sacramento Valley Agricultural Production over the**  
 16 **Long-term Average Conditions under Alternative 3 as Compared to the No Action**  
 17 **Alternative**

Crops	Alternative 3 (\$ millions)	No Action Alternative (\$ millions)	Changes (\$ millions)
Grain Crops	149	150	-0.7
Rice	1,115	1,114	0.6
Field Crops	77	77	-0.1

Crops	Alternative 3 (\$ millions)	No Action Alternative (\$ millions)	Changes (\$ millions)
Forage Crops	246	246	0.5
Vegetables and Truck Crops	967	967	0.0
Orchards and Vineyards	3,192	3,192	0.9
<b>Total</b>	<b>5,746</b>	<b>5,745</b>	<b>1.2</b>

- 1 Notes:
- 2 Grain crops include corn, dry beans, and grain.
- 3 Field crops include cotton, grass, hay, safflower, and sugar beets.
- 4 Forage crops include alfalfa and pasture.
- 5 All values of production are in 2012 dollar equivalent values.

6 **Table 12.35 Changes in Sacramento Valley Agricultural Production in Dry and**  
 7 **Critical Dry Years under Alternative 3 as Compared to the No Action Alternative**

Crops	Alternative 3 (\$ millions)	No Action Alternative (\$ millions)	Changes (\$ millions)
Grain Crops	150	150	0.2
Rice	1,112	1,107	5.8
Field Crops	77	77	0.1
Forage Crops	244	243	0.8
Vegetables and Truck Crops	967	967	0.1
Orchards and Vineyards	3,193	3,191	2.2
<b>Total</b>	<b>5,744</b>	<b>5,735</b>	<b>9.2</b>

- 8 Notes:
- 9 Grain crops include corn, dry beans, and grain.
- 10 Field crops include cotton, grass, hay, safflower, and sugar beets.
- 11 Forage crops include alfalfa and pasture.
- 12 All values of production are in 2012 dollar equivalent values.

13 *San Joaquin Valley*

14 Results of the SWAP analysis indicated that irrigated acreage in the San Joaquin  
 15 Valley, including the Tulare Lake area, would be similar under Alternative 3 as  
 16 compared to the No Action Alternative over long-term average conditions and in  
 17 dry and critical dry years, as summarized in Tables 12.36 and 12.37.

1 **Table 12.36 Changes in San Joaquin Valley Irrigated Acreage over the Long-term**  
 2 **Average Conditions under Alternative 3 as Compared to the No Action Alternative**

<b>Crops</b>	<b>Alternative 3 (1000s acres)</b>	<b>No Action Alternative (1000s acres)</b>	<b>Changes (1000s acres)</b>
<b>Grain Crops</b>	1,024	1,024	0
<b>Rice</b>	17	17	0
<b>Field Crops</b>	828	828	0
<b>Forage Crops</b>	735	735	0
<b>Vegetables and Truck Crops</b>	633	633	0
<b>Orchards and Vineyards</b>	2,156	2,156	0
<b>Total</b>	5,392	5,392	0

3 Notes:

4 Grain crops include corn, dry beans, and grain.

5 Field crops include cotton, grass, hay, safflower, and sugar beets.

6 Forage crops include alfalfa and pasture.

7 **Table 12.37 Changes in San Joaquin Valley Irrigated Acreage in Dry and Critical**  
 8 **Dry Years under Alternative 3 as Compared to the No Action Alternative**

<b>Crops</b>	<b>Alternative 3 (1000s acres)</b>	<b>No Action Alternative (1000s acres)</b>	<b>Changes (1000s acres)</b>
<b>Grain Crops</b>	1,021	1,010	11
<b>Rice</b>	17	17	0
<b>Field Crops</b>	828	827	0
<b>Forage Crops</b>	735	735	0
<b>Vegetables and Truck Crops</b>	633	633	0
<b>Orchards and Vineyards</b>	2,154	2,154	0
<b>Total</b>	5,387	5,375	12

9 Notes:

10 Grain crops include corn, dry beans, and grain.

11 Field crops include cotton, grass, hay, safflower, and sugar beets.

12 Forage crops include alfalfa and pasture.

13 Agricultural production in the San Joaquin Valley would be similar under  
 14 Alternative 3 as compared to the No Action Alternative over long-term average  
 15 conditions and in dry and critical dry years due to reduced use of groundwater, as  
 16 summarized in Tables 12.38 and 12.39.

1 **Table 12.38 Changes in San Joaquin Valley Agricultural Production over the**  
 2 **Long-term Average Conditions under Alternative 3 as Compared to the No Action**  
 3 **Alternative**

<b>Crops</b>	<b>Alternative 3 (\$ millions)</b>	<b>No Action Alternative (\$ millions)</b>	<b>Changes (\$ millions)</b>
<b>Grain Crops</b>	1,373	1,373	0.1
<b>Rice</b>	31	31	0.0
<b>Field Crops</b>	1,437	1,436	0.3
<b>Forage Crops</b>	1,426	1,426	0.1
<b>Vegetables and Truck Crops</b>	4,623	4,623	-0.1
<b>Orchards and Vineyards</b>	16,547	16,547	-0.1
<b>Total</b>	25,437	25,437	0.3

- 4 Notes:  
 5 Grain crops include corn, dry beans, and grain.  
 6 Field crops include cotton, grass, hay, safflower, and sugar beets.  
 7 Forage crops include alfalfa and pasture.  
 8 All values of production are in 2012 dollar equivalent values.

9 **Table 12.39 Changes in San Joaquin Valley Agricultural Production in Dry and**  
 10 **Critical Dry Years under Alternative 3 as Compared to the No Action Alternative**

<b>Crops</b>	<b>Alternative 3 (\$ millions)</b>	<b>No Action Alternative (\$ millions)</b>	<b>Changes (\$ millions)</b>
<b>Grain Crops</b>	1,370	1,359	11.5
<b>Rice</b>	31	31	0.0
<b>Field Crops</b>	1,436	1,436	0.4
<b>Forage Crops</b>	1,426	1,426	-0.1
<b>Vegetables and Truck Crops</b>	4,623	4,623	0.0
<b>Orchards and Vineyards</b>	16,542	16,542	-0.3
<b>Total</b>	25,428	25,417	11.4

- 11 Notes:  
 12 Grain crops include corn, dry beans, and grain.  
 13 Field crops include cotton, grass, hay, safflower, and sugar beets.  
 14 Forage crops include alfalfa and pasture.  
 15 All values of production are in 2012 dollar equivalent values.

1            *Effects Related to Water Transfers*

2 Potential effects to agricultural resources could be similar to those identified in a  
3 recent environmental analysis conducted by Reclamation for long-term water  
4 transfers from the Sacramento to San Joaquin valleys (Reclamation 2014c) as  
5 described above under the No Action Alternative compared to the Second Basis  
6 of Comparison. For the purposes of this EIS, it is anticipated that similar  
7 conditions would occur during implementation of cross Delta water transfers  
8 under Alternative 3 and the No Action Alternative, and that impacts on  
9 agricultural resources would not be substantial in the seller's service area due to  
10 implementation requirements of the transfer programs.

11 Under Alternative 3, water could be transferred throughout the year without an  
12 annual volumetric limit. Under the No Action Alternative, the timing of cross  
13 Delta water transfers would be limited to July through September and include  
14 annual volumetric limits, in accordance with the 2008 USFWS BO and  
15 2009 NMFS BO. Overall, the potential for cross Delta water transfers would be  
16 increased under Alternative 3 as compared to the No Action Alternative.

17 *San Francisco Bay Area, Central Coast, and Southern California Regions*

18            *Potential Changes in Irrigated Agricultural*

19 It is anticipated that reductions in CVP and SWP water supplies within the  
20 San Francisco Bay Area, Central Coast, and Southern California regions would  
21 not result in reductions in irrigated acreage or land use changes due to the use of  
22 other water supplies in the same manner that is projected to occur in the Central  
23 Valley Region.

24 **12.4.3.4.2 Alternative 3 Compared to the Second Basis of Comparison**

25 *Trinity River Region*

26            *Potential Changes in Irrigated Agricultural*

27 There are no agricultural lands irrigated with CVP and SWP water supplies in the  
28 Trinity River Region. Therefore, there would be no changes in irrigated lands  
29 under Alternative 3 as compared to the Second Basis of Comparison.

30 *Central Valley Region*

31            *Potential Changes in Irrigated Agricultural*

32                    *Sacramento Valley*

33 Results of the SWAP analysis indicated that agricultural crop patterns in the  
34 Sacramento Valley would be similar under Alternative 3 as compared to the  
35 Second Basis of Comparison over long-term average conditions and in dry and  
36 critical dry years, as summarized in Tables 12.40 and 12.41.

1 **Table 12.40 Changes in Sacramento Valley Irrigated Acreage over the Long-term**  
 2 **Average Conditions under Alternative 3 as Compared to the Second Basis of**  
 3 **Comparison**

Crops	Alternative 3 (1000s acres)	Second Basis of Comparison (1000s acres)	Changes (1000s acres)
Grain Crops	154	154	0
Rice	548	548	0
Field Crops	59	59	0
Forage Crops	200	200	0
Vegetables and Truck Crops	119	119	0
Orchards and Vineyards	457	457	0
<b>Total</b>	<b>1,537</b>	<b>1,537</b>	<b>0</b>

- 4 Notes:  
 5 Grain crops include corn, dry beans, and grain.  
 6 Field crops include cotton, grass, hay, safflower, and sugar beets.  
 7 Forage crops include alfalfa and pasture.

8 **Table 12.41 Changes in Sacramento Valley Irrigated Acreage in Dry and Critical Dry**  
 9 **Years under Alternative 3 as Compared to the Second Basis of Comparison**

Crops	Alternative 3 (1000s acres)	Second Basis of Comparison (1000s acres)	Changes (1000s acres)
Grain Crops	155	155	0
Rice	547	548	-1
Field Crops	59	59	0
Forage Crops	197	198	-1
Vegetables and Truck Crops	119	119	0
Orchards and Vineyards	456	457	-1
<b>Total</b>	<b>1,533</b>	<b>1,536</b>	<b>-3</b>

- 10 Notes:  
 11 Grain crops include corn, dry beans, and grain.  
 12 Field crops include cotton, grass, hay, safflower, and sugar beets.  
 13 Forage crops include alfalfa and pasture.

1 The agricultural production value under long-term average conditions and dry and  
 2 critical dry conditions would be similar under Alternative 3 and Second Basis of  
 3 Comparison, as summarized in Tables 12.42 and 12.43, primarily due to a  
 4 decrease in groundwater pumping.

5 **Table 12.42 Changes in Sacramento Valley Agricultural Production over the**  
 6 **Long-term Average Conditions under Alternative 3 as Compared to the Second**  
 7 **Basis of Comparison**

Crops	Alternative 3 (\$ millions)	Second Basis of Comparison (\$ millions)	Changes (\$ millions)
<b>Grain Crops</b>	149	149	0.1
<b>Rice</b>	1,115	1,115	-0.3
<b>Field Crops</b>	77	77	0.0
<b>Forage Crops</b>	246	246	-0.1
<b>Vegetables and Truck Crops</b>	967	967	0.0
<b>Orchards and Vineyards</b>	3,192	3,193	-0.1
<b>Total</b>	5,746	5,747	-0.3

8 Notes:  
 9 Grain crops include corn, dry beans, and grain.  
 10 Field crops include cotton, grass, hay, safflower, and sugar beets.  
 11 Forage crops include alfalfa and pasture.  
 12 All values of production are in 2012 dollar equivalent values.

13 **Table 12.43 Changes in Sacramento Valley Agricultural Production in Dry and**  
 14 **Critical Dry Years under Alternative 3 as Compared to the Second Basis of**  
 15 **Comparison**

Crops	Alternative 3 (\$ millions)	Second Basis of Comparison (\$ millions)	Changes (\$ millions)
<b>Grain Crops</b>	150	150	-0.3
<b>Rice</b>	1,112	1,114	-1.5
<b>Field Crops</b>	77	77	0.0
<b>Forage Crops</b>	244	245	-0.6
<b>Vegetables and Truck Crops</b>	967	967	-0.1
<b>Orchards and Vineyards</b>	3,193	3,193	0.4
<b>Total</b>	5,744	5,746	-2.1

16 Notes:  
 17 Grain crops include corn, dry beans, and grain.  
 18 Field crops include cotton, grass, hay, safflower, and sugar beets.  
 19 Forage crops include alfalfa and pasture.  
 20 All values of production are in 2012 dollar equivalent values.

*San Joaquin Valley*

Results of the SWAP analysis indicated that irrigated acreage in the San Joaquin Valley, including the Tulare Lake area, would be similar under Alternative 3 as compared to the Second Basis of Comparison over long-term average conditions and in dry and critical dry years, as summarized in Tables 12.44 and 12.45.

**Table 12.44 Changes in San Joaquin Valley Irrigated Acreage over the Long-term Average Conditions under Alternative 3 as Compared to the Second Basis of Comparison**

Crops	Alternative 3 (1000s acres)	Second Basis of Comparison (1000s acres)	Changes (1000s acres)
<b>Grain Crops</b>	1,024	1,024	0
Rice	17	17	0
<b>Field Crops</b>	828	828	0
<b>Forage Crops</b>	735	735	0
<b>Vegetables and Truck Crops</b>	633	633	0
<b>Orchards and Vineyards</b>	2,156	2,156	0
<b>Total</b>	5,392	5,392	0

Notes:

Grain crops include corn, dry beans, and grain.

Field crops include cotton, grass, hay, safflower, and sugar beets.

Forage crops include alfalfa and pasture.

**Table 12.45 Changes in San Joaquin Valley Irrigated Acreage in Dry and Critical Dry Years under Alternative 3 as Compared to the Second Basis of Comparison**

Crops	Alternative 3 (1000s acres)	Second Basis of Comparison (1000s acres)	Changes (1000s acres)
<b>Grain Crops</b>	1,021	1,024	-3
Rice	17	17	0
<b>Field Crops</b>	828	828	0
<b>Forage Crops</b>	735	735	-1
<b>Vegetables and Truck Crops</b>	633	633	0
<b>Orchards and Vineyards</b>	2,154	2,156	-2
<b>Total</b>	5,387	5,392	-5

Notes:

Grain crops include corn, dry beans, and grain.

Field crops include cotton, grass, hay, safflower, and sugar beets.

Forage crops include alfalfa and pasture.

1 The agricultural production value under long-term average conditions would be  
 2 similar under Alternative 3 and the Second Basis of Comparison, as summarized  
 3 in Tables 12.46 and 12.47, primarily due to an increase in groundwater pumping.

4 **Table 12.46 Changes in San Joaquin Valley Agricultural Production over the**  
 5 **Long-term Average Conditions under Alternative 3 as Compared to the Second**  
 6 **Basis of Comparison**

Crops	Alternative 3 (\$ millions)	Second Basis of Comparison (\$ millions)	Changes (\$ millions)
<b>Grain Crops</b>	1,373	1,373	-0.1
<b>Rice</b>	31	31	0.0
<b>Field Crops</b>	1,437	1,437	-0.1
<b>Forage Crops</b>	1,426	1,426	0.0
<b>Vegetables and Truck Crops</b>	4,623	4,623	0.0
<b>Orchards and Vineyards</b>	16,547	16,547	-0.1
<b>Total</b>	25,437	25,438	-0.3

7 Notes:  
 8 Grain crops include corn, dry beans, and grain.  
 9 Field crops include cotton, grass, hay, safflower, and sugar beets.  
 10 Forage crops include alfalfa and pasture.  
 11 All values of production are in 2012 dollar equivalent values.

12 **Table 12.47 Changes in San Joaquin Valley Agricultural Production in Dry and**  
 13 **Critical Dry Years under Alternative 3 as Compared to the Second Basis of**  
 14 **Comparison**

Crops	Alternative 3 (\$ millions)	Second Basis of Comparison (\$ millions)	Changes (\$ millions)
<b>Grain Crops</b>	1,370	1,373	-2.9
<b>Rice</b>	31	31	0.0
<b>Field Crops</b>	1,436	1,437	-0.6
<b>Forage Crops</b>	1,426	1,426	-0.5
<b>Vegetables and Truck Crops</b>	4,623	4,623	-0.2
<b>Orchards and Vineyards</b>	16,542	16,547	-4.7
<b>Total</b>	25,428	25,437	-8.9

15 Notes:  
 16 Grain crops include corn, dry beans, and grain.  
 17 Field crops include cotton, grass, hay, safflower, and sugar beets.  
 18 Forage crops include alfalfa and pasture.  
 19 All values of production are in 2012 dollar equivalent values.

1            *Effects Related to Water Transfers*

2 It is anticipated that water would be transferred between subbasins in the same  
3 manner under Alternative 3 as compared to the Second Basis of Comparison. If  
4 the water to be transferred is made available through crop idling, there would be a  
5 reduction in irrigated acreage. If the water is used to reduce crop idling in dry and  
6 critical dry years, there would be an increase in irrigated acreage. Therefore, the  
7 changes in agricultural resources would need to be determined for each water  
8 transfer program.

9 Potential effects to agricultural resources could be similar to those identified in a  
10 recent environmental analysis conducted by Reclamation for long-term water  
11 transfers from the Sacramento to San Joaquin valleys (Reclamation 2014c) as  
12 described above under the No Action Alternative compared to the Second Basis  
13 of Comparison. For the purposes of this EIS, it is anticipated that similar  
14 conditions would occur during implementation of cross Delta water transfers  
15 under Alternative 3 as compared to the Second Basis of Comparison, and that  
16 impacts on agricultural resources would not be substantial in the seller's service  
17 area due to implementation requirements of the transfer programs.

18 Under Alternative 3 and the Second Basis of Comparison, water could be  
19 transferred throughout the year without an annual volumetric limit. Overall, the  
20 potential for cross Delta water transfers would be similar under Alternative 3 as  
21 compared to the Second Basis of Comparison.

22 *San Francisco Bay Area, Central Coast, and Southern California Regions*

23            *Potential Changes in Irrigated Agricultural*

24 It is anticipated that reductions in CVP and SWP water supplies within the San  
25 Francisco Bay Area, Central Coast, and Southern California regions would not  
26 result in reductions in irrigated acreage or land use changes due to the use of other  
27 water supplies in the same manner that is projected to occur in the Central Valley  
28 Region.

29            **12.4.3.5 Alternative 4**

30 The agricultural resources under Alternative 4 would be identical to the  
31 conditions under the Second Basis of Comparison; therefore, Alternative 4 is only  
32 compared to the No Action Alternative.

33            **12.4.3.5.1 Alternative 4 Compared to the No Action Alternative**

34 The CVP and SWP operations under Alternative 4 are identical to the CVP and  
35 SWP operations under the Second Basis of Comparison and Alternative 1.  
36 Therefore, changes in agricultural resources under Alternative 4 as compared to  
37 the No Action Alternative would be the same as the impacts described in  
38 Section 12.4.3.2.1, Alternative 1 Compared to the No Action Alternative.

39            **12.4.3.6 Alternative 5**

40 The CVP and SWP operations under Alternative 5 are similar to the No Action  
41 Alternative with modified Old and Middle River flow criteria and New Melones  
42 Reservoir operations.

1 **12.4.3.6.1 Alternative 5 Compared to the No Action Alternative**

2 *Trinity River Region*

3 *Potential Changes in Irrigated Agricultural*

4 There are no agricultural lands irrigated with CVP and SWP water supplies in the  
 5 Trinity River Region. Therefore, there would be no changes in irrigated lands  
 6 under Alternative 5 as compared to the No Action Alternative.

7 *Central Valley Region*

8 *Potential Changes in Irrigated Agricultural*

9 *Sacramento Valley*

10 Results of the SWAP analysis indicated that agricultural crop patterns in the  
 11 Sacramento Valley would be similar under Alternative 5 as compared to the  
 12 No Action Alternative over long-term average conditions and in dry and critical  
 13 dry years, as summarized in Tables 12.48 and 12.49.

14 **Table 12.48 Changes in Sacramento Valley Irrigated Acreage over the Long-term**  
 15 **Average Conditions under Alternative 5 as Compared to the No Action Alternative**

Crops	Alternative 5 (1000s acres)	No Action Alternative (1000s acres)	Changes (1000s acres)
Grain Crops	155	155	0
Rice	548	548	0
Field Crops	59	59	0
Forage Crops	199	199	0
Vegetables and Truck Crops	119	119	0
Orchards and Vineyards	456	456	0
<b>Total</b>	<b>1,537</b>	<b>1,537</b>	<b>0</b>

16 Notes:

17 Grain crops include corn, dry beans, and grain.

18 Field crops include cotton, grass, hay, safflower, and sugar beets.

19 Forage crops include alfalfa and pasture.

20 **Table 12.49 Changes in Sacramento Valley Irrigated Acreage in Dry and Critical Dry**  
 21 **Years under Alternative 5 as Compared to the No Action Alternative**

Crops	Alternative 5 (1000s acres)	No Action Alternative (1000s acres)	Changes (1000s acres)
Grain Crops	155	155	0
Rice	544	544	0
Field Crops	59	59	0
Forage Crops	197	197	0

<b>Crops</b>	<b>Alternative 5 (1000s acres)</b>	<b>No Action Alternative (1000s acres)</b>	<b>Changes (1000s acres)</b>
<b>Vegetables and Truck Crops</b>	119	119	0
<b>Orchards and Vineyards</b>	456	456	0
<b>Total</b>	1,529	1,529	0

- 1 Notes:  
 2 Grain crops include corn, dry beans, and grain.  
 3 Field crops include cotton, grass, hay, safflower, and sugar beets.  
 4 Forage crops include alfalfa and pasture.

5 The agricultural production value under long-term average conditions and dry and  
 6 critical dry conditions would be similar under Alternative 5 and the No Action  
 7 Alternative, as summarized in Tables 12.50 and 12.51.

8 **Table 12.50 Changes in Sacramento Valley Agricultural Production over the**  
 9 **Long-term Average Conditions under Alternative 5 as Compared to the No Action**  
 10 **Alternative**

<b>Crops</b>	<b>Alternative 5 (\$ millions)</b>	<b>No Action Alternative (\$ millions)</b>	<b>Changes (\$ millions)</b>
<b>Grain Crops</b>	150	150	0.0
<b>Rice</b>	1,114	1,114	0.1
<b>Field Crops</b>	77	77	0.0
<b>Forage Crops</b>	246	246	0.0
<b>Vegetables and Truck Crops</b>	967	967	0.0
<b>Orchards and Vineyards</b>	3,192	3,192	0.1
<b>Total</b>	5,745	5,745	0.1

- 11 Notes:  
 12 Grain crops include corn, dry beans, and grain.  
 13 Field crops include cotton, grass, hay, safflower, and sugar beets.  
 14 Forage crops include alfalfa and pasture.  
 15 All values of production are in 2012 dollar equivalent values.

1 **Table 12.51 Changes in Sacramento Valley Agricultural Production in Dry and**  
 2 **Critical Dry Years under Alternative 5 as Compared to the No Action Alternative**

Crops	Alternative 5 (\$ millions)	No Action Alternative (\$ millions)	Changes (\$ millions)
<b>Grain Crops</b>	150	150	-0.1
<b>Rice</b>	1,107	1,107	0.2
<b>Field Crops</b>	77	77	0.0
<b>Forage Crops</b>	243	243	0.1
<b>Vegetables and Truck Crops</b>	967	967	0.0
<b>Orchards and Vineyards</b>	3,192	3,191	0.7
<b>Total</b>	5,736	5,735	0.8

3 Notes:

4 Grain crops include corn, dry beans, and grain.

5 Field crops include cotton, grass, hay, safflower, and sugar beets.

6 Forage crops include alfalfa and pasture.

7 All values of production are in 2012 dollar equivalent values.

8 *San Joaquin Valley*

9 Results of the SWAP analysis indicated that irrigated acreage in the San Joaquin  
 10 Valley, including the Tulare Lake area, would be similar under Alternative 5 as  
 11 compared to the No Action Alternative over long-term average conditions and dry  
 12 and critical dry years, as summarized in Tables 12.52 and 12.53.

13 **Table 12.52 Changes in San Joaquin Valley Irrigated Acreage over the Long-term**  
 14 **Average Conditions under Alternative 5 as Compared to the No Action Alternative**

Crops	Alternative 5 (1000s acres)	No Action Alternative (1000s acres)	Changes (1000s acres)
<b>Grain Crops</b>	1,024	1,024	0
<b>Rice</b>	17	17	0
<b>Field Crops</b>	828	828	0
<b>Forage Crops</b>	735	735	0
<b>Vegetables and Truck Crops</b>	633	633	0
<b>Orchards and Vineyards</b>	2,156	2,156	0
<b>Total</b>	5,392	5,392	0

15 Notes:

16 Grain crops include corn, dry beans, and grain.

17 Field crops include cotton, grass, hay, safflower, and sugar beets.

18 Forage crops include alfalfa and pasture.

1 **Table 12.53 Changes in San Joaquin Valley Irrigated Acreage in Dry and Critical**  
 2 **Dry Years under Alternative 5 as Compared to the No Action Alternative**

Crops	Alternative 5 (1000s acres)	No Action Alternative (1000s acres)	Changes (1000s acres)
Grain Crops	1,010	1,010	0
Rice	17	17	0
Field Crops	827	827	0
Forage Crops	734	735	0
Vegetables and Truck Crops	633	633	0
Orchards and Vineyards	2,153	2,154	-1
<b>Total</b>	<b>5,374</b>	<b>5,375</b>	<b>-1</b>

3 Notes:

4 Grain crops include corn, dry beans, and grain.

5 Field crops include cotton, grass, hay, safflower, and sugar beets.

6 Forage crops include alfalfa and pasture.

7 The agricultural production value under long-term average conditions and dry and  
 8 critical dry year conditions would be similar under Alternative 5 and the No  
 9 Action Alternative, as summarized in Tables 12.54 and 12.55.

10 **Table 12.54 Changes in San Joaquin Valley Agricultural Production over the**

<b>Total</b>	<b>25,437</b>	<b>25,437</b>	<b>-0.1</b>

13 Notes:

14 Grain crops include corn, dry beans, and grain.

15 Field crops include cotton, grass, hay, safflower, and sugar beets.

16 Forage crops include alfalfa and pasture.

17 All values of production are in 2012 dollar equivalent values.

1 **Table 12.55 Changes in San Joaquin Valley Agricultural Production in Dry and**  
 2 **Critical Dry Years under Alternative 5 as Compared to the No Action Alternative**

Crops	Alternative 5 (\$ millions)	No Action Alternative (\$ millions)	Changes (\$ millions)
<b>Grain Crops</b>	1,359	1,359	-0.1
<b>Rice</b>	31	31	0.0
<b>Field Crops</b>	1,435	1,436	-0.2
<b>Forage Crops</b>	1,426	1,426	-0.1
<b>Vegetables and Truck Crops</b>	4,622	4,623	-0.2
<b>Orchards and Vineyards</b>	16,540	16,542	-2.0
<b>Total</b>	25,414	25,417	-2.7

3 Notes:

4 Grain crops include corn, dry beans, and grain.

5 Field crops include cotton, grass, hay, safflower, and sugar beets.

6 Forage crops include alfalfa and pasture.

7 All values of production are in 2012 dollar equivalent values.

#### 8 *Effects Related to Water Transfers*

9 Potential effects to agricultural resources could be similar to those identified in a  
 10 recent environmental analysis conducted by Reclamation for long-term water  
 11 transfers from the Sacramento to San Joaquin valleys (Reclamation 2014c) as  
 12 described above under the No Action Alternative compared to the Second Basis  
 13 of Comparison. For the purposes of this EIS, it is anticipated that similar  
 14 conditions would occur during implementation of cross Delta water transfers  
 15 under Alternative 5 and the No Action Alternative, and that impacts on  
 16 agricultural resources would not be substantial in the seller's service area due to  
 17 implementation requirements of the transfer programs.

18 Under Alternative 5 and the No Action Alternative, the timing of cross Delta  
 19 water transfers would be limited to July through September and include annual  
 20 volumetric limits, in accordance with the 2008 USFWS BO and 2009 NMFS BO.  
 21 Overall, the potential for cross Delta water transfers would be similar under  
 22 Alternative 5 and the No Action Alternative.

#### 23 *San Francisco Bay Area, Central Coast, and Southern California Regions*

##### 24 *Potential Changes in Irrigated Agricultural*

25 It is anticipated that reductions in CVP and SWP water supplies within the San  
 26 Francisco Bay Area, Central Coast, and Southern California regions would not  
 27 result in reductions in irrigated acreage or land use changes due to the use of other  
 28 water supplies in the same manner that is projected to occur in the Central Valley  
 29 Region.

1 **12.4.3.6.2 Alternative 5 Compared to the Second Basis of Comparison**

2 *Trinity River Region*

3 *Potential Changes in Irrigated Agricultural*

4 There are no agricultural lands irrigated with CVP and SWP water supplies in the  
 5 Trinity River Region. Therefore, there would be no changes in irrigated lands  
 6 under Alternative 5 as compared to the Second Basis of Comparison.

7 *Central Valley Region*

8 *Potential Changes in Irrigated Agricultural*

9 *Sacramento Valley*

10 Results of the SWAP analysis indicated that agricultural crop patterns in the  
 11 Sacramento Valley would be similar under Alternative 5 as compared to the  
 12 Second Basis of Comparison over long-term average conditions and in dry and  
 13 critical dry years, as summarized in Tables 12.56 and 12.57.

14 **Table 12.56 Changes in Sacramento Valley Irrigated Acreage over the Long-term**  
 15 **Average Conditions under Alternative 5 as Compared to the Second Basis of**  
 16 **Comparison**

Crops	Alternative 5 (1000s acres)	Second Basis of Comparison (1000s acres)	Changes (1000s acres)
<b>Grain Crops</b>	155	154	1
<b>Rice</b>	548	549	0
<b>Field Crops</b>	59	59	0
<b>Forage Crops</b>	199	200	-1
<b>Vegetables and Truck Crops</b>	119	119	0
<b>Orchards and Vineyards</b>	456	457	0
<b>Total</b>	1,537	1,537	0

17 Notes:

18 Grain crops include corn, dry beans, and grain.

19 Field crops include cotton, grass, hay, safflower, and sugar beets.

20 Forage crops include alfalfa and pasture.

21 **Table 12.57 Changes in Sacramento Valley Irrigated Acreage in Dry and Critical Dry**  
 22 **Years under Alternative 5 as Compared to the Second Basis of Comparison**

Crops	Alternative 5 (1000s acres)	Second Basis of Comparison (1000s acres)	Changes (1000s acres)
<b>Grain Crops</b>	155	155	-1
<b>Rice</b>	544	548	-4
<b>Field Crops</b>	59	59	0

<b>Crops</b>	<b>Alternative 5 (1000s acres)</b>	<b>Second Basis of Comparison (1000s acres)</b>	<b>Changes (1000s acres)</b>
<b>Forage Crops</b>	197	198	-1
<b>Vegetables and Truck Crops</b>	119	119	0
<b>Orchards and Vineyards</b>	456	457	-1
<b>Total</b>	1,529	1,536	-7

1 Notes:

2 Grain crops include corn, dry beans, and grain.

3 Field crops include cotton, grass, hay, safflower, and sugar beets.

4 Forage crops include alfalfa and pasture.

5 The agricultural production value under long-term average conditions and in dry  
6 and critical dry conditions would be similar under Alternative 5 and Second Basis  
7 of Comparison, as summarized in Tables 12.58 and 12.59.

8 **Table 12.58 Changes in Sacramento Valley Agricultural Production over the**  
9 **Long-term Average Conditions under Alternative 5 as Compared to the Second**  
10 **Basis of Comparison**

<b>Crops</b>	<b>Alternative 5 (\$ millions)</b>	<b>Second Basis of Comparison (\$ millions)</b>	<b>Changes (\$ millions)</b>
<b>Grain Crops</b>	150	149	0.8
<b>Rice</b>	1,114	1,115	-0.8
<b>Field Crops</b>	77	77	0.1
<b>Forage Crops</b>	246	246	-0.6
<b>Vegetables and Truck Crops</b>	967	967	0.0
<b>Orchards and Vineyards</b>	3,192	3,193	-0.9
<b>Total</b>	5,745	5,747	-1.5

11 Notes:

12 Grain crops include corn, dry beans, and grain.

13 Field crops include cotton, grass, hay, safflower, and sugar beets.

14 Forage crops include alfalfa and pasture.

15 All values of production are in 2012 dollar equivalent values.

1 **Table 12.59 Changes in Sacramento Valley Agricultural Production in Dry and**  
 2 **Critical Dry Years under Alternative 5 as Compared to the Second Basis of**  
 3 **Comparison**

Crops	Alternative 5 (\$ millions)	Second Basis of Comparison (\$ millions)	Changes (\$ millions)
Grain Crops	150	150	-0.6
Rice	1,107	1,114	-7.1
Field Crops	77	77	-0.1
Forage Crops	243	245	-1.3
Vegetables and Truck Crops	967	967	-0.3
Orchards and Vineyards	3,192	3,193	-1.1
<b>Total</b>	<b>5,736</b>	<b>5,746</b>	<b>-10.5</b>

- 4 Notes:  
 5 Grain crops include corn, dry beans, and grain.  
 6 Field crops include cotton, grass, hay, safflower, and sugar beets.  
 7 Forage crops include alfalfa and pasture.  
 8 All values of production are in 2012 dollar equivalent values.

9 *San Joaquin Valley*

10 Results of the SWAP analysis indicated that irrigated acreage in the San Joaquin  
 11 Valley, including the Tulare Lake area, would be similar under Alternative 5 as  
 12 compared to the Second Basis of Comparison over long-term average conditions  
 13 and in dry and critical dry years, as summarized in Tables 12.60 and 12.61.

14 **Table 12.60 Changes in San Joaquin Valley Irrigated Acreage over the Long-term**  
 15 **Average Conditions under Alternative 5 as Compared to the Second Basis of**  
 16 **Comparison**

Crops	Alternative 5 (1000s acres)	Second Basis of Comparison (1000s acres)	Changes (1000s acres)
Grain Crops	1,024	1,024	0
Rice	17	17	0
Field Crops	828	828	0
Forage Crops	735	735	0
Vegetables and Truck Crops	633	633	0
Orchards and Vineyards	2,156	2,156	0
<b>Total</b>	<b>5,392</b>	<b>5,392</b>	<b>-1</b>

- 17 Notes:  
 18 Grain crops include corn, dry beans, and grain.  
 19 Field crops include cotton, grass, hay, safflower, and sugar beets.  
 20 Forage crops include alfalfa and pasture.

1 **Table 12.61 Changes in San Joaquin Valley Irrigated Acreage in Dry and Critical**  
 2 **Dry Years under Alternative 5 as compared to the Second Basis of Comparison**

Crops	Alternative 5 (1000s acres)	Second Basis of Comparison (1000s acres)	Changes (1000s acres)
<b>Grain Crops</b>	1,010	1,024	-14
<b>Rice</b>	17	17	0
<b>Field Crops</b>	827	828	0
<b>Forage Crops</b>	734	735	-1
<b>Vegetables and Truck Crops</b>	633	633	0
<b>Orchards and Vineyards</b>	2,153	2,156	-3
<b>Total</b>	5,374	5,392	-18

3 Notes:

4 Grain crops include corn, dry beans, and grain.

5 Field crops include cotton, grass, hay, safflower, and sugar beets.

6 Forage crops include alfalfa and pasture.

7 The agricultural production value under long-term average conditions and in dry  
 8 and critical dry conditions would be similar, as summarized in Tables 12.62 and  
 9 12.63, primarily due to an increase in groundwater pumping.

10 **Table 12.62 Changes in San Joaquin Valley Agricultural Production over the**  
 11 **Long-term Average Conditions under Alternative 5 as Compared to the Second**  
 12 **Basis of Comparison**

Crops	Alternative 5 (\$ millions)	Second Basis of Comparison (\$ millions)	Changes (\$ millions)
<b>Grain Crops</b>	1,373	1,373	-0.2
<b>Rice</b>	31	31	0.0
<b>Field Crops</b>	1,436	1,437	-0.5

<b>Orchards and Vineyards</b>	16,547	16,547	-0.1
<b>Total</b>	25,437	25,438	-0.7

13 Notes:

14 Grain crops include corn, dry beans, and grain.

15 Field crops include cotton, grass, hay, safflower, and sugar beets.

16 Forage crops include alfalfa and pasture.

17 All values of production are in 2012 dollar equivalent values.

1 **Table 12.63 Changes in San Joaquin Valley Agricultural Production in Dry and**  
 2 **Critical Dry Years under Alternative 5 as Compared to the Second Basis of**  
 3 **Comparison**

Crops	Alternative 5 (\$ millions)	Second Basis of Comparison (\$ millions)	Changes (\$ millions)
<b>Grain Crops</b>	1,359	1,373	-14.5
<b>Rice</b>	31	31	0.0
<b>Field Crops</b>	1,435	1,437	-1.2
<b>Forage Crops</b>	1,426	1,426	-0.5
<b>Vegetables and Truck Crops</b>	4,622	4,623	-0.5
<b>Orchards and Vineyards</b>	16,540	16,547	-6.4
<b>Total</b>	25,414	25,437	-22.9

- 4 Notes:  
 5 Grain crops include corn, dry beans, and grain.  
 6 Field crops include cotton, grass, hay, safflower, and sugar beets.  
 7 Forage crops include alfalfa and pasture.  
 8 All values of production are in 2012 dollar equivalent values.

9 *Effects Related to Water Transfers*

10 Potential effects to agricultural resources could be similar to those identified in a  
 11 recent environmental analysis conducted by Reclamation for long-term water  
 12 transfers from the Sacramento to San Joaquin valleys (Reclamation 2014c) as  
 13 described above under the No Action Alternative compared to the Second Basis  
 14 of Comparison. For the purposes of this EIS, it is anticipated that similar  
 15 conditions would occur during implementation of cross Delta water transfers  
 16 under Alternative 5 and the Second Basis of Comparison, and that impacts on  
 17 agricultural resources would not be substantial in the seller’s service area due to  
 18 implementation requirements of the transfer programs.

19 Under Alternative 5, the timing of cross Delta water transfers would be limited to  
 20 July through September and include annual volumetric limits, in accordance with  
 21 the 2008 USFWS BO and 2009 NMFS BO. Under Second Basis of Comparison,  
 22 water could be transferred throughout the year without an annual volumetric limit.  
 23 Overall, the potential for cross Delta water transfers would be reduced under  
 24 Alternative 5 as compared to the Second Basis of Comparison.

25 *San Francisco Bay Area, Central Coast, and Southern California Regions*

26 *Potential Changes in Irrigated Agricultural*

27 It is anticipated that reductions in CVP and SWP water supplies within the San  
 28 Francisco Bay Area, Central Coast, and Southern California regions would not  
 29 result in reductions in irrigated acreage or land use changes due to the use of other  
 30 water supplies in the same manner that is projected to occur in the Central Valley  
 31 Region.

1 **12.4.3.7 Summary of Environmental Consequences**

2 The results of the environmental consequences of implementation of  
 3 Alternatives 1 through 5 as compared to the No Action Alternative and the  
 4 Second Basis of Comparison are presented in Tables 12.64 and 12.65. The results  
 5 of the impact analysis represents comparison of long-term changes that would  
 6 occur between alternatives by 2030. The impact analysis does not represent  
 7 short-term responses, especially during one to five years, in response to  
 8 emergency flood or drought conditions.

9 **Table 12.64 Comparison of Alternatives 1 through 5 to No Action Alternative**

Alternative	Potential Change	Consideration for Mitigation Measures
Alternative 1	No effects on agricultural resources.	None needed
Alternative 2	No effects on agricultural resources.	None needed
Alternative 3	No effects on agricultural resources.	None needed
Alternative 4	No effects on agricultural resources.	None needed
Alternative 5	No effects on agricultural resources.	None needed

10 **Table 12.65 Comparison of No Action Alternative and Alternatives 1 through 5 to**  
 11 **Second Basis of Comparison**

Alternative	Potential Change	Consideration for Mitigation Measures
No Action Alternative	No effects on agricultural resources.	Not considered for this comparison.
Alternative 1	No effects on agricultural resources.	Not considered for this comparison.
Alternative 2	No effects on agricultural resources.	Not considered for this comparison.
Alternative 3	No effects on agricultural resources.	Not considered for this comparison.
Alternative 4	No effects on agricultural resources.	Not considered for this comparison.
Alternative 5	No effects on agricultural resources.	Not considered for this comparison.

12 **12.4.3.8 Potential Mitigation Measures**

13 Mitigation measures are presented in this section to avoid, minimize, rectify,  
 14 reduce, eliminate, or compensate for adverse environmental effects of  
 15 Alternatives 1 through 5 as compared to the No Action Alternative. Mitigation  
 16 measures were not included to address adverse impacts under the alternatives as  
 17 compared to the Second Basis of Comparison because this analysis was included  
 18 in this EIS for information purposes only.

1 Changes in CVP and SWP operations under Alternatives 1 through 5 as compared  
 2 to the No Action Alternative, would not result in changes in agricultural  
 3 resources. Therefore, there would be no adverse impacts to agricultural  
 4 resources; and no mitigation measures are required.

5 **12.4.3.9 Cumulative Effects Analysis**

6 As described in Chapter 3, the cumulative effects analysis considers projects,  
 7 programs, and policies that are not speculative; and are based upon known or  
 8 reasonably foreseeable long-range plans, regulations, operating agreements, or  
 9 other information that establishes them as reasonably foreseeable.

10 The cumulative effects analysis Alternatives 1 through 5 for Agricultural  
 11 Resources are summarized in Table 12.66.

12 **Table 12.66 Summary of Cumulative Effects on Agricultural Resources of**  
 13 **Alternatives 1 through 5 as Compared to the No Action Alternative**

Scenarios	Actions	Cumulative Effects of Actions
Past & Present, and Future Actions included in the No Action Alternative and in All Alternatives in Year 2030	Consistent with Affected Environment conditions plus:  Actions in the 2008 USFWS BO and 2009 NMFS BO that would have occurred without implementation of the BOs, as described in Section 3.3.1.2 (of Chapter 3, Descriptions of Alternatives), including climate change and sea level rise  Actions not included in the 2008 USFWS BO and 2009 NMFS BO that would have occurred without implementation of the BOs, as described in Section 3.3.1.3 (of Chapter 3, Descriptions of Alternatives):  <ul style="list-style-type: none"> <li>- Implementation of Federal and state policies and programs, including Clean Water Act (e.g., Total Maximum Daily Loads); Safe Drinking Water Act; Clean Air Act; and flood management programs</li> <li>- General plans for 2030.</li> <li>- Trinity River Restoration Program.</li> <li>- Central Valley Project Improvement Act programs</li> <li>- Iron Mountain Mine Superfund Site</li> <li>- Nimbus Fish Hatchery Fish Passage Project</li> <li>- Folsom Dam Water Control Manual Update</li> <li>- FERC Relicensing for the Middle Fork of the American River Project</li> <li>- Lower Mokelumne River Spawning Habitat Improvement Project</li> <li>- Dutch Slough Tidal Marsh Restoration</li> </ul>	<u>These effects would be the same under all alternatives.</u>  Climate change and sea level rise, development under the general plans, FERC relicensing projects, and some future projects to improve water quality and/or habitat are anticipated to reduce availability of CVP and SWP water supplies as compared to past conditions.  Some future water quality and habitat projects could modify surface water conditions; however, water supplies are not anticipated to be affected.  Future water supply projects are anticipated to both increase water supply reliability due to reduced surface water supplies and to accommodate planned growth in the general plans. Most of these programs were initiated prior to implementation of the 2008 USFWS BO and 2009 NMFS BO which reduced CVP and SWP water supply reliability.  Developments under the general plans and future water supply, water quality improvement, and restoration projects are anticipated to potentially affect agricultural resources. However, development of these future programs would include preparation of environmental documentation that would identify methods to minimize adverse impacts to agricultural resources.

Scenarios	Actions	Cumulative Effects of Actions
	<ul style="list-style-type: none"> <li>- Suisun Marsh Habitat Management, Preservation, and Restoration Plan Implementation</li> <li>- Tidal Wetland Restoration: Yolo Ranch, Northern Liberty Island Fish Restoration Project, Prospect Island Restoration Project, and Calhoun Cut/Lindsey Slough Tidal Habitat Restoration Project</li> <li>- San Joaquin River Restoration Program</li> <li>- Stockton Deep Water Ship Channel Dissolved Oxygen Project</li> <li>- Grasslands Bypass Project</li> <li>- Central Valley Salinity Alternatives for Long-Term Sustainability (CV-SALTS)</li> <li>- Future water supply projects, including water recycling, desalination, groundwater banks and wellfields, and conveyance facilities (projects with completed environmental documents)</li> </ul>	<p>Some of the future actions would reduce the effects of agricultural drainage and/or reduce salinity in the San Joaquin River and the Delta. These programs would result in a beneficial impact to remaining agricultural resources.</p>
<p>Future Actions considered as Cumulative Effects Actions with All Alternatives in Year 2030</p>	<p>Actions as described in Section 3.5 (of Chapter 3, Descriptions of Alternatives):</p> <ul style="list-style-type: none"> <li>- Bay-Delta Water Quality Control Plan Update</li> <li>- FERC Relicensing Projects</li> <li>- Bay Delta Conservation Plan (including the California WaterFix alternative)</li> <li>- Shasta Lake Water Resources, North-of-the-Delta Offstream Storage, Los Vaqueros Reservoir Expansion Phase 2, and Upper San Joaquin River Basin Storage Investigations</li> <li>- El Dorado Water and Power Authority Supplemental Water Rights Project</li> <li>- Sacramento River Water Reliability Project</li> <li>- Semitropic Water Storage District Delta Wetlands</li> <li>- North Bay Aqueduct Alternative Intake</li> <li>- Irrigated Lands Regulatory Program</li> <li>- San Luis Reservoir Low Point Improvement Project</li> <li>- <i>Westlands Water District v. United States Settlement</i></li> <li>- Future water supply projects, including water recycling,</li> </ul>	<p><u>These effects would be the same under all alternatives.</u></p> <p>Most of the reasonably foreseeable actions are anticipated to reduce water supply impacts due to climate change, sea level rise, increased water allocated to improve habitat conditions, and future growth.</p> <p>Some of the reasonably foreseeable actions related to improved water quality and habitat conditions (e.g., Water Quality Control Plan Update and FERC Relicensing Projects), could in further reductions in CVP and SWP water deliveries.</p> <p>Developments under the future projects are anticipated to potentially affect agricultural resources. However, development of these future programs would include preparation of environmental documentation that would identify methods to minimize adverse impacts to agricultural resources.</p> <p>Some of the reasonably foreseeable actions would reduce the effects of agricultural drainage and/or reduce salinity in the San Joaquin River and the Delta. These programs would result in a</p>

Scenarios	Actions	Cumulative Effects of Actions
	desalination, groundwater banks and wellfields, and conveyance facilities (projects that did not have completed environmental documents during preparation of the EIS)	beneficial impact to agricultural resources.
No Action Alternative with Associated Cumulative Effects Actions in Year 2030	Full implementation of the 2008 USFWS BO and 2009 NMFS BO	<p>Climate change and sea level rise, development under the general plans, FERC relicensing projects, and some future projects to improve water quality and/or habitat are anticipated to reduce availability of CVP and SWP water supplies.</p> <p>Future water supply projects are anticipated to both increase water supply reliability due to reduced surface water supplies and to accommodate planned growth in the general plans.</p> <p>Some of the reasonably foreseeable actions would reduce the effects of agricultural drainage and/or reduce salinity in the San Joaquin River and the Delta.</p>
Alternative 1 with Associated Cumulative Effects Actions in Year 2030	No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant)	Implementation of Alternative 1 with reasonably foreseeable actions would result in similar changes as under the No Action Alternative with the added actions.
Alternative 2 with Associated Cumulative Effects Actions in Year 2030	<p>Full implementation of the 2008 USFWS BO and 2009 NMFS BO CVP and SWP operational actions</p> <p>No implementation of structural improvements or other actions that require further study to develop a more detailed action description.</p>	Implementation of Alternative 2 with reasonably foreseeable actions would result in similar changes as under the No Action Alternative with the added actions.
Alternative 3 with Associated Cumulative Effects Actions in Year 2030	<p>No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant)</p> <p>Slight increase in positive Old and Middle River flows in the winter and spring months</p>	Implementation of Alternative 3 with reasonably foreseeable actions would result in similar changes as under the No Action Alternative with the added actions.
Alternative 4 with Associated Cumulative Effects Actions in Year 2030	No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant)	Implementation of Alternative 4 with reasonably foreseeable actions would result in similar changes as under the No Action Alternative with the added actions.
Alternative 5 with Associated Cumulative Effects Actions in Year 20530	<p>Full implementation of the 2008 USFWS BO and 2009 NMFS BO</p> <p>Positive Old and Middle River flows and increased Delta outflow in spring months</p>	Implementation of Alternative 5 with reasonably foreseeable actions would result in similar changes as under the No Action Alternative with the added actions.

## Chapter 13

# 1 Land Use

## 2 13.1 Introduction

3 This chapter describes non-agricultural land use in the study area, and potential  
4 changes that could occur as a result of implementing the alternatives evaluated in  
5 this Environmental Impact Statement (EIS). Implementation of the alternatives  
6 could affect municipal and industrial land uses through potential changes in the  
7 Central Valley Project (CVP) and State Water Project (SWP) operation.

8 Changes in agricultural land use and resources are described in Chapter 12,  
9 Agricultural Resources. Changes to population are described in Chapter 19,  
10 Socioeconomics.

## 11 13.2 Regulatory Environment and Compliance 12 Requirements

13 Potential actions that could be implemented under the alternatives evaluated in  
14 this EIS could affect land uses served by CVP and SWP water supplies. Actions  
15 done on public agency lands, or implemented, funded, or approved by Federal and  
16 state agencies would need to be compliant with appropriate Federal and state  
17 agency policies and regulations (summarized in Chapter 4, Approach to  
18 Environmental Analysis).

## 19 13.3 Affected Environment

20 This section describes land use conditions potentially affected by the  
21 implementation of the alternatives considered in this EIS. Changes in land uses  
22 from changes in CVP and SWP operations may occur in the Trinity River, Central  
23 Valley, San Francisco Bay Area, Central Coast, and Southern California regions.

24 An extensive range of land uses are within this study area. However, direct or  
25 indirect land use effects from implementing the alternatives analyzed in this EIS  
26 are related to changes in agricultural, municipal, and industrial land uses from the  
27 availability and reliability of CVP and SWP water supplies. The following  
28 description of the affected environment is presented at the county-level for  
29 agricultural and municipal and industrial land uses. More detailed agricultural  
30 land use information is presented in Chapter 12, Agricultural Resources.

### 31 13.3.1 Trinity River Region

32 The Trinity River Region includes the area in Trinity County along the Trinity  
33 River from Trinity Lake to the confluence with the Klamath River; and in  
34 Humboldt and Del Norte counties along the Klamath River from the confluence

1 with the Trinity River to the Pacific Ocean. Tribal lands are also included for the  
2 entire Trinity River Region.

3 **13.3.1.1 Trinity County**

4 Trinity County encompasses approximately 3,206 square miles in northwestern  
5 California. It is bounded on the north by Siskiyou County, on the east by Shasta  
6 and Tehama Counties, on the south by Mendocino County, and on the west by  
7 Humboldt County. About 76 percent of the land area is within a national forest  
8 (Shasta-Trinity, Six Rivers, and Mendocino) and in four wilderness areas (Yolla  
9 Bolly-Middle Eel Reserve, Trinity Alps, Chanchellula, and North Fork). Another  
10 14 percent is zoned for timber use or held in agriculture land conservation  
11 contracts (Trinity County 2012).

12 The headwaters of the Trinity River are in the northeastern part of the County at  
13 an elevation of 6,200 feet, in the southern Siskiyou Mountains. Trinity Lake and  
14 Lewiston Reservoir are located along the middle reach of the mainstem  
15 Trinity River. Downstream of Lewiston Dam, the river flows northwest to join  
16 the Klamath River in Humboldt County (Trinity County 2012).

17 Development of communities is relatively limited in Trinity County because  
18 much of the land is within national forests and tribal lands or is characterized by  
19 steep slopes. The largest communities in Trinity County include Lewiston,  
20 Weaverville, and Hayfork (Trinity County 2012).

21 Trinity County's primary industries are tourism and timber and is the sixth largest  
22 timber producer in the state, with substantial acreage in National Forest and  
23 private holdings. There is one operating mill in the County. Recreational  
24 opportunities are also important in this area, as described in Chapter 15,  
25 Recreation Resources (Trinity County 2012).

26 The portion of Trinity County in the Trinity River Region that could be affected  
27 by changes in CVP and/or SWP operations and evaluated in this EIS includes  
28 areas in the vicinity of CVP facilities (Trinity Lake and Lewiston Reservoir) and  
29 areas along the Trinity River that use the river.

30 **13.3.1.2 Humboldt County**

31 Humboldt County encompasses approximately 3,570 square miles in  
32 northwestern California. It is bounded on the north by Del Norte County, on the  
33 east by Siskiyou and Trinity counties, on the south by Mendocino County, and on  
34 the west by the Pacific Ocean. About 25 percent of the land area is within the Six  
35 Rivers National Forest, Trinity Alps Wilderness Area, Redwood National and  
36 State National Park, national wildlife refuges, or other public land. About  
37 3 percent of the land area is within state park lands. The Yurok and Hoopa tribal  
38 lands represent about 5.6 percent of the land within Humboldt County boundaries  
39 (Humboldt County 2012).

40 Most of the population and developed areas are located in western Humboldt  
41 County along U.S. Highway 101 (Humboldt County 2012). Incorporated cities  
42 and residential lands in unincorporated portions of Humboldt County represent  
43 less than 1 percent of the county. Development of communities is relatively

1 limited in Humboldt County because much of the land is within national forests  
 2 and tribal lands, characterized by steep slopes, or within the coastal zone where  
 3 new large scale developments are minimized. Timber and agricultural lands are  
 4 located on over 60 percent of unincorporated areas of Humboldt County.

5 Humboldt County's primary industries are lumber manufacturing, retail, and  
 6 services (Humboldt County 2012). Humboldt County provides over 25 percent of  
 7 the lumber in the state.

8 The portion of Humboldt County in the Trinity River Region evaluated in this EIS  
 9 is located along the Trinity and Klamath rivers. Most of this area is located  
 10 within the Hoopa Valley Indian Reservation and Yurok Indian Reservation. This  
 11 portion of the county includes the communities of Willow Creek and Orleans  
 12 within Humboldt County; Hoopa in the Hoopa Valley Indian Reservation; and the  
 13 communities of Weitchpec, Cappel, Pecwan, and Johnson's in the Yurok Tribe  
 14 Indian Reservation (Humboldt County 2012).

### 15 **13.3.1.3 Del Norte County**

16 Del Norte County encompasses 1,070 square miles in northwestern California. It  
 17 is bounded on the north by the State of Oregon, on the east by Siskiyou County,  
 18 on the south by Humboldt County, and on the west by the Pacific Ocean.

19 Del Norte County includes lands within national forests (Six Rivers and Rogue  
 20 River-Siskiyou), Smith River National Recreation Area, Redwood National and  
 21 State Park, or other federally owned land. State lands include units of the  
 22 Redwoods State Park and the Lake Earl Wildlife Area. The Yurok tribal lands are  
 23 located along the lower Klamath River between the Del Norte and Humboldt  
 24 county boundaries to the Pacific Ocean (Del Norte County 2003).

25 Del Norte County's primary industries are retail and services (Del Norte County  
 26 2003).

27 The portion of Del Norte County in the Trinity River Region evaluated in this EIS  
 28 is located along the lower Klamath River. Most of this area is within the Yurok  
 29 Indian Reservation. This portion of the County includes the communities of  
 30 Requa and Klamath in the Yurok Tribe Indian Reservation (Del Norte  
 31 County 2003).

### 32 **13.3.1.4 Tribal Lands in Trinity River Region**

33 The major federally recognized tribes and tribal lands in the Trinity River Region  
 34 include the tribal lands of the Hoopa Valley Tribe, Yurok Tribe of the Yurok  
 35 Reservation, Resighini Rancheria, and Karuk Tribe. Aquatic and wildlife  
 36 resources associated with the Trinity and Klamath rivers and the surrounding  
 37 lands are very important to these tribes (NCRWQCB et al. 2009; Yurok Tribe  
 38 2005; Karuk Tribe 2010).

39 The Hoopa Valley Indian Reservation includes 93,702.73 acres (Hoopa Valley  
 40 Tribe 2008). The Trinity River flows through the Hoopa Valley Indian  
 41 Reservation.

1 The Yurok Indian Reservation includes about 55,890 acres within Tribal trust,  
2 Tribal fee, allotment, Tribal member fee, nonmember fee, Federal, state, and  
3 county lands (Yurok Tribe 2012). The Tribe employs over 250 in the government  
4 agency, as well as seasonal workers for fisheries, forestry, fire prevention, and  
5 other programs.

6 The Resighini Rancheria includes about 435 acres of land along the south bank  
7 of the lower Klamath River and extends from an inland area to the  
8 U.S. Highway 101 bridge along the western boundary of the Rancheria  
9 (Reclamation 2010). The Rancheria is surrounded by the Yurok Indian  
10 Reservation (Reclamation 2010; Resighini Rancheria 2014). The community  
11 includes tribal offices, a casino, campground, residences, agricultural lands, and  
12 open space.

13 The Karuk Ancestral Territory is located to the north of the Trinity River in the  
14 vicinity of Trinity County and east of the Trinity River in the vicinity of  
15 Humboldt County (Karuk Tribe 2010). The western boundary of the Karuk  
16 Ancestral Territory is relatively concurrent with the western boundary of the  
17 Six Rivers National Forest. Therefore, changes in the Trinity River flow or water  
18 quality that could be affected by changes in CVP and/or SWP operations  
19 considered in the alternatives in this EIS would not occur within the Karuk  
20 Ancestral Territory.

### 21 **13.3.2 Central Valley Region**

22 The Central Valley Region extends from above Shasta Lake to the  
23 Tehachapi Mountains, and includes the Sacramento Valley, San Joaquin Valley,  
24 Delta, and Suisun Marsh.

#### 25 **13.3.2.1 Sacramento Valley**

26 The Sacramento Valley includes the counties of Shasta, Plumas, Tehama, Glenn,  
27 Colusa, Butte, Sutter, Yuba, Nevada, Placer, El Dorado, and Sacramento counties.  
28 Yolo and Solano counties are also located within the Sacramento Valley;  
29 however, these counties are discussed as part of the Delta and Suisun Marsh  
30 subsection because potential changes in land use because of changes in CVP and  
31 SWP long-term operations would primarily occur within the Delta and Suisun  
32 marsh geography. Other counties in this region are not anticipated to be affected  
33 by changes in CVP and SWP operations, and are not discussed here, including:  
34 Alpine, Sierra, Lassen, and Amador counties. Tribal lands are also described for  
35 the entire Sacramento Valley.

##### 36 **13.3.2.1.1 Shasta County**

37 Shasta County encompasses approximately 3,793 square miles in northern  
38 California. It is bounded on the north by Siskiyou County, on the east by Lassen  
39 County, on the south by Tehama County, and on the west by Trinity County.  
40 Shasta County includes lands within national forests (Shasta-Trinity,  
41 Whiskeytown-Shasta-Trinity, and Lassen), Lassen Volcanic National Park, or  
42 other federally owned land. State lands include state forest and state parks  
43 (Shasta County 2004).

1 The Shasta County General Plan identifies four major categories of land use:  
 2 urban, rural, agricultural, and timber (Shasta County 2004). Of Shasta County's  
 3 2,416,440 acres, 613,495 acres (25 percent) are designated as timber preserve  
 4 zones pursuant to California's Forest Taxation Reform Act of 1976 (Shasta  
 5 County 2004). Approximately 169,127 acres (7 percent), are designated as  
 6 agricultural preserve lands.

7 Approximately 1.2 percent of the lands in the County are within incorporated  
 8 areas (Shasta County 2004). Urban development is concentrated in the southern  
 9 central portion of the county in the cities of Redding, Anderson, and Shasta Lake  
 10 (Reclamation 2005a).

11 The portion of the Central Valley Region, Sacramento Valley in Shasta County  
 12 that could be affected by changes in CVP and/or SWP operations and evaluated in  
 13 this EIS includes CVP facilities (Shasta Lake, Keswick Reservoir, and  
 14 Whiskeytown Lake), areas along the Sacramento River and Clear Creek that use  
 15 the surface waters (including agricultural lands), and CVP water service areas.

#### 16 **13.3.2.1.2 Plumas County**

17 Plumas County encompasses approximately 2,610 square miles in northern  
 18 California. It is bounded on the north by Shasta County, on the east by Lassen  
 19 County, on the west by Tehama and Butte counties, and on the south by Sierra  
 20 County. Plumas County includes lands within national forests (Plumas, Lassen,  
 21 Toiyabe, and Tahoe), Lassen Volcanic National Park, or other federally owned  
 22 land. State lands include Plumas-Eureka State Park (Plumas County 2012).

23 Prominent landscape features in Plumas County are the Sierra Valley, the Lake  
 24 Almanor Basin, and the Upper Feather River watershed which includes three  
 25 SWP lakes (Antelope Lake, Lake Davis, and Frenchman Lake). The largest land  
 26 uses in the county are agricultural and timber resource lands. Rural and  
 27 semi-rural development is scattered throughout the County, with most growth  
 28 concentrated in several designated planning areas. The county's only  
 29 incorporated area is the City of Portola.

30 The most recent Plumas County General Plan was adopted in 1984. The county is  
 31 in the process of updating its General Plan through 2030 (Plumas County 2012).  
 32 Approximately 76 percent of the land in Plumas County is National Forest land  
 33 owned and managed by the U.S. Forest Service. The U.S. Forest Service  
 34 prepared the Plumas National Forest Land and Resource Management Plan in  
 35 1988, to guide management and land use planning decisions in the forest. The  
 36 National Forest Land and Resource Management Plan provides a designation for  
 37 areas based on established priorities for various resources, including wilderness,  
 38 recreation, wildlife, timber, and visual resources (Plumas County 2012).

39 The portion of the Central Valley Region, Sacramento Valley in Plumas County  
 40 that could be affected by changes in CVP and/or SWP operations and evaluated in  
 41 this EIS is located at the SWP Antelope Lake, Lake Davis, and Frenchman Lake  
 42 and along the Feather River downstream of Frenchman Lake.

1 **13.3.2.1.3 Tehama County**

2 Tehama County encompasses approximately 2,951 square miles in northern  
3 California. It is bounded on the north by Shasta County, on the east by Plumas  
4 County, on the west by Trinity and Mendocino counties, and on the south by  
5 Glenn and Butte counties. Tehama County includes lands within national forests  
6 (Lassen, Mendocino, and Shasta-Trinity), Lassen Volcanic National Park, or other  
7 federally owned land (Tehama County 2008).

8 Tehama County is predominantly rural, with populations primarily concentrated  
9 in the incorporated cities of Corning, Red Bluff, and Tehama or along the major  
10 transportation corridors. The incorporated areas include less than 1 percent of the  
11 total land area in the county. The primary incorporated and unincorporated  
12 developed areas in the county are adjacent to major transportation centers, with  
13 most adjacent to Interstate 5 and State Route 99. Clustered commercial land uses  
14 are located primarily along the major state and county roadways, most of which  
15 are near Red Bluff, Corning, and the unincorporated community of Los Molinos.  
16 Residential land uses in the developed portions of the county tend to be located  
17 behind or beyond the commercial and service uses adjacent to the major street  
18 network (Tehama County 2008).

19 Ranches, timber company holdings, and government land dominate the county.  
20 Much of the land use is resource-based, such as cropland, rangeland, pasture land,  
21 and timber land (Tehama County 2008). The majority of land within the CVP  
22 water service area in Tehama County is designated for agricultural use (Tehama  
23 County 2008; Reclamation 2005b).

24 The portion of the Central Valley Region, Sacramento Valley in Tehama County  
25 that could be affected by changes in CVP and/or SWP operations and evaluated in  
26 this EIS includes CVP facilities, areas along the Sacramento River that use the  
27 surface waters (including agricultural lands), and CVP water service areas.

28 **13.3.2.1.4 Glenn County**

29 Glenn County encompasses 1,317 square miles in northern California. It is  
30 bounded on the north by Tehama County, on the east by Butte County, on the  
31 west by Lake and Mendocino counties, and on the south by Colusa County.  
32 Glenn County includes lands within the Mendocino National Forest, Sacramento  
33 National Wildlife Refuge, and other federally owned land (Glenn County 1993).

34 Approximately two-thirds (583,974 acres) are croplands and pasture. The two  
35 incorporated towns in the county are Willows, the County seat, and Orland  
36 (Reclamation 2004). Intensive agriculture provides a major segment of the  
37 county's economic base (Glenn County 1993; Reclamation 2005b). The portion of  
38 the Central Valley Region, Sacramento Valley in Glenn County that could be  
39 affected by changes in CVP and/or SWP operations and evaluated in this EIS  
40 includes wildlife refuges (described in Chapter 10, Terrestrial Biological  
41 Resources), and CVP facilities, areas along the Sacramento River that use the  
42 surface waters (including agricultural lands), and CVP water service areas.

1     **13.3.2.1.5 Colusa County**

2     Colusa County encompasses approximately 1,132 square miles in northern  
 3     California. It is bounded on the north by Glenn County, on the east by Butte and  
 4     Sutter counties, on the west by Lake County, and on the south by Yolo County.  
 5     Colusa County includes lands within the Mendocino National Forest, Sacramento  
 6     National Wildlife Refuge complex (Colusa, Delevan, and Sacramento national  
 7     wildlife refuges); East Park Reservoir; and other federally owned land (Colusa  
 8     County 2011). State lands in Colusa County include Willow Creek-Lurline,  
 9     North Central Valley, Colusa Bypass, and Sacramento River wildlife  
 10    management areas.

11    Existing land uses in Colusa County are predominantly agricultural.  
 12    Approximately 76 percent of the county’s total land area is cropland or  
 13    undeveloped rangeland. Twelve percent is national forest and national wildlife  
 14    refuge land. Less than 1 percent is covered by urban and rural communities.  
 15    Colusa and Williams are the only incorporated cities in the county and they  
 16    encompass about 2,574 acres (Colusa County 2011). Arbuckle is the largest  
 17    unincorporated town of the unincorporated communities, which includes  
 18    Arbuckle, College City, Century Ranch, Grimes, Maxwell, Princeton, and  
 19    Stonyford. Together, these established incorporated and unincorporated towns  
 20    cover a total area in “urban” uses of about 5,451 acres (Colusa County 2011).  
 21    The majority of land within the CVP water service area in Colusa County is  
 22    designated for agricultural use (Colusa County 2011; Reclamation 2005b).

23    The portion of the Central Valley Region, Sacramento Valley in Colusa County  
 24    that could be affected by changes in CVP and/or SWP operations and evaluated in  
 25    this EIS includes wildlife refuges (described in Chapter 10, Terrestrial Biological  
 26    Resources) and CVP facilities, areas along the Sacramento River that use the  
 27    surface waters (including agricultural lands), and CVP water service areas.

28    **13.3.2.1.6 Butte County**

29    Butte County encompasses 1,680 square miles in northern California. It is  
 30    bounded on the north by Tehama County, on the east by Plumas County, on the  
 31    west by Glenn and Colusa counties, and on the south by Sutter and Yuba counties.  
 32    Butte County includes lands within national forests (Plumas and Lassen),  
 33    Sacramento National Wildlife Refuge (Butte County 2010). State lands in Butte  
 34    County include Big Chico Creek and Butte Creek ecological preserves; Table  
 35    Mountain Reserve; Gray Lodge, Sacramento River, and Oroville wildlife areas;  
 36    SWP facilities at Lake Oroville and Thermalito Reservoir; and more than  
 37    750 miles of rivers and streams.

38    The county comprises three general topographical areas: valley region, foothills  
 39    east of the valley, and mountain region east of the foothills. Each of these regions  
 40    contains distinct environments with unique wildlife and natural resources.

41    The U.S. Forest Service manages 135,427 acres (12 percent) within Butte County,  
 42    including portions of the Plumas and Lassen National Forests. The Bureau of  
 43    Land Management owns and manages 16,832 acres (1.5 percent) in the county

1 (Butte County 2010). Agriculture is the dominant land use within unincorporated  
2 Butte County, accounting for approximately 599,040 acres (60 percent of the  
3 county area) (Butte County 2010).

4 Butte County contains five incorporated municipalities: Biggs, Chico, Gridley,  
5 Oroville, and Paradise. Each has a general plan that guides development within  
6 its limits and larger planning area (Butte County 2010).

7 The portion of the Central Valley Region, Sacramento Valley, in Butte County  
8 that could be affected by changes in CVP and/or SWP operations and evaluated in  
9 this EIS includes wildlife refuges (described in Chapter 10, Terrestrial Biological  
10 Resources), SWP facilities (Lake Oroville and Thermalito Afterbay), CVP  
11 facilities, areas along the Feather River that use the surface waters (including  
12 agricultural lands), and CVP and SWP water service areas.

### 13 **13.3.2.1.7 Sutter County**

14 Sutter County encompasses approximately 607 square miles in northern  
15 California. It is bounded on the north by Butte County, on the east by Yuba and  
16 Placer counties, on the west by Colusa and Yolo counties, and on the south by  
17 Sacramento County. Sutter County includes lands within the Sutter National  
18 Wildlife Refuge. State lands in Sutter County include Butte Slough, Feather  
19 River, Gray Lodge, Sutter Bypass, and Butte Sink wildlife management areas; and  
20 Sutter Buttes State Park (Sutter County 2010).

21 Sutter County's General Plan was updated in 2011. Approximately 98 percent of  
22 the land in the County is unincorporated, and approximately 98 percent of the  
23 unincorporated land is zoned for agricultural use (Reclamation 2004). The two  
24 incorporated cities within the county, Yuba City and Live Oak, encompass  
25 approximately 10,600 acres.

26 Existing land use in Sutter County is rural and dominated by agricultural areas.  
27 The county has significant natural and recreational resources, and a relatively low  
28 population density. Existing land uses in Yuba City and Live Oak contain the  
29 bulk of the county's urban land uses, such as residences, commercial and  
30 industrial uses, parks, and public facilities (Sutter County 2010). The county  
31 includes several incorporated rural communities: Meridian, Sutter, Robbins,  
32 Rio Oso, Trowbridge, Nicolaus, East Nicolaus, and Pleasant Grove (Sutter  
33 County 2010).

34 The portion of the Central Valley Region, Sacramento Valley in Sutter County  
35 that could be affected by changes in CVP and/or SWP operations and evaluated in  
36 this EIS includes wildlife refuges (described in Chapter 10, Terrestrial Biological  
37 Resources), CVP facilities, areas along the Sacramento River that use the surface  
38 waters (including agricultural lands), and CVP and SWP water service areas.

### 39 **13.3.2.1.8 Yuba County**

40 Yuba County encompasses approximately 634 acres in northern California. It is  
41 bounded on the north by Butte County, on the east by Sierra and Nevada counties,  
42 on the west by Sutter County, and on the south by Placer County. Federally

1 owned lands in Yuba County include Tahoe and Plumas National Forests, and the  
 2 22,944-acre Beale Air Force Base (Yuba County 2011). The Department of Fish  
 3 and Wildlife administers the state Spenceville Wildlife Area.

4 Yuba County is predominantly rural. Over 189,500 acres (46 percent of the  
 5 county), are designated for agricultural land uses. Most of the population lives in  
 6 the two incorporated cities in the county (Marysville and Wheatland); and the  
 7 major unincorporated communities including Brown's Valley, Brownsville,  
 8 Camptonville, Dobbins, Linda/Olivehurst, Log Cabin, Loma Rica, Oregon  
 9 House, Rackerby, and River Highlands (Yuba County 2011).

10 The portion of the Central Valley Region, Sacramento Valley in Yuba County  
 11 that could be affected by changes evaluated in this EIS includes areas within  
 12 Yuba County Water Agency facilities that provide water for environmental and  
 13 water supply purposes within the Central Valley.

#### 14 **13.3.2.1.9 Nevada County**

15 Nevada County encompasses approximately 634,880 acres in northern California.  
 16 It is bounded on the north by Sierra County, on the northwest by Yuba County, on  
 17 and on the south by Placer County. Federally owned lands in Nevada County  
 18 include 169,686 acres in the Tahoe National Forest; 2,574 acres in the Toiyabe  
 19 National Forest; and approximately 11,000 acres administered by the Bureau of  
 20 Land Management (Nevada County 1995). The State Lands Commission  
 21 manages approximately 4,600 acres; State Parks administers 6,300 acres at  
 22 several locations, including Malakoff Diggins State Historical Park and Empire  
 23 Mine State Park; and the Department of Fish and Wildlife administers  
 24 approximately 11,000 acres at the Spenceville Wildlife Management and  
 25 Recreation Area.

26 Nevada County is predominantly rural (Nevada County 2012). Approximately  
 27 91 percent of the county is used for agriculture, timber, or open space. Most of  
 28 the population lives in the three incorporated cities in the county (Grass Valley,  
 29 Nevada City, and Truckee).

#### 30 **13.3.2.1.10 Placer County**

31 Placer County encompasses approximately 1,506 square miles in northern  
 32 California. It is bounded on the north by Nevada County, on the east by the  
 33 California-Nevada boundary, on the west by Yuba and Sutter counties, and on the  
 34 south by Sacramento and El Dorado counties. Placer County includes lands  
 35 within the El Dorado and Tahoe National Forests and other federally owned land  
 36 (Placer County 2011).

37 Placer County is predominantly rural. Most of the population lives in the area  
 38 along Interstate 80 from the City of Auburn to the Sutter and Sacramento county  
 39 boundaries. Incorporated cities and towns include Roseville, Rocklin, Lincoln,  
 40 Colfax, Loomis, and Auburn (Placer County 2011; Reclamation 2005c; SACOG  
 41 2007). Residential land uses range from rural residential areas to medium and  
 42 high-density dwelling units in urbanized areas. Commercial land uses are  
 43 primarily located in the urbanized portions of the county; although a large

1 concentration of commercial development occurs outside existing urban areas  
2 along Interstate 80. Non-urban land uses include agriculture, resource extraction  
3 (timber and mining), and public lands and open space uses. The largest amount of  
4 public lands within Placer County is located in the eastern half of the county, and  
5 is under the jurisdiction of the Bureau of Land Management, U.S. Forest Service,  
6 or the Bureau of Reclamation. The CVP water service area within Placer County  
7 primarily includes the communities and agricultural areas in the western portion  
8 of the county. The portion of the Central Valley Region, Sacramento Valley in  
9 Placer County that could be affected by changes in CVP and/or SWP operations  
10 and evaluated in this EIS includes CVP water facilities (Folsom Lake), areas  
11 along the American River that use the surface waters (including agricultural  
12 lands), and CVP water service areas.

#### 13 **13.3.2.1.11 El Dorado County**

14 El Dorado County encompasses approximately 1,790 square miles in northern  
15 California along the American River. It is bounded on the north by  
16 Placer County, on the east by California-Nevada boundaries, on the west by  
17 Sacramento County, and on the south by Amador and Alpine counties. El Dorado  
18 County includes about 521,210 acres (45.5 percent of the total county), under  
19 Federal ownership or trust, including lands within the El Dorado and Tahoe  
20 national forests. About 9,751 acres (8.5 percent of the county), is under the State  
21 jurisdiction (El Dorado County 2003).

22 The county includes two specific regions: the Lake Tahoe Basin and the western  
23 slopes of the Sierra Nevada (El Dorado County 2003). The CVP water service  
24 area provides water to a large portion of the communities and some agricultural  
25 areas along the western slope. El Dorado County includes two incorporated  
26 cities, Placerville and South Lake Tahoe, which cover 621 acres of land. Other  
27 major communities include El Dorado Hills, Cameron Park, Shingle Springs,  
28 Rescue, Diamond Springs, Camino, Coloma and Gold Hill, Cool and Pilot Hill,  
29 Georgetown and Garden Valley, Pollock Pines, Pleasant Valley, Latrobe,  
30 Somerset, and Mosquito. The rural land uses in the county include over  
31 259,000 acres of private production forests, 153,472 acres of agricultural lands,  
32 and 35,282 acres within the waters of Folsom Lake and Lake Tahoe. The  
33 county's two largest crops are wine grapes and apples.

34 The portion of the Central Valley Region, Sacramento Valley in El Dorado  
35 County that could be affected by changes in CVP and/or SWP operations and  
36 evaluated in this EIS includes CVP water facilities (Folsom Lake), areas along the  
37 American River that use the surface waters, and CVP water service areas.

#### 38 **13.3.2.1.12 Sacramento County**

39 Sacramento County encompasses approximately 1,769 square miles in northern  
40 California. It is bounded on the north by Sutter and Placer counties, on the east  
41 by El Dorado and Amador counties, on the south by Contra Costa and San  
42 Joaquin counties, and on the west by Yolo and Solano counties. Sacramento  
43 County includes federally owned lands within Folsom Lake and Lake Natoma.

1 Residential areas in Sacramento County primarily occur in northern and central  
 2 Sacramento County. Sacramento County includes areas within the Delta,  
 3 including the southwestern portion of the City of Sacramento, City of Isleton and  
 4 the communities of Locke, Ryde, Courtland, Freeport, Hood, and Walnut Grove;  
 5 and areas located to the east of the Delta (Sacramento County 2011). Sacramento  
 6 County has seven incorporated cities located in about 56 percent of the county:  
 7 Sacramento, Elk Grove, Citrus Heights, Folsom, Galt, Isleton, and Rancho  
 8 Cordova. The County includes several unincorporated communities including  
 9 Antelope, Arden-Arcade, Carmichael, Cordova, Elverta, Foothill Farms, Fair  
 10 Oaks, Herold, Natomas, North Highlands, Orangevale, Rancho Murieta, Rio  
 11 Linda, Sloughhouse, and Wilton.

12 The leading agricultural crops in Sacramento County include dairy, wine grapes,  
 13 Bartlett pears, field corn, and turkeys (Sacramento County 2010). Agricultural  
 14 acreage has declined as urban development has continued. Between 1989 and  
 15 2004, the portion of the county designated as agriculture declined from 40 percent  
 16 to 34 percent. The southeastern portion of the county remains primarily rural with  
 17 smaller communities, such as Herald (Sacramento County 2011).

18 The portion of the Central Valley Region, Delta, in Sacramento County that could  
 19 be affected by changes in CVP and/or SWP operations and evaluated in this EIS  
 20 includes CVP facilities (Folsom Lake and Lake Natoma), areas along the  
 21 American and Sacramento rivers and Delta channels that use the surface waters  
 22 (including agricultural lands), and CVP water service areas.

### 23 **13.3.2.1.13 Tribal Lands in Sacramento Valley**

24 This section summarizes the tribal lands that could be affected by changes in CVP  
 25 and/or SWP operations and that are located within the county boundaries.

#### 26 *Tribal Lands within the Boundaries of Shasta County*

27 Major federally recognized tribes and tribal lands within the boundaries of Shasta  
 28 County include the Pit River Tribe and the Redding Rancheria, which is a federal  
 29 reservation of Wintun, Pit River, and Yana Indians near Redding (SDSU 2013).

#### 30 *Tribal Lands within the Boundaries of Tehama County*

31 There are approximately 2,000 acres within the total acreage of Tehama County  
 32 within tribal trust, including land near Corning owned by the Paskenta Band of  
 33 Nomlaki Indians of California (Paskenta 2014).

#### 34 *Tribal Lands within the Boundaries of Glenn County*

35 Major federally recognized tribes and tribal lands within the boundaries of Glenn  
 36 County include the Grindstone Indian Reservation near Elk Creek at the  
 37 Grindstone Indian Rancheria of Wintun-Wailaki Indians of California, and lands  
 38 of the Paskenta Band of Nomlaki Indians of California.

#### 39 *Tribal Lands within the Boundaries of Colusa County*

40 Major federally recognized tribes and tribal lands within the boundaries of Colusa  
 41 County include the Cachil Dehe Band of Wintun Indians of the Colusa Indian

1 Community of the Colusa Rancheria, and the Cortina Indian Rancheria of Wintun  
2 Indians of California (Colusa County 2011).

3 *Tribal Lands within the Boundaries of Butte County*

4 Major federally recognized tribes and tribal lands within the boundaries of Butte  
5 County include the Tyme Maidu of Berry-Creek Rancheria on approximately  
6 90 acres, and the Concow Maidu of Mooretown Rancheria on approximately  
7 300 acres (Butte County 2010).

8 *Tribal Lands within the Boundaries of Nevada County*

9 Major federally recognized tribes and tribal lands within the boundaries of  
10 Nevada County include tribal trust lands of the Shingle Springs Band of Miwok  
11 Indians.

12 *Tribal Lands within the Boundaries of Placer County*

13 Major federally recognized tribes and tribal lands within the boundaries of Placer  
14 County include tribal trust lands of the United Auburn Indian Community of the  
15 Auburn Rancheria of California.

16 *Tribal Lands within the Boundaries of El Dorado County*

17 Major federally recognized tribes and tribal lands within the boundaries of El  
18 Dorado County include the Shingle Springs Band of Miwok Indians.

19 *Tribal Lands within the Boundaries of Sacramento County*

20 Major federally recognized tribes and tribal lands within the boundaries of  
21 Sacramento County include lands of the Wilton Miwok Indians of the Wilton  
22 Rancheria near Elk Grove (SACOG 2007).

23 **13.3.2.2 San Joaquin Valley**

24 The San Joaquin Valley includes Stanislaus, Merced, Madera, San Joaquin,  
25 Fresno, Kings, Tulare, and Kern counties. Other counties in this region are not  
26 anticipated to be affected by changes in CVP and SWP operations, and are not  
27 discussed here. They include Calaveras, Mariposa, and Tuolumne counties.  
28 Tribal lands are also described for the entire San Joaquin Valley.

29 **13.3.2.2.1 Stanislaus County**

30 Stanislaus County encompasses approximately 1,521 square miles in central  
31 California. It is bounded on the north by San Joaquin County, on the east by  
32 Calaveras and Tuolumne counties, on the west by Santa Clara County, and on the  
33 south by Merced County. Stanislaus County includes lands within the San  
34 Joaquin River National Wildlife Refuge (Stanislaus Council of Governments  
35 2007).

36 Land use in the county is primarily agricultural, with nearly 80 percent of the land  
37 zoned for general agriculture or in agricultural production (Stanislaus Council of  
38 Governments 2007). Over the past 40 years, some portions of the county have  
39 been changing from a rural agricultural region to semi-urbanized, especially along  
40 major highways and freeways. There are nine incorporated cities in the county,  
41 including Ceres, Hughson, Modesto, Newman, Oakdale, Patterson, Riverbank,

1 Turlock, and Waterford. Stanislaus County has adopted community plans for  
 2 most of its unincorporated towns, including Crows Landing, Del Rio, Denair,  
 3 Hickman, Keyes, Knights Ferry, La Grange, Westley, and Salida (Stanislaus  
 4 County 2010, 2012).

5 The portion of the Central Valley Region, San Joaquin Valley, in Stanislaus  
 6 County that could be affected by changes in CVP and/or SWP operations and  
 7 evaluated in this EIS includes wildlife refuges (described in Chapter 10,  
 8 Terrestrial Biological Resources), CVP water facilities (New Melones Reservoir,  
 9 Delta-Mendota Canal, and San Luis Canal/California Aqueduct), areas along the  
 10 Stanislaus and San Joaquin rivers that use the surface waters (including  
 11 agricultural lands), and CVP water service areas.

#### 12 **13.3.2.2.2 Merced County**

13 Merced County encompasses approximately 1,977 square miles in central  
 14 California. It is bounded on the north by Stanislaus County, on the east by  
 15 Mariposa County, on the south by Fresno and Madera counties, and on the west  
 16 by Santa Clara and San Benito counties. Merced County includes federally  
 17 owned lands within the San Luis National Wildlife Refuge (Merced County  
 18 2013). State lands within the county include San Luis Reservoir State Recreation  
 19 Area; Great Valley Grasslands State Park; and the Los Banos, North Grasslands,  
 20 and Volta wildlife areas.

21 Merced County includes the six incorporated cities of Atwater, Dos Palos,  
 22 Gustine, Livingston, Los Banos, and Merced. The major unincorporated  
 23 communities include Delhi, Fox Hills, Franklin, Hilmar, LeGrand, Planada, Santa  
 24 Nella, Laguna San Luis, and Winton (Merced County 2013). Unincorporated  
 25 land within the county includes approximately 1.2 million acres (98.1 percent of  
 26 the land in the county). Agriculture is the primary land use, totaling just over  
 27 1 million acres (81.2 percent). Public and quasi-public land is the next largest use  
 28 with 131,582 acres or 10.6 percent of the unincorporated County. Commercial  
 29 land uses represent 3,025 acres (0.2 percent), industrial uses represent 2,488 acres  
 30 (0.2 percent), and mining represents 3,375 acres (0.3 percent). Incorporated cities  
 31 account for 24,138 acres (1.9 percent) (Merced County 2012a, 2013). The  
 32 Merced County Local Agency Formation Commission policies discourage  
 33 annexation of prime agricultural land when significant areas of non-prime  
 34 agricultural land are already available. The policies also encourage development  
 35 of vacant areas in cities before the annexation and development of outlying areas.  
 36 Local Agency Formation Commission policies encourage city annexations that  
 37 reflect a planned, logical, and orderly progression of urban expansion and  
 38 promote efficient delivery of urban services (Merced County 2012b).

39 The portion of the Central Valley Region, San Joaquin Valley in Merced County  
 40 that could be affected by changes in CVP and/or SWP operations and evaluated in  
 41 this EIS includes wildlife refuges (described in Chapter 10, Terrestrial Biological  
 42 Resources), CVP and SWP water facilities (San Luis Reservoir, Delta-Mendota  
 43 Canal, and San Luis Canal/California Aqueduct), areas along the San Joaquin

1 River that use the surface waters (including agricultural lands), and CVP water  
2 service areas.

### 3 **13.3.2.2.3 Madera County**

4 Madera County encompasses approximately 2,147 square miles in central  
5 California. It is bounded on the north by Merced and Mariposa counties, on the  
6 east by Mono County, and on the south and west by Fresno County. Madera  
7 County includes lands within the Sierra and Inyo national forests (Madera County  
8 1995). State lands within the county include the Millerton Lake State  
9 Recreation Area.

10 Land elevations in Madera County range from 180 feet to over 13,000 feet above  
11 mean sea level. Madera County can be divided generally into three regions – the  
12 San Joaquin Valley in the west, the foothills between the Madera Canal and the  
13 3,500-foot elevation contour, and the mountains from the 3,500-foot contour to  
14 the crest of the Sierra Nevada. The County has two incorporated cities, Madera  
15 and Chowchilla (Madera County 1995). Major unincorporated communities in  
16 the county include North Fork, South Fork, O’Neals, Oakhurst, Coarsegold,  
17 Gunner Ranch, and Rio Mesa.

18 The portion of the Central Valley Region, San Joaquin Valley, in Madera County  
19 that could be affected by changes in CVP and/or SWP operations and evaluated in  
20 this EIS includes CVP water facilities (Millerton Lake and the Madera Canal),  
21 areas along the San Joaquin River that use the surface waters (including  
22 agricultural lands), and CVP water service areas.

### 23 **13.3.2.2.4 San Joaquin County**

24 San Joaquin County encompasses approximately 1,426 square miles in central  
25 California. It is bounded on the north by Sacramento County, on the east by  
26 Calaveras and Amador counties, on the south by Stanislaus County, and on the  
27 west by Contra Costa and Alameda counties. San Joaquin County includes about  
28 6,000 acres of federally owned lands (San Joaquin County 2009).

29 San Joaquin County is currently in the process of updating its General Plan. Most  
30 of the county’s land is in agricultural production. Agriculture, the predominant  
31 land use, covers 686,109 acres (75 percent) of the county. Residential land is the  
32 second largest use in the unincorporated lands, encompassing 40,410 acres  
33 (4.4 percent of the county). Residential development in the county is  
34 concentrated in existing cities and in adjacent unincorporated communities. San  
35 Joaquin County has seven incorporated cities: Stockton, Tracy, Manteca, Escalon,  
36 Ripon, Lodi, and Lathrop. Stockton and Tracy are the largest cities in the county.  
37 The major unincorporated areas in the county include French Camp, Linden,  
38 Lockeford, Morada, Mountain House, New Jerusalem, Thornton, and  
39 Woodbridge (San Joaquin County 2009). The incorporated cities account for  
40 90,191 acres (approximately 10 percent of the county).

41 The portion of the Central Valley Region, Delta in San Joaquin County that could  
42 be affected by changes in CVP and/or SWP operations and evaluated in this EIS  
43 includes CVP and SWP facilities (including facilities associated with Rock

1 Slough Pumping Plant, Jones Pumping Plant, Clifton Court, and Banks Pumping  
 2 Plant), areas along the Delta channels that use the surface waters (including  
 3 agricultural lands), and CVP water service areas.

#### 4 **13.3.2.2.5 Fresno County**

5 Fresno County encompasses approximately 6,000 square miles in central  
 6 California. It is bounded on the north by Merced and Madera counties, on the  
 7 east by Mono and Inyo counties, on the south by Kings and Tulare counties, and  
 8 on the west by San Benito and Monterey counties. Fresno County includes lands  
 9 within Millerton Lake, Pine Flat Lake, the Sierra and Sequoia national forests,  
 10 Sequoia National Monument, and Kings Canyon National Park (Fresno County  
 11 2000). State lands within the county include the Millerton Lake State Recreation  
 12 Area, San Joaquin River Parkway, and Mendota Wildlife Area.

13 Fresno County is California's sixth-largest county. Agricultural land uses cover  
 14 over 48 percent of the county, and resource conservation lands (e.g., forests,  
 15 parks, and timber preserves) cover approximately 45 percent of the county. The  
 16 15 incorporated cities and unincorporated communities cover approximately  
 17 5 percent of the county (Fresno County 2000). Development constraints within  
 18 the county are primarily caused by lack of funding for infrastructure  
 19 improvement, availability of water supplies, air quality regulations, and physical  
 20 limitations, especially in the mountains and eastern foothills. The incorporated  
 21 communities include Clovis, Coalinga, Firebaugh, Fowler, Fresno, Huron,  
 22 Kerman, Kingsburg, Mendota, Orange Cove, Parlier-West Parlier, Reedley,  
 23 Sanger, San Joaquin, and Selma (Fresno County 2000). Major unincorporated  
 24 communities include Biola, Caruthers, Del Rey, Friant, Lanare, Laton, Riverdale,  
 25 Shaver Lake, and Tranquility.

26 The portion of the Central Valley Region, San Joaquin Valley in Fresno County  
 27 that could be affected by changes in CVP and/or SWP operations and evaluated in  
 28 this EIS includes CVP water facilities (Millerton Lake and the Friant-Kern  
 29 Canal), areas along the San Joaquin River that use the surface waters, and CVP  
 30 water service areas (including agricultural lands), and CVP water service areas.

#### 31 **13.3.2.2.6 Kings County**

32 Kings County encompasses approximately 1,280 square miles in south central  
 33 California. It is bounded on the north by Fresno County, on the east by Tulare  
 34 County, on the south by Kern County, and on the west by Monterey County.  
 35 Kings County includes lands within Naval Air Station Lemoore (Kings County  
 36 2009).

37 Land use is predominantly agricultural, with more than 90 percent of the county  
 38 designated for agricultural uses. Incorporated cities in Kings County include  
 39 Avenal, Corcoran, Hanford, and Lemoore. Residential land uses in  
 40 unincorporated areas and special districts cover less than 1 percent of the county's  
 41 total acreage including for the communities of Armona, Home Garden, Kettleman  
 42 City, and Stratford (Kings County 2009).

1 The portion of the Central Valley Region, San Joaquin Valley, in Kings County  
2 that could be affected by changes in CVP and/or SWP operations and evaluated in  
3 this EIS includes CVP and SWP water service areas.

4 **13.3.2.2.7 Tulare County**

5 Tulare County encompasses approximately 4,840 square miles in south central  
6 California. It is bounded on the north by Fresno County, on the east by Inyo  
7 County, on the south by Kern County, and on the west by Kings County.  
8 Tulare County includes federally owned lands within the Sequoia National Forest,  
9 Sequoia and Kings Canyon National Parks, Sequoia National Monument, several  
10 wilderness areas, Lake Kaweah, Lake Success, and Pixley National Wildlife  
11 Refuge (Tulare County 2010).

12 Agricultural land uses cover more than 2,150 square miles (approximately  
13 44 percent) of the county. Lands classified as open space (i.e., national forests,  
14 monuments, and parks; wilderness areas; and County parks) make up 25 percent  
15 of the land use in the county. Less than 3 percent of the county lands are in the  
16 incorporated cities of Dinuba, Exeter, Farmersville, Lindsay, Porterville, Tulare,  
17 Visalia, and Woodlake (Tulare County 2010). Less than 2 percent of the county  
18 is designated for unincorporated residential areas, including the major  
19 communities of Alpaugh, Cutler, Ducor, Earlimart, East Oros, Goshen, Ivanhoe,  
20 Lemoncove, London, Oros, Pixley, Plainview, Poplar-Cotton Center, Richgrove,  
21 Springville, Strathmore, Terra Bella, Three Rivers, Tipton, Traver, and  
22 Woodville.

23 The portion of the Central Valley Region, San Joaquin Valley, in Tulare County  
24 that could be affected by changes in CVP and/or SWP operations and evaluated in  
25 this EIS includes CVP water service areas.

26 **13.3.2.2.8 Kern County**

27 Kern County encompasses approximately 8,202 square miles in south central  
28 California. It is bounded on the north by Kings, Tulare, and Inyo counties; on the  
29 east by San Bernardino County, on the south by Ventura and Los Angeles  
30 counties; and on the west by San Luis Obispo County. Kern County includes  
31 lands within the Sequoia National Forest, Kern and Bitter Creek national wildlife  
32 refuges, Lake Isabella, China Lake Naval Air Weapons Station, and Edwards Air  
33 Force Base (Kern County 2004). State lands within the county include the Tule  
34 Elk State Reserve.

35 The county's geography includes mountainous regions, agricultural lands, and  
36 deserts. There are 11 incorporated cities in the county, including Arvin,  
37 Bakersfield, California City, Delano, Maricopa, McFarland, Ridgecrest, Shafter,  
38 Taft, Tehachapi, and Wasco (Kern County 2009). The major unincorporated  
39 communities include Kernville, Lake Isabella, Inyokern, Mojave, Boron,  
40 Rosamond, Golden Hills, Stallion Springs, and Buttonwillow. Agricultural land  
41 uses are designated for approximately 85 percent of the unincorporated lands that  
42 are under the jurisdiction of the county (not including lands under the jurisdiction

1 of the Federal, state, tribes, or incorporated cities). Less than 6 percent of the  
 2 unincorporated lands under county jurisdiction are designated for residential uses.  
 3 The portion of the Central Valley Region, San Joaquin Valley, in Kern County  
 4 that could be affected by changes in CVP and/or SWP operations and evaluated in  
 5 this EIS includes CVP and SWP water service areas.

#### 6 **13.3.2.2.9 Tribal Lands in San Joaquin Valley**

7 This section summarizes the tribal lands that could be affected by changes in CVP  
 8 and/or SWP operations and that are located within the county boundaries  
 9 described above.

##### 10 *Tribal Lands within the Boundaries of Madera County*

11 Major federally recognized tribes and tribal lands within the boundaries of  
 12 Madera County include the Picayune Rancheria of the Chuckchansi Indians of  
 13 California near the community of Coarsegold and the Northfork Rancheria of the  
 14 Mono Indians of California near Northfork (SDSU 2013).

##### 15 *Tribal Lands within the Boundaries of Fresno County*

16 Major federally recognized tribes and tribal lands within the boundaries of Fresno  
 17 County include the lands of the Big Sandy Rancheria of the Western Mono  
 18 Indians of California and Table Mountain Rancheria of California.

##### 19 *Tribal Lands within the Boundaries of Kings County*

20 Major federally recognized tribes and tribal lands within the boundaries of Kings  
 21 County includes the lands of the Santa Rosa Indian Community of Santa Rosa  
 22 Rancheria near the town of Lemoore (SDSU 2013).

##### 23 *Tribal Lands within the Boundaries of Tulare County*

24 Major federally recognized tribes and tribal lands within the boundaries of Tulare  
 25 County includes the Tule River Indian Tribe of the Tule River Reservation of the  
 26 Yokut Indians about 20 miles east of Porterville and covers 55,356 acres  
 27 (SDSU 2013).

#### 28 **13.3.2.3 Delta and Suisun Marsh**

29 The Delta and Suisun Marsh includes Sacramento, Yolo, Solano, San Joaquin,  
 30 and Contra Costa counties. Sacramento County is discussed in the Sacramento  
 31 Valley subsection because more of the land that could be affected by changes in  
 32 CVP and SWP long-term operations is located within the Sacramento Valley than  
 33 in the Delta and Suisun Marsh geographical areas. San Joaquin County is  
 34 discussed in the San Joaquin Valley subsection because more of the land that  
 35 could be affected by changes in CVP and SWP long-term operations is located  
 36 within the San Joaquin Valley than in the Delta and Suisun Marsh geographical  
 37 areas. Contra Costa County is discussed as part of the San Francisco Bay Region  
 38 because more of the land that could be affected by changes in CVP and SWP  
 39 long-term operations is located within the San Francisco Bay Region than in the  
 40 Delta and Suisun Marsh geographical areas.

1     **13.3.2.3.1 Yolo County**

2     Yolo County encompasses approximately 1,021 square miles in northern  
3     California. It is bounded on the north by Colusa County, on the east by Sutter and  
4     Sacramento counties, on the south by Solano County, and on the west by Lake  
5     and Napa counties. Yolo County includes federally owned lands in the Yolo  
6     Bypass and Cache Creek areas and state lands within the Yolo Bypass.

7     Residential areas in Yolo County primarily occur in the county's four  
8     incorporated cities (Davis, West Sacramento, Winters, and Woodland) that  
9     comprise approximately 32,325 acres (5 percent) of county lands (Yolo County  
10    2009). Yolo County includes areas within the Delta, including the City of West  
11    Sacramento and the community of Clarksburg. The unincorporated portion of the  
12    county encompasses 35 community areas, including Capay, Clarksburg,  
13    Dunnigan, Esparto, Guinda, Knights Landing, Madison, Monument Hills,  
14    Rumsey, Yolo, and Zamora.

15    Yolo County adopted its 2030 General Plan in 2011. The general plan designates  
16    more than 92 percent of the County area for agricultural and open space uses.  
17    The major crops are tomatoes, alfalfa, wine grapes, rice, seed crops, almonds,  
18    organic production, walnuts, cattle, and wheat (Yolo County 2009).

19    The 59,000-acre Yolo Bypass is primarily located within Yolo County and  
20    includes a portion of the Sacramento River Flood Control Project, as described in  
21    Chapter 5, Surface Water Resources and Water Supplies (CALFED et al. 2001).  
22    The upper section of the Yolo Bypass is defined as the area between Fremont  
23    Weir and Interstate 80 and is located within Yolo County. The lower section is  
24    defined as the area between Interstate 80 and the southern boundary of Egbert  
25    Tract at the Sacramento River. The portion of the southern area located to the  
26    north of the upper Holland Tract and upper Liberty Island is within Yolo County.  
27    In the northern area, agricultural crops include rice, corn, and safflower with  
28    melons and tomatoes planted in years when the bypass is not inundated with flood  
29    waters. The southern bypass crops include corn, milo, safflower, beans, and  
30    sudan grass. Approximately 16,770 acres in the southern Yolo Bypass is within  
31    the Yolo Bypass Wildlife Area (Yolo County 2009).

32    The portion of the Central Valley Region, Delta in Yolo County that could be  
33    affected by changes in CVP and/or SWP operations and evaluated in this EIS  
34    includes areas in the Yolo Bypass and along the Delta channels that use the  
35    surface waters (including agricultural lands), and CVP water service areas.

36    **13.3.2.3.2 Solano County**

37    Solano County encompasses approximately 910 square miles in northern  
38    California. It is bounded on the north by Yolo County, on the east by Sutter and  
39    Sacramento counties, on the south by Contra Costa County, and on the west by  
40    Napa County. Solano County includes federally owned lands within Travis Air  
41    Force Base (Solano County 2008). State lands include areas within Suisun Marsh  
42    and the Cache Slough area of Yolo Bypass.

1 Solano County's General Plan was adopted in 2008. Approximately 81,678 acres  
 2 of the county (14 percent of the total land area), lies within seven incorporated  
 3 cities: Benicia, Dixon, Fairfield, Rio Vista, Suisun City, Vacaville, and Vallejo.  
 4 Urban development is generally concentrated within the incorporated cities or  
 5 surrounding suburban communities. Travis Air Force Base is located on  
 6 approximately 7,100 acres (1 percent of the land within the county). In 2006,  
 7 agriculture accounted for 56.5 percent of the total land use in Solano County  
 8 (Solano County 2008). The southern section of the Yolo Bypass, as described  
 9 under the Yolo County subsection, is located within Solano County.

10 The portion of the Central Valley Region, Delta in Solano County that could be  
 11 affected by changes in CVP and/or SWP operations and evaluated in this EIS  
 12 includes SWP facilities (North Bay Aqueduct intakes at Barker Slough), areas in  
 13 the Yolo Bypass and along the Delta channels that use the surface waters  
 14 (including agricultural lands), and CVP and SWP water service areas.

### 15 **13.3.2.3.3 Tribal Lands in Delta and Suisun Marsh**

16 This section summarizes the tribal lands that could be affected by changes in CVP  
 17 and/or SWP operations and that are located within the county boundaries  
 18 described above.

#### 19 *Tribal Lands within the Boundaries of Yolo County*

20 Major federally recognized tribes and tribal lands within the boundaries of Yolo  
 21 County include lands of the Yocha Dehe Wintun Nation (previously called the  
 22 Rumsey Indian Rancheria of Wintun Indians of California) (Yolo County 2009).

### 23 **13.3.3 San Francisco Bay Area Region**

24 The San Francisco Bay Area Region includes portions of Napa, Contra Costa,  
 25 Alameda, Santa Clara, and San Benito counties that are within the CVP and SWP  
 26 service areas.

#### 27 **13.3.3.1.1 Napa County**

28 Napa County encompasses approximately 793 square miles in northern  
 29 California. It is bounded on the north by Lake County, on the east by Yolo  
 30 County, on the south by Solano County, and on the west by Sonoma County.  
 31 Napa County includes 62,865 acres of federally owned and 40,307 acres of state-  
 32 owned lands throughout the county, including approximately 28,000 acres related  
 33 to Lake Berryessa and the State Cedar Rough Wilderness and Wildlife Area  
 34 (Napa County 2007).

35 Approximately 479,000 acres (95 percent) of the county, are unincorporated. The  
 36 five incorporated cities include American Canyon, Calistoga, Napa, and  
 37 St. Helena, and the town of Yountville. Land use in the county is predominantly  
 38 agricultural (Napa County 2007, 2008).

39 The portion of the San Francisco Bay Area Region in Napa County that could be  
 40 affected by changes in CVP and/or SWP operations and evaluated in this EIS  
 41 includes SWP water service areas.

1     **13.3.3.1.2 Contra Costa County**

2     Contra Costa County encompasses approximately 805 square miles in northern  
3     California. It is bounded on the north by Solano and Sacramento counties, on the  
4     east by San Joaquin County, on the south by Alameda County, and on the west by  
5     San Francisco Bay. Contra Costa County includes federally owned and state-  
6     owned lands throughout the county, including approximately 20,000 acres within  
7     Mount Diablo State Park (Contra Costa County 2005).

8     Over 40 percent of the county’s land is in agricultural production, or about  
9     200,370 acres. Residential land is the second largest use in the county,  
10    encompassing approximately 122,100 acres (25.4 percent of the county).  
11    Approximately 46,700 acres (9 percent of the land within the county), are within  
12    surface waters (Contra Costa County 2005).

13    Residential development is concentrated in existing cities and adjacent  
14    unincorporated communities. The Contra Costa County incorporated cities  
15    include Antioch, Brentwood, Clayton, Danville, El Cerrito, Hercules, Lafayette,  
16    Martinez, Moraga, Oakley, Orinda, Pinole, Pleasant Hill, Pittsburg, Richmond,  
17    San Pablo, San Ramon, and Walnut Creek. The major unincorporated areas in the  
18    county include Alamo, Bethel Island, Byron, Crockett, Discovery Bay,  
19    Kensington, Knightsen, North Richmond, Pacheco, Port Costa, and Rodeo  
20    (Contra Costa County 2005). Portions of the cities of Pittsburg, Antioch, Oakley,  
21    and Brentwood and eastern Contra Costa County are located within the Delta.

22    The portion of the San Francisco Bay Area Region in Contra Costa County that  
23    could be affected by changes in CVP and/or SWP operations and evaluated in this  
24    EIS includes CVP facilities (including facilities associated with Rock Slough),  
25    areas along the Delta channels that use the surface waters (including agricultural  
26    lands), and CVP water service areas.

27    **13.3.3.1.3 Alameda County**

28    Alameda County encompasses approximately 738 square miles in northern  
29    California. It is bounded on the north by Contra Costa County, on the east by San  
30    Joaquin County, on the south by Santa Clara County, and on the west by San  
31    Francisco Bay. Alameda County includes federally owned and state-owned lands  
32    throughout the county (Alameda County 2009).

33    Western Alameda County and the portions of the Livermore-Amador Valley are  
34    heavily urbanized. The incorporated cities include Oakland, which is the County  
35    seat; Alameda, Albany, Berkeley, Dublin, Emeryville, Fremont, Hayward,  
36    Livermore, Newark, Piedmont, Pleasant, San Leandro, and Union City. The  
37    unincorporated area of the County covers approximately 277,760 acres  
38    (59 percent) of the total land area, includes the unincorporated areas of Castro  
39    Valley, Eden Area, and (Alameda County Community Development Agency  
40    2010; Alameda County 2000, 2009). Large portions of the unincorporated areas  
41    located to the east of Castro Valley and within the Livermore-Amador Valley hills  
42    include agricultural and open space lands which are not served by the CVP or  
43    SWP water supplies.

1 The portion of the San Francisco Bay Area Region in Alameda County that could  
 2 be affected by changes in CVP and/or SWP operations and evaluated in this EIS  
 3 includes CVP and SWP facilities (including the SWP South Bay Aqueduct),  
 4 reservoirs that store CVP or SWP water, and CVP and SWP water service areas.

#### 5 **13.3.3.1.4 Santa Clara County**

6 Santa Clara County encompasses approximately 1,306 square miles in northern  
 7 California. It is bounded on the north by Alameda County, on the east by  
 8 Stanislaus and Merced counties, on the south by San Benito County, and on the  
 9 west by San Mateo and Santa Cruz counties. Santa Clara County includes  
 10 federally owned and state-owned lands throughout the county, including  
 11 approximately 87,000 acres within Henry W. Coe State Park (Santa Clara County  
 12 1994, 2012).

13 Approximately 83 percent of the county's population resides in the  
 14 15 incorporated cities. The incorporated cities include Campbell, Cupertino,  
 15 Gilroy, Los Altos, Los Altos Hills, Los Gatos, Milpitas, Monte Sereno, Morgan  
 16 Hill, Mountain View, Palo Alto, San Jose, Santa Clara, Saratoga, and Sunnyvale.  
 17 The southern portion of the county near Gilroy and Morgan Hill is predominantly  
 18 rural, with low-density residential developments scattered though the valley and  
 19 foothill areas (Santa Clara County 1994, 2012).

20 The portion of the San Francisco Bay Area Region in Santa Clara County that  
 21 could be affected by changes in CVP and/or SWP operations and evaluated in this  
 22 EIS includes CVP and SWP facilities (including the SWP South Bay Aqueduct  
 23 and CVP facilities that convey water from San Luis Reservoir) and CVP and  
 24 SWP water service areas.

#### 25 **13.3.3.1.5 San Benito County**

26 San Benito County encompasses approximately 1,386 square miles in central  
 27 California. It is bounded on the north by Santa Clara County, on the east by  
 28 Merced and Fresno counties, and on the south and west by Monterey County.  
 29 San Benito County includes federally owned and state-owned lands throughout  
 30 the county, including approximately 26,000 acres within Pinnacles National  
 31 Monument, over 105,403 acres owned by Bureau of Land Management, and over  
 32 8,800 acres associated with the Hollister Hills State Vehicular Recreation Area  
 33 and San Juan Bautista State Historic Park (San Benito County 2010, 2013).

34 San Benito County has approximately 882,675 acres of unincorporated lands  
 35 (nearly 99.5 percent of the total land area). The incorporated cities of Hollister  
 36 and San Juan Bautista account for approximately 4,044 acres (0.5 percent of the  
 37 county land area). Agriculture is the predominant land use, totaling 747,409 acres  
 38 (84 percent of the county) (San Benito County 2010, 2013).

39 The portion of the San Francisco Bay Area Region in San Benito County that  
 40 could be affected by changes in CVP and/or SWP operations and evaluated in this  
 41 EIS includes CVP and SWP facilities (including San Justo Reservoir and other  
 42 facilities to convey water from San Luis Reservoir) and CVP water service areas.

1    **13.3.4    Central Coast Region**

2    The Central Coast Region includes portions of San Luis Obispo and Santa  
3    Barbara counties served by the SWP. Tribal lands are also described for the  
4    Central Coast Region.

5    **13.3.4.1    San Luis Obispo County**

6    San Luis Obispo County encompasses approximately 3,594 square miles in  
7    central California, including over 200,000 acres of surface waters (San Luis  
8    Obispo County 2013). It is bounded on the north by Monterey County, on the  
9    east by Kern County, on the south by Santa Barbara County, and on the west by  
10   the Pacific Ocean. Federally owned land in San Luis Obispo County includes  
11   Los Padres National Forest, Carizzo Plain National Monument, several wilderness  
12   areas, and Guadalupe-Nipomo Dunes National Wildlife Refuge. State-owned  
13   lands include Hearst-San Simeon State Historical Monument, Montano de Oro  
14   State Park, and state beaches and marine conservation areas.

15   Land uses in the County are predominantly rural and agricultural with over  
16   1,672,000 acres in agricultural and rural land uses (83 percent of the total county  
17   lands). Incorporated cities include Arroyo Grande, Atascadero, Grover Beach,  
18   Morro Bay, Paso Robles, Pismo Beach, and San Luis Obispo. Major  
19   unincorporated communities include Avila, California Valley, Creston Village,  
20   Edna Village, Heritage Ranch, Los Ranchos, Nipoma, Oak Shores, Oceano, San  
21   Miguel, Santa Margarita, and Templeton (San Luis Obispo County 2013).

22   The portion of the Central Coastal Region in San Luis Obispo County that could  
23   be affected by changes in CVP and/or SWP operations and evaluated in this EIS  
24   includes SWP facilities (including facilities associated with the Central Coast  
25   Water Authority) and SWP water service areas.

26   **13.3.4.2    Santa Barbara County**

27   Santa Barbara County encompasses approximately 2,744 square miles in central  
28   California. It is bounded on the north by San Luis Obispo, on the east by Ventura  
29   County, and on the south and west by the Pacific Ocean. Federally owned land in  
30   Santa Barbara County includes 629,120 acres in the Los Padres National Forest,  
31   98,560 acres in the Vandenberg Air Force Base, Channel Islands National Park,  
32   and Guadalupe-Nipomo Dunes National Wildlife Refuge. The state-owned lands  
33   include the University of California at Santa Barbara, Sedgwick Reserve, La  
34   Purissima Mission State Park and other state parks, and Burton Mesa Ecological  
35   Reserve (Santa Barbara County 2009; SBCAG 2013).

36   Agricultural is the predominant land use in the county with over 1,440,000 acres  
37   (82 percent of the land) (Santa Barbara County 2009; SBCAG 2013). Santa  
38   Barbara County includes eight incorporated cities, Buellton, Carpinteria, Goleta,  
39   Guadalupe, Lompoc, Santa Barbara, Santa Maria, and Solvang. Less than  
40   3 percent of the County is within incorporated cities. The major unincorporated  
41   communities include Cuyuama, Los Alamos, Los Olivos, Mission Hills,  
42   Montecito, New Cayamu, Orcutt, Summerland, and Vandenberg Village. The  
43   portion of the Central Coastal Region, in Santa Barbara County, that could be

1 affected by changes in CVP and/or SWP operations and evaluated in this EIS  
2 includes SWP facilities (including facilities associated with the Central Coast  
3 Water Authority), recreation facilities at Cachuma Lake that stores SWP water,  
4 and SWP water service areas.

#### 5 **13.3.4.3 Tribal Lands in Central Coast Region**

6 This section summarizes the tribal lands that could be affected by changes in CVP  
7 and/or SWP operations and that are located within the county boundaries  
8 described above.

##### 9 *Tribal Lands within the Boundaries of Santa Barbara County*

10 Major federally recognized tribes and tribal lands within the boundaries of Santa  
11 Barbara County include the Santa Ynez Reservation, which is home to the Santa  
12 Ynez Band of Chumash Mission Indians of the Santa Ynez Reservation near  
13 Santa Barbara (SDSU 2013).

#### 14 **13.3.5 Southern California Region**

15 The Southern California Region includes portions of Ventura, Los Angeles,  
16 Orange, San Diego, Riverside, and San Bernardino counties served by the SWP.  
17 Tribal lands are also described for the Southern California Region.

##### 18 **13.3.5.1 Ventura County**

19 Ventura County encompasses approximately 1,873 square miles in southern  
20 California. It is bounded on the north by Kern County, on the east and south by  
21 Los Angeles County, and on the west by Santa Barbara County and the Pacific  
22 Ocean. Ventura County includes federally owned and state-owned lands  
23 throughout the county, including 550,211 acres in Los Padres National Forest,  
24 Chumash and Sespe wilderness area, 4,331 acres at the Point Mugu Naval Air  
25 Station, 670 acres at the California State University Channel Islands, and over  
26 410 acres in state beach parks (Ventura County 2013).

27 Ventura County has 10 incorporated cities, including Camarillo, Fillmore,  
28 Moorpark, Ojai, Oxnard, Port Hueneme, Santa Paula, San Buenaventura, Simi  
29 Valley, and Thousand Oaks (Ventura County 2013). Major unincorporated  
30 communities within the county include Bell Canyon, Box Canyon, Camarillo  
31 Heights, Del Norte, El Rio, Hidden Valley, Lake Sherwood, Matilija Canyon,  
32 Montalvo, Oak Park, Ojai Valley, Piru, Saticoy, and Somis (Ventura County  
33 2005).

34 The portion of the Southern California Region in Ventura County that could be  
35 affected by changes in CVP and/or SWP operations and evaluated in this EIS  
36 includes recreation at Lake Piru that stores SWP water, and SWP water service  
37 areas.

##### 38 **13.3.5.2 Los Angeles County**

39 Los Angeles County encompasses approximately 4,083 square miles in northern  
40 California. It is bounded on the north by Kern County, on the east by San  
41 Bernardino County, on the south by Orange County, and on the west by Ventura

1 County and the Pacific Ocean. Los Angeles County includes federally owned and  
2 state-owned lands throughout the county, including nearly 650,000 acres in Los  
3 Padres and Angeles national forests, portions of Edwards Air Force Base, over  
4 29,000 acres of other federally owned open space (including wilderness areas),  
5 and approximately 50,893 acres of state-owned land, including Hungry Valley  
6 State Vehicular Recreation Area (Los Angeles County 2011).

7 More than half of Los Angeles County's 1,698,240 acres of unincorporated land  
8 area is designated a natural resources land use category. The next highest land  
9 use is rural, which accounts for 39 percent of the unincorporated areas, followed  
10 by residential, which accounts for 3 percent of the unincorporated areas. The  
11 remaining land area is in the county's 88 incorporated cities, the most populous of  
12 which is the City of Los Angeles (Los Angeles County 2012). The County has  
13 approximately 140 unincorporated areas (Los Angeles County 2014).

14 The portion of the Southern California Region in Los Angeles County that could  
15 be affected by changes in CVP and/or SWP operations and evaluated in this EIS  
16 includes SWP facilities and SWP water service areas.

#### 17 **13.3.5.3 Orange County**

18 Orange County encompasses 948 square miles in southern California. It is  
19 bounded on the north by Los Angeles County, on the east by San Bernardino and  
20 Riverside counties, on the south by San Diego County, and on the west by the  
21 Pacific Ocean. Orange County includes federally owned lands, including lands in  
22 the Cleveland National Forests.

23 Orange County has 34 incorporated cities in Orange County. The unincorporated  
24 lands cover approximately 192,758 acres (Orange County 2005). Land zoned as  
25 open space forms the largest land use type (143,313 acres).

26 The portion of the Southern California Region in Orange County that could be  
27 affected by changes in CVP and/or SWP operations and evaluated in this EIS  
28 includes SWP facilities and SWP water service areas.

#### 29 **13.3.5.4 San Diego County**

30 San Diego County encompasses approximately 4,525 square miles in southern  
31 California. It is bounded on the north by Orange and Riverside counties, on the  
32 east by Imperial County, on the south by Mexico, and on the west by the Pacific  
33 Ocean. San Diego County includes federally owned land, including Camp  
34 Pendleton Marine Corps Base, Cleveland National Forest, and San Diego and  
35 San Diego national wildlife refuges. State-owned lands throughout the county,  
36 includes Cuyamaca Rancho State Park, Anza-Borrego Desert State Park, Felipe  
37 Wildlife Area, and Ocotillo Wells State Vehicular Recreation Area (San Diego  
38 County 2011).

39 The incorporated cities include Carlsbad, Chula Vista, Coronado, Del Mar,  
40 El Cajon, Encinitas, Escondido, Imperial Beach, La Mesa, Lemon Grove,  
41 National City, Oceanside, Poway, San Marcos, Santee, Solano Beach, and Vista  
42 San Diego (San Diego County 2011). The unincorporated communities include  
43 Lakeside, Ramona, San Dieguito, Spring Valley, and Valle de Oro.

1 The portion of the Southern California Region in San Diego County that could be  
 2 affected by changes in CVP and/or SWP operations and evaluated in this EIS  
 3 includes SWP facilities, non-SWP reservoirs that store SWP water (including  
 4 Dixon Lake; and San Vicente, Lower Otay, and Sweetwater Reservoir), and CVP  
 5 water service areas.

6 **13.3.5.5 Riverside County**

7 Riverside County encompasses approximately 7,295 square miles in southern  
 8 California. It is bounded on the north by San Bernardino County, on the east by  
 9 the state of Nevada, on the south by San Diego and Imperial counties, and on the  
 10 west by Orange County. Riverside County includes federally owned lands  
 11 throughout the county, including March Air Reserve Base, Chocolate Mountains  
 12 Naval Gunnery Range, Joshua Tree National Park, San Bernardino and Cleveland  
 13 national forests, numerous wilderness areas, and Coachella Valley National  
 14 Wildlife Refuge; and state-owned lands including San Jacinto and Santa Rose  
 15 wildlife areas and Mount San Jacinto State Park (RCIP 2000).

16 Residential land use accounts for approximately 184,000 acres, nearly 57 percent  
 17 of which are within incorporated cities. Approximately 1,313,000 acres  
 18 (28 percent) is in open space, recreation, agriculture, and wildland preservation  
 19 (RCIP 2000).

20 Most of the population is concentrated in the 24 incorporated cities of Banning,  
 21 Beaumont, Calimesa, Canyon Lake, Cathedral City, Coachella, Corona, Desert  
 22 Hot Springs, Hemet, Indian Wells, Indio, Lake Elsinore, La Quinta, Moreno  
 23 Valley, Murrieta, Norco, Palm Desert, Palm Springs, Perris, Rancho Mirage,  
 24 Riverside, San Jacinto, and Temecula. The major unincorporated communities in  
 25 the county include Banning Bench, Bermuda Dunes, Cabazon, Cherry Valley,  
 26 Cleveland Ridge, Desert Center, Eagle Mountain, El Cerrito, Lakeview/Nuevo,  
 27 Meadowbrook, Mecca, Menifee Valley, North Palm Springs, Ripley, Sun City,  
 28 Temescal Canyon, Tenaja, Thermal, Thousand Palms, Warm Springs, and  
 29 Wildomar.

30 The portion of the Southern California Region in Riverside County that could be  
 31 affected by changes in CVP and/or SWP operations and evaluated in this EIS  
 32 includes SWP facilities, reservoirs that store SWP water (including Diamond  
 33 Valley Lake and Lake Skinner), and SWP water service areas.

34 **13.3.5.6 San Bernardino County**

35 San Bernardino County encompasses approximately 20,106 square miles in  
 36 southern California. It is bounded on the north by Inyo County, on the east by the  
 37 state of Nevada, on the south by Riverside County, and on the west by Kern, Los  
 38 Angeles, and Orange counties. Most of the land in San Bernardino County is  
 39 federally owned and state-owned lands, including approximately 10,500,000 acres  
 40 (81 percent of the county) (San Bernardino County 2007, 2012). The federally  
 41 owned lands include 28 Bureau of Land Management wilderness areas  
 42 (approximately 47 percent of the total county), San Bernardino and Angeles  
 43 National Forests (676,666 and 655,387 acres, respectively), Mojave National

1 Preserve, Joshua Tree and Death Valley National Parks, and four military bases  
2 (Edwards Air Force Base, Twentynine Palms Marine Corps Air Ground Combat  
3 Training Center, Fort Irwin, and China Lake Naval Weapons Center). State-  
4 owned lands include Silverwood Lake State Recreation Area at the SWP  
5 reservoir, Wildwood Canyon State Park, and Providence Mountain and Chino  
6 Hills state recreation areas.

7 San Bernardino County includes 24 incorporated cities, including Adelanto,  
8 Apple Valley, Barstow, Big Bear Lake, Chino, Chino Hills, Colton, Fontana,  
9 Grand Terrace, Hesperia, Highland, Loma Linda, Montclair, Needles, Ontario,  
10 Rancho Cucamonga, Redlands, Rialto, San Bernardino, Twentynine Palms,  
11 Upland, Victorville, Yucaipa, and Yucca Valley. Major unincorporated  
12 communities in the county include Amboy, Baker, Bear Valley, Bloomington,  
13 Crest Forest, Earp, Essex, Fontana suburbs, Goffs, Harvard, Havasu Lake,  
14 Helendale, Hilltop, Hinckley, Homestead Valley, Joshua Tree, Kelso, Kramer  
15 Junction, Lake Arrowhead, Landers, Lucerne Valley, Ludlow, Lytle Creek,  
16 Mentone, Moronga Valley, Muscoy, Newberry Springs, Nipton, Oak Glen, Oak  
17 Hills, Parker, Phelan/Pinon Hills, Pioneertown, Red Mountain, Rimrock, Silver  
18 Lake, Trona, Vidal, and Yerno.

19 The portion of the Southern California Region in San Bernardino County that  
20 could be affected by changes in CVP and/or SWP operations and evaluated in this  
21 EIS includes SWP water service areas.

22 **13.3.5.7 Tribal Lands in Southern California Region**

23 This section summarizes the tribal lands that could be affected by changes in CVP  
24 and/or SWP operations and that are located within the county boundaries  
25 described above.

26 *Tribal Lands within the Boundaries of San Diego County*

27 Major federally recognized tribes and tribal lands within the boundaries of  
28 San Diego County includes lands of the Capitan Grande Band of Diegueno  
29 Mission Indians of California (Barona Reservation and Viejas Reservation),  
30 Cahuilla Band of Mission Indians of the Cahuilla Reservation, Campo Band of  
31 Diegueno Mission Indians of the Campo Indian Reservation, Ewiiapaayp Band  
32 of Kumeyaay Indians, Inaja Band of Diegueno Mission Indians of the Inaja and  
33 Cosmit Reservation, Jamul Indian Village of California, La Jolla Band of Luiseno  
34 Indians, La Posta Band of Diegueno Mission Indians of the La Posta Indian  
35 Reservation, Los Coyotes Band of Cahuilla and Cupeno Indians, Manzanita Band  
36 of Diegueno Mission Indians of the Manzanita Reservation, Mesa Grade Band of  
37 Diegueno Mission Indians of the Mesa Grande Reservation, Pala Band of Luiseno  
38 Mission Indians of the Pala Reservation, Pauma Band of Luiseno Mission Indians  
39 of the Pauma & Yuima Reservation, Rincon Band of Luiseno Indians of the  
40 Rincon Reservation, San Pasqual Band of Diegueno Mission Indians of  
41 California, Iipay Nation of Santa Ysabel, and Sycuan Band of Kumeyaay Nation.

1 *Tribal Lands within the Boundaries of Riverside County*  
 2 Major federally recognized tribes and tribal lands within the boundaries of  
 3 Riverside County include lands of the Agua Caliente Band of Cahuilla Indians of  
 4 the Agua Caliente Reservation, Augustine Band of Cahuilla Indians, Cabazon  
 5 Band of Mission Indians, Cahuilla Band of Mission Indians of the Cahuilla  
 6 Reservation, Morongo Band of Mission Indians, Pechanga Band of Luiseno  
 7 Mission Indians of the Pechanga Reservation, Ramona Band of Cahuilla, Santa  
 8 Rosa Band of Cahuilla Indians, Soboba Band of Luiseno Indians, Torres-Martinez  
 9 Desert Cahuilla Indians, Twenty-Nine Palms Band of Mission Indians of  
 10 California, and Colorado River Indian Tribes of the Colorado River Indian  
 11 Reservation (RCIP 2000).

12 *Tribal Lands within the Boundaries of San Bernardino County*  
 13 Major federally recognized tribes and tribal lands within the boundaries of San  
 14 Bernardino County include the lands of the San Manual Band of Mission Indians  
 15 and the Twenty-Nine Palms Band of Mission Indians of California (SDSU 2013).  
 16 The Chemehuevi Indian Tribe of the Chemehuevi Reservation is also located in  
 17 San Bernardino County near the Colorado River.

## 18 **13.4 Impact Analysis**

19 This section describes the potential mechanisms for change in non-agricultural  
 20 land uses and analytical methods; results of the impact analysis; potential  
 21 mitigation measures; and potential cumulative effects.

### 22 **13.4.1 Potential Mechanisms for Change and Analytical Tools**

23 As described in Chapter 4, Approach to Environmental Analysis, the  
 24 environmental consequences assessment considers changes in non-agricultural  
 25 land uses related to changes in CVP and SWP operations under the alternatives as  
 26 compared to the No Action Alternative and Second Basis of Comparison.

#### 27 **13.4.1.1 Changes in Land Uses**

28 Land uses in 2030 are assumed to be consistent with the future projections  
 29 included in existing general plans. The general plans were developed assuming  
 30 adequate water supplies to support the projected lands uses. Changes in CVP and  
 31 SWP operations under the No Action Alternative and Alternatives 1 through 5  
 32 could change the availability of CVP and SWP water supplies. If the CVP and  
 33 SWP water supplies were reduced as compared to the No Action Alternative and  
 34 Second Basis of Comparison to a level that would not support planned municipal  
 35 and industrial water demands, development of future land uses may not occur.  
 36 Potential changes to agricultural land uses are described in Chapter 12,  
 37 Agricultural Resources.

38 Availability of CVP and SWP water supplies were analyzed using CalSim II  
 39 model output (see Chapter 5, Surface Water Resources and Water Supplies).  
 40 Most of the CVP and SWP municipal and industrial water users prepared Urban

1 Water Management Plans (UWMPs) that project availability of water supplies to  
2 support land uses in 2030. That information was used with projected CVP and  
3 SWP water supply availability under each of the alternatives to determine if  
4 projected municipal and industrial water demands could be met in 2030 using the  
5 CWEST model, as described in Chapter 19, Socioeconomics. The results of the  
6 CWEST model indicated that municipal and industrial water demands of CVP  
7 and SWP water users in the Central Valley, San Francisco Bay Area, Central  
8 Coast, and Southern California regions would be met through a combination of  
9 water conservation, available CVP and SWP water supplies, local and regional  
10 surface water supplies, groundwater, recycled water, and, in some cases,  
11 desalination.

12 Alternative 4 includes provisions for floodway development regulations. It is  
13 assumed that under the No Action Alternative and Alternatives 1 through 5,  
14 existing programs to protect floodways would continue to be implemented,  
15 including Federal and state requirements as implemented by the U.S. Army Corps  
16 of Engineers (USACE), Central Valley Flood Protection Board, and Department  
17 of Water Resources (DWR). Within the Delta, the floodways are further  
18 regulated by the Delta Protection Commission and Delta Stewardship Council to  
19 preserve and protect the natural resources of the Delta; and prevent encroachment  
20 into Delta floodways, including the Delta Stewardship Council's recently adopted  
21 Delta Plan. These regulations would continue to be implemented in the No  
22 Action Alternative, Alternatives 1 through 5, and the Second Basis of  
23 Comparison. Therefore, future development would be prevented from occurring  
24 within the Delta floodplains and floodways; and in the Sacramento, Feather,  
25 American, and San Joaquin river corridors upstream of the Delta. Provisions in  
26 Alternative 4 would require additional setbacks along the floodways as compared  
27 to other alternatives and the Second Basis of Comparison. The potential change  
28 in land use is analyzed qualitatively in this chapter.

29 The No Action Alternative, Alternatives 1 through 5, and Second Basis of  
30 Comparison include restoration of more than 10,000 acres of intertidal and  
31 associated subtidal wetlands in Suisun Marsh and Cache Slough; 17,000 to  
32 20,000 acres of seasonal floodplain restoration in the Yolo Bypass; and continued  
33 delivery of refuge water supplies under the Central Valley Project Improvement  
34 Act, as described in Chapter 3, Description of Alternatives. Land uses in 2030  
35 due to implementation of these programs would be consistent between all  
36 alternatives and the Second Basis of Comparison. Therefore, this EIS does not  
37 analyze changes due to these programs.

#### 38 **13.4.1.2 Effects Related to Cross Delta Water Transfers**

39 Cross Delta water transfers involving the CVP and SWP facilities or water  
40 supplies would be required to be implemented in accordance with all existing  
41 regulations and requirements, including not causing adverse impacts to other  
42 water users in accordance with the requirements of Reclamation, DWR, and the  
43 State Water Resources Control Board. It is anticipated that water transfers would  
44 continue under all alternatives to provide water supplies to agricultural, municipal  
45 and industrial, and wildlife refuges under all alternatives and the Second Basis of

1 Comparison in a similar manner. Transfers for municipal and industrial water  
 2 users would be one of several water supply sources to meet the future water  
 3 demands in Year 2030. If the availability of transferred water is reduced, it is  
 4 anticipated that other water supplies (e.g., recycled water and desalination) would  
 5 be increased, as described in the UWMPs for 2030 water demands.

6 Reclamation recently prepared a long-term regional water transfer environmental  
 7 document which evaluated potential changes in surface water conditions related to  
 8 water transfer actions (Reclamation 2014c). Results from this analysis were used  
 9 to inform the impact assessment of potential effects of water transfers under the  
 10 alternatives as compared to the No Action Alternative and the Second Basis of  
 11 Comparison. The analysis indicated that water transfers would not result in  
 12 changes to non-agricultural land uses.

13 Under all of the alternatives and Second Basis of Comparison, it is assumed that  
 14 these transfers would continue to occur each year to meet the water demands in  
 15 the existing general plans. It is not anticipated that water transfers would change  
 16 municipal and industrial land uses as defined in the existing general plans. If a  
 17 water transfer program was implemented for the purposes of changing existing  
 18 general plan land uses, separate environmental documentation would be required  
 19 for the changes to the general plan and the water transfer. Potential effects due to  
 20 Cross Delta water transfers on agricultural land uses are described in  
 21 Chapter 12, Agricultural Resources. Therefore, this chapter does not include  
 22 separate analyses of changes in municipal and industrial land uses due to cross  
 23 Delta water transfers.

#### 24 **13.4.2 Conditions in Year 2030 without Implementation of** 25 **Alternatives 1 through 5**

26 This EIS includes two bases of comparison (described in Chapter 3, Description  
 27 of Alternatives): the No Action Alternative and the Second Basis of Comparison.  
 28 Both of these bases are evaluated at 2030 conditions.

##### 29 **13.4.2.1 No Action Alternative**

30 The impact analysis in this EIS is based upon the comparison of the alternatives to  
 31 the No Action Alternative and the Second Basis of Comparison in the Year 2030.  
 32 Many of the changed conditions would occur in the same manner under both the  
 33 No Action Alternative and the Second Basis of Comparison (e.g., climate change,  
 34 sea level rise, projected development under existing general plans, and  
 35 implementation of reasonable and foreseeable projects). Due to these changes,  
 36 especially climate change and sea level rise, it is anticipated that CVP and SWP  
 37 water supply availability would be less than under recent conditions (described in  
 38 Chapter 5, Surface Water Resources and Water Supplies). However, it is  
 39 anticipated that projected land uses would occur by 2030 with implementation of  
 40 water conservation programs and the development of other water supplies,  
 41 including ongoing recycled water programs, desalination, and groundwater use.

1 By 2030 under the No Action Alternative and the Second Basis of Comparison, it  
2 is assumed that ongoing programs would result in restoration of more than  
3 10,000 acres of intertidal and associated subtidal wetlands in Suisun Marsh and  
4 Cache Slough; and 17,000 to 20,000 acres of seasonal floodplain restoration in the  
5 Yolo Bypass.

6 Under the No Action Alternative and the Second Basis of Comparison, land uses  
7 in 2030 would occur in accordance with the general plans for counties and cities  
8 within the Central Valley Region; tribal lands; and regulations of state and  
9 regional agencies, including Central Valley Flood Protection Board, Delta  
10 Protection Commission, and Delta Stewardship Council.

11 Development along the river corridors in the Central Valley would continue to be  
12 limited by the state regulations to protect floodways. The Central Valley Flood  
13 Protection Board adopts floodway boundaries and approves uses within those  
14 floodways (DWR 2010). Various uses are permitted in the floodways, such as  
15 agriculture, canals, low dikes and berms, parks and parkways, golf courses, sand  
16 and gravel mining, structures that will not be used for human habitation, and other  
17 facilities and activities that will not be substantially damaged by the base flood  
18 event and will not cause adverse hydraulic impacts that will raise the water  
19 surface in the floodway.

20 Within the Delta, future development also is subject to the requirements of the  
21 Delta Protection Commission and Delta Stewardship Council. The general plans  
22 within the Delta are required by state laws to be consistent with the Delta  
23 Protection Commission's *Land Use and Resource Management Plan for the*  
24 *Primary Zone of the Delta* (DPC 2010; OAL 2010), which does not allow  
25 development within the Primary Zone of the Delta unless proponents can  
26 demonstrate that implementing their projects would preserve and protect natural  
27 resources of the Delta, promote protection of remnants of riparian and aquatic  
28 habitat, not result in loss of wetlands or riparian habitat, would not degrade water  
29 quality, would not interfere with migratory birds or public access, would not harm  
30 agricultural operations, and would not degrade levees or expose the public to  
31 increased flood hazards. Farmers are encouraged to implement management  
32 practices to maximize habitat values for migratory birds and wildlife.

33 The Delta Plan adopted by the Delta Stewardship Council in May 2013 included a  
34 policy that protects floodways within the entire Delta that are not regulated by  
35 other Federal or state agencies (23 California Code of Regulations Section 5014).  
36 This policy prevents encroachment into floodways that would impede the free  
37 flow of water in the floodway or jeopardize public safety.

### 38 **13.4.3 Evaluation of Alternatives**

39 As described in Chapter 4, Approach to Environmental Analysis, Alternatives 1  
40 through 5 have been compared to the No Action Alternative; and the No Action  
41 Alternative and Alternatives 1 through 5 have been compared to the Second Basis  
42 of Comparison.

1 During review of the numerical modeling analyses used in this EIS, an error was  
 2 determined in the CalSim II model assumptions related to the Stanislaus River  
 3 operations for the Second Basis of Comparison, Alternative 1, and Alternative 4  
 4 model runs. Appendix 5C includes a comparison of the CalSim II model run  
 5 results presented in this chapter and CalSim II model run results with the error  
 6 corrected. Appendix 5C also includes a discussion of changes in the comparison  
 7 of the following alternative analysis:

- 8 • No Action Alternative compared to the Second Basis of Comparison
- 9 • Alternative 1 compared to the No Action Alternative
- 10 • Alternative 3 compared to the Second Basis of Comparison
- 11 • Alternative 5 compared to the Second Basis of Comparison.

#### 12 **13.4.3.1 No Action Alternative**

13 As described in Chapter 4, Approach to Environmental Analysis, the No Action  
 14 Alternative is compared to the Second Basis of Comparison.

##### 15 **13.4.3.1.1 Changes in Land Use**

16 No municipal and industrial land uses in the Trinity River Region are served by  
 17 CVP and SWP water supplies. Therefore, the municipal and industrial land uses  
 18 would be the same under the No Action Alternative and the Second Basis of  
 19 Comparison in the Trinity River Region.

20 As described in Chapter 5, Surface Water Resources and Water Supplies, CVP  
 21 and SWP water deliveries to municipal and industrial Sacramento River Water  
 22 Rights Settlement Contractors and water rights holders would be similar under the  
 23 No Action Alternative and the Second Basis of Comparison. CVP water  
 24 deliveries to water service contractors over the long-term conditions would be  
 25 6 percent less for the North of Delta water users and 10 percent less for the South  
 26 of Delta users under the No Action Alternative, compared to the Second Basis of  
 27 Comparison. SWP water deliveries to water contractors over the long-term  
 28 conditions (without Article 21 water) would be reduced by 18 percent throughout  
 29 the SWP service area under the No Action Alternative, compared to the Second  
 30 Basis of Comparison. However, as described in Chapter 19, Socioeconomics,  
 31 2030 municipal and industrial water demands would be met through a  
 32 combination of available CVP and SWP water supplies and other water supplies,  
 33 including water conservation, water transfers, local and regional surface water and  
 34 groundwater, recycled water, and desalination. Adequate water supplies would be  
 35 available to support future municipal and industrial land uses projected in existing  
 36 general plans under the No Action Alternative and the Second Basis of  
 37 Comparison. Therefore, land use in 2030 would be the same under the No Action  
 38 Alternative and the Second Basis of Comparison in the Trinity River, Central  
 39 Valley, San Francisco Bay Area, Central Coast, and Southern California regions.

##### 40 **13.4.3.2 Alternative 1**

41 Alternative 1 is identical to the Second Basis of Comparison. Alternative 1 is  
 42 compared to the No Action Alternative and the Second Basis of Comparison.  
 43 However, because land use conditions under Alternative 1 are identical to land

1 use conditions under the Second Basis of Comparison, Alternative 1 is only  
2 compared to the No Action Alternative.

### 3 **13.4.3.2.1 Alternative 1 Compared to the No Action Alternative**

#### 4 *Change in Land Use*

5 No municipal and industrial land uses in the Trinity River Region are served by  
6 CVP and SWP water supplies. Therefore, the municipal and industrial land uses  
7 would be the same under Alternative 1 and the No Action Alternative in the  
8 Trinity River Region.

9 As described in Chapter 5, Surface Water Resources and Water Supplies, CVP  
10 and SWP water deliveries to municipal and industrial Sacramento River Water  
11 Rights Settlement Contractors and water rights holders would be similar under  
12 Alternative 1 and the No Action Alternative. CVP water deliveries to water  
13 service contractors over the long-term conditions would be 7 percent greater for  
14 the North of Delta water users and 11 percent greater for the South of Delta users  
15 under Alternative 1 as compared to the No Action Alternative. SWP water  
16 deliveries to water contractors over the long-term conditions (without Article 21  
17 water) would be increased by 22 percent under Alternative 1 as compared to the  
18 No Action Alternative. The increased CVP and SWP water supply availability  
19 would allow water users to reduce other water supplies, including groundwater. It  
20 is anticipated that the additional water supplies would not result in changes in the  
21 general plan development plans without subsequent environmental  
22 documentation. Adequate water supplies would be available to support future  
23 municipal and industrial land uses projected in existing general plans under  
24 Alternative 1 and the No Action Alternative. Therefore, land use in 2030 would  
25 be the same under Alternative 1 and the No Action Alternative in the Trinity  
26 River, Central Valley, San Francisco Bay Area, Central Coast, and Southern  
27 California regions.

### 28 **13.4.3.2.2 Alternative 1 Compared to the Second Basis of Comparison**

29 Alternative 1 is identical to the Second Basis of Comparison.

### 30 **13.4.3.3 Alternative 2**

31 The land use conditions under Alternative 2 would be identical to the conditions  
32 under the No Action Alternative; therefore, Alternative 2 is only compared to the  
33 Second Basis of Comparison.

### 34 **13.4.3.3.1 Alternative 2 Compared to the Second Basis of Comparison**

35 Changes to land use under Alternatives 2 as compared to the Second Basis of  
36 Comparison would be the same as the impacts described in Section 13.4.3.1,  
37 No Action Alternative.

### 38 **13.4.3.4 Alternative 3**

39 The CVP and SWP operations under Alternative 3 are similar to the Second Basis  
40 of Comparison with modified Old and Middle River flow criteria and New  
41 Melones Reservoir operations.

1 Alternative 3 would include changed water demands for American River water  
 2 supplies as compared to the No Action Alternative or Second Basis of  
 3 Comparison. Alternative 3 would provide water supplies of up to 17 thousand  
 4 acre feet (TAF)/year under a Warren Act Contract for El Dorado Irrigation  
 5 District and 15 TAF/year under a CVP water service contract for El Dorado  
 6 County Water Agency. These demands are not included in the analysis presented  
 7 in this section of the EIS. A sensitivity analysis comparing the results of the  
 8 analysis with and without these demands is presented in Appendix 5B of this EIS.

#### 9 **13.4.3.4.1 Alternative 3 Compared to the No Action Alternative**

##### 10 *Changes in Land Use*

11 No municipal and industrial land uses in the Trinity River Region are served by  
 12 CVP and SWP water supplies. Therefore, the municipal and industrial land uses  
 13 would be the same under Alternative 3 and the No Action Alternative in the  
 14 Trinity River Region.

15 As described in Chapter 5, Surface Water Resources and Water Supplies, CVP  
 16 and SWP water deliveries to municipal and industrial Sacramento River Water  
 17 Rights Settlement Contractors and water rights holders would be similar under  
 18 Alternative 3 and the No Action Alternative. CVP water deliveries to water  
 19 service contractors over the long-term conditions would be similar for the North  
 20 of Delta water users and 9 percent greater for the South of Delta users under  
 21 Alternative 3, compared to the No Action Alternative. SWP water deliveries to  
 22 water contractors over the long-term conditions (without Article 21 water) would  
 23 be increased by 17 percent under Alternative 3, compared to the No Action  
 24 Alternative. The increased CVP and SWP water supply availability would allow  
 25 water users to reduce other water supplies, including groundwater. It is  
 26 anticipated that the additional water supplies would not result in changes in the  
 27 general plan development plans without subsequent environmental  
 28 documentation. Adequate water supplies would be available to support future  
 29 municipal and industrial land uses projected in existing general plans under  
 30 Alternative 3 and the No Action Alternative. Therefore, land use in 2030 would  
 31 be the same under Alternative 3 and the No Action Alternative in the Trinity  
 32 River, Central Valley, San Francisco Bay Area, Central Coast, and Southern  
 33 California regions.

#### 34 **13.4.3.4.2 Alternative 3 Compared to the Second Basis of Comparison**

##### 35 *Changes in Land Use*

36 No municipal and industrial land uses in the Trinity River Region are served by  
 37 CVP and SWP water supplies. Therefore, the municipal and industrial land uses  
 38 would be the same under Alternative 3 and the Second Basis of Comparison in the  
 39 Trinity River Region.

40 As described in Chapter 5, Surface Water Resources and Water Supplies, CVP  
 41 and SWP water deliveries to municipal and industrial Sacramento River Water  
 42 Rights Settlement Contractors and water rights holders would be similar under  
 43 Alternative 3 and the Second Basis of Comparison. CVP water deliveries to

1 water service contractors over the long-term conditions would be similar for the  
2 North of Delta water users and South of Delta users under Alternative 3 and the  
3 Second Basis of Comparison. SWP water deliveries to water contractors over the  
4 long-term conditions (without Article 21 water) would be similar under  
5 Alternative 3 and the Second Basis of Comparison. Adequate water supplies  
6 would be available to support future municipal and industrial land uses projected  
7 in existing general plans under Alternative 3 and the Second Basis of  
8 Comparison. Therefore, land use in 2030 would be the same under Alternative 3  
9 and the Second Basis of Comparison in the Trinity River, Central Valley, San  
10 Francisco Bay Area, Central Coast, and Southern California regions.

11 **13.4.3.5 Alternative 4**

12 The CVP and SWP operations under Alternative 4 are identical to the CVP and  
13 SWP operations under the Second Basis of Comparison and Alternative 1. Under  
14 Alternative 4, new development and substantial improvements would be  
15 prohibited within floodways or within 170 feet of the ordinary high water line of  
16 any floodway.

17 **13.4.3.5.1 Alternative 4 Compared to the No Action Alternative**

18 *Changes in Land Use*

19 The CVP and SWP operations under Alternative 4 are identical to the CVP and  
20 SWP operations under Alternative 1. Therefore, the land use conditions  
21 influenced by availability of CVP and SWP water supplies under Alternative 4  
22 would be the same as conditions under Alternative 1.

23 Under Alternative 4, new development and substantial improvements would be  
24 prohibited within floodways or within 170 feet of the ordinary high water line of  
25 any floodway. Development within floodways is currently prohibited in  
26 accordance with existing general plans and state and regional plans (e.g.,  
27 requirements of the Delta Protection Commission and Delta Stewardship  
28 Council). Structures that either cannot be moved before flood events or that  
29 would reduce the flood management function of the floodway are not allowed. It  
30 is anticipated that these requirements would continue to be implemented in 2030,  
31 to protect the floodways. However, Alternative 4 would include additional  
32 restrictions on new development within 170 feet of the ordinary high water line of  
33 any floodway. It is anticipated that the provisions under Alternative 4 could result  
34 in site-specific parcel changes as compared to the No Action Alternative.  
35 However, the development that would have occurred on these parcels could be  
36 incorporated within the general plan development plans and guidelines.  
37 Therefore, land use conditions under Alternative 4 would be similar to conditions  
38 under the No Action Alternative; and would be the same as the impacts described  
39 in Section 13.4.3.2.1, Alternative 1 Compared to the No Action Alternative.

1    **13.4.3.5.2 Alternative 4 Compared to the Second Basis of Comparison**

2    *Changes in Land Use*

3    The CVP and SWP operations under Alternative 4 are identical to the CVP and  
4    SWP operations under Second Basis of Comparison. Therefore, the land use  
5    conditions influenced by availability of CVP and SWP water supplies under  
6    Alternative 4 would be the same as conditions under the Second Basis of  
7    Comparison.

8    Under Alternative 4, new development and substantial improvements would be  
9    prohibited within floodways or within 170 feet of the ordinary high water line of  
10   any floodway. Development within floodways is currently prohibited in  
11   accordance with existing general plans and state and regional plans (e.g.,  
12   requirements of the Delta Protection Commission and Delta Stewardship  
13   Council). Structures that either cannot be moved prior to flood events or that  
14   would reduce the flood management function of the floodway are not allowed. It  
15   is anticipated that these requirements would continue to be implemented in 2030  
16   to protect the floodways. However, Alternative 4 would include additional  
17   restrictions on new development within 170 feet of the ordinary high water line of  
18   any floodway. It is anticipated that the provisions under Alternative 4 could result  
19   in site-specific parcel changes as compared to the Second Basis of Comparison.  
20   However, the development that would have occurred on these parcels could be  
21   incorporated within the general plan development plans and guidelines.  
22   Therefore, land use conditions under Alternative 4 would be identical to  
23   conditions under the Second Basis of Comparison.

24   **13.4.3.6 Alternative 5**

25   The CVP and SWP operations under Alternative 5 are similar to the No Action  
26   Alternative with modified Old and Middle River flow criteria and New Melones  
27   Reservoir operations.

28   Alternative 5 would include changed water demands for American River water  
29   supplies as compared to the No Action Alternative or Second Basis of  
30   Comparison. Alternative 5 would provide water supplies of up to 17 TAF/year  
31   under a Warren Act Contract for El Dorado Irrigation District and 15 TAF/year  
32   under a CVP water service contract for El Dorado County Water Agency. These  
33   demands are not included in the analysis presented in this section of the EIS. A  
34   sensitivity analysis comparing the results of the analysis with and without these  
35   demands is presented in Appendix 5B of this EIS.

36   **13.4.3.6.1 Alternative 5 Compared to the No Action Alternative**

37   *Changes in Land Use*

38   No municipal and industrial land uses in the Trinity River Region are served by  
39   CVP and SWP water supplies. Therefore, the municipal and industrial land uses  
40   would be the same under Alternative 5 and the No Action Alternative in the  
41   Trinity River Region.

1 As described in Chapter 5, Surface Water Resources and Water Supplies, CVP  
2 and SWP water deliveries to municipal and industrial Sacramento River Water  
3 Rights Settlement Contractors and water rights holders would be similar under  
4 Alternative 5 and the No Action Alternative. CVP water deliveries to water  
5 service contractors over the long-term conditions would be similar for the North  
6 of Delta and South of Delta water users under Alternative 5, compared to the No  
7 Action Alternative. SWP water deliveries to water contractors over the long-term  
8 conditions (without Article 21 water) would be similar under Alternative 5,  
9 compared to the No Action Alternative. Adequate water supplies would be  
10 available to support future municipal and industrial land uses projected in existing  
11 general plans under Alternative 5 and the No Action Alternative. Therefore, land  
12 use in 2030 would be the same under Alternative 5 and the No Action Alternative  
13 in the Trinity River, Central Valley, San Francisco Bay Area, Central Coast, and  
14 Southern California regions.

#### 15 **13.4.3.6.2 Alternative 5 Compared to the Second Basis of Comparison**

##### 16 *Changes in Land Use*

17 No municipal and industrial land uses in the Trinity River Region are served by  
18 CVP and SWP water supplies. Therefore, the municipal and industrial land uses  
19 would be the same under Alternative 5 and the Second Basis of Comparison in the  
20 Trinity River Region.

21 As described in Chapter 5, Surface Water Resources and Water Supplies, CVP  
22 and SWP water deliveries to municipal and industrial Sacramento River Water  
23 Rights Settlement Contractors and water rights holders would be similar under the  
24 No Action Alternative and the Second Basis of Comparison. CVP water  
25 deliveries to water service contractors over the long-term conditions would be  
26 similar for the North of Delta water users and 10 percent less for the South of  
27 Delta water users under Alternative 5 as compared to the Second Basis of  
28 Comparison. SWP water deliveries to water contractors over the long-term  
29 conditions (without Article 21 water) would be reduced by 19 percent throughout  
30 the SWP service area under the Alternative 5, compared to the Second Basis of  
31 Comparison. However, as described in Chapter 19, Socioeconomics, 2030  
32 municipal and industrial water demands would be met through a combination of  
33 available CVP and SWP water supplies and other water supplies, including water  
34 conservation, water transfers, local and regional surface water and groundwater,  
35 recycled water, and desalination. Adequate water supplies would be available to  
36 support future municipal and industrial land uses projected in existing general  
37 plans under Alternative 5 and the Second Basis of Comparison. Therefore, land  
38 use in 2030 would be the same under Alternative 5 and the Second Basis of  
39 Comparison in the Trinity River, Central Valley, San Francisco Bay Area, Central  
40 Coast, and Southern California regions.

#### 41 **13.4.3.7 Summary of Impact Analysis**

42 The results of the environmental consequences of implementation of  
43 Alternatives 1 through 5, compared to the No Action Alternative and the Second  
44 Basis of Comparison are presented in Tables 13.1 and 13.2.

1 **Table 13.1 Comparison of Alternatives 1 through 5 to No Action Alternative**

<b>Alternative</b>	<b>Potential Change</b>	<b>Consideration for Mitigation Measures</b>
Alternative 1	No effects to municipal and industrial and regional land uses	None needed
Alternative 2	No effects to municipal and industrial and regional land uses	None needed
Alternative 3	No effects to municipal and industrial and regional land uses	None needed
Alternative 4	No effects to municipal and industrial and regional land uses	None needed
Alternative 5	No effects to municipal and industrial and regional land uses	None needed

2 **Table 13.2 Comparison of No Action Alternative and Alternatives 1 through 5 to**  
 3 **Second Basis of Comparison**

<b>Alternative</b>	<b>Potential Change</b>	<b>Consideration for Mitigation Measures</b>
No Action Alternative	No effects to municipal and industrial and regional land uses	None needed
Alternative 1	No effects to municipal and industrial and regional land uses	None needed
Alternative 2	No effects to municipal and industrial and regional land uses	None needed
Alternative 3	No effects to municipal and industrial and regional land uses	None needed
Alternative 4	No effects to municipal and industrial and regional land uses	None needed
Alternative 5	No effects to municipal and industrial and regional land uses	None needed

4 **13.4.3.8 Potential Mitigation Measures**

5 Mitigation measures are presented in this section to avoid, minimize, rectify,  
 6 reduce, eliminate, or compensate for adverse environmental effects of  
 7 Alternatives 1 through 5, as compared to the No Action Alternative. Mitigation  
 8 measures were not included to address adverse impacts under the alternatives as  
 9 compared to the Second Basis of Comparison because this analysis was included  
 10 in this EIS for information purposes only.

11 Changes in CVP and SWP operations under Alternatives 1 through 5, compared  
 12 to the No Action Alternative, would not result in changes in municipal and  
 13 industrial land uses or regional lands use plans. Therefore, there would be no  
 14 adverse impacts to land use and no mitigation measures are required.

1 **13.4.3.9 Cumulative Effects Analysis**

2 As described in Chapter 3, Description of Alternatives, the cumulative effects  
 3 analysis considers projects, programs, and policies that are not speculative; and  
 4 are based upon known or reasonably foreseeable long-range plans, regulations,  
 5 operating agreements, or other information that establishes them as reasonably  
 6 foreseeable.

7 The cumulative effects analysis for Alternatives 1 through 5 for Land Use are  
 8 summarized in Table 13.3.

9 **Table 13.3 Summary of Cumulative Effects on Land Use with Implementation of**  
 10 **Alternatives 1 through 5 as Compared to the No Action Alternative**

Scenarios	Actions	Cumulative Effects of Actions
Past & Present, and Future Actions included in the No Action Alternative and all Alternatives in Year 2030	Consistent with Affected Environment conditions plus:  Actions in the 2008 USFWS BO and 2009 NMFS BO that would have occurred without implementation of the BOs, as described in Section 3.3.1.2 (of Chapter 3, Descriptions of Alternatives), including climate change and sea level rise  Actions not included in the 2008 USFWS BO and 2009 NMFS BO that would have occurred without implementation of the BOs, as described in Section 3.3.1.3 (of Chapter 3, Descriptions of Alternatives):  <ul style="list-style-type: none"> <li>- Implementation of Federal and state policies and programs, including Clean Water Act (e.g., Total Maximum Daily Loads); Safe Drinking Water Act; Clean Air Act; and flood management programs</li> <li>- General plans for 2030.</li> <li>- Trinity River Restoration Program.</li> <li>- Central Valley Project Improvement Act programs</li> <li>- Iron Mountain Mine Superfund Site</li> <li>- Nimbus Fish Hatchery Fish Passage Project</li> <li>- Folsom Dam Water Control Manual Update</li> <li>- FERC Relicensing for the Middle Fork of the American River Project</li> <li>- Lower Mokelumne River Spawning Habitat Improvement Project</li> <li>- Dutch Slough Tidal Marsh Restoration</li> <li>- Suisun Marsh Habitat Management, Preservation, and Restoration Plan Implementation</li> <li>- Tidal Wetland Restoration: Yolo Ranch, Northern Liberty Island Fish</li> </ul>	<u>These effects would be the same under all alternatives.</u>  Community development would occur in accordance with general plan projections for 2030. Development within the Delta would be subject to the requirements of the Delta Protection Commission and Delta Stewardship Council.  Restoration plans for the ongoing programs would be completed. Development along river corridors in the Central Valley would continue to be limited by the state regulations to protect floodways.  Climate change and sea level rise, development under the general plans, FERC relicensing projects, and some future projects to improve water quality and/or habitat are anticipated to reduce availability of CVP and SWP water supplies as compared to past conditions.  Future water supply projects are anticipated to both increase water supply reliability due to reduced surface water supplies and to accommodate planned growth in the general plans. Most of these programs were initiated prior to implementation of the 2008 USFWS BO and 2009 NMFS BO which reduced CVP and SWP water supply reliability.

Scenarios	Actions	Cumulative Effects of Actions
	Restoration Project, Prospect Island Restoration Project, and Calhoun Cut/Lindsey Slough Tidal Habitat Restoration Project - San Joaquin River Restoration Program - Future water supply projects, including water recycling, desalination, groundwater banks and wellfields, and conveyance facilities (projects with completed environmental documents)	
Future Actions considered as Cumulative Effects Actions in All Alternatives in Year 2030	Actions as described in Section 3.5 (of Chapter 3, Descriptions of Alternatives): - Bay-Delta Water Quality Control Plan Update - FERC Relicensing Projects - Bay Delta Conservation Plan(including the California WaterFix alternative) - Shasta Lake Water Resources, North-of-the-Delta Offstream Storage, Los Vaqueros Reservoir Expansion Phase 2, and Upper San Joaquin River Basin Storage Investigations - El Dorado Water and Power Authority Supplemental Water Rights Project - Sacramento River Water Reliability Project - Semitropic Water Storage District Delta Wetlands - North Bay Aqueduct Alternative Intake - San Luis Reservoir Low Point Improvement Project - Future water supply projects, including water recycling, desalination, groundwater banks and wellfields, and conveyance facilities (projects that did not have completed environmental documents during preparation of the EIS)	<p><u>These effects would be the same under all alternatives.</u></p> <p>Most of the reasonably foreseeable actions are anticipated to reduce water supply impacts due to climate change, sea level rise, increased water allocated to improve habitat conditions, and future growth.</p> <p>Some of the reasonably foreseeable actions related to improved water quality and habitat conditions (e.g., Water Quality Control Plan Update and FERC Relicensing Projects), could in further reductions in CVP and SWP water deliveries.</p>

Scenarios	Actions	Cumulative Effects of Actions
<p>No Action Alternative with Associated Cumulative Effects Actions in Year 2030</p>	<p>Full implementation of the 2008 USFWS BO and 2009 NMFS BO</p>	<p>Community development would occur in accordance with general plan projections for 2030. Development within the Delta would be subject to the requirements of the Delta Protection Commission and Delta Stewardship Council.</p> <p>Restoration plans for the ongoing programs would be completed. Development along river corridors in the Central Valley would continue to be limited by the state regulations to protect floodways.</p> <p>Climate change and sea level rise, FERC relicensing projects, and some future projects to improve water quality and/or habitat are anticipated to reduce availability of CVP and SWP water supplies as compared to past conditions.</p> <p>Future water supply projects are anticipated to both increase water supply reliability due to reduced surface water supplies and to accommodate planned growth in the general plans.</p>
<p>Alternative 1 reasonably foreseeable actions in Year 2030</p>	<p>No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant)</p>	<p>Implementation of Alternative 1 with reasonably foreseeable actions would result in similar changes as under the No Action Alternative with the added actions.</p>
<p>Alternative 2 reasonably foreseeable actions in Year 2030</p>	<p>Full implementation of the 2008 USFWS BO and 2009 NMFS BO CVP and SWP operational actions No implementation of structural improvements or other actions that require further study to develop a more detailed action description.</p>	<p>Implementation of Alternative 2 with reasonably foreseeable actions would result in similar changes as under the No Action Alternative with the added actions.</p>
<p>Alternative 3 reasonably foreseeable actions in Year 2030</p>	<p>No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant) Slight increase in positive Old and Middle River flows in the winter and spring months</p>	<p>Implementation of Alternative 3 with reasonably foreseeable actions would result in similar changes as under the No Action Alternative with the added actions.</p>

Scenarios	Actions	Cumulative Effects of Actions
Alternative 4 reasonably foreseeable actions in Year 2030	No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant) Increased restrictions for development within floodways.	Implementation of Alternative 4 with reasonably foreseeable actions would result in similar changes as under the No Action Alternative with the added actions.
Alternative 5 reasonably foreseeable actions in Year 20530	Full implementation of the 2008 USFWS BO and 2009 NMFS BO Positive Old and Middle River flows and increased Delta outflow in spring months	Implementation of Alternative 5 with reasonably foreseeable actions would result in similar changes as under the No Action Alternative with the added actions.

## Chapter 14

# 1 Visual Resources

## 2 14.1 Introduction

3 This chapter describes the visual resources in the study area related to natural and  
4 artificial landscape features and potential changes that could occur as a result of  
5 implementing the alternatives evaluated in this Environmental Impact Statement  
6 (EIS). Implementation of the alternatives considered in this EIS could affect  
7 visual resources through changes in surface water elevations at Central Valley  
8 Project (CVP) and State Water Project (SWP) reservoirs and changes in land use  
9 related to potential changes in operation of the CVP and SWP and ecosystem  
10 restoration.

11 Changes in reservoir surface water elevations, agricultural resources, and land use  
12 are described in more detail in Chapter 5, Surface Water Resources and Water  
13 Supplies; Chapter 12, Agricultural Resources; and Chapter 13, Land Use,  
14 respectively.

### 15 14.1.1 Visual Effects

16 Natural and artificial landscape features contribute to perceived visual images and  
17 aesthetic values of views. The values of views frequently are determined by  
18 contrasts of forms and textures related to geology, hydrology, vegetation and  
19 wildlife, agricultural crops, and other land uses. For example, a small water  
20 feature in a plain may be a significant visual feature; however, a small water  
21 feature within an area with vast rivers or larger ponds may be of less significance.

22 Visual effects are dependent upon the viewpoint of individuals because each  
23 person can respond differently to changes in the physical environment depending  
24 upon expectations, historical perspective, duration and frequency of the views,  
25 and extent of a viewshed. A viewshed is defined by the Federal Highway  
26 Administration (DOT 1981) as a surface area visible from a particular location.  
27 The character of a viewshed can also vary daily, seasonally, and with changing  
28 weather.

29 Visual effects also are affected by the general activities of the viewers.

30 Passengers in automobiles and trains with relatively short exposure to views may  
31 have a different experience than recreationists or residents who view the area for  
32 longer periods of time. Residents and recreationists frequently select a location  
33 for their activities due to the views. Changes in views could affect the quality of  
34 their activities, including housing, camping, hiking, or boating locations.

35 Therefore, changes in visual effects are dependent upon the visual quality of the  
36 landscape within the context of the setting (DOT 1981).

37 Visual quality, or scenic value, has been classified with respect to the lines, forms,  
38 colors, textures, and composition of landforms, vegetation, rocks, cultural  
39 features, and water features by the U.S. Department of Agriculture (USDA),

1 Forest Service (USDA 1995). The classification system includes Class A,  
2 Distinctive; Class B, Typical (or ordinary or common features); and Class C,  
3 Indistinctive. This classification system also considers the scenic integrity, or the  
4 completeness of the landscape character.

## 5 **14.2 Regulatory Environment and Compliance** 6 **Requirements**

7 Potential actions that could be implemented under the alternatives evaluated in  
8 this EIS could affect visual resources at reservoirs and lands served by CVP and  
9 SWP water supplies. Actions located on public agency lands or implemented,  
10 funded, or approved by Federal and state agencies, would need to be compliant  
11 with appropriate Federal and state agency policies and regulations, as summarized  
12 in Chapter 4, Approach to Environmental Analysis.

## 13 **14.3 Affected Environment**

14 This section describes visual resources that could be potentially affected by the  
15 implementation of the alternatives considered in this EIS. Changes in visual  
16 resources due to changes in CVP and SWP operations may occur in the Trinity  
17 River, Central Valley, San Francisco Bay Area, and Central Coast and Southern  
18 California regions.

19 Physical form and visual character are the result of the interaction of natural and  
20 engineered elements. Natural elements, including topography, hydrology,  
21 vegetation, and climate create the physical context. Engineered elements, such as  
22 buildings, roads, infrastructure, and settlement patterns, are secondary elements  
23 that act on the natural physical context to establish a visual environment.

24 Both the natural and engineered landscape features contribute to perceived views  
25 and the aesthetic value of those views. In areas considered to have high resource  
26 value and scenic character, it is important to evaluate and protect the visual  
27 character and aesthetic value of landscapes that may undergo alteration.

### 28 **14.3.1 Trinity River Region**

29 The Trinity River Region includes the area along the Trinity River from Trinity  
30 Lake to the confluence with the Klamath River, and along the Klamath River  
31 from the confluence with the Trinity River to the Pacific Ocean.

#### 32 **14.3.1.1 Trinity River Watershed**

33 The Trinity River drains an area of the Coast Range, northwest of the Sacramento  
34 Valley. Dams on the river form Trinity Lake and Lewiston Lake, both of which  
35 are in the Whiskeytown-Shasta-Trinity National Recreation Area, as described in  
36 Chapter 15, Recreation Resources. The Trinity River flows through sparsely  
37 populated and heavily forested, mountainous terrain, jagged cliffs that can be  
38 viewed during numerous recreational opportunities, including fishing, rafting,

1 kayaking, and canoeing. The forests offer visual resources which include snow-  
 2 covered peaks, volcanoes, rock outcroppings, mountain creeks, lakes, meadows,  
 3 and a wide variety of trees and vegetation. Downstream of Lewiston Dam, the  
 4 Trinity River corridor is characterized by gravel bars, riparian vegetation, and  
 5 human-built features (NCRWQCB et al. 2009). Artificial lights occur related to  
 6 passing vehicles and local residential and commercial buildings. Glare related to  
 7 the water surfaces may occur from some view locations.

8 **14.3.1.1.1 Wild and Scenic Rivers and Scenic Highways in the Trinity River**  
 9 **Watershed**

10 On January 19, 1981, the Secretary of the Interior designated portions of the  
 11 Trinity River watershed as part of the National Wild and Scenic Rivers System,  
 12 including the Trinity River downstream of Lewiston Dam, and portions of the  
 13 South Fork, North Fork, and New River (BLM et al. 2012). The State of  
 14 California adopted similar reaches as wild and scenic under Public Resources  
 15 Code sections 5093.54 and 5093.545.

16 The Trinity River Region includes two highways in Trinity County and one  
 17 highway in Humboldt County that are eligible for State Scenic Highway  
 18 designations. The two highways in Trinity County are eligible for State Scenic  
 19 Highway designation and include the Siskiyou-Trinity Scenic Byway (State Route  
 20 3, which extends from south of Hayfork to north of Trinity Lake to Interstate 5)  
 21 and Trinity Scenic Byway (State Route 299, which extends from the Pacific  
 22 Ocean to Redding) (CalTrans 2014a). In Humboldt County, State Route 96 along  
 23 the Trinity River from Willow Creek to the confluence with the Klamath River is  
 24 eligible for State Scenic Highways designation (CalTrans 2014b).

25 **14.3.1.2 Lower Klamath River Watershed**

26 The Klamath River from the confluence with the Trinity River to the Pacific  
 27 Ocean is characterized by a forested river canyon with riparian vegetation along  
 28 the river. Reduced flows in the summer have frequently resulted in algal blooms  
 29 which has reduced water clarity and visual quality of the river corridor (DOI and  
 30 DFG 2012).

31 **14.3.1.2.1 Wild and Scenic Rivers and Scenic Highways in the Klamath**  
 32 **River Watershed**

33 The portion of the Klamath River watershed within the Trinity River Region  
 34 considered in this EIS (from the confluence with the Trinity River to the Pacific  
 35 Ocean) was designated as part of the entire reach of the Klamath River from Iron  
 36 Gate to the Pacific Ocean by the Secretary of the Interior to be part of the  
 37 National Wild and Scenic Rivers System on January 19, 1981. The State of  
 38 California also adopted this reach of Klamath River as wild and scenic under  
 39 Public Resources Code sections 5093.54 and 5093.545.

40 Caltrans has not designated highways within the Klamath River watershed in the  
 41 Trinity River Region as Scenic Highways or identified roadways to be eligible for  
 42 Scenic Highways status (CalTrans 2014b, 2014c).

1 **14.3.2 Central Valley Region**

2 The Central Valley Region extends from above Shasta Lake to the Tehachapi  
3 Mountains, and includes the Sacramento Valley, San Joaquin Valley, Delta, and  
4 Suisun Marsh.

5 The Central Valley Region is predominantly made up of lowlands and plains  
6 surrounded by foothills and tall mountains of the Coast Range to the west, the  
7 Cascade Range to the north, the Sierra Nevada to the east, and the Tehachapi  
8 Mountains to the south. Communities and roadways of various sizes are located  
9 throughout the valley. Land use outside of the communities is primarily  
10 agricultural, with riparian, wetland and oak woodlands along the major  
11 waterways.

12 **14.3.2.1 Sacramento Valley**

13 The Sacramento Valley extends from the northern mountainous areas to the less  
14 dramatic landscapes of the Central Valley at the lower elevations. The  
15 mountainous areas are characterized by rugged and deep river canyons and  
16 valleys that extend from jagged peaks to forested areas with pine and deciduous  
17 trees. Large rivers flow from the mountain areas through the foothills into the  
18 agricultural areas and communities along the valley floor. Oak woodlands are  
19 located at middle and lower elevations of the foothills and along riparian corridors  
20 on the valley floor.

21 The Sacramento Valley extends from Shasta Lake and Whiskeytown Lake to the  
22 Delta. The Sacramento Valley portion of the Central Valley Region considered in  
23 this EIS includes the middle and lower portions of the Feather River and  
24 American River watersheds that are influenced by CVP and SWP water supply  
25 facilities, respectively.

26 **14.3.2.1.1 Shasta Lake, Keswick Reservoir, and Whiskeytown Lake**

27 Shasta Lake, Keswick Reservoir, and Whiskeytown Lake are in the  
28 Whiskeytown-Shasta-Trinity National Recreation Area, as described in  
29 Chapter 15, Recreation Resources. These watersheds provide opportunities for  
30 high quality visual attractions, such as mountains, forests, waterfalls, streams,  
31 open water, and vistas of the sky that can be experienced during numerous  
32 recreational activities such as boating, water skiing, swimming, fishing, camping,  
33 picnicking, hiking, hunting, and mountain biking. Panoramic views for travelers  
34 through the area can be seen from many locations, including State Route 151 vista  
35 point, Shasta Dam Visitor Center, and Interstate 5. The contrast between the open  
36 water bodies and surrounding mountains provides a wide diversity of views. The  
37 quality and diversity of visual resources at the lakes and the surrounding areas is  
38 influenced by human-built features such as highways, railroads, resorts, bridges,  
39 communities, and electrical transmission facilities. The visual quality of open  
40 waters also is influenced by fluctuating water levels. Typically, the water levels  
41 decline from an annual maximum in May to a minimum in October. In extremely  
42 dry years, exposed bare mineral soils in a “bathtub ring” are in substantial contrast  
43 to the open water and the upslope vegetation (Reclamation 2013a).

1 Between the lakes, pine and oak forests predominate, with intermittent chaparral  
 2 and rock outcrops. The landscape includes mountain ranges, volcanoes, and  
 3 waterways, opening below the reservoir to the agricultural vistas and communities  
 4 of the Central Valley.

5 **14.3.2.1.2 Sacramento River Watershed: Keswick Reservoir to**  
 6 **Feather River**

7 The scenic qualities of the upper reaches of the Sacramento River watershed south  
 8 of Keswick Reservoir are generally considered to be of high quality, especially in  
 9 areas where little to no development has occurred. Varied topography, geologic  
 10 formations, and natural and manmade water bodies provide striking vistas.

11 Similar conditions are found in the Sierra Nevada Mountains and foothills near  
 12 the upper and middle Feather, Yuba, American, Mokelumne, Calaveras, and  
 13 Stanislaus rivers watersheds.

14 The foothills provide views of rolling hills, open grasslands, and scattered oak and  
 15 pine woodlands. In the lower elevations of the Central Valley, the human-built  
 16 environment becomes more dominant, and detracts from views of the natural  
 17 landscape. Outside of the urban and suburban areas, land use is rural in character,  
 18 with agricultural areas that include irrigated row crops, orchards, and grazing  
 19 lands. Sporadically, flooded agricultural fields, especially rice fields managed for  
 20 wetlands, are used heavily by migrating birds.

21 Between the Keswick Reservoir and Feather River confluence with the  
 22 Sacramento River, the landscape also includes human-built reservoirs and canals.  
 23 Black Butte Reservoir is operationally integrated with the CVP, and the canal  
 24 system includes the CVP Corning Canal, Tehama-Colusa Canal, and Glenn-  
 25 Colusa Irrigation District's canal. The canals provide visual interest in localized  
 26 areas with limited viewing opportunities (Reclamation 1997).

27 Visual resources that could be affected in the Feather River and American River  
 28 watersheds are described below. The remaining portions of the Sacramento  
 29 Valley between the Feather River and the San Francisco Bay Area Region  
 30 includes the Delta (described in following subsections of this chapter) and areas  
 31 located to the east and west of the Delta. Land uses located to the south of the  
 32 Feather River and outside of the Delta include agricultural, open space, and major  
 33 urban centers that all use SWP water supplies. The urban areas include the cities  
 34 of Vacaville, Fairfield, and Vallejo in Solano County and unincorporated areas of  
 35 Napa County.

36 *Scenic Highways in the Sacramento River Area*

37 In the Sacramento Valley portion of the Central Valley Region, there are several  
 38 designated State Scenic Highways and several roads that are eligible for this  
 39 designation, including the following roadways:

- 40 • Shasta County: State Route 151 from Shasta Dam to Lake Boulevard is  
 41 designated as a State Scenic Highway due to views of the Sacramento River,  
 42 Shasta Lake, and distant hills. State Routes 299, 44, and 89 are eligible for  
 43 State Scenic Highway designation (CalTrans 2014a, 2014d).

- 1 • Tehama County: State Routes 89 and 36 are eligible for State Scenic Highway  
2 designation (CalTrans 2014e).
- 3 • Yolo County: A portion of State Route 16 is eligible for State Scenic  
4 Highways designation (CalTrans 2014f).
- 5 • Solano County: A portion of State Route 37 is eligible for State Scenic  
6 Highways designation (CalTrans 2014g).
- 7 • Napa County: Portions of State Routes 29 and 121 are eligible for State  
8 Scenic Highways designation (CalTrans 2014h).

### 9 **14.3.2.1.3 Feather River Watershed**

10 Antelope Lake, Lake Davis, Frenchman Lake, Lake Oroville, and Thermalito  
11 Afterbay on the Feather River are human-built reservoirs providing visual contrast  
12 with surrounding terrain.

#### 13 *Upper Feather River*

14 Antelope Lake, Lake Davis, and Frenchman Lake are located in the upper Feather  
15 River watershed (DWR 2013a; USFS 2006a, 2006b, 2011). Antelope Lake,  
16 located on Indian Creek, has the longest dam of the three reservoirs. This remote  
17 lake, surrounded by pine and fir trees, can be viewed from Fruit Growers  
18 Boulevard and Indian Creek Road. Lake Davis is formed by Grizzly Dam on Big  
19 Grizzly Creek, and is the largest of the three dams. It is located in the upper  
20 watershed surrounded by many trees, and can be viewed from Beckwourth-  
21 Taylorsville Road and Lake Davis Road. Frenchman Lake, located on Last  
22 Chance Creek, is formed by the tallest dam of the three dams. This lake also is  
23 surrounded by trees to the waterline and can be viewed from Little Last Chance  
24 Creek Road and Frenchman Lake Road.

#### 25 *Lake Oroville and Thermalito Reservoir*

26 The terrain adjacent to Lake Oroville is generally quite steep with limited  
27 vehicular access. Most views of the water are from the bridges on State Route  
28 162, State Route 70, and several county roads. Some residents live in the lands  
29 around Lake Oroville and Thermalito Afterbay. The residents can easily view the  
30 water and visitors can view the structures. As described above for Shasta Lake  
31 and other reservoirs in the upper Sacramento River watershed, Lake Oroville  
32 water levels decline as summer progresses, leaving a ring of bare soil along the  
33 water's edge. In extremely dry years at Lake Oroville, more than 200 vertical feet  
34 of bare mineral soils in a "bathtub ring" may be exposed when the surface water  
35 elevation approaches 710 feet above mean sea level (DWR 2007).

36 The Diversion Pool between Oroville Dam and Thermalito Diversion Dam  
37 extends about 4.5 miles along the Feather River and meanders through hillsides  
38 with substantial vegetation within widths ranging from 50 to 200 feet (DWR  
39 2007). Vistas of the Diversion Pool are primarily viewed by recreationists on the  
40 water or along the adjacent trails. A 1.9-mile-long concrete Thermalito Power  
41 Canal appears as a contrast from State Route 70 and county roads to the  
42 undeveloped landscape between the Diversion Dam and the Thermalito Forebay.

1 The Thermalito Forebay is a 630-acre reservoir, approximately 3 miles in length  
 2 that can be viewed by recreationists along or within the open water and travelers  
 3 along State Route 70 as the roadway extends from the foothills to the valley floor.  
 4 Water levels in these human-built features generally vary by 2 to 4 feet during a  
 5 week. When the water levels are low, exposed bare soils create a “bathtub ring”  
 6 effect.

7 Thermalito Afterbay is located in a more flat terrain than Lake Oroville and can  
 8 be viewed from many locations and residences. The Thermalito Afterbay Dam is  
 9 located parallel to State Route 99 and rises over 30 feet above the roadway (DWR  
 10 2007). The Thermalito Afterbay is approximately 4,300 acres and is visible from  
 11 State Route 162, several county roads, recreation areas, and neighboring  
 12 residences. Because the afterbay is located on flat lands with minimal foothills,  
 13 vistas from the water or lands surrounding the afterbay extend from the Sierra  
 14 Nevada foothills to the Feather River on the valley floor. Water levels in the  
 15 afterbay generally vary by 2 to 6 feet during a week, but can decline by as much  
 16 as 11 feet. When the water levels are low, exposed bare soils create a “bathtub  
 17 ring” effect.

18 The low flow channel of the Feather River extends from the Diversion Dam  
 19 through the community of Oroville (DWR 2007). Urban land uses and other  
 20 buildings, including the Feather River Fish Hatchery, are located along the  
 21 channel upstream of the State Route 70 bridge. The Oroville Wildlife Area  
 22 extends from State Route 70 on the east, downstream of the bridge, and includes  
 23 the Thermalito Afterbay area. Dredge tailings from hydraulic mining that  
 24 occurred over 100 years ago occur along the low flow channel with some of the  
 25 tailings reaching heights of more than 40 feet above the roadway.

26 *Wild and Scenic Rivers and Scenic Highways in the Feather River Watershed*

27 Within the Central Valley Region considered in this EIS, the Middle Fork Feather  
 28 River (from Beckworth to Lake Oroville) was designated as part of Public Law  
 29 90-542 (Wild and Scenic Rivers Act) to be part of the National Wild and Scenic  
 30 Rivers System on October 2, 1968.

31 In the Feather River watershed and adjacent Bear River watershed of the Central  
 32 Valley Region, there is one designated State Scenic Highway and several roads  
 33 that are eligible for this designation, including the following roadways.

- 34 • Butte County: State Route 70 is eligible for State Scenic Highways designation  
 35 (CalTrans 2014i).
- 36 • Plumas County: State Routes 70 and 89 are eligible for State Scenic Highways  
 37 designation (CalTrans 2014j).
- 38 • Nevada County: State Route 20 from Skillman Flat Campground to half-mile  
 39 east of Lowell Hill Road is designated as a State Scenic Highway and a U.S.  
 40 Forest Service (USFS) Scenic Byway due to views of pine forests and results  
 41 of hydraulic mining. Interstate 80 and State Routes 20, 49, and 174 are  
 42 eligible for State Scenic Highways designation (CalTrans 2014k).

1 **14.3.2.1.4 Yuba River Watershed**

2 The middle and lower Yuba River watershed extends through Nevada and Yuba  
3 counties. Upstream of New Bullards Bar Reservoir, the watershed is  
4 characterized by coniferous, mixed conifer/hardwood, and ponderosa pine forests  
5 along steep canyons. Most of the upper watershed is undeveloped with rural  
6 communities located along State Route 49 (DWR et al. 2007).

7 New Bullards Bar Reservoir, on the Yuba River and in Yuba County, is a human  
8 built reservoir providing visual contrast of the lake surface with mountainous  
9 landscape with conifers and mixed hardwood forests (DWR et al. 2007). There  
10 are many locations in the watershed to view the lake and the adjacent forests.  
11 Recreational developments are located near the marina and campgrounds near the  
12 shoreline.

13 Downstream of New Bullards Bar Reservoir along the Middle Yuba River and to  
14 Englebright Reservoir (located in Nevada and Yuba counties), the landscape is  
15 characterized by rolling hills with hardwood and coniferous trees and grasslands  
16 (DWR et al. 2007, USACE 2012). This portion of the watershed is rural with  
17 communities located along State Route 20.

18 Downstream of Englebright Reservoir, the landscape includes grasslands and  
19 agricultural fields with several small communities (USACE 2012). Along the  
20 river, the landscape is dominated by remnants of historic gold and gravel mining  
21 and ongoing gravel mining activities with minimal riparian vegetation. This  
22 portion of the watershed can be viewed from State Route 20.

23 **14.3.2.1.5 Middle and Lower American River Watershed**

24 The middle and lower American River watershed extends through Placer, El  
25 Dorado, and Sacramento counties. Upstream of Folsom Dam, much of Placer and  
26 El Dorado counties are characterized by undeveloped rolling grasslands and oak  
27 woodlands with sporadic agricultural activities related to orchards, vineyards,  
28 ornamental flowers, and Christmas tree farms in the wooded foothills.  
29 Communities have been developed throughout the counties especially near  
30 Interstate 80, U.S. Highway 50, and State Routes 49 and 89.

31 Folsom Lake, on the American River, is a human built reservoir providing visual  
32 contrast with the foothill landscape. Views from the water surface provide  
33 panoramic vistas of the foothills with open grasslands, oak woodlands, and pine  
34 woodlands. Folsom Lake is generally considered to provide a pleasing visual  
35 setting for recreationists, residences, and from roadways along the foothills above  
36 the reservoir, especially from the Lake Overlook and the Folsom Dam  
37 Observation Point vista points. Increased population in the communities around  
38 the lake have provided more scenic view points, including increased vistas of  
39 human-built structures such as electric transmission facilities, roadways, dams,  
40 and residential subdivisions. Reservoir levels fluctuate and decline as summer  
41 progresses, leaving a “bathtub ring” of bare soil along the water’s edge. The  
42 visual quality also degrades because visitors drive vehicles onto the exposed soils  
43 which cause tire tracks and erosion (Reclamation et al. 2006).

1 Lake Natoma extends from Folsom Dam along the American River to Nimbus  
 2 Dam. The land along the river is mostly undeveloped and includes wooded  
 3 canyon areas, sheer bluffs, and dredge tailings from the gold mining era.  
 4 Residential and community developments have been constructed along the  
 5 foothills that overlook the canyon, and these structures can be seen by  
 6 recreationists from the water or adjacent trails. Lake Natoma can be viewed from  
 7 U.S. Highway 50 and local roads.

8 Downstream of Nimbus Dam to Gristmill Recreation Area (downstream of  
 9 William B. Pond Recreation Area and approximately 2 miles upstream from the  
 10 Watt Avenue Bridge), the American River flows through a landscape  
 11 characterized by steep bluffs, terraces, mid-river sand and gravel bars, backwater  
 12 areas along the edges, and riparian vegetation. This viewshed is seen from the  
 13 recreational areas on the water and adjoining trails, from the bridge crossings, and  
 14 from residences along the terraces and foothills. Downstream of the Gristmill  
 15 Dam Recreation Area, the visual characteristics are less complex with an  
 16 increased number of bridges, water treatment plant intake, and artificial bank  
 17 protection. The communities along the American River corridor include the cities  
 18 of Folsom, Roseville, Rancho Cordova, and Sacramento and unincorporated  
 19 areas. The communities, transportation infrastructure, and water-river corridor  
 20 are visible from multiple vantage points.

21 *Wild and Scenic Rivers and Scenic Highways in the American River Watershed*  
 22 Within the American River watershed, the Lower American River from Nimbus  
 23 Dam to the confluence with the Sacramento River were designated by the  
 24 Secretary of the Interior to be part of the National Wild and Scenic Rivers System  
 25 on January 19, 1981. The State of California also designated the Lower American  
 26 River as wild and scenic under Public Resources Code sections 5093.54 and  
 27 5093.545. In addition, the state designated the North Fork American River from  
 28 the source to Iowa Hill Bridge as wild and scenic.

29 In the portion of the American River watershed in the study area of this EIS, there  
 30 is one roadway designated as a State Scenic Highway and one road that is eligible  
 31 for this designation. In El Dorado County, U.S. Highway 50 from Government  
 32 Center Interchange in Placerville to South Lake Tahoe is designated as a State  
 33 Scenic Highway due to vistas of the American River canyon, suburban foothills,  
 34 granite peaks, and Lake Tahoe. Also in El Dorado County, State Route 49 is  
 35 eligible for State Scenic Highways designation (CalTrans 2014).

#### 36 **14.3.2.2 San Joaquin Valley**

37 The San Joaquin Valley land cover ranges from high alpine vegetation near the  
 38 crest of the Sierra Nevada Mountains, through coniferous forest, mixed forest, oak  
 39 woodlands and oak savanna, to grasslands and agricultural areas at the lower  
 40 elevations (Reclamation 1997, 2005a, 2005b). Water bodies include reservoirs,  
 41 natural lakes and ponds, rivers, and tributary streams. The human-built  
 42 environment is more dominant at lower elevations, and includes roadways,  
 43 communities, roadside businesses, and transmission lines, detracting from views  
 44 of the natural environment. On the valley floor, the San Joaquin Valley is

1 characterized by agricultural lands, including many that are irrigated with CVP  
2 and/or SWP water supplies. The valley is arid to semi-arid, and there are few  
3 natural lakes or streams on the valley floor.

4 Several wetlands have been established as wildlife refuges in the San Joaquin  
5 Valley (as described in Chapter 10, Terrestrial Biological Resources), providing  
6 views of water and vegetation, enhanced seasonally by waterfowl and seasonal  
7 wildflowers.

8 The predominant land use is agricultural, with sparse to moderate populations.  
9 Interstate 5 and major railroads pass along the western San Joaquin Valley at the  
10 base of the Coast Ranges foothills. State Route 99 and other railroads are located  
11 along the eastern San Joaquin Valley at the base of the Sierra Nevada foothills.  
12 Interstate 580 and State Routes 152, 198, and 46 cross the San Joaquin Valley  
13 from east to west between Interstate 5 and State Route 99. Larger cities have  
14 been established in the northern San Joaquin Valley, including Lodi, Stockton,  
15 Lathrop, Manteca, and Tracy; and along State Route 99, including Merced,  
16 Fresno, Visalia, and Bakersfield. Both Interstate 5 and State Route 99 are  
17 extensively traveled and provide numerous viewing opportunities.

#### 18 **14.3.2.2.1 Northern San Joaquin Valley**

19 In the northern San Joaquin Valley, the foothills range from rolling hills to  
20 mountainous terrain with riparian corridors that range from narrow canyons to  
21 alluvial plains. The San Joaquin, Stanislaus, Merced, and Tuolumne rivers are the  
22 principal water features that flow from the Sierra Nevada foothills. One or more  
23 reservoirs are located along each of these rivers, including the CVP New Melones  
24 Reservoir on the Stanislaus River and Millerton Lake on the San Joaquin River.  
25 Other reservoirs are owned and operated by local and regional water suppliers, as  
26 described in Chapter 5, Surface Water Resources and Water Supplies. Dredge  
27 tailings have been deposited along some of the rivers as the streams flow from the  
28 mountains into the foothills.

29 The CVP New Melones Reservoir is located in the western foothills of the Sierra  
30 Nevada along the Stanislaus River. The area is characterized by foothills, ridges,  
31 and small valleys with vegetated slopes and the open water surface (Reclamation  
32 2010). The vegetation is primarily grasslands and oak woodlands with varying  
33 densities, with gray pine and low shrubs along some slopes. Views of the water  
34 are primarily from the water surface, adjacent recreation areas, and State  
35 Route 49. The surrounding lands are rural and undeveloped except for the  
36 infrastructure associated with the dam, canals, and power generation facilities and  
37 some minor structures associated with the recreation areas and utility lines. When  
38 the reservoir is drawn down, broad bands of bare soil are exposed.

39 Millerton Lake also is located in the western foothills of the Sierra Nevada along  
40 the San Joaquin River in an area that ranges from grasslands and rolling hills near  
41 Friant Dam to steep, craggy slopes in the upper reaches of the lake (Reclamation  
42 et al. 2011a). The lake, dam infrastructure, and surrounding hills can be viewed  
43 from the lake surface and adjacent county roads. Development has occurred  
44 along the hillsides that can be viewed from the lake surface and adjacent

1 recreation areas; however; future development will be regulated by Madera and  
 2 Fresno counties to protect visual and scenic resources. When the reservoir is  
 3 drawn down, broad bands of bare soil are exposed. The Madera Canal and Friant-  
 4 Kern Canal extend from Millerton Lake to the north and south, respectively. The  
 5 canals are located along the Sierra Nevada foothills through mostly agricultural  
 6 landscapes and limited residences (Reclamation et al. 2011, Reclamation 1997).  
 7 The canals are only intermittently visible from county roads.

#### 8 **14.3.2.2.2 Western San Joaquin Valley**

9 The Coast Range foothills on the western side of the northern San Joaquin Valley  
 10 are sparsely populated and characterized by mountainous to hilly terrain with  
 11 grasslands and scattered oak woodlands along narrow streams. The CVP and  
 12 SWP San Luis Reservoir complex is located within the western foothills; and the  
 13 CVP and SWP water supply canals are located at the base of the foothills to the  
 14 north and south of the San Luis Reservoir.

15 The CVP and SWP water supply facilities are prominent features in the viewshed  
 16 of the San Joaquin Valley, including facilities at or near San Luis Reservoir,  
 17 Delta-Mendota Canal, San Luis Canal-California Aqueduct, Cross Valley Canal,  
 18 New Melones Reservoir, and Millerton Lake. The San Luis Reservoir, O'Neill  
 19 Forebay, and Los Banos Creek Reservoir are located in northwestern San Joaquin  
 20 Valley. State Route 152 is located along the northern and eastern rims of San  
 21 Luis Reservoir and the western rim of O'Neill Forebay (Reclamation and State  
 22 Parks 2013). O'Neill Forebay and Los Banos Creek Reservoir can be seen to the  
 23 west from Interstate 5. The reservoirs are also part of the visual resources for the  
 24 San Luis Reservoir State Recreation Area, Pacheco State Park, and Upper and  
 25 Lower Cottonwood Wildlife Areas (which are described in Chapter 10, Terrestrial  
 26 Biological Resources, and Chapter 15, Recreation Resources). The shorelines of  
 27 the reservoirs are undeveloped, except for recreational facilities. Views included  
 28 annual grassland, coastal sage, and riparian woodland. When the reservoirs are  
 29 drawn down, broad bands of bare soil are exposed. Open water viewing  
 30 opportunities also occur to the south of the San Luis complex at the Little  
 31 Panoche Reservoir located to the west of Interstate 5.

32 The open water and canal infrastructure of the Delta-Mendota Canal, San Luis  
 33 Canal-California Aqueduct, Cross Valley Canal, and irrigation district canals can  
 34 be viewed from Interstate 5 and the railroad lines along the western San Joaquin  
 35 Valley. The open water of Mendota Pool is located at the terminus of the Delta  
 36 Mendota Canal and can be viewed from county roads.

#### 37 **14.3.2.2.3 Southern San Joaquin Valley**

38 In the southern portion of the San Joaquin Valley, the Kings, Kaweah, Tule, and  
 39 Kern rivers are the principal water features along the eastern Sierra Nevada  
 40 foothills. One or more reservoirs are located along each of these rivers. Riparian  
 41 vegetation and oak woodlands occur along these river corridors. The western  
 42 Coast Ranges foothills are characterized by distinct, folded foothills with

1 grasslands and infrequent oak woodlands along small drainages. The Tehachapi  
2 Mountains rise abruptly along the southern boundary of the valley.

3 **14.3.2.2.4 Wild and Scenic Rivers and Scenic Highways in the San Joaquin**  
4 **Valley**

5 In the San Joaquin Valley within or near the Central Valley Region considered in  
6 this EIS, four rivers were designated to be part of the National Wild and Scenic  
7 Rivers System. Portions of the Tuolumne River from the source waters to Don  
8 Pedro Reservoir were designated through Public Law 98-425 as wild and scenic.  
9 Portions of the Merced River were designated through Public Laws 100-149 and  
10 102-432 as wild and scenic, including the entire South Fork and the mainstem  
11 from the source waters to Lake McClure. Portions of the Kings River were  
12 designated as wild and scenic through Public Law 100-150, including the Middle  
13 Fork and South Fork from their respective sources to the confluences with the  
14 mainstem; and the mainstem from these confluences to an elevation of 1595 feet  
15 above mean sea level (upstream of the confluence with the North Fork and Pine  
16 Flat Lake). Portions of the Kern River were designated as wild and scenic  
17 through Public Law 100-174, including the North Fork from the source to the  
18 Tulare County/Kern County boundary; and the South Fork from the source to the  
19 Domeland Wilderness. Most of these reaches are located outside of the Central  
20 Valley Region; however, the flows from these reaches could influence the visual  
21 resources of downstream reaches in the Central Valley Region.

22 In the San Joaquin Valley of the Central Valley Region, there are five roadway  
23 sections designated as a State Scenic Highway and seven roadway sections that  
24 are eligible for this designation.

- 25 • San Joaquin County and Alameda County: Interstate 580 from Interstate 5 to  
26 State Route 205 is designated as a State Scenic Highway due to vistas of the  
27 Coast Ranges and Central Valley. Interstate 5 from the Stanislaus County  
28 boundary to Interstate 580 is designated as a State Scenic Highway due to  
29 vistas of agricultural lands and the Delta Mendota Canal and California  
30 Aqueduct (CalTrans 2014m, 2014n).
- 31 • Stanislaus County: Interstate 5 from the San Joaquin County boundary to the  
32 Merced County boundary is designated as a State Scenic Highway due to  
33 vistas of agricultural lands and the Delta Mendota Canal and California  
34 Aqueduct (CalTrans 2014o).
- 35 • Merced County: Interstate 5 from State Route 152 to the Stanislaus County  
36 boundary is designated as a State Scenic Highway due to vistas of agricultural  
37 lands and the Delta Mendota Canal and California Aqueduct (CalTrans  
38 2014p). State Route 152 from Interstate 5 to the Santa Clara County boundary  
39 is designated as a State Scenic Highway due to vistas of agricultural lands and  
40 the San Luis Reservoir State Recreational Area.
- 41 • Fresno County: State Routes 168, 180, and 198 are eligible for State Scenic  
42 Highways designation (CalTrans 2014q).

- 1 • Tulare County: State Routes 190 and 198 are eligible for State Scenic  
2 Highways designation (CalTrans 2014s).
- 3 • Kern County: State Routes 14 and 58 are eligible for State Scenic Highways  
4 designation (CalTrans 2014t).

### 5 **14.3.2.3 Delta and Suisun Marsh**

6 Most of the Delta is used for agricultural purposes with major waterways and  
7 sloughs that connect the Sacramento, San Joaquin, Mokelumne, Cosumnes, and  
8 Calaveras rivers (CALFED 2000). Flood management and irrigation facilities  
9 include levees, impoundments, pumping plants, and control gate structures.  
10 Bodies of open water occur where historic levee failures were not repaired,  
11 including Franks Tract and Liberty Island. The Sacramento Deep Water Ship  
12 Channel is a larger water feature between levees that extends from the  
13 Sacramento River near Rio Vista to West Sacramento. Cities within the Delta  
14 include the southern portion of Sacramento, Isleton, West Sacramento, Rio Vista,  
15 Lathrop, western portions of Stockton and Manteca, Tracy, Brentwood, Oakley,  
16 Antioch, and Pittsburg. Small communities to serve the agriculture and recreation  
17 users include Freeport, Clarksburg, Hood, Courtland, Locke, Walnut Grove,  
18 Ryde, Thornton, Knightsen, and Collinsville. Vistas of the Delta can be seen  
19 from residences and agricultural areas in the Delta, open water areas used by  
20 recreationists, and from vehicles on roadways and railroads that cross the Delta.  
21 Waterfront industries are located along the rivers, especially along the San  
22 Joaquin River.

23 The Suisun Marsh is characterized by tidal and freshwater wetlands and riparian  
24 woodlands (Reclamation et al. 2010). The area is bounded by Interstate 80 and  
25 State Route 12 on the north; the Montezuma Hills and Sulphur Springs Mountains  
26 on the east and west, respectively; and on the south by the open waters of Suisun  
27 Bay, Grizzly Bay, and Honker Bay with adjoining wetlands, marshes, and riparian  
28 forests. The marsh is relatively flat and comprised primarily of tidal marsh and  
29 submerged lands. Upland areas serve as a backdrop with grasslands and nearby  
30 rolling foothills. Vistas of Suisun Marsh can be viewed from adjacent roadways  
31 railroads; roads and trails within the marsh; a few residences within the marsh;  
32 and open water that can be accessed by boats, kayaks, and canoes. Much of  
33 Suisun Marsh is managed wetlands and provides habitat for resident and  
34 migrating birds and waterfowl.

#### 35 **14.3.2.3.1 Scenic Highways in the Delta**

36 In the Delta and Suisun Marsh portion of the Central Valley Region, there two  
37 roadway sections designated as a State Scenic Highway and two roadway sections  
38 that are eligible for this designation.

- 39 • Sacramento County: State Route 160 between the southern limits of the City  
40 of Sacramento to the Contra Costa County boundary is designated as a State  
41 Scenic Highway due to the views of historic Delta agriculture and small towns  
42 along the Sacramento River (CalTrans 2014u).

- 1 • Contra Costa County: State Route 160 from the Antioch Bridge to State  
2 Route 4 and State Route 4 continuing on towards Brentwood are eligible for  
3 State Scenic Highways designation (CalTrans 2014v).

#### 4 **14.3.3 San Francisco Bay Area Region**

5 The San Francisco Bay Area Region includes portions of Contra Costa, Alameda,  
6 Santa Clara, and San Benito counties that are within the CVP and SWP service  
7 areas. The San Francisco Bay Area Region ranges in topography from sea level  
8 to the East Bay and South Bay foothills that reach elevations of 3,500 feet and  
9 higher (CALFED 2000; WTA 2003; Reclamation 2005c). It offers a diverse  
10 physical and natural environment, and a wide range of visual resources. Typical  
11 views and landscapes include urban development, natural and altered open-space  
12 areas, major ridgelines, and scenic waterways. The terrain ranges from alluvial  
13 plains to gently sloping hills and wooded ravines. Striking views of iconic scenes  
14 are available throughout the area, of San Francisco Bay, the San Francisco  
15 skyline, Angel Island, Mount Tamalpais, Peninsula foothills, and the East Bay  
16 hills. Views to the east are dominated by Mount Diablo and adjacent Diablo  
17 Ridge and valleys. Views in the South Bay extend through the baylands that  
18 extend along the Contra Costa, San Mateo, Santa Clara, and Alameda counties  
19 shorelines; the river floodplains of the Guadalupe River and Coyote Creek in  
20 Santa Clara County; and towards the Santa Cruz Mountains (Santa Clara County  
21 1994).

22 Urban and industrial areas are located throughout the San Francisco Bay Area  
23 Region, including along the San Francisco Bay shoreline. Smaller, localized  
24 scenic resources include wetlands, isolated hilltops, rock outcroppings, mature  
25 stands of trees, lakes, reservoirs, and other natural features. City parks and  
26 recreation areas, open-space areas adjacent to ravines, golf courses, and resource  
27 preserves provide visual opportunities in urban areas. The reservoirs that store  
28 CVP or SWP water or water from other surface water sources are human built  
29 reservoirs located in the foothills or at the edge of the foothills. The water can be  
30 viewed from roadways located at elevations higher than the reservoirs and by  
31 recreationists on the reservoirs. Agricultural areas that use CVP and SWP water  
32 are located within coastal valleys especially within the Livermore-Amador valleys  
33 of Alameda County, southern Santa Clara County, and northern San Benito  
34 County.

##### 35 **14.3.3.1 Scenic Highways in the San Francisco Bay Area Region**

36 In the San Francisco Bay Area Region, there are four roadway sections designated  
37 as a State Scenic Highway and five roadway sections that are eligible for this  
38 designation.

- 39 • Contra Costa County: State Route 24 from the Alameda County boundary to  
40 Interstate 680, and Interstate 680 from State Route 24 to Interstate 580 at the  
41 Alameda County boundary are designated as State Scenic Highways due to  
42 the views of Mount Diablo and attractive residential and commercial areas  
43 (CalTrans 2014v).

- 1 • Alameda County: Interstate 580 between Interstate 80 and State Route 92 are  
2 designated as a State Scenic Highways (CalTrans 2014n). Portions of  
3 Interstate 680 from the Contra Costa County boundary to Mission Boulevard  
4 in Fremont and portions of State Route 84 are designated as State Scenic  
5 Highways due to vistas of wooded hillsides and valleys. Other portions of  
6 Interstate 580 are eligible for State Scenic Highways designation.
- 7 • Santa Clara County: Portions of State Routes 152 and 280 within the San  
8 Francisco Bay Area Region are eligible for State Scenic Highways  
9 designation (CalTrans 2014w).
- 10 • San Benito County: Portions of State Routes 156 and 25 within the San  
11 Francisco Bay Area Region are eligible for State Scenic Highways  
12 designation (CalTrans 2014x).

### 13 **14.3.4 Central Coast and Southern California Regions**

14 The Central Coast and Southern California Regions include portions of San Luis  
15 Obispo, Santa Barbara, Ventura, Los Angeles, Orange, San Diego, Riverside, and  
16 San Bernardino counties served by the SWP.

17 Areas along the Pacific Coast in San Luis Obispo, Santa Barbara, Ventura,  
18 portions of Los Angeles, portions of Orange, and San Diego counties are  
19 characterized by steep, craggy coastal mountains and coastal plains that can be  
20 viewed from the roadways, residences, and the Pacific Ocean. The visual  
21 resources include beaches, sand dunes, coastal bluffs, headlands, wetlands,  
22 estuaries, islands, hillsides, and canyons (Santa Barbara County 2009, SBCAG  
23 2013). The foothills extend from the Pacific Ocean to more than 800 feet above  
24 mean sea level; and the mountains extend to more than 3,000 feet above mean sea  
25 level. The foothills are generally covered with mature trees and shrubs, including  
26 native oaks, deciduous trees, and eucalyptus. The coastal plains gradually slope  
27 towards the foothills with streams through the plains. Small to medium size  
28 communities occur along the coast and the coastal plains in San Luis Obispo,  
29 Santa Barbara, and Ventura counties and within portions of the coastline in Los  
30 Angeles, Orange and San Diego counties. Larger communities also are located  
31 along the coastline separated by large areas of undeveloped lands.

32 Inland from the Pacific Ocean, urban areas extend throughout large portions of  
33 the foothills and valleys of Los Angeles, Orange, San Diego, Riverside, and San  
34 Bernardino counties. Reduced abundance of natural features, vistas, and non-  
35 urban land uses may diminish the visual resources for many viewers (SCAG  
36 2010). However, in many inland areas urban areas are separated by areas of  
37 undeveloped or agricultural lands, especially in Riverside and San Bernardino  
38 counties. Minimal development has occurred within the higher elevations of the  
39 Central Coast and Southern California regions, as described in Chapter 13, Land  
40 Use. Therefore, the mountainous areas (such as the San Gabriel, Santa Monica,  
41 Santa Ana, Santa Rosa, and San Jacinto mountains) provide dramatic viewsheds  
42 from the valleys (Los Angeles 2011, RCIP 2000, San Bernardino County 2007).  
43 The mountains also are characterized by deep canyons, rock outcroppings, and  
44 sparse vegetation. In the Coachella Valley portion of Riverside County, the visual

1 resources are dominated by dramatic vistas of the Santa Rosa, San Jacinto, San  
2 Bernardino, Cottonwood, and Chocolate mountains with high desert craggy rock  
3 outcroppings and sparse vegetation. The Salton Sea in the southern Coachella  
4 Valley provides dramatic vistas from the shoreline and highways that extend  
5 around the open water.

6 The inland areas also include major surface water resources that provide open  
7 water vistas, including Twitchell Reservoir, Silverwood Lake, Diamond Valley  
8 Lake, Lake Perris, Lake Skinner, Vail Lake, and Lake Mathews; and smaller  
9 water supply reservoirs. Many of these reservoirs store CVP and SWP water and  
10 are human built reservoirs located in the foothills or at the edge of the foothills.  
11 The water can be viewed from highways located at elevations higher than the  
12 reservoirs and by recreationists on the reservoirs.

13 **14.3.4.1 Wild and Scenic Rivers and Scenic Highways in the Central**  
14 **Coast and Southern California Regions**

15 The wild and scenic rivers in the Central Coast and Southern California areas are  
16 not located within the study area of this EIS.

17 In the Central Coast and Southern California regions, there are seven roadway  
18 sections designated as State Scenic Highways and several roadway sections that  
19 are eligible for this designation.

- 20 • San Luis Obispo County: U.S. Highway 1 from the Monterey County  
21 boundary to the City of San Luis Obispo is designated as a State Scenic  
22 Highway and an All American Road due to dramatic vista along the  
23 mountains and rocky headlands of the Pacific Ocean coastline (CalTrans  
24 2014y). Portions of State Route 41 and Interstate 101 are eligible for State  
25 Scenic Highways designation.
- 26 • Santa Barbara County: U.S. Highway 1 from Interstate 101 near Las Cruces to  
27 near Lompoc is designated as a State Scenic Highway due to dramatic vista  
28 along the mountains and rocky headlands of the Pacific Ocean coastline  
29 (CalTrans 2014z). Portions of Interstate 101 are eligible for State Scenic  
30 Highways designation.
- 31 • Ventura County: State Route 33 from the Santa Barbara County boundary to  
32 the north of the junction with State Route 150 is designated as a State Scenic  
33 Highway and a USFS Scenic Byway due to dramatic vista along the  
34 mountains between the Coast Ranges and the Central Valley with landscapes  
35 that range from pine forests to semi-desert vegetation (CalTrans 2014aa).  
36 Portions of Interstate 101 and State Routes 33 and 1 are eligible for State  
37 Scenic Highways designation.
- 38 • Los Angeles County: State Route 2 from near La Cañada-Flintridge to the San  
39 Bernardino County boundary is designated as a State Scenic Highway and a  
40 U.S. Forest Service Scenic Byway due to dramatic vista along the San Gabriel  
41 Mountains with vistas of the Mojave Desert and the Los Angeles Basin  
42 (CalTrans 2014ab). Portions of Interstate 101, 210, and 110 and State

- 1 Routes 1, 23, 27, 39, 118, and 126 are eligible for State Scenic Highways  
 2 designation.
- 3 • Orange County: State Route 91 from State Route 55 to the City of Anaheim is  
 4 designated as a State Scenic Highway due vistas of the Santa Ana River and  
 5 urban development with intermittent riparian and chaparral vegetation  
 6 (CalTrans 2014ac). State Routes 1, 57, and 74 and portions of State Route 91  
 7 are eligible for State Scenic Highways designation.
  - 8 • San Diego County: State Route 75 from the City of Imperial Beach to  
 9 Coronado is designated as a State Scenic Highway due to vistas of the Pacific  
 10 Ocean, San Diego Harbor, and the Coronado Bridge (CalTrans 2014ad). State  
 11 Route 125 between State Routes 94 and 8 is designated as a State Scenic  
 12 Highway due to vistas of Mt. Helix and attractive residential and commercial  
 13 areas. Interstate 5 and 8 and portions of State Routes 52, 76, and 93 within  
 14 the Southern California Region are eligible for State Scenic Highways  
 15 designation.
  - 16 • Riverside County: State Route 243 from the City of Banning to State Route 74  
 17 is designated as a State Scenic Highway and a U.S. Forest Service Scenic  
 18 Byway due to the vistas of the San Bernardino Mountains and valley  
 19 (CalTrans 2014ae). Interstate 15 and State Routes 71, 74, 91, and 111 are  
 20 eligible for State Scenic Highways designation.
  - 21 • San Bernardino County: State Routes 2, 18, 38, 138, 173, 189, and 247 are  
 22 eligible for State Scenic Highways designation (CalTrans 2014af).

23 **14.4 Impact Analysis**

24 This section describes the potential mechanisms and analytical methods for  
 25 change in visual resources; results of the impact analysis; potential mitigation  
 26 measures; and cumulative effects.

27 **14.4.1 Potential Mechanisms for Change and Analytical Methods**

28 As described in Chapter 4, Approach to Environmental Analysis, the impact  
 29 analysis considers changes in visual resources conditions related to changes in  
 30 CVP and SWP operations under the alternatives as compared to the No Action  
 31 Alternative and Second Basis of Comparison.

32 Changes in CVP and SWP operations under the alternatives as compared to the  
 33 No Action Alternative and Second Basis of Comparison could change the vistas at  
 34 reservoirs that store CVP and SWP water during dry and critical dry water years  
 35 and at irrigated agricultural lands during dry and critical dry water years when the  
 36 crops are idled.

1     **14.4.1.1   Changes in Visual Resources at Reservoirs that Store CVP and**  
2                    **SWP Water**

3     Vistas at reservoirs that store CVP and SWP water provide a wide diversity of  
4     visual experiences related to the contrasts between the open water surface and  
5     surrounding foothills or mountains. By the end of September, the surface water  
6     elevations decline, and a bare “bathtub ring” appears in contrast to the open water  
7     and the upslope vegetation. Changes in CVP and SWP operations under the  
8     alternatives could change the extent of the “bathtub” ring over the long-term  
9     average condition and in dry and critical dry years as compared to the No Action  
10    Alternative and Second Basis of Comparison.

11    The CalSim II model output includes monthly reservoir elevations for CVP and  
12    SWP reservoirs in the Central Valley and Trinity Lake. The end-of-September  
13    reservoir elevations in dry and critical dry water years generally indicate low  
14    reservoir elevations. To assess changes in visual resources, changes in reservoir  
15    storage elevations for the end of September in dry and critical dry years were  
16    compared between alternatives and the No Action Alternative and Second Basis  
17    of Comparison.

18    Reservoirs in the San Francisco Bay Area, Central Coast, and Southern California  
19    regions store water from multiple water supplies including CVP and SWP water;  
20    however, these reservoirs are not included in the CalSim II model simulation. For  
21    the purposes of this EIS analysis, changes in surface water elevations in these  
22    reservoirs were assumed to be related to changes in CVP and SWP water  
23    deliveries to the areas located to the south of the Delta.

24    **14.4.1.2   Changes in Vista at Irrigated Agricultural Lands**

25    Agrarian vistas of irrigated row crops, orchards, and grazing lands intermixed  
26    within a landscape of grasslands, large water canals, isolated riparian corridors,  
27    and several small communities occur throughout the Central Valley, San  
28    Francisco Bay Area, Central Coast, and Southern California regions. Changes in  
29    CVP and SWP operations under the alternatives could change the extent of  
30    irrigated acreage and the associated vistas over the long-term average condition  
31    and in dry and critical dry years as compared to the No Action Alternative and  
32    Second Basis of Comparison. However, as described in Chapter 12, Agricultural  
33    Resources, the extents of irrigated acreage between Alternatives 1 through 5 are  
34    similar to irrigated acreage under the No Action Alternative and the Second Basis  
35    of Comparison. Therefore, changes in CVP and SWP operations would not  
36    change irrigated acreage and as a result they are not analyzed in this EIS.

37    **14.4.1.3   Effects Related to Water Transfers**

38    Historically water transfer programs have been developed on an annual basis.  
39    The demand for water transfers is dependent upon the availability of water  
40    supplies to meet water demands. Water transfer transactions have increased over  
41    time as CVP and SWP water supply availability has decreased, especially during  
42    drier water years.

1 Parties seeking water transfers generally acquire water from sellers who have  
 2 available surface water who can make the water available through releasing  
 3 previously stored water; pumping groundwater instead of using surface water  
 4 (groundwater substitution); idle crops; or substitute crops that use less water in  
 5 order to reduce normal consumptive use of surface water.

6 Water transfers using CVP and SWP Delta pumping plants and south of Delta  
 7 canals generally occur when there is unused capacity in these facilities. These  
 8 conditions generally occur during drier water year types when the flows from  
 9 upstream reservoirs plus unregulated flows are adequate to meet the Sacramento  
 10 Valley water demands and the CVP and SWP export allocations. In non-wet  
 11 years, the CVP and SWP water allocations would be less than full contract  
 12 amounts; therefore, capacity may be available in the CVP and SWP conveyance  
 13 facilities to move water from other sources.

14 Projecting future visual conditions related to water transfer activities is difficult  
 15 because specific water transfer actions required to make the water available,  
 16 convey the water, and/or use the water would change each year due to changing  
 17 hydrological conditions, CVP and SWP water availability, specific local agency  
 18 operations, and local cropping patterns. Reclamation recently prepared a long-  
 19 term regional water transfer environmental document which evaluated potential  
 20 changes in conditions related to water transfer actions (Reclamation 2014c).  
 21 Results from this analysis were used to inform the impact assessment of potential  
 22 effects of water transfers under the alternatives as compared to the No Action  
 23 Alternative and the Second Basis of Comparison.

#### 24 **14.4.2 Conditions in Year 2030 without Implementation of** 25 **Alternatives 1 through 5**

26 This EIS includes two bases of comparison, as described in Chapter 3,  
 27 Description of Alternatives: the No Action Alternative and the Second Basis of  
 28 Comparison. Both of these bases are evaluated at 2030 conditions. Changes that  
 29 would occur over the next 15 years without implementation of the alternatives are  
 30 not analyzed in this EIS. However, the changes to visual resources that are  
 31 assumed to occur by 2030 under the No Action Alternative and the Second Basis  
 32 of Comparison are summarized in this section. Many of the changed conditions  
 33 would occur in the same manner under both the No Action Alternative and the  
 34 Second Basis of Comparison.

##### 35 **14.4.2.1 Common Changes in Conditions under the No Action Alternative** 36 **and Second Basis of Comparison**

37 Conditions in 2030 would be different than existing conditions due to:

- 38 • Climate change and sea-level rise
- 39 • General plan development throughout California, including increased water  
 40 demands in portions of Sacramento Valley
- 41 • Implementation of reasonable and foreseeable water resources management  
 42 projects to provide water supplies

1 It is anticipated that climate change would result in more short-duration high-  
2 rainfall events and less snowpack in the winter and early spring months. The  
3 reservoirs would be full more frequently by the end of April or May by 2030 than  
4 in recent historical conditions. However, as the water is released in the spring,  
5 there would be less snowpack to refill the reservoirs. This condition would  
6 reduce reservoir storage and available water supplies to downstream uses in the  
7 summer. The reduced end-of-September storage would also reduce the ability to  
8 release stored water to downstream regional reservoirs. These conditions would  
9 occur for all reservoirs in the California foothills and mountains, including non-  
10 CVP and SWP reservoirs.

11 These changes would result in a decline of the long-term average CVP and SWP  
12 water supply deliveries by 2030 as compared to recent historical long-term  
13 average deliveries under the No Action Alternative and the Second Basis of  
14 Comparison. However, the CVP and SWP water deliveries would be less under  
15 the No Action Alternative as compared to the Second Basis of Comparison, as  
16 described in Chapter 5, Surface Water Resources and Water Supplies, which  
17 could result in more crop-idling.

18 Under the No Action Alternative and the Second Basis of Comparison, land uses  
19 in 2030 would occur in accordance with adopted general plans. Development  
20 under the general plans would change visual resources, especially near municipal  
21 areas.

22 The No Action Alternative and the Second Basis of Comparison assumes  
23 completion of water resources management and environmental restoration  
24 projects that would have occurred without implementation of Alternatives 1  
25 through 5, including regional and local recycling projects, surface water and  
26 groundwater storage projects, conveyance improvement projects, and desalination  
27 projects, as described in Chapter 3, Description of Alternatives. The No Action  
28 Alternative and the Second Basis of Comparison also assumes implementation of  
29 actions included in the 2008 U.S. Fish and Wildlife Service (USFWS) Biological  
30 Opinion (BO) and 2009 National Marine Fisheries Service (NMFS) BO that  
31 would have been implemented without the BOs by 2030, as described in Chapter  
32 3, Description of Alternatives. These projects would include several projects that  
33 would affect visual resources, including:

- 34 • Restoration of more than 10,000 acres of intertidal and associated subtidal  
35 wetlands in Suisun Marsh and Cache Slough; and at least 17,000 to  
36 20,000 acres of seasonal floodplain restoration in Yolo Bypass
- 37 • Restoration of Battle Creek
- 38 • Implementation of Red Bluff Pumping Plant

### 39 **14.4.3 Evaluation of Alternatives**

40 Alternatives 1 through 5 have been compared to the No Action Alternative; and  
41 the No Action Alternative and Alternatives 1 through 5 have been compared to  
42 the Second Basis of Comparison.

1 During review of the numerical modeling analyses used in this EIS, an error was  
 2 determined in the CalSim II model assumptions related to the Stanislaus River  
 3 operations for the Second Basis of Comparison, Alternative 1, and Alternative 4  
 4 model runs. Appendix 5C includes a comparison of the CalSim II model run  
 5 results presented in this chapter and CalSim II model run results with the error  
 6 corrected. Appendix 5C also includes a discussion of changes in the comparison  
 7 of groundwater conditions for the following alternative analyses.

- 8 • No Action Alternative compared to the Second Basis of Comparison
- 9 • Alternative 1 compared to the No Action Alternative
- 10 • Alternative 3 compared to the Second Basis of Comparison
- 11 • Alternative 5 compared to the Second Basis of Comparison

12 **14.4.3.1 No Action Alternative**

13 The No Action Alternative is compared to the Second Basis of Comparison.

14 **14.4.3.1.1 Trinity River Region**

15 *Potential Changes in Visual Resources at Reservoirs that Store CVP and*  
 16 *SWP Water*

17 Changes in CVP water supplies and operations under the No Action Alternative  
 18 as compared to the Second Basis of Comparison would result in similar end-of-  
 19 September reservoir elevations (changes within 5 percent) and related visual  
 20 resources at Trinity Lake in all water year types, as described in Chapter 5,  
 21 Surface Water Resources and Water Supplies.

22 **14.4.3.1.2 Central Valley Region**

23 *Potential Changes in Visual Resources at Reservoirs that Store CVP and*  
 24 *SWP Water*

25 Changes in CVP water supplies and operations under the No Action Alternative  
 26 as compared to the Second Basis of Comparison would result in similar end-of-  
 27 September reservoir elevations and related visual resources at Shasta Lake, Lake  
 28 Oroville, Folsom Lake, and New Melones Reservoir in all water year types; and  
 29 at San Luis Reservoir in above-normal, below-normal, and dry years, as described  
 30 in Chapter 5, Surface Water Resources and Water Supplies. Changes in visual  
 31 resources at San Luis Reservoir would be reduced in wet year and critical dry  
 32 years because the end-of-September surface water elevations would be reduced by  
 33 6.2 percent in wet and critical dry years.

34 *Effects Related to Cross Delta Water Transfers*

35 Potential effects to visual resources could be similar to those identified in a recent  
 36 environmental analysis conducted by Reclamation for long-term water transfers  
 37 from the Sacramento to San Joaquin valleys (Reclamation 2014c). Potential  
 38 effects to visual resources were identified as changes in reservoir surface water  
 39 elevations, streams, irrigated acreage, and water elevations in canals that would  
 40 convey transferred water. The analysis indicated that these potential impacts  
 41 would not be substantial because the conditions with and without the water  
 42 transfers would be similar.

1 Under the No Action Alternative, the timing of cross Delta water transfers would  
2 be limited to July through September and include annual volumetric limits, in  
3 accordance with the 2008 USFWS BO and 2009 NMFS BO. Under the Second  
4 Basis of Comparison, water could be transferred throughout the year without an  
5 annual volumetric limit. Overall, the potential for cross Delta water transfers  
6 would be less under the No Action Alternative than under the Second Basis of  
7 Comparison.

8 **14.4.3.1.3 San Francisco Bay Area, Central Coast, and Southern California**  
9 **Regions**

10 *Potential Changes in Visual Resources at Reservoirs that Store CVP and*  
11 *SWP Water*

12 Changes in visual resources at reservoirs that store CVP and SWP water supplies  
13 are assumed to be related to changes in water deliveries over long-term conditions  
14 for this EIS analysis. Monthly deliveries are not necessarily indicative of  
15 reservoir storage because all or a portion of the water deliveries could be directly  
16 conveyed to water users in any specific month. Therefore, annual deliveries are  
17 considered to be relatively proportional to the amount of water that could be  
18 stored over all water year types. In the San Francisco Bay Area Region, values  
19 for the CVP municipal and industrial water deliveries and the SWP south of the  
20 Delta water deliveries (without Article 21 deliveries) were considered; and SWP  
21 south of the Delta water deliveries (without Article 21 deliveries) were considered  
22 for the Central Coast and Southern California regions. Under the No Action  
23 Alternative as compared to the Second Basis of Comparison CVP water deliveries  
24 would be reduced by 10 percent and SWP water deliveries would be reduced by  
25 18 percent. Therefore, for this EIS analysis, it is assumed that visual resources  
26 related to surface water elevations in reservoirs that store CVP and SWP water  
27 supplies would be reduced by 10 to 18 percent in the San Francisco Bay Area  
28 Region and 18 percent in the Central Coast and Southern California regions.

29 **14.4.3.2 Alternative 1**

30 Alternative 1 is identical to the Second Basis of Comparison. Alternative 1 is  
31 compared to the No Action Alternative and the Second Basis of Comparison.  
32 However, because visual resource conditions under Alternative 1 are identical to  
33 visual resource conditions under the Second Basis of Comparison; Alternative 1 is  
34 only compared to the No Action Alternative.

35 **14.4.3.2.1 Alternative 1 Compared to the No Action Alternative**

36 *Trinity River Region*

37 *Potential Changes in Visual Resources at Reservoirs that Store CVP and*  
38 *SWP Water*

39 Changes in CVP water supplies and operations under Alternative 1 as compared  
40 to the No Action Alternative would result in similar end-of-September reservoir  
41 elevations and related visual resources at Trinity Lake in all water year types, as  
42 described in Chapter 5, Surface Water Resources and Water Supplies.

1 *Central Valley Region*

2 *Potential Changes in Visual Resources at Reservoirs that Store CVP and*  
 3 *SWP Water*

4 Changes in CVP water supplies and operations under Alternative 1 as compared  
 5 to the No Action Alternative would result in similar end-of-September reservoir  
 6 elevations and related visual resources at Shasta Lake, Lake Oroville, Folsom  
 7 Lake, and New Melones Reservoir in all water year types; and at San Luis  
 8 Reservoir in above-normal, below-normal, and dry years, as described in Chapter  
 9 5, Surface Water Resources and Water Supplies. Changes in visual resources at  
 10 San Luis Reservoir would be reduced in wet year and critical dry years because  
 11 the end-of-September surface water elevations would be increased by 6.6 percent  
 12 in wet and critical dry years.

13 *Effects Related to Cross Delta Water Transfers*

14 Potential effects to visual resources could be similar to those identified in a recent  
 15 environmental analysis conducted by Reclamation for long-term water transfers  
 16 from the Sacramento to San Joaquin valleys (Reclamation 2014c) as described  
 17 above under the No Action Alternative compared to the Second Basis of  
 18 Comparison. For the purposes of this EIS, it is anticipated that similar conditions  
 19 would occur during implementation of cross Delta water transfers under  
 20 Alternative 1 and the No Action Alternative, and that impacts on visual resources  
 21 would not be substantial in the seller's service area due to implementation  
 22 requirements of the transfer programs.

23 Under Alternative 1, water could be transferred throughout the year without an  
 24 annual volumetric limit. Under the No Action Alternative, the timing of cross  
 25 Delta water transfers would be limited to July through September and include  
 26 annual volumetric limits, in accordance with the 2008 USFWS BO and 2009  
 27 NMFS BO. Overall, the potential for cross Delta water transfers would be  
 28 increased under Alternative 1 as compared to the No Action Alternative.

29 *San Francisco Bay Area, Central Coast, and Southern California Regions*

30 *Potential Changes in Visual Resources at Reservoirs that Store CVP and*  
 31 *SWP Water*

32 Changes in visual resources at reservoirs that store CVP and SWP water supplies  
 33 are assumed to be related to changes in water deliveries over long-term conditions  
 34 for this EIS analysis, as described above under the No Action Alternative as  
 35 compared to the Second Basis of Comparison. Therefore, under Alternative 1 as  
 36 compared to the No Action Alternative, visual resources related to surface water  
 37 elevations in reservoirs that store CVP and SWP water supplies would be  
 38 increased by 11 to 21 percent in the San Francisco Bay Area Region and  
 39 21 percent in the Central Coast and Southern California regions.

40 **14.4.3.2.2 Alternative 1 Compared to the Second Basis of Comparison**

41 Alternative 1 is identical to the Second Basis of Comparison.

1    **14.4.3.3    Alternative 2**

2    The CVP and SWP operations under Alternative 2 are identical to the CVP and  
3    SWP operations under the No Action Alternative; therefore, Alternative 2 is only  
4    compared to the Second Basis of Comparison.

5    **14.4.3.3.1    Alternative 2 Compared to the Second Basis of Comparison**

6    The CVP and SWP operations under Alternative 2 are identical to the CVP and  
7    SWP operations under the No Action Alternative. Therefore, changes to visual  
8    resources conditions under Alternatives 2 as compared to the Second Basis of  
9    Comparison would be the same as the impacts described in Section 14.4.3.1, No  
10   Action Alternative.

11   **14.4.3.4    Alternative 3**

12   As described in Chapter 3, Description of Alternatives, CVP and SWP operations  
13   under Alternative 3 are similar to the Second Basis of Comparison with modified  
14   Old and Middle River flow criteria and New Melones Reservoir operations. As  
15   described in Chapter 4, Approach to Environmental Analysis, Alternative 3 is  
16   compared to the No Action Alternative and the Second Basis of Comparison.

17   **14.4.3.4.1    Alternative 3 Compared to the No Action Alternative**

18    *Trinity River Region*

19        *Potential Changes in Visual Resources at Reservoirs that Store CVP and*  
20        *SWP Water*

21   Changes in CVP water supplies and operations under Alternative 3 as compared  
22   to the No Action Alternative would result in similar end-of-September reservoir  
23   elevations and related visual resources at Trinity Lake in all water year types, as  
24   described in Chapter 5, Surface Water Resources and Water Supplies.

25    *Central Valley Region*

26        *Potential Changes in Visual Resources at Reservoirs that Store CVP and*  
27        *SWP Water*

28   Changes in CVP water supplies and operations under Alternative 3 as compared  
29   to the No Action Alternative would result in similar end-of-September reservoir  
30   elevations and related visual resources at Shasta Lake, Lake Oroville, Folsom  
31   Lake, and New Melones Reservoir in all water year types; and at San Luis  
32   Reservoir in below-normal, dry, and critical dry years, as described in Chapter 5,  
33   Surface Water Resources and Water Supplies. Changes in visual resources at San  
34   Luis Reservoir would be reduced in wet year and critical dry years because the  
35   end-of-September surface water elevations would be increased by 7.9 percent in  
36   wet years and 5.7 percent in above-normal years.

37        *Effects Related to Cross Delta Water Transfers*

38   Potential effects to visual resources could be similar to those identified in a recent  
39   environmental analysis conducted by Reclamation for long-term water transfers  
40   from the Sacramento to San Joaquin valleys (Reclamation 2014c) as described  
41   above under the No Action Alternative compared to the Second Basis of

1 Comparison. For the purposes of this EIS, it is anticipated that similar conditions  
 2 would occur during implementation of cross Delta water transfers under  
 3 Alternative 3 and the No Action Alternative, and that impacts on visual resources  
 4 would not be substantial in the seller’s service area due to implementation  
 5 requirements of the transfer programs.

6 Under Alternative 3, water could be transferred throughout the year without an  
 7 annual volumetric limit. Under the No Action Alternative, the timing of cross  
 8 Delta water transfers would be limited to July through September and include  
 9 annual volumetric limits, in accordance with the 2008 USFWS BO and 2009  
 10 NMFS BO. Overall, the potential for cross Delta water transfers would be  
 11 increased under Alternative 3 as compared to the No Action Alternative.

12 *San Francisco Bay Area, Central Coast, and Southern California Regions*

13 *Potential Changes in Visual Resources at Reservoirs that Store CVP and*  
 14 *SWP Water*

15 Changes in visual resources at reservoirs that store CVP and SWP water supplies  
 16 are assumed to be related to changes in water deliveries over long-term conditions  
 17 for this EIS analysis, as described above under the No Action Alternative as  
 18 compared to the Second Basis of Comparison. Therefore, under Alternative 3 as  
 19 compared to the No Action Alternative, visual resources related to surface water  
 20 elevations in reservoirs that store CVP and SWP water supplies would be  
 21 increased by 9 to 17 percent in the San Francisco Bay Area Region and 17 percent  
 22 in the Central Coast and Southern California regions.

23 **14.4.3.4.2 Alternative 3 Compared to the Second Basis of Comparison**

24 *Trinity River Region*

25 *Potential Changes in Visual Resources at Reservoirs that Store CVP and*  
 26 *SWP Water*

27 Changes in CVP water supplies and operations under Alternative 3 as compared  
 28 to the Second Basis of Comparison would result in similar end-of-September  
 29 reservoir elevations and related visual resources at Trinity Lake in all water year  
 30 types, as described in Chapter 5, Surface Water Resources and Water Supplies.

31 *Central Valley Region*

32 *Potential Changes in Visual Resources at Reservoirs that Store CVP and*  
 33 *SWP Water*

34 Changes in CVP water supplies and operations under Alternative 3 as compared  
 35 to the Second Basis of Comparison would result in similar end-of-September  
 36 reservoir elevations and related visual resources at Shasta Lake, Lake Oroville,  
 37 Folsom Lake, New Melones Reservoir, and San Luis Reservoir in all water year  
 38 types, as described in Chapter 5, Surface Water Resources and Water Supplies.

39 *Effects Related to Cross Delta Water Transfers*

40 Potential effects to visual resources could be similar to those identified in a recent  
 41 environmental analysis conducted by Reclamation for long-term water transfers  
 42 from the Sacramento to San Joaquin valleys (Reclamation 2014c) as described

1 above under the No Action Alternative compared to the Second Basis of  
2 Comparison. For the purposes of this EIS, it is anticipated that similar conditions  
3 would occur during implementation of cross Delta water transfers under  
4 Alternative 3 and the Second Basis of Comparison, and that impacts on visual  
5 resources would not be substantial in the seller's service area due to  
6 implementation requirements of the transfer programs.

7 Under Alternative 3 and the Second Basis of Comparison, water could be  
8 transferred throughout the year without an annual volumetric limit. Overall, the  
9 potential for cross Delta water transfers would be similar under Alternative 3 and  
10 the Second Basis of Comparison.

11 *San Francisco Bay Area, Central Coast, and Southern California Regions*

12 *Potential Changes in Visual Resources at Reservoirs that Store CVP and*  
13 *SWP Water*

14 Changes in visual resources at reservoirs that store CVP and SWP water supplies  
15 are assumed to be related to changes in water deliveries over long-term conditions  
16 for this EIS analysis, as described above under the No Action Alternative as  
17 compared to the Second Basis of Comparison. Therefore, under Alternative 3 as  
18 compared to the Second Basis of Comparison, visual resources related to surface  
19 water elevations in reservoirs that store CVP and SWP water supplies would be  
20 similar (changes within 5 percent).

#### 21 **14.4.3.5 Alternative 4**

22 The visual resources conditions under Alternative 4 would be identical to the  
23 conditions under the Second Basis of Comparison; therefore, Alternative 4 is only  
24 compared to the No Action Alternative.

#### 25 **14.4.3.5.1 Alternative 4 Compared to the No Action Alternative**

26 The CVP and SWP operations under Alternative 4 are identical to the CVP and  
27 SWP operations under the Second Basis of Comparison and Alternative 1.  
28 Therefore, changes in visual resources conditions under Alternative 4 as  
29 compared to the No Action Alternative would be the same as the impacts  
30 described in Section 14.4.3.2.1, Alternative 1 Compared to the No Action  
31 Alternative.

#### 32 **14.4.3.6 Alternative 5**

33 As described in Chapter 3, Description of Alternatives, CVP and SWP operations  
34 under Alternative 5 are similar to the No Action Alternative with modified Old  
35 and Middle Rivers (OMR) flow criteria and New Melones Reservoir operations.  
36 As described in Chapter 4, Approach to Environmental Analysis, Alternative 5 is  
37 compared to the No Action Alternative and the Second Basis of Comparison.

1 **14.4.3.6.1 Alternative 5 Compared to the No Action Alternative**

2 *Trinity River Region*

3 *Potential Changes in Visual Resources at Reservoirs that Store CVP and*  
 4 *SWP Water*

5 Changes in CVP water supplies and operations under Alternative 5 as compared  
 6 to the No Action Alternative would result in similar end-of-September reservoir  
 7 elevations and related visual resources at Trinity Lake in all water year types, as  
 8 described in Chapter 5, Surface Water Resources and Water Supplies.

9 *Central Valley Region*

10 *Potential Changes in Visual Resources at Reservoirs that Store CVP and*  
 11 *SWP Water*

12 Changes in CVP water supplies and operations under Alternative 5 as compared  
 13 to the No Action Alternative would result in similar end-of-September reservoir  
 14 elevations and related visual resources at Shasta Lake, Lake Oroville, Folsom  
 15 Lake, New Melones Reservoir, and San Luis Reservoir in all water year types, as  
 16 described in Chapter 5, Surface Water Resources and Water Supplies.

17 *Effects Related to Cross Delta Water Transfers*

18 Potential effects to visual resources could be similar to those identified in a recent  
 19 environmental analysis conducted by Reclamation for long-term water transfers  
 20 from the Sacramento to San Joaquin valleys (Reclamation 2014c) as described  
 21 above under the No Action Alternative compared to the Second Basis of  
 22 Comparison. For the purposes of this EIS, it is anticipated that similar conditions  
 23 would occur during implementation of cross Delta water transfers under  
 24 Alternative 5 and the No Action Alternative, and that impacts on visual resources  
 25 would not be substantial in the seller’s service area due to implementation  
 26 requirements of the transfer programs.

27 Under Alternative 5 and the No Action Alternative, the timing of cross Delta  
 28 water transfers would be limited to July through September and include annual  
 29 volumetric limits, in accordance with the 2008 USFWS BO and 2009 NMFS BO.  
 30 Overall, the potential for cross Delta water transfers would be similar under  
 31 Alternative 5 and the No Action Alternative.

32 *San Francisco Bay Area, Central Coast, and Southern California Region*

33 *Potential Changes in Visual Resources at Reservoirs that Store CVP and*  
 34 *SWP Water*

35 Changes in visual resources at reservoirs that store CVP and SWP water supplies  
 36 are assumed to be related to changes in water deliveries over long-term conditions  
 37 for this EIS analysis, as described above under the No Action Alternative as  
 38 compared to the Second Basis of Comparison. Therefore, under Alternative 5 as  
 39 compared to the No Action Alternative, visual resources would be similar.

1 **14.4.3.6.2 Alternative 5 Compared to the Second Basis of Comparison**

2 *Trinity River Region*

3 *Potential Changes in Visual Resources at Reservoirs that Store CVP and*  
4 *SWP Water*

5 Changes in CVP water supplies and operations under Alternative 5 as compared  
6 to the Second Basis of Comparison would result in similar end-of-September  
7 reservoir elevations and related visual resources at Trinity Lake in all water year  
8 types, as described in Chapter 5, Surface Water Resources and Water Supplies.

9 *Central Valley Region*

10 *Potential Changes in Visual Resources at Reservoirs that Store CVP and*  
11 *SWP Water*

12 Changes in CVP water supplies and operations under Alternative 5 as compared  
13 to the Second Basis of Comparison would result in similar end-of-September  
14 reservoir elevations and related visual resources at Shasta Lake, Lake Oroville,  
15 Folsom Lake, and New Melones Reservoir in all water year types; and at San Luis  
16 Reservoir in wet, above-normal, and below-normal years, as described in Chapter  
17 5, Surface Water Resources and Water Supplies. Changes in visual resources at  
18 San Luis Reservoir would be reduced in dry year and critical dry years because  
19 the end-of-September surface water elevations would be decreased by 6.2 percent  
20 in dry years and 8.5 percent in critical dry years.

21 *Effects Related to Cross Delta Water Transfers*

22 Potential effects to visual resources could be similar to those identified in a recent  
23 environmental analysis conducted by Reclamation for long-term water transfers  
24 from the Sacramento to San Joaquin valleys (Reclamation 2014c) as described  
25 above under the No Action Alternative compared to the Second Basis of  
26 Comparison. For the purposes of this EIS, it is anticipated that similar conditions  
27 would occur during implementation of cross Delta water transfers under  
28 Alternative 5 and the Second Basis of Comparison, and that impacts on visual  
29 resources would not be substantial in the seller's service area due to  
30 implementation requirements of the transfer programs.

31 Under Alternative 5, the timing of cross Delta water transfers would be limited to  
32 July through September and include annual volumetric limits, in accordance with  
33 the 2008 USFWS BO and 2009 NMFS BO. Under the Second Basis of  
34 Comparison, water could be transferred throughout the year without an annual  
35 volumetric limit. Overall, the potential for cross Delta water transfers would be  
36 reduced under Alternative 5 as compared to the Second Basis of Comparison.

37 *San Francisco Bay Area, Central Coast, and Southern California Regions*

38 *Potential Changes in Visual Resources at Reservoirs that Store CVP and*  
39 *SWP Water*

40 Changes in visual resources at reservoirs that store CVP and SWP water supplies  
41 are assumed to be related to changes in water deliveries over long-term conditions  
42 for this EIS analysis, as described above under the No Action Alternative as  
43 compared to the Second Basis of Comparison. Therefore, under Alternative 5 as

1 compared to the Second Basis of Comparison, visual resources related to surface  
 2 water elevations in reservoirs that store CVP and SWP water supplies would be  
 3 reduced by 10 to 18 percent in the San Francisco Bay Area Region and 18 percent  
 4 in the Central Coast and Southern California regions.

5 **14.4.3.7 Summary of Impact Assessment**

6 The results of the impact assessment of implementation of Alternatives 1 through  
 7 5 as compared to the No Action Alternative and the Second Basis of Comparison  
 8 are presented in Tables 14.1 and 14.2.

9 **Table 14.1 Comparison of Alternatives 1 through 5 to No Action Alternative**

Alternative	Potential Change	Consideration for Mitigation Measures
Alternative 1	Visual resources would be similar at Trinity Lake, Shasta Lake, Lake Oroville, Folsom Lake, and New Melones Reservoir in all water year types; and at San Luis Reservoir in above-normal, below-normal, and dry years. Visual resources would be increased by 6 percent in wet and critical dry years at San Luis Reservoir, by 11 to 21 percent in the San Francisco Bay Area Region, and by 21 percent in the Central Coast and Southern California regions.	None needed.
Alternative 2	No effects on visual resources.	None needed.
Alternative 3	Visual resources would be similar at Trinity Lake, Shasta Lake, Lake Oroville, Folsom Lake, and New Melones Reservoir in all water year types; and at San Luis Reservoir in above-normal, below-normal, and dry years. Visual resources would be increased by 8 percent in wet years and 6 percent in above-normal years at San Luis Reservoir, by 9 to 17 percent in the San Francisco Bay Area Region, and by 17 percent in the Central Coast and Southern California regions.	None needed.
Alternative 4	Same effects as described for Alternative 1 compared to the No Action Alternative.	None needed.
Alternative 5	Visual resources would be similar at Trinity Lake, Shasta Lake, Lake Oroville, Folsom Lake, San Luis Reservoir, and other reservoirs that store CVP and SWP water in the San Francisco Bay Area, Central Coast, and Southern California regions.	None needed.

10 Note: Due to the limitations and uncertainty in the CalSim II monthly model and other  
 11 analytical tools, incremental differences of 5 percent or less between alternatives and the  
 12 Second Basis of Comparison are considered to be “similar.”

1 **Table 14.2 Comparison of No Action Alternative and Alternatives 1 through 5 to**  
 2 **Second Basis of Comparison**

Alternative	Potential Change	Consideration for Mitigation Measures
No Action Alternative	Visual resources would be similar at Trinity Lake, Shasta Lake, Lake Oroville, Folsom Lake, and New Melones Reservoir in all water year types; and at San Luis Reservoir in above-normal, below-normal, and dry years. Visual resources would be reduced by 6 percent in wet and critical dry years at San Luis Reservoir, by 10 to 18 percent in the San Francisco Bay Area Region, and by 18 percent in the Central Coast and Southern California regions.	Not considered for this comparison.
Alternative 1	No effects on visual resources.	Not considered for this comparison.
Alternative 2	Same effects as described for No Action Alternative as compared to the Second Basis of Comparison.	Not considered for this comparison.
Alternative 3	Visual resources would be similar at Trinity Lake, Shasta Lake, Lake Oroville, Folsom Lake, San Luis Reservoir, and other reservoirs that store CVP and SWP water in the San Francisco Bay Area, Central Coast, and Southern California regions.	Not considered for this comparison.
Alternative 4	No effects on visual resources.	Not considered for this comparison.
Alternative 5	Visual resources would be similar at Trinity Lake, Shasta Lake, Lake Oroville, Folsom Lake, and New Melones Reservoir in all water year types; and at San Luis Reservoir in above-normal, below-normal, and dry years. Visual resources would be reduced by 6 percent in dry years and 9 percent in critical dry years at San Luis Reservoir, by 10 to 18 percent in the San Francisco Bay Area Region, and by 18 percent in the Central Coast and Southern California regions.	Not considered for this comparison.

3 Note: Due to the limitations and uncertainty in the CalSim II monthly model and other  
 4 analytical tools, incremental differences of 5 percent or less between alternatives and the  
 5 Second Basis of Comparison are considered to be “similar.”

6 **14.4.3.8 Potential Mitigation Measures**

7 Mitigation measures are presented in this section to avoid, minimize, rectify,  
 8 reduce, eliminate, or compensate for adverse environmental effects of  
 9 Alternatives 1 through 5 as compared to the No Action Alternative. Mitigation  
 10 measures were not included to address adverse impacts under the alternatives as

1 compared to the Second Basis of Comparison because this analysis was included  
 2 in this EIS for information purposes only.

3 Changes in CVP and SWP operations under Alternatives 1 through 5, as  
 4 compared to the No Action Alternative, would not result in changes in visual  
 5 resources. Therefore, there would be no adverse impacts to visual resources and  
 6 no mitigation measures are required.

7 **14.4.3.9 Cumulative Effects Analysis**

8 As described in Chapter 3, the cumulative effects analysis considers projects,  
 9 programs, and policies that are not speculative and are based upon known or  
 10 reasonably foreseeable long-range plans, regulations, operating agreements, or  
 11 other information that establishes them as reasonably foreseeable.

12 The cumulative effects analysis for Alternatives 1 through 5 for Visual Resources  
 13 are summarized in Table 14.3.

14 **Table 14.3 Summary of Cumulative Effects on Visual Resources with**  
 15 **Implementation of Alternatives 1 through 5 as Compared to the No Action**  
 16 **Alternative**

Scenarios	Actions	Cumulative Effects of Actions
Past & Present, and Future Actions included in the No Action Alternative in All Alternatives in Year 2030	Consistent with Affected Environment conditions plus: Actions in the 2008 USFWS BO and 2009 NMFS BO that would have occurred without implementation of the BOs, as described in Section 3.3.1.2 (of Chapter 3, Descriptions of Alternatives), including climate change and sea level rise Actions not included in the 2008 USFWS BO and 2009 NMFS BO that would have occurred without implementation of the BOs, as described in Section 3.3.1.3 (of Chapter 3, Descriptions of Alternatives): <ul style="list-style-type: none"> <li>- Implementation of Federal and state policies and programs, including Clean Water Act (e.g., Total Maximum Daily Loads); Safe Drinking Water Act; Clean Air Act; and flood management programs</li> <li>- General plans for 2030.</li> <li>- Trinity River Restoration Program.</li> <li>- Central Valley Project Improvement Act programs</li> <li>- Folsom Dam Water Control Manual Update</li> <li>- FERC Relicensing for the Middle Fork of the American River Project</li> <li>- Lower Mokelumne River Spawning Habitat Improvement Project</li> </ul>	<u>These effects would be the same under all alternatives.</u> Climate change and sea level rise, development under the general plans, FERC relicensing projects, and some future projects to improve water quality and/or habitat are anticipated to reduce end of September storage in CVP and SWP reservoirs compared to past conditions, and to reduce CVP and SWP water supply reliability which could result in less irrigated lands compared to past conditions. General plans would be completed for projected conditions by 2030, as described in Chapter 13, Land Use. Restoration plans for the ongoing programs would be completed which would change visual resources of the restored lands.

Scenarios	Actions	Cumulative Effects of Actions
	<ul style="list-style-type: none"> <li>- Dutch Slough Tidal Marsh Restoration</li> <li>- Suisun Marsh Habitat Management, Preservation, and Restoration Plan Implementation</li> <li>- Tidal Wetland Restoration: Yolo Ranch, Northern Liberty Island Fish Restoration Project, Prospect Island Restoration Project, and Calhoun Cut/Lindsey Slough Tidal Habitat Restoration Project</li> <li>- San Joaquin River Restoration Program</li> <li>- Future water supply projects, including water recycling, desalination, groundwater banks and wellfields, and conveyance facilities (projects with completed environmental documents)</li> </ul>	
<p>Future Actions considered as Cumulative Effects Actions in All Alternatives in Year 2030</p>	<p>Actions as described in Section 3.5 (of Chapter 3, Descriptions of Alternatives):</p> <ul style="list-style-type: none"> <li>- Bay-Delta Water Quality Control Plan Update</li> <li>- FERC Relicensing Projects</li> <li>- Bay Delta Conservation Plan (including the California WaterFix alternative)</li> <li>- Shasta Lake Water Resources, North-of-the-Delta Offstream Storage, Los Vaqueros Reservoir Expansion Phase 2, and Upper San Joaquin River Basin Storage Investigations</li> <li>- El Dorado Water and Power Authority Supplemental Water Rights Project</li> <li>- Sacramento River Water Reliability Project</li> <li>- Semitropic Water Storage District Delta Wetlands</li> <li>- North Bay Aqueduct Alternative Intake</li> <li>- San Luis Reservoir Low Point Improvement Project</li> <li>- Future water supply projects, including water recycling, desalination, groundwater banks and wellfields, and conveyance facilities (projects that did not have completed environmental documents during preparation of the EIS)</li> </ul>	<p><u>These effects would be the same under all alternatives.</u></p> <p>Most of the future reasonably foreseeable actions are anticipated to reduce water supply impacts due to climate change, sea level rise, increased water allocated to improve habitat conditions, and future growth.</p> <p>Some of the future reasonably foreseeable actions related to improved water quality and habitat conditions (e.g., Water Quality Control Plan Update and FERC Relicensing Projects), could in further reductions in CVP and SWP water deliveries and associated extent of irrigated lands.</p>

Scenarios	Actions	Cumulative Effects of Actions
No Action Alternative with Associated Cumulative Effects Actions in Year 2030	Full implementation of the 2008 USFWS BO and 2009 NMFS BO	<p>Climate change and sea level rise, FERC relicensing projects, and some future projects to improve water quality and/or habitat are anticipated to reduce end of September CVP and SWP reservoir storage as compared to past conditions.</p> <p>Community development would occur in accordance with general plan projections for 2030. Restoration plans for the ongoing programs would be completed.</p> <p>Future water supply projects are anticipated to both increase water supply reliability due to reduced surface water supplies and to accommodate planned growth in the general plans.</p>
Alternative 1 with Associated Cumulative Effects Actions in Year 2030	No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant)	Implementation of Alternative 1 with future reasonably foreseeable actions would result in similar changes as under the No Action Alternative with the added actions.
Alternative 2 with Associated Cumulative Effects Actions in Year 2030	<p>Full implementation of the 2008 USFWS BO and 2009 NMFS BO CVP and SWP operational actions</p> <p>No implementation of structural improvements or other actions that require further study to develop a more detailed action description.</p>	Implementation of Alternative 2 with future reasonably foreseeable actions would result in similar changes as under the No Action Alternative with the added actions.
Alternative 3 with Associated Cumulative Effects Actions in Year 2030	<p>No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant)</p> <p>Slight increase in positive Old and Middle River flows in the winter and spring months</p>	Implementation of Alternative 3 with future reasonably foreseeable actions would result in similar changes as under the No Action Alternative with the added actions.
Alternative 4 with Associated Cumulative Effects Actions in Year 2030	No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant)	Implementation of Alternative 4 with future reasonably foreseeable actions would result in similar changes as under the No Action Alternative with the added actions.
Alternative 5 with Associated Cumulative Effects Actions in Year 20530	<p>Full implementation of the 2008 USFWS BO and 2009 NMFS BO</p> <p>Positive Old and Middle River flows and increased Delta outflow in spring months</p>	Implementation of Alternative 5 with future reasonably foreseeable actions would result in similar changes as under the No Action Alternative with added actions.

**Chapter 15****1 Recreation Resources****2 15.1 Introduction**

3 This chapter describes recreational resources in the study area; and potential  
4 changes that could occur as a result of implementing the alternatives evaluated in  
5 this Environmental Impact Statement (EIS). Implementation of the alternatives  
6 could affect recreation resources through potential changes in operation of the  
7 Central Valley Project (CVP) and State Water Project (SWP) and ecosystem  
8 restoration.

**9 15.2 Regulatory Environment and Compliance  
10 Requirements**

11 Potential actions that could be implemented under the alternatives evaluated in  
12 this EIS could affect recreational resources at reservoirs and lands served by CVP  
13 and SWP water supplies. Actions located on public agency lands; or  
14 implemented, funded, or approved by Federal and state agencies would need to be  
15 compliant with appropriate Federal and state agency policies and regulations, as  
16 summarized in Chapter 4, Approach to Environmental Analyses.

**17 15.3 Affected Environment**

18 This section describes recreational resources that could be potentially affected by  
19 the implementation of the alternatives considered in this EIS. Changes in  
20 recreation opportunities due to changes in CVP and SWP operations may occur in  
21 the Trinity River, Central Valley, San Francisco Bay Area, Central Coast, and  
22 Southern California regions. Recreational fishing in San Francisco Bay and along  
23 the Pacific Coast also may be affected by changes in CVP and SWP operations.

24 There are extensive recreational opportunities within this study area. However,  
25 the recreational opportunities that could be directly or indirectly affected through  
26 implementation of the alternatives analyzed in this EIS are related to water-related  
27 recreation activities at CVP and SWP reservoirs and in the rivers downstream of  
28 those reservoir, fishing opportunities in the Delta and the Pacific Ocean that are  
29 affected by the water flows managed by CVP and SWP operations, and bird  
30 watching, wildlife viewing, and hunting activities at wildlife refuges that use CVP  
31 water supplies. Therefore, the following description of the affected environment  
32 is limited to these recreational aspects. The wildlife refuges identified to receive  
33 CVP water supplies are shown on Figure 15.1.

1 **15.3.1 Trinity River Region**

2 The Trinity River Region includes the area along the Trinity River from Trinity  
 3 Lake to the confluence with the Klamath River; and along the lower Klamath  
 4 River from the confluence with the Trinity River to the Pacific Ocean. Major  
 5 recreational opportunities occur at Trinity Lake, Lewiston Reservoir, along the  
 6 Trinity River between Lewiston Reservoir and the confluence with the Klamath  
 7 River, and along the lower Klamath River.

8 **15.3.1.1 Trinity Lake**

9 Trinity Lake is a CVP facility on the Trinity River that is located approximately  
 10 50 miles northwest of Redding, as described in Chapter 5, Surface Water  
 11 Resources and Water Supplies. Trinity Lake is part of the Whiskeytown-Shasta-  
 12 Trinity National Recreation Area and part of the Shasta-Trinity National Forest.  
 13 Recreational facilities and activities at Trinity Lake are administered by the U.S.  
 14 Forest Service (USFS). When the water storage in the reservoir is at full capacity  
 15 (water elevation at 2370 feet mean sea level (msl), Trinity Lake has a surface area  
 16 of 17,222 acres and 147 miles of shoreline (USFS 2014).

17 Boating, windsurfing, and fishing primarily occur in the northern part of the lake  
 18 near Trinity Center. Houseboats, motorboats, water skiing primarily occur in the  
 19 southern part of the lake. There are six public boat ramps on Trinity Lake as  
 20 summarized in Table 15.1.

21 **Table 15.1 Trinity Lake Boat Ramps**

Location	Boat Ramp	Comments	Useable Elevations (feet, msl)
Trinity Lake	Bowerman	–	2,370 to 2,323
Trinity Lake	Clark Spring	–	2,370 to 2,313
Trinity Lake	Fairview	–	2,370 to 2,313
Trinity Lake	Minersville	–	2,305 to 2,170
Trinity Lake	Stuart Fork	–	2,370 to 2,338
Trinity Lake	Trinity Center	–	2,370 to 2,300

22 Source: USFS 2014

23 Three major marinas are located at Trinity Lake, as summarized in Table 15.2.  
 24 The USFS can permit up to 1,000 boat slips at the Trinity Lake marinas (USFS  
 25 2014). Many commercial houseboats are available for rent at the marinas.  
 26 Trinity Lake shoreline includes approximately 32 miles of prime houseboating  
 27 areas and 18.5 miles of secondary houseboating areas. The USFS issues permits  
 28 for houseboats and privately-owned recreational occupancy vehicles that use the  
 29 water overnight. At Trinity Lake, up to 99 permits for privately-owned vessels  
 30 and 85 permits for commercially-owned vessels may be issued each year.

1 **Table 15.2 Trinity Lake Marinas and Moorage Facilities**

Location	Marina and Moorage Facility	Number
Trinity Lake	Cedar Stock Resort & Marina	31 Commercial and 220 Private Slips, including 10 Commercial Houseboats
Trinity Lake	KOA Campground	15 Commercial and 110 Private Slips
Trinity Lake	Pinewood Cove Docks	52 Private Slips
Trinity Lake	Trinity Alps Marina	31 Commercial and 63 Private Slips, including 25 Commercial Houseboats
Trinity Lake	Trinity Center Marina	80 Private Slips

2 Source: USFS 2014

3 The Trinity Unit of the Whiskeytown-Shasta-Trinity National Recreation Area  
 4 includes many campground sites, including campgrounds for group camping  
 5 opportunities (USFS 2014), as summarized in Table 15.3. There are other  
 6 campgrounds within the upper elevations of the Trinity Lake watershed that are  
 7 not directly or indirectly affected by changes in surface water elevations.

8 **Table 15.3 Trinity Lake Major Campgrounds**

Location	Campground	Comments	Number of Campsites
Trinity Lake	Alpine View	–	53
Trinity Lake	Bushytail	–	11
Trinity Lake	Captain’s Point	Boat-In Campground	3
Trinity Lake	Clark Springs	–	21
Trinity Lake	Fawn	Group Campground	60
Trinity Lake	Hayward Flat	–	98
Trinity Lake	Jackass Springs	–	10
Trinity Lake	Mariner’s Roost	Boat-In Campground	7
Trinity Lake	Minersville	–	14
Trinity Lake	Ridgeville	Boat-In Campground	10
Trinity Lake	Ridgeville Island	Boat-In Campground	3
Trinity Lake	Stoney Creek	Group Campground	10
Trinity Lake	Stoney Point	–	15
Trinity Lake	Tannery Gulch	–	82

9 Source: USFS 2014

1 Trinity Lake recreational areas also include day use areas for picnicking,  
 2 swimming, and other recreational opportunities, as summarized in Table 15.4.  
 3 The locations for shoreline day use areas are limited due to the steep and rocky  
 4 elevations at the shorelines. To develop two swimming beaches at Trinity Lake,  
 5 the rocky shorelines were covered with sand and/or decomposed granite at a  
 6 specific elevation. Uses of these locations are less desirable when the water  
 7 elevations decline.

8 **Table 15.4 Trinity Lake Major Day Use Areas**

Location	Day Use Area	Comments	Number
Trinity Lake	Clark Springs Day Use and Beach	Picnic and Swimming	34 picnic sites
Trinity Lake	North Shore Vista	Vistas and Interpretative Site	–
Trinity Lake	Osprey Info Site	Vistas and Interpretative Site	–
Trinity Lake	Stoney Creek	Picnic and Swimming	4 picnic sites
Trinity Lake	Tanbark Picnic	Picnic and Swimming	8 picnic sites
Trinity Lake	Trail of Trees	Interpretative Trail at Tannery Gulch Campground	0.5 miles
Trinity Lake	Trinity Lakeshore Trail	Trail	4 miles
Trinity Lake	Trinity Vista	Vistas and Interpretative Site	–

9 Source: USFS 2014

10 Trinity Lake fishing opportunities include Smallmouth Bass, Largemouth Bass,  
 11 Rainbow Trout, Brown Trout, Chinook Salmon, and Kokanee Salmon (USFS  
 12 2014). White Catfish, Brown Bullhead, Green Sunfish, Bluegill, Klamath  
 13 Smallscale Sucker, and Pacific Lamprey also are present but are not generally  
 14 considered as part of the recreational fishing opportunities. Wildlife viewing  
 15 opportunities extend throughout the Trinity Lake area, including viewing of Bald  
 16 Eagles, Black-tailed Deer, Black Bear, Gray Squirrel, rabbit, turkey, and  
 17 California Quail.

18 **15.3.1.2 Lewiston Reservoir**

19 Lewiston Reservoir is a CVP facility on the Trinity River that is located  
 20 immediately downstream of the Trinity Dam, as described in Chapter 5, Surface  
 21 Water Resources and Water Supplies. Lewiston Reservoir is part of the  
 22 Whiskeytown-Shasta-Trinity National Recreation Area and part of the Shasta-  
 23 Trinity National Forest. Recreational facilities and activities are administered by  
 24 the USFS. When the water storage in the reservoir is at full capacity (water

1 elevation at 1,874 feet msl), the reservoir has a surface area of 759 acres and  
 2 15 miles of shoreline (USFS 2014).  
 3 The water elevation is generally stable in Lewiston Reservoir because it is used as  
 4 regulating reservoir for releases to downstream uses. Water is diverted from the  
 5 lower outlets in Trinity Lake to Lewiston Reservoir to provide cold water to  
 6 Trinity River and Whiskeytown Lake. Therefore, recreational opportunities in  
 7 Lewiston Reservoir include boating and fishing; however, there are fewer  
 8 opportunities for swimming and water skiing. Lewiston Reservoir does not  
 9 support houseboats. There is one primary boat ramp and two marinas in Lewiston  
 10 Reservoir, as summarized in Tables 15.5 and 15.6.

11 **Table 15.5 Lewiston Reservoir Boat Ramps**

Location	Boat Ramp	Comments	Useable Elevations (feet, msl)
Lewiston Lake	Pine Cove	Open all year	Around 1870

12 Source: USFS 2014

13 **Table 15.6 Lewiston Lake Marinas and Moorage Facilities**

Location	Marina and Moorage Facility	Number
Lewiston Lake	Lakeview Terrace Docks	14 Commercial and 7 Private Slips
Lewiston Lake	Pine Cove Marina	20 Commercial and 34 Private Slips

14 Source: USFS 2014

15 The Whiskeytown-Shasta-Trinity National Recreation Area includes campground  
 16 sites near the Lewiston Reservoir shoreline, including campgrounds for group  
 17 camping opportunities (USFS 2014), as summarized in Table 15.7. Lewiston  
 18 Reservoir recreational areas also include day use areas for picnicking, swimming,  
 19 and other recreational opportunities, as summarized in Table 15.8. Because the  
 20 water surface elevations are more stable in Lewiston Reservoir than Trinity Lake,  
 21 the day use areas have more vegetation along the shoreline.

22 **Table 15.7 Lewiston Lake Major Campgrounds**

Location	Campground	Comments	Number of Campsites
Lewiston Lake	Ackerman	–	51
Lewiston Lake	Cooper Gulch	–	5
Lewiston Lake	Mary Smith	–	17
Lewiston Lake	Tunnel Rock	–	6

23 Source: USFS 2014

1 **Table 15.8 Lewiston Major Lake Day Use Areas**

Location	Day Use Area	Comments	Number
Lewiston Lake	Baker Gulch Trail	Trail	0,2 miles
Lewiston Lake	Lewiston Vista	Vistas and Interpretative Site	–
Lewiston Lake	North Lakeshore Trail	Trail	2 miles
Lewiston Lake	Pine Cove	Picnic	2 picnic sites
Lewiston Lake	South Lakeshore Trail	Trail	1 mile

2 Source: USFS 2014

3 Lewiston Reservoir fishing opportunities include Smallmouth Bass, Rainbow  
4 Trout, Brown Trout, Three-spine Stickleback, Golden Shiner, and Kokanee  
5 Salmon (USFS 2014). Klamath Smallscale Sucker, and Pacific Lamprey also are  
6 present but are not generally considered as part of the recreational fishing  
7 opportunities. Wildlife viewing opportunities extend throughout the Lewiston  
8 Reservoir area, including viewing of Bald Eagles, Black-tailed Deer, River Otter,  
9 ring-tailed cats, raccoon, and California Quail. Waterfowl use Lewiston  
10 Reservoir throughout the year with increased populations in the winter.

### 11 **15.3.1.3 Trinity River from Lewiston Dam to the Klamath River**

12 The Trinity River flows approximately 112 miles from Lewiston Dam to the  
13 Klamath River (NCRWQCB et al. 2009) through Trinity, Humboldt, and Del  
14 Norte counties.

15 The first mile of the river below the Lewiston Dam is located within the  
16 Whiskeytown-Shasta-Trinity National Recreation Area. Portions of the Trinity  
17 River downstream of Lewiston Dam and Junction City to the confluence with  
18 North Fork Trinity River are under the jurisdiction of the Department of the  
19 Interior, Bureau of Land Management (BLM) (USFWS et al. 1999). Between the  
20 confluence with the North Fork Trinity River and the confluence of New River,  
21 the area along the Trinity River is located within the USFS Shasta-Trinity  
22 National Forest. Between the confluence with the New River and the Hoopa  
23 Indian Reservation, most of the area along the Trinity River is located within the  
24 USFS Six Rivers National Forest. The remaining portions of the Trinity River to  
25 the confluence with the Klamath River are located within the Hoopa Indian  
26 Reservation.

27 On January 19, 1981, the Secretary of the Interior designated the Trinity River  
28 starting 100 yards downstream of the Lewiston Dam to the confluence with the  
29 Klamath River as part of the National Wild and Scenic Rivers System. The  
30 designation also included portions of the South Fork, North Fork, and New River  
31 (BLM et al 2012). However, because the flows in the South Fork, North Fork,  
32 and New River are not affected by the alternatives considered in this EIS, these  
33 rivers are not evaluated in this EIS.

1 There are approximately 35 developed recreation sites and more than 200 access  
 2 points along the Trinity River corridor within a half mile of the river, and  
 3 numerous river access sites between Lewiston Dam and Weitchpec (NCRWQCB  
 4 et al. 2009; USFWS et al. 1999).

5 Recreation occurs year-round in the Trinity River area. Water-related activities  
 6 include boating, kayaking, canoeing, whitewater rafting, inner tubing, fishing,  
 7 swimming, wading, gold panning, camping, and picnicking (NCRWQCB et al.  
 8 2009). Fishing opportunities include steelhead, Rainbow Trout, Brown Trout, and  
 9 Chinook Salmon.

#### 10 **15.3.1.4 Lower Klamath River from Trinity River Confluence to the** 11 **Pacific Ocean**

12 The Klamath River continues for 43.5 miles from the Trinity River confluence to  
 13 the Pacific Ocean (NCRWQCB et al. 2009).

14 Downstream of the Trinity River, the Klamath River flows through the Hoopa  
 15 Indian Reservation, Yurok Indian Reservation, and Resighini Indian Reservation  
 16 as well as lands owned by local agencies and private entities (DOI and DFG  
 17 2012). Near the confluence with the Pacific Ocean, the Klamath River flows  
 18 through the Redwood National Park. These reaches are primarily within  
 19 Humboldt and Del Norte counties.

20 The portion of the Klamath River from the confluence with the Trinity River to  
 21 the Pacific Ocean is part of the Klamath River designated by the Secretary of the  
 22 Interior to be part of the National Wild and Scenic Rivers System on January 19,  
 23 1981. The State of California also designated this reach of Klamath River as wild  
 24 and scenic under Public Resources Code sections 5093.54 and 5093.545.

25 Recreation along the Klamath River downstream of the Trinity River is limited  
 26 (DOI and DFG 2012). Canoeing, kayaking, and whitewater boating occurs along  
 27 this reach. Whitewater rafting generally requires a minimum flow of 1,800 cfs in  
 28 this portion of the Klamath River. Four campgrounds, picnic areas, and water  
 29 access at public lands are located along the Klamath River near the confluence  
 30 with the Pacific Ocean. Fishing opportunities in the lower Klamath River are  
 31 primarily related to Chinook Salmon. Del Norte County operates two public boat  
 32 ramps along the Klamath River. The Redwood National and State Parks operate  
 33 Lagoon Creek near the confluence of the Klamath River and the Pacific Ocean  
 34 (RNSP 2013; Del Norte County 2003). There are other trails near the Pacific  
 35 Ocean, including the California Coastal Trail which is generally located along the  
 36 northern and eastern banks of the Klamath River at the Pacific Ocean (California  
 37 Coastal Trail 2014).

#### 38 **15.3.2 Central Valley Region**

39 The Central Valley Region extends from above Shasta Lake to the Tehachapi  
 40 Mountains, and includes the Sacramento Valley, San Joaquin Valley, Delta, and  
 41 Suisun Marsh.

1 **15.3.2.1 Sacramento Valley**

2 Recreational opportunities in the Sacramento Valley upstream of the Delta that  
 3 are influenced by CVP and SWP operations occur at Shasta Lake, Keswick  
 4 Reservoir, Whiskeytown Lake, Clear Creek, Sacramento River between Keswick  
 5 Dam and the Delta, Lake Oroville and Thermalito Afterbay, Yuba River from  
 6 between New Bullards Bar and Feather River, Bear River between Camp Far  
 7 West Reservoir and Feather River, Feather River between Thermalito Dam and  
 8 the Sacramento River, Folsom Lake and Lake Natoma, American River between  
 9 Nimbus Dam and the Sacramento River, and refuges that use CVP water supplies.

10 **15.3.2.1.1 Shasta Lake**

11 Shasta Lake is a CVP facility on the Sacramento River that is located near  
 12 Redding, as described in Chapter 5, Surface Water Resources and Water Supplies.  
 13 Shasta Lake is part of the Whiskeytown-Shasta-Trinity National Recreation Area  
 14 and part of the Shasta-Trinity National Forest. Recreational facilities and  
 15 activities at Shasta Lake are administered by the USFS. When the water storage  
 16 in the lake is at full capacity (water elevation at 1067 feet msl), Shasta Lake has a  
 17 surface area of approximately 30,000 acres and 365 miles of shoreline  
 18 (Reclamation 2013a; USFS 2014).

19 Boating, water skiing, other water sports, and fishing occur in many locations in  
 20 the lake. Many types of boats are used, including fishing boats, deck boats,  
 21 houseboats, cabin cruisers, pontoon boats, personal watercraft, runabouts, and ski  
 22 boats (Reclamation 2013a; USFS 2014). There are seven public boat ramps on  
 23 Shasta Lake, as summarized in Table 15.9.

24 **Table 15.9 Shasta Lake Boat Ramps**

Location	Boat Ramp	Comments	Useable Elevations (feet, msl)
Shasta Lake	Antlers	–	1,067 to 992
Shasta Lake	Bailey Cove	–	1,067 to 1,017
Shasta Lake	Centimudi	–	1,067 to 857
Shasta Lake	Hirz Bay	–	1,067 to 972
Shasta Lake	Jones Valley	–	1,067 to 857
Shasta Lake	Packers Bay	–	1,067 to 952
Shasta Lake	Sugar Loaf	–	992 to 907

25 Source: USFS 2014

26 A boating safety issue that arises with fluctuations in water level is the associated  
 27 fluctuation of the pattern of submerged obstacles. When the water level  
 28 decreases, many rocks, shoals, and islands are much closer to the water surface,  
 29 and can be easily struck by boats. When the water level rises, debris and  
 30 obstacles that were previously easily visible may be dangerously out of sight and  
 31 struck by boats (Reclamation 2013a).

1 Nine major marinas are located at Shasta Lake, as summarized in Table 15.10.  
 2 The USFS can permit up to 3,000 boat slips at the Shasta Lake marinas (USFS  
 3 2014). Many commercial houseboats are available for rent at the marinas. Shasta  
 4 Lake shoreline includes approximately 109 miles of prime houseboating areas and  
 5 153 miles of secondary houseboating areas. The USFS issues permits for  
 6 houseboats and privately-owned recreational occupancy vehicles that use the  
 7 water overnight. At Shasta Lake, up to 613 permits for privately-owned vessels  
 8 and 450 permits for commercially-owned vessels may be issued each year.

9 **Table 15.10 Shasta Lake Marinas and Moorage Facilities**

Location	Marina and Moorage Facility	Number
Shasta Lake	Antlers Resort and Marina	101 Commercial and 200 Private Slips, including 35 Commercial Houseboats
Shasta Lake	Bridge Bay Resort	140 Commercial and 7,773 Private Slips, including 92 Commercial Houseboats
Shasta Lake	Digger Bay Marina	75 Commercial and 145 Private Slips, including 50 Commercial Houseboats
Shasta Lake	Holiday Harbor	95 Commercial and 330 Private Slips, including 70 Commercial Houseboats
Shasta Lake	Jones Valley Marina	90 Commercial and 99 Private Slips, including 64 Commercial Houseboats
Shasta Lake	Packers Bay Marina	51 Commercial Slips, including 26 Commercial Houseboats
Shasta Lake	Shasta Lake RV Resort	22 Private Slips
Shasta Lake	Shasta Marina	54 Commercial and 139 Private Slips, including 24 Commercial Houseboats
Shasta Lake	Silverthorn Resort Marina	59 Commercial and 113 Private Slips, including 35 Commercial Houseboats
Shasta Lake	Sugarloaf Cottages	16 Private Slips
Shasta Lake	Sugarloaf Marina	41 Commercial and 40 Private Slips, including 21 Commercial Houseboats
Shasta Lake	Tsardi Resort	30 Private Slips

10 Source: USFS 2014

1 The Shasta Unit of the Whiskeytown-Shasta-Trinity National Recreation Area  
 2 includes many campground sites, including campgrounds for group camping  
 3 opportunities (USFS 2014), as summarized in Table 15.11. There are other  
 4 campgrounds within the upper elevations of the Shasta Lake watershed that are  
 5 not directly or indirectly affected by changes in surface water elevations.  
 6 Campers are also affected by declining water elevations because this increases the  
 7 distance from the campsites to the shoreline. Drawdown of the reservoir has an  
 8 aesthetic effect on users because the land exposed during drawdown is generally  
 9 composed of bare earth and rock.

10 **Table 15.11 Shasta Lake Major Campgrounds**

Location	Campground	Comments	Number of Campsites
Shasta Lake	Antlers	–	59
Shasta Lake	Arbuckle Flat	Boat-In Campground	11
Shasta Lake	Beehive	Shoreline Campground	No specified number
Shasta Lake	Bailey Cove	–	7
Shasta Lake	Dekkas Rock	Group Campground	60
Shasta Lake	Ellery Creek	–	19
Shasta Lake	Gooseneck Cove	Boat-In Campground	8
Shasta Lake	Green's Creek	Boat-In Campground	9
Shasta Lake	Gregory Creek	Shoreline Campground	18
Shasta Lake	Hirz Bay	Individual and Group Campground	48 Individual Sites and 200 Group Sites
Shasta Lake	Jones Valley (Upper & Lower)	Includes Shoreline Campground at Inlet	21
Shasta Lake	Lakeshore East	–	26
Shasta Lake	Lower Salt Creek	Shoreline Campground	No specified number
Shasta Lake	Mariners Point	Shoreline Campground	No specified number
Shasta Lake	McCloud Bridge	–	14
Shasta Lake	Moore Creek	Individual and Group Campground	12 Individual Sites and 90 Group Sites
Shasta Lake	Nelson Point	Individual and Group Campground	8 Individual Sites and 60 Group Sites
Shasta Lake	Oak Grove	–	45
Shasta Lake	Pine Point	Individual and Group Campground	14 Individual Sites and 100 Group Sites
Shasta Lake	Ski Island	Boat-In Campground	23

11 Source: USFS 2014

1 Shasta Lake recreational areas also include day use areas for picnicking,  
 2 swimming, and other recreational opportunities, as summarized in Table 15.12.  
 3 The locations for shoreline day use areas are limited due to the steep and rocky  
 4 elevations at the shorelines. Uses of these locations are less desirable when the  
 5 water elevations decline.

6 **Table 15.12 Shasta Lake Day Use Areas**

Location	Day Use Area	Comments	Number
Shasta Lake	Bailey Cove	Picnic and Trail	9 picnic sites 3.1 miles
Shasta Lake	Clikapudi	Trail	8 miles with 1 mile advanced trail
Shasta Lake	Dekkas Rock	Picnic	5 picnic sites
Shasta Lake	Dry Fork Creek	Trail	4.7 miles
Shasta Lake	Fisherman's Point	Picnic and Trail	7 picnic sites 0.5 miles
Shasta Lake	Hirz Bay	Trail	1.6 miles
Shasta Lake	McCloud Bridge	Picnic	5 picnic sites
Shasta Lake	Packers Bay	Trail	Four Trails: 0.4 to 2.8 miles
Shasta Lake	Potem Falls	Trail	0.3 miles
Shasta Lake	Samwel Cave Nature Trail	Interpretative Trail	1 mile
Shasta Lake	Sugarloaf	Trail	1 mile

7 Source: USFS 2014

8 Additional recreational opportunities are provided at the Shasta Dam Visitors  
 9 Center.

10 Fishing is also popular at Shasta Lake, performed mostly by boat as opposed to  
 11 from the shoreline. Anglers can catch warmwater and coldwater fish species  
 12 year-round due to the summer stratification of the lake into a warm layer above a  
 13 coldwater pool (Reclamation 2013a). Shasta Lake warm water fishing  
 14 opportunities include Black Bass, Smallmouth Bass, Largemouth Bass, Spotted  
 15 Bass, Black Crappie, Channel Catfish, and Bluegill (USFS 2014). There are  
 16 many bass tournaments at Shasta Lake each summer. The cooler water strata  
 17 supports fishing for Rainbow Trout and Chinook Salmon.

18 **15.3.2.1.2 Keswick Reservoir**

19 Keswick Reservoir is a CVP afterbay that extends 9 miles along the Sacramento  
 20 River from Shasta Dam to Keswick Dam, as described in Chapter 5, Surface  
 21 Water Resources and Water Supplies. Recreational facilities and activities at  
 22 Keswick Reservoir are administered by BLM, Shasta County, and U.S. Forest  
 23 Service for the Department of the Interior, Bureau of Reclamation (Reclamation).  
 24 The maximum water storage elevation at the top of the Keswick Dam spillway is

1 587 feet msl (Reclamation 2009). The water level fluctuates frequently in  
2 Keswick Reservoir, depending on the operations of Shasta Dam.

3 Water-related activities include boating, fishing, and water sports. The Keswick  
4 Boat Launch, operated by BLM, is located on the western shoreline at the south  
5 end of the reservoir (BLM 2005).

6 There are several trails along Keswick Reservoir and areas for off highway  
7 vehicles (OHVs) with camping allowed at one of the locations (BLM 2005; BLM  
8 2011). The Sacramento Rail Trail extends from Moccasin Creek below Shasta  
9 Dam to Redding along the western shoreline of Keswick Reservoir and the  
10 Sacramento River downstream of Keswick Dam. The Fisherman Trail extends  
11 along the shoreline from the lower Sacramento Rail Trail to Keswick Dam. The  
12 F.B. Trail extends from the Ribbon Bridge downstream of the Keswick Dam to  
13 Walker Mine Road along the eastern side of the Keswick Reservoir. There are  
14 several other trails at higher elevations above Keswick Reservoir, including the  
15 Hornbeck Tail, Upper and Lower Sacramento Ditch Trails, Flanagan Trail, and  
16 Chamise Peak Trail.

17 The Chappie-Shasta OHV Area provides over 200 miles of roads in  
18 approximately 52,000 acres (Reclamation 2013a). The area is accessed at two  
19 staging areas. The Chappie-Shasta OHV Staging Area and Shasta Campground  
20 includes a staging area for day use activities, including picnics, and 22 campsites  
21 (BLM 2005). This site is located along the western shoreline of Keswick  
22 Reservoir at the trailhead of the Sacramento Rail Trail at Moccasin Creek. The  
23 Copley Mountain OHV Staging Area is located along the western shoreline of  
24 Keswick Reservoir about midway between Shasta and Keswick dams. This site  
25 also provides a staging area for day use activities, including picnics.

26 Fishing opportunities are primarily for German Brown Trout and Rainbow Trout.

### 27 **15.3.2.1.3 Whiskeytown Lake**

28 Whiskeytown Lake is a CVP facility on Clear Creek that is located approximately  
29 8 miles west of Redding on the eastern slope of the Coast Range, as described in  
30 Chapter 5, Surface Water Resources and Water Supplies. Whiskeytown Lake is  
31 part of the Whiskeytown-Shasta-Trinity National Recreation Area. Recreational  
32 facilities and activities administered by the National Park Service (NPS). When  
33 the water storage in the reservoir is at full capacity (water elevation at  
34 1210 feet msl), Whiskeytown Lake has a surface area of 3,250 acres and 36 miles  
35 of shoreline (Reclamation 1997).

36 Boating, water skiing, sailing, kayaking, and canoeing, swimming, and fishing  
37 occur in many locations in the lake. Boat launches are available at Oak Bottom,  
38 Brandy Creek, and Whiskey Creek and at marinas at Oak Bottom and Brandy  
39 Creek (NPS 2012), as summarized in Table 15.13.

1 **Table 15.13 Whiskeytown Lake Boat Ramps**

Location	Boat Ramp	Comments	Useable Elevations (feet, msl)
Whiskeytown Lake	Brandy Creek	–	1210 to 1190
Whiskeytown Lake	Oak Bottom	–	1210 to 1195
Whiskeytown Lake	Oak Bottom Marina	–	1210 to 1198
Whiskeytown Lake	Whiskey Creek	–	1210 to 1195

2 Sources: NPS 2012; Reclamation 1997

3 The lake level is relatively stable and do not reduce the ability for boat launching  
 4 until late summer or early fall.

5 The Whiskeytown Unit of the Whiskeytown-Shasta-Trinity National Recreation  
 6 Area includes many campground sites, including campgrounds for group camping  
 7 opportunities (NPS 2012), as summarized in Table 15.14.

8 **Table 15.14 Whiskeytown Lake Major Campgrounds**

Location	Campground	Comments	Number of Campsites
Whiskeytown Lake	Brandy Creek RV	–	37 RV Sites
Whiskeytown Lake	Brandy Creek	Primitive Campground	2 Sites
Whiskeytown Lake	Coggins Park	Primitive Campground	1 Site
Whiskeytown Lake	Crystal Creek	Primitive Campground near Crystal Creek	2 Sites
Whiskeytown Lake	Dry Creek	Group Campground	100 people
Whiskeytown Lake	Horse Camp	Primitive Campground	2 Sites
Whiskeytown Lake	Oak Bottom Tent and Recreation Vehicle (RV)	–	98 Tent Sites and 22 RV Sites
Whiskeytown Lake	Peltier Bridge	Primitive Campground near Clear Creek	9 Sites
Whiskeytown Lake	Sheep Camp	Primitive Campground	4 Sites

9 Source: NPS 2012

1 Whiskeytown Lake recreational areas also include day use areas for picnicking,  
 2 swimming, and other recreational opportunities, as summarized in Table 15.15.  
 3 Shoreline day use areas are limited at some locations due to the steep and rocky  
 4 elevations at the shorelines.

5 **Table 15.15 Whiskeytown Lake Day Use Areas**

Location	Day Use Area	Comments	Number
Whiskeytown Lake	Boulder Creek Falls	Trail	1 mile with 2.75-mile advanced trail
Whiskeytown Lake	Brandy Creek Beach and Falls	Picnic, Swimming, and Trails	1.6 and 1.5 miles
Whiskeytown Lake	Buck Hollow	Trail	1 mile
Whiskeytown Lake	Camden Water Ditch	Trail	1.1 miles
Whiskeytown Lake	Clear Creek Canal and Vista	Picnic and Trails	2.4 and 4.5 miles
Whiskeytown Lake	Crystal Creek Water Ditch and Falls	Picnic and Trails	0.75 and 0.3 miles
Whiskeytown Lake	Davis Gulch	Trail	3.3 miles
Whiskeytown Lake	East Beach	Swimming	–
Whiskeytown Lake	Guardian Rock	Trail	0.25 miles
Whiskeytown Lake	James K. Carr Trail	Trail	1.7 miles
Whiskeytown Lake	Judge Francis Carr Powerhouse	Picnic	–
Whiskeytown Lake	Kanaka Peak	Trail	3.6 miles
Whiskeytown Lake	Logging Camp	Trail	1 mile
Whiskeytown Lake	Mill Creek	Trail	6.1 miles
Whiskeytown Lake	Mt. Shasta Mine	Trail	3.5 miles
Whiskeytown Lake	Mule Mountain Pass	Trail	4.4 miles
Whiskeytown Lake	Oak Bottom Beach	Picnic and Swimming	–
Whiskeytown Lake	Oak Bottom Ditch	Trail	2.75 miles
Whiskeytown Lake	Papoose Pass	Trail	5.5 miles
Whiskeytown Lake	Peltier	Trail	1.75 miles
Whiskeytown Lake	Rich Gulch	Trail	1.8 miles
Whiskeytown Lake	Salt Creek	Trail	1.8 miles
Whiskeytown Lake	Salt Gulch	Trail	1.6 miles
Whiskeytown Lake	Shasta Divide Nature Trail	Trail	0.4 miles
Whiskeytown Lake	Whiskey Creek	Group Picnic Area and Swimming	–

6 Source: NPS 2012

1 Additional recreational opportunities are provided at the Whiskeytown Visitors  
2 Center.

3 Fishing opportunities at Whiskeytown Lake include Brown Trout and Rainbow  
4 Trout; Kokanee Salmon; Smallmouth Bass, Largemouth Bass, and Spotted Bass;  
5 Bluegill; crappie; and Sacramento Pikeminnow (NPS No Date).

#### 6 **15.3.2.1.4 Clear Creek from Whiskeytown Dam to the Sacramento River**

7 Whiskeytown Lake is operated to release most of the water through the Spring  
8 Creek Power Conduit into Keswick Reservoir, as described in Chapter 5, Surface  
9 Water Resources and Water Supplies. Flows are also released from Whiskeytown  
10 Lake to Clear Creek to be consistent with federal and state requirements. During  
11 high flow events, additional flows may be released into Clear Creek.

12 The initial reaches of Clear Creek downstream of the Whiskeytown Dam are  
13 located within the Whiskeytown-Shasta-Trinity National Recreation Area. The  
14 remaining portions of Clear Creek flow to the Sacramento River through lands  
15 owned by BLM and private owners. All of these reaches are located within  
16 Shasta County and the most eastern reaches are within the City of Redding.

17 BLM has established the Clear Creek Greenway along a large portion of the lower  
18 Clear Creek from within the Whiskeytown-Shasta-Trinity National Recreation  
19 Area to the Sacramento River (BLM n.d.). The area also includes the Horsetown-  
20 Clear Creek Preserve which is a private-public partnership recreation area.

21 Hiking, picnicking, kayaking, swimming, fishing, and gold panning occur along  
22 the lower Clear Creek (SRWP 2010). The Clear Creek Greenway includes ten  
23 trails and eight picnic areas (BLM n.d.). Hunting is allowed in the Swasey and  
24 Muletown Road areas of the Clear Creek Greenway. Fishing opportunities  
25 include steelhead, Chinook Salmon, carp, suckers, Bluegill, bass, and Sacramento  
26 Pikeminnow (SRWP 2010).

#### 27 **15.3.2.1.5 Sacramento River from Keswick Dam to the Delta**

28 The Sacramento River from Keswick Dam to the Sacramento-San Joaquin Delta  
29 (Delta) is divided into three reaches for discussion in this section: Keswick  
30 Reservoir to Red Bluff, Red Bluff to the Feather River, and Feather River  
31 confluence to the Delta (near the City of West Sacramento).

##### 32 *Sacramento River from Keswick Dam to Red Bluff*

33 The upper reach of the Sacramento River flows for approximately 60 miles from  
34 Keswick Dam to Red Bluff (Reclamation 1997). Water-related recreational  
35 activities include boating, picnicking, camping, and wildlife viewing. Boating  
36 opportunities include motor-boating, jet-skiing, kayaking, canoeing, and  
37 whitewater rafting in some locations (Reclamation 2013a, Reclamation et al.  
38 2002). River flows can increase for short-term periods when water is being  
39 released from the CVP facilities and during and following storm events in the  
40 upper Sacramento River watershed. Flows in the late fall months may decrease to  
41 levels that are not favorable for boating. Water temperatures in this reach are  
42 generally cold throughout the year.

1 Much of the land along the Sacramento River between Balls Ferry and Red Bluff  
2 is owned and managed by BLM (Reclamation 2013a). Public access points are  
3 provided by the cities of Redding and Anderson and the BLM. Lake Redding  
4 Park, Turtle Bay, and the Anderson River Park are some of the prominent access  
5 areas. Boat launching can occur at eight public boat ramps and two smaller  
6 launch facilities, including at Turtle Bay, Caldwell Park, and South Bonneyview  
7 in the City of Redding; Ball Ferry; Battle Creek confluence with the Sacramento  
8 River; Bend Bridge; and Red Bluff River Park in the City of Red Bluff.

9 There are two whitewater river reaches, including between Keswick Dam and the  
10 Anderson-Cottonwood Irrigation District Diversion Dam and between Anderson  
11 River Park and William B. Ide Adobe State Historic Park.

12 Camping facilities include public campgrounds along the Sacramento River at  
13 Lake Red Bluff Recreation Area (Reclamation 2013a).

14 There are trails or trail access and picnicking facilities with access to the river in  
15 this reach of the Sacramento River (Reclamation 2013a). The trails include the  
16 13-mile Sacramento River Trail between Keswick Dam to Turtle Bay Park in the  
17 City of Redding. Many of the picnicking locations are managed by local  
18 municipalities, including the cities of Redding, Anderson, and Red Bluff.  
19 Coleman National Fish Hatchery, located along Battle Creek near the Sacramento  
20 River, provides recreational and educational opportunities.

21 Fishing opportunities along the upper Sacramento River include Chinook Salmon,  
22 steelhead, Rainbow Trout, sunfish, and bass (Reclamation 2013a). Fishing can  
23 occur from boats along the Sacramento River and at four public fishing access  
24 points, including Turtle Bay East, Kapusta Property, Deschutes Road, Reading  
25 Island, Diestlehorst Pasture River Access, Jellys Ferry, and Sacramento River  
26 Island.

27 The Mouth of Cottonwood Creek Wildlife Area is operated by California  
28 Department of Fish and Wildlife (DFW). This area provides viewing  
29 opportunities for Swainson's Hawk, Bald Eagle, ringtail cat, River Otter, and  
30 other birds and wildlife (Reclamation 2013a). Hunting opportunities on BLM  
31 land occur at Inks Creek, Massacre Flat, Perry Rifle, Paynes Creek, Bald Hill and  
32 Iron Canyon. Commonly hunted game includes quail, dove, waterfowl, deer, pig,  
33 turkey, and bear (Reclamation 2013a).

#### 34 *Sacramento River from Red Bluff to Feather River*

35 The middle reach of the Sacramento River flows approximately 160 miles from  
36 Red Bluff to the confluence with the Feather River (Reclamation 1997).

37 Water-dependent activities along the middle reach include boating, swimming,  
38 and fishing (Reclamation 2005a). Water-contact activities are popular in this  
39 section of the river due to relatively warm water. Public access points are  
40 provided along this reach by California Department of Parks and Receptions  
41 (State Parks); and Tehama, Glenn, Colusa, and Sutter counties (Reclamation  
42 2005a; Reclamation 1997). River access in this reach is primarily provided at  
43 private fishing access points, marinas, and resorts.

1 The three major State Parks properties along the middle reach include the  
 2 Woodson Bridge State Recreation Area, the Bidwell-Sacramento River State  
 3 Park, and the Colusa-Sacramento River State Recreation area (DFG 2004;  
 4 Reclamation 2013a). Public access for fishing, hunting, and wildlife viewing also  
 5 is provided at the DFW Fremont Weir Wildlife Area (DFW 2014a).

6 Fishing opportunities include Chinook Salmon, steelhead, trout, American Shad,  
 7 sturgeon, catfish, and Striped Bass (Reclamation 2005a).

8 Seasonal game includes Ring-necked Pheasants, California Quail, various species  
 9 of ducks and geese, Mourning Doves, and Mule Deer (Reclamation 2013a).

#### 10 *Sacramento River from Feather River to the Northern Delta Boundary*

11 The lower reach of the Sacramento River flows for approximately 20 river miles  
 12 between the confluence with Feather River and immediately downstream of the  
 13 confluence with the American River (USACE 1991). The major portion of this  
 14 reach of the Sacramento River flows along private property.

15 Water-related activities in this reach include boating, swimming and beach use,  
 16 picnicking, biking, sightseeing, and fishing. Public access is provided by Yolo  
 17 County at Elkhorn Regional Park (Yolo County ); Sacramento County and the  
 18 City of Sacramento at Discovery Park and Miller Park, respectively (Sacramento  
 19 County 2012; Reclamation 2005a); and by the City of West Sacramento at  
 20 Broderick Boat Ramp (West Sacramento 2000).

21 Fishing opportunities in this area include Chinook Salmon, steelhead, American  
 22 Shad, sturgeon, catfish, and Striped Bass (Reclamation 1997, 2005a).

#### 23 **15.3.2.1.6 Sacramento Valley Wildlife Refuges**

24 Wildlife refuges in the Sacramento Valley that rely upon CVP water supplies  
 25 include the Sacramento National Wildlife Refuge (NWR) Complex include  
 26 Sacramento, Delevan, Colusa, and Sutter NWRs and Gray Lodge Wildlife Area,  
 27 as described in Chapter 5, Surface Water Resources and Water Supplies, and  
 28 Chapter 10, Terrestrial Biological Resources (Reclamation 2012). Water-related  
 29 activities include wildlife viewing, hiking along the refuge wetlands, and  
 30 waterfowl hunting. Shoreline fishing opportunities at Gray Lodge Wildlife Area  
 31 include bass, sunfish, perch, catfish, and carp (DFW 2014b)

#### 32 **15.3.2.1.7 Feather River Watershed**

33 Antelope Lake, Lake Davis, and Frenchman Lake located in the Upper Feather  
 34 River; Lake Oroville and Thermalito Forebay and Afterbay; and the lower Feather  
 35 River are located within areas in the Feather River watershed that could be  
 36 affected by changes in CVP and/or SWP operations.

#### 37 *Upper Feather River Lakes*

38 The Upper Feather River Lakes, including Antelope Lake, Lake Davis, and  
 39 Frenchman Lake, are SWP facilities on the upper Feather River upstream of Lake  
 40 Oroville. These lakes are part of the Plumas National Forest (DWR 2013a).

1 Recreational facilities and activities at all three lakes are managed by private  
2 concessionaires under contract with the Plumas National Forest.

3 For Antelope Lake, when the water storage in the lake is at full capacity (water  
4 elevation at 5,002 feet), the lake has a surface area of 930 acres and 15 miles of  
5 shoreline (DWR 2013a; USFS 2011). Water related activities include boating,  
6 water skiing, swimming, fishing, camping, and picnicking. There is a boat  
7 launching ramp, three fishing access sites, and a picnic area. There are three  
8 campgrounds at Antelope Lake, including Boulder Creek, Lone Rock, and Long  
9 Point. There are approximately 194 campsites and 4 group campsites at the three  
10 campgrounds for use between May through October. Fishing opportunities in  
11 Antelope Lake include Rainbow Trout, Brook Trout, crappie, Channel Catfish,  
12 and Smallmouth Bass, Largemouth Bass. Hunting opportunities around Antelope  
13 Lake include Mule Deer and Black-tailed Deer.

14 For Lake Davis, when the water storage in the lake is at full capacity (water  
15 elevation at 5,785 feet), the lake has a surface area of 4,030 acres and 32 miles of  
16 shoreline (DWR 2013a; USFS 2006a). Water related activities include boating,  
17 fishing, camping, and picnicking. There are boat launching ramps at Lightning  
18 and Honker Cove, car-top boat ramp at Mallard Cove, a fishing access site, and a  
19 picnic area. There are three campgrounds at Lake Davis, including Grizzly,  
20 Grasshopper, and Lightning Tree. There are approximately 180 campsites at the  
21 three campgrounds for use between May through October. Fishing opportunities  
22 in Lake Davis include Rainbow Trout, German Brown Trout, Eagle Lake trout,  
23 Brown Bullhead, and Largemouth Bass. Hunting opportunities around Lake  
24 Davis include Mule Deer and Black-tailed Deer.

25 For Frenchman Lake, when the water storage in the lake is at full capacity (water  
26 elevation at 5,588 feet), the lake has a surface area of 1,580 acres and 21 miles of  
27 shoreline (DWR 2013a; USFS 2006b). Water related activities include boating,  
28 water skiing, swimming, fishing, camping, picnicking, and ice fishing. There are  
29 two boat launching ramps (Frenchman and Lunker Point), six fishing access sites,  
30 and a picnic area. There are five campgrounds at Frenchman Lake, including  
31 Chilcoot, Cottonwood Springs, Frenchman, Spring Creek, and Big Cove. There  
32 are approximately 209 campsites and 2 group campsites at the five campgrounds  
33 for use between May through October. Fishing opportunities in Frenchman Lake  
34 include Rainbow Trout, Brown Trout, Eagle Lake trout, and Smallmouth Bass.  
35 Hunting opportunities around Frenchman Lake include deer and waterfowl.

36 *Lake Oroville and Thermalito Forebay and Afterbay*

37 Lake Oroville and Thermalito Forebay and Afterbay are SWP facilities on the  
38 Feather River, as described in Chapter 5, Surface Water Resources and Water  
39 Supplies. The upper North Fork arm of Lake Oroville is part of the Lassen  
40 National Forest; and the upper Middle Fork and South Fork arms of Lake Oroville  
41 are part of Plumas National Forest. The Middle Fork Feather River (from  
42 Beckwourth downstream of Lake Davis to Lake Oroville) was designated as part  
43 of Public Law 90-542 (Wild and Scenic Rivers Act) to be part of the National  
44 Wild and Scenic Rivers System on October 2, 1968. Recreational facilities and  
45 activities at the Lake Oroville Complex (including Lake Oroville and Thermalito

1 Forebay and Afterbay) are managed by State Parks as part of the Lake Oroville  
 2 State Recreation Area. When the water storage in the lake is at full capacity  
 3 (water elevation at 900 feet msl), Lake Oroville has a surface area of 15,810 acres  
 4 and 167 miles of shoreline. Thermalito Forebay has a surface area of 630 acres.  
 5 Thermalito Afterbay has a surface area of 4,300 acres and 26 miles of shoreline  
 6 when the water elevation is at 136.5 feet msl (DWR 2007a, 2007c, 2013b).

7 Water-related activities include boating, whitewater boating, camping, picnicking,  
 8 and fishing (DWR 2007a). Boating includes kayaking, canoeing, and fishing  
 9 boats. Whitewater boating occurs on the Big Bend area of the North Fork Feather  
 10 River when Lake Oroville elevations are sufficiently low to expose several miles  
 11 of river. This portion of the North Fork Feather River forms the Upper North  
 12 Fork arm of Lake Oroville. Generally, this area is exposed in the late fall months.  
 13 Another whitewater area is located in the Bald Rock Canyon on the Middle Fork  
 14 Feather River. This whitewater area is located upstream of the Middle Fork arm  
 15 of Lake Oroville.

16 There are 11 boat ramps on Lake Oroville, as summarized in Table 15.16. Two of  
 17 the boat ramps are located at marinas (DWR 2007a).

18 **Table 15.16 Lake Oroville, Thermalito Forebay, and Thermalito Afterbay Boat**  
 19 **Ramps**

Location	Boat Ramp	Comments	Useable Elevations (feet, msl)
Lake Oroville	Bidwell Canyon	Day Use Area Marina with 280 berths and 400 mooring anchors	900 to 700
Lake Oroville	Dark Canyon	Car-Top Launching	900 to 765
Lake Oroville	Enterprise		900 to 835
Lake Oroville	Foreman Creek	Car-Top Launching	900 to approximately 800
Lake Oroville	Lime Saddle	Day Use Area Marina, including houseboat rentals	900 to 702
Lake Oroville	Loafer Creek	Boat-In Campground	900 to 775
Lake Oroville	Monument Hill	Day Use Area	900 to approximately 700
Lake Oroville	Nelson Bar	Car-Top Launching	900 to 825
Lake Oroville	Spillway	Day Use Area	900 to 695
Lake Oroville	Stringtown Creek	Car-Top Launching	900 to 866
Lake Oroville	Vinton Gulch	Car-Top Launching	900 to 825

Location	Boat Ramp	Comments	Useable Elevations (feet, msl)
Thermalito Forebay	North Thermalito Forebay	Day Use Area Also used by California State University, Chico	Water elevation does not vary substantially
Thermalito Forebay	South Thermalito Forebay	Day Use Area	Water elevation does not vary substantially
Thermalito Afterbay	Larkin Road	Car-Top Launching	Water elevation does not vary substantially
Thermalito Afterbay	Oroville Wildlife Area		Water elevation does not vary substantially
Thermalito Afterbay	Thermalito Afterbay Outlet		Water elevation does not vary substantially
Thermalito Afterbay	Wilbur Road		Water elevation does not vary substantially

1 Sources: DWR 2006, 2007a

2 There are 16 campgrounds at Oroville Lake and Thermalito complex (DWR  
3 2007a), as summarized in Table 15.17. Campers are affected by declining water  
4 elevations because this increases the distance from the campsites to the shoreline,  
5 and makes it difficult to access shoreline campgrounds at Bidwell Canyon, Lime  
6 Saddle, and Loafer Creek when water elevations are lower than 850 feet msl.

7 **Table 15.17 Lake Oroville, Thermalito Forebay, and Thermalito Afterbay Major**  
8 **Campgrounds**

Location	Campground	Comments	Number of Campsites
Lake Oroville	Bidwell Canyon	Campground	75
Lake Oroville	Bloomer Cove	Boat-In Campground	5
Lake Oroville	Bloomer Group	Boat-In Group Campground	75
Lake Oroville	Bloomer Knoll	Boat-In Campground	6
Lake Oroville	Bloomer Point	Boat-In Campground	25
Lake Oroville	Craig Saddle	Boat-In Campground	18
Lake Oroville	Floating Campsites	Boat-In Campground	10 Different Locations with approximately 15 sites per location
Lake Oroville	Foreman Creek	Boat-In Campground	26
Lake Oroville	Goat Ranch	Boat-In Campground	5
Lake Oroville	Lime Saddle	Campground and Group Campground	45

Location	Campground	Comments	Number of Campsites
Lake Oroville	Loafer Creek	Campground and Group Campground Horse Campground	137 6 15
Thermalito Forebay	North Thermalito Forebay "En Route"	Recreational Vehicle Campground	15
Thermalito Afterbay	Oroville Wildlife Area	Primitive Campground	Several

1 Sources: DWR 2006, 2007a

2 Lake Oroville recreational areas also include day use areas for picnicking,  
 3 swimming, and other recreational opportunities, as summarized in Table 15.18.  
 4 The locations for shoreline day use areas are limited due to the steep and rocky  
 5 elevations at the shorelines. Uses of these locations are less desirable when the  
 6 water elevations decline. It is difficult to access shoreline campgrounds at  
 7 Bidwell Canyon and Loafer Creek when water elevations are lower than  
 8 850 feet msl.

9 **Table 15.18 Lake Oroville, Thermalito Forebay, and Thermalito Afterbay Day**  
 10 **Use Areas**

Location	Day Use Area	Comments	Number
Lake Oroville	Bidwell Canyon With Saddle Dam trailhead	Trail and picnic	4.9 mile trail (hiking and bicycling) 21 picnic sites
Lake Oroville	Chaparral Trail	Interpretative Trail	0.2 miles
Lake Oroville	Dan Beebe Trail With Saddle Dam, Lakeland Boulevard, Oro Dam Boulevard, and visitor center trailheads	Trail	14.3 mile trail (equestrian and hiking)
Lake Oroville	Lake Oroville Visitors Center	Visitors Center and picnic	18 picnic sites
Lake Oroville	Lime Saddle	Picnic	13 picnic sites
Lake Oroville	Loafer Creek	Trail, swimming, and picnic	3.2 mile trail (equestrian and hiking) 1.7 mile trail (hiking and bicycling) 30 picnic sites
Lake Oroville	Model Aircraft Flying Facility	Aircraft staging and picnic	6 picnic sites

Chapter 15: Recreation Resources

<b>Location</b>	<b>Day Use Area</b>	<b>Comments</b>	<b>Number</b>
Lake Oroville	Oroville Dam Overlook and Spillway Day Use Area	Trail, picnic, and shoreline fishing	1 mile along Oroville Dam crest 8 picnic sites
Lake Oroville	Potter's Ravine	Trail	5.5 miles
Lake Oroville	Roy Rogers Trail	Trail	4 miles (equestrian and hiking)
Lake Oroville	Sewim Bo Trail	Trail and picnic	0.5 miles (equestrian and hiking) 1 picnic site
Lake Oroville	Wyk Island Trail	Trail	0.2 miles
Feather River downstream of Oroville Dam	Feather River Fish Hatchery	Hatchery and picnic	1 picnic site
Oroville Dam Crest, Diversion Pool, Thermalito Forebay, and Thermalito Afterbay	Brad Freeman Trail Diversion Pool access road, East Hamilton Road, Powerhouse Road, Toland Road, and Tres Vias Road trailheads	Trail Loop	41 miles
Thermalito Forebay	North Thermalito Forebay	Picnic, swimming, and shoreline fishing	117 picnic sites
Thermalito Forebay	South Thermalito Forebay	Picnic, swimming, and shoreline fishing	10 picnic sites
Thermalito Afterbay	Monument Hill	Picnic, swimming, and shoreline fishing	10 picnic sites
Oroville Wildlife Area	Rabe Road Shooting Range	Range and target shooting and picnic	7 picnic sites
Oroville Wildlife Area	Clay Pit State Vehicular Recreation Area	Off-highway vehicle riding	-
Thermalito Afterbay	Thermalito Afterbay Outlet and Oroville Wildlife Area	Trail, picnic, shoreline fishing, and hunting	Several trails and day use areas

1 Sources: DWR 2006, 2007a

2 Fishing is popular at the Lake Oroville complex and is performed by boat and  
 3 from the shoreline (DWR 2007a). Fishing opportunities in Lake Oroville include  
 4 Smallmouth Bass, Largemouth Bass, Spotted Bass, red-eye bass, Black Crappie,

1 Bluegill, Green Sunfish, Channel Catfish, and White Catfish, Coho Salmon,  
 2 Rainbow Trout, and Brown Trout. In Thermalito Forebay, fish species include  
 3 Brook Trout, Brown Trout, Rainbow Trout, and Chinook Salmon. In Thermalito  
 4 Afterbay, fishing opportunities include Smallmouth Bass, Largemouth Bass, trout,  
 5 Channel Catfish, White Catfish, and carp. Downstream in the Feather River,  
 6 fishing opportunities include steelhead, Chinook Salmon, American Shad,  
 7 Smallmouth Bass, Largemouth Bass, and White Sturgeon.

8 Hunting opportunities occur around Thermalito Afterbay and/or Oroville Wildlife  
 9 Area for turkey (in the spring), dove, quail, waterfowl, pheasant, deer, squirrel,  
 10 and rabbit.

11 *Feather River from Thermalito Afterbay/Oroville Wildlife Area to Sacramento*  
 12 *River*

13 The Feather River flows from the Thermalito Dam to approximately 40 miles  
 14 downstream to the confluence with the Sacramento River (Reclamation 1997).  
 15 The Feather River Wildlife Area, managed by DFW, is located along the Feather  
 16 River near the confluence with the Bear River. The Feather River Wildlife Area  
 17 includes the Abbott Lake, Star Bend, O'Connor Lakes, Lake of the Woods, and  
 18 Nelson Slough units; and Bobelaine Audubon Ecological Reserve (DFG 2008a).  
 19 The southern boundary of the wildlife area is located adjacent to the Sutter  
 20 Bypass. In Sutter County, water-related recreation opportunities along the  
 21 Feather River also include public access at Donahue Road Park, Tisdale Boat  
 22 Ramp, Boyd's Pump boat launch, Feather River parkway, Yuba City Boat Ramp,  
 23 Riverfront Park in Marysville, and Live Oak Park and Recreation Area (Sutter  
 24 County 2010). There are several private facilities that offer camping, boating, and  
 25 river access.

26 **15.3.2.1.8 Yuba River Watershed**

27 Portions of the Yuba River watershed along the North Yuba River between New  
 28 Bullards Bar Reservoir and Englebright Lake and along the Lower Yuba River  
 29 between Englebright Lake and the Feather River could be affected by operation of  
 30 the Lower Yuba River Water Accord (DWR et al. 2007), as described in  
 31 Chapter 5, Surface Water Resources and Water Supplies. New Bullards Bar Dam  
 32 and Reservoir are owned and operated by the Yuba County Water Agency to  
 33 provide flood control, water storage, and hydroelectric generation. The Harry L.  
 34 Englebright Dam and Reservoir were constructed by the California Debris  
 35 Commission downstream of New Bullards Bar Reservoir to trap and store  
 36 sediment from historical hydraulic mining sites in the upper watershed, and  
 37 provide recreation and hydroelectric generation opportunities (USACE 2013).  
 38 Following decommissioning of the California Debris Commission in 1986,  
 39 administration of Englebright Dam and Reservoir (Lake) was assumed by the  
 40 U.S. Army Corps of Engineers.

41 Portions of the watershed along the Middle Yuba River between New Bullards  
 42 Bar Reservoir and Englebright Reservoir are within the Plumas and Tahoe  
 43 national forests. There are also lands owned and managed by the Bureau of Land  
 44 Management and U.S. Army Corps of Engineers along this reach of the river.

1 This reach also includes the confluence with the South Yuba River. Portions of  
2 the Lower South Yuba River are designated as a California Wild and Scenic River  
3 (USFS et al. No Date). Portions of the South Yuba River State Park located near  
4 the confluence along the South Yuba River and Yuba River provide recreational  
5 opportunities for swimming, fishing, bird watching, and gold panning (State  
6 Parks 2009).

7 *New Bullards Bar Reservoir*

8 The New Bullards Bar Reservoir has a storage capacity of 966,103 acre-feet when  
9 the water elevation is at 1,956 feet. When full, the lake has a surface area of  
10 4,790 acres and 71.9 miles of shoreline (YCWA 2012). Recreational facilities  
11 and activities are the responsibility of Yuba County Water Agency. Water related  
12 activities include boating, fishing, camping from May through September, and  
13 picnicking (DWR et al. 2007). There are several campgrounds adjacent to the  
14 lake, including Schoolhouse and Dark Day campgrounds along the shoreline and  
15 Madrone Cove and Garden Point that are only accessed by boat. Boat access is  
16 provided at Emerald Cove Resort and Marina, Cottage Creek, and Dark Day. The  
17 Cottage Creek and Dark Day boat ramps are not useable when the lake elevation  
18 declines below 1,822 and 1,798 feet, respectively. Fishing opportunities include  
19 Rainbow Trout, Brown Trout, Kokanee Salmon, Bluegill, crappie, Bullhead,  
20 Smallmouth Bass, and Largemouth Bass.

21 *Englebright Reservoir*

22 The Englebright Reservoir has a storage capacity of approximately 70,000 acre-  
23 feet when the water elevation is at 527 feet (USACE 2012, 2013, 2014). When  
24 full, the lake has a surface area of 815 acres and 24 miles of shoreline.  
25 Recreational facilities and activities are the responsibility of U.S. Army Corps of  
26 Engineers. Water related activities include boating, water-skiing, fishing, boat-  
27 access camping, and picnicking. There are 96 boat-access only camping sites.  
28 There are two boat ramps to provide access to the lower part of the lake. The  
29 upper portion of the lake is characterized by narrow canyons and sharp bends  
30 which limit boat access. Fishing opportunities include Rainbow Trout, Brown  
31 Trout, Kokanee Salmon, sunfish, catfish, Smallmouth Bass, and  
32 Largemouth Bass.

33 *Lower Yuba River*

34 Hiking and boating opportunities occur along the 24 miles of the Lower Yuba  
35 River between Englebright Reservoir and the Feather River (DWR et al. 2007).  
36 Public river access is provided at several locations to support fishing, picnicking,  
37 rafting, kayaking, tubing, and swimming. Fishing opportunities include American  
38 Shad, Chinook Salmon, steelhead, Smallmouth Bass, and Striped Bass.

39 **15.3.2.1.9 American River Watershed**

40 Folsom Lake and Lake Natoma on the American River and the lower American  
41 River are located within areas in the American River watershed that could be  
42 affected by changes in CVP and/or SWP operations.

1 *Folsom Lake and Lake Natoma*  
 2 Folsom Lake is a CVP facility on the American River, as described in Chapter 5,  
 3 Surface Water Resources and Water Supplies. The El Dorado National Forest is  
 4 located in the upper American River watershed upstream of Folsom Lake. The  
 5 State of California designated the North Fork American River from the source to  
 6 Iowa Hill Bridge upstream of Folsom Lake as wild and scenic. Recreational  
 7 facilities and activities in the Folsom Lake area are within the Folsom Lake State  
 8 Recreation Area or the Folsom Powerhouse State Historic Park that are managed  
 9 by State Parks. Recreational activities upstream of Folsom Lake occur on or  
 10 adjacent to many lands owned by the Bureau of Land Management, State Parks,  
 11 and El Dorado County. When the water storage in the lake is at full capacity  
 12 (466 feet msl), Folsom Lake has a surface area of 11,450 acres and 75 miles of  
 13 shoreline (State Parks and Reclamation 2003, 2007).

14 The upper extent of Lake Natoma is located about 1 mile downstream of Folsom  
 15 Dam. Lake Natoma continues from the Rainbow Bridge to Nimbus Dam, about a  
 16 4-mile distance (State Parks and Reclamation 2003, 2007). Recreational facilities  
 17 and activities at the Lake Natoma area are part of the Folsom Lake State  
 18 Recreation Area and managed by State Parks. When the water storage in the  
 19 reservoir is at full capacity (132 feet msl), Lake Natoma has a surface area of  
 20 540 acres and 14 miles of shoreline.

21 Water-related activities at Folsom Lake include boating, jet skiing, water skiing,  
 22 wind surfing, rafting, sailing, canoeing, kayaking, swimming, and fishing  
 23 (Reclamation 2005b; State Parks and Recreation 2003, 2007). White water  
 24 rafting occurs along the South Fork American River upstream of Folsom Lake  
 25 and at Skunk Hollow and Salmon Falls.

26 Water-related activities at Lake Natoma generally only includes paddling, rowing,  
 27 and fishing due to a 5 miles/hour speed limit for motorized watercraft. California  
 28 State University Sacramento operates an aquatic center at Lake Natoma  
 29 (Reclamation et al. 2006).

30 Folsom Lake Marina at Brown’s Ravine is the only marina at Folsom Lake.  
 31 There are six boat launch facilities at Folsom Lake and three boat launch facilities  
 32 at Lake Natoma, as summarized in Table 15.19.

33 **Table 15.19 Folsom Lake and Lake Natoma Boat Ramps**

Location	Boat Ramp	Comments	Useable Elevations (feet, msl)
Folsom Lake	Beal’s Point	Day Use Area Informal Boat Ramp	465 to 420
Folsom Lake	Brown’s Ravine	Day Use Area Folsom Lake Marina with 685 wet slips and 175 dry storage slips	466 to 395
Folsom Lake	Folsom Point	–	466 to 406

Location	Boat Ramp	Comments	Useable Elevations (feet, msl)
Folsom Lake	Granite Bay	Day Use Area Largest Boat Launch Facility at Folsom Lake	466 to 360
Folsom Lake	Hobie Cove	–	426 to 375
Folsom Lake	Peninsula	Day Use Area	466 to 410
Folsom Lake	Rattlesnake Bar	–	466 to 425
Lake Natoma	Negro Bar	–	121 to 115
Lake Natoma	Nimbus Flat	Main Boat Ramp Informal Boat Ramp	128 to 115 128 to 120
Lake Natoma	Willow Creek	Informal Boat Ramp	125 to 115

1 Sources: Reclamation et al. 2006; State Parks and Reclamation 2003, 2007

2 Campgrounds are located at Folsom Lake and Lake Natoma, as summarized in  
 3 Table 15.20. Campers are also affected by declining water elevations because this  
 4 increases the distance from the campsites to the shoreline. Drawdown of the  
 5 reservoir has an aesthetic effect on users because the land exposed during  
 6 drawdown is generally composed of bare earth and rock.

7 **Table 15.20 Folsom Lake and Lake Natoma Major Campgrounds**

Location	Campground	Comments	Number of Campsites
Folsom Lake	Beal's Point	–	49 Camp Sites 20 Recreation Vehicles
Folsom Lake	Peninsula	Campground Boat-In Campground	104 Camp Sites
Lake Natoma	Negro Bar	Group Campground	3 Major Camp Sites

8 Note: State Parks and Reclamation 2003, 2007; Reclamation et al. 2006

9 Folsom Lake and Lake Natoma recreational areas also include day use areas for  
 10 picnicking, swimming, and other recreational opportunities, as summarized in  
 11 Table 15.21. The locations for shoreline day use areas are limited due to the steep  
 12 and rocky elevations at the shorelines. Uses of these locations are less desirable  
 13 when the water elevations decline. The Jedediah Smith Memorial Trail begins at  
 14 Beal's Point and extends along Lake Natoma to the confluence of the American  
 15 River and Sacramento River downstream of Nimbus Dam. The Pioneer Express  
 16 Trail which extends from the Auburn State Recreation Area to Beal's Point is part  
 17 of the Western States Pioneer Express Trail (a National Recreation Trail).

1 **Table 15.21 Folsom Lake and Lake Natoma Day Use Areas**

<b>Location</b>	<b>Day Use Area</b>	<b>Comments</b>	<b>Number</b>
Folsom Lake	Beal's Point	Picnic and Swimming Trailhead for Jedediah Smith Memorial Trail	53 picnic sites in Day Use area 69 at campground
Folsom Lake	Brown's Ravine Trail	Trail (to Old Salmon Falls)	12 miles
Folsom Lake	Darrington Trail	Trail	9 miles
Folsom Lake	Doton's Point ADA Trail	Trail	1 mile
Folsom Lake	Folsom Point	Picnic and water skiing Trail (to Brown's Ravine Trail)	50 picnic sites 4 miles
Folsom Lake	Folsom Powerhouse	Historic Site and Museum Trail	10 picnic sites 1 mile
Folsom Lake	Folsom Reservoir River Access Areas	Whitewater rafting (South Fork)	40 commercial rafting outfitters with 67 permits No permits for private boats
Folsom Lake	Granite Bay	Trail Picnic, Swimming, fishing, equestrian, and hiking	Several trails: 1 to 5 miles 100 picnic sites
Folsom Lake	Los Lagos Trail	Trail	1.5 miles
Folsom Lake	Old Salmon Falls	Swimming, equestrian, and hiking Trailhead for Brown's Ravine and Sweetwater trails	–
Folsom Lake	Peninsula	Trail Picnic	1 mile 6 picnic sites in Day Use area 104 at campground
Folsom Lake	Pioneer Express Trail	Trail	21 miles
Folsom Lake	Rattlesnake Bar	Equestrian	–
Folsom Lake	Skunk Hollow and Salmon Falls	Whitewater rafting (South Fork)	–

Location	Day Use Area	Comments	Number
Folsom Lake	Sweetwater Creek	Trailhead for Sweetwater Trail	–
Folsom Lake	Sweetwater Trail	Trail	2 miles
Lake Natoma	Lake Natoma Trails	Trail	Several trails: 1 to 10 miles
Lake Natoma	Lake Overlook	Trailhead for Lake Natoma Trail	–
Lake Natoma	Negro Bar	Picnic, fishing, and equestrian Trailhead for Lake Natoma Trail	32 picnic sites in Day Use area 17 at campground
Lake Natoma	Nimbus Fish Hatchery	Hatchery	–
Lake Natoma	Nimbus Flat	California State University, Sacramento Aquatic Center Trailhead for Lake Natoma Trail	37 picnic sites
Lake Natoma	Willow Creek	Trailhead for Lake Natoma Trail	4 picnic sites

1 Sources: Reclamation et al. 2006; State Parks and Reclamation 2003, 2007

2 Fishing is also popular at Folsom Lake and Lake Natoma from boats and the  
 3 shoreline. Anglers can catch warmwater and coldwater fish species due to the  
 4 summer stratification of the lake into a warm layer above a coldwater pool  
 5 especially in Folsom Lake (State Parks and Reclamation 2007). Warm water  
 6 fishing opportunities include Smallmouth Bass, Largemouth Bass, Spotted Bass,  
 7 and black and White Crappie. The cooler water strata support fishing for  
 8 Rainbow Trout, Brown Trout, and Chinook Salmon.

9 *American River from Nimbus Dam to the Confluence with Sacramento River*

10 The American River flows 14 miles between Nimbus Dam and the confluence  
 11 with the Sacramento River was designated by the Secretary of the Interior to be  
 12 part of the National Wild and Scenic Rivers System on January 19, 1981. The  
 13 State of California also designated the Lower American River as wild and scenic  
 14 under Public Resources Code sections 5093.54 and 5093.545.

15 The Jedediah Smith Memorial Trail (also known as the American River Bike  
 16 Trail) continues along the American River from Beal’s Point at Folsom Lake,  
 17 along Folsom Lake and Lake Natoma, and along the Lower American River  
 18 through Discovery Park to the confluence with the Sacramento River  
 19 (Reclamation 2005b).

1 The American River Parkway is a 26-mile green space designated and managed  
 2 by Sacramento County Parks and Recreation along the Lower American River  
 3 from Nimbus Dam to the confluence with the Sacramento River at Discovery  
 4 Park. This parkway provides extensive recreational opportunities, including  
 5 boating rafting, kayaking, canoeing, swimming, and fishing (Reclamation 2005b;  
 6 Sacramento County 2008). Pedestrian access is provided at 87 locations along the  
 7 parkway. Bicycle access and equestrian access are provided at 65 and 37  
 8 locations, respectively. Boat launch ramps are provided at 7 locations and Car-  
 9 top Boat Launch opportunities are provided at 17 locations. Picnic locations are  
 10 located at numerous locations along the American River. Fishing opportunities  
 11 along the Lower American River include Chinook Salmon, steelhead, trout,  
 12 Striped Bass, American Shad, Largemouth Bass, Bluegill, crappie, sunfish, and  
 13 catfish (Sacramento County 2008).

14 *Sacramento Municipal Utility District – Rancho Seco Park and Lake*

15 Rancho Seco Park and Lake, operated by Sacramento Municipal Utility District,  
 16 is used to store CVP water (Reclamation 2005b). The lake has a surface area of  
 17 160 acres. Water-related activities include boating, camping, picnicking, bird  
 18 watching and fishing. Facilities available for these activities are two boat ramps  
 19 and a fish cleaning facility. Game fish species found at the lake include catfish,  
 20 Bluegill, crappie, and trout. Birds that use the area include ducks, geese, hawks,  
 21 Bald Eagles, blue heron, and migratory birds (SMUD 2013).

22 **15.3.2.2 San Joaquin Valley**

23 Recreational opportunities in the San Joaquin Valley upstream of the Delta that  
 24 are influenced by CVP and SWP operations occur at Millerton Lake, San Joaquin  
 25 River between Friant Dam and the Delta, New Melones Reservoir, Stanislaus  
 26 River between Tulloch Dam and San Joaquin River, San Luis Reservoir complex,  
 27 recreation areas along Delta Mendota Canal and California Aqueduct, and refuges  
 28 that use CVP water supplies.

29 **15.3.2.2.1 Millerton Lake**

30 Millerton Lake is a CVP facility on the San Joaquin River, as described in  
 31 Chapter 5, Surface Water Resources and Water Supplies. Millerton Lake is part  
 32 of the Millerton State Recreation Area. Recreational facilities and activities at  
 33 Millerton Lake are administered by State Parks. When the water storage in the  
 34 lake is at full capacity (water elevation at 580.6 feet msl), Millerton Lake has a  
 35 surface area of approximately 4,900 acres and 44 miles of shoreline (Reclamation  
 36 and DWR 2011).

37 Boating, sailing, water skiing, jetskiing, swimming, tournament and recreational  
 38 fishing, camping, and picnicking (Reclamation and DWR 2011; Reclamation and  
 39 State Parks 2010). Whitewater rafting opportunities occur upstream of Millerton  
 40 Lake. There are six public boat ramps on Millerton Lake, as summarized in  
 41 Table 15.22.

1 **Table 15.22 Millerton Lake Boat Ramps**

Location	Boat Ramp	Comments	Useable Elevations (feet, msl)
Millerton Lake	Crow's Nest	On South Shore	580 to 487
Millerton Lake	Grange Cove	On South Shore	Several Boat Ramps: 580 to 500
Millerton Lake	McKenzie Point	On South Shore	580 to 472
Millerton Lake	North Shore	On North Shore	580 to 470
Millerton Lake	South Bay	On South Shore	580 to 500

2 Sources: Reclamation and DWR 2011; Reclamation and State Parks 2010

3 The marina at Millerton Lake is located at Winchell Cove on the South Shore  
 4 (Reclamation and State Parks 2010). The marina includes 500 boat slips. There  
 5 are also eight boat slips at Crow's Nest.

6 Campgrounds are located along the Millerton Lake North Shore, as summarized  
 7 in Table 15.23. Many of these campsites are located along the shoreline. These  
 8 campsites are affected by declining water elevations because this increases the  
 9 distance from the campsites to the shoreline.

10 **Table 15.23 Millerton Lake Major Campgrounds**

Location	Campground	Comments	Number of Campsites
Millerton Lake	Dumna Strand	–	10
Millerton Lake	Fort Miller	Shoreline Campground	36
Millerton Lake	Group Campsites	Group Campground Amphitheater	Two sites with total of 120 sites
Millerton Lake	Meadows	Campsites Equestrian Campsites	59 4 corrals and campsites
Millerton Lake	Mono	–	16
Millerton Lake	North Fine Gold Campground	Boat-In Campground	15
Millerton Lake	Rocky Point	–	21
Millerton Lake	Temperance Flat Boat	Boat-In Campground	25
Millerton Lake	Valley Oak	–	6

11 Source: Reclamation and State Parks 2010

12 Millerton Lake recreational areas also include day use areas for picnicking,  
 13 swimming, and other recreational opportunities, as summarized in Table 15.24  
 14 (Reclamation and State Parks 2010). The locations for shoreline day use areas are  
 15 less desirable when the water elevations decline.

1 **Table 15.24 Millerton Lake Day Use Areas**

Location	Day Use Area	Comments	Number
Millerton Lake	Blue Oak	Picnic and Trail along the South Shore	3 sites 4 miles
Millerton Lake	Buzzard’s Roost Trail	Picnic and Trail	2 sites 0.5 miles
Millerton Lake	Crow’s Nest	Picnic	13 sites
Millerton Lake	Eagle’s Nest	Picnic and Trailhead	2 sites
Millerton Lake	Fort Miller	Trail	0.25 miles
Millerton Lake	Grange Grove	Picnic	74 sites
Millerton Lake	La Playa	Picnic and Swimming	95 sites
Millerton Lake	McKenzie Point	Picnic	–
Millerton Lake	Meadows	Picnic	10 sites
Millerton Lake	Millerton Courthouse	Historic Site and Picnic	3 sites
Millerton Lake	San Joaquin River Trail	Portions along the Millerton Lake shoreline	14 miles
Millerton Lake	South Bay	Picnic	9 sites
Millerton Lake	South Fine Gold	Picnic and Trail	10 sites 11 miles

2 Sources: Reclamation and State Parks 2010; State Parks 2008

3 Fishing is also popular at Millerton Lake from boats and shoreline. Fishing  
 4 opportunities include Striped Bass, Black Bass, Largemouth Bass, Green Sunfish,  
 5 and American Shad (Reclamation and State Parks 2010).

6 **15.3.2.2.2 San Joaquin River from Friant Dam to the Delta**

7 The San Joaquin River flows 100 miles from Friant Dam to the Delta.  
 8 Downstream of Friant Dam, the San Joaquin River flows 23 miles through lands  
 9 within the San Joaquin River Parkway which includes parks, trails, and ecological  
 10 reserve areas between Friant Dam and State Route 145 managed by the San  
 11 Joaquin River Parkway and Conservation Trust (Reclamation and DWR 2011).

12 Water-related recreational activities include boating, canoeing, kayaking,  
 13 whitewater rafting, camping, picnicking, fishing, and hunting (Reclamation and  
 14 DWR 2011). Access and facilities for these activities are available at several  
 15 locations along and adjacent to the San Joaquin River.

16 Between Friant Dam and the confluence with the Merced River, whitewater  
 17 rafting occurs between Friant Dam to Skaggs Bridge Park at State Route 145.  
 18 Public access locations are generally located within the San Joaquin River

1 Parkway. Seven boat launching locations along the San Joaquin River Parkway  
2 that are managed by the San Joaquin River Parkway and Conservation Trust  
3 and/or DFW, Fresno County, or private operators. Lost Lake Park, managed by  
4 the San Joaquin River Parkway and Conservation Trust and DFW, provides a  
5 non-powered car-top boat launch. Sycamore Island Park, managed by San  
6 Joaquin River Parkway and Conservation Trust offers a boat ramp for small boats.  
7 River access also is available at Skaggs Bridge Park, managed by Fresno County.  
8 Picnicking is provided at most of the public access locations and at several other  
9 locations within the parkway. Camping is provided at Scout Island and Lost Lake  
10 Park managed by Fresno County and the private Fort Washington Beach. Trails  
11 include the 5-mile long Lewis S. Eaton Trail.

12 Downstream of State Route 145, major recreational areas include the 85-acre  
13 Mendota Pool in Mendota; Dunkle and Maldonado parks in the City of Firebaugh;  
14 and Las Palmas Fishing Access and Laird Park in Stanislaus County. Public  
15 access is provided at all of these sites. A boat ramp is located upstream of  
16 Mendota Dam.

17 The majority of these areas permit fishing. Fishing opportunities in the San  
18 Joaquin River include sunfish, crappie, Bluegill, Striped Bass, Largemouth Bass,  
19 and catfish (Reclamation and DWR 2011).

#### 20 **15.3.2.2.3 San Joaquin Valley Refuges**

21 Wildlife refuges in the San Joaquin Valley that rely upon CVP water supplies  
22 include the San Luis NWR (including the San Luis Unit, West Bear Creek Unit,  
23 East Bear Creek Unit, Freitas Unit, and Kesterson Unit); Merced NWR; Los  
24 Banos Wildlife Area; Volta Wildlife Area; Mendota Wildlife Area; North  
25 Grasslands Wildlife Area (including China Island Unit and Salt Slough Unit); and  
26 Grasslands Resource Conservation District, as described in Chapter 5, Surface  
27 Water Resources and Water Supplies, and Chapter 10, Terrestrial Biological  
28 Resources (Reclamation 2012). Water-related activities include wildlife viewing,  
29 and hunting. Hunting opportunities include waterfowl, shorebirds, and pheasants  
30 (Reclamation and DWR 2011).

31 Several wildlife areas along the San Joaquin River could be affected by CVP  
32 operations of Millerton Lake, including the West Hilmar Wildlife Area  
33 downstream of the confluence with the Merced River and the San Joaquin River  
34 NWR located between the Tuolumne and Stanislaus rivers (Reclamation and  
35 DWR 2011). West Hilmar Wildlife Area includes 340 acres of wildlife area  
36 accessible by boat. The San Joaquin River NWR includes over 7,000 acres of  
37 riparian woodlands, wetlands, and grasslands for native wildlife with limited  
38 access at Pelican Trail.

39 In the southern San Joaquin Valley, the Kern and Pixley NWRs provide wildlife  
40 viewing opportunities.

1 **15.3.2.2.4 Stanislaus River Watershed**

2 New Melones Reservoir and Tulloch Reservoir on the Stanislaus River and the  
 3 lower Stanislaus River are located within areas in the Stanislaus River watershed  
 4 that could be affected by changes in CVP operations.

5 *New Melones Reservoir*

6 New Melones Reservoir is a CVP facility on the Stanislaus River, as described in  
 7 Chapter 5, Surface Water Resources and Water Supplies. Recreation activities  
 8 and facilities at New Melones Reservoir area are managed by Reclamation.

9 When the water storage in the reservoir is at full capacity, New Melones  
 10 Reservoir has a surface area of approximately 12,500 acres and 105 miles of  
 11 shoreline at a surface elevation of 1,088 feet msl (Reclamation 1997, 2010a).

12 Water-related activities include boating, waterskiing, camping, picnicking,  
 13 wildlife viewing, spelunking, rock climbing, gold panning, and fishing  
 14 (Reclamation 2010a). Float planes can land within the North, Middle, and South  
 15 Bays of the reservoir. A model airplane club operates an airstrip near New  
 16 Melones Dam. Cave exploration occurs in the Stanislaus River Canyon. Rock  
 17 climbing occurs on Table Mountain. In years when the reservoir elevation is low,  
 18 whitewater rafters launch at the Old Camp Nine Bridge.

19 There are five boat ramps at New Melones Reservoir, as summarized in  
 20 Table 15.25.

21 **Table 15.25 New Melones Reservoir Boat Ramps**

Location	Boat Ramp	Comments	Useable Elevations (feet, msl)
New Melones Reservoir	Angels Creek	–	1,088 to 975
New Melones Reservoir	Glory Hole	Location of New Melones Lake Marina	Several Boat Ramps: 1,088 to 860
New Melones Reservoir	Mark Twain	Unimproved Ramp	1,088 to 760
New Melones Reservoir	Parrotts Ferry	Unimproved Ramp	Several Boat Ramps: 1,088 to 900

22 Source: Reclamation 2010a

23 The New Melones Marina is the only location with mooring facilities and  
 24 houseboat rentals (Reclamation 2010a). Up to 50 private houseboats on mooring  
 25 balls, 38 private houseboats in slips, and 20 rental houseboats may be maintained  
 26 on the reservoir.

27 Campgrounds are located at Glory Hole and Tuttle town, as summarized in  
 28 Table 15.26 (Reclamation 2010a). Some of the campsites are located along the  
 29 shoreline. These campsites are affected by declining water elevations because  
 30 this increases the distance from the campsites to the shoreline.

1 **Table 15.26 New Melones Reservoir Major Campgrounds**

Location	Campground	Comments	Number of Campsites
New Melones Reservoir	Glory Hole	Two campgrounds	144
New Melones Reservoir	Tuttletown	Three campgrounds Two Group campgrounds	161 16

2 Source: Reclamation 2010a

3 New Melones Reservoir recreational areas also include day use areas for  
 4 picnicking, swimming, and other recreational opportunities, as summarized in  
 5 Table 15.27 (Reclamation 2010a). The locations for shoreline day use areas are  
 6 less desirable when the water elevations decline.

7 **Table 15.27 New Melones Reservoir Day Use Areas**

Location	Day Use Area	Comments	Number
New Melones Reservoir	Glory Hole	Picnic and Trails	61 sites Several trails: 0.25 to 2.5 miles
New Melones Reservoir	Mark Twain	Picnic and Norwegian Gulch Trail	0.5 miles
New Melones Reservoir	Natural Bridges	Trail	0.7 miles
New Melones Reservoir	Shoreline	Swimming and Recreational Gold Panning	–
New Melones Reservoir	Table Mountain	Trail	Several trails: 1.5 to 4.0 miles
New Melones Reservoir	New Melones Lake Visitor	Visitor Center	–
New Melones Reservoir	Tuttletown	Picnic and Trail	52 sites Several trails: 0.4 to 1.7 miles

8 Sources: Reclamation 2010a, 2010b, 2014

9 *Tulloch Reservoir*

10 Tulloch Reservoir is a reservoir owned and operated by the Oakdale and South  
 11 San Joaquin Irrigation Districts on the Stanislaus River downstream of New  
 12 Melones Reservoir, as described in Chapter 5, Surface Water Resources and  
 13 Water Supplies. When the water storage in the reservoir is at full capacity (water  
 14 elevation at 510 feet msl), the reservoir has a surface area of 1,260 acres and  
 15 55 miles of shoreline (CBC 2013; Tri-Dam Project 2002).

1 Water-related activities include boating, sailing, windsurfing, jet and water skiing,  
 2 camping, picnicking, and fishing. Most of the shoreline is privately owned with  
 3 shoreline access and more than 400 private docks for residents (Tri-Dam Project  
 4 2012). Public access is provided at a DFW marina and campground with a boat  
 5 ramp at South Shore.

6 *Stanislaus River from Tulloch Dam to the San Joaquin River*

7 Downstream of Tulloch Dam, the Stanislaus River flows to Goodwin Dam, and  
 8 then continues approximately 40 miles to the confluence with the San Joaquin  
 9 River. Water-related activities along the lower portion of the Stanislaus River  
 10 include whitewater rafting, camping, picnicking, swimming, and fishing.  
 11 Whitewater rafting begins at Goodwin Dam and continues almost 4 miles to  
 12 Knights Ferry (Reclamation 1997). Downstream of Knights Ferry, there are  
 13 seven parks, including Caswell Memorial State Park, a 258-acre park managed by  
 14 State Parks (Stanislaus County 1987; State Parks 2006a). Fishing opportunities  
 15 on the lower Stanislaus River include bass, catfish, and crappie.

16 **15.3.2.2.5 San Luis Reservoir State Recreation Area**

17 The San Luis Reservoir complex includes CVP and SWP offstream storage  
 18 facilities located south of the Delta, as described in Chapter 5, Surface Water  
 19 Resources and Water Supplies. The San Luis Reservoir complex includes San  
 20 Luis Reservoir, O'Neill Forebay, and Los Banos Creek Reservoir. The San Luis  
 21 Reservoir complex is located within the San Luis Reservoir State Recreation  
 22 Area, and the recreational facilities are operated by State Parks (State Parks  
 23 2003). Los Banos Creek Reservoir is a flood detention basin to protect the  
 24 community of Los Banos and San Luis Canal/California Aqueduct. This reservoir  
 25 and a similar flood management reservoir that is not within the San Luis  
 26 Reservoir State Recreation Area (Little Panoche Creek Reservoir) are not affected  
 27 by CVP and SWP operations. Therefore, Los Banos Creek Reservoir and Little  
 28 Panoche Creek Reservoir are not considered in detail in this EIS.

29 When the water storage in the San Luis Reservoir is at full capacity (water  
 30 elevation at 540 feet msl), the reservoir has a surface area of 12,700 acres and  
 31 65 miles of shoreline (Reclamation and State Parks 2013; State Parks 2010).

32 The O'Neill Forebay is east of the San Luis Reservoir downstream of the San  
 33 Luis Dam. When the water storage in the forebay is at full capacity (water  
 34 elevation of 230 feet msl), the reservoir has a surface area of 2,210 acres and  
 35 14 miles of shoreline (Reclamation and State Parks 2013; State Parks 2010).

36 Water-related activities include boating, camping, picnicking, wildlife and scenic  
 37 viewing, fishing, and hunting occur throughout the San Luis Reservoir State  
 38 Recreation Area (Reclamation 2005c; State Parks 2010; Reclamation and State  
 39 Parks 2013). Boat ramps are located at all three reservoirs, as summarized below.

- 40 • San Luis Reservoir: Boat ramps at Basalt Area and Dinosaur Point  
 41 (operational to 340 feet and 360 feet msl, respectively).

- 1 • O'Neill Forebay: Boat ramps at Group Campground and Medeiros  
2 Campground.
  - 3 • Los Banos Creek Reservoir: Boat ramp at Los Banos Creek Campground.
- 4 Camping occurs at Basalt Area at San Luis Reservoir (79 sites), O'Neill Forebay  
5 (50 sites), San Luis Creek Area (53 sites and two group campsites with 90 sites),  
6 and Los Banos Creek Area (14 sites) (Reclamation and State Parks 2013). Picnic  
7 sites, swimming, and/or trails occur at Basalt Area, Medeiros Area, and Los  
8 Banos Creek Area (Reclamation 2005c; State Parks 2010; Reclamation and State  
9 Parks 2013).
- 10 Fishing opportunities include Striped Bass, American Shad, and catfish  
11 (Reclamation and State Parks 2013). Hunting opportunities occur at San Luis  
12 Reservoir for waterfowl, deer, and wild pig (Reclamation 2005c; Reclamation and  
13 State Parks 2013).

#### 14 **15.3.2.2.6 Delta Mendota Canal**

15 Delta Mendota Canal is a CVP facility, as described in Chapter 5, Surface Water  
16 Resources and Water Supplies. The Delta-Mendota Canal includes two fishing  
17 sites: one in Stanislaus County and the other in Fresno County (Reclamation  
18 2005c). Fishing opportunities include Striped Bass and catfish (Reclamation  
19 1997).

#### 20 **15.3.2.2.7 California Aqueduct/San Luis Canal**

21 The California Aqueduct is a SWP facility, as described in Chapter 5, Surface  
22 Water Resources and Water Supplies. A portion of the canal is also co-located  
23 with the CVP San Luis Canal. Fishing is permitted at 12 sites along the  
24 California Aqueduct between Bethany Reservoir and Perris Lake in Southern  
25 California. Fishing opportunities include Striped Bass, Largemouth Bass, catfish,  
26 crappie, Green Sunfish, Bluegill, and starry flounder (Reclamation 1997).

#### 27 **15.3.2.3 Delta**

28 The Delta is located at the terminus of the Sacramento River and the San Joaquin  
29 River. Water-related activities in the Delta include boating, sailing, water skiing,  
30 canoeing, kayaking, picnicking, fishing, and hunting. Recreational opportunities  
31 exist in many areas of the Delta; however, the analysis in this EIS is related to  
32 areas that could be affected by changes in CVP and/or SWP water supply  
33 operations and restoration in the Yolo Bypass. The following discussion  
34 describes recreation throughout the Delta followed by more specific discussions  
35 of recreation within the Yolo Bypass and Cache Slough.

#### 36 **15.3.2.3.1 Delta Recreational Opportunities**

37 The primary recreational activities in the Delta are related to boating and fishing  
38 (DPC 2012). Public recreation facilities are limited within the Delta. Most  
39 recreational opportunities are provided by private enterprises, including marinas,  
40 restaurants, hunting venues, and wineries and farm visits. Public access is  
41 provided at DFW and U.S. Fish and Wildlife Service (USFWS) sites.

1 The most recent survey of boating opportunities in the Delta was completed in  
 2 2002 by the California Department of Boating and Waterways (DBW 2014; DPC  
 3 2012). The survey indicated that of the 95 marinas surveyed, three were  
 4 publically-owned and 92 were privately-owned (including 87 that were open to  
 5 the public and five that were for members). The survey indicated that within the  
 6 Delta there were over 11,600 boat slips, 55 boat launches, 2,182 campsites, and  
 7 324 picnic sites.

8 Public access sites for boating and wildlife and scenic viewing in the Delta  
 9 include:

- 10 • USFWS: Stone Lakes NWR, Antioch Dunes NWR.
- 11 • DFW: Calhoun Cut Ecological Reserve, Decker Island Wildlife Area, Lower  
 12 Sherman Island Wildlife Area, Miner Slough Wildlife Area, Rhode Island  
 13 Wildlife Area, White Slough Wildlife Area, Woodbridge Ecological Reserve,  
 14 Fremont Weir Wildlife Area, Sacramento Bypass Wildlife Area, and Yolo  
 15 Bypass Wildlife Area.
- 16 • State Parks: Brannan Island-Franks Tract State Recreation Areas, Delta  
 17 Meadows State Recreation Area.
- 18 • Department of Water Resources: Clifton Court Forebay.
- 19 • The Nature Conservancy/DFW: Cosumnes River Preserve.
- 20 • Solano Land Trust: Jepson Prairie Preserve.
- 21 • East Bay Regional Park District: Big Break Regional Shoreline,  
 22 Antioch/Oakley Regional Shoreline, Browns Island Regional Preserve, Bay  
 23 Point Regional Shoreline, Martinez Regional Shoreline, Carquinez Strait  
 24 Regional Shoreline-Crockett Hills Regional Park, and Contra Costa Canal  
 25 Trail.
- 26 • Municipal Marinas, Boat Launching, and Fishing Access Facilities: City of  
 27 Antioch Marina and Municipal Boat Ramp; City of Pittsburg Riverview Park;  
 28 Sacramento County Cliffhouse, Georgiana Slough Fishing Access, Hogback  
 29 Island Access, and Sherman Island Public Access Facility; City of Sacramento  
 30 Garcia Bend Park; several public and private marinas in Sacramento County;  
 31 12 public and private marinas with over 900 boat slips and boat access within  
 32 the City of Stockton; San Joaquin County Dos Reis Regional Park, Mossdale  
 33 Crossing Regional Park, and Westgate Landing Regional Park; and Yolo  
 34 County Clarksburg River Access.

35 Several of these sites include launch sites for boats, canoes, and kayaks and  
 36 numerous trails (DPC 2012; DSC 2011; DFG 2008b, 2008d, 2009; EBRPD  
 37 2013a; Antioch 2003; Pittsburg 2001; Sacramento County 2014; Sacramento  
 38 2005; Stockton 2007; Yolo County 2009).

39 One of the larger bodies of water in the Delta is the SWP Clifton Court Forebay.  
 40 Fishing is the only recreational opportunity that occurs within the Clifton Court  
 41 Forebay; and the opportunities are limited (DWR 2013c). Public access is

1 restricted near the radial gate along West Canal. However, boat access occurs at a  
2 boat dock along West Canal to the east of the radial gate and by a trail from  
3 Clifton Court Road.

4 Fishing opportunities in the Delta generally include Striped Bass, Smallmouth  
5 Bass, Largemouth Bass, Spotted Bass, American Shad, Black Crappie, Chinook  
6 Salmon, steelhead, catfish, sunfish, Tule Perch, Warmouth, and White Sturgeon  
7 (DPC 2006).

8 Hunting opportunities for waterfowl, shorebirds, doves, and pheasants occur in  
9 many areas of the Delta on privately-owned land. Hunting also occurs at several  
10 publically-owned sites within the Delta, including:

- 11 • USFWS: Stone Lakes NWR.
- 12 • DFW: Decker Island Wildlife Area, Lower Sherman Island Wildlife Area,  
13 Miner Slough Wildlife Area, Rhode Island Wildlife Area, White Slough  
14 Wildlife Area, Yolo Bypass Wildlife Area; and on some lands owned by  
15 DWR (including Sherman and Twitchell islands and Clifton Court Forebay).

16 The Delta Protection Commission identified several physical constraints to Delta  
17 recreational opportunities that could be affected by CVP and SWP operations,  
18 including changes in water quality and operation of the CVP or SWP water  
19 facilities (Delta Cross Channel, South Delta Temporary Barriers, and Montezuma  
20 Slough Salinity Gates) (DPC 2012).

### 21 **15.3.2.3.2 Yolo Bypass and Cache Slough Recreational Opportunities**

22 The primary recreational activities in the Yolo Bypass and Cache Slough areas are  
23 related to wildlife viewing and hunting. Many recreational hunting opportunities  
24 occur on private lands, including private hunting clubs. Areas within Yolo  
25 Bypass and Cache Slough that provide public access for wildlife viewing or  
26 hunting within the Yolo Bypass and Cache Slough area, include:

- 27 • Fremont Weir Wildlife Area (DFW 2014a).
  - 28 – Wildlife viewing and fishing.
  - 29 – Hunting for pheasant, waterfowl, Mourning Dove, deer, quail, rabbit, and  
30 turkey.
- 31 • Sacramento Bypass Wildlife Area (DFW 2014c).
  - 32 – Wildlife viewing and fishing, including for White Sturgeon, White  
33 Catfish, and Black Crappie in the Tule Canal; and Largemouth Bass,  
34 Bluegill, and White Catfish in the borrow pits.
  - 35 – Hunting for pheasant and Mourning Dove.
- 36 • Yolo Bypass Wildlife Area (DFG 2008c, 2010).
  - 37 – Wildlife viewing and hiking.
  - 38 – Fishing for sturgeon, Striped Bass, Black Bass, and catfish.

- 1       – Hunting for waterfowl, coots, Moorhens, Snipe, pheasants, and Mourning
- 2       Doves.
- 3       – Educational and interpretative programs.
- 4       • Calhoun Cut Ecological Reserve (DFG 2008d).
- 5       – Waterfowl hunting and fishing from a boat.

6 There are other publically-owned lands within the Yolo Bypass and Cache Slough  
7 that provide habitat or will be restored to provide habitat. However, these lands  
8 are generally not available for public access to protect fragile ecosystems.

#### 9 **15.3.2.4 Suisun Marsh**

10 Suisun Marsh is 106,511 acres of wetlands located between the Delta and the  
11 San Francisco Bay. Water-related activities at Suisun Marsh include waterfowl  
12 hunting, boating, kayaking, hiking, wildlife viewing, fishing, and hunting  
13 (Reclamation et al. 2011). Water-related recreation occurs within the two major  
14 channels, Montezuma and Suisun sloughs; and several moderately sized channels,  
15 Cordelia, Denverton, Nurse, and Hill sloughs.

16 The DFW manages several areas within the Suisun Marsh for public access, as  
17 described in Chapter 10, Terrestrial Biological Resources. These areas include  
18 (Reclamation et al. 2011):

- 19       • Grizzly Island Wildlife Area
  - 20           – Wildlife viewing, hiking, and fishing (February through July, and late
  - 21           September).
  - 22           – Hunting (August through mid-September, and October through January).
- 23       • Hill Slough Wildlife Area
  - 24           – Wildlife viewing and fishing.
- 25       • Peytonia Slough Ecological Preserve
  - 26           – Kayaking.
  - 27           – Wildlife viewing and fishing.
- 28       • Belden's Landing Water Access Facility
  - 29           – Boat launch ramp and fishing pier.

30 Suisun City Marina and Solano Yacht Club, Suisun City Boat Launch, and  
31 McAvoy Yacht Harbor and Club also provide boat launch ramp facilities  
32 (Reclamation et al. 2011). Pier fishing opportunities are provided at Suisun City  
33 Boat Launch.

34 The Solano Land Trust's Rush Ranch also provides opportunities for hiking and  
35 picnicking in the wetlands and upland areas near Potrero Hills (Reclamation et al.  
36 2010).

1 Fishing opportunities within Suisun Marsh include Striped Bass, White Sturgeon,  
2 catfish, and carp (Reclamation et al. 2011). Occasionally, Chinook Salmon,  
3 steelhead, and Largemouth Bass are caught in Suisun Marsh near Grizzly Island.  
4 Duck hunting generates the most frequent recreational visits in Suisun Marsh  
5 (Reclamation et al. 2011). About 37,500 acres of Suisun Marsh are owned and  
6 operated by private duck clubs. DFW manages about 15,300 acres of public lands  
7 in Grizzly Island Wildlife Area for hunting of waterfowl, Snipe, coots, Moorhens,  
8 Mourning Doves, pheasants, rabbits, and Tule Elk.  
9 There are other publically-owned lands within Suisun Marsh that provide habitat  
10 or will be restored to provide habitat. However, these lands are generally not  
11 available for public access to protect fragile ecosystems.

### 12 **15.3.3 San Francisco Bay Area Region**

13 The San Francisco Bay Area Region includes portions of Contra Costa, Alameda,  
14 Santa Clara, San Benito, and Napa counties that are within the CVP and SWP  
15 service areas. This section describes reservoirs in the San Francisco Bay Area  
16 Region that could be affected by CVP and SWP operations, including the CVP  
17 Contra Loma and San Justo reservoirs; the SWP Bethany Reservoir and Lake Del  
18 Valle; the Contra Costa Water District Los Vaqueros Reservoir; and the East Bay  
19 Municipal Utility District Upper San Leandro, San Pablo, Briones, and Lafayette  
20 reservoirs and Lake Chabot. CVP and SWP are generally not stored in reservoirs  
21 within Santa Clara County (SCVWD 2010).

#### 22 **15.3.3.1 Contra Loma Reservoir**

23 The Contra Loma Reservoir is a CVP facility in Contra Costa County that  
24 provides offstream storage along the Contra Costa Canal, as described in  
25 Chapter 5, Surface Water Resources and Water Supplies. The recreation facilities  
26 are managed by East Bay Regional Park District. The 80 acre reservoir is part of  
27 661-acre Contra Loma Regional Park and Antioch Community Park (Reclamation  
28 2014a). Water-related activities include boating, wind surfing, kayaking,  
29 picnicking, and fishing. No bodily contact is to occur in Contra Loma Reservoir;  
30 therefore, a large swimming pool was constructed for the visitors by the East Bay  
31 Regional Park District. There is one boat launch at the reservoir. Contra Loma  
32 Reservoir accommodates fishing all year-round. Fishing opportunities include  
33 catfish, Black Bass, Striped Bass, Largemouth Bass, Bluegill, crappie, trout, and  
34 Redear Sunfish (EBRPD 2013c).

#### 35 **15.3.3.2 San Justo Reservoir**

36 The San Justo Reservoir is a CVP facility in San Benito County that provides  
37 offstream storage as part of the San Felipe Division, as described in Chapter 5,  
38 Surface Water Resources and Water Supplies. San Justo Reservoir recreation  
39 facilities have been closed to the public since 2009 due to an infestation by the  
40 zebra mussel. Previously, the recreation facilities were managed by San Benito  
41 County Water District (SBCWD 2014).

1     **15.3.3.3   Bethany Reservoir**

2     Bethany Reservoir is a SWP facility located between the California Aqueduct and  
3     South Bay Aqueduct in Alameda County, as described in Chapter 5, Surface  
4     Water Resources and Water Supplies. The recreation facilities are part of the  
5     Bethany Reservoir State Recreation Area and are managed by State Parks. When  
6     the water storage in the reservoir is at full capacity (water elevation at  
7     243 feet msl), Bethany Reservoir has 161 acres of surface area and 6 miles of  
8     shoreline (DWR 2001). Water-related activities include boating, windsurfing,  
9     picnicking, and fishing. There is one boat launch at the reservoir (State Parks  
10    2013a). Fishing opportunities include Striped Bass, Smallmouth Bass,  
11    Largemouth Bass, Spotted Bass, White Bass, catfish, crappie, and trout.

12    **15.3.3.4   Lake Del Valle**

13    Lake Del Valle is a SWP facility located along the South Bay Aqueduct in  
14    Alameda County, as described in Chapter 5, Surface Water Resources and Water  
15    Supplies. The recreation facilities are managed by East Bay Regional Park  
16    District as part of the Del Valle Regional Park. When the water storage in the  
17    reservoir is at full capacity (water elevation at 703 feet msl), Lake Del Valle has  
18    708 acres of surface area and 16 miles of shoreline (DWR 2001). Water-related  
19    activities include boating, windsurfing, camping, swimming, and fishing (DWR  
20    2001). There is a boat launch at the lake (EBRPD 2014). Boating hazards can  
21    occur along the variable shoreline when the surface water elevation declines to  
22    678 feet msl. There are seven group campsites for up to 475 and a family  
23    campground (DWR 2001; EBRPD 2014). Fishing opportunities include trout,  
24    catfish, Largemouth Bass, and Smallmouth Bass, Striped Bass, and Panfish  
25    (EBRPD 2014).

26    **15.3.3.5   Los Vaqueros Reservoir**

27    Los Vaqueros Reservoir is a Contra Costa Water District offstream storage  
28    facility in Contra Costa County, as described in Chapter 5, Surface Water  
29    Resources and Water Supplies. Recreation facilities are managed by Contra  
30    Costa Water District. Water-related activities include boating using rented  
31    electrical boats, and fishing (CCWD 2014). The Los Vaqueros recreation  
32    facilities include a marina, four fishing piers, 55 miles of trails, several individual  
33    and group picnic areas, and an interpretative center. Fishing opportunities include  
34    Rainbow Trout, Brown Bullhead, White Catfish, Channel Catfish, sunfish, White  
35    Crappie, Largemouth Bass, Striped Bass, Chinook Salmon, Kokanee Salmon,  
36    Green Sunfish, and Sacramento Perch (EBRPD 2014).

37    **15.3.3.6   San Pablo Reservoir, Lafayette Reservoir, Lake Chabot, and East  
38    Bay Municipal Utility District Trails**

39    The East Bay Municipal Utility District reservoirs in Alameda and Contra Costa  
40    County are used to store water within and near the East Bay Municipal Utility  
41    District service area. Water stored in these reservoirs includes water from local  
42    watersheds, the Mokelumne River watershed, and CVP water supplies, as  
43    described in Chapter 5, Surface Water Resources and Water Supplies. Recreation  
44    is allowed within the waters of San Pablo and Lafayette reservoirs and Lake

1 Chabot (EBMUD 2011). Recreation is not allowed within the waters of Upper  
2 San Leandro and Briones reservoir. East Bay Municipal Utility District maintains  
3 trails within the watersheds of the reservoirs.

4 Recreation facilities at San Pablo Reservoir are managed by East Bay Municipal  
5 Utility District. Water-related activities at San Pablo Reservoir include boating,  
6 picnicking, and fishing (EBMUD 2014a). There is a boat launch at the reservoir.  
7 There are individual sites and nine group picnic areas that can accommodate up to  
8 100 people at each site. Hiking can occur in the San Pablo Reservoir watershed  
9 on 8.7 miles of trails which connect to about 13 miles of trails in the Briones  
10 Reservoir watershed (EBMUD 2007a). The surface water of the reservoirs can be  
11 viewed from many locations along these trails. Fishing opportunities at San Pablo  
12 Reservoir include Rainbow Trout, catfish, Black Bass, Bluegill, and crappie  
13 (EBMUD 2014a).

14 Recreation facilities at Lafayette Reservoir are managed by East Bay Municipal  
15 Utility District. Water-related activities at Lafayette Reservoir include boating,  
16 picnicking, and fishing (EBMUD 2014b). There is a private car-top boat launch  
17 at the reservoir. There are 125 picnic sites around the reservoir. Hiking can occur  
18 in the Lafayette Reservoir watershed on 7.4 miles of trails. Fishing opportunities  
19 at Lafayette Reservoir include Rainbow Trout, catfish, Black Bass, and sunfish.

20 There are no water-related activities within or adjacent to Upper San Leandro  
21 Reservoir. However, East Bay Municipal Utility District maintains over 26 miles  
22 of trails within the Upper San Leandro Reservoir watershed. The surface water of  
23 the reservoirs can be viewed from many locations along these trails (EBMUD  
24 2007b).

25 Recreation facilities at Lake Chabot are managed by East Bay Regional Park  
26 District as part of the Lake Chabot Regional Park (EBRPD 2011). Water-related  
27 activities at Lake Chabot include boating, camping, picnicking, and fishing.  
28 There is a boat launch at the reservoir and boat rides are offered on the *Chabot*  
29 *Queen*. Individual campsites and group campsites are located near the southern  
30 portion of the park. Picnic sites are located near the Lake Chabot Marina. Hiking  
31 can occur along the shoreline on over 9 miles of trails which connect to more than  
32 17 miles of other trails in the watershed (EBRPD 2011, 2013d). Other  
33 recreational activities, including equestrian trails and a marksmanship range, are  
34 located in the upper Lake Chabot watershed. Fishing opportunities at Lake  
35 Chabot include Rainbow Trout, catfish, Black Bass, crappie, Bluegill, and carp.

#### 36 **15.3.4 Central Coast Region**

37 The Central Coast Region includes portions of San Luis Obispo and Santa  
38 Barbara counties served by the SWP. The SWP water supplies generally are  
39 conveyed to Central Coast municipal, industrial, and agricultural water users in  
40 pipelines and closed reservoirs. Water is delivered to southern Santa Barbara  
41 County communities through Cachuma Lake. Therefore, in the Central Coast  
42 Region, the only recreational opportunities that may be affected by changes in  
43 SWP operations would be Cachuma Lake in Santa Barbara County (CCWA  
44 2014).

1     **15.3.4.1   Cachuma Lake**

2     Cachuma Lake is a facility owned and operated by Reclamation in Santa Barbara  
3     County, as described in Chapter 5, Surface Water Resources and Water Supplies.  
4     Recreation facilities are managed by Santa Barbara County Parks Department.  
5     Water-related activities include boating, and fishing within the lake and along the  
6     lake shoreline (Reclamation 2010c). Cachuma Lake recreation facilities include a  
7     marina with 87 rental boats and a public boat launch, 94 private boat slips,  
8     520 campsites, equestrian campsites, family center, amphitheater, and trails that  
9     range from 0.25 to 9 miles in length. Fishing opportunities include trout, catfish,  
10    crappie, bass, Redear Perch, and Bluegill.

11    **15.3.5     Southern California Region**

12    The Southern California Region includes portions of Ventura, Los Angeles,  
13    Orange, San Diego, Riverside, and San Bernardino counties served by the SWP.  
14    The SWP water supplies generally are conveyed to Southern California  
15    municipal, industrial, and agricultural water users in canals and pipelines. There  
16    are six SWP reservoirs along the main canal, West Branch, and East Branch of the  
17    California Aqueduct and many other reservoirs owned and operated by regional  
18    and local agencies. The Metropolitan Water District of Southern California's  
19    Diamond Valley Lake and Lake Skinner primarily store water from the SWP.  
20    Other reservoirs that store SWP water, include United Water Conservation  
21    District's Lake Piru; City of Escondido's Dixon Lake; City of San Diego's San  
22    Vicente, El Capitan, Lower Otay, Hodges, and Murray reservoirs; Helix Water  
23    District's Lake Jennings; and Sweetwater Authority's Sweetwater Reservoir.

24    This section does not include reservoirs that do not provide recreational  
25    opportunities, such as Vail Lake in Riverside County or Olivenhain Reservoir in  
26    San Diego County, or reservoirs that do not store SWP water supplies, such as  
27    Lake Mathews in Riverside County which is used to store Colorado River water  
28    (RCWD 2011; SDCWA 2015; Riverside County 2000).

29    **15.3.5.1   Quail Lake**

30    Quail Lake is a SWP facility in Los Angeles County, as described in Chapter 5,  
31    Surface Water Resources and Water Supplies. Recreation facilities are managed  
32    by DWR (DWR 2014a). Water-related activities include fishing within the lake  
33    and along the shoreline. Fishing opportunities include Channel Catfish, Striped  
34    Bass, Blackfish, Tule Perch, Threadfin Shad, and Hitch.

35    **15.3.5.2   Pyramid Lake**

36    Pyramid Lake is a SWP facility located in Los Angeles County and upstream of  
37    Castaic Lake on the West Branch of the California Aqueduct, as described in  
38    Chapter 5, Surface Water Resources and Water Supplies. Recreation facilities are  
39    managed by the U.S. Forest Service (DWR 2000, 2014b). Water-related activities  
40    include boating, camping, water skiing, swimming, and fishing. Boat launch  
41    facilities are available at Vaqueros Beach and Emigrant Landing. A marina and  
42    picnic sites are available at Emigrant Landing. Four picnic and viewing sites are  
43    accessible only by boat. Family and group camping are available at two sites.

1 Fishing opportunities include largemouth, smallmouth, and Striped Bass; catfish,  
2 blue gill; crappie; and trout. Reservoir elevations can vary substantially on a daily  
3 basis because the lake provides short-term storage for the downstream Castaic  
4 Powerplant.

5 **15.3.5.3 Castaic Lake**

6 Castaic Lake is a SWP facility located in Los Angeles County at the terminal end  
7 of the West Branch of the California Aqueduct, as described in Chapter 5, Surface  
8 Water Resources and Water Supplies. Recreation facilities are managed by the  
9 Los Angeles County Department of Parks (DWR 2007b). Water-related activities  
10 include boating, water skiing, jet skiing, wakeboarding, camping, picnicking,  
11 swimming at the lagoon/afterbay, and fishing. Fishing opportunities include  
12 trout, Largemouth Bass, Striped Bass, catfish, and crappie (DWR 2014c).

13 **15.3.5.4 Silverwood Lake**

14 Silverwood Lake is a SWP facility located in San Bernardino County along the  
15 East Branch of the California Aqueduct, as described in Chapter 5, Surface Water  
16 Resources and Water Supplies. Recreation facilities are managed by State Parks  
17 as part of the Silverwood Lake State Recreational Area (State Parks 2006b).  
18 Water-related activities include boating, water skiing, camping, picnicking,  
19 swimming, and fishing. Facilities available for boating include a boat ramp,  
20 marina, and waterskiing area. Camping facilities include 136 family sites, seven  
21 walk-in sites, and several group sites for up to 120 people. The park includes two  
22 swimming beaches and 13 miles of trails. Fishing opportunities include  
23 Largemouth Bass, Striped Bass, Bluegill, crappie, and catfish.

24 **15.3.5.5 Crafton Hills Reservoir**

25 Crafton Hills Reservoir is a SWP facility located in the City of Yucaipa within  
26 San Bernardino County, as described in Chapter 5, Surface Water Resources and  
27 Water Supplies. Recreation facilities are managed by DWR (DWR 2009).  
28 Recreation activities in vicinity of the reservoir are associated with hiking trails in  
29 the open space within the Crafton Hills watershed. The surface water of the  
30 reservoirs can be viewed from many locations along these trails.

31 **15.3.5.6 Lake Perris**

32 Lake Perris is a SWP facility located in Riverside County at the terminal end of  
33 the East Branch of the California Aqueduct, as described in Chapter 5, Surface  
34 Water Resources and Water Supplies. Recreation facilities are managed by State  
35 Parks as part of the Lake Perris State Recreational Area (State Parks 2013b; DWR  
36 2010). Water-related activities include boating, camping, swimming, picnicking,  
37 and fishing. Boating facilities include a marina and three boat launch ramps.  
38 Other recreational facilities include two swimming beaches, family campground,  
39 seven equestrian camp sites, boat-in picnic sites on Alessandro Island, and the  
40 Ya'i Hek'i Regional Indian Museum. Fishing opportunities include Largemouth  
41 Bass, catfish, crappie, carp, Bluegill, and Redear Sunfish.

**15.3.5.7 Diamond Valley Lake**

Diamond Valley Lake is an offstream storage facility located in Riverside County owned and operated by Metropolitan Water District of Southern California, as described in Chapter 5, Surface Water Resources and Water Supplies (MWD 2013). The lake is used to store SWP water. Water-related activities include boating, and fishing. Boating facilities include a marina with boat rentals. Other recreational facilities include a visitor center, Western Science Center, and the Valley-Wide Recreation and Park District Regional Aquatic Center and Community Park. Fishing opportunities include Black Bass, Bluegill, redear sunfish, Rainbow Trout, blue catfish, and Channel Catfish (DVM 2014).

**15.3.5.8 Lake Skinner**

Lake Skinner is an offstream storage facility located in Riverside County owned and operated by Metropolitan Water District of Southern California, as described in Chapter 5, Surface Water Resources and Water Supplies. Recreation facilities are managed by Riverside County Parks (Riverside County 2014). The lake is used to store SWP water. Water-related activities include boating, camping, and fishing. Other recreational facilities include an amphitheater and Splash Pad. Fishing opportunities include Striped Bass, Largemouth Bass, Bluegill, Rainbow Trout, catfish, and carp.

**15.3.5.9 Lake Piru**

Lake Piru is located on Piru Creek, a tributary of the Santa Clara River, in Ventura County (UWCD 2014). The lake is owned and operated by United Water Conservation District, as described in Chapter 5, Surface Water Resources and Water Supplies. Lake Piru is located within Los Padres National Forest (PMC 2014). The lake is used to store SWP water.

Recreation facilities are managed by a private concessionaire for the district (UWCD 2014; PMC 2014). Water-related activities include boating, camping, and picnicking. The marina includes a boat launch and private boat slips. There are over 220 campsites, including several group campsites.

**15.3.5.10 Dixon Lake**

Dixon Lake is located in the hills above the City of Escondido in San Diego County (Escondido 2014a). The lake is owned and operated by the City of Escondido, as described in Chapter 5, Surface Water Resources and Water Supplies. The lake is used to store SWP water.

Recreation facilities are managed by the City of Escondido (Escondido 2014b). Water-related activities include camping, picnicking, and fishing. Boats are allowed on the lake for fishing. There are 45 campsites and 22 picnic sites (Escondido 2014 n.d.; Escondido 2014c). Fishing opportunities include trout, bass, Bluegill, carp, catfish, and crappie.

1     **15.3.5.11 San Vicente, El Capitan, Lower Otay, Hodges, and Murray**  
2             **Reservoirs**

3 San Vicente Reservoir, El Capitan, Lower Otay, Hodges, and Murray reservoirs  
4 are located in San Diego County (San Diego 2011). The reservoirs are owned and  
5 operated by the City of San Diego, as described in Chapter 5, Surface Water  
6 Resources and Water Supplies. The reservoirs are used to store SWP water.

7 Recreation facilities are managed by the City of San Diego (San Diego 2014a,  
8 2015a, 2015b). Water-related activities at the reservoirs include boating,  
9 picnicking, and fishing (San Diego 2014b, 2015a, 2015b). There are 16 picnic  
10 sites at Lower Otay Reservoir. Fishing opportunities at Lower Otay Reservoir  
11 include Largemouth Bass, Bluegill, black and White Crappie, Channel Catfish,  
12 blue catfish, White Catfish, and bullhead. Recreational activities at San Vicente  
13 Reservoir are temporarily closed during construction to raise the dam (San Diego  
14 2014c). Fishing opportunities at El Capitan Reservoir include Largemouth Bass,  
15 Bluegill, crappie, Channel Catfish, Blue Catfish, Green Sunfish, and carp (San  
16 Diego 2014d). Hodges Reservoir provides recreational opportunities including  
17 boating, boardsailing, and fishing for bass, catfish, crappie, Bluegill, Bullhead,  
18 and carp (San Diego 2015a). Murray Reservoir provides recreational  
19 opportunities for boating, floating, swimming, and fishing for Largemouth Bass,  
20 Bluegill, Channel Catfish, Black Crappie, and trout (San Diego 2015b).

21     **15.3.5.12 Lake Jennings**

22 Lake Jennings is located in San Diego County (HWD 2014). The lake is owned  
23 and operated by Helix Water District, as described in Chapter 5, Surface Water  
24 Resources and Water Supplies. The lake is used to store SWP water.

25 Recreation facilities are managed by Helix Water District (HWD 2014). Water-  
26 related activities include boating, camping, picnicking, and fishing. There are  
27 96 campsites. There are a variety of picnic sites at Lake Jennings including:  
28 Cloister Cover, Siesta Point, Hermit Cove, and Eagle Point. Bird watchers at  
29 Lake Jennings can see Loons, Grebes, Cormorants, Herons, Swans, Geese,  
30 Eagles, Hawks, Thrushes, Warblers, and many others. Hikers at Lake Jennings  
31 have access to a variety of different trails near the lake including a 5.5 mile loop  
32 around the lake. Fishing opportunities include trout, bass, and catfish.

33     **15.3.5.13 Sweetwater Reservoir**

34 Sweetwater Reservoir is located in San Diego County (Sweetwater Authority  
35 2014). The lake is owned and operated by Sweetwater Authority, as described in  
36 Chapter 5, Surface Water Resources and Water Supplies. The reservoir is used to  
37 store SWP water. Recreation facilities are managed by Sweetwater Authority.  
38 Water-related activities include fishing.

39     **15.3.5.14 Lake Arrowhead**

40 Lake Arrowhead is located in San Bernardino County (LACSD 2014). The lake  
41 is owned and operated by Arrowhead Lake Association. The Lake Arrowhead  
42 Community Services District stores SWP water in the lake, as described in  
43 Chapter 5, Surface Water Resources and Water Supplies. Recreation facilities are

1 managed by the Arrowhead Lake Association. Water-related activities include  
2 boating, camping, and fishing (Lake Arrowhead 2014).

### 3 **15.3.6 Recreational Fishing in San Pablo and San Francisco Bays**

4 Recreational fishing for sturgeon, Striped Bass, steelhead, trout, and salmon in  
5 San Pablo and San Francisco bays could be affected by changes in populations  
6 that may occur due to implementation of the alternatives considered in this EIS.  
7 Of these species, the majority of recreational fishing in the San Francisco Bay  
8 Estuary is related to Striped Bass and sturgeon fishing, especially in San Pablo  
9 and Suisun bays.

10 Recreational fishing for White Sturgeon is limited to three sturgeons per person  
11 each year, with a daily bag limit of one fish/day and a size limitation of 40 to  
12 60 inches (from the nose tip to fork in the tail). In addition, White Sturgeon  
13 fishing is not allowed in San Francisco Bay from March 16 through December 31.  
14 Green sturgeon fishing is not allowed. Striped bass fishing occurs throughout the  
15 year with a daily bag limit two fish/day and a minimum size limitation of  
16 18 inches. Salmon sportfishing also occurs within the San Francisco Bay Estuary  
17 during periods specified by the National Marine Fisheries Service (NMFS).

### 18 **15.3.7 Recreational Salmon Fishing along Northern California** 19 **Coast**

20 Chinook Salmon, Coho Salmon, and steelhead are generally the primary species  
21 for recreational fishing that could be affected by changes in CVP and SWP  
22 operations along the Pacific Coast of Northern California from Pigeon Point to  
23 southern Oregon (near Elk River). The Pacific Coast salmon fisheries are  
24 managed by the Pacific Fishery Management Council (PFMC) in waters between  
25 the United States/Canada border to the United States/Mexico border between  
26 3 and 200 nautical miles offshore (PFMC 2014). The State DFW manages the  
27 salmon fisheries within 0 to 3 nautical miles offshore with regulations that are  
28 generally similar to the PFMC to the salmon fishing requirements. The PFMC  
29 analyzes the a fisheries evaluation each year; and defines the periods of time for  
30 the fishing season and minimum size fish to be caught for commercial,  
31 recreational, and tribal salmon fishing activities, as described in more detail for  
32 recreational and commercial salmon fishing in Chapter 19, Socioeconomics.

## 33 **15.4 Impact Analysis**

34 This section describes the potential mechanisms and analytical methods for  
35 change in recreation resources; results of the impact analysis; potential mitigation  
36 measures; and cumulative effects.

### 37 **15.4.1 Potential Mechanisms for Change and Analytical Methods**

38 As described in Chapter 4, Approach to Environmental Analysis, the impact  
39 analysis considers changes in recreational resources conditions related to changes

1 in CVP and SWP operations under the alternatives as compared to the No Action  
2 Alternative and Second Basis of Comparison.

3 As described in Section 15.3, Affected Environment, there are a wide range of  
4 recreational opportunities at the reservoirs and along the downstream rivers. This  
5 analysis focuses on the potential changes in these recreational opportunities and  
6 not specific recreational actions. For example, this analysis focuses on changes in  
7 surface water elevations at reservoirs which could affect boating, shoreline  
8 camping and picnicking, and use of trails. The changes in reservoir elevations  
9 would occur within the historical range of elevation changes; therefore, none of  
10 the recreational opportunities would be permanently reduced or expanded. The  
11 changes that would occur within the alternatives would change the potential for  
12 enjoyable recreational opportunities based upon changes in reservoir surface  
13 water elevations and river flows.

14 Changes in CVP and SWP operations under the alternatives as compared to the  
15 No Action Alternative and Second Basis of Comparison could change recreational  
16 opportunities at water bodies affected by CVP and SWP operations.

17 **15.4.1.1 Changes in Recreational Resources at Reservoirs that Store CVP**  
18 **and SWP Water**

19 Reservoirs that store CVP and SWP water provide a wide diversity of recreational  
20 experiences on the water surface, at shoreline campgrounds, and along shoreline  
21 trails. By the end of September, the surface water elevations can decline from  
22 higher elevations in the spring by up to 100 feet in Shasta Lake and Lake  
23 Oroville; and over 50 feet in Trinity and Folsom lakes and New Melones and San  
24 Luis reservoirs. As the water elevations declines, boat ramps become unavailable  
25 and the water surface recedes along steep slopes from shoreline campgrounds and  
26 trails. Changes in CVP and SWP operations under the alternatives could change  
27 the surface water elevations, especially in dry and critical dry years as compared  
28 to the No Action Alternative and Second Basis of Comparison.

29 The CalSim II model output includes monthly reservoir elevations for CVP and  
30 SWP reservoirs in the Central Valley and Trinity Lake. The end of September  
31 reservoir elevations generally indicate low reservoir elevations. To assess  
32 changes in recreational resources, changes in reservoir elevations for the end of  
33 September were compared between alternatives and the No Action  
34 Alternative and Second Basis of Comparison. The reservoir elevations at the end  
35 of September were compared to minimum allowable boat ramp elevations as a  
36 measure of surface water accessibility.

37 Reservoirs in the San Francisco Bay Area, Central Coast, and Southern California  
38 regions store water from multiple water supplies including CVP and SWP water;  
39 however, these reservoirs are not included in the CalSim II model simulation. For  
40 the purposes of this EIS analysis, changes in surface water elevations in these  
41 reservoirs were assumed to be related to changes in CVP and SWP water  
42 deliveries to the areas located to the south of the Delta.

1     **15.4.1.2   Changes in Recreational Resources along Rivers downstream of**  
2     **CVP and SWP Reservoirs**

3     Changes in CVP and SWP operations under the alternatives could change the  
4     river flows in Trinity, Sacramento, Feather, American, and Stanislaus rivers in a  
5     manner that would affect recreational opportunities including boating and  
6     swimming during the spring and summer months, especially in dry and critical  
7     dry years.

8     Results of the CalSim II model were used to assess changes in average monthly  
9     flows that could affect recreational opportunities under the alternatives, the No  
10    Action Alternative, and the Second Basis of Comparison. This analysis is focused  
11    on the Trinity, Sacramento, Feather, American, and Stanislaus rivers. Generally,  
12    flow in rivers downstream of San Luis Reservoir and the reservoirs in the San  
13    Francisco Bay Area, Central Coast, and Southern California that store CVP and  
14    SWP water are based upon minimum instream flow requirements except in high  
15    flow events because the reservoirs are operated primarily to provide water into  
16    downstream water distribution systems.

17    **15.4.1.3   Changes in Recreational Opportunities at Wildlife Refuges**

18    Changes in CVP and SWP operations under the alternatives would not change  
19    water supplies to wildlife refuges that use CVP water for Level 2 water demands,  
20    as described in Chapter 5, Surface Water Resources and Water Supplies.  
21    Therefore, these changes are not analyzed in this EIS.

22    **15.4.1.4   Effects Related to Water Transfers**

23    Historically water transfer programs have been developed on an annual basis.  
24    The demand for water transfers is dependent upon the availability of water  
25    supplies to meet water demands. Water transfer transactions have increased over  
26    time as CVP and SWP water supply availability has decreased, especially during  
27    drier water years.

28    Water transfers using CVP and SWP Delta pumping plants and south of Delta  
29    canals generally occur when there is unused capacity in these facilities. These  
30    conditions generally occur during drier water year types when the flows from  
31    upstream reservoirs plus unregulated flows are adequate to meet the Sacramento  
32    Valley water demands and the CVP and SWP export allocations. In non-wet  
33    years, the CVP and SWP water allocations would be less than full contract  
34    amounts; therefore, capacity may be available in the CVP and SWP conveyance  
35    facilities to move water from other sources.

36    Projecting future recreational conditions related to water transfer activities is  
37    difficult because specific water transfer actions required to make the water  
38    available, convey the water, and/or use the water would change each year due to  
39    changing hydrological conditions, CVP and SWP water availability, specific local  
40    agency operations, and local cropping patterns. Reclamation recently prepared a  
41    long-term regional water transfer environmental document which evaluated  
42    potential changes in conditions related to water transfer actions (Reclamation  
43    2014f). Results from this analysis were used to inform the impact assessment of

1 potential effects of water transfers under the alternatives as compared to the No  
2 Action Alternative and the Second Basis of Comparison.

3 **15.4.2 Conditions in Year 2030 without Implementation of**  
4 **Alternatives 1 through 5**

5 This EIS includes two bases of comparison, as described in Chapter 3,  
6 Description of Alternatives: the No Action Alternative and the Second Basis of  
7 Comparison. Both of these bases are evaluated at 2030 conditions. Changes that  
8 would occur over the next 15 years without implementation of the alternatives are  
9 not analyzed in this EIS. However, the changes to recreational resources that are  
10 assumed to occur by 2030 under the No Action Alternative and the Second Basis  
11 of Comparison are summarized in this section. Many of the changed conditions  
12 would occur in the same manner under both the No Action Alternative and the  
13 Second Basis of Comparison.

14 **15.4.2.1 Common Changes in Conditions under the No Action**  
15 **Alternative and Second Basis of Comparison**

16 Conditions in 2030 would be different than existing conditions due to:

- 17 • Climate change and sea level rise  
18 • General plan development throughout California, including increased water  
19 demands in portions of Sacramento Valley  
20 • Implementation of reasonable and foreseeable water resources management  
21 projects to provide water supplies

22 It is anticipated that climate change would result in more short-duration high-  
23 rainfall events and less snowpack in the winter and early spring months. The  
24 reservoirs would be full more frequently by the end of April or May by 2030 than  
25 in recent historical conditions. However, as the water is released in the spring,  
26 there would be less snowpack to refill the reservoirs. This condition would  
27 reduce reservoir storage and available water supplies to downstream uses in the  
28 summer. The reduced end of September storage also would reduce the ability to  
29 release stored water to downstream regional reservoirs. These conditions would  
30 occur for all reservoirs in the California foothills and mountains, including non-  
31 CVP and SWP reservoirs.

32 Under the No Action Alternative and the Second Basis of Comparison, land uses  
33 in 2030 would occur in accordance with adopted general plans. Development  
34 under the general plans would could increase demand for recreational resources.

35 The No Action Alternative and the Second Basis of Comparison assumes  
36 completion of water resources management and environmental restoration  
37 projects that would have occurred without implementation of Alternatives 1  
38 through 5, including regional and local recycling projects, surface water and  
39 groundwater storage projects, conveyance improvement projects, and desalination  
40 projects, as described in Chapter 3, Description of Alternatives. The No Action  
41 Alternative and the Second Basis of Comparison also assumes implementation of  
42 actions included in the 2008 USFWS Biological Opinion (BO) and 2009 NMFS

1 BO that would have been implemented without the BOs by 2030, as described in  
 2 Chapter 3, Description of Alternatives. These projects would include several  
 3 projects that would affect recreational resources, including restoration of more  
 4 than 10,000 acres of intertidal and associated subtidal wetlands in Suisun Marsh  
 5 and Cache Slough; and at least 17,000 to 20,000 acres of seasonal floodplain  
 6 restoration in Yolo Bypass.

### 7 **15.4.3 Evaluation of Alternatives**

8 Alternatives 1 through 5 have been compared to the No Action Alternative; and  
 9 the No Action Alternative and Alternatives 1 through 5 have been compared to  
 10 the Second Basis of Comparison.

11 During review of the numerical modeling analyses used in this EIS, an error was  
 12 determined in the CalSim II model assumptions related to the Stanislaus River  
 13 operations for the Second Basis of Comparison, Alternative 1, and Alternative 4  
 14 model runs. Appendix 5C includes a comparison of the CalSim II model run  
 15 results presented in this chapter and CalSim II model run results with the error  
 16 corrected. Appendix 5C also includes a discussion of changes in the comparison  
 17 of groundwater conditions for the following alternative analyses.

- 18 • No Action Alternative compared to the Second Basis of Comparison
- 19 • Alternative 1 compared to the No Action Alternative
- 20 • Alternative 3 compared to the Second Basis of Comparison
- 21 • Alternative 5 compared to the Second Basis of Comparison

#### 22 **15.4.3.1 No Action Alternative**

23 The No Action Alternative is compared to the Second Basis of Comparison.

##### 24 **15.4.3.1.1 Trinity River Region**

###### 25 *Potential Changes in Recreational Resources at Reservoirs that Store CVP and* 26 *SWP Water*

27 Changes in CVP water supplies and operations under the No Action  
 28 Alternative as compared to the Second Basis of Comparison would result in  
 29 similar end of September reservoir elevations (changes within 5 percent) and  
 30 related recreational resources at Trinity Lake in all water year types, as described  
 31 in Chapter 5, Surface Water Resources and Water Supplies.

32 There are several boat ramps at Trinity Lake that provide access at different  
 33 elevations. Boat ramps at Stuart Fork and Bowerman are not useable when the  
 34 water elevation is less than 2,323 feet which occurs approximately 80 percent of  
 35 the time under the No Action Alternative and Second Basis of Comparison. Boat  
 36 ramps at Clark Springs, Fairview, and Trinity Center are not useable when the  
 37 water elevation is lower than 2,300 feet which occurs approximately 62 percent of  
 38 the time under the No Action Alternative and Second Basis of Comparison. The  
 39 Minersville boat ramp is accessible until the elevation declines below 2,170 feet  
 40 which occurs approximately 5 percent of the time under the No Action  
 41 Alternative and Second Basis of Comparison.

1 *Potential Changes in Recreational Resources along Rivers Downstream of the*  
2 *CVP and SWP Reservoirs*

3 The following changes would occur on the Trinity River under the No Action  
4 Alternative as compared to the Second Basis of Comparison, as summarized in  
5 Chapter 5, Surface Water Resources and Water Supplies.

- 6 • Over long-term conditions, flows would be similar in March through  
7 November; and reduced in December through February (up to 9.5 percent).
- 8 • In wet years, flows would be similar in April through November; and reduced  
9 in December through March (up to 11.2 percent).
- 10 • In dry years, flows would be similar in all months.

11 Flows in Trinity River would be similar during the recreation season (spring and  
12 summer months); therefore, recreational opportunities would be similar.

13 **15.4.3.1.2 Central Valley Region**

14 *Potential Changes in Recreational Resources at Reservoirs that Store CVP and*  
15 *SWP Water*

16 Changes in CVP water supplies and operations under the No Action  
17 Alternative as compared to the Second Basis of Comparison would result in  
18 similar end of September reservoir elevations and related recreational resources at  
19 Shasta Lake, Lake Oroville, Folsom Lake, and New Melones Reservoir in all  
20 water year types; and at San Luis Reservoir in above normal, below normal, and  
21 dry years, as described in Chapter 5, Surface Water Resources and Water  
22 Supplies. Changes in recreational resources at San Luis Reservoir would be  
23 reduced in wet year and critical dry years because the end of September surface  
24 water elevations would be reduced by 6.2 percent in wet and critical dry years.

25 There are several boat ramps at each of the reservoirs that provide access at  
26 different elevations. At Shasta Lake, boat ramps at Antlers, Hirz Bay, Packers  
27 Bay, Sugar Loaf, and Centimundi and Jones Valley are not accessible  
28 approximately 55, 35, 20, 10, and 9 percent of the time, respectively, under the  
29 No Action Alternative; and approximately 55, 30, 15, 10, and 7 percent of the  
30 time, respectively, under the Second Basis of Comparison.

31 At Lake Oroville, boat ramps at Enterprise, Vinton Gulch, and Nelson Bar;  
32 Foreman Creek; Dark Canyon and Loafer Creek; and Bidwell Canyon, Lime  
33 Saddle, and Spillway are not accessible approximately 95, 87, 73, and 35 percent  
34 of the time, respectively, under the No Action Alternative; and approximately  
35 85, 75, 62, and 25 percent of the time, respectively, under the Second Basis of  
36 Comparison.

37 At Folsom Lake, boat ramps at Rattlesnake Bar, Beal's Point; Peninsula, Brown's  
38 Ravine, and Folsom Point; Hobie Cove; and Granite Bay are not accessible  
39 approximately 80, 65, 40, 10, and 7 percent of the time, respectively, under the  
40 No Action Alternative; and approximately 65, 40, 10, and 7 percent of the time,  
41 respectively, under the Second Basis of Comparison.

1 At New Melones Reservoir, the boat ramp at Angels Creek, Parrott's Ferry, Glory  
 2 Hole, and Mark Twain are not accessible approximately 65, 25, 18, and 5 percent  
 3 of the time, respectively, under the No Action Alternative; and approximately  
 4 30, 25, 15, 5 percent of the time, respectively, under the Second Basis of  
 5 Comparison.

6 At San Luis Reservoir, the boat ramps at Dinosaur Point and Basalt Area are not  
 7 useable approximately 50 and 10 percent of the time, respectively, under the No  
 8 Action Alternative; and approximately 20 and 5 percent of the time, respectively,  
 9 under the Second Basis of Comparison.

10 At all reservoirs, boating opportunities would be decreased, and shoreline  
 11 recreational opportunities would be similar or decreased under the No Action  
 12 Alternative as compared to the Second Basis of Comparison.

13 *Potential Changes in Recreational Resources along Rivers Downstream of the*  
 14 *CVP and SWP Reservoirs*

15 The recreational opportunities along the Sacramento, Feather, American, and  
 16 Stanislaus rivers would be affected by the following changes in river flows, as  
 17 described in Chapter 5.

- 18 • Sacramento River downstream of Keswick Dam
  - 19 – Over long-term conditions, similar flows would occur in October,  
 20 February through May, July, and August; increased flows in September  
 21 and November (up to 37.7 percent); and reduced flows in December,  
 22 January, and June (up to 7.8 percent).
  - 23 – In wet years, similar flows would occur in January through July; increased  
 24 flows in September through November (up to 77.7 percent); and reduced  
 25 flows in December and August (up to 14.6 percent).
  - 26 – In dry years, similar flows would occur in July through October,  
 27 December through March, and May; increased flows in November  
 28 (33.4 percent).
- 29 • Sacramento River at Freeport
  - 30 – Over long-term conditions, similar flows would occur in October,  
 31 December through May, and August; increased flows in September,  
 32 November, and July (up to 43.3 percent); and reduced flows in June  
 33 (11.4 percent).
  - 34 – In wet years, similar flows would occur in January through June and  
 35 October; increased flows in July through September and November (up to  
 36 90.3 percent); and reduced flows in December (10.7 percent).
  - 37 – In dry years, similar flows would occur in August through October and  
 38 December through April; increased flows in November and July (up to  
 39 15.8 percent); and reduced flows in May and June (up to 11.9 percent).

- 1 • Feather River downstream of the Thermalito Complex
  - 2 – Over long-term conditions, similar flows would occur in November and
  - 3 April; increased flows in July through September (up to 76.1 percent); and
  - 4 reduced flows in October, December through March, May, and June (up to
  - 5 27.2 percent).
  - 6 – In wet years, similar flows would occur in October through November and
  - 7 March through May; increased flows in July through September (up to
  - 8 184 percent) and reduced flows in December through February (up to
  - 9 26.0 percent).
  - 10 – In dry years, similar flows would occur in November through March;
  - 11 increased flows in April and July (up to 52.4 percent); and reduced flows
  - 12 in August through October and May and June (up to 27.6 percent).
- 13 • American River downstream of Nimbus Dam
  - 14 – Over long-term conditions, similar flows would occur in November
  - 15 through May and July; increased flows in September and October (up to
  - 16 44.7 percent); and reduced flows in June and August (up to 6.1 percent).
  - 17 – In wet years, similar flows would occur in October through November and
  - 18 January through July; increased flows in September (91.1 percent) and
  - 19 reduced flows in December and August (up to 10.7 percent).
  - 20 – In dry years, similar flows would occur in all months except October,
  - 21 February and July; increased flows in October (16.5 percent); and reduced
  - 22 flows in February and July (up to 7.3 percent).
- 23 • Stanislaus River downstream of Goodwin Dam
  - 24 – Over long-term conditions, similar flows would occur in May and July
  - 25 through September; increased flows in October, March, and April (up to
  - 26 148.7 percent); and reduced flows in November through February and
  - 27 June (up to 33.8 percent).
  - 28 – In wet years, similar flows would occur in February and April; increased
  - 29 flows in October, March, May, July, and August (up to 117.1 percent);
  - 30 and reduced flows in September, November through January, and June (up
  - 31 to 50.8 percent).
  - 32 – In dry years, similar flows would occur in July through September;
  - 33 increased flows in October and April (up to 154.3 percent); and reduced
  - 34 flows in November through March, May, and June (up to 35.7 percent).

35 During the spring and summer months, the changes in flow conditions between  
36 the No Action Alternative and the Second Basis of Comparison vary on a monthly  
37 basis in the Sacramento, Feather, American, and Stanislaus rivers within a water  
38 year type. For example, flows in the Sacramento River at Freeport would  
39 increase in several months under the No Action Alternative as compared to the  
40 Second Basis of Comparison by up to 90 percent, and decrease in several months  
41 up to 11 percent. The overall range of flows is within the historical operational

1 range; therefore, recreational opportunities still exist. However, the value of the  
 2 recreational opportunities would be both improved and reduced depending upon  
 3 the timing of the changes.

4 Overall, under the No Action Alternative and the Second Basis of Comparison,  
 5 recreational opportunities would be reduced on the Sacramento River downstream  
 6 of Keswick Dam; and both improved and reduced on the Sacramento River near  
 7 Freeport, Feather River downstream of Thermalito Complex, American River  
 8 downstream of Nimbus Dam, and the Stanislaus River downstream of Goodwin  
 9 Dam depending upon the month.

#### 10 *Effects Related to Cross Delta Water Transfers*

11 Potential effects to recreational resources could be similar to those identified in a  
 12 recent environmental analysis conducted by Reclamation for long-term water  
 13 transfers from the Sacramento to San Joaquin valleys (Reclamation 2014c).

14 Potential effects to recreational resources were identified as changes in reservoir  
 15 surface water elevations, streams, and the Delta. The analysis indicated that these  
 16 potential impacts would not be substantial because the conditions with and  
 17 without the water transfers would be similar.

18 Under the No Action Alternative, the timing of cross Delta water transfers would  
 19 be limited to July through September and include annual volumetric limits, in  
 20 accordance with the 2008 USFWS BO and 2009 NMFS BO. Under the Second  
 21 Basis of Comparison, water could be transferred throughout the year without an  
 22 annual volumetric limit. Overall, the potential for cross Delta water transfers  
 23 would be less under the No Action Alternative than under the Second Basis of  
 24 Comparison.

#### 25 **15.4.3.1.3 San Francisco Bay Area, Central Coast, and Southern California** 26 **Region**

##### 27 *Potential Changes in Recreational Resources at Reservoirs that Store CVP and* 28 *SWP Water*

29 Changes in recreational resources at reservoirs that store CVP and SWP water  
 30 supplies are assumed to be related to changes in water deliveries over long-term  
 31 conditions for this EIS analysis. Monthly deliveries are not necessarily indicative  
 32 of reservoir storage because all or a portion of the water deliveries could be  
 33 directly conveyed to water users in any specific month. Therefore, annual  
 34 deliveries are considered to be relatively proportional to the amount of water that  
 35 could be stored over all water year types. In the San Francisco Bay Area Region,  
 36 values for the CVP municipal and industrial water deliveries and the SWP south  
 37 of the Delta water deliveries (without Article 21 deliveries) were considered; and  
 38 SWP south of the Delta water deliveries (without Article 21 deliveries) were  
 39 considered for the Central Coast and Southern California regions. Under the No  
 40 Action Alternative as compared to the Second Basis of Comparison CVP water  
 41 deliveries would be reduced by 10 percent and SWP water deliveries would be  
 42 reduced by 18 percent. Therefore, for this EIS analysis, it is assumed that  
 43 recreational resources related to surface water elevations in reservoirs that store  
 44 CVP and SWP water supplies would be reduced by 10 to 18 percent in the

1 San Francisco Bay Area Region and 18 percent in the Central Coast and Southern  
2 California regions.

3 **15.4.3.2 Alternative 1**

4 Alternative 1 is identical to the Second Basis of Comparison. As described in  
5 Chapter 4, Approach to Environmental Analysis, Alternative 1 is compared to the  
6 No Action Alternative and the Second Basis of Comparison. However, because  
7 recreational resource conditions under Alternative 1 are identical to recreational  
8 resource conditions under the Second Basis of Comparison; Alternative 1 is only  
9 compared to the No Action Alternative.

10 **15.4.3.2.1 Alternative 1 Compared to the No Action Alternative**

11 *Trinity River Region*

12 *Potential Changes in Recreational Resources at Reservoirs that Store CVP*  
13 *and SWP Water*

14 Changes in CVP water supplies and operations under Alternative 1 as compared  
15 to the No Action Alternative would result in similar end of September reservoir  
16 elevations and related recreational resources at Trinity Lake in all water year  
17 types, as described in Chapter 5, Surface Water Resources and Water Supplies.

18 There are several boat ramps at Trinity Lake that provide access at different  
19 elevations. Boat ramps at Stuart Fork and Bowerman are not useable when the  
20 water elevation is less than 2,323 feet which occurs approximately 80 percent of  
21 the time under Alternative 1 and the No Action Alternative. Boat ramps at Clark  
22 Springs, Fairview, and Trinity Center are not useable when the water elevation is  
23 lower than 2,300 feet which occurs approximately 62 percent of the time under  
24 Alternative 1 and the No Action Alternative. The Minersville boat ramp is  
25 accessible until the elevation declines below 2,170 feet which occurs  
26 approximately 5 percent of the time under Alternative 1 and the No Action  
27 Alternative.

28 The potential for reduced recreational resources at Trinity Lake related to  
29 shoreline activities would be less under the No Action Alternative as compared to  
30 the Second Basis of Comparison.

31 *Potential Changes in Recreational Resources along Rivers Downstream of the*  
32 *CVP and SWP Reservoirs*

33 The following changes would occur on the Trinity River under Alternative 1 as  
34 compared to the No Action Alternative, as summarized in Chapter 5, Surface  
35 Water Resources and Water Supplies.

- 36 • Over long-term conditions, flows would be similar in March through  
37 November; and increased in December through February (up to 10.5 percent).
- 38 • In wet years, flows would be similar in April through November; and  
39 increased in December through March (up to 12.6 percent).
- 40 • In dry years, flows would be similar all months.

1 Flows in Trinity River would be similar during the recreation season (spring and  
2 summer months); therefore, recreational opportunities would be similar.

### 3 *Central Valley Region*

#### 4 *Potential Changes in Recreational Resources at Reservoirs that Store CVP* 5 *and SWP Water*

6 Changes in CVP water supplies and operations under Alternative 1 as compared  
7 to the No Action Alternative would result in similar end of September reservoir  
8 elevations and related recreational resources at Shasta Lake, Lake Oroville,  
9 Folsom Lake, and New Melones Reservoir in all water year types; and at San Luis  
10 Reservoir in above normal, below normal, and dry years, as described in  
11 Chapter 5, Surface Water Resources and Water Supplies. Changes in recreational  
12 resources at San Luis Reservoir would be reduced in wet year and critical dry  
13 years because the end of September surface water elevations would be increased  
14 by 6.6 percent in wet and critical dry years.

15 There are several boat ramps at each of the reservoirs that provide access at  
16 different elevations. At Shasta Lake, boat ramps at Antlers, Hirz Bay, Packers  
17 Bay, Sugar Loaf, and Centimundi and Jones Valley are not accessible  
18 approximately 55, 30, 15, 10, and 7 percent of the time, respectively, under  
19 Alternative 1; and approximately 55, 35, 20, 10, and 9 percent of the time,  
20 respectively, under the No Action Alternative.

21 At Lake Oroville, boat ramps at Enterprise, Vinton Gulch, and Nelson Bar;  
22 Foreman Creek; Dark Canyon and Loafer Creek; and Bidwell Canyon, Lime  
23 Saddle, and Spillway are not accessible approximately 85, 75, 62, and 25 percent  
24 of the time, respectively, under Alternative 1; and approximately 95, 87, 73, and  
25 35 percent of the time, respectively, under the No Action Alternative.

26 At Folsom Lake, boat ramps at Rattlesnake Bar, Beal's Point; Peninsula, Brown's  
27 Ravine, and Folsom Point; Hobie Cove; and Granite Bay are not accessible  
28 approximately 65, 40, 10, and 7 percent of the time, respectively, under  
29 Alternative 1; and approximately 80, 65, 40, 10, and 7 percent of the time,  
30 respectively, under the No Action Alternative.

31 At New Melones Reservoir, the boat ramp at Angels Creek, Parrott's Ferry, Glory  
32 Hole, and Mark Twain are not accessible approximately 30, 25, 15, 5 percent of  
33 the time, respectively, under Alternative 1 as compared to approximately 65, 25,  
34 18, and 5 percent of the time, respectively, under the No Action Alternative.

35 At San Luis Reservoir, the boat ramps at Dinosaur Point and Basalt Area are not  
36 useable approximately 20 and 5 percent of the time, respectively, under  
37 Alternative 1; and approximately 50 and 10 percent of the time, respectively,  
38 under the No Action Alternative.

39 At all reservoirs, boating opportunities would be increased, and shoreline  
40 recreational opportunities would be similar or increased under Alternative 1 as  
41 compared to the No Action Alternative.

1        *Potential Changes in Recreational Resources along Rivers Downstream of the*  
2        *CVP and SWP Reservoirs*

3        The recreational opportunities along the Sacramento, Feather, American, and  
4        Stanislaus rivers would be affected by the following changes in river flows, as  
5        described in Chapter 5.

- 6        • Sacramento River downstream of Keswick Dam
  - 7            – Over long-term conditions, similar flows would occur in October,  
8            February through May, July, and August; reduced flows in September and  
9            November (up to 27.4 percent); and increased flows in December,  
10           January, and June (up to 8.4 percent).
  - 11           – In wet years, similar flows would occur in January through July; reduced  
12           flows in September through November (up to 43.7 percent); and increased  
13           flows in December and August (up to 17.0 percent).
  - 14           – In dry years, similar flows would occur in July through October,  
15           December through March, and May; reduced flows in November  
16           (25.0 percent); and increased flows in April and June (up to 7.8 percent).
- 17        • Sacramento River at Freeport
  - 18           – Over long-term conditions, similar flows would occur in October,  
19           December through May, and August; reduced flows in September,  
20           November, and July (up to 30.2 percent); and increased flows in June  
21           (12.8 percent).
  - 22           – In wet years, similar flows would occur in January through June and  
23           October; reduced flows in July through September and November (up to  
24           47.4 percent); and increased flows in December (6.6 percent).
  - 25           – In dry years, similar flows would occur in August through October and  
26           December through April; reduced flows in November and July (up to  
27           13.6 percent); and increased flows in May and June (up to 13.5 percent).
- 28        • Feather River downstream of the Thermalito Complex
  - 29           – Over long-term conditions, similar flows would occur in November and  
30           April; reduced flows in July through September (up to 43.2 percent); and  
31           increased flows in October, December through March, May, and June (up  
32           to 37.4 percent).
  - 33           – In wet years, similar flows would occur in October, November, and March  
34           through May; reduced flows in July through September (up to  
35           64.9 percent); and increased flows in December through February and  
36           June (up to 35.1 percent).
  - 37           – In dry years, similar flows would occur in December through April;  
38           reduced flows in July (34.4 percent); and increased flows in August  
39           through October, May, and June (up to 38.1 percent).

- 1 • American River downstream of Nimbus Dam
  - 2 – Over long-term conditions, similar flows would occur in November
  - 3 through May and July; reduced flows in September and October (up to
  - 4 30.9 percent); and increased flows in June (5.4 percent).
  - 5 – In wet years, similar flows would occur in October, November, and
  - 6 January through July; reduced flows in September (47.7 percent); and
  - 7 increased flows in August (12.0 percent).
  - 8 – In dry years, similar flows would occur in November through January,
  - 9 March through June, August, and September; reduced flows in October
  - 10 (14.1 percent); and increased flows in February and July (up to
  - 11 7.9 percent).
- 12 • Stanislaus River downstream of Goodwin Dam
  - 13 – Over long-term conditions, similar flows would occur in July through
  - 14 September; reduced flows in October, March, and April (up to
  - 15 59.8 percent); and increased flows in November through February and
  - 16 June (up to 51.1 percent).
  - 17 – In wet years, similar flows would occur in February and April; reduced
  - 18 flows in October, March, May, July, and August (up to 53.9 percent); and
  - 19 increased flows in September, November through January, and June (up to
  - 20 103.2 percent).
  - 21 – In dry years, similar flows would occur in July through September;
  - 22 reduced flows in October and April (up to 60.7 percent); and increased
  - 23 flows in November through March, May, and June (up to 55.5 percent).

24 During the spring and summer months, the changes in flow conditions between  
 25 Alternative 1 as compared to the No Action Alternative vary on a monthly basis  
 26 in the Sacramento, Feather, American, and Stanislaus rivers within a water year  
 27 type. For example, flows in the Sacramento River at Freeport would increase in  
 28 several months under Alternative 1 as compared to the No Action Alternative by  
 29 up to 17 percent, and decrease in several months up to 44 percent. The overall  
 30 range of flows is within the historical operational range; therefore, recreational  
 31 opportunities still exist. However, the value of the recreational opportunities  
 32 would be both improved and reduced depending upon the timing of the changes.

33 Overall, under Alternative 1 as compared to the No Action Alternative,  
 34 recreational opportunities would be improved on the Sacramento River  
 35 downstream of Keswick Dam; and both improved and reduced on the Sacramento  
 36 River near Freeport, Feather River downstream of Thermalito Complex,  
 37 American River downstream of Nimbus Dam, and the Stanislaus River  
 38 downstream of Goodwin Dam depending upon the month.

### 39 *Effects Related to Cross Delta Water Transfers*

40 Potential effects to recreational resources could be similar to those identified in a  
 41 recent environmental analysis conducted by Reclamation for long-term water  
 42 transfers from the Sacramento to San Joaquin valleys (Reclamation 2014c) as

1 described above under the No Action Alternative compared to the Second Basis  
2 of Comparison. For the purposes of this EIS, it is anticipated that similar  
3 conditions would occur during implementation of cross Delta water transfers  
4 under Alternative 1 and the No Action Alternative, and that impacts on  
5 recreational resources would not be substantial in the seller's service area due to  
6 implementation requirements of the transfer programs.

7 Under Alternative 1, water could be transferred throughout the year without an  
8 annual volumetric limit. Under the No Action Alternative, the timing of cross  
9 Delta water transfers would be limited to July through September and include  
10 annual volumetric limits, in accordance with the 2008 USFWS BO and 2009  
11 NMFS BO. Overall, the potential for cross Delta water transfers would be  
12 increased under Alternative 1 as compared to the No Action Alternative.

13 *San Francisco Bay Area, Central Coast, and Southern California Regions*

14 *Potential Changes in Recreational Resources at Reservoirs that Store CVP*  
15 *and SWP Water*

16 Changes in recreational resources at reservoirs that store CVP and SWP water  
17 supplies are assumed to be related to changes in water deliveries over long-term  
18 conditions for this EIS analysis, as described above under the No Action  
19 Alternative as compared to the Second Basis of Comparison. Therefore, under  
20 Alternative 1 as compared to the No Action Alternative, recreational resources  
21 related to surface water elevations in reservoirs that store CVP and SWP water  
22 supplies would be increased by 11 to 21 percent in the San Francisco Bay Area  
23 Region and 21 percent in the Central Coast and Southern California regions.

24 **15.4.3.2.2 Alternative 1 Compared to the Second Basis of Comparison**

25 Alternative 1 is identical to the Second Basis of Comparison.

26 **15.4.3.3 Alternative 2**

27 The CVP and SWP operations under Alternative 2 are identical to the CVP and  
28 SWP operations under the No Action Alternative; therefore, Alternative 2 is only  
29 compared to the Second Basis of Comparison.

30 **15.4.3.3.1 Alternative 2 Compared to the Second Basis of Comparison**

31 The CVP and SWP operations under Alternative 2 are identical to the CVP and  
32 SWP operations under the No Action Alternative. Therefore, changes to  
33 recreational resources conditions under Alternatives 2 as compared to the Second  
34 Basis of Comparison would be the same as the impacts described in Section  
35 15.4.3.1, No Action Alternative.

36 **15.4.3.4 Alternative 3**

37 As described in Chapter 3, Description of Alternatives, CVP and SWP operations  
38 under Alternative 3 are similar to the Second Basis of Comparison with modified  
39 Old and Middle River flow criteria and New Melones Reservoir operations; and  
40 additional predation control actions to reduce the populations of striped bass. As

1 described in Chapter 4, Approach to Environmental Analysis, Alternative 3 is  
2 compared to the No Action Alternative and the Second Basis of Comparison.

### 3 **15.4.3.4.1 Alternative 3 Compared to the No Action Alternative**

#### 4 *Trinity River Region*

##### 5 *Potential Changes in Recreational Resources at Reservoirs that Store CVP* 6 *and SWP Water*

7 Changes in CVP water supplies and operations under Alternative 3 as compared  
8 to the No Action Alternative would result in similar end of September reservoir  
9 elevations and related recreational resources at Trinity Lake in all water year  
10 types, as described in Chapter 5, Surface Water Resources and Water Supplies.

11 There are several boat ramps at Trinity Lake that provide access at different  
12 elevations. Boat ramps at Stuart Fork and Bowerman are not useable when the  
13 water elevation is less than 2,323 feet which occurs approximately 80 percent of  
14 the time under Alternative 3 and the No Action Alternative. Boat ramps at Clark  
15 Springs, Fairview, and Trinity Center are not useable when the water elevation is  
16 lower than 2,300 feet which occurs approximately 62 percent of the time under  
17 Alternative 3 and the No Action Alternative. The Minersville boat ramp is  
18 accessible until the elevation declines below 2,170 feet which occurs  
19 approximately 5 percent of the time under Alternative 3 and the No Action  
20 Alternative.

##### 21 *Potential Changes in Recreational Resources along Rivers Downstream of the* 22 *CVP and SWP Reservoirs*

23 The following changes would occur on the Trinity River under Alternative 3 as  
24 compared to the No Action Alternative, as summarized in Chapter 5, Surface  
25 Water Resources and Water Supplies.

- 26 • Over long-term conditions, flows would be similar in March through  
27 November; and increased in December through February (up to 11.8 percent).
- 28 • In wet years, flows would be similar in April through October; reduced in  
29 November (7.0 percent); and increased in December through March (up to  
30 15.1 percent).
- 31 • In dry years, flows would be similar in all months.

32 Flows in Trinity River would be similar during the recreation season (spring and  
33 summer months); therefore, recreational opportunities would be similar.

#### 34 *Central Valley Region*

##### 35 *Potential Changes in Recreational Resources at Reservoirs that Store CVP* 36 *and SWP Water*

37 Changes in CVP water supplies and operations under Alternative 3 as compared  
38 to the No Action Alternative would result in similar end of September reservoir  
39 elevations and related recreational resources at Shasta Lake, Lake Oroville,  
40 Folsom Lake, and New Melones Reservoir in all water year types; and at San Luis  
41 Reservoir in below normal, dry, and critical dry years, as described in Chapter 5,

1 Surface Water Resources and Water Supplies. Changes in recreational resources  
2 at San Luis Reservoir would be reduced in wet year and critical dry years because  
3 the end of September surface water elevations would be increased by 7.9 percent  
4 in wet years and 5.7 percent in above normal years.

5 There are several boat ramps at each of the reservoirs that provide access at  
6 different elevations. At Shasta Lake, boat ramps at Antlers, Hirz Bay, Packers  
7 Bay, Sugar Loaf, and Centimundi and Jones Valley are not accessible  
8 approximately 55, 30, 15, 10, and 7 percent of the time, respectively, under  
9 Alternative 3; and approximately 55, 35, 20, 10, and 9 percent of the time,  
10 respectively, under the No Action Alternative.

11 At Lake Oroville, boat ramps at Enterprise, Vinton Gulch, and Nelson Bar;  
12 Foreman Creek; Dark Canyon and Loafer Creek; and Bidwell Canyon, Lime  
13 Saddle, and Spillway are not accessible approximately 85, 75, 62, and 25 percent  
14 of the time, respectively, under Alternative 3; and approximately 95, 87, 73, and  
15 35 percent of the time, respectively, under the No Action Alternative.

16 At Folsom Lake, boat ramps at Rattlesnake Bar, Beal's Point; Peninsula, Brown's  
17 Ravine, and Folsom Point; Hobie Cove; and Granite Bay are not accessible  
18 approximately 65, 40, 10, and 7 percent of the time, respectively, under  
19 Alternative 3; and approximately 80, 65, 40, 10, and 7 percent of the time,  
20 respectively, under the No Action Alternative.

21 At New Melones Reservoir, the boat ramp at Angels Creek, Parrott's Ferry, Glory  
22 Hole, and Mark Twain are not accessible approximately 22, 18, 10, and 5 percent  
23 of the time, respectively, under Alternative 3 as compared to approximately  
24 65, 25, 18, and 5 percent of the time, respectively, under the No Action  
25 Alternative.

26 At San Luis Reservoir, the boat ramps at Dinosaur Point and Basalt Area are not  
27 useable approximately 28 and 8 percent of the time, respectively, under  
28 Alternative 3; and approximately 50 and 10 percent of the time, respectively,  
29 under the No Action Alternative.

30 At Lake Oroville, Folsom Lake, New Melones Reservoir, and San Luis Reservoir,  
31 boating opportunities would be increased, and opportunities would be similar at  
32 Shasta Lake under Alternative 3 as compared to the No Action Alternative. At  
33 Shasta Lake, Lake Oroville, and New Melones Reservoir shoreline recreational  
34 opportunities would be increased, and opportunities would be similar at Folsom  
35 Lake and San Luis Reservoir under Alternative 3 as compared to the No Action  
36 Alternative.

37 *Potential Changes in Recreational Resources along Rivers Downstream of the*  
38 *CVP and SWP Reservoirs*

39 The recreational opportunities along the Sacramento, Feather, American, and  
40 Stanislaus rivers would be affected by the following changes in river flows, as  
41 described in Chapter 5.

- 1 • Sacramento River downstream of Keswick Dam
- 2 – Over long-term conditions, similar flows would occur in October,  
3 February through May, July, and August; reduced flows in September and  
4 November (up to 20.1 percent); and increased flows in December,  
5 January, and June (up to 8.9 percent).
- 6 – In wet years, similar flows would occur in February through August;  
7 reduced flows in September through November (up to 42.1 percent); and  
8 increased flows in December and January (up to 16.9 percent).
- 9 – In dry years, similar flows would occur in July through September and  
10 December through May; reduced flows in November (24.6 percent); and  
11 increased flows in January and June (up to 7.3 percent).
- 12 • Sacramento River at Freeport
- 13 – Over long-term conditions, similar flows would occur in October,  
14 December through May, July, and August; reduced flows in September  
15 and November (up to 30.1 percent); and increased flows in June  
16 (12.1 percent).
- 17 – In wet years, similar flows would occur in January through May, July, and  
18 October; reduced flows in August, September, and November (up to  
19 48.1 percent); and increased flows in December and June (up to  
20 6.6 percent).
- 21 – In dry years, similar flows would occur in July through October and  
22 December through April; reduced flows in November (14.2 percent); and  
23 increased flows in May and June (up to 15.7 percent).
- 24 • Feather River downstream of the Thermalito Complex
- 25 – Over long-term conditions, similar flows would occur in October,  
26 November, March, April, and July; reduced flows in August and  
27 September (up to 49.4 percent); and increased flows in December through  
28 February, May, and June (up to 33.9 percent).
- 29 – In wet years, similar flows would occur in October, November, February  
30 through May, and July; reduced flows in August and September (up to  
31 70.0 percent) and increased flows in December, January, and June (up to  
32 28.1 percent).
- 33 – In dry years, similar flows would occur in September and January through  
34 April; reduced flows in October through December and July (up to  
35 14.5 percent); and increased flows in May, June, and August  
36 (36.9 percent).
- 37 • American River downstream of Nimbus Dam
- 38 – Over long-term conditions, similar flows would occur in November,  
39 January through May, July, and August; reduced flows in September and  
40 October (up to 28.7 percent); and increased flows in June (5.8 percent).

- 1       – In wet years, similar flows would occur in October, November, and  
2       January through July; reduced flows in September (45.9 percent); and  
3       increased flows in August and December (up to 8.5 percent).
- 4       – In dry years, similar flows would occur in November through January and  
5       March through September; reduced flows in October (11.2 percent); and  
6       increased flows in February (6.1 percent).
- 7       • Stanislaus River downstream of Goodwin Dam
- 8       – Over long-term conditions, reduced flows would occur in October and  
9       March through June (up to 58.3 percent); and increased flows in  
10       November through February and July through September (up to  
11       36.81 percent).
- 12       – In wet years, similar flows would occur in April; reduced flows in  
13       October, March, and May (up to 52.9 percent); and increased flows in  
14       June through September and November through February (up to  
15       67.8 percent).
- 16       – In dry years, similar flows would occur in March and July through  
17       September; reduced flows in October and April through June (up to  
18       59.6 percent); and increased flows in November through February (up to  
19       37.0 percent).

20       During the spring and summer months, the changes in flow conditions between  
21       Alternative 3 and the No Action Alternative vary on a monthly basis in the  
22       Sacramento, Feather, American, and Stanislaus rivers within a water year type.  
23       For example, flows in the Sacramento River at Freeport would increase in several  
24       months under Alternative 3 as compared to the No Action Alternative by up to  
25       15 percent, and decrease in several months up to 30 percent. The overall range of  
26       flows is within the historical operational range; therefore, recreational  
27       opportunities still exist. However, the value of the recreational opportunities  
28       would be both improved and reduced depending upon the timing of the changes.

29       Overall, under Alternative 3 as compared to the No Action Alternative,  
30       recreational opportunities would be similar or improved on the Sacramento River  
31       downstream of Keswick Dam and American River downstream of Nimbus Dam;  
32       and both improved and reduced on the Sacramento River near Freeport, Feather  
33       River downstream of Thermalito Complex, and the Stanislaus River downstream  
34       of Goodwin Dam depending upon the month.

35       Recreational opportunities related to Striped Bass fishing would initially be  
36       increased when Alternative 3 is implemented. However, by 2030, Striped Bass  
37       fishing opportunities would be reduced under Alternative 3 as compared to the No  
38       Action Alternative due to actions to reduce predation.

39       Recreational opportunities related to sport ocean salmon fishing would be reduced  
40       under Alternative 3 as compared to the No Action Alternative.

1        *Effects Related to Cross Delta Water Transfers*

2 Potential effects to recreational resources could be similar to those identified in a  
3 recent environmental analysis conducted by Reclamation for long-term water  
4 transfers from the Sacramento to San Joaquin valleys (Reclamation 2014c) as  
5 described above under the No Action Alternative compared to the Second Basis  
6 of Comparison. For the purposes of this EIS, it is anticipated that similar  
7 conditions would occur during implementation of cross Delta water transfers  
8 under Alternative 3 and the No Action Alternative, and that impacts on  
9 recreational resources would not be substantial in the seller's service area due to  
10 implementation requirements of the transfer programs.

11 Under Alternative 3, water could be transferred throughout the year without an  
12 annual volumetric limit. Under the No Action Alternative, the timing of cross  
13 Delta water transfers would be limited to July through September and include  
14 annual volumetric limits, in accordance with the 2008 USFWS BO and 2009  
15 NMFS BO. Overall, the potential for cross Delta water transfers would be  
16 increased under Alternative 3 as compared to the No Action Alternative.

17 *San Francisco Bay Area, Central Coast, and Southern California Regions*

18        *Potential Changes in Recreational Resources at Reservoirs that Store CVP*  
19        *and SWP Water*

20 Changes in recreational resources at reservoirs that store CVP and SWP water  
21 supplies are assumed to be related to changes in water deliveries over long-term  
22 conditions for this EIS analysis, as described above under the No Action  
23 Alternative as compared to the Second Basis of Comparison. Therefore, under  
24 Alternative 3 as compared to the No Action Alternative, recreational resources  
25 related to surface water elevations in reservoirs that store CVP and SWP water  
26 supplies would be increased by 9 to 17 percent in the San Francisco Bay Area  
27 Region and 17 percent in the Central Coast and Southern California regions.

28 **15.4.3.4.2 Alternative 3 Compared to the Second Basis of Comparison**

29 *Trinity River Region*

30        *Potential Changes in Recreational Resources at Reservoirs that Store CVP*  
31        *and SWP Water*

32 Changes in CVP water supplies and operations under Alternative 3 as compared  
33 to the Second Basis of Comparison would result in similar end of September  
34 reservoir elevations and related recreational resources at Trinity Lake in all water  
35 year types, as described in Chapter 5, Surface Water Resources and Water  
36 Supplies.

37 There are several boat ramps at Trinity Lake that provide access at different  
38 elevations. Boat ramps at Stuart Fork and Bowerman are not useable when the  
39 water elevation is less than 2,323 feet which occurs approximately 80 percent of  
40 the time under Alternative 3 and the Second Basis of Comparison. Boat ramps at  
41 Clark Springs, Fairview, and Trinity Center are not useable when the water  
42 elevation is lower than 2,300 feet which occurs approximately 62 percent of the  
43 time under Alternative 3 and the Second Basis of Comparison. The Minersville

1 boat ramp is accessible until the elevation declines below 2,170 feet which occurs  
2 approximately 5 percent of the time under Alternative 3 and the Second Basis of  
3 Comparison.

4 The potential for reduced recreational resources at Trinity Lake related to  
5 shoreline activities would be greater in critical dry years and similar in dry years  
6 and over the long-term average conditions under the No Action Alternative as  
7 compared to the Second Basis of Comparison.

8 *Potential Changes in Recreational Resources along Rivers Downstream of the*  
9 *CVP and SWP Reservoirs*

10 Flows in the Trinity River and recreational opportunities under Alternative 3  
11 would be similar to the Second Basis of Comparison, as summarized in Chapter 5,  
12 Surface Water Resources and Water Supplies.

13 *Central Valley Region*

14 *Potential Changes in Recreational Resources at Reservoirs that Store CVP*  
15 *and SWP Water*

16 Changes in CVP water supplies and operations under Alternative 3 as compared  
17 to the Second Basis of Comparison would result in similar end of September  
18 reservoir elevations and related recreational resources at Shasta Lake, Lake  
19 Oroville, Folsom Lake, New Melones Reservoir, and San Luis Reservoir in all  
20 water year types, as described in Chapter 5, Surface Water Resources and Water  
21 Supplies.

22 There are several boat ramps at each of the reservoirs that provide access at  
23 different elevations. At Shasta Lake, boat ramps at Antlers, Hirz Bay, Packers  
24 Bay, Sugar Loaf, and Centimundi and Jones Valley are not accessible  
25 approximately 55, 30, 15, 10, and 7 percent of the time, respectively, under  
26 Alternative 3 and the Second Basis of Comparison.

27 At Lake Oroville, boat ramps at Enterprise, Vinton Gulch, and Nelson Bar;  
28 Foreman Creek; Dark Canyon and Loafer Creek; and Bidwell Canyon, Lime  
29 Saddle, and Spillway are not accessible approximately 85, 75, 62, and 35 percent  
30 of the time, respectively, under Alternative 3 and the Second Basis of  
31 Comparison.

32 At Folsom Lake, boat ramps at Rattlesnake Bar; Beal's Point; Peninsula, Brown's  
33 Ravine, and Folsom Point; Hobie Cove; and Granite Bay are not accessible  
34 approximately 70, 65, 40, 10, and 7 percent of the time, respectively, under  
35 Alternative 3 and the Second Basis of Comparison.

36 At New Melones Reservoir, the boat ramp at Angels Creek, Parrott's Ferry, Glory  
37 Hole, and Mark Twain are not accessible approximately 22, 18, 10, and 8 percent  
38 of the time, respectively, under Alternative 3 as compared to approximately  
39 30, 25, 15, and 3 percent of the time, respectively, under the Second Basis of  
40 Comparison.

41 At San Luis Reservoir, the boat ramps at Dinosaur Point and Basalt Area are not  
42 useable approximately 28 and 8 percent of the time, respectively, under

1 Alternative 3; and approximately 20 and 5 percent of the time, respectively, under  
2 the Second Basis of Comparison.

3 Boating opportunities would be increased at New Melones Reservoir, decreased  
4 at San Luis Reservoir, and similar at all other reservoirs under Alternative 3 as  
5 compared to the Second Basis of Comparison. Shoreline recreational  
6 opportunities would be increased at New Melones Reservoir, decreased at Lake  
7 Oroville, and similar at all other reservoirs under Alternative 3 as compared to the  
8 Second Basis of Comparison.

9 *Potential Changes in Recreational Resources along Rivers Downstream of the*  
10 *CVP and SWP Reservoirs*

11 The recreational opportunities along the Sacramento, Feather, American, and  
12 Stanislaus rivers would be affected by the following changes in river flows, as  
13 described in Chapter 5.

- 14 • Similar or increased flows in the Sacramento River downstream of Keswick  
15 Dam and at Freeport.
- 16 • Feather River downstream of the Thermalito Complex
  - 17 – Over long-term conditions, similar flows would occur in November and  
18 January through June; reduced flows in October, December, and  
19 September (up to 12.5 percent); and increased flows in July and August  
20 (up to 17.0 percent).
  - 21 – In wet years, similar flows would occur in November and January through  
22 May; reduced flows in October, December, and September (up to  
23 14.6 percent); and increased flows in June through August (up to  
24 10.9 percent).
  - 25 – In dry years, similar flows would occur in November and January through  
26 June; reduced flows in August through October (up to 21.2 percent); and  
27 increased flows in July (37.1 percent).
- 28 • Similar flows in American River downstream of Nimbus Dam.
- 29 • Stanislaus River downstream of Goodwin Dam
  - 30 – Over long-term conditions, similar flows would occur in October,  
31 December, January, and March; reduced flows would occur in November,  
32 May, and June (up to 52.3 percent); and increased flows in February,  
33 April, and July through September (up to 26.8 percent).
  - 34 – In wet years, similar flows would occur in October, November, January,  
35 and April; reduced flows in May and June (up to 44.8 percent); and  
36 increased flows in December, February, March, and July through  
37 September (up to 68.6 percent).
  - 38 – In dry years, similar flows would occur in July through October; reduced  
39 flows in November through March and May through June (up to  
40 36.0 percent); and increased flows in April (40.2 percent).

1 During the spring and summer months, the changes in flow conditions between  
2 Alternative 3 and the Second Basis of Comparison vary on a monthly basis in the  
3 Sacramento, Feather, American, and Stanislaus rivers within a water year type.  
4 For example, flows in the Stanislaus River downstream of Goodwin Dam would  
5 increase in several months under Alternative 3 as compared to the Second Basis  
6 of Comparison by up to 90 percent, and decrease in several months up to  
7 11 percent. The overall range of flows is within the historical operational range;  
8 therefore, recreational opportunities still exist.

9 Overall, under Alternative 3 as compared to the Second Basis of Comparison,  
10 recreational opportunities would be similar or improved on the Sacramento,  
11 Feather, and American rivers; and both improved and reduced on the Stanislaus  
12 River depending upon the month.

13 Recreational opportunities related to Striped Bass fishing would initially be  
14 increased when Alternative 3 is implemented. However, by 2030, Striped Bass  
15 fishing opportunities would be reduced under Alternative 3 as compared to the  
16 Second Basis of Comparison due to actions to reduce predation.

17 Recreational opportunities related to sport ocean salmon fishing would be reduced  
18 under Alternative 3 as compared to the Second Basis of Comparison.

19 *Effects Related to Cross Delta Water Transfers*

20 Potential effects to recreational resources could be similar to those identified in a  
21 recent environmental analysis conducted by Reclamation for long-term water  
22 transfers from the Sacramento to San Joaquin valleys (Reclamation 2014c) as  
23 described above under the No Action Alternative compared to the Second Basis  
24 of Comparison. For the purposes of this EIS, it is anticipated that similar  
25 conditions would occur during implementation of cross Delta water transfers  
26 under Alternative 3 and the Second Basis of Comparison, and that impacts on  
27 recreational resources would not be substantial in the seller's service area due to  
28 implementation requirements of the transfer programs.

29 Under Alternative 3 and the Second Basis of Comparison, water could be  
30 transferred throughout the year without an annual volumetric limit. Overall, the  
31 potential for cross Delta water transfers would be similar under Alternative 3 and  
32 the Second Basis of Comparison.

33 *San Francisco Bay Area, Central Coast, and Southern California Regions*

34 *Potential Changes in Recreational Resources at Reservoirs that Store CVP*  
35 *and SWP Water*

36 Changes in recreational resources at reservoirs that store CVP and SWP water  
37 supplies are assumed to be related to changes in water deliveries over long-term  
38 conditions for this EIS analysis, as described above under the No Action  
39 Alternative as compared to the Second Basis of Comparison. Therefore, under  
40 Alternative 3 as compared to the Second Basis of Comparison, recreational  
41 resources related to surface water elevations in reservoirs that store CVP and  
42 SWP water supplies would be similar (changes within 5 percent).

1    **15.4.3.5   Alternative 4**

2    The recreational resources under Alternative 4 would be similar to the conditions  
3    under the Second Basis of Comparison with additional predation control actions  
4    to reduce the populations of striped bass.

5    **15.4.3.5.1   Alternative 4 Compared to the No Action Alternative**

6    The CVP and SWP operations under Alternative 4 are identical to the CVP and  
7    SWP operations under the Second Basis of Comparison and Alternative 1.  
8    However, Alternative 4 includes predation controls as compared to the Second  
9    Basis. Therefore, reservoir and flow-related changes in recreational resources  
10   under Alternative 4 as compared to the No Action Alternative would be the same  
11   as the impacts described in Section 15.4.3.2.1, Alternative 1 Compared to the No  
12   Action Alternative.

13   Recreational opportunities related to Striped Bass fishing would initially be  
14   increased when Alternative 4 is implemented. However, by 2030, Striped Bass  
15   fishing opportunities would be reduced under Alternative 4 as compared to the No  
16   Action Alternative due to actions to reduce predation.

17   Recreational opportunities related to sport ocean salmon fishing would be reduced  
18   under Alternative 4 as compared to the No Action Alternative.

19   **15.4.3.5.2   Alternative 4 Compared to the Second Basis of Comparison**

20   The CVP and SWP operations under Alternative 4 are identical to the CVP and  
21   SWP operations under the Second Basis of Comparison and Alternative 1.  
22   However, Alternative 4 includes predation controls as compared to the Second  
23   Basis of Comparison. Therefore, flow-related changes in recreational resources  
24   under Alternative 4 are the same as recreational resources under the Second Basis  
25   of Comparison.

26   Recreational opportunities related to Striped Bass fishing would initially be  
27   increased when Alternative 4 is implemented. However, by 2030, Striped Bass  
28   fishing opportunities would be reduced under Alternative 4 as compared to the  
29   Second Basis of Comparison due to actions to reduce predation.

30   Recreational opportunities related to sport ocean salmon fishing would be reduced  
31   under Alternative 4 as compared to the Second Basis of Comparison.

32   **15.4.3.6   Alternative 5**

33   As described in Chapter 3, Description of Alternatives, CVP and SWP operations  
34   under Alternative 5 are similar to the No Action Alternative with modified Old  
35   and Middle River flow criteria and New Melones Reservoir operations. As  
36   described in Chapter 4, Approach to Environmental Analysis, Alternative 5 is  
37   compared to the No Action Alternative and the Second Basis of Comparison.

1 **15.4.3.6.1 Alternative 5 Compared to the No Action Alternative**

2 *Trinity River Region*

3 *Potential Changes in Recreational Resources at Reservoirs that Store CVP*  
4 *and SWP Water*

5 Changes in CVP water supplies and operations under Alternative 5 as compared  
6 to the No Action Alternative would result in similar end of September reservoir  
7 elevations and related recreational resources at Trinity Lake in all water year  
8 types, as described in Chapter 5, Surface Water Resources and Water Supplies.

9 There are several boat ramps at Trinity Lake that provide access at different  
10 elevations. Boat ramps at Stuart Fork and Bowerman are not useable when the  
11 water elevation is less than 2,323 feet which occurs approximately 80 percent of  
12 the time under Alternative 5 and the No Action Alternative. Boat ramps at Clark  
13 Springs, Fairview, and Trinity Center are not useable when the water elevation is  
14 lower than 2,300 feet which occurs approximately 62 percent of the time under  
15 Alternative 5 and the No Action Alternative. The Minersville boat ramp is  
16 accessible until the elevation declines below 2,170 feet which occurs  
17 approximately 8 percent of the time under Alternative 5 and 5 percent of the time  
18 under the No Action Alternative.

19 The potential for reduced recreational resources at Trinity Lake related to  
20 shoreline activities would be slightly less in critical dry years and similar over the  
21 long-term average conditions and dry years under Alternative 5 as compared to  
22 the No Action Alternative.

23 *Potential Changes in Recreational Resources along Rivers Downstream of the*  
24 *CVP and SWP Reservoirs*

25 Flows in the Trinity River and recreational opportunities under Alternative 5  
26 would be similar to the No Action Alternative, as summarized in Chapter 5,  
27 Surface Water Resources and Water Supplies.

28 *Central Valley Region*

29 *Potential Changes in Recreational Resources at Reservoirs that Store CVP*  
30 *and SWP Water*

31 Changes in CVP water supplies and operations under Alternative 5 as compared  
32 to the No Action Alternative would result in similar end of September reservoir  
33 elevations and related recreational resources at Shasta Lake, Lake Oroville,  
34 Folsom Lake, New Melones Reservoir, and San Luis Reservoir in all water year  
35 types, as described in Chapter 5, Surface Water Resources and Water Supplies.

36 There are several boat ramps at each of the reservoirs that provide access at  
37 different elevations. At Shasta Lake, boat ramps at Antlers, Hirz Bay, Packers  
38 Bay, Sugar Loaf, and Centimundi and Jones Valley are not accessible  
39 approximately 55, 35, 20, 10, and 9 percent of the time, respectively, under  
40 Alternative 5 and the No Action Alternative.

41 At Lake Oroville, boat ramps at Enterprise, Vinton Gulch, and Nelson Bar;  
42 Foreman Creek; Dark Canyon and Loafer Creek; and Bidwell Canyon, Lime  
43 Saddle, and Spillway are not accessible approximately 95, 87, 73, and 35 percent

1 of the time, respectively, under Alternative 5 and the Second Basis of  
2 Comparison.

3 At Folsom Lake, boat ramps at Rattlesnake Bar, Beal's Point; Peninsula, Brown's  
4 Ravine, and Folsom Point; Hobie Cove; and Granite Bay are not accessible  
5 approximately 80, 65, 40, 10, and 7 percent of the time, respectively, under  
6 Alternative 5 and the No Action Alternative.

7 At New Melones Reservoir, the boat ramp at Angels Creek, Parrott's Ferry, Glory  
8 Hole, and Mark Twain are not accessible approximately 35, 30, 22, and 8 percent  
9 of the time, respectively, under Alternative 5 as compared to approximately  
10 65, 25, 18, and 5 percent of the time, respectively, under the No Action  
11 Alternative.

12 At San Luis Reservoir, the boat ramps at Dinosaur Point and Basalt Area are not  
13 useable approximately 50 and 10 percent of the time, respectively, under  
14 Alternative 5 and the No Action Alternative.

15 Increased shoreline recreational opportunities at New Melones Reservoir in long-  
16 term average conditions and dry years, decreased opportunities at New Melones  
17 Reservoir in critical dry years, and similar opportunities at all times analyzed at  
18 all other reservoirs under Alternative 5 as compared to the No Action Alternative.  
19 Increased boating opportunities at New Melones Reservoir and similar  
20 opportunities at all other reservoirs under Alternative 5 as compared to the No  
21 Action Alternative.

22 *Potential Changes in Recreational Resources along Rivers downstream of the*  
23 *CVP and SWP Reservoirs*

24 The recreational opportunities along the Sacramento, Feather, American, and  
25 Stanislaus rivers would be affected by the following changes in river flows, as  
26 described in Chapter 5.

- 27 • Flows in the Sacramento River downstream of Keswick Dam and near  
28 Freeport would be similar.
- 29 • Feather River downstream of the Thermalito Complex
  - 30 – Over long-term conditions, similar flows would occur in June through  
31 April; and reduced flows in May (6.6 percent).
  - 32 – In wet years, similar flows would occur in all months.
  - 33 – In dry years, similar flows would occur in September through April and  
34 June; reduced flows in May (27.1 percent); and increased flows in July  
35 and August (up to 8.9 percent).
- 36 • Flows in the American River downstream of Nimbus Dam would be similar.
- 37 • Stanislaus River downstream of Goodwin Dam
  - 38 – Over long-term conditions, flows would be similar in September through  
39 February and June; reduced flows would occur in March, July, and August

- 1 (up to 8.0 percent); and increased flows in April and May (up to  
2 22.4 percent).
- 3 – In wet years, similar flows would occur in October, November, January,  
4 February, and April through June; reduced flows in December, March, and  
5 July through September (up to 18.0 percent).
  - 6 – In dry years, similar flows would occur in June through March; and  
7 increased flows in April and May (up to 47.3 percent).

8 During the spring and summer months, the changes in flow conditions between  
9 Alternative 5 and the No Action Alternative vary on a monthly basis in the  
10 Sacramento, Feather, American, and Stanislaus rivers within a water year type.  
11 For example, flows in the Feather River downstream of Thermalito Complex  
12 would increase in several months under Alternative 5 and the No Action  
13 Alternative by up to 9 percent, and decrease in several months up to 27 percent.  
14 The overall range of flows is within the historical operational range; therefore,  
15 recreational opportunities still exist. However, the value of the recreational  
16 opportunities would be both improved and reduced depending upon the timing of  
17 the changes.

18 Overall, under Alternative 5 and the No Action Alternative, recreational  
19 opportunities would be similar or improved on the Sacramento and American  
20 rivers; and both improved and reduced on the Feather and Stanislaus rivers.

#### 21 *Effects Related to Cross Delta Water Transfers*

22 Potential effects to recreational resources could be similar to those identified in a  
23 recent environmental analysis conducted by Reclamation for long-term water  
24 transfers from the Sacramento to San Joaquin valleys (Reclamation 2014c) as  
25 described above under the No Action Alternative compared to the Second Basis  
26 of Comparison. For the purposes of this EIS, it is anticipated that similar  
27 conditions would occur during implementation of cross Delta water transfers  
28 under Alternative 5 and the No Action Alternative, and that impacts on  
29 recreational resources would not be substantial in the seller's service area due to  
30 implementation requirements of the transfer programs.

31 Under Alternative 5 and the No Action Alternative, the timing of cross Delta  
32 water transfers would be limited to July through September and include annual  
33 volumetric limits, in accordance with the 2008 USFWS BO and 2009 NMFS BO.  
34 Overall, the potential for cross Delta water transfers would be similar under  
35 Alternative 5 and the No Action Alternative.

#### 36 *San Francisco Bay Area, Central Coast, and Southern California Region*

##### 37 *Potential Changes in Recreational Resources at Reservoirs that Store CVP* 38 *and SWP Water*

39 Changes in recreational resources at reservoirs that store CVP and SWP water  
40 supplies are assumed to be related to changes in water deliveries over long-term  
41 conditions for this EIS analysis, as described above under the No Action  
42 Alternative as compared to the Second Basis of Comparison. Therefore, under

1 Alternative 5 as compared to the No Action Alternative, recreational resources  
2 would be similar.

### 3 **15.4.3.6.2 Alternative 5 Compared to the Second Basis of Comparison**

#### 4 *Trinity River Region*

##### 5 *Potential Changes in Recreational Resources at Reservoirs that Store CVP* 6 *and SWP Water*

7 Changes in CVP water supplies and operations under Alternative 5 as compared  
8 to the Second Basis of Comparison would result in similar end of September  
9 reservoir elevations and related recreational resources at Trinity Lake in all water  
10 year types, as described in Chapter 5, Surface Water Resources and Water  
11 Supplies.

12 There are several boat ramps at Trinity Lake that provide access at different  
13 elevations. Boat ramps at Stuart Fork and Bowerman are not useable when the  
14 water elevation is less than 2,323 feet which occurs approximately 80 percent of  
15 the time under Alternative 5 and the Second Basis of Comparison. Boat ramps at  
16 Clark Springs, Fairview, and Trinity Center are not useable when the water  
17 elevation is lower than 2,300 feet which occurs approximately 62 percent of the  
18 time under Alternative 5 and the Second Basis of Comparison. The Minersville  
19 boat ramp is accessible until the elevation declines below 2,170 feet which occurs  
20 approximately 8 percent of the time under Alternative 5 and 5 percent of the time  
21 under the Second Basis of Comparison.

22 The potential for reduced recreational resources at Trinity Lake related to  
23 shoreline activities would be similar under Alternative 5 as compared to the  
24 Second Basis of Comparison.

##### 25 *Potential Changes in Recreational Resources along Rivers Downstream of the* 26 *CVP and SWP Reservoirs*

27 Flows in Trinity River would be similar during the recreation season (spring and  
28 summer months); therefore, recreational opportunities would be similar under  
29 Alternative 5 as compared to the Second Basis of Comparison.

#### 30 *Central Valley Region*

##### 31 *Potential Changes in Recreational Resources at Reservoirs that Store CVP* 32 *and SWP Water*

33 Changes in CVP water supplies and operations under Alternative 5 as compared  
34 to the Second Basis of Comparison would result in similar end of September  
35 reservoir elevations and related recreational resources at Shasta Lake, Lake  
36 Oroville, Folsom Lake, and New Melones Reservoir in all water year types; and  
37 at San Luis Reservoir in wet, above normal, and below normal years, as described  
38 in Chapter 5, Surface Water Resources and Water Supplies. Changes in  
39 recreational resources at San Luis Reservoir would be reduced in dry year and  
40 critical dry years because the end of September surface water elevations would be  
41 decreased by 6.2 percent in dry years and 8.5 percent in critical dry years.

- 1 There are several boat ramps at each of the reservoirs that provide access at  
2 different elevations. At Shasta Lake, boat ramps at Antlers, Hirz Bay, Packers  
3 Bay, Sugar Loaf, and Centimundi and Jones Valley are not accessible  
4 approximately 55, 35, 20, 10, and 9 percent of the time, respectively, under  
5 Alternative 5; and approximately 55, 30, 15, 10, and 7 percent of the time,  
6 respectively, under the Second Basis of Comparison.
- 7 At Lake Oroville, boat ramps at Enterprise, Vinton Gulch, and Nelson Bar;  
8 Foreman Creek; Dark Canyon and Loafer Creek; and Bidwell Canyon, Lime  
9 Saddle, and Spillway are not accessible approximately 95, 87, 73, and 35 percent  
10 of the time, respectively, under Alternative 5; and approximately 85, 75, 62, and  
11 25 percent of the time, respectively, under the Second Basis of Comparison.
- 12 At Folsom Lake, boat ramps at Rattlesnake Bar are not accessible 80 percent of  
13 the time under Alternative 5, and 70 percent of the time, respectively, under the  
14 Second Basis of Comparison. Boat ramps at Beal's Point; Peninsula, Brown's  
15 Ravine, and Folsom Point; Hobie Cove; and Granite Bay are not accessible  
16 approximately 65, 40, 10, and 7 percent of the time, respectively, under  
17 Alternative 5 and the Second Basis of Comparison.
- 18 At New Melones Reservoir, the boat ramp at Angels Creek, Parrott's Ferry, Glory  
19 Hole, and Mark Twain are not accessible approximately 35, 30, 22, and 8 percent  
20 of the time, respectively, under Alternative 5 as compared to approximately  
21 30, 25, 15, and 5 percent of the time, respectively, under the Second Basis of  
22 Comparison.
- 23 At San Luis Reservoir, the boat ramps at Dinosaur Point and Basalt Area are not  
24 useable approximately 50 and 10 percent of the time, respectively, under  
25 Alternative 5; and approximately 20 and 5 percent of the time, respectively, under  
26 the Second Basis of Comparison.
- 27 Decreased shoreline recreational opportunities at Shasta Lake, Lake Oroville, and  
28 New Melones Reservoir, and similar opportunities at all other reservoirs under  
29 Alternative 5 as compared to the Second Basis of Comparison. Decreased  
30 boating opportunities at Lake Oroville, New Melones Reservoir, and San Luis  
31 Reservoir and similar opportunities at all other reservoirs under Alternative 5 as  
32 compared to the Second Basis of Comparison.
- 33 *Potential Changes in Recreational Resources along Rivers Downstream of the*  
34 *CVP and SWP Reservoirs*
- 35 The recreational opportunities along the Sacramento, Feather, American, and  
36 Stanislaus rivers would be affected by the following changes in river flows, as  
37 described in Chapter 5.
- 38 • Sacramento River downstream of Keswick Dam
    - 39 – Over long-term conditions, flows would be similar in July, August,  
40 October, and February through April; reduced in December, January, May  
41 and June (up to 8.2 percent); and increased in September and November  
42 (up to 38.5 percent).

- 1       – In wet years, flows would be similar in January through July; reduced in  
2       December and August (up to 15.0 percent); and increased in September  
3       through November (up to 77.3 percent).
- 4       – In dry years, similar flows would occur in July through October and  
5       December through March; reduced in April through June (up to  
6       10.1 percent); and increased flows in November (32.1 percent).
- 7       • Sacramento River at Freeport
- 8       – Over long-term conditions, flows would be similar in October and  
9       December through April; reduced in May and June (up to 11.5 percent);  
10      and increased in July through September and November (43.4 percent).
- 11      – In wet years, flows would be similar in October and January through June;  
12      reduced in December (6.2 percent); and increased in July through  
13      September and November (up to 89.0 percent).
- 14      – In dry years, similar flows would occur in August through October and  
15      December through April; reduced in May and June (up to 13.6 percent);  
16      and increased flows in July and November (up to 19.3 percent).
- 17      • Feather River downstream of the Thermalito Complex
- 18      – Over long-term conditions, similar flows would occur in November and  
19      April; reduced flows in October, December through March, May, and June  
20      (up to 27.7 percent); and increased flows in July through September (up to  
21      76.2 percent).
- 22      – In wet years, similar flows would occur in October, November, March  
23      through May; reduced flows in December through February and June (up  
24      to 25.6 percent); and increased flows in July through September (up to  
25      181.9 percent).
- 26      – In dry years, similar flows would occur in November through April;  
27      reduced flows in October, May, June, August, and September (up to  
28      45.4 percent); and increased flows in July (60.4 percent).
- 29      • American River downstream of Nimbus Dam
- 30      – Over long-term conditions, similar flows would occur in November  
31      through July; reduced flows in August (5.8 percent); and increased in  
32      September and October (42.4 percent).
- 33      – In wet years, similar flows would occur in October, November, and  
34      January through July; reduced flows in December and August (up to  
35      13.7 percent); and increased flows in September (88.2 percent).
- 36      – In dry years, similar flows would occur in November through September;  
37      and increased flows in October (16.7 percent).
- 38      • Stanislaus River downstream of Goodwin Dam
- 39      – Over long-term conditions, similar flows would occur in August; reduced  
40      flows would occur in November through February, June, July, August, and

1 September (up to 35.8 percent); and increased flows in October and March  
2 through May (up to 144.8 percent).

3 – In wet years, similar flows would occur in February and April; reduced  
4 flows in November through January and June through September (up to  
5 52.8 percent); and increased flows in October and March (up to  
6 113.1 percent).

7 – In dry years, similar flows would occur in July through September;  
8 reduced flows in November through March and June (up to 35.7 percent);  
9 and increased flows in October, April, and May (150.1 percent).

10 During the spring and summer months, the changes in flow conditions between  
11 Alternative 5 and the Second Basis of Comparison vary on a monthly basis in the  
12 Sacramento, Feather, American, and Stanislaus rivers within a water year type.  
13 For example, flows in the Sacramento River at Freeport would increase in several  
14 months under Alternative 5 as compared to the Second Basis of Comparison by  
15 up to 89 percent, and decrease in several months up to 13 percent. The overall  
16 range of flows is within the historical operational range; therefore, recreational  
17 opportunities still exist. However, the value of the recreational opportunities  
18 would be both improved and reduced depending upon the timing of the changes.

19 Overall, under Alternative 5 as compared to the Second Basis of Comparison,  
20 recreational opportunities would be similar or improved on the Sacramento River  
21 downstream of Keswick Dam and American River downstream of Nimbus Dam;  
22 and both improved and reduced on the Sacramento River near Freeport, Feather  
23 River downstream of Thermalito Complex, and the Stanislaus River downstream  
24 of Goodwin Dam depending upon the month.

#### 25 *Effects Related to Cross Delta Water Transfers*

26 Potential effects to recreational resources could be similar to those identified in a  
27 recent environmental analysis conducted by Reclamation for long-term water  
28 transfers from the Sacramento to San Joaquin valleys (Reclamation 2014c) as  
29 described above under the No Action Alternative compared to the Second Basis  
30 of Comparison. For the purposes of this EIS, it is anticipated that similar  
31 conditions would occur during implementation of cross Delta water transfers  
32 under Alternative 5 and the Second Basis of Comparison, and that impacts on  
33 recreational resources would not be substantial in the seller's service area due to  
34 implementation requirements of the transfer programs.

35 Under Alternative 5, the timing of cross Delta water transfers would be limited to  
36 July through September and include annual volumetric limits, in accordance with  
37 the 2008 USFWS BO and 2009 NMFS BO. Under the Second Basis of  
38 Comparison, water could be transferred throughout the year without an annual  
39 volumetric limit. Overall, the potential for cross Delta water transfers would be  
40 reduced under Alternative 5 as compared to the Second Basis of Comparison.

1 *San Francisco Bay Area, Central Coast, and Southern California Regions*  
 2 *Potential Changes in Recreational Resources at Reservoirs that Store CVP*  
 3 *and SWP Water*  
 4 Changes in recreational resources at reservoirs that store CVP and SWP water  
 5 supplies are assumed to be related to changes in water deliveries over long-term  
 6 conditions for this EIS analysis, as described above under the No Action  
 7 Alternative as compared to the Second Basis of Comparison. Therefore, under  
 8 Alternative 5 as compared to the Second Basis of Comparison, recreational  
 9 resources related to surface water elevations in reservoirs that store CVP and  
 10 SWP water supplies would be reduced by 10 to 18 percent in the San Francisco  
 11 Bay Area Region and 18 percent in the Central Coast and Southern California  
 12 regions.

13 **15.4.3.7 Summary of Impact Assessment**

14 The results of the impact assessment of implementation of Alternatives 1  
 15 through 5 as compared to the No Action Alternative and the Second Basis of  
 16 Comparison are presented in Tables 15.28 and 15.29.

17 **Table 15.28 Comparison of Alternatives 1 through 5 to No Action Alternative**

Alternative	Potential Change	Consideration for Mitigation Measures
Alternative 1	<p>Recreational resources would be similar at Trinity Lake, Shasta Lake, Lake Oroville, Folsom Lake, and New Melones Reservoir in all water year types; and at San Luis Reservoir in above normal, below normal, and dry years. Recreational resources would be increased by 6 percent in wet and critical dry years at San Luis Reservoir, by 11 to 21 percent in the San Francisco Bay Area Region, and by 21 percent in the Central Coast and Southern California regions.</p> <p>Recreational opportunities would be similar or improved on Trinity River, Sacramento River downstream of Keswick Dam, and American River downstream of Nimbus Dam. On the Sacramento River near Freeport, Feather River downstream of Thermalito Complex, and the Stanislaus River downstream of Goodwin Dam recreational opportunities would be similar or improved in most spring and summer months; and reduced in July in all years and August in wetter years.</p>	No mitigation measures identified at this time to reduce flow reduction impacts on recreation opportunities.
Alternative 2	No effects on recreational resources.	None needed

Chapter 15: Recreation Resources

Alternative	Potential Change	Consideration for Mitigation Measures
Alternative 3	<p>Recreational resources would be similar at Trinity Lake, Shasta Lake, Lake Oroville, Folsom Lake, and New Melones Reservoir in all water year types; and at San Luis Reservoir in above normal, below normal, and dry years. Recreational resources would be increased by 8 percent in wet years and 6 percent in above normal years at San Luis Reservoir, by 9 to 17 percent in the San Francisco Bay Area Region, and by 17 percent in the Central Coast and Southern California regions.</p> <p>Recreational opportunities would be similar or improved on Trinity River, Sacramento River downstream of Keswick Dam, and American River downstream of Nimbus Dam. On the Sacramento River near Freeport and Feather River downstream of Thermalito Complex, recreational opportunities would be similar or improved in most spring and summer months; and reduced in August in all years on both rivers and in July on the Feather River in dry years. On the Stanislaus River downstream of Goodwin Dam recreational opportunities would be similar or improved in summer months; and reduced in May and June in all water year types.</p> <p>Recreational opportunities related to Striped Bass fishing and sport ocean salmon fishing would be reduced.</p>	<p>No mitigation measures identified at this time to reduce flow reduction impacts on recreation opportunities.</p> <p>No mitigation measures identified at this time to reduce impacts to reduction in Striped Bass and sport ocean salmon fishing opportunities.</p>
Alternative 4	<p>Reservoir and flow-related recreational opportunities would be as described for Alternative 1 compared to the No Action Alternative.</p> <p>Recreational opportunities related to Striped Bass fishing and sport ocean salmon fishing would be reduced.</p>	<p>No mitigation measures identified at this time to reduce flow reduction impacts on recreation opportunities.</p> <p>No mitigation measures identified at this time to reduce impacts to reduction in Striped Bass and sport ocean salmon fishing opportunities.</p>
Alternative 5	<p>Recreational resources would be similar at Trinity Lake, Shasta Lake, Lake Oroville, Folsom Lake, San Luis Reservoir, and other reservoirs that store CVP and SWP water in the San Francisco Bay Area, Central Coast, and Southern California regions.</p> <p>Recreational opportunities would be similar or improved on Trinity River, Sacramento River downstream of Keswick Dam and near Freeport, and American River downstream of Nimbus Dam. On the Feather River downstream of Thermalito Complex, recreational opportunities would be similar or improved in most spring and summer months; and reduced in May in all years. On the Stanislaus River downstream of Goodwin Dam recreational opportunities would be similar or improved in spring months; and reduced in July and August in most water year types.</p>	<p>No mitigation measures identified at this time to reduce flow reduction impacts on recreation opportunities.</p>

1 Note: Due to the limitations and uncertainty in the CalSim II monthly model and other  
2 analytical tools, incremental differences of 5 percent or less between alternatives and the  
3 No Action Alternative are considered to be “similar.”

1 **Table 15.29 Comparison of No Action Alternative and Alternatives 1 through 5 to**  
 2 **Second Basis of Comparison**

Alternative	Potential Change	Consideration for Mitigation Measures
No Action Alternative	<p>Recreational resources would be similar at Trinity Lake, Shasta Lake, Lake Oroville, Folsom Lake, and New Melones Reservoir in all water year types; and at San Luis Reservoir in above normal, below normal, and dry years. Recreational resources would be reduced by 6 percent in wet and critical dry years at San Luis Reservoir, by 10 to 18 percent in the San Francisco Bay Area Region, and by 18 percent in the Central Coast and Southern California regions.</p> <p>Recreational opportunities would be similar or improved on Trinity River. On the Sacramento River downstream of Keswick Dam and near Freeport, Feather River downstream of Thermalito Complex, American River downstream of Nimbus Dam, and the Stanislaus River downstream of Goodwin Dam recreational opportunities would be similar or improved in most spring and summer months; and reduced in June in most years, August in some years on the Feather and American rivers, and in May in some years on Sacramento River near Freeport and on the Feather River.</p>	Not considered for this comparison.
Alternative 1	No effects on recreational resources.	Not considered for this comparison.
Alternative 2	Same effects as described for No Action Alternative as compared to the Second Basis of Comparison.	Not considered for this comparison.
Alternative 3	<p>Recreational resources would be similar at Trinity Lake, Shasta Lake, Lake Oroville, Folsom Lake, San Luis Reservoir, and other reservoirs that store CVP and SWP water in the San Francisco Bay Area, Central Coast, and Southern California regions.</p> <p>Recreational opportunities would be similar or improved on Trinity River, Sacramento River downstream of Keswick Dam and near Freeport, and American River downstream of Nimbus Dam. On the Feather River downstream of Thermalito Complex, recreational opportunities would be similar or improved in most spring and summer months; and reduced in August in dry years. On the Stanislaus River downstream of Goodwin Dam recreational opportunities would be similar or improved in summer months; and reduced in May and June in all water year types.</p> <p>Recreational opportunities related to Striped Bass fishing and sport ocean salmon fishing would be reduced.</p>	Not considered for this comparison.
Alternative 4	<p>Reservoir and flow-related recreational opportunities would be similar.</p> <p>Recreational opportunities related to Striped Bass fishing and sport ocean salmon fishing would be reduced.</p>	Not considered for this comparison.

Alternative	Potential Change	Consideration for Mitigation Measures
Alternative 5	<p>Recreational resources would be similar at Trinity Lake, Shasta Lake, Lake Oroville, Folsom Lake, and New Melones Reservoir in all water year types; and at San Luis Reservoir in above normal, below normal, and dry years. Recreational resources would be reduced by 6 percent in dry years and 9 percent in critical dry years at San Luis Reservoir, by 10 to 18 percent in the San Francisco Bay Area Region, and by 18 percent in the Central Coast and Southern California regions.</p> <p>Recreational opportunities would be similar or improved on Trinity River. On the Sacramento River downstream of Keswick Dam and near Freeport, Feather River downstream of Thermalito Complex, American River downstream of Nimbus Dam, and the Stanislaus River downstream of Goodwin Dam recreational opportunities would be similar or improved in many spring and summer months. Flows would reduce in May and June in most years on the Sacramento and Feather rivers; in August on the American River; and in June through August on the Stanislaus River.</p>	Not considered for this comparison.

1 Note: Due to the limitations and uncertainty in the CalSim II monthly model and other  
 2 analytical tools, incremental differences of 5 percent or less between alternatives and the  
 3 No Action Alternative are considered to be “similar.”

4 **15.4.3.8 Potential Mitigation Measures**

5 Mitigation measures are not included in this EIS to address adverse impacts under  
 6 the alternatives as compared to the Second Basis of Comparison because this  
 7 analysis was included in this EIS for information purposes only.

8 Changes in CVP and SWP operations under Alternatives 1 through 5 as compared  
 9 to the No Action Alternative would not result in adverse changes in recreational  
 10 resources at reservoirs. However, implementation of Alternatives 1, 3, 4, and 5  
 11 would result in adverse changes in recreational opportunities along rivers  
 12 downstream of CVP and SWP reservoirs. Implementation of Alternatives 3 and 4  
 13 would result in adverse changes in recreational Striped Bass and sport ocean  
 14 salmon fishing opportunities. Mitigation measures have not been identified at this  
 15 time.

16 **15.4.3.9 Cumulative Effects Analysis**

17 As described in Chapter 3, the cumulative effects analysis considers projects,  
 18 programs, and policies that are not speculative; and are based upon known or  
 19 reasonably foreseeable long-range plans, regulations, operating agreements, or  
 20 other information that establishes them as reasonably foreseeable.

21 The cumulative effects analysis for Alternatives 1 through 5 for Recreational  
 22 Opportunities are summarized in Table 15.30.

1 **Table 15.30 Summary of Cumulative Effects on Recreational Opportunities with**  
 2 **Implementation of Alternatives 1 through 5 as Compared to the No Action**  
 3 **Alternative**

Scenarios	Actions	Cumulative Effects of Actions
<p>Past &amp; Present, and Future Actions Included and in the No Action Alternative and in All Alternatives in Year 2030</p>	<p>Consistent with Affected Environment conditions plus:</p> <p>Actions in the 2008 USFWS BO and 2009 NMFS BO that would have occurred without implementation of the BOs, as described in Section 3.3.1.2 (of Chapter 3, Descriptions of Alternatives), including climate change and sea level rise</p> <p>Actions not included in the 2008 USFWS BO and 2009 NMFS BO that would have occurred without implementation of the BOs, as described in Section 3.3.1.3 (of Chapter 3, Descriptions of Alternatives):</p> <ul style="list-style-type: none"> <li>- Implementation of Federal and state policies and programs, including Clean Water Act (e.g., Total Maximum Daily Loads); Safe Drinking Water Act; Clean Air Act; and flood management programs</li> <li>- General plans for 2030.</li> <li>- Trinity River Restoration Program.</li> <li>- Central Valley Project Improvement Act programs</li> <li>- Folsom Dam Water Control Manual Update</li> <li>- FERC Relicensing for the Middle Fork of the American River Project</li> <li>- San Joaquin River Restoration Program</li> <li>- Contra Loma Recreation Resource Management Plan</li> <li>- San Luis Reservoir State Recreation Area Resource Management Plan/General Plan</li> </ul>	<p><u>These effects would be the same under all alternatives.</u></p> <p>Climate change and sea level rise and development under the general plans are anticipated to reduce carryover storage in reservoirs and changes in stream flow patterns in a manner that would change recreational opportunities, and could reduce the opportunities for sport ocean salmon fishing.</p> <p>Other actions, including restoration projects, FERC relicensing projects, and some future projects to improve water quality and/or habitat are anticipated to improve recreational opportunities.</p>
<p>Future Actions Considered as Cumulative Effects Actions in All Alternatives in Year 2030</p>	<p>Actions as described in Section 3.5 (of Chapter 3, Descriptions of Alternatives):</p> <ul style="list-style-type: none"> <li>- Bay-Delta Water Quality Control Plan Update</li> <li>- FERC Relicensing Projects</li> <li>- Bay Delta Conservation Plan (including the California WaterFix alternative)</li> <li>- Shasta Lake Water Resources, North-of-the-Delta Offstream Storage, Los Vaqueros Reservoir Expansion Phase 2, and Upper San Joaquin River Basin Storage Investigations</li> <li>- El Dorado Water and Power Authority Supplemental Water Rights Project</li> <li>- Semitropic Water Storage District Delta Wetlands</li> <li>- North Bay Aqueduct Alternative Intake</li> <li>- Irrigated Lands Regulatory Program</li> </ul>	<p><u>These effects would be the same under all alternatives.</u></p> <p>Some of the future reasonably foreseeable actions to improve water quality and FERC Relicensing projects would improve recreational opportunities.</p> <p>Other future reasonably foreseeable actions, such as expanded or new reservoirs would improve recreational opportunities.</p>
<p>No Action Alternative with Associated Cumulative Effects Actions in Year 2030</p>	<p>Full implementation of the 2008 USFWS BO and 2009 NMFS BO</p>	<p>Implementation of No Action Alternative with future reasonably foreseeable actions would result in changes stream flows would result in changes to related recreational opportunities as compared to historical conditions prior to the BOs.</p>

Chapter 15: Recreation Resources

Scenarios	Actions	Cumulative Effects of Actions
Alternative 1 with Associated Cumulative Effects Actions in Year 2030	No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant)	Implementation of Alternative 1 with future reasonably foreseeable actions would result in reduced stream flows and related recreational opportunities along the Sacramento River near Freeport, Feather River downstream of Thermalito Complex, American River downstream of Nimbus Dam, and the Stanislaus River downstream of Goodwin Dam in July in all years and August in wetter years compared to the No Action Alternative with the added actions.
Alternative 2 with Associated Cumulative Effects Actions in Year 2030	Full implementation of the 2008 USFWS BO and 2009 NMFS BO CVP and SWP operational actions No implementation of structural improvements or other actions that require further study to develop a more detailed action description.	Implementation of Alternative 2 with future reasonably foreseeable actions for recreational opportunities would be the same as for the No Action Alternative with the added actions.
Alternative 3 with Associated Cumulative Effects Actions in Year 2030	No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant) Slight increase in positive Old and Middle River flows in the winter and spring months Increased bag limits for Striped Bass and Pikeminnow Increased sport ocean salmon fishing harvest limitations	Implementation of Alternative 3 with future reasonably foreseeable actions would result in reduced stream flows and related recreational opportunities along the Sacramento River near Freeport, Feather River downstream of Thermalito Complex would be reduced in August in all years on both rivers and in July on the Feather River in dry years. On the Stanislaus River downstream of Goodwin Dam recreational opportunities would be reduced in May and June in all water year types compared to the No Action Alternative with the added actions. Recreational opportunities related to Striped Bass fishing would initially be increased; however by 2030 recreational fishing related to Striped Bass would be reduced. Recreational opportunities related to sport ocean salmon fishing would be reduced.
Alternative 4 with Associated Cumulative Effects Actions in Year 2030	No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant) Increased bag limits for Striped Bass and Pikeminnow Increased sport ocean salmon fishing harvest limitations	Implementation of Alternative 4 with future reasonably foreseeable actions would result in reduced stream flows and related recreational opportunities along the Sacramento River near Freeport, Feather River downstream of Thermalito Complex, American River downstream of Nimbus Dam, and the Stanislaus River downstream of Goodwin Dam in July in all years and August in wetter years compared to the No Action Alternative with the added actions. Recreational opportunities related to Striped Bass fishing would initially be increased; however by 2030 recreational fishing related to Striped Bass would be reduced. Recreational opportunities related to sport ocean salmon fishing would be reduced.

Scenarios	Actions	Cumulative Effects of Actions
Alternative 5 with Associated Cumulative Effects Actions in Year 20530	Full implementation of the 2008 USFWS BO and 2009 NMFS BO Positive Old and Middle River flows and increased Delta outflow in spring months	Implementation of Alternative 5 with future reasonably foreseeable actions would result in reduced stream flows and related recreational opportunities along the Feather River downstream of Thermalito Complex would be reduced in May in all years compared to the No Action Alternative with the added actions. On the Stanislaus River downstream of Goodwin Dam recreational opportunities would be reduced in July and August in most water year types compared to the No Action Alternative with the added actions.

## Chapter 16

# 1 Air Quality and Greenhouse Gas 2 Emissions

## 3 16.1 Introduction

4 This chapter describes existing and future air quality conditions and the potential  
5 for greenhouse gas emissions that could occur as a result of implementing the  
6 alternatives that could change the long-term operation of the Central Valley  
7 Project (CVP) and State Water Project (SWP) as evaluated in this Environmental  
8 Impact Statement (EIS). Implementation of the alternatives could affect CVP and  
9 SWP water deliveries which could indirectly affect air quality.

## 10 16.2 Terminology

11 Important air quality and greenhouse gas emission terminology used in this  
12 chapter are defined by the U.S. Environmental Protection Agency (USEPA) and  
13 the California Air Resources Board (ARB), as summarized below.

- 14 • **Attainment Area:** A geographic area considered to have air quality as good  
15 as or better than the national and/or state ambient air quality standards. An  
16 area may be an attainment area for one pollutant and a non-attainment area for  
17 others (USEPA 2006).
- 18 • **California Ambient Air Quality Standard (CAAQS):** A legal limit that  
19 specifies the maximum level and time of exposure in the outdoor air for a  
20 given air pollutant and which is protective of human health and public welfare  
21 (California Health and Safety Code section 39606b). CAAQS are  
22 recommended by the California Office of Environmental Health Hazard  
23 Assessment and adopted into regulation by the ARB. CAAQS are the  
24 standards which must be met per the requirements of the California Clean Air  
25 Act (ARB 2010).
- 26 • **Criteria Pollutant:** An air pollutant for which acceptable levels of exposure  
27 can be determined and for which an ambient air quality standard has been set  
28 (ARB 2010). The criteria pollutants are ozone (O<sub>3</sub>), carbon monoxide (CO),  
29 nitrogen oxides (NO<sub>x</sub>), sulfur dioxide (SO<sub>2</sub>), particulate matter less than  
30 10 microns in aerodynamic diameter (PM<sub>10</sub>), particulate matter less than  
31 2.5 microns in aerodynamic diameter (PM<sub>2.5</sub>), and lead (Pb).
- 32 • **Greenhouse Gases (GHGs):** Atmospheric gases (such as carbon dioxide  
33 (CO<sub>2</sub>), methane (CH<sub>4</sub>), hydrofluorocarbons (HFC), nitrous oxide (N<sub>2</sub>O), O<sub>3</sub>,  
34 perfluorocarbons (PFC), sulfur hexafluoride (SF<sub>6</sub>), and water vapor) that slow  
35 the passage of re-radiated heat through the Earth's atmosphere (ARB 2010).

- 1 Six of the GHGs are the subject of reductions under the Kyoto Protocol and  
2 California Assembly Bill 32 are CO<sub>2</sub>, CH<sub>4</sub>, N<sub>2</sub>O, HFC, PFC, and SF<sub>6</sub>.
- 3 • **National Ambient Air Quality Standard (NAAQS):** Standards established  
4 by USEPA that apply for outdoor air throughout the United States (USEPA  
5 2006).
  - 6 • **Nonattainment Area:** A geographic area identified by the USEPA and/or  
7 ARB as not meeting either NAAQS or CAAQS for a given pollutant  
8 (ARB 2010).
  - 9 • **Precursor:** In photochemistry, a compound antecedent to a pollutant. For  
10 example, volatile organic compounds (VOC) and NO<sub>x</sub> react in sunlight to  
11 form the criteria pollutant ozone. As such, VOCs and NO<sub>x</sub> are precursors to  
12 O<sub>3</sub> (USEPA 2006).
  - 13 • **Reactive Organic Gas (ROG):** A photochemically reactive chemical gas  
14 composed of non-methane hydrocarbons (HCs) that may contribute to the  
15 formation of smog (ARB 2010). ROG may also be referred to as non-  
16 methane organic gases, VOCs, or HCs.
  - 17 • **State Implementation Plan (SIP):** A plan prepared by states and submitted  
18 to USEPA describing how each area will attain and maintain NAAQS. SIPs  
19 include the technical foundation for understanding the air quality (e.g.,  
20 emission inventories and air quality monitoring), control measures and  
21 strategies, and enforcement mechanisms (ARB 2010).
  - 22 • **Toxic Air Contaminant (TAC):** An air pollutant, identified in regulation by  
23 the ARB, which may cause or contribute to an increase in deaths or in serious  
24 illness, or which may pose a present or potential hazard to human health.  
25 Health effects of TACs may occur at extremely low levels and it is typically  
26 difficult to identify levels of exposure that do not produce adverse health  
27 effects (ARB 2010).

28 In California, local air districts have been established to oversee the attainment of  
29 air quality standards within air basins as defined by the State. Local air districts  
30 administer air quality laws and regulations within the air basins. The local air  
31 districts have permitting authority over all stationary sources of air pollutants  
32 within their district boundaries and provide the primary review of environmental  
33 documents prepared for projects with air quality issues.

### 34 **16.3 Regulatory Environment and Compliance** 35 **Requirements**

36 Potential actions that could be implemented under the alternatives evaluated in  
37 this EIS could affect future air quality conditions and the potential for GHG  
38 emissions. Implementation of the alternatives could affect CVP and SWP water  
39 deliveries which could affect air quality related to agricultural operations and  
40 fugitive dust generation. Changes in air quality and GHG emissions are analyzed

1 in this EIS relative to appropriate Federal and state agency policies and  
2 regulations, as described in Chapter 4, Approach to Environmental Analyses.

3 Several of the Federal and state laws and regulations that provide quantitative  
4 criteria to determine compliance also are summarized in this subsection of this  
5 chapter to provide context for information provided in the remaining sections of  
6 this chapter, including:

- 7 • Federal Clean Air Act
  - 8 – National Ambient Air Quality Standards and Federal Air Quality
  - 9 Designations
  - 10 – Federal General Conformity Requirements
- 11 • California Clean Air Act
- 12 • California Assembly Bill 32, California Global Warming Solutions Act
- 13 of 2006

#### 14 **16.3.1 Federal Clean Air Act**

15 National air quality policies are regulated through the Federal Clean Air Act  
16 (FCAA) of 1970 and its 1977 and 1990 amendments. Basic elements of the  
17 FCCA include NAAQS for criteria air pollutants, hazardous air pollutants  
18 standards, state attainment plans, motor vehicle emissions standards, stationary  
19 source emissions standards and permits, acid rain control measures, stratospheric  
20 ozone protection, and enforcement provisions.

##### 21 **16.3.1.1 National Ambient Air Quality Standards and Federal Air Quality** 22 **Designations**

23 Pursuant to the FCAA, the USEPA established NAAQS for O<sub>3</sub>, CO, NO<sub>2</sub>, sulfur  
24 dioxide (SO<sub>x</sub> as SO<sub>2</sub>), PM<sub>10</sub>, PM<sub>2.5</sub>, and lead. These pollutants are referred to as  
25 criteria pollutants because numerical health-based criteria have been established  
26 that define acceptable levels of exposure for each pollutant. The NAAQS and the  
27 CAAQS are summarized in Table 16.1 (ARB 2013).

1

**Table 16.1 Federal and State Ambient Air Quality Standards**

Pollutant	Averaging Time	National Standards <sup>a</sup> Primary <sup>b, i</sup>	National Standards <sup>a</sup> Secondary <sup>c, i</sup>	California Standards <sup>d</sup>
Ozone	8 Hour 1 Hour	0.075 ppm –	0.075 ppm –	0.07 ppm 0.09 ppm
Carbon monoxide	8 Hour 1 Hour	9 ppm 35 ppm	– –	9.0 ppm 20 ppm
Nitrogen dioxide <sup>j</sup>	Annual Arithmetic Mean 1 Hour	0.053 ppm 100 ppb	0.053 ppm –	0.30 ppm 0.18 ppm
Sulfur dioxide <sup>e</sup>	Annual Arithmetic Mean 24 Hour 3 Hour 1 Hour	0.030 ppm 0.14 ppm – 75 ppb	– – 0.5 ppm –	– 0.04 ppm – 0.25 ppm
PM <sub>10</sub> <sup>f</sup>	Annual Arithmetic Mean 24 Hour	– 150 µg/m <sup>3</sup>	– 150 µg/m <sup>3</sup>	20 µg/m <sup>3</sup> 50 µg/m <sup>3</sup>
PM <sub>2.5</sub> <sup>f</sup>	Annual Arithmetic Mean 24 Hour	12 µg/m <sup>3</sup> 35 µg/m <sup>3</sup>	15 µg/m <sup>3</sup> 35 µg/m <sup>3</sup>	12 µg/m <sup>3</sup> –
Sulfates	24 Hour	–	–	25 µg/m <sup>3</sup>
Lead <sup>g, k</sup>	30 Day Average Calendar Quarter Rolling 3-Month Average	– 1.5 µg/m <sup>3</sup> 0.15 µg/m <sup>3</sup>	– 1.5 µg/m <sup>3</sup> 0.15 µg/m <sup>3</sup>	1.5 µg/m <sup>3</sup> – –
Hydrogen sulfide	1 Hour	–	–	0.03 ppm
Vinyl chloride	24 Hour	–	–	0.01 ppm
Visibility-reducing particles	8 Hour	–	–	See Note <sup>h</sup>

2 Source: ARB 2012, ARB 2013b.

3 Notes:

4 a. National standards, other than ozone, particulate matter, and those based on annual  
5 averages or annual arithmetic means, are not to be exceeded more than once a year.  
6 The ozone standard is attained when the fourth highest eight hour concentration in a  
7 year, averaged over three years, is equal to or less than the standard. For PM<sub>10</sub>, the  
8 24-hour standard is attained when the expected number of days per calendar year with a  
9 24-hour average concentration above 150 µg/m<sup>3</sup> is equal to or less than one. For PM<sub>2.5</sub>,  
10 the 24-hour standard is attained when 98 percent of the daily concentrations, averaged  
11 over 3 years, are equal to or less than the standard.

12 b. National Primary Standards: The levels of air quality necessary, with an adequate  
13 margin of safety, to protect the public health.

- 1 c. National Secondary Standards: The levels of air quality necessary to protect the public  
2 welfare from any known or anticipated adverse effects of a pollutant.
- 3 d. California standards for ozone, carbon monoxide, sulfur dioxide (1-hour and 24-hour),  
4 nitrogen dioxide, suspended particulate matter (PM<sub>10</sub>, PM<sub>2.5</sub>, and visibility reducing  
5 particles), are values that are not to be exceeded. All others are not to be equaled or  
6 exceeded. All others are not to be equaled or exceeded. California ambient air quality  
7 standards are listed in the Table of Standards in Section 70200 of Title 17 of the  
8 California Code of Regulations.
- 9 e. On June 2, 2010, a new 1-hour SO<sub>2</sub> standard was established and the existing 24-hour  
10 and annual primary standards were revoked. To attain the 1-hour national standard, the  
11 3-year average of the annual 99th percentile of the 1-hour daily maximum concentrations  
12 at each site must not exceed 75 ppb. The 1971 SO<sub>2</sub> national standards (24-hour and  
13 annual) remain in effect until one year after an area is designated for the 2010 standard,  
14 except for areas designated nonattainment for the 1971 standards, where the 1971  
15 standards remain in effect until implementation plans to attain or maintain the 2010  
16 standards are approved.
- 17 f. On December 14, 2012, the national annual PM<sub>2.5</sub> primary standard was lowered from  
18 15 µg/m<sup>3</sup> to 12.0 µg/m<sup>3</sup>. The existing national 24-hour PM<sub>2.5</sub> standards (primary and  
19 secondary) were retained at 35 µg/m<sup>3</sup>, as was the annual secondary standard of  
20 15 µg/m<sup>3</sup>. The existing 24-hour PM<sub>10</sub> standards (primary and secondary) of 150 µg/m<sup>3</sup>  
21 also were retained. The form of the annual primary and secondary standards is the  
22 annual mean, averaged over 3 years.
- 23 g. The national standard for lead was revised on October 15, 2008, to a rolling 3-month  
24 average. The 1978 lead standard (1.5 µg/m<sup>3</sup> as a quarterly average) remains in effect  
25 until one year after an area is designated for the 2008 standard, except for areas  
26 designated nonattainment for the 1978 standard, where the 1978 standard remains in  
27 effect until implementation plans to attain or maintain the 2008 standard are approved.
- 28 h. In 1989, the ARB converted both the general statewide 10-mile visibility standard and  
29 the Lake Tahoe 30-mile visibility standard to instrumental equivalents, which are  
30 "extinction of 0.23 per kilometer" and "extinction of 0.07 per kilometer" for the statewide  
31 and Lake Tahoe Air Basin standards, respectively.
- 32 i. Concentration expressed first in units in which it was promulgated. Equivalent units  
33 given in parentheses are based upon a reference temperature of 25°C and a reference  
34 pressure of 760 torr. Most measurements of air quality are to be corrected to a reference  
35 temperature of 25°C and a reference pressure of 760 torr; ppm in this table refers to ppm  
36 by volume, or micromoles of pollutant per mole of gas.
- 37 j. To attain the 1-hour national standard, the 3-year average of the annual 98<sup>th</sup> percentile  
38 of the 1-hour daily maximum concentrations at each site must not exceed 100 ppb. Note  
39 that the national 1-hour standard is in units of parts per billion (ppb). California standards  
40 are in units of parts per million (ppm). To directly compare the national 1-hour standard  
41 to the California standards the units can be converted from ppb to ppm. In this case, the  
42 national standard of 100 ppb is identical to 0.100 ppm.
- 43 k. The ARB has identified lead and vinyl chloride as 'toxic air contaminants' with no  
44 threshold level of exposure for adverse health effects determined. These actions allow  
45 for the implementation of control measures at levels below the ambient concentrations  
46 specified for these pollutants.
- 47 µg/m<sup>3</sup> = micrograms per cubic meter.  
48 ppb = parts per billion (by volume).  
49 ppm = parts per million (by volume).

1 The USEPA designates areas as attainment, nonattainment, or unclassified for  
2 individual criteria pollutants depending on whether the areas achieve (i.e., attain)  
3 the applicable NAAQS for each pollutant. For some pollutants, there are  
4 numerous classifications of the nonattainment designation, depending on the  
5 severity of an area's nonattainment status. Areas that lack monitoring data are  
6 designated as unclassified areas, and considered as attainment areas for regulatory  
7 purposes.

8 Under the 1977 FCAA amendments, states (or areas within states) with ambient  
9 air quality concentrations that do not meet the NAAQS are required to develop  
10 and maintain SIPs. These implementation plans constitute a federally enforceable  
11 definition of the state's approach and schedule for the attainment of the NAAQS.  
12 If a nonattainment area achieves compliance, the area is classified as an  
13 attainment maintenance area for 20 years.

#### 14 **16.3.1.2 Federal General Conformity Requirements**

15 The 1977 FCAA amendments state that the Federal government is prohibited  
16 from engaging in, supporting, providing financial assistance for, licensing,  
17 permitting, or approving any activity that does not conform to an applicable SIP.  
18 In the 1990 FCAA amendments, the USEPA included provisions requiring  
19 Federal agencies to ensure that actions undertaken in nonattainment or attainment  
20 maintenance areas are consistent with applicable SIPs. The process of  
21 determining whether a Federal action is consistent with applicable SIPs is called  
22 "conformity" determination. A conformity determination is required only for the  
23 project alternative that is ultimately selected and approved. The USEPA general  
24 conformity regulation applies only to Federal actions that result in emissions of  
25 "nonattainment or maintenance pollutants" or their precursors in federally  
26 designated nonattainment or maintenance areas. The emission thresholds that  
27 trigger requirements of the general conformity regulation for Federal actions  
28 emitting nonattainment or maintenance pollutants, or their precursors, are called  
29 *de Minimis* levels, as summarized in Table 16.2.

1 **Table 16.2 General Conformity *de Minimis* Levels**

Pollutant	Area Type	Tons/Year
Ozone (VOC or NOx)	Serious nonattainment	50
	Severe nonattainment	25
	Extreme nonattainment	10
	Other areas outside an ozone transport region	100
Ozone (NOx)	Marginal and moderate nonattainment inside an ozone transport region	100
	Maintenance	100
Ozone (VOC)	Marginal and moderate nonattainment inside an ozone transport region	50
	Maintenance within an ozone transport region	50
	Maintenance outside an ozone transport region	100
Carbon monoxide, SO <sub>2</sub> and NO <sub>2</sub>	All nonattainment and maintenance	100
PM <sub>10</sub>	Serious nonattainment	70
	Moderate nonattainment and maintenance	100
PM <sub>2.5</sub> Direct emissions, SO <sub>2</sub> , NOx (unless determined not to be a significant precursor), VOC or ammonia (if determined to be significant precursors)	All nonattainment and maintenance	100
Lead (Pb)	All nonattainment and maintenance	25

2 Source: USEPA 2015b

3 **16.3.1.3 California Clean Air Act**

4 The California Clean Air Act (CCAA) provides the State with a comprehensive  
 5 framework for air quality planning regulation. Prior to passage of the CCAA,  
 6 Federal law contained the only comprehensive planning framework. The CCAA  
 7 requires attainment of state ambient air quality standards by the earliest  
 8 practicable date.

9 The FCAA requires adoption of SIPs for nonattainment areas to describe actions  
 10 that will be undertaken to achieve the NAAQS. In addition, the CCAA requires  
 11 local air districts in nonattainment areas to prepare and maintain Air Quality  
 12 Management Plans (AQMPs) to achieve compliance with CAAQS. These  
 13 AQMPs also serve as a basis for preparing the SIP for the State of California,

1 which must ultimately be approved by the USEPA and codified in the Code of  
2 Federal Register (CFR).

### 3 **16.4 Affected Environment**

4 This section describes the area of analysis, ambient air quality and conditions, and  
5 GHG emissions in the study area.

6 The air basins and air districts in California, including those in the study area, do  
7 not specifically align with the study area regions, as noted below and in the  
8 description of each air basin (ARB 2011a; ARB 2011b).

9 The discussion in this chapter area is organized by the study area regions and air  
10 basins. The study area regions include the following air basins and counties.

- 11 • Trinity River Region is located within portions of the North Coast Air Basin.
  - 12 – The Trinity River Region includes the area in Trinity County along the
  - 13 Trinity River from Trinity Lake to the confluence with the Klamath River;
  - 14 and the area in Humboldt and Del Norte counties along the Klamath River
  - 15 from the confluence with the Trinity River to the Pacific Ocean.
- 16 • Central Valley Region is located within portions of the Sacramento Valley,  
17 Mountain Counties, San Joaquin Valley, San Francisco Bay Area, Mojave  
18 Desert air basins.
  - 19 – The Central Valley Region includes all or portions the counties of Shasta,
  - 20 Plumas, Tehama, Glenn, Colusa, Butte, Sutter, Yuba, Nevada, Placer,
  - 21 El Dorado, Sacramento, Yolo, Solano, Napa, San Joaquin, Stanislaus,
  - 22 Merced, Madera, Fresno, Kings, Tulare, and Kern that are within the CVP
  - 23 and SWP service areas.
- 24 • San Francisco Bay Area Region is located within portions of the San  
25 Francisco Bay Area and North Central Coast air basins.
  - 26 – The San Francisco Bay Area Region includes portions of Contra Costa,
  - 27 Alameda, Santa Clara, and San Benito counties that are within the CVP
  - 28 and SWP service areas.
- 29 • Central Coast Region is located within portions of the South Central Coast  
30 Air Basin.
  - 31 – The Central Coast Region includes portions of San Luis Obispo and Santa
  - 32 Barbara counties served by the SWP.
- 33 • Southern California Region is located within portions of the South Central  
34 Coast, South Coast, San Diego, Mojave Desert, and Salton Sea air basins.
  - 35 – The Southern California Region includes portions of Ventura, Los
  - 36 Angeles, Orange, San Diego, Riverside, and San Bernardino counties
  - 37 served by the SWP.

### 16.4.1 Ambient Air Quality

Air quality conditions and potential impacts in the project area are evaluated and discussed qualitatively, rather than quantitatively. The following subsections briefly describe the existing air quality environmental setting by air basin for the project area. The counties within each air basin in the project area are presented in Table 16.3, along with non-attainment designations to characterize existing ambient air quality. Non-attainment designations indicate that concentrations of pollutants measured in ambient air exceed the applicable ambient air quality standards. As shown in Table 16.3, many of the counties included in the project area are designated as nonattainment for the Federal and/or State ozone and particulate matter standards. These air quality issues may be exacerbated under dry conditions because when irrigation water supplies are decreased, there is increased potential for the formation and transport of fugitive dust.

**Table 16.3 Pollutants Designated as Nonattainment Pursuant to Federal and State Ambient Air Quality Standards**

County	Air Basin	Air District	Federal Nonattainment Designations <sup>a</sup>	State Nonattainment Designations <sup>b</sup>
<b>Trinity River Region</b>				
Trinity	North Coast	North Coast Unified	–	–
Humboldt	North Coast	North Coast Unified	–	–
Del Norte	North Coast	North Coast Unified	–	–
<b>Central Valley Region</b>				
Shasta	Sacramento Valley	Shasta	–	Ozone, PM <sub>10</sub>
Tehama	Sacramento Valley	Tehama	Ozone (Tuscan Buttes area)	Ozone, PM <sub>10</sub>
Butte	Sacramento Valley	Butte	Ozone and PM <sub>2.5</sub> in Chico	Ozone, PM <sub>10</sub> , PM <sub>2.5</sub>
Glenn	Sacramento Valley	Glenn	–	PM <sub>10</sub>
Colusa	Sacramento Valley	Colusa	–	PM <sub>10</sub>
Yuba	Sacramento Valley	Feather River	–	Ozone, PM <sub>10</sub>
Sutter	Sacramento Valley	Feather River	Ozone	Ozone, PM <sub>10</sub>
Yolo	Sacramento Valley	Yolo-Solano	Ozone, PM <sub>2.5</sub>	Ozone, PM <sub>10</sub>
Sacramento	Sacramento Valley	Sacramento Metro	Ozone, PM <sub>2.5</sub>	Ozone, PM <sub>10</sub>

1 Sources: USEPA 2014; ARB 2015

2 Notes:

3 a. Areas designated as nonattainment by U.S. Environmental Protection Agency related  
4 to National Ambient Air Quality Standards as of January 30, 2015.

5 b. Areas designated as nonattainment by California Air Resources Board related to  
6 California Ambient Air Quality Standards as of April 10, 2014. No changes to the state  
7 area designations were proposed for 2014.

#### 8 **16.4.1.1 North Coast Air Basin**

9 The North Coast Air Basin includes Humboldt, Del Norte, Trinity, Mendocino,  
10 and north Sonoma counties (ARB 2013a). This air basin is located within the  
11 Trinity River Region of the study area. The basin is sparsely populated, and  
12 stretches along the northern coastline through forested mountains. Prevailing  
13 winds blow clean air inland from the Pacific Ocean, and air quality is typically  
14 good. Humboldt, Del Norte, and Trinity counties are designated attainment for  
15 the federal and state air quality standards (USEPA 2015b, ARB 2014).

1     **16.4.1.2 Sacramento Valley Air Basin**

2     The Sacramento Valley Air Basin encompasses 9 air districts and 11 counties,  
3     including: all of Shasta, Tehama, Glenn, Colusa, Butte, Sutter, Yuba, Sacramento,  
4     and Yolo counties; the westernmost portion of Placer County; and the  
5     northeastern half of Solano County. The air basin is bounded by tall mountains,  
6     including the Coast Range to the west, the Cascade Range to the north, and the  
7     Sierra Nevada Range to the east. This air basin is located within the northern  
8     portion of the Central Valley Region of the study area.

9     Winters are wet and cool, and summers are hot and dry. When air stagnates, or is  
10    trapped by an inversion layer in the valley, ambient pollutant concentrations can  
11    reach or exceed threshold levels. On-road vehicles are the largest source of smog-  
12    forming pollutants, and particulate matter emissions are primarily from area  
13    sources, such as fugitive dust from paved and unpaved roads and vehicle travel  
14    (ARB 2013a).

15    To characterize the existing ambient air quality in the Sacramento Valley Air  
16    Basin, data from area monitoring stations were reviewed (ARB 2011d). For the  
17    three years from 2007 to 2009, monitoring data indicated the following:

- 18    • Concentrations of O<sub>3</sub> and 24-hour PM<sub>2.5</sub> have exceeded the NAAQS and  
19    CAAQS.
- 20    • Concentrations of PM<sub>10</sub> have exceeded the CAAQS but are below the  
21    NAAQS.
- 22    • Measured concentrations of CO and NO<sub>2</sub> have complied with the NAAQS and  
23    CAAQS.
- 24    • Monitored SO<sub>2</sub> concentrations are extremely low, and lead concentrations are  
25    monitored as part of the air toxics program.

26    In the time since ARB compiled the 2007 to 2009 air quality monitoring data  
27    reported above, Glenn and Colusa counties have been redesignated as attainment  
28    for the California ozone standards (ARB 2014). In addition, Sacramento County  
29    has been redesignated as attainment for the California PM<sub>2.5</sub> standards (ARB  
30    2014). No other changes in air quality nonattainment designations have been  
31    recorded (USEPA 2014; ARB 2014).

32    **16.4.1.3 Mountain Counties Air Basin**

33    The Mountain Counties Air Basin includes the mountainous areas of the central  
34    and northern Sierra Nevada Mountains, from Plumas County south to Mariposa  
35    County, including Plumas, Sierra, Nevada, Central Placer, West El Dorado,  
36    Amador, Calaveras, Tuolumne, and Mariposa counties (ARB 2013a). This air  
37    basin includes portions of the central-eastern Central Valley Region of the study  
38    area; as well as areas located to the east of the study area.

39    Sparsely populated, motor vehicles are the primary source of emissions in the air  
40    basin. Air quality issues often result when eastward surface winds transport  
41    pollution from more populated air basins to the west and south. Wood smoke  
42    from stoves and fireplaces contribute to elevated ambient PM<sub>10</sub> concentrations

1 during winter. Nevada, Placer, El Dorado, Amador, Calaveras, Tuolumne, and  
 2 Mariposa counties are designated as nonattainment for the Federal and State  
 3 ozone standards (ARB 2014). Plumas, Sierra, Nevada, Placer, El Dorado, and  
 4 Calaveras counties are designated as nonattainment for the State PM<sub>10</sub> standards  
 5 (ARB 2014).

#### 6 **16.4.1.4 San Joaquin Valley Air Basin**

7 The San Joaquin Valley Air Basin encompasses eight counties, including: all of  
 8 San Joaquin, Stanislaus, Madera, Merced, Fresno, Kings, Tulare counties; and  
 9 western Kern County. It is bounded on the west by the Coast Range, on the east  
 10 by the Sierra Nevada, and in the south by the Tehachapi Mountains. This air  
 11 basin is located within the central and southern portions of the Central Valley  
 12 Region of the study area.

13 Winters are cool and wet and summers are dry and very hot. The area is heavily  
 14 agricultural, and hosts other localized industries such as forest products, oil and  
 15 gas production, and oil refining. On-road vehicles are the largest source of smog-  
 16 forming pollutants, and PM<sub>10</sub> emissions are primarily from sources such as  
 17 agricultural operations and fugitive dust from paved and unpaved roads and  
 18 vehicle travel (ARB 2013a). Air quality issues may be exacerbated under dry  
 19 conditions. When water supplies and irrigation levels are decreased in urban,  
 20 rural, and agricultural areas, there is increased potential for the formation and  
 21 transport of fugitive dust.

22 To characterize the existing ambient air quality for the San Joaquin Valley Air  
 23 Basin, data from area monitoring stations were reviewed (ARB 2011d). For the  
 24 three years from 2007 to 2009, monitoring data indicated the following:

- 25 • Concentrations of O<sub>3</sub> and 24-hour PM<sub>2.5</sub> have exceeded the NAAQS and  
 26 CAAQS.
- 27 • Concentrations of PM<sub>10</sub> have exceeded the CAAQS but are below the  
 28 NAAQS.
- 29 • Measured concentrations of CO and NO<sub>2</sub> have complied with the NAAQS and  
 30 CAAQS.
- 31 • Monitored SO<sub>2</sub> concentrations are extremely low, and lead concentrations are  
 32 monitored as part of the air toxics program.

33 In the time since ARB compiled the 2007 to 2009 air quality monitoring data  
 34 reported above, no changes in air quality nonattainment designations have been  
 35 recorded in the San Joaquin Valley Region counties in this study (USEPA 2015;  
 36 ARB 2014).

#### 37 **16.4.1.4.1 Dust and Particulate Matter in San Joaquin Valley**

38 The San Joaquin Valley Air Pollution Control District (SJVAPCD) is the local  
 39 regulatory agency with jurisdiction over air quality issues in the San Joaquin  
 40 Valley area. In response to the area's historical air quality problems with dust and  
 41 particulate matter, the SJVAPCD was the first agency in the state to regulate

1 emissions from on-field agricultural operations. In 2004, the agency adopted  
2 Rule 4550, the Conservation Management Practices rule, and Rule 3190, the  
3 Conservation Management Practices Fee rule. To comply with these rules,  
4 farmers with 100 acres or more of contiguous land must prepare and implement  
5 biennial Conservation Management Plans to reduce dust and particulate matter  
6 emissions from on-farm sources, such as unpaved roads and equipment yards,  
7 land preparation, harvest activities, and other farming activities. A handbook  
8 titled “Agricultural Air Quality Conservation Management Practices for San  
9 Joaquin Valley Farms” was published by the agriculture industry in 2004 to  
10 provide guidance to farmers on Conservation Management Practices (SJVAPCD  
11 2004a, 2004b). Examples of Conservation Management Practices include  
12 activities that reduce or eliminate the need for soil disturbance, activities that  
13 protect soil from wind, dust suppressants, alternatives to burning agricultural  
14 wastes, and reduced travel speeds on unpaved roads and equipment yards. Lands  
15 not currently under cultivation or used for pasture are exempt from Rule 4550,  
16 other than recordkeeping to document the exemption. Fees vary depending on the  
17 size of the farm, and include an initial application fee, and a biennial renewal fee.

18 In addition to requirements for on-field agricultural practices, the SJVAPCD rules  
19 and regulations address avoidance of nuisance conditions (Rule 4102),  
20 prohibitions on opening burning (Rule 4103), and fugitive-dust control  
21 (Regulation VIII). Specifically, the SJVAPCD dust-control rules include  
22 Rule 8021 for control of PM<sub>10</sub> from construction, demolition, excavation,  
23 extraction, and other earth moving activities; Rule 8031 for control of PM<sub>10</sub> from  
24 handling and storage of bulk materials; Rule 8051 for control of PM<sub>10</sub> from  
25 disturbed open areas; Rule 8061 for control of PM<sub>10</sub> from travel on paved and  
26 unpaved roads; Rule 8071 for control of PM<sub>10</sub> from unpaved vehicle and  
27 equipment traffic areas; and Rule 8081 for off-field agricultural sources, such as  
28 bulk materials handling and transport and travel on unpaved roads. Each of these  
29 rules requires fugitive dust control, often through application of water, gravel, or  
30 chemical dust stabilizers.

#### 31 **16.4.1.5 San Francisco Bay Area Air Basin**

32 The San Francisco Bay Area Air Basin consists of a single air district and nine  
33 counties, including: all of Napa, Marin, San Francisco, Contra Costa, Alameda,  
34 San Mateo, and Santa Clara counties; the southern portion of Sonoma County;  
35 and the southwestern portion of Solano County (ARB 2013a). The hills of the  
36 Coast Range bound the San Francisco and San Pablo bays and the inland valleys  
37 of the air basin. This air basin includes the San Francisco Bay Area Region of the  
38 study area.

39 The San Francisco Bay Area Air Basin includes the second largest urban area in  
40 California, hosting industry, airports, international ports, freeways, and surface  
41 streets. On-road vehicles are the largest source of smog-forming pollutants, and  
42 PM<sub>10</sub> emissions are primarily from area sources, such as fugitive dust from paved  
43 and unpaved roads and vehicle travel (ARB 2013a). Air quality in the San  
44 Francisco Bay Area is often good as sea breezes blow clean air from the Pacific  
45 Ocean into the air basin, but transport of pollutants from the San Francisco Bay

1 Area can exacerbate air quality problems in the downwind portions of the  
 2 San Francisco Bay Area Air Basin; as well as in the Sacramento Valley and San  
 3 Joaquin Valley air basins.

4 To characterize the existing ambient air quality for the San Francisco Bay Area  
 5 Air Basin, data from area monitoring stations were reviewed (ARB 2011d). For  
 6 the three years from 2007 to 2009, monitoring data indicated the following:

- 7 • Concentrations of O<sub>3</sub> and 24-hour PM<sub>2.5</sub> have exceeded the NAAQS and  
 8 CAAQS.
- 9 • Concentrations of PM<sub>10</sub> exceeded the CAAQS in 2008 but were below the  
 10 CAAQS in 2007 and 2009. Concentrations of PM<sub>10</sub> were below the NAAQS.
- 11 • Measured concentrations of CO and NO<sub>2</sub> have complied with the NAAQS and  
 12 CAAQS.
- 13 • Monitored SO<sub>2</sub> concentrations are extremely low, and lead concentrations are  
 14 monitored as part of the air toxics program.

15 In the time since ARB compiled the 2007 to 2009 air quality monitoring data  
 16 reported above, no changes in air quality nonattainment designations have been  
 17 recorded in the San Francisco Bay Region counties in this study (USEPA 2015;  
 18 ARB 2014).

#### 19 **16.4.1.6 North Central Coast Air Basin**

20 The North Central Coast Air Basin includes Santa Cruz, San Benito and Monterey  
 21 counties (ARB 2013a). This air basin includes San Benito County which is  
 22 located within the San Francisco Bay Area Region of the study area.

23 The North Central Coast Air Basin is in attainment for all NAAQS, and is  
 24 designated as nonattainment for the State ozone and PM<sub>10</sub> standards (ARB 2014).  
 25 Though separated by the Santa Cruz Mountains and Coast Ranges to the north,  
 26 wind can transport air pollution from the San Francisco Bay Area Air Basin and  
 27 contribute to elevated ozone concentrations in the area (ARB 2013a).

#### 28 **16.4.1.7 South Central Coast Air Basin**

29 The South Central Coast Air Basin includes San Luis Obispo, Santa Barbara and  
 30 Ventura counties. It is bordered by the Pacific Ocean on the south and west and  
 31 lies just north of the highly populated South Coast Air Basin. This air basin  
 32 includes the Central Coast Region and the northern Southern California Region of  
 33 the study area.

34 Sources of pollutants in the air basin include power plants, oil production and  
 35 refining, vehicle travel, and agricultural operations. San Luis Obispo, Santa  
 36 Barbara, and Ventura counties are designated as nonattainment for the State ozone  
 37 and PM<sub>10</sub> standards. Eastern San Luis Obispo and Ventura counties are  
 38 designated as nonattainment for the Federal ozone standard (USEPA 2015).  
 39 Wind patterns link Ventura and Santa Barbara counties, resulting in pollutant  
 40 transport between the South Central Coast and South Coast air basins. San Luis  
 41 Obispo County is separated from these counties by mountains, and the air quality

1 in San Luis Obispo County is linked more with conditions in the San Francisco  
2 Bay Area Air Basin and San Joaquin Valley Air Basin. Additionally, air  
3 emissions from the South Coast Air Basin can be blown offshore, and then carried  
4 to the coastal cities of the South Central Coast Air Basin. Under some conditions,  
5 the reverse air flow can carry pollutants from the South Central Coast Air Basin to  
6 the South Coast Air Basin and contribute to ozone violations there (ARB 2013a).

7 **16.4.1.8 South Coast Air Basin**

8 The South Coast Air Basin is California's largest metropolitan region. The area  
9 includes the southern two-thirds of Los Angeles County, all of Orange County,  
10 and the western urbanized portions of Riverside and San Bernardino counties.  
11 The South Coast Air Basin is bounded by the Pacific Ocean on the west and by  
12 mountains on the other three sides. This air basin includes the western-central  
13 portion of the Southern California Region of the study area.

14 The area includes industry, airports, international ports, freeways, and surface  
15 streets. On-road vehicles are the largest source of smog-forming pollutants, and  
16 PM<sub>10</sub> emissions are primarily from area sources, such as fugitive dust from paved  
17 and unpaved roads and vehicle travel (ARB 2013a). One-third of the state's total  
18 criteria pollutant emissions are generated within the basin (ARB 2013a). The  
19 pollutant emissions and fugitive dust generated in the South Coast Air Basin  
20 affects other air basins. For example, fugitive dust generated in the South Coast  
21 Air Basin contributes to poor air quality in the Salton Sea Air Basin and the  
22 Coachella Valley portion of Riverside County (USGS 2014).

23 The persistent high pressure system and frequent low inversion heights caused by  
24 the surrounding mountains on three sides of the air basin trap pollutants in the air  
25 basin (ARB 2013a). Sunny weather contributes to smog formation. Portions of  
26 the South Coast Air Basin are designated as nonattainment for the Federal and  
27 State ozone, PM<sub>10</sub>, and PM<sub>2.5</sub> standards (ARB 2014; USEPA 2015). Wind often  
28 transports air pollutants from the South Coast Air Basin to nearby air basins.

29 **16.4.1.9 Mojave Desert Air Basin**

30 The sparsely populated Mojave Desert Air Basin covers most of California's high  
31 desert and is made up of eastern Kern and Riverside counties and northern Los  
32 Angeles and San Bernardino counties. The San Gabriel and San Bernardino  
33 mountains lie to the south, separating the Mojave Desert Air Basin from the South  
34 Coast Air Basin. To the northwest, the Tehachapi Mountains separate the Mojave  
35 Desert Air Basin from the San Joaquin Valley Air Basin. This air basin includes  
36 the southeastern portion of the Central Valley Region and the northeastern portion  
37 of the Southern California Region of the study area.

38 The primary sources of air pollution in the air basin are military bases, highways,  
39 railroads, cement manufacturing, and mineral processing (ARB 2013a). The  
40 Mojave Desert Air Basin also is affected by air quality conditions in the San  
41 Joaquin Valley and South Coast air basins. Air from the South Coast Air Basin is  
42 transported over the San Gabriel Mountains, heavily impacting the areas of the  
43 Mojave Desert Air Basin located to the north of the South Coast Air Basin.

1 The Mojave Desert Air Basin also is located downwind of the San Joaquin Valley  
2 Air Basin; and the winds pass through the Tehachapi Mountains carrying air  
3 emissions from the San Joaquin Valley Air Basin. Due to the impacts from the  
4 South Coast Air Basin, the worst air quality in the Mojave Desert Air Basin is  
5 along the southern edge that borders the South Coast Air Basin. This is also  
6 where most of the population within the Mojave Desert Air Basin is located  
7 (ARB 2013a).

8 Portions of the Mojave Desert Air Basin are designated as nonattainment for the  
9 Federal and State ozone and PM<sub>10</sub> standards (ARB 2014; USEPA 2015).

#### 10 **16.4.1.10 San Diego Air Basin**

11 The San Diego Air Basin is in the southwest corner of California and comprises  
12 all of San Diego County. This air basin includes the southwestern portion of the  
13 Southern California Region of the study area.

14 The population and emissions are concentrated in the western portion of the air  
15 basin, which is bordered on the west by the Pacific Ocean. The climate is  
16 relatively mild near the ocean, with higher temperatures and seasonal variations  
17 further inland (ARB 2013a).

18 The air basin includes industrial facilities, airports, an international port,  
19 freeways, and surface streets. The San Diego Air Basin is designated as  
20 nonattainment for the Federal ozone standard and the State ozone, PM<sub>10</sub>, and  
21 PM<sub>2.5</sub> standards (ARB 2014). Air quality in the San Diego Air Basin is impacted  
22 not only by local emission sources, but also from transport of air emissions from  
23 the South Coast Air Basin and Mexico.

#### 24 **16.4.1.11 Salton Sea Air Basin**

25 The Salton Sea Air Basin is in the southeast corner of California and includes all  
26 of Imperial County and central Riverside County. The air basin is characterized  
27 by flat terrain and the Salton Sea surrounded by high mountains to the west, north,  
28 and east. The southern portion of the air basin extends towards the Gulf of  
29 California. The flat terrain and strong temperature differentials created by intense  
30 heating and cooling patterns produce moderate winds and deep thermal  
31 circulation systems which disperse local air emissions (DWR 2006). This air  
32 basin includes the northeastern portion of the Southern California Region of the  
33 study area.

34 The primary sources of air pollution are from vehicles and equipment exhaust and  
35 particulate matter from disturbed soils and wind erosion. The Salton Sea Air  
36 Basin is designated as nonattainment for the Federal and State ozone and PM<sub>10</sub>  
37 standards (ARB 2014; USEPA 2015). Portions of the Salton Sea Air Basin  
38 located outside of the study area near Calexico also are in nonattainment for PM<sub>2.5</sub>  
39 standards.

1 **16.4.2 Existing Greenhouse Gases and Emissions Sources**

2 This subsection presents an overview of the greenhouse effect and climate  
3 change, and potential sources of GHG emissions and information related to  
4 climate change and GHG emissions in California. GHG emissions and their  
5 climate-related impacts are not limited to specific geographic locations, but occur  
6 on global or regional scales. GHG emissions contribute cumulatively to the  
7 overall heat-trapping capability of the atmosphere, and the effects of the warming,  
8 such as climate change, are manifested in different ways across the planet.

9 **16.4.2.1 Greenhouse Gas Emissions Regulations and Analyses**

10 Global warming is the name given to the increase in the average temperature of  
11 the Earth's near-surface air and oceans since the mid-20th century and its  
12 projected continuation. Warming of the climate system is now considered to be  
13 unequivocal (DWR 2010) with global surface temperature increasing  
14 approximately 1.33°F over the last one hundred years. Continued warming is  
15 projected to increase global average temperature between 2 and 11 degrees  
16 Fahrenheit (°F) over the next one hundred years.

17 The causes of this warming have been identified as both natural processes and as  
18 the result of human actions. The Intergovernmental Panel on Climate Change  
19 (IPCC) concludes that variations in natural phenomena such as solar radiation and  
20 volcanoes produced most of the warming from pre-industrial times to 1950 and  
21 had a small cooling effect afterward. However, after 1950, increasing GHGs  
22 concentrations resulting from human activity such as fossil fuel burning and  
23 deforestation have been responsible for most of the observed temperature  
24 increase. These basic conclusions have been endorsed by more than 45 scientific  
25 societies and academies of science, including all of the national academies of  
26 science of the major industrialized countries.

27 Increases in GHG concentrations in the Earth's atmosphere are thought to be the  
28 main cause of human-induced climate change. GHGs naturally trap heat by  
29 impeding the exit of solar radiation that has hit the Earth and is reflected back into  
30 space. Some GHGs occur naturally and are necessary for keeping the Earth's  
31 surface inhabitable. However, increases in the concentrations of these gases in  
32 the atmosphere during the last hundred years have decreased the amount of solar  
33 radiation that is reflected back into space, intensifying the natural greenhouse  
34 effect and resulting in the increase of global average temperature (DWR 2010).

35 The principal GHGs considered in this EIS are CO<sub>2</sub>, CH<sub>4</sub>, N<sub>2</sub>O, SF<sub>6</sub>, PFC, and  
36 HFC, in accordance with the California Health and Safety Code section 38505(g)  
37 (DWR 2010). Each of the principal GHGs has a long atmospheric lifetime (one  
38 year to several thousand years). In addition, the potential heat-trapping ability of  
39 each of these gases varies significantly from one another, and also vary over time.  
40 For example, CH<sub>4</sub> is 25 times as potent as CO<sub>2</sub>; while SF<sub>6</sub> is 32,800 times more  
41 potent than CO<sub>2</sub> with a 100-year time horizon (IPCC 2007).

42 The primary man-made processes that release these gases include: burning of  
43 fossil fuels for transportation, heating and electricity generation; agricultural  
44 practices that release CH<sub>4</sub>, such as livestock grazing and crop residue

1 decomposition; and industrial processes that release smaller amounts of high  
 2 global warming potential gases such as SF<sub>6</sub>, PFCs, and HFCs (DWR 2010).  
 3 Deforestation and land cover conversion have also been identified as contributing  
 4 to global warming by reducing the Earth's capacity to remove CO<sub>2</sub> from the air  
 5 and altering the Earth's albedo or surface reflectance, allowing more solar  
 6 radiation to be absorbed.

#### 7 **16.4.2.2 An Overview of the Greenhouse Effect**

8 The greenhouse effect is a natural phenomenon that is essential to keeping the  
 9 Earth's surface warm (DWR 2010). Like a greenhouse window, GHGs allow  
 10 sunlight to enter and then prevent heat from leaving the atmosphere. Solar  
 11 radiation enters the Earth's atmosphere from space. A portion of this radiation is  
 12 reflected by particles in the atmosphere back into space, and a portion is absorbed  
 13 by the Earth's surface and emitted back into space. The portion absorbed by the  
 14 Earth's surface and emitted back into space is emitted as lower-frequency infrared  
 15 radiation. This infrared radiation is absorbed by various GHGs present in the  
 16 atmosphere. While these GHGs are transparent to the incoming solar radiation,  
 17 they are effective at absorbing infrared radiation emitted by the Earth's surface.  
 18 Therefore, some of the lower-frequency infrared radiation emitted by the Earth's  
 19 surface is retained in the atmosphere, creating a warming of the atmosphere.

#### 20 **16.4.2.2.1 Global Climate Trends and Associated Impacts**

21 The rate of increase in global average surface temperature over the last hundred  
 22 years has not been consistent (DWR 2010). The last three decades have warmed  
 23 at a much faster rate than the previous seven decades – on average 0.32°F per  
 24 decade. Eleven of the twelve years from 1995 to 2006, rank among the twelve  
 25 warmest years in the instrumental record of global average surface temperature  
 26 since 1850.

27 Increased global warming has occurred concurrent with many other changes have  
 28 occurred in other natural systems (DWR 2010). Global sea levels have risen on  
 29 average 1.8 millimeters per year; precipitation patterns throughout the world have  
 30 shifted, with some areas becoming wetter and other drier; tropical storm activity  
 31 in the North Atlantic has increased; peak runoff timing of many glacial and snow  
 32 fed rivers has shifted earlier; as well as numerous other observed conditions.  
 33 Though it is difficult to prove a definitive cause and effect relationship between  
 34 global warming and other observed changes to natural systems, there is high  
 35 confidence in the scientific community that these changes are a direct result of  
 36 increased global temperatures.

#### 37 **16.4.2.2.2 Overview of Greenhouse Gas Emission Sources**

38 Naturally occurring GHGs include water vapor, CO<sub>2</sub>, methane, and nitrous oxide.  
 39 Water vapor is introduced to the atmosphere from oceans and the natural  
 40 biosphere. Water vapor introduced directly to the atmosphere from agricultural or  
 41 other activities is not long lived, and thus does not contribute substantially to a  
 42 warming effect (NAS 2005). Carbon and nitrogen contained in CO<sub>2</sub>, methane,  
 43 and nitrous oxide naturally cycle from gaseous forms to organic biomass through

1 processes such as plant and animal respiration and seasonal cycles of plant growth  
2 and decay (USEPA 2012). Although naturally occurring, the emissions and  
3 sequestration of these gases are also influenced by human activities, and in some  
4 cases, are caused by human activities (anthropogenic). In addition to these  
5 GHGs, several classes of halogenated substances that contain fluorine, chlorine,  
6 or bromine also contribute to the greenhouse effect. However, these compounds  
7 are the product of industrial activities for the most part.

8 Each of the GHGs has a different capacity to trap heat in the atmosphere, with  
9 some of these gases being more effective at trapping heat than others. For  
10 calculating emissions, ARB (ARB 2007) uses a metric developed by the IPCC to  
11 account for these differences and to provide a standard basis for calculations. The  
12 metric, called the global warming potential (GWP), is used to compare the future  
13 climate impacts of emissions of various long-lived GHGs. The GWP of each  
14 GHG is indexed to the heat-trapping capability of CO<sub>2</sub>, and allows comparison of  
15 the global warming influence of each GHG relative to CO<sub>2</sub>. The GWP is used to  
16 translate emissions of each GHG to emissions of carbon dioxide equivalents, or  
17 CO<sub>2</sub>e. In this way, emissions of various GHGs can be summed, and total GHG  
18 emissions can be inventoried in common units of metric tons per year of CO<sub>2</sub>e.  
19 Most international inventories, including the United States inventory, use GWP  
20 values from the IPCC Fourth Assessment Report, per international consensus  
21 (IPCC 2007; USEPA 2012).

22 CO<sub>2</sub> is a byproduct of burning fossil fuels and biomass, as well as land-use  
23 changes and other industrial processes (USEPA 2012). It is the principal  
24 anthropogenic GHG that contributes to the Earth's radiative balance, and it  
25 represents the dominant portion of GHG emissions from activities that result from  
26 the combustion of fossil fuels (e.g., construction activities, electrical generation,  
27 and transportation).

#### 28 **16.4.2.3 California Climate Trends and Greenhouse Gas Emissions**

29 Maximum (daytime) and minimum (nighttime) temperatures are increasing  
30 almost everywhere in California but at different rates. The annual minimum  
31 temperature averaged over all of California has increased 0.33°F per decade  
32 during the period 1920 to 2003, while the average annual maximum temperature  
33 has increased 0.1°F per decade (DWR 2010).

34 With respect to California's water resources, the most significant impacts of  
35 global warming have been changes to the water cycle and sea level rise. Over the  
36 past century, the precipitation mix between snow and rain has shifted in favor of  
37 more rainfall and less snow, and snow pack in the Sierra Nevada is melting earlier  
38 in the spring (DWR 2010). The average early spring snowpack in the Sierra  
39 Nevada has decreased by about 10 percent during the last century, a loss of  
40 1.5 million acre-feet of snowpack storage. These changes have significant  
41 implications for water supply, flooding, aquatic ecosystems, energy generation,  
42 and recreation throughout the state.

1 During the same period, sea levels along California's coast have risen. The Fort  
 2 Point tide gauge in San Francisco was established in 1854 and is the longest  
 3 continually monitored gauge in the United States. Sea levels measured at this  
 4 gauge and two other west coast gauges indicate that the sea levels have risen at an  
 5 average rate of about 7.9 inches/century (0.08 inch/year) over the past 150 years  
 6 (BCDC 2011). Continued sea level rise associated with global warming may  
 7 threaten coastal lands and infrastructure, increase flooding at the mouths of rivers,  
 8 place additional stress on levees in the Sacramento-San Joaquin Delta, and  
 9 intensify the difficulty of managing the Sacramento-San Joaquin Delta as the  
 10 heart of the state's water supply system (DWR 2010).

#### 11 **16.4.2.3.1 Potential Effects of Global Climate Change in California**

12 Warming of the atmosphere has broad implications for the environment. In  
 13 California, one of the effects of climate change could be increases in temperature  
 14 that could affect the timing and quantity of precipitation. California receives most  
 15 of its precipitation in the winter months, and a warming environment would raise  
 16 the elevation of snow pack and result in reduced spring snowmelt and more  
 17 winter runoff. These effects on precipitation and water storage in the snow pack  
 18 could have broad implications on the environment in California.

19 The following are some of the potential effects of a warming climate in California  
 20 (California Climate Change Portal 2007):

- 21 • Loss of snowpack storage will cause increased winter runoff that generally  
 22 would not be captured and stored because of the need to reserve flood  
 23 capacity in reservoirs during the winter.
- 24 • Less spring runoff would mean lower early summer storage at major  
 25 reservoirs, which would result in less hydroelectric power production.
- 26 • Higher temperatures and reduced snowmelt would compound the problem of  
 27 providing suitable cold water habitat for salmonid species. Lower reservoir  
 28 levels would also contribute to this problem, reducing the flexibility of cold  
 29 water releases.
- 30 • Sea level rise would affect the Delta, worsening existing levee problems,  
 31 causing more saltwater intrusion, and adversely affecting many coastal  
 32 marshes and wildlife reserves. Release of water to streams to meet water  
 33 quality requirements could further reduce storage levels.
- 34 • Increased temperatures would increase the agricultural demand for water and  
 35 increase the level of stress on native vegetation, potentially allowing for an  
 36 increase in pest and insect epidemics and a higher frequency of large,  
 37 damaging wildfires.

38 Future climate scenarios have also been evaluated in the U.S. Global Change  
 39 Research Program National Climate Assessments. The most recent assessment,  
 40 *Climate Change Impacts in the United States*, was released in May 2014  
 41 (USGCRP 2014). For the Southwest Region of the United States, the report  
 42 projects that water supply availability would be reduced as compared to recent

1 conditions due to reduced snowpack and declining stream flows. Rising  
 2 temperatures in the future would increase disruptions to electricity generation  
 3 which could further reduce water availability. The National Climate Assessment  
 4 also indicates that mitigation policies and other factors have lowered the United  
 5 States' nationwide GHG emissions in recent years; however, substantial global  
 6 emissions reductions are needed to avoid many of the predicted consequences. A  
 7 considerable amount of planning for resilience and adaptation is underway, but  
 8 implementation of adaptive measures have been limited in scope.

9 **16.4.2.3.2 Current California Emission Sources**

10 The recent California's GHG emission inventory was released on April 6, 2012,  
 11 with data updated through October 2011. The GHG emissions in California have  
 12 been estimated for each year from 2000 to 2009, and are reported for several large  
 13 sectors of emission sources. The estimates for 2009 are summarized in  
 14 Table 16.4, reported by sector as millions of tons per year of CO<sub>2</sub> (ARB 2011e).

15 **Table 16.4 California Greenhouse Gas Emissions by Sector in 2009**

Sector	Total Emissions (million tons/year of CO <sub>2</sub> e)	Percent of Statewide Total Gross Emissions <sup>a</sup>
Agriculture	32.1	7
Commercial and Residential	43	9.4
Electric Power	103.6	22.7
Forestry (excluding CO <sub>2</sub> sinks)	0.2	< 1.0
Industrial	81.4	17.8
Recycling and Waste	7.3	1.6
Transportation	172.9	37.9
High Global Warming Potential substance and ozone-depleting substance use <sup>b</sup>	16.3	3.6
<b>Total</b>	<b>456.8</b>	<b>100</b>
Forestry Net Emissions	-3.8	-

16 Source: ARB 2011e.

17 Notes:

18 a. Based on the 456.8 million tons/year of CO<sub>2</sub>e Total Gross Emissions estimate.

19 b. High Global Warming Potential substance and ozone-depleting substance use are not  
 20 attributed to an individual sector.

21 Total gross statewide GHG emissions in 2009 were estimated to be 456.8 million  
 22 tons per year of CO<sub>2</sub>e. The two largest sectors contributing to emissions in  
 23 California are transportation and electric power (the latter sector includes both  
 24 in-state generation and imported electricity). The agricultural sector represents  
 25 only 7 percent of the total gross statewide emissions.

1 The agricultural sector includes manure management, enteric fermentation,  
 2 agricultural residue burning, and soils management. The forestry sector  
 3 contributes to overall emissions, but is a net sink of emissions.

4 The California Global Warming Solutions Act of 2006 (California Assembly  
 5 Bill 32) requires California to reduce statewide emissions to 1990 levels by 2020.

6 In December 2007, ARB adopted an emission limit for 2020 of 427 million tons  
 7 per year of CO<sub>2</sub>e. Increases in the stateside renewable energy portfolio and  
 8 reductions in importation of coal-based electrical power will contribute to meeting  
 9 California's near-term GHG emission reduction goals. The ARB estimates that a  
 10 reduction of 169 million metric tons net CO<sub>2</sub>e emissions below business-as-usual  
 11 would be required by 2020 to meet the 1990 levels (ARB 2007). This amounts to  
 12 approximately a 30 percent reduction from projected "business-as-usual" levels  
 13 in 2020.

## 14 **16.5 Impact Analysis**

15 This section describes the potential mechanisms and analytical methods for  
 16 change in air quality and GHG emissions; results of the impact analysis; potential  
 17 mitigation measures; and cumulative effects.

### 18 **16.5.1 Potential Mechanisms for Change and Analytical Methods**

19 As described in Chapter 4, Approach to Environmental Analysis, the impact  
 20 analysis considers changes in air quality and GHG emissions related to changes in  
 21 CVP and SWP operations under the alternatives as compared to the No Action  
 22 Alternative and Second Basis of Comparison.

23 Changes in CVP and SWP operations under the alternatives as compared to the  
 24 No Action Alternative and Second Basis of Comparison could directly or  
 25 indirectly change air quality and GHG emissions due to use of engines or  
 26 electricity that operate groundwater wells, changes in cropping patterns, or odor  
 27 emissions.

#### 28 **16.5.1.1 Changes in Emissions of Criteria Air Pollutants and Precursors, 29 and/or Exposure of Sensitive Receptors to Substantial 30 Concentrations of Air Contaminants**

31 Changes in CVP and SWP operations under the alternatives could change the use  
 32 of individual engines to operate groundwater wells. The CVHM model is used to  
 33 evaluate changes in groundwater conditions in the Central Valley, as described in  
 34 Chapter 7, Groundwater Resources and Groundwater Quality. To evaluate the  
 35 potential for changes in emissions of criteria air pollutants and precursors, and/or  
 36 exposure of sensitive receptors to substantial concentrations of air contaminants,  
 37 results from the CVHM model that indicate changes in groundwater withdrawals  
 38 due to changes in CVP and SWP operations. However, it is not known how many  
 39 of the groundwater pumps use electricity and how many use diesel engines. The  
 40 diesel engines have the potential to emit criteria air pollutants and precursors, and  
 41 toxic air contaminants.

1 Most of the groundwater wells in the Central Valley use electrical pumps. As  
2 reported in a recent environmental assessment, approximately 14 to 15 percent of  
3 the pumps used diesel fuel in 2003 (Reclamation 2013a). It is assumed for this  
4 EIS, that the portion of groundwater pumps that use electricity would remain  
5 approximately at 85 percent. Therefore, it is assumed that increases or decreases  
6 in groundwater pumping would be indicative of an increase or decrease in the use  
7 of diesel engines in the Central Valley as well as in the San Francisco Bay Area,  
8 Central Coast, and Southern California regions. Changes in CVP and SWP  
9 operations would not result in changes in groundwater pumping in the Trinity  
10 River Region; therefore, this analysis does not address Trinity River Region.

11 **16.5.1.2 Changes in Exposure of Sensitive Receptors to**  
12 **Particulate Matter**

13 Changes in CVP and SWP operations under the alternatives could change the  
14 potential for dust generation on irrigated lands that would be idled due to reduced  
15 CVP and SWP water supplies. However, as described in Chapter 12, Agricultural  
16 Resources, irrigated acreage under Alternatives 1 through 5 would be similar to  
17 irrigated acreage under both the No Action Alternative and the Second Basis of  
18 Comparison. Therefore, there would be no change in potential for dust  
19 generation. Therefore, these changes are not analyzed in this EIS.

20 **16.5.1.3 Changes in Exposure of Sensitive Receptors to Odor Emissions**  
21 **from Wetlands**

22 Restoration of seasonal floodplains and tidally-influenced wetlands could result in  
23 additional odors at surrounding sensitive receptors near the restoration locations.  
24 However, these actions would occur in a similar manner under the No Action  
25 Alternative, Alternatives 1 through 5, and Second Basis of Comparison, as  
26 described in Chapter 3, Description of Alternatives. Therefore, odor emissions  
27 would be the same under all of the alternatives and the Second Basis of  
28 Comparison. Therefore, this change is not analyzed in this EIS.

29 **16.5.1.4 Changes in GHG Emissions due to Changes in Energy**  
30 **Generation or Use**

31 Changes in CVP and SWP operations under the alternatives could change CVP  
32 and SWP energy generation and use, and the associated GHG emissions. In  
33 addition, operational changes could also affect the use of energy by CVP and  
34 SWP water users through the implementation of regional and local alternative  
35 water supplies, such as recycling or desalination. When CVP and SWP water  
36 deliveries decline, CVP and SWP net energy generation changes; and water users  
37 are anticipated to increase use of groundwater, recycled water, and/or desalinated  
38 water from existing facilities or facilities that are reasonably foreseeable to be  
39 constructed by 2030. When CVP and SWP water deliveries increase, CVP and  
40 SWP net energy generation would change; and water users are anticipated to  
41 reduce use of alternate water supplies either due to economic considerations or to  
42 allow the amount of stored water to increase under a conjunctive use pattern. It is  
43 not known whether the changes in CVP and SWP net energy generation would be

1 similar to the changes in energy use for alternate regional and local water  
 2 supplies.

3 Changes in the timing and magnitude of net CVP and SWP hydropower  
 4 generation would result in changes in GHG emissions. Increased net CVP and  
 5 SWP hydropower generation would reduce the need for electricity generated  
 6 through fossil fuel combustion, and would avoid the GHG emissions that would  
 7 result from fossil fuel use. In comparison, reduced hydroelectric generation  
 8 would increase the need for other types of electricity production, including  
 9 electricity generated from fossil fuels, with the result that GHG emissions would  
 10 increase.

11 Potential changes in GHG emissions due to changes in CVP and SWP energy  
 12 generation or use, and the evaluation of potential for changes in use of energy by  
 13 CVP and SWP water users to implement alternative water supplies, are analyzed  
 14 broadly and qualitatively across the overall study area. Some of the changes in  
 15 energy use and generation will occur across the CVP and SWP system, others  
 16 may require additional energy resources. Specific locations of the energy sources  
 17 and users have not been defined.

#### 18 **16.5.1.5 Effects due to Cross Delta Water Transfers**

19 Historically water transfer programs have been developed on an annual basis.  
 20 The demand for water transfers is dependent upon the availability of water  
 21 supplies to meet water demands. Water transfer transactions have increased over  
 22 time as CVP and SWP water supply availability has decreased, especially during  
 23 drier water years.

24 Parties seeking water transfers generally acquire water from sellers who have  
 25 available surface water who can make the water available through releasing  
 26 previously stored water, pump groundwater instead of using surface water  
 27 (groundwater substitution); idle crops; or substitute crops that uses less water in  
 28 order to reduce normal consumptive use of surface water.

29 Water transfers using CVP and SWP Delta pumping plants and south of Delta  
 30 canals generally occur when there is unused capacity in these facilities. These  
 31 conditions generally occur during drier water year types when the flows from  
 32 upstream reservoirs plus unregulated flows are adequate to meet the Sacramento  
 33 Valley water demands and the CVP and SWP export allocations. In non-wet  
 34 years, the CVP and SWP water allocations would be less than full contract  
 35 amounts; therefore, capacity may be available in the CVP and SWP conveyance  
 36 facilities to move water from other sources.

37 Projecting future air quality conditions related to water transfer activities is  
 38 difficult because specific water transfer actions required to make the water  
 39 available, convey the water, and/or use the water would change each year due to  
 40 changing hydrological conditions, CVP and SWP water availability, specific local  
 41 agency operations, and local cropping patterns. Reclamation recently prepared a  
 42 long-term regional water transfer environmental document which evaluated  
 43 potential changes in conditions related to water transfer actions (Reclamation

1 2014c). Results from this analysis were used to inform the impact assessment of  
2 potential effects of water transfers under the alternatives as compared to the No  
3 Action Alternative and the Second Basis of Comparison.

#### 4 **16.5.2 Conditions in Year 2030 without Implementation of** 5 **Alternatives 1 through 5**

6 This EIS includes two bases of comparison, as described in Chapter 3,  
7 Description of Alternatives: the No Action Alternative and the Second Basis of  
8 Comparison. Both of these bases are evaluated at 2030 conditions. Changes that  
9 would occur over the next 15 years without implementation of the alternatives are  
10 not analyzed in this EIS. However, the changes to air quality that are assumed to  
11 occur by 2030 under the No Action Alternative and the Second Basis of  
12 Comparison are summarized in this section. Many of the changed conditions  
13 would occur in the same manner under both the No Action Alternative and the  
14 Second Basis of Comparison.

##### 15 **16.5.2.1 Common Changes in Conditions under the No Action Alternative** 16 **and Second Basis of Comparison**

17 Conditions in 2030 would be different than existing conditions due to:

- 18 • Climate change and sea level rise
- 19 • General plan development throughout California, including increased water  
20 demands in portions of Sacramento Valley
- 21 • Implementation of reasonable and foreseeable water resources management  
22 projects to provide water supplies

23 It is anticipated that climate change would result in warmer temperatures, more  
24 short-duration high-rainfall events, and less snowpack in the winter and early  
25 spring months. The reservoirs would be full more frequently by the end of April  
26 or May by 2030 than in recent historical conditions. However, as the water is  
27 released in the spring, there would be less snowpack to refill the reservoirs. This  
28 condition would reduce reservoir storage and available water supplies to  
29 downstream uses in the summer. The reduced end of September storage also  
30 would reduce the ability to release stored water to downstream regional  
31 reservoirs. These conditions would occur for all reservoirs in the California  
32 foothills and mountains, including non-CVP and SWP reservoirs.

33 These changes would result in a decline of the long-term average CVP and SWP  
34 water supply deliveries by 2030 as compared to recent historical long-term  
35 average deliveries under the No Action Alternative and the Second Basis of  
36 Comparison. However, the CVP and SWP water deliveries would be less under  
37 the No Action Alternative as compared to the Second Basis of Comparison, as  
38 described in Chapter 5, Surface Water Resources and Water Supplies, which  
39 could result in more crop idling which could result in increased dust generation.

1 Under the No Action Alternative and the Second Basis of Comparison, land uses  
2 in 2030 would occur in accordance with adopted general plans. Development  
3 under the general plans would be required to be implemented in accordance with  
4 adopted air quality management plans.

5 The No Action Alternative and the Second Basis of Comparison assumes  
6 completion of water resources management and environmental restoration  
7 projects that would have occurred without implementation of Alternatives 1  
8 through 5, including regional and local recycling projects, surface water and  
9 groundwater storage projects, conveyance improvement projects, and desalination  
10 projects. These projects would increase energy demand and could be associated  
11 with increases in indirect greenhouse gas emissions.

12 By 2030, more efficient energy use, increases in renewable energy production,  
13 and energy conservation are also anticipated to reduce future GHG emissions  
14 rates.

15 Under the No Action Alternative and the Second Basis of Comparison, there are  
16 several major variables with varying degrees of uncertainty. These variables  
17 include future population growth in the air basins, the extent and emissivity of  
18 various emissions sources from existing and future activities, and the success of  
19 the local jurisdictions and others in implementing effective air emissions control  
20 measures. It is assumed that air quality in 2030 will be similar to the conditions  
21 described in the Affected Environment even with population growth because the  
22 current air quality management plans were developed with consideration of future  
23 growth by at least 2030. It is anticipated that the non-attainment areas will reduce  
24 the contaminants to a level of attainment in accordance with adopted air quality  
25 management plans. In addition, it is assumed that the California Renewables  
26 Portfolio Standard (RPS) will be implemented by 2020. The RPS was established  
27 in accordance with California Senate Bill 1078 in 2002, Senate Bill 107 in 2006,  
28 and Senate Bill 2 in 2011 to require investor-owned utilities, electric service  
29 providers, and community-choice aggregators (e.g., local agencies that purchase  
30 or generate electricity for their community) to provide at least 33 percent of their  
31 total energy procurement from renewable energy sources by 2020.

32 Increased groundwater use and related groundwater elevation reductions could  
33 occur due to reduction in CVP and SWP water supplies. The increased pumping  
34 would increase demand for electricity, and could result indirectly in increases in  
35 greenhouse gas emissions. As described above, approximately 15 percent of  
36 groundwater pumps rely upon diesel fuels. Increased groundwater pumping could  
37 result in increased emissions of criteria air pollutants and precursors, and/or  
38 exposure of sensitive receptors to substantial concentrations of air contaminants  
39 from increased use of diesel engines.

40 The No Action Alternative and the Second Basis of Comparison would include  
41 restoration of more than 10,000 acres of intertidal and associated subtidal  
42 wetlands in Suisun Marsh and Cache Slough; and 17,000 to 20,000 acres of  
43 seasonal floodplain restoration in Yolo Bypass. Operation of wetlands restoration  
44 projects could result in periodic odors due to anaerobic decomposition of organic

1 matter in portions of the wetlands. As a result, odorous compounds, such as  
2 ammonia and hydrogen sulfide, are generated and may be released into the  
3 environment. Marshes and wetlands can also be a source of odors during some  
4 time periods when ponds or shallow water areas undergo algal or vegetative  
5 growth. Marshes, wetlands, shallow water areas, or canals may require periodic  
6 maintenance to inhibit algal or vegetative growth, and avoid conditions conducive  
7 to anaerobic digestion. The occurrence and severity of odor impacts depend on  
8 numerous factors, including the nature, frequency, and intensity of the source;  
9 wind speed and direction; and the presence of sensitive receptors. Although odors  
10 rarely cause any physical harm, they can still be unpleasant to some individuals.

### 11 **16.5.3 Evaluation of Alternatives**

12 Alternatives 1 through 5 have been compared to the No Action Alternative; and  
13 the No Action Alternative and Alternatives 1 through 5 have been compared to  
14 the Second Basis of Comparison.

15 During review of the numerical modeling analyses used in this EIS, an error was  
16 determined in the CalSim II model assumptions related to the Stanislaus River  
17 operations for the Second Basis of Comparison, Alternative 1, and Alternative 4  
18 model runs. Appendix 5C includes a comparison of the CalSim II model run  
19 results presented in this chapter and CalSim II model run results with the error  
20 corrected. Appendix 5C also includes a discussion of changes in the comparison  
21 of groundwater conditions for the following alternative analyses.

- 22 • No Action Alternative compared to the Second Basis of Comparison
- 23 • Alternative 1 compared to the No Action Alternative
- 24 • Alternative 3 compared to the Second Basis of Comparison
- 25 • Alternative 5 compared to the Second Basis of Comparison

#### 26 **16.5.3.1 No Action Alternative**

27 The No Action Alternative is compared to the Second Basis of Comparison.

##### 28 **16.5.3.1.1 Central Valley Region**

29 *Changes in Emissions of Criteria Air Pollutants and Precursors, and/or Exposure*  
30 *of Sensitive Receptors to Substantial Concentrations of Air Contaminants Related*  
31 *to Changes in Groundwater Pumping*

32 As described in Chapter 7, Groundwater Resources and Groundwater Quality,  
33 groundwater pumping in the San Joaquin Valley portion of the Central Valley  
34 Region would increase by 8 percent under the No Action Alternative as compared  
35 to the Second Basis of Comparison. It is not known if the additional groundwater  
36 pumping would rely upon electricity or diesel to drive the pump engines. Under  
37 the worst case analysis, it is assumed that the increased use of diesel engines  
38 would be proportional to the increased use of groundwater. Therefore, under the  
39 No Action Alternative, there would be a potential increase in emissions of criteria  
40 air pollutants and precursors, and/or exposure of sensitive receptors to substantial  
41 concentrations of air contaminants as compared to the Second Basis of  
42 Comparison.

1 *Effects Related to Cross Delta Water Transfers*

2 Potential effects to air quality could be similar to those identified in a recent  
 3 environmental analysis conducted by Reclamation for long-term water transfers  
 4 from the Sacramento to San Joaquin valleys (Reclamation 2014c). Potential  
 5 effects to air quality were identified as increased emissions of air pollutants due to  
 6 the use of diesel engines for groundwater pumps that were used to provide  
 7 transfer water through groundwater substitution programs. The analysis indicated  
 8 that the effects could be reduced to avoid substantial impacts through the use of  
 9 electric engines or reducing the amount of groundwater substitution. Other  
 10 identified effects were considered to be not substantial or beneficial as related to  
 11 crop idling to provide transfer water in the seller's service area; and reduction of  
 12 groundwater pumping that could use diesel engines or dust generation from crop  
 13 idled lands in the purchaser's service area.

14 Under the No Action Alternative, the timing of cross Delta water transfers would  
 15 be limited to July through September and include annual volumetric limits, in  
 16 accordance with the 2008 USFWS BO and 2009 NMFS BO. Under the Second  
 17 Basis of Comparison, water could be transferred throughout the year without an  
 18 annual volumetric limit. Overall, the potential for cross Delta water transfers  
 19 would be less under the No Action Alternative than under the Second Basis of  
 20 Comparison.

21 **16.5.3.1.2 San Francisco Bay Area, Central Coast, and Southern**  
 22 **California Regions**

23 *Changes in Emissions of Criteria Air Pollutants and Precursors, and/or Exposure*  
 24 *of Sensitive Receptors to Substantial Concentrations of Air Contaminants Related*  
 25 *to Changes in Groundwater Pumping*

26 It is anticipated that CVP and SWP water supplies would be decreased by  
 27 10 percent and 18 percent, respectively, in the San Francisco Bay Area, Central  
 28 Coast, and Southern California regions under No Action Alternative as compared  
 29 to the Second Basis of Comparison. The decrease in surface water supplies could  
 30 result in additional use of groundwater pumps and emissions of air pollutants and  
 31 contaminants if the use of diesel engines is also increased.

32 **16.5.3.1.3 Overall Study Area**

33 *Changes in GHG Emissions due to Changes in Energy Generation or Use*

34 As described in Chapter 8, Energy, changes in CVP and SWP operations under  
 35 the No Action Alternative as compared to the Second Basis of Comparison would  
 36 result in a reduction of CVP and SWP water deliveries to areas located south of  
 37 the Delta; and therefore, annual energy use for conveyance would decline. CVP  
 38 annual net generation would be similar; and SWP net energy generation would  
 39 increase which could result indirectly in less GHG emissions if the hydropower  
 40 generation replaces fossil fuel generation.

41 In addition to changes in CVP and SWP energy generation and use and the  
 42 associated GHG emissions, CVP and SWP operations under the No Action  
 43 Alternative as compared to the Second Basis of Comparison could potentially

1 increase use of energy by CVP and SWP water users to implement regional and  
2 local alternate water supplies, such as increased groundwater pumping and use of  
3 recycled water treatment plants and desalination water treatment plants. These  
4 facilities would require energy which could result in increased GHG emissions.

5 **16.5.3.2 Alternative 1**

6 Alternative 1 is identical to the Second Basis of Comparison. Alternative 1 is  
7 compared to the No Action Alternative and the Second Basis of Comparison.  
8 However, because CVP and SWP operations conditions under Alternative 1 are  
9 identical to conditions under the Second Basis of Comparison; Alternative 1 is  
10 only compared to the No Action Alternative.

11 **16.5.3.2.1 Alternative 1 Compared to the No Action Alternative**

12 *Central Valley Region*

13 *Changes in Emissions of Criteria Air Pollutants and Precursors, and/or*  
14 *Exposure of Sensitive Receptors to Substantial Concentrations of Air*  
15 *Contaminants Related to Changes in Groundwater Pumping*

16 Groundwater pumping in the San Joaquin Valley portion of the Central Valley  
17 Region would decrease by 8 percent under Alternative 1 as compared to the No  
18 Action Alternative. It is not known if the reduction in groundwater pumping  
19 would result in a reduction of the use of electricity or diesel to drive the pump  
20 engines. For this analysis, it is assumed that the decreased use of diesel engines  
21 would be proportional to the decreased use of groundwater. Therefore, under  
22 Alternative 1, there would be a potential decrease in emissions of criteria air  
23 pollutants and precursors, and/or exposure of sensitive receptors to substantial  
24 concentrations of air contaminants as compared to the No Action Alternative.

25 *Effects Related to Cross Delta Water Transfers*

26 Potential effects to air quality could be similar to those identified in a recent  
27 environmental analysis conducted by Reclamation for long-term water transfers  
28 from the Sacramento to San Joaquin valleys (Reclamation 2014c) as described  
29 above under the No Action Alternative compared to the Second Basis of  
30 Comparison. For the purposes of this EIS, it is anticipated that similar conditions  
31 would occur during implementation of cross Delta water transfers under  
32 Alternative 1 and the No Action Alternative, and that impacts on air quality would  
33 not be substantial due to implementation requirements of the transfer programs.

34 Under Alternative 1, water could be transferred throughout the year without an  
35 annual volumetric limit. Under the No Action Alternative, the timing of cross  
36 Delta water transfers would be limited to July through September and include  
37 annual volumetric limits, in accordance with the 2008 USFWS BO and 2009  
38 NMFS BO. Overall, the potential for cross Delta water transfers would be  
39 increased under Alternative 1 as compared to the No Action Alternative.

1 *San Francisco Bay Area, Central Coast, and Southern California Regions*  
 2 *Changes in Emissions of Criteria Air Pollutants and Precursors, and/or*  
 3 *Exposure of Sensitive Receptors to Substantial Concentrations of Air*  
 4 *Contaminants Related to Changes in Groundwater Pumping*

5 It is anticipated that CVP and SWP water supplies would be increased by  
 6 11 percent and 21 percent, respectively, in the San Francisco Bay Area, Central  
 7 Coast, and Southern California regions under Alternative 1 as compared to the  
 8 No Action Alternative. The increase in surface water supplies could result in the  
 9 reduction in use of groundwater pumps and emissions of air pollutants and  
 10 contaminants if the use of diesel engines is also decreased.

11 *Overall Study Area*

12 *Changes in GHG Emissions due to Changes in Energy Generation or Use*

13 As described in Chapter 8, Energy, changes CVP and SWP operations under  
 14 Alternative 1 as compared to the No Action Alternative would result in an  
 15 increase of CVP and SWP water deliveries to areas located south of the Delta; and  
 16 therefore, annual energy use for conveyance would increase. CVP annual net  
 17 generation would be similar, and SWP annual net generation would be decrease  
 18 over the long-term average conditions. This could result in increased GHG  
 19 emissions if fossil fuel generation replaces hydropower generation.

20 In addition to changes in CVP and SWP energy generation and use, and the  
 21 associated GHG emissions, CVP and SWP operations under Alternative 1 as  
 22 compared to the No Action Alternative could potentially decrease the use of  
 23 energy by CVP and SWP water users due to less need to implement regional and  
 24 local alternative water supplies, such as increased groundwater pumping and use  
 25 of recycled water treatment plants and desalination water treatment plants. As the  
 26 need for alternative water supplies is decreased, the associated energy demand  
 27 and indirect GHG emissions would also be decreased under Alternative 1 as  
 28 compared to the No Action Alternative.

29 **16.5.3.2.2 Alternative 1 Compared to the Second Basis of Comparison**

30 Alternative 1 is identical to the Second Basis of Comparison.

31 **16.5.3.3 Alternative 2**

32 The CVP and SWP operations under Alternative 2 are identical to the CVP and  
 33 SWP operations under the No Action Alternative, as described in Chapter 3,  
 34 Description of Alternatives; therefore, Alternative 2 is only compared to the  
 35 Second Basis of Comparison.

36 **16.5.3.3.1 Alternative 2 Compared to the Second Basis of Comparison**

37 The CVP and SWP operations under Alternative 2 are identical to the CVP and  
 38 SWP operations under the No Action Alternative. Therefore, changes to air  
 39 quality and GHG emission conditions under Alternatives 2 as compared to the  
 40 Second Basis of Comparison would be the same as the impacts described in  
 41 Section 16.5.3.1, No Action Alternative.

1 **16.5.3.4 Alternative 3**

2 As described in Chapter 3, Description of Alternatives, CVP and SWP operations  
3 under Alternative 3 are similar to the Second Basis of Comparison with modified  
4 Old and Middle River flow criteria and New Melones Reservoir operations. As  
5 described in Chapter 4, Approach to Environmental Analysis, Alternative 3 is  
6 compared to the No Action Alternative and the Second Basis of Comparison.

7 **16.5.3.4.1 Alternative 3 Compared to the No Action Alternative**

8 *Central Valley Region*

9 *Changes in Emissions of Criteria Air Pollutants and Precursors, and/or*  
10 *Exposure of Sensitive Receptors to Substantial Concentrations of Air*  
11 *Contaminants Related to Changes in Groundwater Pumping*

12 Groundwater pumping in the San Joaquin Valley portion of the Central Valley  
13 Region would decrease by 6 percent under Alternative 3 as compared to the No  
14 Action Alternative. It is not known if the reduction in groundwater pumping  
15 would result in a reduction of the use of electricity or diesel to drive the pump  
16 engines. For this analysis, it is assumed that the decreased use of diesel engines  
17 would be proportional to the decreased use of groundwater. Therefore, under  
18 Alternative 3, there would be a potential decrease in emissions of criteria air  
19 pollutants and precursors, and/or exposure of sensitive receptors to substantial  
20 concentrations of air contaminants as compared to the No Action Alternative.

21 *Effects Related to Cross Delta Water Transfers*

22 Potential effects to air quality could be similar to those identified in a recent  
23 environmental analysis conducted by Reclamation for long-term water transfers  
24 from the Sacramento to San Joaquin valleys (Reclamation 2014c) as described  
25 above under the No Action Alternative compared to the Second Basis of  
26 Comparison. For the purposes of this EIS, it is anticipated that similar conditions  
27 would occur during implementation of cross Delta water transfers under  
28 Alternative 3 and the No Action Alternative, and that impacts on air quality would  
29 not be substantial due to implementation requirements of the transfer programs.

30 Under Alternative 3, water could be transferred throughout the year without an  
31 annual volumetric limit. Under the No Action Alternative, the timing of cross  
32 Delta water transfers would be limited to July through September and include  
33 annual volumetric limits, in accordance with the 2008 USFWS BO and 2009  
34 NMFS BO. Overall, the potential for cross Delta water transfers would be  
35 increased under Alternative 3 as compared to the No Action Alternative.

36 *San Francisco Bay Area, Central Coast, and Southern California Regions*

37 *Changes in Emissions of Criteria Air Pollutants and Precursors, and/or*  
38 *Exposure of Sensitive Receptors to Substantial Concentrations of Air*  
39 *Contaminants Related to Changes in Groundwater Pumping*

40 It is anticipated that CVP and SWP water supplies would be increased by  
41 9 percent and 17 percent, respectively, in the San Francisco Bay Area, Central  
42 Coast, and Southern California regions under Alternative 3 as compared to the  
43 No Action Alternative. The increase in surface water supplies could result in the

1 reduction in use of groundwater pumps and emissions of air pollutants and  
2 contaminants if the use of diesel engines is also decreased.

### 3 *Overall Study Area*

#### 4 *Changes in GHG Emissions due to Changes in Energy Generation or Use*

5 As described in Chapter 8, Energy, changes in CVP and SWP operations under  
6 Alternative 3 as compared to the No Action Alternative would result in an  
7 increase of CVP and SWP water deliveries to areas located south of the Delta; and  
8 therefore, annual energy use for conveyance would increase. CVP annual net  
9 energy generation would be similar; and SWP annual net energy generation  
10 would be less which could result in increased GHG emissions if fossil fuel  
11 generation replaces hydropower generation.

12 In addition to changes in CVP and SWP energy generation and use, and the  
13 associated GHG emissions, CVP and SWP operations under Alternative 3 as  
14 compared to the No Action Alternative could potentially decrease the use of  
15 energy by CVP and SWP water users due to less need to implement regional and  
16 local alternative water supplies, such as increased groundwater pumping and use  
17 of recycled water treatment plants and desalination water treatment plants. As the  
18 need for alternative water supplies is decreased, the associated energy demand  
19 and GHG emissions would also be decreased under Alternative 3 as compared to  
20 the No Action Alternative.

### 21 **16.5.3.4.2 Alternative 3 Compared to the Second Basis of Comparison**

#### 22 *Central Valley Region*

#### 23 *Changes in Emissions of Criteria Air Pollutants and Precursors, and/or* 24 *Exposure of Sensitive Receptors to Substantial Concentrations of Air* 25 *Contaminants Related to Changes in Groundwater Pumping*

26 Groundwater pumping in the San Joaquin Valley portion of the Central Valley  
27 Region would be similar (within a 5 percent change) under Alternative 3 as  
28 compared to the Second Basis of Comparison. Therefore, the emissions of  
29 criteria air pollutants and precursors, and/or exposure of sensitive receptors to  
30 substantial concentrations of air contaminants would be similar under  
31 Alternative 3 as compared to the Second Basis of Comparison.

#### 32 *Effects Related to Cross Delta Water Transfers*

33 Potential effects to air quality could be similar to those identified in a recent  
34 environmental analysis conducted by Reclamation for long-term water transfers  
35 from the Sacramento to San Joaquin valleys (Reclamation 2014c) as described  
36 above under the No Action Alternative compared to the Second Basis of  
37 Comparison. For the purposes of this EIS, it is anticipated that similar conditions  
38 would occur during implementation of cross Delta water transfers under  
39 Alternative 3 and the Second Basis of Comparison, and that impacts on air quality  
40 would not be substantial in the seller's service area due to implementation  
41 requirements of the transfer programs.

1 Under Alternative 3 and the Second Basis of Comparison, water could be  
2 transferred throughout the year without an annual volumetric limit. Overall, the  
3 potential for cross Delta water transfers would be similar under Alternative 3 and  
4 the Second Basis of Comparison.

5 *San Francisco Bay Area, Central Coast, and Southern California Regions*  
6 *Changes in Emissions of Criteria Air Pollutants and Precursors, and/or*  
7 *Exposure of Sensitive Receptors to Substantial Concentrations of Air*  
8 *Contaminants Related to Changes in Groundwater Pumping*

9 It is anticipated that CVP and SWP water supplies and emissions from diesel  
10 engines used for groundwater pumping would be similar in the San Francisco Bay  
11 Area, Central Coast, and Southern California regions under Alternative 3 as  
12 compared to the Second Basis of Comparison.

13 *Overall Study Area*

14 *Changes in GHG Emissions due to Changes in Energy Generation or Use*

15 As described in Chapter 8, Energy, changes in CVP and SWP operations under  
16 Alternative 3 as compared to the Second Basis of Comparison would result in a  
17 decrease of CVP and SWP water deliveries to areas located south of the Delta;  
18 and therefore, annual energy use for conveyance would decrease. CVP annual net  
19 energy generation would be similar; and SWP annual net energy generation  
20 would be greater which could result in decreased GHG emissions if hydropower  
21 generation replaces fossil fuel generation.

22 In addition to changes in CVP and SWP energy generation and use, and the  
23 associated GHG emissions, CVP and SWP operations under Alternative 3 as  
24 compared to the Second Basis of Comparison could potentially increase the use of  
25 energy by CVP and SWP water users to implement regional and local alternative  
26 water supplies, such as increased groundwater pumping and use of recycled water  
27 treatment plants and desalination water treatment plants. These facilities would  
28 require energy which could indirectly result in increased GHG emissions.

29 **16.5.3.5 Alternative 4**

30 The air quality and GHG emissions under Alternative 4 would be identical to the  
31 air quality and GHG emissions under the Second Basis of Comparison; therefore,  
32 Alternative 4 is only compared to the No Action Alternative.

33 **16.5.3.5.1 Alternative 4 Compared to the No Action Alternative**

34 The CVP and SWP operations under Alternative 4 is identical to the CVP and  
35 SWP operations under the Second Basis of Comparison and Alternative 1.  
36 Therefore, changes in air quality and GHG emissions under Alternative 4 as  
37 compared to the No Action Alternative would be the same as the impacts  
38 described in Section 16.5.3.2.1, Alternative 1 Compared to the No Action  
39 Alternative.

1 **16.5.3.6 Alternative 5**

2 As described in Chapter 3, Description of Alternatives, CVP and SWP operations  
3 under Alternative 5 are similar to the No Action Alternative with modified Old  
4 and Middle River flow criteria and New Melones Reservoir operations. As  
5 described in Chapter 4, Approach to Environmental Analysis, Alternative 5 is  
6 compared to the No Action Alternative and the Second Basis of Comparison.

7 **16.5.3.6.1 Alternative 5 Compared to the No Action Alternative**

8 *Central Valley Region*

9 *Changes in Emissions of Criteria Air Pollutants and Precursors, and/or*  
10 *Exposure of Sensitive Receptors to Substantial Concentrations of Air*  
11 *Contaminants Related to Changes in Groundwater Pumping*

12 Groundwater pumping in the San Joaquin Valley portion of the Central Valley  
13 Region would be similar under Alternative 5 as compared to the No Action  
14 Alternative. Therefore, the emissions of criteria air pollutants and precursors,  
15 and/or exposure of sensitive receptors to substantial concentrations of air  
16 contaminants would be similar under Alternative 5 as compared to the No  
17 Action Alternative.

18 *Effects Related to Cross Delta Water Transfers*

19 Potential effects to air quality could be similar to those identified in a recent  
20 environmental analysis conducted by Reclamation for long-term water transfers  
21 from the Sacramento to San Joaquin valleys (Reclamation 2014c) as described  
22 above under the No Action Alternative compared to the Second Basis of  
23 Comparison. For the purposes of this EIS, it is anticipated that similar conditions  
24 would occur during implementation of cross Delta water transfers under  
25 Alternative 5 and the No Action Alternative, and that impacts on air quality would  
26 not be substantial in the seller's service area due to implementation requirements  
27 of the transfer programs.

28 Under Alternative 5 and the No Action Alternative, the timing of cross Delta  
29 water transfers would be limited to July through September and include annual  
30 volumetric limits, in accordance with the 2008 USFWS BO and 2009 NMFS BO.  
31 Overall, the potential for cross Delta water transfers would be similar under  
32 Alternative 5 and the No Action Alternative.

33 *San Francisco Bay Area, Central Coast, and Southern California Regions*

34 *Changes in Emissions of Criteria Air Pollutants and Precursors, and/or*  
35 *Exposure of Sensitive Receptors to Substantial Concentrations of Air*  
36 *Contaminants Related to Changes in Groundwater Pumping*

37 It is anticipated that CVP and SWP water supplies and emissions from diesel  
38 engines used for groundwater pumping would be similar in the San Francisco Bay  
39 Area, Central Coast, and Southern California regions under Alternative 5 as  
40 compared to the No Action Alternative.

1 *Overall Study Area*

2 *Changes in GHG Emissions due to Changes in Energy Generation or Use*

3 As described in Chapter 8, Energy, changes in CVP and SWP operations under  
4 Alternative 5 as compared to the No Action Alternative would result in similar  
5 CVP and SWP water deliveries to areas located south of the Delta except in April  
6 and May when exports would decline. Overall, annual CVP and SWP net energy  
7 generation would be similar under Alternative 5 and the No Action Alternative.

8 In addition to changes in CVP and SWP energy generation and use, and the  
9 associated GHG emissions, CVP and SWP operations under Alternative 5 as  
10 compared to the No Action Alternative could potentially increase the use of  
11 energy by CVP and SWP water users to implement regional and local alternative  
12 water supplies, such as increased groundwater pumping and use of recycled water  
13 treatment plants and desalination water treatment plants. These facilities would  
14 require energy which could indirectly result in increased GHG emissions.

15 **16.5.3.6.2 Alternative 5 Compared to the Second Basis of Comparison**

16 *Central Valley Region*

17 *Changes in Emissions of Criteria Air Pollutants and Precursors, and/or*  
18 *Exposure of Sensitive Receptors to Substantial Concentrations of Air*  
19 *Contaminants Related to Changes in Groundwater Pumping*

20 Groundwater pumping in the San Joaquin Valley portion of the Central Valley  
21 Region would increase by 8 percent under Alternative 5 as compared to the  
22 Second Basis of Comparison. It is not known if the additional groundwater  
23 pumping would rely upon electricity or diesel to drive the pump engines. Under  
24 the worst case analysis, it is assumed that the increased use of diesel engines  
25 would be proportional to the increased use of groundwater. Therefore, under  
26 Alternative 5, there would be a potential increase in emissions of criteria air  
27 pollutants and precursors, and/or exposure of sensitive receptors to substantial  
28 concentrations of air contaminants as compared to the Second Basis of  
29 Comparison.

30 *Effects Related to Cross Delta Water Transfers*

31 Potential effects to air quality could be similar to those identified in a recent  
32 environmental analysis conducted by Reclamation for long-term water transfers  
33 from the Sacramento to San Joaquin valleys (Reclamation 2014c) as described  
34 above under the No Action Alternative compared to the Second Basis of  
35 Comparison. For the purposes of this EIS, it is anticipated that similar conditions  
36 would occur during implementation of cross Delta water transfers under  
37 Alternative 5 and the Second Basis of Comparison, and that impacts on air quality  
38 would not be substantial in the seller's service area due to implementation  
39 requirements of the transfer programs.

40 Under Alternative 5, the timing of cross Delta water transfers would be limited to  
41 July through September and include annual volumetric limits, in accordance with  
42 the 2008 USFWS BO and 2009 NMFS BO. Under the Second Basis of  
43 Comparison, water could be transferred throughout the year without an annual

1 volumetric limit. Overall, the potential for cross Delta water transfers would be  
 2 reduced under Alternative 5 as compared to the Second Basis of Comparison.

3 *San Francisco Bay Area, Central Coast, and Southern California Regions*  
 4 *Changes in Emissions of Criteria Air Pollutants and Precursors, and/or*  
 5 *Exposure of Sensitive Receptors to Substantial Concentrations of Air*  
 6 *Contaminants Related to Changes in Groundwater Pumping*

7 It is anticipated that CVP and SWP water supplies would be decreased by  
 8 10 percent and 18 percent, respectively, in the San Francisco Bay Area, Central  
 9 Coast, and Southern California regions under Alternative 5 as compared to the  
 10 Second Basis of Comparison. The decrease in surface water supplies could result  
 11 in increased use of groundwater pumps and emissions of air pollutants and  
 12 contaminants if the use of diesel engines is also increased.

13 *Overall Study Area*

14 *Changes in GHG Emissions due to Changes in Energy Generation or Use*

15 As described in Chapter 8, Energy, changes in CVP and SWP operations under  
 16 Alternative 5 as compared to the Second Basis of Comparison would result in a  
 17 decrease of CVP and SWP water deliveries to areas located south of the Delta;  
 18 and therefore, annual energy use for conveyance would decrease. CVP annual net  
 19 generation would be similar; and SWP net energy generation would increase  
 20 which could result indirectly in less GHG emissions if the hydropower generation  
 21 replaces fossil fuel generation.

22 In addition to changes in CVP and SWP energy generation and use, and the  
 23 associated GHG emissions, CVP and SWP operations under Alternative 5 as  
 24 compared to the Second Basis of Comparison could potentially increase the use of  
 25 energy by CVP and SWP water users to implement regional and local alternative  
 26 water supplies, such as increased groundwater pumping and use of recycled water  
 27 treatment plants and desalination water treatment plants. These facilities would  
 28 require energy which could indirectly result in increased GHG emissions.

29 **16.5.3.7 Summary of Environmental Consequences**

30 The results of the environmental consequences of implementation of  
 31 Alternatives 1 through 5 as compared to the No Action Alternative and the  
 32 Second Basis of Comparison are presented in Tables 16.5 and 16.6.

1 **Table 16.5 Comparison of Alternatives 1 through 5 to No Action Alternative**

<b>Alternative</b>	<b>Potential Change</b>	<b>Consideration for Mitigation Measures</b>
Alternative 1	<p>Decrease potential for emissions of criteria air pollutants and precursors, and/or exposure of sensitive receptors to substantial concentrations of air contaminants by 8 percent in the Central Valley, 11 to 21 percent in the San Francisco Bay Area Region, and by 21 percent in the Central Coast and Southern California regions.</p> <p>Potentially, could indirectly result in an increase of GHG emissions due to a decrease in SWP net energy generation; however, GHG emissions could decrease due to a reduced need for additional energy for alternative water supplies. The overall changes in GHG emissions are not known at this time because the need for energy use by alternative water supplies is not known at this time.</p>	None needed
Alternative 2	No effects on air quality.	None needed
Alternative 3	<p>Decrease potential for emissions of criteria air pollutants and precursors, and/or exposure of sensitive receptors to substantial concentrations of air contaminants by 6 percent in the Central Valley, 9 to 17 percent in the San Francisco Bay Area Region, and by 17 percent in the Central Coast and Southern California regions.</p> <p>Potentially, could indirectly result in an increase of GHG emissions due to a decrease in SWP net energy generation; however, GHG emissions could decrease due to a reduced need for additional energy for alternative water supplies. The overall changes in GHG emissions are not known at this time because the need for energy use by alternative water supplies is not known at this time.</p>	None needed
Alternative 4	Same effects as described for Alternative 1 compared to the No Action Alternative.	None needed

<b>Alternative</b>	<b>Potential Change</b>	<b>Consideration for Mitigation Measures</b>
Alternative 5	<p>Similar potential for emissions of criteria air pollutants and precursors, and/or exposure of sensitive receptors to substantial concentrations of air contaminants in the Central Valley, San Francisco Bay Area, Central Coast, and Southern California regions.</p> <p>Potentially, could indirectly result in an increase of GHG emissions due to the need for additional energy for alternative water supplies. The overall changes in GHG emissions are not known at this time because the need for energy use by alternative water supplies is not known at this time.</p>	None needed

Note: Due to the limitations and uncertainty in the CalSim II monthly model and other analytical tools, incremental differences of 5 percent or less between alternatives and the No Action Alternative are considered to be “similar.”

1 **Table 16.6 Comparison of Alternatives 1 through 5 to Second Basis of Comparison**

<b>Alternative</b>	<b>Potential Change</b>	<b>Consideration for Mitigation Measures</b>
No Action Alternative	<p>Increase potential for emissions of criteria air pollutants and precursors, and/or exposure of sensitive receptors to substantial concentrations of air contaminants by 8 percent in the Central Valley, 10 to 18 percent in the San Francisco Bay Area Region, and by 18 percent in the Central Coast and Southern California regions.</p> <p>Potentially, could indirectly result in a decrease of GHG emissions due to an increase in SWP net energy generation; however, GHG emissions could increase due to the need for additional energy for alternative water supplies. The overall changes in GHG emissions are not known at this time because the need for energy use by alternative water supplies is not known at this time.</p>	Not considered for this comparison.
Alternative 1	No effects on air quality.	Not considered for this comparison.
Alternative 2	Same effects as described for No Action Alternative as compared to the Second Basis of Comparison.	Not considered for this comparison.

Alternative	Potential Change	Consideration for Mitigation Measures
Alternative 3	<p>Similar potential for emissions of criteria air pollutants and precursors, and/or exposure of sensitive receptors to substantial concentrations of air contaminants in the Central Valley, San Francisco Bay Area, Central Coast, and Southern California regions.</p> <p>Potentially, could indirectly result in a decrease of GHG emissions due to an increase in SWP net energy generation; however, GHG emissions could increase due to the need for additional energy for alternative water supplies. The overall changes in GHG emissions are not known at this time because the need for energy use by alternative water supplies is not known at this time.</p>	Not considered for this comparison.
Alternative 4	No effects on air quality.	Not considered for this comparison.
Alternative 5	<p>Increase potential for emissions of criteria air pollutants and precursors, and/or exposure of sensitive receptors to substantial concentrations of air contaminants by 8 percent in the Central Valley, 10 to 18 percent in the San Francisco Bay Area Region, and by 18 percent in the Central Coast and Southern California regions.</p> <p>Potentially, could indirectly result in a decrease of GHG emissions due to an increase in SWP net energy generation; however, GHG emissions could increase due to the need for additional energy for alternative water supplies. The overall changes in GHG emissions are not known at this time because the need for energy use by alternative water supplies is not known at this time.</p>	Not considered for this comparison.

1 Note: Due to the limitations and uncertainty in the CalSim II monthly model and other  
 2 analytical tools, incremental differences of 5 percent or less between alternatives and the  
 3 No Action Alternative are considered to be “similar.”

4 **16.5.3.8 Potential Mitigation Measures**

5 Mitigation measures are presented in this section to avoid, minimize, rectify,  
 6 reduce, eliminate, or compensate for adverse environmental effects of  
 7 Alternatives 1 through 5 as compared to the No Action Alternative. Mitigation  
 8 measures were not included to address adverse impacts under the alternatives as  
 9 compared to the Second Basis of Comparison because this analysis was included  
 10 in this EIS for information purposes only.

1 Changes in CVP and SWP operations under Alternatives 1 through 5 as compared  
2 to the No Action Alternative would not result in changes in air quality. Therefore,  
3 there would be no adverse impacts to air quality; and no mitigation measures  
4 are required.

5 **16.5.3.9 Cumulative Effects Analysis**

6 As described in Chapter 3, the cumulative effects analysis considers projects,  
7 programs, and policies that are not speculative; and are based upon known or  
8 reasonably foreseeable long-range plans, regulations, operating agreements, or  
9 other information that establishes them as reasonably foreseeable.

10 The cumulative effects analysis considers potential incremental impacts of the  
11 alternatives when added to other past and present actions (as described in the  
12 Affected Environment section) and reasonably foreseeable future actions (as  
13 described in the No Action Alternative section plus cumulative effects) regardless  
14 of what agency (federal or non-federal) or person undertakes such actions  
15 (40 CFR 1508.7, 1508.25, and 43 CFR 46.115). The quantitative effects of these  
16 items are based upon the quantitative comparisons of Alternatives 1 through 5 to  
17 the No Action Alternative presented in previous sections of this chapter; and the  
18 qualitative cumulative effects of the alternatives are based upon the qualitative  
19 comparisons of Alternatives 1 through 5 to the No Action Alternative presented in  
20 previous sections of this chapter and the effects of the cumulative actions that are  
21 less certain than future actions under the No Action Alternative.

22 The cumulative effects analysis for Alternatives 1 through 5 for Air Quality issues  
23 are summarized in Table 16.7.

1  
2

**Table 16.7 Summary of Cumulative Effects on Air Quality with Implementation of Alternatives 1 through 5 as Compared to the No Action Alternative**

Scenarios	Actions	Cumulative Effects of Actions
<p>Past &amp; Present, and Future Actions included in the No Action Alternative and in All Alternatives in Year 2030</p>	<p>Consistent with Affected Environment conditions plus:</p> <p>Actions in the 2008 USFWS BO and 2009 NMFS BO that would have occurred without implementation of the BOs, as described in Section 3.3.1.2 (of Chapter 3, Descriptions of Alternatives), including climate change and sea level rise</p> <p>Actions not included in the 2008 USFWS BO and 2009 NMFS BO that would have occurred without implementation of the BOs, as described in Section 3.3.1.3 (of Chapter 3, Descriptions of Alternatives):</p> <ul style="list-style-type: none"> <li>• Implementation of Federal and state policies and programs, including Clean Water Act (e.g., Total Maximum Daily Loads); Safe Drinking Water Act; Clean Air Act; and flood management programs</li> <li>• General plans for 2030.</li> <li>• Trinity River Restoration Program.</li> <li>• Central Valley Project Improvement Act programs</li> <li>• Folsom Dam Water Control Manual Update</li> <li>• FERC Relicensing for the Middle Fork of the American River Project</li> <li>• San Joaquin River Restoration Program</li> <li>• Future water supply projects, including water recycling, desalination, groundwater banks and wellfields, and conveyance facilities (projects with completed environmental documents)</li> </ul>	<p><u>These effects would be the same under all alternatives.</u></p> <p>Climate change and sea level rise, development under the general plans, FERC relicensing projects, and some future projects to improve water quality and/or habitat are anticipated to reduce carryover storage in reservoirs and changes in stream flow patterns in a manner that could reduce hydroelectric generation in the summer and fall months which could result in increased use of fossil fuels and indirectly increase GHG emissions for fossil fuel generation and increased use of diesel engines for additional groundwater use.</p> <p>Reduced CVP and SWP water deliveries south of the Delta would reduce CVP and SWP electricity use for conveyance; and could reduce the need for electricity generation using fossil fuels and indirectly reduce GHG emissions.</p> <p>Future water supply projects are anticipated to both improve water supply reliability due to reduced surface water supplies and to accommodate planned growth in the general plans. It is anticipated that some of these projects could increase energy use, such as implementation of desalination projects. However, other projects, such as water recycling, would not substantially increase energy use because most of the energy use was previously required for wastewater treatment. It is anticipated that energy required for water treatment of alternative water supplies would be similar as treatment for CVP and SWP water supplies. Increased energy use could increase use of electricity generation by fossil fuels; which could increase air quality issues and indirectly increase GHG emissions.</p> <p>Most of these programs were initiated prior to implementation of the 2008 USFWS BO and 2009 NMFS BO which reduced CVP and SWP water supply reliability.</p>

Scenarios	Actions	Cumulative Effects of Actions
<p>Future Actions considered as Cumulative Effects Actions in All Alternatives in Year 2030</p>	<p>Actions as described in Section 3.5 (of Chapter 3, Descriptions of Alternatives):</p> <ul style="list-style-type: none"> <li>• Bay-Delta Water Quality Control Plan Update</li> <li>• FERC Relicensing Projects</li> <li>• Bay Delta Conservation Plan (including the California WaterFix alternative)</li> <li>• Shasta Lake Water Resources, North-of-the-Delta Offstream Storage, Los Vaqueros Reservoir Expansion Phase 2, and Upper San Joaquin River Basin Storage Investigations</li> <li>• El Dorado Water and Power Authority Supplemental Water Rights Project</li> <li>• Sacramento River Water Reliability Project</li> <li>• Semitropic Water Storage District Delta Wetlands</li> <li>• North Bay Aqueduct Alternative Intake</li> <li>• Irrigated Lands Regulatory Program</li> <li>• San Luis Reservoir Low Point Improvement Project</li> <li>• <i>Westlands Water District v. United States Settlement</i></li> <li>• Future water supply projects, including water recycling, desalination, groundwater banks and wellfields, and conveyance facilities (projects that did not have completed environmental documents during preparation of the EIS)</li> </ul>	<p><u>These effects would be the same under all alternatives.</u></p> <p>Most of the future reasonably foreseeable actions are anticipated to improve water supplies in California to reduce impacts due to climate change, sea level rise, increased water allocated to improve habitat conditions, and future growth. If CVP and SWP water supply reliability increases, energy use for conveyance of CVP and SWP water supplies also would increase.</p> <p>Some of the future reasonably foreseeable actions are anticipated to potentially reduce CVP and SWP water supply reliability (e.g., Water Quality Control Plan Update and FERC Relicensing Projects).</p> <p>Future water supply projects are anticipated to both improve water supply reliability due to reduced surface water supplies and to accommodate planned growth in the general plans. It is anticipated that some of these projects could increase energy use, such as implementation of desalination projects. However, other projects, such as water recycling, would not substantially increase energy use because most of the energy use was previously required for wastewater treatment. It is anticipated that energy required for water treatment of alternative water supplies would be similar as treatment for CVP and SWP water supplies. Increased use of groundwater pumps would increase energy use.</p>

Scenarios	Actions	Cumulative Effects of Actions
No Action Alternative with Associated Cumulative Effects Actions in Year 2030	Full implementation of the 2008 USFWS BO and 2009 NMFS BO CVP and SWP	<p>Implementation of No Action Alternative would result in changes stream flows and related changes in hydroelectric generation patterns, and reduced CVP and SWP water supplies as compared to conditions prior to the BOs.</p> <p>If CVP and SWP water supply reliability decreases, energy use for conveyance of CVP and SWP water supplies also would decrease and energy use for alternative water supplies could increase.</p> <p>Increased energy use could increase use of electricity generation by fossil fuels; which could increase air quality issues and indirectly increase GHG emissions.</p>
Alternatives 1 and 4 with Associated Cumulative Effects Actions in Year 2030	No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant)	<p>Implementation of Alternatives 1 and 4 with reasonably foreseeable actions would result in changes in stream flows and related hydroelectric generation patterns, and increased CVP and SWP water supplies as compared to the No Action Alternative with the added actions.</p> <p>Increased CVP and SWP water supply reliability would increase energy use for conveyance of CVP and SWP water supplies; and it is anticipated that energy use for alternative water supplies would decrease as compared to the No Action Alternative with the added actions.</p> <p>Increased energy use for CVP and SWP conveyance could increase use of electricity generation by fossil fuels; which could increase air quality issues and indirectly increase GHG emissions. However, decreased energy use for alternative water supplies could decrease use of electricity generation by fossil fuels; which could decrease air quality issues and indirectly decrease GHG emissions as compared to for the No Action Alternative with the added actions.</p>
Alternative 2 with Associated Cumulative Effects Actions in Year 2030	<p>Full implementation of the 2008 USFWS BO and 2009 NMFS BO CVP and SWP operational actions</p> <p>No implementation of structural improvements or other actions that require further study to develop a more detailed action description.</p>	Implementation of Alternative 2 with reasonably foreseeable actions for energy resources would be the same as for the No Action Alternative with the added actions.

Scenarios	Actions	Cumulative Effects of Actions
<p>Alternative 3 with Associated Cumulative Effects Actions in Year 2030</p>	<p>No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant)</p> <p>Slight increase in positive Old and Middle River flows in the winter and spring months</p>	<p>Implementation of Alternative 3 with reasonably foreseeable actions would result in changes in stream flows and related hydroelectric generation patterns, and increased CVP and SWP water supplies as compared to the No Action Alternative with the added actions.</p> <p>Increased CVP and SWP water supply reliability would increase energy use for conveyance of CVP and SWP water supplies; and it is anticipated that energy use for alternative water supplies would decrease as compared to the No Action Alternative with the added actions.</p> <p>Increased energy use for CVP and SWP conveyance could increase use of electricity generation by fossil fuels; which could increase air quality issues and indirectly increase GHG emissions. However, decreased energy use for alternative water supplies could decrease use of electricity generation by fossil fuels; which could decrease air quality issues and indirectly decrease GHG emissions as compared to for the No Action Alternative with the added actions.</p>
<p>Alternative 5 with Associated Cumulative Effects Actions in Year 20530</p>	<p>Full implementation of the 2008 USFWS BO and 2009 NMFS BO</p> <p>Positive Old and Middle River flows and increased Delta outflow in spring months</p>	<p>Implementation of Alternative 5 with reasonably foreseeable actions would result in similar net CVP and SWP hydroelectric generation, and reduced CVP and SWP water supplies as compared to the No Action Alternative with the added actions.</p> <p>It is anticipated that energy use for alternative water supplies would increase as compared to the No Action Alternative with cumulative effects which could increase air quality issues and indirectly increase GHG emissions as compared to for the No Action Alternative with the added actions.</p>

## Chapter 17

# 1 Cultural Resources

## 2 17.1 Introduction

3 Cultural resources are defined as prehistoric and historic archaeological sites,  
4 architectural features (e.g., buildings, bridges, flumes, trestles, railroads), and  
5 traditional cultural properties. However, the focus of this chapter is more on  
6 cultural resources than historic properties.

7 This chapter describes the known existing cultural resources conditions in the  
8 study area and the potential changes that could occur as a result of implementing  
9 the alternatives evaluated in this Environmental Impact Statement (EIS).

10 Implementation of the alternatives could affect cultural and historic resources  
11 through potential changes in the operation of the Central Valley Project (CVP)  
12 and State Water Project (SWP). Changes in CVP and SWP operations could  
13 increase the frequency and duration of low-elevation reservoir conditions that  
14 would increase the time of exposure of inundated cultural resources within  
15 reservoirs that store CVP and SWP water. Changes in CVP and SWP operations  
16 also could reduce water supply availability to agricultural lands, and those lands  
17 could be subject to land use changes that could increase disturbances of cultural  
18 resources if present.

## 19 17.2 Regulatory Environment and Compliance 20 Requirements

21 Potential actions that could be implemented under the alternatives evaluated in  
22 this EIS could affect reservoirs, streams, and lands served by CVP and SWP  
23 water supplies located on lands with cultural resources. Actions implemented,  
24 funded, or approved by Federal and state agencies would need to be compliant  
25 with appropriate Federal and state agency policies and regulations, as summarized  
26 in Chapter 4, Approach to Environmental Analyses.

## 27 17.3 Affected Environment

28 This section describes the types of cultural resources that could be potentially  
29 affected by the implementation of the alternatives considered in this EIS.  
30 Changes in areas with cultural resources due to changes in CVP and SWP  
31 operations may occur at reservoirs that store CVP and SWP water and on lands  
32 that use CVP and SWP water supplies in the Trinity River, Central Valley, San  
33 Francisco Bay Area, and Central Coast and Southern California regions.

1    **17.3.1    Prehistoric Context**

2    **17.3.1.1    Introduction to the Prehistoric Context**

3    The study area has a long and complex cultural history with distinct regional  
4    patterns that extend back more than 11,000 years (Reclamation 1997). The first  
5    generally agreed upon evidence for the presence of prehistoric peoples in the  
6    study area is represented by the distinctive fluted spear points called Clovis  
7    points. These artifacts have been found on the margins of extinct lakes in the San  
8    Joaquin Valley. The Clovis points are found on the same surface with the bones  
9    of animals that are now extinct, such as mammoths, sloths, and camels. The  
10   subsequent period from about 10000 to 8000 BP (before present) was  
11   characterized by a small number of sites with stemmed spear points instead of  
12   fluted spear points. Approximately 8,000 years ago, many California cultures  
13   shifted the main focus of their subsistence strategies from hunting to seed  
14   gathering as evidenced by the increase in food-grinding implements found in  
15   archaeological sites dating to this period. In the last 3,000 years, the  
16   archaeological record becomes more complex as specialized adaptations to locally  
17   available resources were developed and populations expanded. Many sites dated  
18   to this time period contain mortars and pestles or are associated with bedrock  
19   mortars, implying that the occupants exploited acorns intensively. The range of  
20   subsistence resources that were used increased, exchange systems expanded, and  
21   social stratification and craft specialization occurred as indicated by well-made  
22   artifacts such as charm stones and beads, which were often found with burials.

23   **17.3.1.2    Prehistory of the Trinity River Region**

24   The Trinity River Region includes portions of Trinity County including Trinity  
25   Lake, Lewiston Reservoir, and Trinity River from Lewiston Reservoir to the  
26   Humboldt County boundary (near the eastern boundary of Hoopa Valley Indian  
27   Reservation); portions of Humboldt County including the Hoopa Valley Indian  
28   Reservation, Trinity River from the Humboldt County border to the Del Norte  
29   County border (near the confluence of the Trinity and Klamath rivers); and Del  
30   Norte County including the Lower Klamath River from the confluence with the  
31   Trinity River to the Pacific Ocean.

32   The area surrounding the present Trinity Lake and the Trinity River to its  
33   confluence with the Klamath River and along the Klamath River to the Pacific  
34   Ocean was inhabited by the Wintu, Chimariko, Yurok, and Hupa Indians at the  
35   time of Euroamerican contact.

36   **17.3.1.3    Prehistory of the Central Valley Region**

37   The Central Valley Region extends from above Shasta Lake to the Tehachapi  
38   Mountains and includes the Sacramento Valley, San Joaquin Valley, and the  
39   Delta and Suisun Marsh areas. The Sacramento Valley and San Joaquin Valley  
40   are divided into Eastern and Western subregions.

### 1 **17.3.1.3.1 Prehistory of the Sacramento Valley**

2 The western Sierra Nevada foothills appear to have been first used by Great Basin  
3 people around 8000 BP (Reclamation 1997). By approximately 4000 BP, people  
4 possibly from the Great Basin were seasonally hunting and gathering in the Sierra  
5 Nevada and the Sacramento Valley.

6 In the northern western portion of Sacramento Valley, between approximately  
7 12,000 and 150 years ago (12000 to 100 BP), the prehistoric societies of northern  
8 California underwent a series of slow but significant changes in subsistence and  
9 economic orientation, population densities and distribution, and social  
10 organization. These changes are thought to reflect migrations of various peoples  
11 into the area and displacement of earlier populations (Jensen and Reed 1980;  
12 Farber 1985; Reclamation 1997). Early archaeological investigations within  
13 Nomlaki and Wintu ethnographic territory, particularly the present Redding area  
14 and adjacent tracts of the southern Klamath Mountains, appear to indicate that  
15 human occupation of this area began approximately 1050 to 950 BP.

16 Little is known of human occupation on the floor of the Sacramento Valley prior  
17 to 4500 BP (Reclamation 1997). Because of alluvial and colluvial deposition  
18 over the past 10,000 years, ancient cultural deposits have been deeply buried in  
19 many areas. Initially, humans appeared to adapt to lakes, marshes, and grasslands  
20 environments until approximately 8000 to 7000 BP (Placer County 2007). The  
21 earliest evidence of widespread villages and permanent occupation of the lower  
22 Sacramento Valley, Delta, and Suisun Marsh areas comes from several sites  
23 assigned to the Windmill Pattern (previously, “Early Horizon”), dated circa  
24 4500 to 2500 BP (Ragir 1972; Reclamation 1997; Reclamation et al. 2010).

25 From circa 2500 to 1500 BP in the Central Valley area, villages were  
26 characterized by deep midden deposits, suggesting intensified occupation and a  
27 broadened subsistence base (Reclamation 1997, 2005a; Reclamation et al. 2010;  
28 Beardsley 1948; Heizer and Fenenga 1939; Moratto 1984).

29 During the late prehistoric period from 1500 to 100 BP, development may have  
30 been initiated due to the southward expansion of Wintuan populations into the  
31 Sacramento Valley (Moratto 1984; Reclamation 1997; Reclamation et al. 2010).  
32 The period is characterized by intensified hunting, fishing, and gathering  
33 subsistence with larger communities, highly developed trade networks, elaborate  
34 ceremonial and mortuary practices, and social stratification.

### 35 **17.3.1.3.2 Prehistory of the San Joaquin Valley**

36 Evidence of prehistoric occupation of the central and southern Sierra Nevada  
37 foothills goes back to 9,500 years ago. The vast majority of investigated sites,  
38 however, are less than 500 years old, probably representing a relatively recent  
39 proliferation of settlements by Yokut Indians (Moratto 1984; Reclamation 1997).  
40 The chronological sequence developed in the south-central Sierra Nevada as a  
41 result of the Buchanan Reservoir project in present Madera County is still used as  
42 a general framework (Reclamation 1997). Similar findings were identified in

1 major settlement sites along the San Joaquin River and in the present New  
2 Melones Reservoir area (Reclamation 2010; Reclamation and DWR 2011).

3 During the early Holocene period (10,000 to 12,000 years ago), peoples probably  
4 inhabited or passed through the San Joaquin Valley; however, few indications of  
5 this period have been discovered, probably due to burial beneath accumulated  
6 river sediment (Reclamation 1997, 2012). Examples of early Holocene cultural  
7 remains are known primarily from the Tulare Basin in the southern San Joaquin  
8 Valley. Evidence along the southern shoreline of the ancient Tulare Lake  
9 indicates that human presence may have occurred from 11000 BP (Reclamation  
10 and State Parks 2013).

11 From approximately 1650 to 950 BP, there is evidence that the people of the  
12 eastern San Joaquin Valley may have interacted with people in the Delta area  
13 (Reclamation 1997, 2012).

14 From approximately 450 to 100 BP, the people of the eastern San Joaquin Valley  
15 may have interacted with people in the Central Coast and Southern California  
16 areas. Material found in Pacheco to Panoche strata indicates a trade relationship  
17 with people of the Delta, Central Coast, and Southern California regions (Moratto  
18 1984; Reclamation 1997, 2012).

19 **17.3.1.4 Prehistory of the San Francisco Bay Area Region**

20 The San Francisco Bay Area Region only includes portions of the Bay Area that  
21 could be affected through implementation of the alternatives considered in this  
22 EIS, which includes Contra Costa, Alameda, Santa Clara, and San Benito  
23 counties. The prehistory context is different throughout the San Francisco Bay  
24 Area Region. Human occupation in the northern valley regions of present San  
25 Benito County occurred as described above for the western San Joaquin Valley  
26 (San Benito County 2010).

27 Human occupation in the coastal regions of present Contra Costa and Alameda  
28 counties occurred as described above for the southern portion of the Sacramento  
29 Valley (Reclamation 1997; DWR 2008; Zone 7 2006). From 5000 to 2500 BP,  
30 dense settlements extended from the coastal marshes to interior grasslands and  
31 woodlands (Zone 7 2006). From about 2500 to 950 BP, coastal communities  
32 relied upon shellfish, and major shellmounds were created near these  
33 communities, including near the present Alameda County shorelines and some  
34 interior valleys.

35 Settlement of the interior valleys of the present Contra Costa, Alameda, and Santa  
36 Clara counties occurred during the past 12,000 years. From 6000 to 1700 BP,  
37 settlements occurred, as there was less emphasis on nomadic hunting for large  
38 animals and increased emphasis on the use of plant materials and hunting, fishing,  
39 and shellfish collection (Santa Clara County 2012; CCWD et al. 2009). The  
40 communities established economies and traded between the communities.

1 **17.3.1.5 Prehistory of the Central Coast Region**

2 The prehistory of the Central Coast Region for this EIS (present day San Luis  
3 Obispo and Santa Barbara counties) is poorly known but may have begun around  
4 11000 BP and probably represents mobile hunter-gatherers (Reclamation 1997;  
5 San Luis Obispo County 2010; Santa Barbara 2010). Fishing, intensive shellfish  
6 collecting, and hunting began around 9000 BP. Use of milling stones and  
7 establishment of communities occurred after about 8500 BP. After about  
8 5000 BP, there was greater reliance on hunting of land and sea mammals,  
9 gathering of shellfish, and use of mortars and pestles. Subsequently, larger  
10 settlements occurred for ethnographically known peoples, including the Chumash.

11 **17.3.1.6 Prehistory of the Southern California Region**

12 The Southern California Region includes the present Ventura, Los Angeles,  
13 Orange, San Diego, Riverside, and San Bernardino counties, which have  
14 substantially different prehistory characteristics.

15 In the coastal areas of the Southern California Region (present Ventura, Los  
16 Angeles, Orange, and San Diego counties), early habitation extends over  
17 12,000 years ago (Ventura County 2005; Los Angeles 2005; San Diego County  
18 2011b). Between 12000 and 7500 BP, the inhabitants were hunter-gatherer  
19 populations that used land and marine resources. The population along the  
20 northern coast of Southern California began expanding between 9000 and  
21 8500 BP. Permanent coastal settlements expanded as plants, shellfish, and marine  
22 mammals became a large part of the subsistence (Glassow et al. 2007; Los  
23 Angeles 2005). From 5000 to 450 BP, the use of plant materials and exploitation  
24 of fish and sea mammals increased sedentism and socioeconomic interaction  
25 (Glassow 1999; Los Angeles 2005; San Diego County 2011b).

26 The interior area within the Southern California Region considered in this EIS  
27 includes portions of Riverside and San Bernardino counties that use SWP water  
28 supplies, including the Mojave Desert and the Peninsular Ranges.

29 Clovis (circa 12000 to 10000 BP) is the only cultural complex dating from the  
30 Pleistocene that can be consistently identified in the Mojave Desert (Sutton et al.  
31 2007). The Clovis culture characteristics appear to be associated with Paleo-  
32 Indian groups as big game hunters. More recently, there have been indications  
33 that the people had greater cultural and economic diversity than previously  
34 recognized (CDFG 2009). Paleo-Indian groups were likely small, highly mobile  
35 populations living in small, temporary camps near permanent water sources  
36 (Sutton et al. 2007).

37 From 10000 and 8000 BP, communities were organized around relatively small  
38 social units (Sutton et al. 2007; Riverside County 2000). From 7000 to 4000 BP,  
39 hunting continued while foraging subsistence transformed during this period to  
40 more collection of plant and animal materials within adjacent ecological zones  
41 (CDFG 2009; Riverside County 2000; Sutton et al. 2007). Between 4000 and  
42 1750 BP, permanent seasonally occupied settlements occurred in the lower valley  
43 with the use of oak woodlands and mesquite groves (Riverside County 2000;  
44 Sutton et al. 2007).

1 From 1750 to 850 BP, communities increased and trade between communities  
2 expanded (CDFG 2009; Gardner 2002, 2006; Riverside County 2000;  
3 Sutton et al. 2007; Sutton 1988, 1996; Warren and Crabtree 1986). During this  
4 period, the lower Coloradan culture became more prevalent along the shoreline of  
5 the Lake Cahuilla area (site of the present Salton Sea and Coachella Valley Water  
6 District) (Riverside County 2000). The lower Coloradans relied upon shellfish,  
7 fish, aquatic birds, marsh and riparian vegetation, and mammals. The culture may  
8 have been influenced by the Anasazi settlements of present Southern Nevada,  
9 including cultivation of corns, beans, and squash. The Anasazi people also  
10 occupied portions of present San Bernardino County where turquoise was mined.  
11 Extensive trading occurred between the people in the inland areas and the people  
12 along the coast.

13 After about 850 BP, populations appeared to decline, and several cultural  
14 complexes emerged (Sutton et al. 2007). Late Prehistoric occupation sites were  
15 based on hunting and gathering, especially of plant foods and small game  
16 (Riverside County 2000). Villages in Antelope Valley began to disappear in the  
17 later prehistoric times, probably due to the disappearance of lakes that were the  
18 headwaters of the Mojave River or changes in trade route locations (DWR 2009).  
19 Lake Cahuilla declined around 450 BP and the large populations dispersed to the  
20 Colorado River, western Peninsular Ranges in present western Riverside County,  
21 and the Pacific Ocean coast (Riverside County 2000).

## 22 **17.3.2 Ethnographic Context**

### 23 **17.3.2.1 Introduction to Ethnographic Context**

24 This section provides brief ethnographic sketches for each native cultural group  
25 whose traditional territories are within the study area. Each ethnographic sketch  
26 presents the territorial limits of each respective cultural group and then focuses  
27 mainly on those aspects of culture that are potentially represented in the  
28 archaeological record.

29 The study area encompasses lands occupied by more than 40 distinct Native  
30 American cultural groups. Although most California tribes shared similar  
31 elements of social organization and material culture, linguistic affiliation and  
32 territorial boundaries primarily distinguish them from each other. Before  
33 European settlement of California, an estimated 310,000 native Californians  
34 spoke dialects of as many as 80 mutually unintelligible languages representing  
35 six major North American language stocks (Cook 1978; Moratto 1984;  
36 Reclamation 1997; Shipley 1978).

### 37 **17.3.2.2 Ethnography of the Trinity River Region**

38 The Trinity River Region includes portions of Shasta, Trinity, Siskiyou,  
39 Humboldt, and Del Norte counties. This area is bounded by the Sacramento  
40 River on the east, the Pacific Ocean on the west, and the middle and upper  
41 Klamath Basin on the north. The ethnography of the Yurok, Hupa, Wintu, and  
42 Chimariko is described below.

1 **17.3.2.2.1 Yurok**

2 The Yurok inhabited California's northwestern coastline from Little River to  
3 Damnation Creek; along the Klamath River from the confluence with the Pacific  
4 Ocean up past the Klamath-Trinity confluence to Slate Creek; and approximately  
5 6 miles along the Trinity River upstream of the confluence with the Klamath  
6 River (Pilling 1978; USFWS et al. 1999). The Yurok life, communities, society,  
7 and ceremonies are deeply connected with the Klamath River (DOI and CDFG  
8 2012). Yurok culture and traditional stories describe that the Klamath River was  
9 created to facilitate the interaction with two neighboring people, the Hupa and the  
10 Karuk, and with the salmon that lived in the Klamath River. Both the Hupa and  
11 Karuk culture and traditional stories also describe this close interaction of the  
12 peoples, salmon, and Klamath River.

13 Yurok are recognized for their highly stylized art forms and their skills in making  
14 redwood canoes, weaving fine baskets, hunting, and especially riverine salmon  
15 fishing. The ancient traditions are continued through contemporary times  
16 (USFWS et al. 1999). The redwood canoes for ocean conditions can be 30 to  
17 40 feet in length, designed to haul large amounts of fish and seal carcasses, and  
18 paddled by 5 to 20 paddlers (DOI and CDFG 2012). The canoes are used to  
19 gather food and materials, transport people and materials, and for ceremonial  
20 aspects of the Yurok culture. The Jump and Deerskin ceremonies are held in late  
21 fall to give thanks for abundant food supplies. The Deerskin Ceremony includes a  
22 Boat Ceremony in which the participants travel down the Klamath River to thank  
23 the river for continuing to flow and provide resources.

24 **17.3.2.2.2 Hupa**

25 The Hupa inhabited the area surrounding the lower reaches of the Trinity River  
26 from approximately Salyer to approximately 6 miles upstream from the  
27 confluence with the Klamath River (Wallace 1978a; USFWS et al. 1999). Hupa  
28 life is defined by extended families affiliated with villages.

29 The Hupa believe that the Klamath and Trinity rivers were created to provide  
30 interaction with other peoples (Yurok and Karuk) and with the salmon (DOI and  
31 CDFG 2012). Many of the Hupa ceremonies highlight their relationship with the  
32 rivers, including world renewal ceremonies and ceremonies for bountiful harvests.  
33 The world renewal ceremonies include the White Deerskin and Jump ceremonies  
34 to honor the earth and the creator for providing food and other resources. The  
35 ceremonies for bountiful harvest of fish and acorns include the First Salmon  
36 ceremony and the Acorn Feast.

37 **17.3.2.2.3 Wintu**

38 When the Europeans and Americans first explored California, most of the western  
39 side of the Sacramento Valley north of about Suisun Bay was inhabited by  
40 Wintun-speaking people (USFWS et al. 1999). Early in the anthropological study  
41 of the region, a linguistic and cultural distinction was recognized between the  
42 Wintun-speaking people in the southwestern Central Valley (the Patwin) and the

1 people occupying the northwestern Central Valley and Trinity River Valley  
2 (LaPena 1978; USFWS et al. 1999).

### 3 **17.3.2.2.4 Chimariko**

4 The Chimariko lived in a 20-mile-long reach of the Trinity River from  
5 approximately Big Bar to the confluence with the South Fork (Silver 1978a;  
6 USFWS et al. 1999). Although the Chimariko language is now extinct, early  
7 ethnographers recorded some words, and the language is thought to be of Hokan  
8 stock.

### 9 **17.3.2.3 Ethnography of the Central Valley Region**

#### 10 **17.3.2.3.1 Ethnography of the Sacramento Valley**

##### 11 *Maidu, Konkow, and Nisenan*

12 Maidu (also known as northeastern Maidu), Konkow (also known as northwestern  
13 Maidu), and Nisenan (also known as southern Maidu) inhabited an area of  
14 California from Lassen Peak to the Cosumnes River, and from the Sacramento  
15 River to Honey Lake (Reclamation 1997; Shipley 1978). Northeastern Maidu  
16 territory extended from Lassen Peak on the west to Honey Lake on the east,  
17 Sierra Buttes on the south, and Eagle Lake on the north. The Konkow inhabited  
18 the region from the Lower Feather River in the north, to the Sutter Buttes in the  
19 south, and to the west beyond the Sacramento River. The Nisenan lived in the  
20 area east of the Sacramento River and along the Middle Fork Feather River, Bear  
21 River, American River, and Cosumnes River from the Sacramento River  
22 almost to Lake Tahoe (Riddell 1978; Wilson and Towne 1978; Reclamation  
23 1997, 2005b).

##### 24 *Yana*

25 The Yana of north-central California inhabited an area from Lassen Peak and the  
26 southern Cascade foothills on the east, Rock Creek on the south, Pit River on the  
27 north, and the eastern bank of the Sacramento River on the west. The western  
28 boundary is the most uncertain (J. Johnson 1978a; Reclamation 1997).

##### 29 *Achumawi, Atsugewi, and Shasta*

30 The Achumawi and Atsugewi of northeastern California are two linguistically and  
31 culturally distinct but related groups (Reclamation 1997). The Achumawi and  
32 Atsugewi languages belong to the Palaihnihan family, or Hokan stock. The  
33 territory of the Achumawi extended generally to Mount Lassen, west to Mount  
34 Shasta, northeast to Goose Lake, and east to the Warner Range (Kroeber 1925;  
35 Olmsted and Stewart 1978; Garth 1978; Reclamation 1997). Overlapping this  
36 area to some extent, the Atsugewi territory ranged from Mount Lassen in the  
37 southwest, the Pit River in the north, and Horse Lake to the east.

38 The Shasta peoples were originally thought to be associated with the Achumawi  
39 and Atsugewi but then were considered as a separate group (Kroeber 1925;  
40 Reclamation 1997; Shipley 1978). The Shasta peoples inhabited the area from  
41 southern Oregon at the Rogue River, south to the present Cecilville, and the area  
42 between the Marble and Salmon mountains to Mount Shasta in the west and the

1 Cascade Range in the east. In California, the core areas of settlement were in  
 2 Shasta Valley, Scotts Valley, and along the Klamath River from about Scotts  
 3 River to the town of Hornbrook (Silver 1978b).

4 *Plains Miwok*

5 The Plains Miwok established villages along river courses in the foothills located  
 6 east of Sacramento and the Delta (Reclamation 2005b).

7 *Nomlaki*

8 Two major divisions existed among the Nomlaki: the River and Hill Nomlaki  
 9 (Goldschmidt 1978; DuBois 1935; Reclamation 1997). The River Nomlaki  
 10 occupied the Sacramento River Valley in present eastern Tehama County. The  
 11 Hill Nomlaki occupied the eastern side of the Coast Ranges in present Tehama  
 12 and Glenn counties. The Nomlaki and Wintu conducted trading between the  
 13 peoples (Goldschmidt 1978; DuBois 1935; Reclamation 1997).

14 *Patwin*

15 The Patwin lived along the western side of the Sacramento Valley from the  
 16 present Princeton to Benicia, including Suisun Marsh (Kroeber 1925;  
 17 Reclamation 1997; Reclamation et al. 2010). Within this large area, the Patwin  
 18 have traditionally been divided into River, Hill, and Southern Patwin groups.  
 19 Settlements generally were located on high ground along the Sacramento River or  
 20 tributary streams, or in the eastern Coast Range valleys. The ethnographically  
 21 recorded villages of Aguasto and Suisun were located near San Pablo and Suisun  
 22 bays (P. Johnson 1978b; Reclamation 1997; Reclamation et al. 2010).

23 **17.3.2.3.2 Ethnography of the San Joaquin Valley**

24 *Eastern Miwok*

25 The Miwok cultures in present California include the Coast Miwok, Lake Miwok,  
 26 and Eastern Miwok divisions. The Eastern Miwok included five separate groups  
 27 (Bay, Plains, Northern Sierra, Central Sierra, and Southern Sierra) that inhabited  
 28 the area from present Walnut Creek in Contra Costa County and the Delta, along  
 29 the lower Mokelumne and Cosumnes rivers and along the Sacramento River from  
 30 present Rio Vista to Freeport, the foothill and mountain areas of the upper  
 31 Mokelumne River and Calaveras River watersheds, the upper Stanislaus River  
 32 and Tuolumne River watersheds, and the upper Merced River and Chowchilla  
 33 River watersheds, respectively (Levy 1978a; Reclamation 1997; Shipley 1978).  
 34 No one Miwok tribal organization encompassed all the peoples speaking  
 35 Miwokan languages, nor was there a single tribal organization that encompassed  
 36 an entire division.

37 *Yokuts*

38 Yokuts are a large and diverse number of people in the San Joaquin Valley and  
 39 Sierra Nevada foothills of central California, including the Southern San Joaquin  
 40 Valley Yokuts, Northern San Joaquin Valley Yokuts, and Foothill Yokuts  
 41 (Reclamation 1997; Reclamation et al. 2011a; SJRRP 2011). The three  
 42 subdivisions of the Yokuts languages belong to the Yokutsan family, or Penutian  
 43 stock (Shipley 1978).

1 The Southern Valley Yokuts inhabited the southern San Joaquin Valley from  
2 present Fresno to the Tehachapi Mountains (Wallace 1978b). The Northern  
3 Valley Yokuts inhabited the northern San Joaquin Valley from Bear Creek to the  
4 San Joaquin River near present Mendota, western San Joaquin Valley near present  
5 San Luis Reservoir, and eastern present Contra Costa and Alameda counties  
6 (ECCCHCPA et al. 2006; Wallace 1978c; Reclamation and State Parks 2012;  
7 Reclamation and DWR 2011). The Foothill Yokuts inhabited the western slopes  
8 of the Sierra Nevada foothills from the Fresno River to the Kern River (Spier  
9 1978b; Reclamation and State Parks 2013). Yokuts were mobile hunters and  
10 gatherers with semipermanent villages and seasonal travel corridors to food  
11 sources.

12 The Yokuts probably traded with the Costanoan people from the coastal areas  
13 based upon the abalone and other mussel shells found in settlement sites  
14 (Reclamation and State Parks 2012).

15 *Dumna and Kechayi*

16 The Dumna and Kechayi lived along the San Joaquin River in the Sierra Nevada  
17 foothills near the present Millerton Lake (Reclamation and State Parks 2013).

18 **17.3.2.4 Ethnography of the San Francisco Bay Area Region**

19 Native inhabitants of the San Francisco Bay Area Region include the Miwok,  
20 Cholvon Northern Valley Yokuts, and the Costanoan Indians (Reclamation 1997;  
21 CCWD et al. 2009; ECCCHCPA et al. 2006; EBMUD 2009; Reclamation 2005b;  
22 Santa Clara County 2012; San Benito County 2013).

23 **17.3.2.4.1 Miwok**

24 In the San Francisco Bay Area Region, the Coast Miwok people lived along lower  
25 San Joaquin River and San Pablo Bay and in the interior of the present Contra  
26 Costa and Alameda counties (Reclamation 1997; ECCCHCPA et al. 2006; Kelly  
27 1978). The Bay Miwok villages were located in the San Ramon Valley with other  
28 settlements on the western slopes of the Diablo Range. The Volvons, speakers of  
29 the Bay Miwok language, settled along Marsh Creek and Kellogg Creek on the  
30 northern side of the Diablo Range and near the present Los Vaqueros Reservoir  
31 (CCWD et al. 2009). The Miwok people may have held lands at the peak of  
32 Mount Diablo.

33 **17.3.2.4.2 Costanoan**

34 The Costanoans (also known as Ohlone) are a linguistically defined group with  
35 several autonomous tribelets that speak related languages (Levy 1978b;  
36 Reclamation 1997; EBMUD 2009; Zone 7 2006; Santa Clara County 2012). The  
37 Costanoans inhabited coastal shorelines along San Francisco, San Pablo, and  
38 Suisun Bay and along the Pacific Ocean Coast from the Golden Gate to Monterey  
39 Bay and interior valleys that extended approximately 60 miles inland, including  
40 areas within Santa Clara and San Benito counties (Reclamation 1997;  
41 ECCCHCPA et al. 2006; San Benito County 2010).

1 **17.3.2.5 Ethnography of the Central Coast Region**

2 The Central Coast Region considered in this EIS includes the coastal areas of  
3 present San Luis Obispo and Ventura counties. This area was home to the  
4 Salinan, Chumash, and Tataviam people.

5 The Salinan territory extends from about the present location of Soledad  
6 (Monterey County) to San Luis Obispo (Hester 1978). The Chumash are  
7 considered to have been one of the most elaborate cultures in California. The  
8 Chumash culture is characterized by large villages with social ranking, intensive  
9 trade, craft specialization, and well-developed art styles (Grant 1978b;  
10 Greenwood 1978; Kroeber 1925; Moratto 1984; Reclamation 1997; San Luis  
11 Obispo County 2010; Santa Barbara 2010; Santa Barbara County 2010). The  
12 Chumash inhabited the central coastal area of California from approximately  
13 present San Luis Obispo to Malibu Canyon and inland to western San Joaquin  
14 Valley.

15 **17.3.2.6 Ethnography of the Southern California Region**

16 The coastal portion of the Southern California Region considered in this EIS  
17 includes the present Ventura, Los Angeles, Orange, and San Diego counties. The  
18 interior portion of the Southern California Region includes the present western  
19 and central Riverside County and western San Bernardino County.

20 **17.3.2.6.1 Prehistory of Southern California Region, Coastal Portion**

21 The Chumash and Tataviam people lived in the present Ventura County and  
22 northern Los Angeles County areas. The ethnography of the Chumash people is  
23 similar to that described above for the Central Coast Region. The Tataviam  
24 people lived inland of the Chumash and Gabrielino on the upper reaches of the  
25 Santa Clara River drainage east of Piru Creek and extending over the Sawmill  
26 Mountains to the edge of the southwestern Antelope Valley (King and  
27 Blackburn 1978).

28 The Gabrielino and Juaneño people lived in the present Los Angeles and Orange  
29 counties areas. The Gabrielino (also known as Gabrielino Tongva or Gabrieleño)  
30 occupied the Southern California coast in the vicinity around Mission San  
31 Gabrielal areas. The Juaneño occupied the area around the mission (Bean and  
32 Smith 1978; Los Angeles 2005; Riverside County 2000). These people traded  
33 with other people in Southern California.

34 The Luiseño and Tipai-Ipai people lived in the present Orange and San Diego  
35 counties areas. The Luiseño occupied most of the San Luis Rey and Santa  
36 Margarita River drainages near San Luis Rey Mission (Bean and Shipek 1978).  
37 The Luiseño shared many cultural traits with the Gabrielino and Chumas people.  
38 The Tipai-Ipai (also known as Kumeyaay) occupied extreme Southern California  
39 and Northern Baja California in autonomous, seminomadic bands of patrilineal  
40 clans (Luomala 1978; San Diego County 2011b; CDFG 2009). The Ipai occupied  
41 the areas north of the San Diego River, and the Tipai occupied the area south of  
42 the San Diego River (San Diego County 2011b).

1     **17.3.2.6.2 Prehistory of Southern California Region, Interior Portion**

2     The Cahuilla, Serrano, Tubatalabal, Kawaiisu, and Quechan people lived in  
3     present Riverside, eastern Los Angeles, southeastern Kern, and western San  
4     Bernardino counties. The Tubatalabal also lived in the southeastern San Joaquin  
5     Valley in present southeastern Kern County.

6     *Cahuilla*

7     The Cahuilla lived inland within present Riverside County. Villages were located  
8     in canyons or on alluvial fans close to food and water sources. The Cahuilla  
9     interacted frequently with other people in Southern California (Bean 1978;  
10    Riverside County 2000).

11    *Serrano*

12    The Serrano lived in the San Bernardino Mountains within present northeastern  
13    Los Angeles County and southwestern San Bernardino County and in the  
14    northwestern valleys and mountains of Riverside County. Villages were located  
15    close to food and water sources along perennial streams and lakes. The Serrano  
16    interacted frequently with other people in Southern California (Riverside County  
17    2000; DWR 2009).

18    *Kawaiisu*

19    The Kawaiisu occupied a mountainous area between the Mojave Desert and the  
20    southern San Joaquin Valley, mostly in Kern County, and the Tehachapi Valley  
21    (Zigmond 1986; California State Parks 2014). The Kawaiisu lived in permanent  
22    winter villages and traveled during the warmer months into the Mojave Desert  
23    and Antelope Valley. They traded and interacted with neighboring groups,  
24    including the Chumash, Yokuts, and Tubatalabal people.

25    *Quechan*

26    The Quechan were Yuman people that occupied areas along the Colorado River  
27    and adjacent valleys, including present Coachella and Imperial valleys (Riverside  
28    County 2000). The Quechan had a strong tribal identity and traveled extensively  
29    for trade.

30    **17.3.3 Historical Context**

31    The historical context presented in this section is focused on historical activities  
32    and resources that affected and/or were affected by implementation of water  
33    resource actions of CVP and SWP water users. Changes in CVP and SWP  
34    operations under implementation of alternatives considered in this EIS could not  
35    only affect CVP and SWP facilities. These changes also could affect regional and  
36    local water supplies, reservoirs, and associated land uses of those that use CVP  
37    and SWP water.

38    **17.3.3.1 Introduction to Historical Context**

39    Initial contact with Europeans and Americans occurred with Spanish missionaries  
40    and soldiers, who entered California from the south in 1769, eventually founding  
41    21 missions along the California coast (Reclamation 1997). This period is  
42    characterized by the establishment of missions and military presidios, the

1 development of large tracts of land owned by the missions, and subjugation of the  
2 local Indian population for labor. This way of life began to change in 1822 when  
3 Mexico became independent of Spain. The mission lands were divided by  
4 government grants into large ranchos often consisting of tens of thousands of  
5 acres. The owners of these large *estancias* built homes, often of adobe, and  
6 maintained large herds of cattle and horses.

7 During the Spanish and Mexican periods, explorers entered the region. Fort Ross  
8 on the Sonoma coast was established by the Russians from 1812 until 1841 to  
9 support hunting, fishing, and whaling businesses (Reclamation 1997). American  
10 explorer Jedediah Smith and Peter Skene Odgen, Chief Trader for the Hudson  
11 Bay Company, with other members of the Hudson Bay Company also came to  
12 California during this period.

13 In 1848, the Treaty of Guadalupe Hidalgo transferred the lands of California from  
14 the Mexican Republic to the United States and initiated what is called the  
15 American Period in California history (Reclamation 1997). During that same  
16 year, gold was discovered in the foothills of the Sierra Nevada, and thousands of  
17 hopeful miners as well as storekeepers, settlers, and farmers entered the region.  
18 Mining in the Trinity River Region was expanded for both gold and copper mines  
19 (Placer County 2007).

20 To support this growth, extensive transportation systems were created to support  
21 wagon routes, steamboats on the major rivers, and numerous railroads  
22 (Reclamation 1997). Many of the supply centers and shipment points along these  
23 transportation corridors developed into cities, towns, and settlements. Logging  
24 and ranching also expanded to meet the needs of the new settlers. American  
25 ranchers found Central California ideally suited for grazing large herds of stock.  
26 During the latter part of the 19th century, American ranchers amassed large tracts  
27 of former rancho land, and several great cattle empires were formed. As  
28 settlements grew, farming increased. A primary constraint to expansion of crop  
29 diversity and areas under cultivation was the lack of water. Irrigation was  
30 virtually unknown in California until the 1880s, when large-scale irrigation  
31 systems were developed to improve agriculture yields. With the development of  
32 irrigation and improved transportation, new crops were added to the grains  
33 obtained from dry farming, including vegetables, fruits, and nuts.

34 Irrigation capabilities further expanded in the 1950s and 1960s with the  
35 implementation of multiple water projects. The availability of water also  
36 expanded the agricultural and urban water supplies in the Central Valley,  
37 San Francisco Bay Area, Central Coast, and Southern California regions.

### 38 **17.3.3.2 History of the Trinity River Region**

39 Explorers from the Philippines and Europe may have visited and interacted with  
40 the Yurok people as early as the late 1700s. Peter Skene Odgen and Jedediah  
41 Smith initially visited the Lower and Middle Klamath River reaches in the 1820s.  
42 In 1828, Jedediah Smith and his party of explorers were the first white men  
43 known to have visited the Trinity River watershed (USFWS et al. 1999).

1 Although the area was first used extensively by trappers, gold was discovered on  
2 the Trinity River in 1848, and by the late 1840s, gold mining was a major activity  
3 along the Trinity River (Hoover et al. 1990; Del Norte County 2003; USFWS  
4 et al. 1999). Weaverville was the center of gold mining activity after 1849 with  
5 numerous mining camps and settlements along the Trinity River. Mining  
6 continued along the Trinity River through the early and mid-1900s with  
7 large-scale dragline and bucket dredging operations beginning in 1939.  
8 Logging has occurred since the 1880s and continues in the Trinity River Region.  
9 These activities resulted in significant changes to rivers and may have caused  
10 the destruction of many prehistoric or historic archaeological sites (Hoover  
11 et al. 1990).

12 Increased activities within the Trinity River Region led to conflicts between the  
13 new residents and the Yurok and Hupa people. On November 16, 1855, the  
14 Klamath Indian Reservation was established by Executive Order for lands from  
15 the mouth of the Klamath River to a location upstream of Tectah Creek that  
16 extended 1 mile wide on either side of the river for the approximately 20-mile  
17 reach (DOI and CDFG 2012). The Hoopa Valley Reservation was established in  
18 1864 and expanded in 1891 to include lands from the mouth of the Klamath River  
19 to the Hoopa Valley that extended 1 mile wide on either side of the river  
20 including portions of the Klamath Indian Reservation. In 1988, the Hoopa-Yurok  
21 Settlement Act (Public Law 100-580) partitioned portions of the previously  
22 established reservations into the Yurok Indian Reservation and Hoopa Valley  
23 Reservation and established the Resighini Rancheria.

### 24 **17.3.3.3 History of the Central Valley Region**

#### 25 **17.3.3.3.1 History of the Sacramento Valley**

26 Europeans, Americans, and Canadians may have initially entered the Sacramento  
27 Valley in the late 1700s and early 1800s as part of missionary or military  
28 expeditions (Reclamation 1997, 2005a; Reclamation et al. 2006; Placer County  
29 2007). By 1776, Jose Canizares explored areas located south of the present  
30 Sacramento community, and in 1813, there was a major battle between the  
31 Spanish and the Miwok people near the confluence of the Cosumnes River along  
32 the Sacramento River. Fur trappers moved through this area from the 1820s  
33 to 1840s.

34 The first settlements in this area occurred in the 1830s and 1840s on Mexican  
35 Land Grants. The New Helvetica Land Grant, which included more than  
36 40,000 acres in the Sacramento Valley, was awarded to John Sutter in 1841  
37 (DSC 2011).

38 Following the discovery of gold on the New Helvetica Land Grant in 1848 near  
39 present-day Coloma, numerous mining-related settlements were established in  
40 areas with the Nisenan, Maidu, Konkow, and Atsugewi people in the eastern  
41 portion of the Sacramento Valley and in areas with the Nomlaki and Wintu people  
42 in the western Sacramento Valley. Many of the Native Americans died after

1 exposure to diseases from the new settlers, including malaria. Numerous other  
 2 Native American died during battles against the new settlers.

3 Mining activities in the northern Sacramento Valley foothills and mountains near  
 4 present Redding primarily were related to gold and copper (Reclamation 2013a).  
 5 Mining activities in the central Sierra Nevada foothills primarily were related to  
 6 gold. In 1848, mining started along the Trinity River and upper Sacramento River  
 7 tributaries, primarily for copper and gold (Reclamation 2013a; Reclamation et al.  
 8 2006). Smelters, mills, and communities grew rapidly near the mining areas,  
 9 including the town of Keswick, and communities were established within and  
 10 adjacent to the present day Folsom Lake. The development of hydraulic mining  
 11 in 1851 required establishment of substantial water diversions, flumes, and  
 12 ditches to convey the water and displacement of vast amounts of sediment into the  
 13 streams and along the banks of the waterways.

14 Logging also was a dominant industry in the western Sacramento Valley since the  
 15 1850s (Reclamation 1997, 2013a). The logging industry grew as the railroads  
 16 were extended. Establishment of logging in the Sierra Nevada foothills and  
 17 mountains also led to development of water infrastructure to move and/or mill the  
 18 logs. One of the first water system infrastructures developed for these purposes  
 19 was the original Folsom Dam constructed in 1893 (Reclamation et al. 2006).

20 Agricultural activities were successful throughout the Sacramento Valley to serve  
 21 the mining communities (Reclamation 1997). The completion of the first  
 22 transcontinental railroad in 1869 increased the number of settlers and allowed  
 23 transport of crops from the Sacramento Valley to Nevada, Utah, and subsequently  
 24 to other areas of the nation (Reclamation 2005b). The expanded agricultural  
 25 markets expanded due to the establishment and development of commercial  
 26 crops, accessibility to markets, and new farming techniques and irrigation.

27 Construction of hydroelectric power and water storage facilities in the Sacramento  
 28 Valley foothills started in the early 1900s to provide hydropower and water  
 29 supplies to local and regional users, as well as export to other portions of the state  
 30 using CVP, SWP, City and County of San Francisco, and East Bay Municipal  
 31 Utility District facilities.

### 32 **17.3.3.3.2 History of the San Joaquin Valley**

33 The San Joaquin Valley area was not widely settled by Europeans or Mexicans  
 34 when California lands were under Spanish rule (1769 to 1821) or Mexican rule  
 35 (1821 to 1848). Numerous expeditions travelled through the San Joaquin Valley  
 36 during this period but did not establish major settlements (Reclamation 2010).  
 37 During the Spanish rule, several settlements occurred along Fresno Slough  
 38 (Reclamation and State Parks 2012; Reclamation and DWR 2011). There were  
 39 several settlements along the San Joaquin River and along the western boundary  
 40 of the San Joaquin Valley during Mexican rule when ranches were established in  
 41 the Coast Range foothills, including in Pacheco Pass and along Los Banos Creek.

42 In the latter half of the 19th century, agricultural settlements and mining camps  
 43 were established in the San Joaquin Valley along the railroad corridors

1 (Reclamation 1997; Reclamation and DWR 2011). The town of Rootville,  
2 subsequently renamed Millerton in honor of Major Miller, was established near  
3 the present Millerton Lake with a military post, Camp Barbour (later named Fort  
4 Miller) to maintain order in the mining camps.

5 Initially, agricultural activities were related to ranching and dry farming.  
6 Livestock ranching expanded in the late 1860s (Reclamation et al. 2011b). With  
7 the increased availability of electric pumps, groundwater and surface water  
8 irrigation was used throughout the valley. Many irrigation districts were formed  
9 after the passage of the Wright Act in 1877 that provided methods to finance  
10 major irrigation projects. One of the first irrigation systems constructed in the  
11 eastern San Joaquin Valley was the “Main Canal” as part of the Miller and Lux’s  
12 San Joaquin and Kings River Canal and Irrigation Company (Reclamation and  
13 State Parks 2013).

14 Historic resources are related to the settlement of the valley and include  
15 homesteads, transportation infrastructure (such as ship landings, ferry ports, and  
16 bridges), food processing and other industrial facilities, residential properties,  
17 commercial establishments, mining features (in the eastern portion), and  
18 government facilities (Reclamation 1997, 2010; Reclamation and DWR 2011).

#### 19 **17.3.3.3 History of the Delta and Suisun Marsh**

20 Communities were not established in the Delta and Suisun Marsh areas until the  
21 mid-1800s. There were numerous Spanish expeditions under Spanish rule. In the  
22 1830s and 1840s, Mexico established land grants, including Rancho Suisun  
23 located west of present City of Fairfield (Reclamation et al. 2010).

24 Following the discovery of gold in the Sacramento Valley, settlements occurred in  
25 the Delta to provide support services and agricultural products for those traveling  
26 to the gold fields and the Sacramento and San Francisco areas. Passage of the  
27 Swamp and Overflow Act in 1850 led to the transfer of lands from the U.S.  
28 Government in the Delta to the State of California, which subsequently sold the  
29 land to individuals. The new settlers in the Delta constructed levees to protect the  
30 lands from periodic flooding and drained other lands to reduce the potential for  
31 mosquito-borne diseases. By the 1920s, numerous communities were established  
32 around food processing and packing houses that supported a wide range of crops  
33 such as asparagus, barley, celery, corn, winter grain, sugar beets, onions, and  
34 alfalfa for local dairy farms were introduced to the area (DSC 2011; Reclamation  
35 et al. 2010). By the 1950s, major food packers and processors moved from the  
36 Delta, and many communities became smaller. Recreational opportunities were  
37 established in the 1850s with duck hunting opportunities in the Suisun Marsh  
38 area.

#### 39 **17.3.3.4 History of the San Francisco Bay Area Region**

40 In 1579, Sir Francis Drake and other Spanish explorers led expeditions into the  
41 San Francisco Bay Area. However, in general, the Spanish did not settle Northern  
42 California until the 1700s when other Europeans established trading settlements  
43 for fur, mining, and other products. Initially, the Spanish confined their

1 settlement to the coastline to establish military bases, or presidios (Hoover et al.  
 2 1990). Father Junipero Serra and other Franciscans worked with the Spanish  
 3 explorers to establish missions along the Alta California coastal areas between  
 4 present Sonoma County (San Francisco Solano established in 1823) to present  
 5 Ventura County (San Buenaventura established in 1782), including three missions  
 6 in areas that use CVP and SWP water (Mission San Jose established in 1797,  
 7 Mission Santa Clara established in 1777, and Mission San Juan Bautista  
 8 established in 1797).

9 San Jose was one the first towns established in Alta California as Pueblo de San  
 10 José de Guadalupe (Santa Clara County 2012). The Spanish government awarded  
 11 land grants in the San Francisco Bay Area Region (DWR 2008; EBMUD 2009;  
 12 Hoover et al. 1990; Reclamation 2005b; San Benito County 2010; Zone 7 2006).  
 13 In 1821, Mexico won independence from Spain, began to establish more secular  
 14 communities around the missions, and divided many of the ranchos into smaller  
 15 pueblos (Santa Clara County 2012). These actions supported growth in the  
 16 present California coastal areas.

17 Following California statehood in 1849, ranching and farming communities were  
 18 established in the interior valleys of the San Francisco Bay Area Region (Santa  
 19 Clara County 2012; CCWD et al. 2009; ECCCHCPA et al. 2006). Starting in the  
 20 late 1800s, expansion of the railroads in the area and use of improved irrigation  
 21 systems led to the expansion of agriculture throughout the area. In mid-1900s,  
 22 industrial expansion occurred in Contra Costa, Alameda, and Santa Clara  
 23 counties.

#### 24 **17.3.3.5 History of the Central Coast Region**

25 In 1542, Portuguese explorer Juan Rodríguez Cabrillo entered Santa Barbara  
 26 Harbor (Puerto de Santa Bárbara). In 1587, Pedro de Unamuno brought his ship  
 27 into Morro Bay, explored inland to the present site of the City of San Luis  
 28 Obispo, and claimed the area for Spain. In 1595, Sebastián Rodríguez Cermeño  
 29 entered San Luis Obispo Bay (Hoover et al. 1990). The explorations laid the  
 30 foundation for the founding of five missions in the Central Coast Region  
 31 considered in this EIS. Ranchos were granted throughout the region in the 1830s  
 32 and 1840s.

33 Following the California statehood, ranching and farming continued to be the  
 34 main economic activity of the Central Coast Region to the present.

#### 35 **17.3.3.6 History of the Southern California Region**

36 In 1540, Hernando de Alarcón explored the inland areas of the Southern  
 37 California Region with an expedition that had explored the Colorado River. In  
 38 1542, Cabrillo apparently became the first European to sight the coast of Southern  
 39 California, including the Los Angeles area and Santa Catalina Island, although he  
 40 did not make landfall (Hoover et al. 1990).

41 In 1769, Gaspar de Portolá explored a trail by land from present San Diego  
 42 through present San Diego, Orange, and Los Angeles counties (Hoover et al.  
 43 1990). He camped near the Los Angeles River and the Indian Village of Yang-Na

1 (within the present City of Los Angeles). In 1772, Pedro Fages made an inland  
2 journey from present San Diego through western Riverside County to San Luis  
3 Obispo (Hoover et al. 1990; Riverside County 2000). In 1776, friar Francisco  
4 Garcés explored from present San Gabriel Valley to the Antelope Valley. More  
5 than 20 missions were established along the Southern California coastline (Los  
6 Angeles 2005). Pueblos were established near the missions, including the Pueblo  
7 of Los Angeles in 1781.

8 The first known discovery of gold in California was made between 1775 and 1780  
9 in the Potholes district of southeastern California in present Imperial County  
10 (Clark 1970). Other placer deposits were found in 1828 at San Ysidro in present  
11 San Diego County, and in 1835 and 1842 at San Francisquito Canyon and  
12 Placerita Canyon, respectively, in present Los Angeles County (Clark 1970;  
13 Vredenburg 1991). Some of the mines continued to produce gold through the  
14 early 1990s.

15 Following the end of Spanish Rule, the Mexican Government deeded the  
16 extensive land holdings to ranchos to develop ranches and orchards (Riverside  
17 County 2000). Oranges and lemons became major agricultural crops between the  
18 1850s and 1880s, and railroads were built to transport the products.

19 Water supply systems were constructed to provide water to missions and pueblo  
20 villages. One of the first systems was the Zanja Madre that was constructed in  
21 1781 to convey water to the pueblo in the present City of Los Angeles (Los  
22 Angeles 2005; DWR 2009). The system was expanded in the 1850s and 1860s to  
23 convey water to vineyards and fruit orchards. During the late 1800s and early  
24 1900s, numerous dams and conveyance facilities were constructed in the area to  
25 support the communities and agriculture.

#### 26 **17.3.4 Known Cultural Resources**

27 The following subsections describe known cultural resources in the counties  
28 within the study area as determined through review of reports prepared for other  
29 projects in the study area. No physical or record surveys were conducted for this  
30 EIS because no site-specific construction actions were considered in this EIS.

31 The EIS evaluates alternatives to continue the coordinated long-term operation of  
32 the CVP and SWP. The resources described in this subsection indicate the types  
33 of resources that occur in areas served by CVP and SWP water and adjacent  
34 areas. Therefore, some of the known resources presented in this chapter are  
35 located in portions of the counties that are not within the CVP and SWP water  
36 service areas.

##### 37 **17.3.4.1 Known Cultural Resources of the Trinity River Region**

38 Within Trinity County, a cultural resources records search of the Trinity River  
39 Region was conducted for the Trinity River Mainstem Fishery Restoration  
40 EIS/Environmental Impact Report (EIR) (USFWS et al. 1999). The area covered  
41 included 660 feet on either side of the Trinity River from Trinity Lake to the  
42 eastern boundary of Hoopa Valley Indian Reservation and the inundation areas of  
43 the Trinity Lake and Lewiston Reservoir. More than 150 recorded cultural

1 resources were identified along the mainstem of Trinity River within Trinity  
 2 County, including 20 types of prehistoric and historic sites. Among these were  
 3 Native American villages, camps, and lithic scatters; historic Indian sites; mines;  
 4 ditches; cabins; structures; a school; USFWS stations and campgrounds;  
 5 cemeteries; a rock wall; trails; a wagon road; and a bridge. Fifty-one sites are  
 6 inundated within Trinity Lake and Lewiston Reservoir. Few of these sites have  
 7 been evaluated for eligibility to be included in the National Register of Historic  
 8 Places (NRHP). With respect to more recent historic sites in Trinity County, none  
 9 of the sites listed in the NRHP, California State Historical Landmarks, California  
 10 Register of Historical Resources (CRHR), and/or Points of Interest is located  
 11 within or along banks of the Trinity River (CSPOHP 2014a).

12 Within Humboldt County, numerous culturally sensitive areas are located along  
 13 the Lower Klamath and Lower Trinity rivers. The culturally sensitive areas  
 14 include the areas along the riverbanks associated with religious and/or resource-  
 15 producing important sites, in addition to specific known cultural resources. Many  
 16 cultural resource locations are in the Hoopa Valley Indian Reservation and Yurok  
 17 Reservation, including villages, cemeteries, ceremonial and gathering areas, and  
 18 along ridgeline corridors that were used for traveling between villages (Humboldt  
 19 County 2012). With respect to more recent historic sites in Humboldt County,  
 20 none of the sites listed in the NRHP, California State Historical Landmarks,  
 21 CRHR, and/or Points of Interest is located within or along banks of the Trinity or  
 22 Klamath rivers (CSPOHP 2014b).

23 Within Del Norte County, numerous culturally sensitive areas are located along  
 24 the Lower Klamath River, including areas within the Yurok Reservation and the  
 25 Resighini Rancheria along the southern shoreline of the mouth of the Klamath  
 26 River at the Pacific Ocean (Del Norte County 2003). The mouth of the Klamath  
 27 River is of great spiritual significance for the Yurok people (Yurok Tribe 2005).  
 28 The Yurok Tribe has suggested that the entire Klamath River, including the  
 29 Lower Klamath River, be designated as a Cultural Riverscape and be submitted  
 30 for consideration as a NRHP (Yurok Tribe 2005). With respect to more recent  
 31 historic sites in Del Norte County, none of the sites listed in the NRHP, California  
 32 State Historical Landmarks, CRHR, and/or Points of Interest is located within or  
 33 along banks of the Klamath River (CSPOHP 2014c).

#### 34 **17.3.4.2 Previously Recorded Cultural Resources in the Central Valley** 35 **Region**

36 The Central Valley Region is rich in both historic- and prehistoric-period  
 37 resources (Reclamation 1997), including large, deep midden sites (which  
 38 generally contains waste materials that indicate human inhabitation) that provide  
 39 information on prehistoric culture extending over thousands of years.

40 As described above, implementation of the alternatives considered in this EIS  
 41 could affect cultural resources at CVP and SWP reservoir facilities and in areas  
 42 that use CVP and SWP water that could experience land uses because of changes  
 43 in CVP and SWP water supply availability.

1 **17.3.4.2.1 Cultural Resources at CVP and SWP Reservoir Facilities in the**  
2 **Sacramento Valley**

3 Previous cultural resource studies were conducted at and/or near Shasta Lake,  
4 Lake Oroville, and Folsom Lake.

5 The studies near Shasta Lake surveyed approximately 8 percent of the study area  
6 and identified 261 cultural resources, including 190 prehistoric properties,  
7 45 historic resources, and 26 properties with prehistoric and historic resources  
8 (Reclamation 2013a). The prehistoric sites include habitation sites, artifact and  
9 lithic scatters, caves used as shelter, and cemeteries. The historic sites included  
10 bridges, railways, a dam, buildings, ranches, orchards, mines, towns, and  
11 cemeteries. Several prehistoric and historic cemeteries located within the  
12 inundation area were moved prior to completion of the Shasta Lake complex. The  
13 Dog Creek Bridge is the only resource in this area that is listed on the NRHP.  
14 The Shasta and Keswick dams were determined to be NRHP-eligible.

15 The studies near Lake Oroville identified 261 cultural resources areas, including  
16 234 prehistoric properties, 462 historic resources, and 91 properties with  
17 prehistoric and historic resources (DWR 2004, 2007). Within the Lake Oroville  
18 inundation area, 93 prehistoric properties and 19 historic sites were identified  
19 prior to the completion of the reservoir. The prehistoric sites include habitation  
20 sites, milling sites, quarries, artifact and lithic scatters, caves used as shelter, rock  
21 art, fishing and hunting grounds, battle sites, trails, and cemeteries. The historic  
22 sites included bridges, railways, a dam, buildings, ranches, orchards, mines,  
23 towns, and cemeteries.

24 Oroville Dam and peripheral dams, Thermalito Diversion Dam, Thermalito  
25 Forebay and Afterbay, Fish Barrier Dam, Hyatt Pumping-Generating Plant and  
26 Intake Structure, Thermalito Power Plant and Power Canal, Lake Oroville Visitor  
27 Center and Visitor Viewing Platform, and Feather River Fish Hatchery were  
28 determined to be NRHP-eligible.

29 The studies near Folsom Lake identified 185 prehistoric properties and 59 historic  
30 sites (Reclamation 2005b; Reclamation et al. 2006). The prehistoric sites include  
31 habitation sites, middens, groundstones, and artifact and lithic scatters. The  
32 historic sites included buildings, mining areas, and refuse dumps. Folsom Dam  
33 was determined to be NRHP-eligible.

34 **17.3.4.2.2 Cultural Resources at CVP and SWP Reservoir and Pumping**  
35 **Plant Facilities in the San Joaquin Valley**

36 Previous cultural resource studies were conducted at and/or near New Melones  
37 Reservoir, San Luis Reservoir, and Millerton Lake and San Joaquin River  
38 downstream of Friant Dam.

39 The studies near New Melones Reservoir surveyed approximately 78 percent of  
40 the study area and identified 725 cultural resources within the New Melones  
41 Reservoir area or within 0.25 mile of this area (Reclamation 2010). The  
42 prehistoric sites include habitation sites, artifact and lithic scatters, mortars, caves,  
43 rock art, and cemeteries. The historic sites included bridges, buildings, ranches,

1 orchards, towns, water and power systems, transportation infrastructure, and  
 2 cemeteries. Many of the sites are located within the inundation area. However,  
 3 substantial surveys were conducted prior to construction of New Melones  
 4 Reservoir in the 1980s.

5 The studies near San Luis Reservoir identified 51 prehistoric and historic cultural  
 6 resources (Reclamation and State Parks 2012). The prehistoric sites include  
 7 habitation sites and artifact and lithic scatters. The historic sites included bridges,  
 8 water infrastructure, buildings, ranches, orchards, towns, and cemeteries. One of  
 9 the major historic sites in this area is the remnant locations of Rancho San Luis  
 10 Gonzaga. Many portions of the ranch are located within the inundation area.  
 11 However, many of the structures were moved to a site near Pacheco Pass. The  
 12 remaining portions of the ranch were deeded to the State of California in 1992 to  
 13 become part of the Pacheco State Park. Rancho San Luis Gonzaga, a historic  
 14 stock ranch landscape, has been designated by the state to be a Historic  
 15 District/Cultural Landscape that is potentially NRHP-eligible and CRHR-eligible.

16 Recent studies along the San Joaquin River identified 19 prehistoric sites within  
 17 the seasonal inundation area of Millerton Lake (Reclamation and DWR 2011;  
 18 Reclamation and State Parks 2013). Additional sites are located within the area of  
 19 the lake that is constantly inundated. Some of the known sites include the  
 20 remains of Kuyu Illik; the Dumna “head” village; the Kechaye/”Dumna” village  
 21 of Sanwo Kianu; remains of Fort Miller, Millerton, and Collins Sulphur Springs;  
 22 and prehistoric sites with housepits, mortars, grinding sticks, and rock alignments  
 23 (Reclamation and State Parks 2013).

24 Along the San Joaquin River downstream of Friant Dam (which forms Millerton  
 25 Lake) to the confluence of the Merced River, 84 prehistoric sites, 18 historic sites,  
 26 and 7 sites with both prehistoric and historic resources were identified as part of  
 27 the San Joaquin River Restoration Program. The prehistoric sites include  
 28 habitation sites, artifact and lithic scatters, and bedrock milling features. The  
 29 historic sites included bridges, buildings, ranches, orchards, towns, water and  
 30 power systems, and transportation infrastructure.

31 The Friant Dam, Friant-Kern Canal, associated features (berms, siphons, control  
 32 structures, inlets, outlets, and check structures), approximately 40 bridges that  
 33 cross the canal, and Little Dry Creek Wasteway Facility are considered historic  
 34 resources (Reclamation and State Parks 2013; Reclamation et al. 2011b). The  
 35 Friant Dam and Friant-Kern Canal was determined to be NRHP-eligible.

#### 36 **17.3.4.2.3 Cultural Resources in the areas that use CVP and SWP Water** 37 **Supplies in the Central Valley**

38 Numerous cultural and historical resources are in the Central Valley, as  
 39 summarized in Table 17.1. Most of the cultural resources are located within areas  
 40 that would not be affected by land use changes that could result from changes in  
 41 CVP and SWP water supplies. The resources listed in Table 17.1 also include the  
 42 sites described above near CVP and SWP facilities.

1 **Table 17.1 Previously Recorded Cultural and Historical Resources of the Central**  
 2 **Valley Region**

County	Historic Site Types	Prehistoric Site Types
Butte	26 NRHP properties, 8 California Historical Landmarks, and 21 California Points of Historical Interest (Reclamation 1997; CSPOHP 2014e).	1,198 Known Prehistoric Site Types (Reclamation 1997).
Colusa	7 NRHP properties, 3 California Historical Landmarks, and 3 California Points of Historical Interest (Reclamation 1997; CSPOHP 2014g).	115 Known Prehistoric Site Types (Reclamation 1997).
El Dorado	18 NRHP properties, 30 California Historical Landmarks, 8 California Points of Historical Interest; numerous historic sites, such as mining features, building foundations, trash scatters, and bridges, were inundated by Folsom Lake (Reclamation 1997; CSPOHP 2014h).	595 Known Prehistoric Site Types (Reclamation 1997).
Fresno	38 NRHP properties, 8 California Historic Landmarks, and 13 of which are California Points of Historical Interest (Reclamation 1997; CSPOHP 2014i).	2,603 Known Prehistoric Site Types (Reclamation 1997).
Glenn	2 NRHP properties, 2 California Historical Landmarks, and 17 California Points of Historical Interest (Reclamation 1997; CSPOHP 2014j).	373 Known Prehistoric Site Types (Reclamation 1997).
Kern	20 NRHP properties, 47 California Historic Landmarks, and 11 California Points of Historical Interest (Reclamation 1997; CSPOHP 2014k).	3,850 Known Prehistoric and Historic Site Types (Reclamation 1997).
Kings	4 NRHP properties, 3 California Historic Landmarks; the San Luis Canal, the only CVP facility in Kings County, has no historic or architectural resources in its vicinity (Reclamation 1997; CSPOHP 2014l).	56 Known Prehistoric Site Types (Reclamation 1997).
Madera	2 NRHP property, 1 California Historic Landmarks, and 9 California Points of Historical Interest (Reclamation 1997; CSPOHP 2014n).	2,043 Known Prehistoric Site Types (Reclamation 1997).
Merced	14 NRHP properties, 5 California Historic Landmarks, 1 CRHR properties, and 8 California Points of Historical Interest (Reclamation 1997; CSPOHP 2014p).	316 Known Prehistoric Site Types (Reclamation 1997).

County	Historic Site Types	Prehistoric Site Types
Napa	76 NRHP properties, 17 California Historical Landmarks, and 13 California Points of Historical Interest (Reclamation 1997; CSPOHP 2014q).	700 Known Prehistoric Site Types (Reclamation 1997).
Placer	18 NRHP properties, 20 California Historical Landmarks, 21 California Points of Historical Interest; numerous historic sites, such as mining features, building foundations, trash scatters, and bridges, were inundated by Folsom Lake, which is a CVP facility (Reclamation 1997; CSPOHP 2014s).	627 Known Prehistoric Site Types (Reclamation 1997).
Plumas	6 NRHP properties, 13 California Historical Landmarks, and 5 California Points of Historical Interest (Reclamation 1997; CSPOHP 2014t).	1,639 prehistoric sites in Plumas County (Plumas County 2012).
Sacramento	<p>90 NRHP properties, 56 California Historical Landmarks, 4 CRHR properties, 20 California Points of Historical Interest; numerous historic sites, such as mining features, building foundations, trash scatters, and bridges, were inundated by Folsom Lake; the Folsom Mining District surrounds Lake Natoma (Reclamation 1997; CSPOHP 2014u).</p> <p>There are over 40 historic sites along the Sacramento River between Sutter County boundary and Freeport (Reclamation 2005b); including Natomas Main Drainage Canal, Town of Freeport, Sacramento Weir, Yolo Bypass, homes and farms, and a church.</p> <p>There are 14 historic sites along the American River between Folsom Dam and the confluence with the Sacramento River (Reclamation 2005b).</p>	<p>407 Known Prehistoric Site Types (Reclamation 1997). There are 24 prehistoric sites along the Sacramento River between Sutter County boundary and Freeport (Reclamation 2005b). There are 22 prehistoric sites along the American River between Folsom Dam and the confluence with the Sacramento River (Reclamation 2005b).</p>
San Joaquin	31 NRHP properties, 25 California Historical Landmarks, 3 CRHR properties, and 7 are California Points of Historical Interest (Reclamation 1997; CSPOHP 2014v).	189 Known Prehistoric Site Types (Reclamation 1997).

<b>County</b>	<b>Historic Site Types</b>	<b>Prehistoric Site Types</b>
Shasta	26 NRHP properties, 19 California Historical Landmarks, 1 CRHR properties, 15 California Points of Historical Interest (Reclamation 1997; CSPOHP 2014w). The Anderson-Cottonwood Irrigation District Diversion Dam has been determined to be eligible for NRHP listing (Reclamation 2013a).	1,419 Known Prehistoric Site Types. Many of these sites occur along the Sacramento River near Redding and between Battle Creek and Table Mountain (Reclamation 2013a).
Solano	23 NRHP properties, 14 California Historical Landmarks, and 9 California Points of Historical Interest (Reclamation 1997; CSPOHP 2014x).	300 Known Prehistoric Site Types (Reclamation 1997).
Stanislaus	21 NRHP properties, 5 California Historic Landmarks, and 7 are California Points of Historical Interest; the former right-of-way for the Patterson and Western Railroad, which was constructed in 1916, bisects the Delta-Mendota Canal (Reclamation 1997; CSPOHP 2014y).	280 Known Prehistoric Site Types (Reclamation 1997).
Sutter	7 NRHP properties, 2 California Historical Landmarks, and 22 California Points of Historical Interest (Reclamation 1997; CSPOHP 2014z).	62 Known Prehistoric Site Types (Reclamation 1997).
Tehama	10 NRHP properties, 3 California Historical Landmarks, and 1 California Point of Historical Interest (Reclamation 1997; CSPOHP 2014aa).	1,415 Known Prehistoric Site Types (Reclamation 1997).
Tulare	34 NRHP properties, 8 California Historic Landmarks, and no California Points of Historical Interest (Reclamation 1997; CSPOHP 2014ab).	1,857 Known Prehistoric Site Types (Reclamation 1997).
Yolo	21 NRHP properties, 2 California Historical Landmarks, 1 CRHR properties, and 8 California Points of Historical Interest (Reclamation 1997; CSPOHP 2014ad).	175 Known Prehistoric Site Types (Reclamation 1997). Includes possible fishing stations along Putah and Cache Creeks, the Sacramento, and ephemeral tributaries to these watercourses.
Yuba	10 NRHP properties, 6 California Historical Landmarks, and 14 California Points of Historical Interest (Reclamation 1997; CSPOHP 2014ae).	1,112 Known Prehistoric Site Types (Reclamation 1997).

1 **17.3.4.3 Previously Recorded Cultural Resources in the San Francisco**  
 2 **Bay Area Region**

3 The San Francisco Bay Area Region includes Alameda, Contra Costa, Santa  
 4 Clara, and San Benito counties. Much of this region is highly urbanized and that  
 5 development has affected archaeological resources. Numerous cultural and  
 6 historical resources are in the San Francisco Bay Area Region, as summarized in  
 7 Table 17.2. Most of the cultural resources are located within areas that would not  
 8 be affected by land use changes that could result from changes in CVP and SWP  
 9 water supplies.

10 **Table 17.2 Previously Recorded Cultural Resources of the San Francisco Bay Area**  
 11 **Region**

County	Historic Site Types	Prehistoric Site Types
Alameda	141 NRHP properties, 34 California Historical Landmarks, 2 CRHR properties, and 4 California Points of Historical Interest (CSPOHP 2014af).	No comprehensive inventory of prehistoric sites in Alameda County (Zone 7 2006).
Contra Costa	40 NRHP properties, 13 California Historical Landmarks, 1 CRHR property, and 12 California Points of Historical Interest (CSPOHP 2014ag).	No comprehensive inventory of prehistoric sites in Contra Costa County (Contra Costa County 2005). Up to 41 sites were identified in the Kellogg Creek Historic District near Los Vaqueros Reservoir (CCWD et al. 2009).
San Benito	12 NRHP properties, 5 California Historic Landmarks, and 2 California Points of Historical Interest (Reclamation 1997; CSPOHP 2014ah).	180 Known Prehistoric Site Types (Reclamation 1997).
Santa Clara	101 NRHP properties, 41 California Historical Landmarks, and 58 California Points of Historical Interest (CSPOHP 2014ai; Santa Clara County 1994).	Between 1912 and 1960, 43 sites were recorded in the Santa Clara Valley portion of Santa Clara County (Santa Clara 2012).

12 **17.3.4.4 Previously Recorded Cultural Resources in the Central Coast**  
 13 **and Southern California Regions**

14 The Central Coast Region includes San Luis Obispo and Santa Barbara counties.  
 15 Within the Central Coast Region, the SWP provides water supplies to portions of  
 16 San Luis Obispo and Santa Barbara counties. Within the Southern California  
 17 Region, the SWP provides water supplies to portions of Ventura, Los Angeles,  
 18 Orange, Riverside, San Bernardino, and San Diego counties. Numerous cultural  
 19 and historical resources are in the Central Coast and Southern California regions,  
 20 as summarized in Table 17.3. Most of the cultural resources are located within  
 21 areas that would not be affected by land use changes that could result from  
 22 changes in SWP water supplies.

1  
2**Table 17.3 Previously Recorded Cultural and Historical Resources of the Central Coast and Southern California Regions**

<b>County</b>	<b>Historic Site Types</b>	<b>Prehistoric Site Types</b>
San Luis Obispo	34 NRHP properties, 2 California Historical Landmarks, and 4 California Points of Historical Interest (CSPOHP 2014ao).	The San Luis Obispo County General Plan discusses several hundred prehistoric resources throughout San Luis Obispo County related to the Chumash people (San Luis Obispo County 2010).
Santa Barbara	43 NRHP properties, 16 California Historical Landmarks, and 7 California Points of Historical Interest (CSPOHP 2014ap).	The 2010 Santa Barbara Conservation Element of the Comprehensive Plan noted prehistoric resources throughout Santa Barbara County related to the Chumash people (Santa Barbara County 2010).
Los Angeles	431 NRHP properties, 90 California Historical Landmarks, 6 CRHR property, and 65 California Points of Historical Interest (CSPOHP 2014aj).	Over 4,196 prehistoric sites in Los Angeles County (SCAG 2011).
Orange	108 NRHP properties, 24 California Historical Landmarks, and 20 California Points of Historical Interest (CSPOHP 2014ak).	Over 1,710 prehistoric sites in Orange County (SCAG 2011; Orange County 2005).
Riverside	52 NRHP properties, 23 California Historical Landmarks, and 72 California Points of Historical Interest (CSPOHP 2014al).	Over 19,858 prehistoric sites in Orange County (SCAG 2011). Some of the Cahuilla, Serrano, and Luiseño communities were inundated within Lake Perris (Reclamation and DWR 2003).
San Bernardino	56 NRHP properties, 39 California Historical Landmarks, 2 CRHR property, and 119 California Points of Historical Interest (CSPOHP 2014am).	Over 29,480 prehistoric sites in San Bernardino County, including the Calico "Early Man" Site (SCAG 2011).
San Diego	130 NRHP properties, 63 California Historical Landmarks, 3 CRHR property, and 16 California Points of Historical Interest (CSPOHP 2014an).	The San Diego County General Plan discussed that there are many prehistoric sites within San Diego County; however, the number and locations are not identified to protect the resources (San Diego County 2011a).

County	Historic Site Types	Prehistoric Site Types
Ventura	34 NRHP properties, 11 California Historical Landmarks, and 4 California Points of Historical Interest (CSPOHP 2014aq).	Over 1,806 prehistoric sites in San Bernardino County (SCAG 2011).

1 **17.4 Impact Analysis**

2 This section describes the potential mechanisms for change in cultural resources  
 3 and analytical methods, results of the impact analysis, potential mitigation  
 4 measures, and potential cumulative effects.

5 **17.4.1 Potential Mechanisms for Change and Analytical Tools**

6 As described in Chapter 4, Approach to Environmental Analysis, the  
 7 environmental consequences assessment considers changes in cultural resources  
 8 conditions related to changes in CVP and SWP operations under the alternatives  
 9 as compared to the No Action Alternative and Second Basis of Comparison that  
 10 could result in land disturbance or increased exposure of cultural resources sites.

11 **17.4.1.1 Changes in the Potential for Land Disturbance**

12 Under Alternatives 1 through 5, No Action Alternative, and Second Basis of  
 13 Comparison, CVP and SWP water supplies would continue to be provided within  
 14 the currently designated service areas. Implementation of the alternatives does  
 15 not include expansion of designated service areas or increased water contract  
 16 amounts. Land use in 2030 would be consistent with existing general plan  
 17 projections under all alternatives and the Second Basis of Comparison. The CVP  
 18 and SWP water contract amounts would be the same under all alternatives and the  
 19 Second Basis of Comparison. The alternatives would not result in expansion of  
 20 municipal or agricultural lands, or associated disturbances of cultural resources  
 21 because of expansion of development or cultivated lands in addition to the  
 22 conditions projected under existing general plans. Therefore, changes in CVP and  
 23 SWP water supply availability that would result in changes in land use and  
 24 associated potential for disturbance of cultural resources are not analyzed in  
 25 this EIS.

26 **17.4.1.2 Changes in Potential Exposure of Cultural Resources at  
 27 Reservoirs that Store CVP and SWP Water**

28 Changes in CVP and SWP operations under the alternatives as compared to the  
 29 No Action Alternative and Second Basis of Comparison could result in increased  
 30 periods of time when low water elevations occur in reservoirs that store CVP and  
 31 SWP water, including the CVP and SWP reservoirs. The lowest reservoir  
 32 elevations generally occur in September in dry and critical dry years, as described  
 33 in Chapter 5, Surface Water Resources and Water Supplies. The minimum and  
 34 maximum elevations of the reservoir surface water under Alternatives 1

1 through 5, No Action Alternative, and Second Basis of Comparison would be  
2 the same as under current conditions.

3 **17.4.1.3 Effects Related to Cross Delta Water Transfers**

4 Water transfer programs have been used to provide water to existing agricultural  
5 and municipal service areas when other water supplies are not available. It is  
6 anticipated that water transfers under all alternatives and the Second Basis of  
7 Comparison would continue in this manner to provide water supplies to land uses  
8 projected under existing general plans which would not result in expansion of  
9 municipal or agricultural lands, or associated disturbances of cultural resources  
10 because of expansion of development or cultivated lands in addition to conditions  
11 projected under existing general plans. Therefore, effects related to cross Delta  
12 water transfers and associated potential for disturbance of cultural resources are  
13 not analyzed in this EIS.

14 **17.4.2 Conditions in Year 2030 without Implementation of**  
15 **Alternatives 1 through 5**

16 The impact analysis in this EIS is based upon the comparison of the alternatives to  
17 the No Action Alternative and the Second Basis of Comparison in the Year 2030.  
18 Many of the changed conditions would occur in the same manner under both the  
19 No Action Alternative and the Second Basis of Comparison (e.g., climate change,  
20 sea level rise, general plan development, and implementation of reasonable and  
21 foreseeable projects). Because of these changes, especially climate change and  
22 sea level rise, it is anticipated that reservoir elevations at the end of September  
23 would be lower, flows patterns in the rivers downstream of the reservoirs would  
24 be different than under recent condition, and CVP and SWP water deliveries  
25 would be less than under recent condition, as described in Chapter 5, Surface  
26 Water Resources and Water Supplies. In all regions, the minimum reservoir  
27 elevations under the No Action Alternative and Second Basis of Comparison  
28 would be similar to minimum elevations during recent conditions.

29 **17.4.3 Evaluation of Alternatives**

30 As described in Chapter 4, Approach to Environmental Analysis, Alternatives 1  
31 through 5 have been compared to the No Action Alternative, and the No Action  
32 Alternative and Alternatives 1 through 5 have been compared to the Second Basis  
33 of Comparison.

34 During review of the numerical modeling analyses used in this EIS, an error was  
35 determined in the CalSim II model assumptions related to the Stanislaus River  
36 operations for the Second Basis of Comparison, Alternative 1, and Alternative 4  
37 model runs. Appendix 5C includes a comparison of the CalSim II model run  
38 results presented in this chapter and CalSim II model run results with the error  
39 corrected. Appendix 5C also includes a discussion of changes in the comparison  
40 of the following alternatives analyses.

- 41 • No Action Alternative compared to the Second Basis of Comparison
- 42 • Alternative 1 compared to the No Action Alternative

- 1 • Alternative 3 compared to the Second Basis of Comparison
- 2 • Alternative 5 compared to the Second Basis of Comparison

3 **17.4.3.1 No Action Alternative**

4 As described in Chapter 4, Approach to Environmental Analysis, the No Action  
5 Alternative is compared to the Second Basis of Comparison.

6 **17.4.3.1.1 Potential Exposure of Cultural Resources at Reservoirs that Store  
7 CVP and SWP Water**

8 As described above, the minimum reservoir elevations in all regions under the No  
9 Action Alternative and the Second Basis of Comparison would be within historic  
10 ranges and would not expose lands that are not currently exposed. Therefore,  
11 conditions of cultural resources would be similar under the No Action Alternative  
12 and Second Basis of Comparison.

13 **17.4.3.2 Alternative 1**

14 Alternative 1 is identical to the Second Basis of Comparison. Alternative 1 is  
15 compared to the No Action Alternative and the Second Basis of Comparison.  
16 However, because cultural resource conditions under Alternative 1 are identical to  
17 cultural resource conditions under the Second Basis of Comparison, Alternative 1  
18 is only compared to the No Action Alternative.

19 **17.4.3.2.1 Alternative 1 Compared to the No Action Alternative**

20 *Potential Exposure of Cultural Resources at Reservoirs that Store CVP and SWP*  
21 *Water*

22 As described above, the minimum reservoir elevations in all regions under  
23 Alternative 1 as compared to the No Action Alternative would be within historic  
24 ranges and would not expose lands that are not currently exposed. Therefore,  
25 conditions of cultural resources would be similar under Alternative 1 and the No  
26 Action Alternative.

27 **17.4.3.2.2 Alternative 1 Compared to the Second Basis of Comparison**

28 Alternative 1 is identical to the Second Basis of Comparison.

29 **17.4.3.3 Alternative 2**

30 The cultural resources conditions under Alternative 2 would be identical to the  
31 conditions under the No Action Alternative; therefore, Alternative 2 is only  
32 compared to the Second Basis of Comparison.

33 **17.4.3.3.1 Alternative 2 Compared to the Second Basis of Comparison**

34 Changes to cultural resources conditions under Alternatives 2 as compared to the  
35 Second Basis of Comparison would be the same as the impacts described in  
36 Section 17.4.3.1, No Action Alternative.

1 **17.4.3.4 Alternative 3**

2 CVP and SWP operations under Alternative 3 are similar to the Second Basis of  
3 Comparison with modified Old and Middle River flow criteria and New Melones  
4 Reservoir operations.

5 **17.4.3.4.1 Alternative 3 Compared to the No Action Alternative**

6 *Potential Exposure of Cultural Resources at Reservoirs that Store CVP and SWP*  
7 *Water*

8 As described above, the minimum reservoir elevations in all regions under  
9 Alternative 3 as compared to the No Action Alternative would be within historic  
10 ranges and would not expose lands that are not currently exposed. Therefore,  
11 conditions of cultural resources would be similar under Alternative 3 as compared  
12 to the No Action Alternative.

13 **17.4.3.4.2 Alternative 3 Compared to the Second Basis of Comparison**

14 *Potential Exposure of Cultural Resources at Reservoirs that Store CVP and*  
15 *SWP Water*

16 As described above, the minimum reservoir elevations in all regions under  
17 Alternative 3 as compared to the Second Basis of Comparison would be within  
18 historic ranges and would not expose lands that are not currently exposed.  
19 Therefore, conditions of cultural resources would be similar under Alternative 3  
20 and Second Basis of Comparison.

21 **17.4.3.5 Alternative 4**

22 The cultural resources conditions under Alternative 4 would be identical to the  
23 conditions under the Second Basis of Comparison. Therefore, Alternative 4 is  
24 only compared to the No Action Alternative.

25 **17.4.3.5.1 Alternative 4 Compared to the No Action Alternative**

26 Changes in cultural resources conditions under Alternative 4 as compared to the  
27 No Action Alternative would be the same as the impacts described in  
28 Section 17.4.3.2.1, Alternative 1 Compared to the No Action Alternative.

29 **17.4.3.6 Alternative 5**

30 The CVP and SWP operations under Alternative 5 are similar to the No Action  
31 Alternative with modified Old and Middle River flow criteria and New Melones  
32 Reservoir operations.

33 **17.4.3.6.1 Alternative 5 Compared to the No Action Alternative**

34 *Potential Exposure of Cultural Resources at Reservoirs that Store CVP and*  
35 *SWP Water*

36 As described above, the minimum reservoir elevations in all regions under  
37 Alternative 5 as compared to the No Action Alternative would be within historic  
38 ranges and would not expose lands that are not currently exposed. Therefore,  
39 conditions of cultural resources would be similar under Alternative 5 as compared  
40 to the No Action Alternative.

1 **17.4.3.6.2 Alternative 5 Compared to the Second Basis of Comparison**

2 *Potential Exposure of Cultural Resources at Reservoirs that Store CVP and*  
 3 *SWP Water*

4 As described above, the minimum reservoir elevations in all regions under  
 5 Alternative 5 as compared to the Second Basis of Comparison would be within  
 6 historic ranges and would not expose lands that are not currently exposed.  
 7 Therefore, conditions of cultural resources would be similar under Alternative 5  
 8 and Second Basis of Comparison.

9 **17.4.3.7 Summary of Impact Analysis**

10 The results of the impact analysis of implementation of Alternatives 1 through 5  
 11 as compared to the No Action Alternative and the Second Basis of Comparison  
 12 are presented in Tables 17.4 and 17.5.

13 **Table 17.4 Comparison of Alternatives 1 through 5 to No Action Alternative**

<b>Alternative</b>	<b>Potential Change</b>	<b>Consideration for Mitigation Measures</b>
Alternative 1	No effects to cultural resources	None needed
Alternative 2	No effects to cultural resources	None needed
Alternative 3	No effects to cultural resources	None needed
Alternative 4	No effects to cultural resources	None needed
Alternative 5	No effects to cultural resources	None needed

14 **Table 17.5 Comparison of No Action Alternative and Alternatives 1 through 5 to**  
 15 **Second Basis of Comparison**

<b>Alternative</b>	<b>Potential Change</b>	<b>Consideration for Mitigation Measures</b>
Alternative 1	No effects to cultural resources	None needed
Alternative 2	No effects to cultural resources	None needed
Alternative 3	No effects to cultural resources	None needed
Alternative 4	No effects to cultural resources	None needed
Alternative 5	No effects to cultural resources	None needed

16 **17.4.3.8 Potential Mitigation Measures**

17 Mitigation measures are presented in this section to avoid, minimize, rectify,  
 18 reduce, eliminate, or compensate for adverse environmental effects of  
 19 Alternatives 1 through 5, as compared to the No Action Alternative. Mitigation  
 20 measures were not included to address adverse impacts under the alternatives as  
 21 compared to the Second Basis of Comparison because this analysis was included  
 22 in this EIS for information purposes only.

1 Implementation of Alternatives 1 through 5 as compared to the No Action  
 2 Alternative would not result in increased potential exposure or disturbance of  
 3 cultural resources. Therefore, there would be no adverse impacts to cultural  
 4 resources because of implementation of the alternatives; and no mitigation  
 5 measures are needed.

6 **17.4.3.9 Cumulative Effects Analysis**

7 As described in Chapter 3, the cumulative effects analysis considers projects,  
 8 programs, and policies that are not speculative and are based upon known or  
 9 reasonably foreseeable long-range plans, regulations, operating agreements, or  
 10 other information that establishes them as reasonably foreseeable.

11 The cumulative effects analysis for Alternatives 1 through 5 for Cultural  
 12 Resources are summarized in Table 17.6.

13 **Table 17.6 Summary of Cumulative Effects on Cultural Resources with**  
 14 **Implementation of Alternatives 1 through 5 as Compared to the No Action**  
 15 **Alternative**

Scenarios	Actions	Cumulative Effects of Actions
Past & Present, and Future Actions Included in All Alternatives in Year 2030	Consistent with Affected Environment conditions plus: Actions in the 2008 USFWS BO and 2009 NMFS BO that would have occurred without implementation of the BOs, as described in Section 3.3.1.2 (of Chapter 3, Descriptions of Alternatives), including climate change and sea level rise Actions not included in the 2008 USFWS BO and 2009 NMFS BO that would have occurred without implementation of the BOs, as described in Section 3.3.1.3 (of Chapter 3, Descriptions of Alternatives):  - Implementation of Federal and state policies and programs, including Clean Water Act (e.g., Total Maximum Daily Loads); Safe Drinking Water Act; Clean Air Act; and flood management programs - General plans for 2030. - Trinity River Restoration Program. - Central Valley Project Improvement Act programs - Iron Mountain Mine Superfund Site	<u>These effects would be the same under all alternatives.</u> Community development would occur in accordance with general plan projections for 2030. Development within the Delta would be subject to the requirements of the Delta Protection Commission and Delta Stewardship Council. Future development projects are anticipated to potentially effect cultural resources. However, development of these future programs would include preparation of environmental documentation that would identify methods to minimize adverse impacts to cultural resources. Restoration plans for the ongoing programs would be completed. Development along river corridors in the Central Valley. Future restoration projects are anticipated to potentially affect cultural resources. However, development of these future programs would include preparation of environmental documentation that would identify methods to

<p>No Action Alternative with Associated Cumulative Effects Actions in Year 2030</p>	<p>Full implementation of the 2008 USFWS BO and 2009 NMFS BO</p>	<p>Community development and restoration projects for the ongoing programs would be completed.</p> <p>Climate change and sea level rise, FERC relicensing projects, and some future projects to improve water quality and/or habitat are anticipated to reduce availability of CVP and SWP water supplies as compared to past conditions.</p> <p>Future water supply projects are anticipated to both increase water supply reliability due to reduced surface water supplies and to accommodate planned growth in the general plans.</p> <p>Future development projects are anticipated to potentially affect cultural resources. However, development of these future programs would include preparation of environmental documentation that would identify methods to minimize adverse impacts to cultural resources.</p>

Scenarios	Actions	Cumulative Effects of Actions
Alternative 1 with Associated Cumulative Effects Actions in Year 2030	No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant)	Implementation of Alternative 1 with reasonably foreseeable actions would result in similar changes as under the No Action Alternative with the added actions.
Alternative 2 with Associated Cumulative Effects Actions in Year 2030	Full implementation of the 2008 USFWS BO and 2009 NMFS BO CVP and SWP operational actions No implementation of structural improvements or other actions that require further study to develop a more detailed action description.	Implementation of Alternative 2 with reasonably foreseeable actions would result in similar changes as under the No Action Alternative with the added actions.
Alternative 3 with Associated Cumulative Effects Actions in Year 2030	No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant)  Slight increase in positive Old and Middle River flows in the winter and spring months	Implementation of Alternative 3 with reasonably foreseeable actions would result in similar changes as under the No Action Alternative with the added actions.
Alternative 4 with Associated Cumulative Effects Actions in Year 2030	No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant)	Implementation of Alternative 4 with reasonably foreseeable actions would result in similar changes as under the No Action Alternative with the added actions.
Alternative 5 with Associated Cumulative Effects Actions in Year 20530	Full implementation of the 2008 USFWS BO and 2009 NMFS BO Positive Old and Middle River flows and increased Delta outflow in spring months	Implementation of Alternative 5 with reasonably foreseeable actions would result in similar changes as under the No Action Alternative with the added actions.

**Chapter 18****1 Public Health****2 18.1 Introduction**

3 This chapter describes public health hazards in the study area related to changes  
4 in the environment that could occur as a result of implementing the alternatives  
5 evaluated in this Environmental Impact Statement (EIS). Implementation of the  
6 alternatives considered in this EIS could affect public health through changes in  
7 available water supplies from the Central Valley Project (CVP) and State Water  
8 Project (SWP); changes in irrigated crop acreage related to potential changes in  
9 operation of the CVP and SWP; changes in wetlands acreage related to potential  
10 changes in ecosystem restoration; and changes in water quality related to potential  
11 changes in operation of the CVP and SWP.

12 Changes in available water supplies, agricultural resources, wetlands, and water  
13 quality are described in more detail in Chapter 5, Surface Water Resources and  
14 Water Supplies; Chapter 12, Agricultural Resources; and Chapter 6, Water  
15 Quality, respectively.

**16 18.2 Regulatory Environment and Compliance**  
**17 Requirements**

18 Potential actions that could be implemented under the alternatives evaluated in  
19 this EIS could affect public health throughout the study area. Some of the actions  
20 considered in the alternatives evaluated in this EIS could include facilities located  
21 on public agency lands; or actions implemented, funded, or approved by Federal  
22 and state agencies. These actions would need to be compliant with appropriate  
23 Federal and state agency policies and regulations, as summarized in Chapter 4,  
24 Approach to Environmental Analyses.

**25 18.3 Affected Environment**

26 This section describes the following public health factors that could be potentially  
27 affected by the implementation of the alternatives considered in this EIS.

- 28 • Changes in available water supplies.
- 29 • Increases in the potential for mosquito-borne diseases due to an increase in  
30 wetlands.
- 31 • Changes in the potential for Valley Fever from disturbed soils when irrigation  
32 water supplies change.
- 33 • Changes in the potential for bioaccumulation of mercury in fish and shellfish.

1 Changes in the potential of direct or indirect exposure to high water quality  
2 concentrations of various constituents also may occur due to implementation of  
3 the alternatives. These direct changes to water quality and the related changes to  
4 drinking water safety and consumption of fish or shellfish exposed to high  
5 concentrations of constituents of concern are described in Chapter 6, Water  
6 Quality.

7 Public health effects that could occur due to construction activities are not  
8 discussed in this chapter, including increased exposure to naturally occurring  
9 asbestos, methane production from disturbance of peat soils, disturbance of oil  
10 and gas production fields, use and transport of hazardous wastes, and changes in  
11 wastewater or stormwater discharges. Although several of the alternatives  
12 include assumptions of constructed facilities, those actions will require  
13 subsequent planning and environmental documentation prior to implementation.  
14 The subsequent environmental documentation and related permits will evaluate  
15 public health effects associated with construction and implementation of those  
16 facilities.

### 17 **18.3.1 Public Health Issues Related to Available Water Supplies**

18 Water supply availability can affect public health in several ways. Potential direct  
19 effects to public health are related to reduction of municipal water supplies.  
20 Potential indirect effects to public health are related to reduction of industrial and  
21 irrigation water supplies which could affect the ability to earn an income to fund  
22 food, shelter, and other critical factors necessary for public health. Effects related  
23 to loss of jobs.

24 Availability of water supplies substantially decreased for CVP and SWP water  
25 users during recent droughts in 1976-1977, 1987-1992, and 2012-2014. In  
26 addition, as described in Chapter 5, Surface Water Resources and Water Supplies,  
27 the frequency of substantially reduced water supplies provided by the CVP and  
28 SWP have increased since the 1976-1977 drought due to changes in regulations  
29 and increased water demands by users with higher priorities for water use.

30 During the 2014 drought, CVP and SWP water supply allocations have been  
31 reduced substantially to protect future water supplies and the ability to meet  
32 existing regulations, as described in Chapter 5, Surface Water Resources and  
33 Water Supplies. The allocations were modified throughout the 2013-2014 winter  
34 with the allocations that are the most stringent in the history of the CVP and/or  
35 SWP operations, as summarized below (Reclamation 2014a, 2014b; DWR 2013,  
36 2014).

- 37 • CVP North of Delta Water Users.
  - 38 – Sacramento River Settlement Contractors – allocated 40 percent of total
  - 39 contracted water supply.
  - 40 – Sacramento Valley Refuges that use CVP water supplies – allocated
  - 41 40 percent of total contracted water supply.

- 1       – Agricultural Water Service Contractors – allocated 0 percent of total
- 2       contracted water supply.
- 3       – Municipal and Industrial Water Service Contractors – allocated 50 percent
- 4       of historic water use.
- 5       • CVP In-Delta Water Service Contractor: Contra Costa Water District –
- 6       allocated 50 percent of historic water use.
- 7       • CVP South of Delta Water Users.
- 8       – San Joaquin River Exchange and Settlement Contractors – allocated
- 9       65 percent of total contracted water supply.
- 10      – San Joaquin Valley Refuges that use CVP water supplies – allocated
- 11      65 percent of total contracted water supply.
- 12      – Agricultural Water Service Contractors – allocated 0 percent of total
- 13      contracted water supply.
- 14      – Municipal and Industrial Water Service Contractors – allocated 50 percent
- 15      of historic water use.
- 16      • CVP Friant Division Contractors – allocated 0 percent of total contracted
- 17      water supply.
- 18      • CVP Eastside Water Service Contractors: Water supplies delivered from New
- 19      Melones Reservoir – allocated 55 percent of total contracted water supply.
- 20      • SWP Water Service Contractors – 5 percent of total contracted water supply.

21 Another potential indirect effect to public health is related to reduction of stored  
 22 water in the CVP and SWP reservoirs which could affect the ability to provide  
 23 enough water for firefighting,

24 **18.3.1.1 Public Health and Safety Related to Available Municipal and**  
 25 **Industrial Water Supplies**

26 The Department of the Interior, Bureau of Reclamation (Reclamation) current  
 27 *Draft Municipal and Industrial Shortage Policy* (Reclamation 2005) describes  
 28 that the CVP water service contractors should develop public health and safety  
 29 volumes based California’s public health and safety criteria or criteria developed  
 30 in coordination with Reclamation. Currently, California does not have a uniform  
 31 set of public health and safety criteria for municipal and industrial water supplies.  
 32 At this time, most of the urban communities have not adopted specific public  
 33 health and safety criteria. However, in some of the recently completed Urban  
 34 Water Management Plans, criteria have been identified to protect public health  
 35 and safety that range from 25 to 50 percent of the total water demand, as  
 36 described in Chapter 5, Surface Water Resources and Water Supplies (CCWD  
 37 2011; City of Folsom 2011; Metropolitan 2010). The Urban Water Management  
 38 Plans indicate that during the critical periods with reductions in water supplies,  
 39 municipal and industrial water uses will be focused on inside water uses with little  
 40 or no outside irrigation water.

1 At this time, no specific volumes have been identified for public health and safety  
2 quantities for the CVP and/or SWP water users. During the 2014 drought, the  
3 Department of Water Resources (DWR) and Reclamation identified 1,500 cubic  
4 feet per second as a minimum amount of CVP and SWP Delta exports for public  
5 health and safety uses for municipal and industrial water supplies. This amount is  
6 also defined by the limitations of the CVP and SWP conveyance facilities, as  
7 described in Chapter 5, Surface Water Resources and Water Supplies.

8 As described above, in 2014, CVP and SWP water supply allocations are at  
9 historically low values. However, it is difficult to identify local public health and  
10 safety issues, non-agricultural related industrial job losses, and economic losses  
11 associated with reductions in CVP and/or SWP water supplies. The potential  
12 economic losses, socioeconomic effects, and environmental justice effects are  
13 described in Chapter 19, Socioeconomics, and Chapter 21, Environmental Justice.

14 **18.3.1.2 Public Health and Safety Related to Available Agricultural Water**  
15 **Supplies**

16 Agricultural water suppliers have developed responses to the reductions in  
17 agricultural water supplies from the CVP and SWP, as described in Chapter 12,  
18 Agricultural Resources. Historically, the number of employment opportunities  
19 that rely directly or indirectly on the availability of CVP and/or SWP water  
20 supplies for irrigation have declined in the areas where the water supplies have  
21 declined, communities within the Central Valley Region and Southern California  
22 Region, as described in Chapter 19, Socioeconomics.

23 **18.3.1.3 Public Health and Safety Related to Water Supply Availability for**  
24 **Wildland Firefighting**

25 Complex terrain, Mediterranean climate, productive natural plant communities,  
26 and ample natural and aboriginal ignition sources has caused California to be a  
27 complex wildfire-prone and fire-adapted landscape. While natural wildfires  
28 support ecosystem health and are critical to maintaining the structure and function  
29 of ecosystems, wildfires pose a significant threat to life, public health,  
30 infrastructure, properties, and natural resources.

31 In accordance with Public Resources Code sections 4201 to 4204 and  
32 Government Code sections 51175 to 51189, the California Department of  
33 Forestry and Fire Prevention (CAL FIRE) has mapped areas of significant fire  
34 hazards based on fuels, terrain, weather, and other relevant factors. The zones are  
35 referred to as Fire Hazard Severity Zones and represent the risks associated with  
36 wildland fires. Under CAL FIRE regulations, areas within very high fire-hazard  
37 risk zones must comply with specific building and vegetation requirements  
38 intended to reduce property damage and loss of life within these areas.

39 According to CAL FIRE, there is an increasing trend of acres burned statewide,  
40 with particular increase in conifer vegetation types (CAL FIRE FRAP 2010).  
41 Statewide, there are 21.3 million acres of land designated as high priority  
42 landscape. The high priority landscape areas include locations with high value  
43 water supplies and high threats of fire and large communities which should be  
44 protected to prevent wildfire threats to maintain ecosystem health, water supplies,

1 and large communities. These areas include the upper Trinity River watershed in  
 2 the Trinity River Region; the upper Shasta Lake, Lake Oroville, Folsom Lake,  
 3 New Melones Reservoir, and Millerton Lake watersheds in the Central Valley  
 4 Region; and communities in throughout the Southern California Region. Areas  
 5 designated as high priority landscape occur within 46 of 58 counties. Many rural  
 6 counties have significant numbers of communities and acreage in medium priority  
 7 landscape, including 508 communities with some high priority landscape areas.

8 CAL FIRE manages the State Responsibility Areas, and local fire districts  
 9 manage Local Responsibility Areas. First responders are typically the local fire  
 10 districts. The U.S. Forest Service provides wildland fire protection both  
 11 independently and cooperatively with the California Department of Forestry and  
 12 Fire Protection. In addition, the U.S. Department of the Interior National Park  
 13 Service and Bureau of Land Management provide resource management and fire  
 14 protection on portions of Federal lands.

15 Firefighting actions frequently involve use of water from reservoirs located close  
 16 to wildland fires in the Trinity River, Central Valley, Central Coast, and Southern  
 17 California regions, including reservoirs owned by Reclamation and DWR.

### 18 **18.3.2 Public Health Issues Related to Mosquito-Borne Diseases**

19 There are more than 50 species of mosquitos in California, including members of  
 20 the four major genera: 24 species of *Aedes*, 5 species of *Anopheles*, 11 species of  
 21 *Culex*, and 4 species of *Culiseta* (CDPH et al. 2012). Not all of these species are  
 22 known to transmit mosquito-borne viruses, as described below. There are  
 23 approximately 15 mosquito-borne viruses that occur in California; however, the  
 24 most significant viruses that cause human disease are St. Louis encephalitis virus  
 25 (SLEV), western equine encephalomyelitis (WEEV), and West Nile virus (WNV)  
 26 (CDPH et al. 2014). No cases of SLEV or WEEV have been reported in humans  
 27 over the past few years in California. Malaria also is a mosquito-borne disease  
 28 that is caused by a parasite instead of a virus.

29 The *Culex tarsalis* has been identified as part of transmission of SLEV, WEEV,  
 30 and WNV, especially in rural areas. The *Culex pipiens* and *Culex*  
 31 *quinquefasciatus* have been identified as part of the transmission of WNV and  
 32 SLEV. The *Culex stigmatosoma* has been identified as part of the transmission of  
 33 WNV and SLEV, especially among birds. The *Aedes melanimon*, *Aedes vexans*,  
 34 and *Culex erythrothorax* have been identified as species involved in transmitting  
 35 the virus between birds and mammals or between mammals.

36 Mosquitoes, especially *Culex tarsalis*, live in every area of California, and can be  
 37 a threat to the health of humans and domestic animals throughout the state. The  
 38 mosquito life cycle requires water for the egg, larva, and pupa stages. Some of  
 39 the species are more associated with irrigated agriculture, and others are more  
 40 associated with urban communities (CDPH et al. 2014). Most of the diseases are  
 41 not treatable and vaccines are not available for humans. Methods to prevent  
 42 mosquitoes from becoming adults and methods to prevent mosquitos from biting  
 43 humans are the only available and practical methods to protect public health.

1 California Health and Safety Code (Sections 2001 – 4(d); 2002; and 2060(b))  
2 describes that landowners are legally responsible to eliminate public nuisances  
3 from their properties, including mosquito breeding habitat (CDPH 2008; CDPH  
4 et al. 2012). Federal, state, and local agencies supplement the preventive  
5 activities of individual landowners toward protecting humans and domestic  
6 animals from mosquito-borne diseases. The California Department of Public  
7 Health (CDPH) monitors mosquito populations throughout the state. In 1915, the  
8 state legislature enacted the Mosquito Abatement Act to allow local mosquito  
9 abatement special districts. The local mosquito and vector control districts  
10 monitor mosquito populations and take actions such as eliminating breeding sites,  
11 using biological control (predators such as mosquitofish), and using chemical  
12 control, to reduce mosquito population size (CDPH 2013a).

### 13 **18.3.2.1 St. Louis Encephalitis Virus**

14 The SLEV is a mosquito-borne virus that circulates among birds and is  
15 transmitted to humans via mosquito bites (CALSURV 2013a; CDPH 2007).  
16 Human infection with SLE can cause mild to severe fever and headaches due to  
17 inflammation of the brain. In severe cases, the illness can cause disorientation  
18 and comas and possibly cause death. Elderly can become more severely ill than  
19 young children with SLEV as compared to WEEV.

20 Since the SLEV was first recognized in 1933 in St. Louis, Missouri, outbreaks  
21 have been reported throughout the United States, Canada, and northern Mexico,  
22 generally between August and October (CALSURV 2013a). In 1984 and 1989,  
23 29 human cases were reported in the San Joaquin Valley of the Central Valley  
24 Region. During the same time periods, 26 human cases were reported in the Los  
25 Angeles area of the Southern California Region. The last human case reported in  
26 California occurred in 1997 in Los Angeles County.

### 27 **18.3.2.2 Western Equine Encephalitis**

28 The WEEV is another mosquito-borne virus that circulates among birds and is  
29 transmitted to horses and humans by mosquitoes (CDPH 2007). Symptoms are  
30 similar to SLEV. Infants and small children are most severely afflicted with  
31 WEEV as compared to SLEV. There is a vaccine for horses, but not for humans.  
32 Historically, substantial number of horses died due to this disease as well as  
33 humans. Recently, there has not been a recorded case of WEEV in humans in  
34 California (CDPH et al. 2014).

### 35 **18.3.2.3 West Nile Virus**

36 West Nile virus (WNV) can cause mild to severe illness in human, other  
37 mammals, and birds.

38 The virus circulates among birds and is transmitted to humans primarily by *Culex*  
39 mosquitoes (CDPH et al. 2014). The WNV was first detected in North America  
40 in New York in 1999, and has subsequently spread to 48 states, Canada, and  
41 Mexico.

42 The WNV first appeared in humans in California in 2002 with the identification  
43 of one human case (CALSURV 2013b). In 2003, three human cases and one

1 equine case were reported with numerous verified findings of WNV activity  
2 among dead birds and mosquitoes. In 2004, the WNV was reported in  
3 58 counties, with 779 human cases, including 29 WNV-associated deaths  
4 (CALSURV 2013b). From 2003 through 2013, there were 4,004 reported human  
5 cases of WNV with 145 deaths; 16,299 reported bird deaths; and 1,202 reported  
6 cases involving horses (CDPH 2014a). In 2007, 2008, and between 2010 and  
7 2013, the majority of reported human cases occurred in the six counties in  
8 Southern California Region, with most of the cases reported in Los Angeles  
9 County. Between 2007 and 2013, numerous human cases were reported in Butte,  
10 Sutter, Sacramento, Stanislaus, Fresno, Tulare, and Kern counties in the Central  
11 Valley Region. During this same period, no human cases were reported in the  
12 Trinity River Region; Lassen, Plumas, and Nevada counties in the Central Valley  
13 Region; San Benito County in the San Francisco Bay Area Region; and San Luis  
14 Obispo County in the Central Coast Region.

15 In humans, WNV may not result in any symptoms or only mild viral symptoms,  
16 including mild fever, headache, body aches, skin rash, and swollen lymph glands.  
17 Symptoms in less than 1 percent of people that are infected can include headache,  
18 high fever, neck stiffness, stupor, disorientation, coma, tremors, convulsions,  
19 muscle weakness, and paralysis that are associated with meningitis or  
20 encephalitis.

#### 21 **18.3.2.4 Malaria**

22 Malaria also is a mosquito-borne disease caused by a parasite that destroys the red  
23 blood cells of its host. People with malaria often experience fever, chills, and flu-  
24 like illness which can lead to death (CDPH et al. 2012). Malaria is no longer  
25 endemic in California, as well as the rest of the United States, due to intense  
26 mosquito control efforts and anti-malarial drugs. However, the disease is  
27 diagnosed every year, especially in people who have traveled outside the United  
28 States. In 2012, 92 human cases were reported in California (CDPH 2013). Of  
29 the 92 cases, 90 patients had traveled to countries characterized as endemic with  
30 malaria during the previous three years. The *Anopheles* mosquitoes can transmit  
31 the parasite to humans and are prevalent in California (CDPH et al. 2012).

#### 32 **18.3.3 Public Health Issues Related to Valley Fever**

33 Valley fever is an illness that is caused by inhaling the spores of a fungus  
34 *Coccidioides immitis* (CDPH 2013c). This fungus lives in the top layers of some  
35 soils within 2 to 12 inches from the ground surface. When the soil is disturbed by  
36 digging, vehicles, cultivation, or wind, the fungal spores can be inhaled by  
37 persons within the area. Irrigated soils are less likely to contain the fungus than  
38 dry, previously undisturbed soils.

39 In most cases, symptoms in humans include mild cough and flu-like symptoms  
40 (CDPH 2013c). However, in about 40 percent of the reported cases, the illness  
41 can last for more than a month, make the person susceptible to pneumonia, and  
42 include cough, fever, chest pain, headache, muscle ache, rash, joint pain, and/or  
43 fatigue. In about 5 percent of the reported cases, the disease becomes

1 “disseminated Valley Fever” and can cause meningitis and/or affect bones, joints,  
2 skin, or other organs. There are no vaccines to prevent Valley Fever.

3 The *Coccidioides immitis* is endemic in many areas of the southwestern United  
4 States, Mexico, Central America, and South America. In California, the fungus is  
5 found in many areas of the San Joaquin Valley and Southern California  
6 (CDPH 2011, 2014b). In California between 2001 and 2012, there were over  
7 35,000 reported cases of Valley Fever. The number of incidences increased from  
8 1,483 cases in 2001 to 4,094 cases in 2012. The highest number of cases reported  
9 during this period occurred in Kings, Kern, Fresno, Tulare, and Madera counties  
10 in the San Joaquin Valley within the Central Valley Region; San Luis Obispo  
11 County in the Central Coast Region; and Los Angeles County in the Southern  
12 California Region.

13 In general, the people who have the highest risk of exposure to the fungus include  
14 construction workers, archeologists, geologists, wildland fighters, military  
15 personnel, mining or gas/oil extraction workers, and agricultural workers in  
16 non-irrigated areas (CDPH 2013c). Other employees also may be at risk. For  
17 example, members of the cast and crew of a television film became ill with Valley  
18 Fever after working on an outdoor set in Ventura County (CDCP 2014).

19 In 2011, Fresno, Kern, Kings, San Joaquin, San Luis Obispo, and Tulare counties  
20 conducted an analysis of information related to Valley Fever incidences (Fresno  
21 County et al. 2011). The observations included:

- 22 • More incidences were reported in the western parts of Kern, Kings, Fresno,  
23 and San Joaquin counties than in other portions of the counties.
- 24 • More incidences were reported in northern San Luis Obispo County and  
25 southern Tulare County than other portions of the counties.
- 26 • In recent years, there was increased reporting of Valley Fever in the prison  
27 populations in Fresno and Kings counties. In Kern County, 8 percent of the  
28 reported cases between 2005 and 2008 were prison inmates. In Fresno  
29 County, incidences at Pleasant Valley State Prison were 43 percent of the total  
30 cases in the county between 2004 and 2010. In Kings County, incidences at  
31 state prisons were 58 percent of the total cases in the county between 2007  
32 and 2010.

33 In 2012, the San Joaquin Valley Air Pollution Control District (SJVAPCD)  
34 evaluated causes for Valley Fever and options to reduce social and economic  
35 effects of Valley Fever in the San Joaquin Valley (SJVAPCD 2012). The analysis  
36 described that Valley Fever appears to be related to a fungus that forms in subsoil  
37 strata that are dry through a portion of the year. The analysis referred to other  
38 studies that correlated weather patterns with outbreaks of Valley Fever during dry  
39 periods following periods of heavy rainfall. The study also indicated that airborne  
40 *Coccidioides* spores do not generally come from irrigated agriculture. It appears  
41 that it is more likely that the spores are from non-irrigated lands, including  
42 undisturbed natural lands, undeveloped land, and grazing areas. The study  
43 indicated that additional monitoring or reduction of particulate matter of

1 10 microns, or PM<sub>10</sub>, did not appear to be useful in reduction of the potential for  
 2 Valley Fever. The study recommended additional funding to develop a vaccine  
 3 for Valley Fever.

4 **18.3.4 Public Health Issues Related to High Concentrations of**  
 5 **Mercury in Fish and Shellfish**

6 As described in Chapter 6, Water Quality, high concentrations of certain  
 7 substances accumulate in fish and shellfish based upon the water quality. The  
 8 California Environmental Protection Agency, Office of Environmental Health  
 9 Hazard Assessment (OEHHA) evaluates concentrations of potentially toxic  
 10 substances in edible tissues of fish and shellfish harvested in water bodies in  
 11 California (OEHHA 2014a). Based upon the evaluation, general and specific safe  
 12 eating guidelines are developed for the fish and shellfish, as summarized in  
 13 Table 18.1. For the water bodies in the study area, the primary constituents that  
 14 have triggered the development of safe eating guidelines are mercury, dieldrin,  
 15 and/or polychlorinated biphenyl (PCB). Other constituents are present, including  
 16 selenium; however, the concentrations do not exceed thresholds that would trigger  
 17 safe eating guidelines. The OEHHA develops two separate guidelines:  
 18 (1) Guidelines for Children from 1 to 17 years and Women from 18 to 45 years;  
 19 and (2) Guidelines for Women over 45 years old and Men over 17 years old. The  
 20 guidelines recommend the number of servings per week by fish or shellfish  
 21 harvested from specific waters. A “serving size” is defined as “about the size and  
 22 thickness of your hand” (OEHHA 2014a).

23 **Table 18.1 Summary of Safe Eating Guidelines for Fish and Shellfish from Water**  
 24 **Bodies in the Study Area Based on Mercury and PCB (servings per week)**

Region	Water Body	Fish and Shellfisha	Guidelines for Children and Women up to 45 Years Oldb	Guidelines for Men and Women over 45 Years Oldb
Trinity River	Trinity Lake	Rainbow Trout, Brown Trout, White Catfish	2	5
		Largemouth Bass, Smallmouth Bass	Do not eat	1
	Lewiston Lake	Trout	5	7
Central Valley	Sacramento River and Northern Delta	American Shad, Chinook Salmon, Rainbow Trout, Steelhead Trout	2 to 3	7

1 Sources: OEHHA 2014b, 2014c, 2014d, 2014e, 2014f, 2014g, 2014h, 2014i, 2014j,  
 2 2014k, 2014l, 2014m, 2014n, 2014o, 2014p, 2014q, 2014r, 2014s, 2014t, 2014u, 2014v,  
 3 2014w

4 Notes:

- 5 a. All fish and shellfish names are as appears in the OEHHA guidelines.  
 6 b. The OEHHA guidelines refer to the total number of servings of fish per week for one  
 7 water body, not just the total for a specific species. For example, OEHHA guidelines for  
 8 Men eating fish from Trinity Lake would include no more than 5 servings of Rainbow  
 9 Trout, Brown Trout, or White Catfish; OR 1 serving of Largemouth Bass or Smallmouth  
 10 Bass.

11 Resident Delta fish accumulate mercury primarily through dietary exposure;  
 12 larger, piscivorous (fish-eating) fish show the greatest levels of tissue mercury. In  
 13 contrast to anadromous fish (migratory species), the resident fish experience  
 14 constant exposure to local mercury sources. Resident species include larger fish  
 15 with human health exposure (such as Largemouth Bass) and smaller, forage fish  
 16 (such as Inland Silversides). Fish tissues are the ultimate route of exposure to  
 17 mercury for humans who consume locally caught fish.

18 Historically, substantial levels of mercury contamination have occurred in fish  
 19 throughout the Delta. Mercury concentrations in tissue of the larger piscivorous  
 20 fish are lower in for fish in the central Delta as compared to fish from the  
 21 Mokelumne, Cosumnes, Sacramento, and San Joaquin rivers (CVRWQCB 2010a,  
 22 2010b). Larger, piscivorous resident fish, in general, provide a good record of  
 23 fish tissue mercury as a baseline condition for the Delta. Largemouth Bass were  
 24 chosen because they are popular sport fish, top predators, live for several years,  
 25 and tend to stay in the same area (exhibit high site fidelity). Consequently, they  
 26 are excellent indicators of long-term average mercury exposure, risk, and spatial  
 27 pattern for ecological and human health. Mercury in sport fish from the Delta  
 28 region was reported for Largemouth Bass as a median tissue mercury  
 29 concentration of 0.53 mg mercury per kilogram (Hg/kg) wet weight (Davis et al.  
 30 2003). Current fish tissue concentrations thus exceed both adopted regulatory  
 31 standards and guidance from the U.S. Environmental Protection Agency  
 32 (USEPA). In the 2010 Delta TMDL for methylmercury, the Central Valley  
 33 Regional Water Quality Control Board (Central Valley RWQCB) established a  
 34 fish tissue threshold (fillet concentrations, wet weight mercury) of 0.24 mg Hg/kg  
 35 wet weight in trophic level 4 fish (adult, top predatory sport fish, such as  
 36 Largemouth Bass) (Central Valley Water Board 2010a). These values are slightly  
 37 lower than USEPA’s national recommended water quality criterion for fish tissue  
 38 of 0.3 mg Hg/kg wet weight for protection of human health and wildlife (USEPA

1 2001). Therefore, the Delta average for Largemouth Bass fillet concentrations in  
 2 the study by Davis et al. exceeds both recommended safe consumption guidelines.

### 3 **18.4 Impact Analysis**

4 This section describes the potential mechanisms for change in conditions and  
 5 analytical methods; results of impact analyses; potential mitigation measures; and  
 6 cumulative effects.

#### 7 **18.4.1 Potential Mechanisms for Change and Analytical Methods**

8 As described in Chapter 4, Approach to Environmental Analysis, the impact  
 9 analysis considers changes in public health factors related to changes in CVP and  
 10 SWP operations under the alternatives as compared to the No Action Alternative  
 11 and Second Basis of Comparison.

12 Changes in CVP and SWP operations under the alternatives as compared to the  
 13 No Action Alternative and Second Basis of Comparison could change public  
 14 health factors affected by CVP and SWP operations.

##### 15 **18.4.1.1 Changes in Public Health Factors Related to Available CVP and** 16 **SWP Agricultural Water Supplies**

17 Changes in water supply availability to agricultural water users could result in  
 18 reductions of irrigated acreage and related jobs. The availability of jobs can affect  
 19 public health, as described in Section 18.3.2, Public Health Issues Related to  
 20 Available Water Supplies. As described in Chapter 12, Agricultural Resources,  
 21 agricultural acreage would be similar under Alternatives 1 through 5, No Action  
 22 Alternative, and Second Basis of Comparison. Therefore, the change in public  
 23 health conditions would be the same under all of the alternatives and the Second  
 24 Basis of Comparison; and is not analyzed in this EIS.

##### 25 **18.4.1.2 Changes in Public Health Factors Related to Available Municipal** 26 **Water Supplies**

27 As described in Section 18.3.2, Public Health Issues Related to Available Water  
 28 Supplies, water supply availability can affect public health related to direct use  
 29 within the household and indirect effects related to adequate water supplies for  
 30 industrial and commercial water users that provide employment. As described in  
 31 Chapter 5, Surface Water Resources and Water Supplies, and Chapter 18,  
 32 Socioeconomics, municipal and industrial water users would rely upon alternate  
 33 water supplies to meet water demands in 2030. Therefore, public health  
 34 conditions related to availability of municipal and industrial water supplies would  
 35 be the same under all of the alternatives and the Second Basis of Comparison; and  
 36 is not analyzed in this EIS.

##### 37 **18.4.1.3 Changes in Public Health Factors Related to Wildland** 38 **Firefighting and CVP and SWP Reservoir Storage**

39 Stored water in water supply reservoirs is used for wildland firefighting in the  
 40 California foothills and mountains, including water stored in CVP and SWP

1 reservoirs. During drier periods, reduced storage levels could affect the  
2 availability of water for wildlife firefighting, as indicated in changes in CVP and  
3 SWP reservoir at the end of September in critical dry water years, as described in  
4 Chapter 5, Surface Water Resources and Water Supplies.

5 Reservoirs that store water in the San Francisco Bay Area, Central Coast, and  
6 Southern California regions are managed to store water supplies as part of short-  
7 term conveyance management or storage for regional and local water supplies  
8 using water from numerous sources and water for wildland firefighting is not  
9 known; and therefore, are not analyzed in this EIS.

10 **18.4.1.4 Changes in Public Health Factors Related to Wetlands**  
11 **Restoration and Mosquito-Borne Diseases**

12 Wetlands provide habitat for mosquito breeding, especially in tidally-influenced  
13 wetlands with slow moving water and floodplains after the majority of the water  
14 recedes. Management practices (e.g., designing wetlands to provide flushing  
15 flows, use of biological controls) can reduce the nuisance and public health  
16 aspects of mosquito populations. The extent of seasonal floodplains and tidally-  
17 influenced wetlands in Yolo Bypass, Cache Slough, and Suisun Marsh areas  
18 would increase in a similar manner under all of the alternatives and the Second  
19 Basis of Comparison, as described in Chapter 3, Description of Alternatives.  
20 Therefore, the potential for changes in public health conditions related to  
21 mosquito populations would be the same under all of the alternatives and the  
22 Second Basis of Comparison; and is not analyzed in this EIS.

23 **18.4.1.5 Changes in Public Health Factors Related to Potential**  
24 **Valley Fever**

25 As described above, recent studies have indicated that valley fever exposure  
26 appears to be related to cultivated lands, including lands that are idled due to  
27 agricultural practices or reduced water supply availability. Changes in CVP and  
28 SWP operations under the alternatives and the Second Basis of Comparison  
29 would not affect the extent of non-irrigated lands. Therefore, the potential for  
30 changes in public health conditions related to Valley Fever would be the same  
31 under all of the alternatives and the Second Basis of Comparison; and is not  
32 analyzed in this EIS.

33 **18.4.1.6 Changes in Public Health Factors Related to Mercury in Fish**  
34 **used for Human Consumption**

35 As described above, fish used for human consumption in the Delta have mercury  
36 levels that exceed OEHHA guidelines. Changes in CVP and SWP operations  
37 under the alternatives and the Second Basis of Comparison would change the  
38 accumulated mercury concentrations in fish in the Delta. As described in Chapter  
39 6, Surface Water Quality, the bioavailability and toxicity of mercury is enhanced  
40 through the natural, bacterial conversion of mercury to methylmercury in  
41 marshlands or wetlands. These stagnant locations with reduced oxygen  
42 concentrations promote chemical reduction processes that make methylation  
43 possible. The methylmercury model is based upon the Total Maximum Daily  
44 Load translation equation for mercury developed by the Central Valley Regional

1 Water Quality Control Board. The model estimates fish tissue concentrations  
 2 from waterborne concentrations of mercury in the Delta and evaluates the  
 3 potential to cause exceedances of water quality or tissue benchmarks. The tissue  
 4 concentrations associated with the Alternatives 1 through 5 were compared to the  
 5 No Action Alternative and the Second Basis of Comparison.

#### 6 **18.4.2 Conditions in Year 2030 without Implementation of** 7 **Alternatives 1 through 5**

8 This EIS includes two bases of comparison, as described in Chapter 3,  
 9 Description of Alternatives: the No Action Alternative and the Second Basis of  
 10 Comparison. Both of these bases are evaluated at 2030 conditions. Changes that  
 11 would occur over the next 15 years without implementation of the alternatives are  
 12 not analyzed in this EIS. However, the changes to public health that are assumed  
 13 to occur by 2030 under the No Action Alternative and the Second Basis of  
 14 Comparison are summarized in this section. Many of the changed conditions  
 15 would occur in the same manner under both the No Action Alternative and the  
 16 Second Basis of Comparison.

##### 17 **18.4.2.1 Common Changes in Conditions under the No Action Alternative** 18 **and Second Basis of Comparison**

19 Conditions in 2030 would be different than existing conditions due to:

- 20 • Climate change and sea level rise
- 21 • General plan development throughout California, including increased water  
 22 demands in portions of Sacramento Valley
- 23 • Implementation of reasonable and foreseeable water resources management  
 24 projects to provide water supplies

25 It is anticipated that climate change would result in more short-duration high-  
 26 rainfall events and less snowpack in the winter and early spring months. The  
 27 reservoirs would be full more frequently by the end of April or May by 2030 than  
 28 in recent historical conditions. However, as the water is released in the spring,  
 29 there would be less snowpack to refill the reservoirs. This condition would  
 30 reduce reservoir storage and available water supplies to downstream uses in the  
 31 summer. The reduced end of September storage also would reduce the ability to  
 32 release stored water to downstream regional reservoirs. These conditions would  
 33 occur for all reservoirs in the California foothills and mountains, including  
 34 non-CVP and SWP reservoirs.

35 These changes would result in a decline of the long-term average CVP and SWP  
 36 water supply deliveries by 2030 as compared to recent historical long-term  
 37 average deliveries under the No Action Alternative and the Second Basis of  
 38 Comparison. However, the CVP and SWP water deliveries would be less under  
 39 the No Action Alternative as compared to the Second Basis of Comparison, as  
 40 described in Chapter 5, Surface Water Resources and Water Supplies. Due to  
 41 climate change and related lower snowfall, end of September low reservoir  
 42 storage would be lower in critical dry years by 2030 as compared to recent

1 historical conditions in Shasta Lake, Lake Oroville, Folsom Lake, New Melones  
2 Reservoir, and San Luis Reservoir. Therefore, the potential for reduced reservoir  
3 water supplies for wildland firefighting would be greater under the No Action  
4 Alternative and Second Basis of Comparison as compared to recent historical  
5 conditions.

6 Under the No Action Alternative and the Second Basis of Comparison, land uses  
7 in 2030 would occur in accordance with adopted general plans.

8 The No Action Alternative and the Second Basis of Comparison assumes  
9 completion of water resources management and environmental restoration  
10 projects that would have occurred without implementation of Alternatives 1  
11 through 5, including regional and local recycling projects, surface water and  
12 groundwater storage projects, conveyance improvement projects, and desalination  
13 projects, as described in Chapter 3, Description of Alternatives. The No Action  
14 Alternative and the Second Basis of Comparison also assumes implementation of  
15 actions included in the 2008 U.S. Fish and Wildlife Service (USFWS) Biological  
16 Opinion (BO) and 2009 National Marine Fisheries Service (NMFS) BO that  
17 would have been implemented without the BOs by 2030, as described in  
18 Chapter 3, Description of Alternatives.

19 Under the No Action Alternative and Second Basis of Comparison, it is  
20 anticipated that mercury concentrations in fish tissue within the Delta will be  
21 either similar or greater than recent historical conditions. Phase 1 of the Delta  
22 Mercury Program mandated by the Central Valley RWQCB is currently being  
23 completed to protect people eating one meal per week of larger fish from the  
24 Delta, including Largemouth Bass. Phase 1 is focused on studies and pilot  
25 projects to develop and evaluate management practices to control methylmercury  
26 from mercury sources in the Delta and Yolo Bypass; and to reduce total mercury  
27 loading to the San Francisco Bay. Following completion of Phase 1 in 2019,  
28 Phase 2 will be implemented through 2030. Phase 2 will focus on methylmercury  
29 control programs and reduction programs for total inorganic mercury. Due to the  
30 extent of these studies, it is not anticipated that changes in methylmercury or total  
31 mercury concentrations in fish tissue will be reduced by 2030. Future mercury  
32 reduction and control programs will reduce mercury sources and related fish  
33 tissue concentrations; however, that will occur after 2030.

### 34 **18.4.3 Evaluation of Alternatives**

35 As described in Chapter 4, Approach to Environmental Analysis, Alternatives 1  
36 through 5 have been compared to the No Action Alternative; and the No Action  
37 Alternative and Alternatives 1 through 5 have been compared to the Second Basis  
38 of Comparison.

39 During review of the numerical modeling analyses used in this EIS, an error was  
40 determined in the CalSim II model assumptions related to the Stanislaus River  
41 operations for the Second Basis of Comparison, Alternative 1, and Alternative 4  
42 model runs. Appendix 5C includes a comparison of the CalSim II model run  
43 results presented in this chapter and CalSim II model run results with the error

1 corrected. Appendix 5C also includes a discussion of changes in the comparison  
2 of groundwater conditions for the following alternative analyses.

- 3 • No Action Alternative compared to the Second Basis of Comparison
- 4 • Alternative 1 compared to the No Action Alternative
- 5 • Alternative 3 compared to the Second Basis of Comparison
- 6 • Alternative 5 compared to the Second Basis of Comparison

#### 7 **18.4.3.1 No Action Alternative**

8 The No Action Alternative is compared to the Second Basis of Comparison.

##### 9 **18.4.3.1.1 Trinity River Region**

###### 10 *Changes in Public Health Factors Related to Wildland Firefighting and CVP and* 11 *SWP Reservoir Storage*

12 Changes in CVP water supplies and operations under the No Action Alternative  
13 as compared to the Second Basis of Comparison would result in similar end of  
14 September reservoir elevations in critical dry years (changes within 5 percent) at  
15 Trinity Lake, as described in Chapter 5, Surface Water Resources and Water  
16 Supplies. Therefore, the potential for water availability for wildland firefighting  
17 would be similar under the No Action Alternative as compared to the Second  
18 Basis of Comparison.

##### 19 **18.4.3.1.2 Central Valley Region**

###### 20 *Changes in Public Health Factors Related to Wildland Firefighting and CVP and* 21 *SWP Reservoir Storage*

22 Changes in CVP water supplies and operations under the No Action Alternative  
23 as compared to the Second Basis of Comparison would result in similar end of  
24 September reservoir elevations in critical dry years (changes within 5 percent) at  
25 Shasta Lake, Lake Oroville, Folsom Lake, and New Melones Reservoir, as  
26 described in Chapter 5, Surface Water Resources and Water Supplies. Therefore,  
27 the potential for water availability for wildland firefighting would be similar  
28 under the No Action Alternative as compared to the Second Basis of Comparison.

29 End of September surface water elevations at San Luis Reservoir in critical dry  
30 years would be 6 percent lower under the No Action Alternative as compared to  
31 the Second Basis of Comparison. Therefore, the potential for water availability  
32 for wildland firefighting would be reduced at San Luis Reservoir under the No  
33 Action Alternative as compared to the Second Basis of Comparison.

###### 34 *Changes in Public Health Factors Related to Mercury in Fish used for Human* 35 *Consumption*

36 Mercury concentrations in Largemouth Bass would be similar (within 5 percent  
37 change) in most locations in the Delta, except for Rock Slough, San Joaquin River  
38 near Antioch, and Montezuma Slough in Suisun Marsh. In these areas, the  
39 mercury concentrations would increase by 7 percent over long-term conditions  
40 under the No Action Alternative as compared to the Second Basis of Comparison.

1 Under dry and critical dry years, mercury concentrations would increase by 7 to  
2 8 percent at Rock Slough, intakes of the Banks and Jones pumping plants, and  
3 Victoria Canal. All values exceed the threshold of 0.24 mg/kg ww for mercury.

#### 4 **18.4.3.2 Alternative 1**

5 Alternative 1 is identical to the Second Basis of Comparison. Alternative 1 is  
6 compared to the No Action Alternative and the Second Basis of Comparison.  
7 However, because CVP and SWP operations under Alternative 1 are identical to  
8 conditions under the Second Basis of Comparison; Alternative 1 is only compared  
9 to the No Action Alternative.

#### 10 **18.4.3.2.1 Alternative 1 Compared to the No Action Alternative**

##### 11 *Trinity River Region*

##### 12 *Changes in Public Health Factors Related to Wildland Firefighting and CVP* 13 *and SWP Reservoir Storage*

14 Changes in CVP water supplies and operations under Alternative 1 as compared  
15 to the No Action Alternative would result in similar end of September reservoir  
16 elevations in critical dry years at Trinity Lake, as described in Chapter 5, Surface  
17 Water Resources and Water Supplies. Therefore, the potential for water  
18 availability for wildland firefighting would be similar under Alternative 1 as  
19 compared to the No Action Alternative.

##### 20 *Central Valley Region*

##### 21 *Changes in Public Health Factors Related to Wildland Firefighting and CVP* 22 *and SWP Reservoir Storage*

23 Changes in CVP water supplies and operations under Alternative 1 as compared  
24 to the No Action Alternative would result in similar end of September reservoir  
25 elevations in critical dry years at Shasta Lake, Lake Oroville, Folsom Lake, and  
26 New Melones Reservoir, as described in Chapter 5, Surface Water Resources and  
27 Water Supplies. Therefore, the potential for water availability for wildland  
28 firefighting would be similar under Alternative 1 as compared to the No Action  
29 Alternative.

30 End of September surface water elevations at San Luis Reservoir in critical dry  
31 years would be 7 percent higher under Alternative 1 as compared to the No  
32 Action Alternative. Therefore, the potential for water availability for wildland  
33 firefighting would be increased at San Luis Reservoir under Alternative 1 as  
34 compared to the No Action Alternative.

##### 35 *Changes in Public Health Factors Related to Mercury in Fish used for Human* 36 *Consumption*

37 Mercury concentrations in Largemouth Bass would be similar in most locations in  
38 the Delta, except for Rock Slough, San Joaquin River near Antioch, and  
39 Montezuma Slough in Suisun Marsh. In these areas, the mercury concentrations  
40 would decrease by 6 percent over the long-term conditions under Alternative 1 as  
41 compared to the No Action Alternative. Under dry and critical dry years, mercury  
42 concentrations would decrease by 6 to 8 percent at Rock Slough, intakes of the

1 Banks and Jones pumping plants, and Victoria Canal. All values exceed the  
2 threshold of 0.24 mg/kg ww for mercury.

### 3 **18.4.3.2.2 Alternative 1 Compared to the Second Basis of Comparison**

4 Alternative 1 is identical to the Second Basis of Comparison.

### 5 **18.4.3.3 Alternative 2**

6 The CVP and SWP operations under Alternative 2 are identical to the CVP and  
7 SWP operations under the No Action Alternative; therefore, Alternative 2 is only  
8 compared to the Second Basis of Comparison.

### 9 **18.4.3.3.1 Alternative 2 Compared to the Second Basis of Comparison**

10 The CVP and SWP operations under Alternative 2 are identical to the CVP and  
11 SWP operations under the No Action Alternative. Therefore, changes to public  
12 health conditions under Alternatives 2 as compared to the Second Basis of  
13 Comparison would be the same as the impacts described in Section 18.4.3.1,  
14 No Action Alternative.

### 15 **18.4.3.4 Alternative 3**

16 As described in Chapter 3, Description of Alternatives, CVP and SWP operations  
17 under Alternative 3 are similar to the Second Basis of Comparison with modified  
18 Old and Middle River flow criteria and New Melones Reservoir operations.

19 As described in Chapter 4, Approach to Environmental Analysis, Alternative 3 is  
20 compared to the No Action Alternative and the Second Basis of Comparison.

### 21 **18.4.3.4.1 Alternative 3 Compared to the No Action Alternative**

#### 22 *Trinity River Region*

#### 23 *Changes in Public Health Factors Related to Wildland Firefighting and CVP* 24 *and SWP Reservoir Storage*

25 Changes in CVP water supplies and operations under Alternative 3 as compared  
26 to the No Action Alternative would result in similar end of September reservoir  
27 elevations in critical dry years at Trinity Lake, as described in Chapter 5, Surface  
28 Water Resources and Water Supplies. Therefore, the potential for water  
29 availability for wildland firefighting would be similar under Alternative 3 as  
30 compared to the No Action Alternative.

#### 31 *Central Valley Region*

#### 32 *Changes in Public Health Factors Related to Wildland Firefighting and CVP* 33 *and SWP Reservoir Storage*

34 Changes in CVP water supplies and operations under Alternative 3 as compared  
35 to the No Action Alternative would result in similar end of September reservoir  
36 elevations in critical dry years at Shasta Lake, Lake Oroville, Folsom Lake, New  
37 Melones Reservoir, and San Luis Reservoir, as described in Chapter 5, Surface  
38 Water Resources and Water Supplies. Therefore, the potential for water  
39 availability for wildland firefighting would be similar under Alternative 3 as  
40 compared to the No Action Alternative.

1        *Changes in Public Health Factors Related to Mercury in Fish used for Human*  
2        *Consumption*

3 Mercury concentrations in Largemouth Bass would be similar (within 5 percent  
4 change) in most locations in the Delta, except for San Joaquin River near Antioch  
5 and Montezuma Slough in Suisun Marsh. In these areas, the mercury  
6 concentrations would decrease by 6 percent over the long-term conditions under  
7 Alternative 3 as compared to the No Action Alternative. Mercury concentrations  
8 under the dry and critical dry years would be similar throughout the Delta. All  
9 values exceed the threshold of 0.24 mg/kg ww for mercury.

10    **18.4.3.4.2 Alternative 3 Compared to the Second Basis of Comparison**

11    *Trinity River Region*

12        *Changes in Public Health Factors Related to Wildland Firefighting and CVP*  
13        *and SWP Reservoir Storage*

14 Changes in CVP water supplies and operations under Alternative 3 as compared  
15 to the Second Basis of Comparison would result in similar end of September  
16 reservoir elevations in critical dry years at Trinity Lake, as described in Chapter 5,  
17 Surface Water Resources and Water Supplies. Therefore, the potential for water  
18 availability for wildland firefighting would be similar under Alternative 3 as  
19 compared to the Second Basis of Comparison.

20    *Central Valley Region*

21        *Changes in Public Health Factors Related to Wildland Firefighting and CVP*  
22        *and SWP Reservoir Storage*

23 Changes in CVP water supplies and operations under Alternative 3 as compared  
24 to the Second Basis of Comparison would result in similar end of September  
25 reservoir elevations in critical dry years at Shasta Lake, Lake Oroville, Folsom  
26 Lake, New Melones Reservoir, and San Luis Reservoir, as described in Chapter 5,  
27 Surface Water Resources and Water Supplies. Therefore, the potential for water  
28 availability for wildland firefighting would be similar under Alternative 3 as  
29 compared to the Second Basis of Comparison.

30        *Changes in Public Health Factors Related to Mercury in Fish used for Human*  
31        *Consumption*

32 Mercury concentrations in Largemouth Bass would be similar throughout the  
33 Delta under Alternative 3 as compared to the Second Basis of Comparison, as  
34 summarized in Chapter 6, Surface Water Quality. All values exceed the threshold  
35 of 0.24 mg/kg ww for mercury.

36    **18.4.3.5 Alternative 4**

37 The public health conditions under Alternative 4 would be identical to the  
38 conditions under the Second Basis of Comparison; therefore, Alternative 4 is only  
39 compared to the No Action Alternative.

1 **18.4.3.5.1 Alternative 4 Compared to the No Action Alternative**

2 The CVP and SWP operations under Alternative 4 are identical to the CVP and  
 3 SWP operations under the Second Basis of Comparison and Alternative 1.  
 4 Therefore, changes in public health conditions under Alternative 4 as compared to  
 5 the No Action Alternative would be the same as the impacts described in  
 6 Section 12.4.4.2.1, Alternative 1 Compared to the No Action Alternative.

7 **18.4.3.6 Alternative 5**

8 As described in Chapter 3, Description of Alternatives, CVP and SWP operations  
 9 under Alternative 5 are similar to the No Action Alternative with modified Old  
 10 and Middle River flow criteria and New Melones Reservoir operations. As  
 11 described in Chapter 4, Approach to Environmental Analysis, Alternative 5 is  
 12 compared to the No Action Alternative and the Second Basis of Comparison.

13 **18.4.3.6.1 Alternative 5 Compared to the No Action Alternative**

14 *Trinity River Region*

15 *Changes in Public Health Factors Related to Wildland Firefighting and CVP*  
 16 *and SWP Reservoir Storage*

17 Changes in CVP water supplies and operations under Alternative 5 as compared  
 18 to the No Action Alternative would result in similar end of September reservoir  
 19 elevations in critical dry years at Trinity Lake, as described in Chapter 5, Surface  
 20 Water Resources and Water Supplies. Therefore, the potential for water  
 21 availability for wildland firefighting would be similar under Alternative 5 as  
 22 compared to the No Action Alternative.

23 *Central Valley Region*

24 *Changes in Public Health Factors Related to Wildland Firefighting and CVP*  
 25 *and SWP Reservoir Storage*

26 Changes in CVP water supplies and operations under Alternative 5 as compared  
 27 to the No Action Alternative would result in similar end of September reservoir  
 28 elevations in critical dry years at Shasta Lake, Lake Oroville, Folsom Lake, New  
 29 Melones Reservoir, and San Luis Reservoir, as described in Chapter 5, Surface  
 30 Water Resources and Water Supplies. Therefore, the potential for water  
 31 availability for wildland firefighting would be similar under Alternative 5 as  
 32 compared to the No Action Alternative.

33 *Changes in Public Health Factors Related to Mercury in Fish used for Human*  
 34 *Consumption*

35 Mercury concentrations in Largemouth Bass would be similar throughout the  
 36 Delta under Alternative 5 as compared to the No Action Alternative, as  
 37 summarized in Chapter 6, Surface Water Quality. All values exceed the threshold  
 38 of 0.24 mg/kg ww for mercury.

1 **18.4.3.6.2 Alternative 5 Compared to the Second Basis of Comparison**

2 *Trinity River Region*

3 *Changes in Public Health Factors Related to Wildland Firefighting and CVP*  
4 *and SWP Reservoir Storage*

5 Changes in CVP water supplies and operations under Alternative 5 as compared  
6 to the Second Basis of Comparison would result in similar end of September  
7 reservoir elevations in critical dry years at Trinity Lake, as described in Chapter 5,  
8 Surface Water Resources and Water Supplies. Therefore, the potential for water  
9 availability for wildland firefighting would be similar under Alternative 5 as  
10 compared to the Second Basis of Comparison.

11 *Central Valley Region*

12 *Changes in Public Health Factors Related to Wildland Firefighting and CVP*  
13 *and SWP Reservoir Storage*

14 Changes in CVP water supplies and operations under Alternative 5 as compared  
15 to the Second Basis of Comparison would result in similar end of September  
16 reservoir elevations in critical dry years at Shasta Lake, Lake Oroville, Folsom  
17 Lake, and New Melones Reservoir, as described in Chapter 5, Surface Water  
18 Resources and Water Supplies. Therefore, the potential for water availability for  
19 wildland firefighting would be similar under Alternative 5 as compared to the  
20 Second Basis of Comparison.

21 End of September surface water elevations at San Luis Reservoir in critical dry  
22 years would be 9 percent lower under Alternative 5 as compared to the Second  
23 Basis of Comparison. Therefore, the potential for water availability for wildland  
24 firefighting would be reduced at San Luis Reservoir under Alternative 5 as  
25 compared to the Second Basis of Comparison.

26 *Changes in Public Health Factors Related to Mercury in Fish used for*  
27 *Human Consumption*

28 Mercury concentrations in Largemouth Bass would be similar in most locations in  
29 the Delta, except for Rock Slough, San Joaquin River near Antioch, and  
30 Montezuma Slough in Suisun Marsh. In these areas, the mercury concentrations  
31 would increase by 7 to 8 percent over long-term conditions under Alternative 5 as  
32 compared to the Second Basis of Comparison. During dry and critical dry years,  
33 mercury concentrations also would increase by 7 percent at intakes to Banks  
34 Pumping Plant and Jones Pumping Plant; and 13 percent at Rock Slough. All  
35 values exceed the threshold of 0.24 mg/kg ww for mercury.

36 **18.4.3.7 Summary of Environmental Consequences**

37 The results of the environmental consequences of implementation of  
38 Alternatives 1 through 5 as compared to the No Action Alternative and the  
39 Second Basis of Comparison are presented in Tables 18.2 and 18.3, respectively.

1 **Table 18.2 Comparison of Alternatives 1 through 5 to No Action Alternative**

<b>Alternative</b>	<b>Potential Change</b>	<b>Consideration for Mitigation Measures</b>
Alternative 1	<p>Similar water supply availability for wildland firefighting at Trinity Lake, Shasta Lake, Lake Oroville, Folsom Lake, and New Melones Reservoir; and a 7 percent increase at San Luis Reservoir.</p> <p>Similar mercury concentrations in Largemouth Bass in the most of the Delta; and a 6 percent decrease near Rock Slough, San Joaquin River at Antioch, and Montezuma Slough over the long-term conditions.</p>	None needed
Alternative 2	No effects on public health issues.	None needed
Alternative 3	<p>Similar water supply availability for wildland firefighting at Trinity Lake, Shasta Lake, Lake Oroville, Folsom Lake, New Melones Reservoir, and San Luis Reservoir.</p> <p>Similar mercury concentrations in Largemouth Bass in the most of the Delta; and a 6 percent decrease near San Joaquin River at Antioch and Montezuma Slough over the long-term conditions.</p>	None needed
Alternative 4	Same effects as described for Alternative 1 compared to the No Action Alternative.	None needed
Alternative 5	<p>Similar water supply availability for wildland firefighting at Trinity Lake, Shasta Lake, Lake Oroville, Folsom Lake, New Melones Reservoir, and San Luis Reservoir.</p> <p>Similar mercury concentrations in Largemouth Bass throughout the Delta.</p>	None needed

2 Note: Due to the limitations and uncertainty in the CalSim II monthly model and other  
 3 analytical tools, incremental differences of 5 percent or less between alternatives and the  
 4 Second Basis of Comparison are considered to be “similar.”

5

1 **Table 18.3 Comparison of No Action Alternative and Alternatives 1 through 5 to**  
 2 **Second Basis of Comparison**

Alternative	Potential Change	Consideration for Mitigation Measures
No Action Alternative	Similar water supply availability for wildland firefighting at Trinity Lake, Shasta Lake, Lake Oroville, Folsom Lake, and New Melones Reservoir; and a 6 percent decrease at San Luis Reservoir. Similar mercury concentrations in Largemouth Bass in the most of the Delta; and a 7 percent increase near Rock Slough, San Joaquin River at Antioch, and Montezuma Slough over the long-term conditions.	Not considered for this comparison.
Alternative 1	No effects on public health issues.	Not considered for this comparison.
Alternative 2	Same effects as described for No Action Alternative as compared to the Second Basis of Comparison.	Not considered for this comparison.
Alternative 3	Similar water supply availability for wildland firefighting at Trinity Lake, Shasta Lake, Lake Oroville, Folsom Lake, New Melones Reservoir, and San Luis Reservoir. Similar mercury concentrations in Largemouth Bass throughout the Delta.	Not considered for this comparison.
Alternative 4	No effects on public health issues.	Not considered for this comparison.
Alternative 5	Similar water supply availability for wildland firefighting at Trinity Lake, Shasta Lake, Lake Oroville, Folsom Lake, and New Melones Reservoir; and a 9 percent decrease at San Luis Reservoir. Similar mercury concentrations in Largemouth Bass in the most of the Delta; and a 7 percent increase near Rock Slough, San Joaquin River at Antioch, and Montezuma Slough over the long-term conditions.	Not considered for this comparison.

3 Note: Due to the limitations and uncertainty in the CalSim II monthly model and other  
 4 analytical tools, incremental differences of 5 percent or less between alternatives and the  
 5 Second Basis of Comparison are considered to be “similar.”

#### 6 **18.4.3.8 Potential Mitigation Measures**

7 Mitigation measures are presented in this section to avoid, minimize, rectify,  
 8 reduce, eliminate, or compensate for adverse environmental effects of  
 9 Alternatives 1 through 5 as compared to the No Action Alternative. Mitigation

1 measures were not included to address adverse impacts under the alternatives as  
 2 compared to the Second Basis of Comparison because this analysis was included  
 3 in this EIS for information purposes only.

4 Changes in CVP and SWP operations under Alternatives 1 through 5 as compared  
 5 to the No Action Alternative would not result in changes in public health factors.  
 6 Therefore, there would be no adverse impacts to public health factors; and no  
 7 mitigation measures are required.

8 **18.4.3.9 Cumulative Effects Analysis**

9 As described in Chapter 3, the cumulative effects analysis considers projects,  
 10 programs, and policies that are not speculative; and are based upon known or  
 11 reasonably foreseeable long-range plans, regulations, operating agreements, or  
 12 other information that establishes them as reasonably foreseeable.

13 The cumulative effects analyses for Alternatives 1 through 5 for Public Health are  
 14 summarized in Table 18.4.

15 **Table 18.4 Summary of Cumulative Effects on Public Health with Implementation of**  
 16 **Alternatives 1 through 5 as Compared to the No Action Alternative**

Scenarios	Actions	Cumulative Effects of Actions
Past & Present, and Future Actions included in the No Action Alternative in All Alternatives in Year 2030	Consistent with Affected Environment conditions plus: Actions in the 2008 USFWS BO and 2009 NMFS BO that would have occurred without implementation of the BOs, as described in Section 3.3.1.2 (of Chapter 3, Descriptions of Alternatives), including climate change and sea level rise Actions not included in the 2008 USFWS BO and 2009 NMFS BO that would have occurred without implementation of the BOs, as described in Section 3.3.1.3 (of Chapter 3, Descriptions of Alternatives):  - Implementation of Federal and state policies and programs, including Clean Water Act (e.g., Total Maximum Daily Loads); Safe Drinking Water Act; Clean Air Act; and flood management programs - General plans for 2030. - Trinity River Restoration Program. - Central Valley Project Improvement Act programs	These effects would be the same under all alternatives. Climate change and sea level rise, development under the general plans, FERC relicensing projects, and some future projects to improve water quality and/or habitat are anticipated to reduce end of September storage in CVP and SWP reservoirs. Mercury concentrations in fish tissue within the Delta will be either similar or greater than recent historical conditions because Phases 1 and 2 of the Delta Mercury Program would be completed by 2030, as mandated by the Central Valley RWQCB, including methylmercury control programs and reduction programs for total inorganic mercury. Due to the extent of these programs, it is anticipated that the programs would be initiated; however, future reductions in mercury sources and related reductions of mercury and

Scenarios	Actions	Cumulative Effects of Actions
	<ul style="list-style-type: none"> <li>- Folsom Dam Water Control Manual Update</li> <li>- FERC Relicensing for the Middle Fork of the American River Project</li> <li>- Lower Mokelumne River Spawning Habitat Improvement Project</li> <li>- Dutch Slough Tidal Marsh Restoration</li> <li>- Suisun Marsh Habitat Management, Preservation, and Restoration Plan Implementation</li> <li>- Tidal Wetland Restoration: Yolo Ranch, Northern Liberty Island Fish Restoration Project, Prospect Island Restoration Project, and Calhoun Cut/Lindsey Slough Tidal Habitat Restoration Project</li> <li>- San Joaquin River Restoration Program</li> <li>- Future water supply projects, including water recycling, desalination, groundwater banks and wellfields, and conveyance facilities (projects with completed environmental documents)</li> </ul>	<p>methylmercury concentrations in fish tissue would actually occur after 2030.</p>
<p>Future Actions considered as Cumulative Effects Actions in All Alternatives in Year 2030</p>	<p>Actions as described in Section 3.5 (of Chapter 3, Descriptions of Alternatives):</p> <ul style="list-style-type: none"> <li>- Bay-Delta Water Quality Control Plan Update</li> <li>- FERC Relicensing Projects</li> <li>- Bay Delta Conservation Plan (including the California WaterFix alternative)</li> <li>- Shasta Lake Water Resources, North-of-the-Delta Offstream Storage, Los Vaqueros Reservoir Expansion Phase 2, and Upper San Joaquin River Basin Storage Investigations</li> <li>- El Dorado Water and Power Authority Supplemental Water Rights Project</li> <li>- Sacramento River Water Reliability Project</li> <li>- Semitropic Water Storage District Delta Wetlands</li> </ul>	<p>These effects would be the same under all alternatives. Reasonably foreseeable storage projects would increase reservoir storage at Shasta Lake and Los Vaqueros Reservoir, and provide new reservoir storage at North-of-the-Delta Offstream Storage, Upper San Joaquin River Basin Storage, and Delta Wetlands.</p>

<b>Scenarios</b>	<b>Actions</b>	<b>Cumulative Effects of Actions</b>
	<ul style="list-style-type: none"> <li>- North Bay Aqueduct Alternative Intake</li> <li>- San Luis Reservoir Low Point Improvement Project</li> <li>- Future water supply projects, including water recycling, desalination, groundwater banks and wellfields, and conveyance facilities (projects that did not have completed environmental documents during preparation of the EIS)</li> </ul>	
No Action Alternative with Associated Cumulative Effects Actions in Year 2030	Full implementation of the 2008 USFWS BO and 2009 NMFS BO	Climate change and sea level rise, FERC relicensing projects, and some future projects to improve water quality and/or habitat are anticipated to reduce end of September CVP and SWP reservoir storage as compared to past conditions. Mercury and methylmercury concentrations in fish tissue would be similar or greater than past conditions.
Alternative 1 with Associated Cumulative Effects Actions in Year 2030	No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant)	Implementation of Alternative 1 with future reasonably foreseeable actions would result in similar changes as under the No Action Alternative with the added actions.
Alternative 2 with Associated Cumulative Effects Actions in Year 2030	<p>Full implementation of the 2008 USFWS BO and 2009 NMFS BO CVP and SWP operational actions</p> <p>No implementation of structural improvements or other actions that require further study to develop a more detailed action description.</p>	Implementation of Alternative 2 with reasonably foreseeable actions would result in similar changes as under the No Action Alternative with the added actions.
Alternative 3 with Associated Cumulative Effects Actions in Year 2030	<p>No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant)</p> <p>Slight increase in positive Old and Middle River flows in the winter and spring months</p>	Implementation of Alternative 3 with reasonably foreseeable actions would result in similar changes as under the No Action Alternative with the added actions.

Scenarios	Actions	Cumulative Effects of Actions
Alternative 4 with Associated Cumulative Effects Actions in Year 2030	No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant)	Implementation of Alternative 4 with reasonably foreseeable actions would result in similar changes as under the No Action Alternative with the added actions.
Alternative 5 with Associated Cumulative Effects Actions in Year 20530	Full implementation of the 2008 USFWS BO and 2009 NMFS BO Positive Old and Middle River flows and increased Delta outflow in spring months	Implementation of Alternative 5 with reasonably foreseeable actions would result in similar changes as under the No Action Alternative with the added actions.

**Chapter 19****1 Socioeconomics****2 19.1 Introduction**

3 This Chapter describes socioeconomic conditions in the Study Area; and potential  
4 changes that could occur as a result of implementing the alternatives evaluated in  
5 this Environmental Impact Statement (EIS). Implementation of the alternatives  
6 could affect socioeconomic conditions through potential changes in operation of  
7 the Central Valley Project (CVP) and State Water Project (SWP) that would  
8 change CVP and SWP water supply availability to agricultural water users and  
9 municipal and industrial (M&I) water users. Changes in CVP and SWP  
10 operations also would result in changes to recreational resources at reservoirs that  
11 store CVP and SWP water.

12 Changes in agricultural production, including costs to provide Alternative water  
13 supplies when CVP and SWP water supplies are not available, are presented in  
14 Chapter 12, Agricultural Resources. Changes in reservoir recreational  
15 opportunities that would occur due to reduction in reservoir storage elevations are  
16 presented in Chapter 15, Recreational Resources. The results of these analyses  
17 are summarized in Section 19.4, Environmental Consequences, of this  
18 Chapter and considered in the determination of regional socioeconomics effects.

**19 19.2 Regulatory Environment and Compliance  
20 Requirements**

21 Potential actions that could be implemented under the alternatives evaluated in  
22 this EIS could affect socioeconomic conditions in portions of the Study Area  
23 affected by or served by CVP and SWP water supplies. Actions located on public  
24 agency lands; or implemented, funded, or approved by Federal and state agencies  
25 would need to be compliant with appropriate Federal and state agency policies  
26 and regulations, as summarized in Chapter 4, Approach to Environmental  
27 Analyses.

**28 19.3 Affected Environment**

29 This section describes socioeconomic conditions that could be potentially affected  
30 by implementation of the alternatives considered in this EIS. The socioeconomic  
31 conditions described in this Chapter are related to population, employment,  
32 income, and taxes.

33 Housing information is not described in this Chapter because implementation of  
34 the No Action Alternative, Second Basis of Comparison, and Alternatives 1  
35 through 5 would not result in changes to land use that would displace or relocate

1 housing stocks. Land use would be the same under the No Action Alternative,  
2 Second Basis of Comparison, and Alternatives 1 through 5, as described in  
3 Chapter 13, Land Use. The only changes in land use between recent historical  
4 conditions and conditions in 2030 for the No Action Alternative, Second Basis of  
5 Comparison, and Alternatives 1 through 5 would occur due to ecosystem  
6 restoration on agricultural lands, open space, and public lands that do not support  
7 housing units.

### 8 **19.3.1 Characterization of Socioeconomic Conditions**

9 Characterization of the socioeconomic conditions within the Study Area is based  
10 upon publically available data sources. The data sources used include the U.S.  
11 Census Bureau, U.S. Bureau of Economic Analysis, U.S. Bureau of Labor  
12 Statistics, California Department of Finance, California Employment  
13 Development Department, and California Board of Equalization. The data were  
14 summarized and used to compare historical and current trends in the  
15 socioeconomic conditions in the Study Area.

16 Population and income data used to characterize the socioeconomic conditions are  
17 reported from 2000 to 2012 by the California Department of Finance.

18 The employment data presented in this Chapter are reported from 2001 to 2008  
19 and from 2008 to 2012 (the latest values from consistent data sources). The first  
20 period from 2001 to 2008 represents a period of time prior to implementation of  
21 the 2008 U.S. Fish and Wildlife Service (USFWS) Biological Opinion (BO) and  
22 the 2009 National Marine Fisheries Service (NMFS) BO. The second period  
23 from 2008 to 2012 represents a period of time following implementation of the  
24 2008 USFWS BO and 2009 NMFS BO.

25 There are two estimates of employment that are typically used to describe  
26 employment. The civilian labor force employment data compiled by the Bureau  
27 of Labor Statistics reflect the employment status of individuals that are covered  
28 by unemployment insurance by “place of residence,” and includes the self-  
29 employed, employees on unpaid leave of absence, unpaid family workers, and  
30 household workers. These data do not include sole proprietors, some self-  
31 employed, and some farm workers and domestic workers. Employment by  
32 industry data compiled by the Bureau of Economic Analysis, including farm  
33 employment, reflect jobs by “place of work” and include sole proprietors and  
34 active partners, self-employed, farm workers, and domestic workers. Individuals  
35 with more than one job are counted only once in civilian labor force data and  
36 counted in each job in the employment by industry data. Therefore, the  
37 employment by industry data are greater than the civilian labor force data.

### 38 **19.3.2 Trinity River Region**

39 The Trinity River Region includes the area in Trinity County along the Trinity  
40 River from Trinity Lake to the confluence with the Klamath River; and in  
41 Humboldt and Del Norte counties along the lower Klamath River from the  
42 confluence with the Trinity River to the Pacific Ocean. Tribal lands along the  
43 Trinity or lower Klamath River within the Trinity River Region include the

1 Hoopa Valley Indian Reservation, Yurok Indian Reservation, and Resighini  
2 Rancheria.

3 Trinity County includes extensive trails, lakes, and the Trinity River Scenic  
4 Byway, providing several venues for outdoor enthusiasts and travelers. The  
5 recreation and tourism industries are major contributors to the local economy of  
6 Trinity County (EDD 2013).

7 Humboldt County is the largest and most populous of the north coast counties. Its  
8 2012 population of 134,728 ranked 35th among the 58 counties in California  
9 (EDD 2014a). Humboldt County encompasses 2.3 million acres, 80 percent of  
10 which is forestlands, protected redwoods and recreation areas (Humboldt County  
11 2014). Humboldt County is the leading timber producing county in the state  
12 (CDFA 2014). As described in Chapter 13, Land Use, the portion of Humboldt  
13 County in the Trinity River Region evaluated in this EIS is located along the  
14 Trinity and Klamath rivers. This portion of the county includes the communities  
15 of Willow Creek and Orleans within Humboldt County; Hoopa in the Hoopa  
16 Valley Indian Reservation; and the communities of Weitchpec, Cappell, Pecwan,  
17 and Johnson's in the Yurok Tribe Indian Reservation (Humboldt County 2012).

18 Del Norte County is the northernmost county in California. The county includes  
19 Redwood National Park and other state parks making tourism a natural industry in  
20 the county (EDD 2014b). As described in Chapter 13, Land Use, the portion of  
21 Del Norte County in the Trinity River Region evaluated in this EIS is located  
22 along the lower Klamath River. Most of this area is located within the Yurok  
23 Indian Reservation, and includes the communities of Requa and Klamath (Del  
24 Norte County 2003).

### 25 **19.3.2.1 Population**

26 Population in the Trinity River Region, by county and for the region as a whole, is  
27 presented in Table 19.1. The population of Trinity River Region has increased,  
28 although at a small average annual growth rate for the period shown.

29 **Table 19.1 Population Characteristics in Trinity River Region**

Area	Population 2000	Population 2012	Average Annual Growth Rate (percent) 2000-2012
Trinity County	13,022	13,471	0.3
Humboldt County	126,518	134,728	0.5
Del Norte County	27,507	28,527	0.3
Total Trinity River Region	167,047	176,726	0.5
<b>STATE OF CALIFORNIA</b>	<b>33,873,086</b>	<b>37,427,946</b>	<b>0.9</b>

30 Sources: DOF 2013a, 2013b, 2014

31 Tribal enrollment for the Hoopa Valley Tribe, Yurok Tribe, Karuk Tribe, and  
32 Resighini Rancheria as reported by the Bureau of Indian Affairs is presented in  
33 Table 19.2. These values do not necessarily include all members that live within  
34 the area, and should be considered as representative of trends. Values were only  
35 available for the years of 2001, 2003, 2005, and 2013.

1 **Table 19.2 Tribal Enrollment in Trinity River Region**

Tribe	2001	2003	2005	2013
Hoopa Valley Tribe	1,893	1,893	1,893	1,719 <sup>a</sup>
Yurok Tribe	4,466	4,466	4,912	Not available
Karuk Tribe	3,165	3,165	3,427	Not available
Resighini Rancheria	90	175	111	Not available
<b>TOTAL</b>	<b>9,614</b>	<b>9,699</b>	<b>10,343</b>	–

2 Sources: BIA 2003, 2006, 2008, 2014

3 Note:

4 a. Value is reported as population, not enrollment, for Hoopa Valley Tribe in 2013.

5 **19.3.2.2 Employment**

6 Civilian labor force characteristics for the Trinity River Region are presented in  
 7 Table 19.3. The civilian labor force (composed of employment and  
 8 unemployment) in the Trinity River Region increased between 2001 and 2008 and  
 9 between 2008 and 2012 (BLS 2014).

10 **Table 19.3 Civilian Labor Force and Unemployment Rates in Trinity River Region**

Area	Civilian Labor Force (subject to unemployment insurance)			Unemployment Rate (percent)		
	2001	2008	2012	2001	2008	2012
Trinity County	5,394	4,855	5,019	9.3	12.7	15.8
Humboldt County	60,443	60,039	60,144	6.0	7.2	10.5
Del Norte County	10,221	11,376	11,381	8.0	8.8	13.4
Total Trinity River Region	76,058	76,270	76,544	6.5	7.8	11.2
<b>STATE OF CALIFORNIA</b>	<b>17,152,106</b>	<b>18,392,000</b>	<b>18,494,881</b>	<b>5.4</b>	<b>7.2</b>	<b>10.5</b>

11 Source: BLS 2014

12 Available labor force and unemployment rates for members of the tribes in the  
 13 Trinity River Region are presented in Table 19.4. These individuals may or may  
 14 not be included in the values presented in Table 19.3 because different sources are  
 15 used for each table.

16 **Table 19.4 Available Labor Force and Unemployment Rates Related to the Tribes in**  
 17 **Trinity River Region**

Area	Civilian Labor Force				Unemployment Rate (percent)			
	2001	2003	2005	2013	2001	2003	2005	2013

Yurok Tribe	2,151	2,151	1,096	NA	74	74	74	38
Karuk Tribe	3,307	3,307	915	NA	14	14	63	29
Resighini Rancheria	37	44	45	NA	57	59	60	NA

18 Sources: BIA 2003, 2006, 2008, 2014

19 Note:

20 NA = Not Available

1 Total employment and the farm employment in 2001, 2008 and 2012 in the  
 2 Trinity River Region counties are presented in Table 19.5. The Trinity River  
 3 Region farm employment represents less than 1 percent of farm employment in  
 4 the state and the lowest amount of farm employment in counties within the Study  
 5 Area, as indicated in Figure 19.1.

6 **Table 19.5 Employment in Trinity River Region**

Area	Total Employment			Farm Employment <sup>a</sup>		
	2001	2008	2012	2001	2008	2012
Trinity County	4,878	4,930	4,788	155	161	165
Humboldt County	68,596	71,552	68,861	1,662	1,383	1,227
Del Norte County	10,266	11,531	10,720	384	309	231
Total Trinity River Region	83,740	88,013	84,369	2,201	1,853	1,623
<b>STATE OF CALIFORNIA</b>	<b>19,411,367</b>	<b>20,820,306</b>	<b>20,653,860</b>	<b>479,283</b>	<b>438,013</b>	<b>443,764</b>

7 Source: BEA 2014a.

8 Note:

9 a. Farm employment includes employment numbers in forestry, fishing, and related activities.

### 10 **19.3.2.3 Income**

11 Per capita personal income for the Trinity River Region counties for 2000, 2008,  
 12 and 2012 is presented in Table 19.6. Humboldt County had the highest per capita  
 13 income, and Del Norte County had the lowest.

14 **Table 19.6 Per Capita Personal Income in Trinity River Region**

Area	Per Capita Personal Income			Average Annual Growth Rate (percent)	
	2000	2008	2012	2000-2008	2008-2012
Trinity County	\$20,489	\$28,861	\$34,027	4.4	4.2
Humboldt County	\$23,980	\$32,859	\$35,681	4.0	2.1
Del Norte County	\$18,563	\$26,420	\$30,016	4.5	3.2
Total Trinity River Region	\$22,818	\$31,497	\$34,647	4.1	2.4
<b>STATE OF CALIFORNIA</b>	<b>\$33,404</b>	<b>\$44,003</b>	<b>\$43,647</b>	<b>3.5</b>	<b>1.4</b>

15 Source: BEA 2014e

### 16 **19.3.2.4 Local Government Finances**

17 The sales tax rates, as of April 1, 2014, were 7.5 percent in all three counties in  
 18 the Trinity River Region (BOE 2014). Total annual taxable sales within the  
 19 Trinity River Region in 2000, 2008, and 2012 are presented in Table 19.7. The  
 20 region's total taxable sales represents less than one tenth of one percent of total  
 21 annual state taxable sales.

1 **Table 19.7 Total Taxable Sales in Trinity River Region**

Area	Total Taxable Sales (millions)			Average Annual Growth Rate (percent)	
	2000	2008	2012	2000-2008	2008-2012
Trinity County	\$61	\$74	\$87	2.6	3.9
Humboldt County	\$1,293	\$1,693	\$1,768	3.4	1.1
Del Norte County	\$176	\$232	\$226	3.5	-0.6
Total Trinity River Region	\$1,530	\$1,999	\$2,081	3.4	1.0
<b>STATE OF CALIFORNIA</b>	<b>\$441,854</b>	<b>\$531,654</b>	<b>\$407,714</b>	<b>2.3</b>	<b>-6.4</b>

2 Sources: BOE 2000, 2008, 2012

3 Total property tax charges (secured and unsecured) within the Trinity River  
4 Region in Fiscal Year 2011-2012 were \$160.2 million (California State Controller  
5 2012). The Humboldt County share of the total property tax revenues was the  
6 largest at \$126 million. The Del Norte and Trinity counties contributions to the  
7 total were \$19 million and \$13 million, respectively.

8 **19.3.3 Central Valley Region**

9 The Central Valley Region extends from above Shasta Lake to the Tehachapi  
10 Mountains, and includes the Sacramento Valley, San Joaquin Valley, and Delta  
11 and Suisun Marsh subregions.

12 **19.3.3.1 Sacramento Valley**

13 The Sacramento Valley includes the counties of Shasta, Plumas, Tehama, Glenn,  
14 Colusa, Butte, Sutter, Yuba, Nevada, Placer, and El Dorado counties.  
15 Sacramento, Yolo, and Solano counties also are located within the Sacramento  
16 Valley; however, these counties are discussed below as part of the Delta and  
17 Suisun Marsh subsection. Other counties in Sacramento Valley are not  
18 anticipated to be affected by changes in CVP and SWP operations, and are not  
19 discussed here, including: Alpine, Sierra, Lassen, and Amador counties.

20 The Sacramento Valley includes major agricultural counties, including Glenn,  
21 Colusa, Sutter and Placer counties, as described in Chapter 12, Agricultural  
22 Resources. The region also includes some of the leading major timber producing  
23 counties of the state. Shasta County is the second and Plumas County is the fifth  
24 among the leading timber producing counties in the state.

25 **19.3.3.1.1 Population**

26 Population characteristics in the Sacramento Valley portion of the Central Valley  
27 Region are presented in Table 19.8. Among the counties evaluated in the  
28 Sacramento Valley portion of the Central Valley Region, Placer County had the  
29 highest average annual population growth rate between 2000 and 2012; and  
30 Plumas County was the only county with a reduction in population.

1 **Table 19.8 Population Characteristics in Central Valley Region – Sacramento Valley**

Area	Population		Average Annual Growth Rate (percent)
	2000	2012	2000-2012
Shasta County	163,256	177,516	0.8
Plumas County	20,824	19,901	-0.4
Tehama County	56,039	62,985	1.1
Glenn County	26,453	28,105	0.6
Colusa County	18,804	21,552	1.2
Butte County	203,171	220,465	0.7
Yuba County	60,219	72,642	1.6
Nevada County	92,033	97,366	0.5
Sutter County	78,930	94,620	1.7
Placer County	248,399	351,463	3.2
El Dorado County	156,299	180,483	1.3
Sacramento Valley Subtotal	1,124,427	1,333,615	1.4
Total Central Valley Region	6,214,316	7,408,750	1.5
<b>STATE OF CALIFORNIA</b>	<b>33,873,086</b>	<b>37,668,804</b>	<b>0.9</b>

2 Sources: DOF 2013a, 2013b, 2014

3 **19.3.3.1.2 Employment**

4 Civilian labor force characteristics for the counties in the Sacramento Valley  
5 portion of the Central Valley Region are presented in Table 19.9. The civilian  
6 labor force increased between 2001 and 2012. The data for 2008 represents the  
7 employment situation immediately following the recent economic recession that  
8 started in 2007. The average unemployment rate in the civilian labor force  
9 increased from 2001 to 2012. The average unemployment rate in the Sacramento  
10 Valley portion of the Central Valley Region between 2001 and 2012 has been  
11 higher than the state unemployment rate; and lower than for the counties in the  
12 Central Valley Region.

1 **Table 19.9 Civilian Labor Force and Unemployment Rates in Central Valley**  
 2 **Region – Sacramento Valley**

Area	Civilian Labor Force (subject to unemployment insurance)			Unemployment Rate (percent)		
	2001	2008	2012	2001	2008	2012
Shasta County	77,647	82,675	81,245	6.3	10.0	13.4
Plumas County	9,958	9,824	9,478	7.6	10.5	14.7
Tehama County	24,574	25,185	25,251	6.5	9.2	13.9
Glenn County	11,239	12,196	12,841	8.8	10.4	14.7
Colusa County	9,130	10,505	11,860	12.8	13.7	20.0
Butte County	95,216	102,952	102,063	6.6	8.4	12.2
Yuba County	24,862	27,729	27,772	8.5	11.8	16.9
Nevada County	46,947	50,428	50,742	4.4	6.5	9.4
Sutter County	38,457	41,100	42,810	9.7	12.3	17.6
Placer County	139,106	177,243	178,818	4.0	6.4	9.4
El Dorado County	84,064	90,732	90,525	4.3	6.9	10.4
Sacramento Valley Subtotal	561,200	630,569	633,405	5.8	8.3	12.0
Total Central Valley Region	3,519,870	3,885,435	3,990,083	6.8	8.7	12.6
<b>STATE OF CALIFORNIA</b>	<b>17,152,106</b>	<b>18,392,000</b>	<b>18,494,881</b>	<b>4.9</b>	<b>7.2</b>	<b>10.5</b>

3 Source: BLS 2014

4 Total employment and farm employment in 2001, 2008, and 2012 in the  
 5 Sacramento Valley portion of the Central Valley Region are presented in  
 6 Table 19.10. The contribution of farm employment to the total employment in the  
 7 Sacramento Valley portion of the Central Valley Region declined between 2001  
 8 and 2008 and increased slightly by 2012.

1 **Table 19.10 Employment in Central Valley Region – Sacramento Valley**

Area	Total Employment			Farm Employment		
	2001	2008	2012	2001	2008	2012
Shasta County	85,937	91,883	86,696	1,821	1,781	1,751
Plumas County	10,813	10,524	9,493	288	140	138
Tehama County	23,760	24,284	22,669	2,716	2,332	3,042
Glenn County	11,526	11,987	11,856	2,873	1,927	2,049
Colusa County	9,770	10,863	11,266	2,943	1,954	1,831
Butte County	99,757	105,703	101,805	5,293	4,618	4,527
Yuba County	26,162	26,473	26,861	2,494	1,722	1,623
Nevada County	51,323	57,968	55,898	1,161	1,153	1,089
Sutter County	39,489	43,764	43,329	5,454	4,165	4,427
Placer County	158,070	192,171	188,729	2,064	1,925	1,844
El Dorado County	78,052	95,608	90,435	1,937	1,849	1,737
Sacramento Valley Subtotal	594,659	671,228	649,037	29,044	23,566	24,058
Total Central Valley Region	3,616,241	3,997,557	3,923,230	256,672	226,321	230,832
<b>STATE OF CALIFORNIA</b>	<b>19,411,367</b>	<b>20,820,306</b>	<b>20,653,860</b>	<b>479,283</b>	<b>438,013</b>	<b>443,764</b>

2 Source: BEA 2014a

3 Note:

4 Farm employment includes employment numbers in forestry, fishing, and related activities.

5 The annual farm employment for the Sacramento Valley portion of the Central  
6 Valley Region declined in 2004 and remained relatively stable through 2012, as  
7 shown in Figure 19.2. The overall trend in farm employment is influenced by the  
8 farm employment trends in Butte, Sutter, Tehama, Colusa, and Glenn counties, as  
9 shown in Figure 19.3. The decrease in farm employment is related to the  
10 reduction in cultivated acreage during this period, as described in Chapter 12,  
11 Agricultural Resources.

12 The farm employment numbers presented in Table 19.10 include only workers  
13 directly involved in farming, forestry, and fishing activities. However, farming is  
14 one of the most important basic industries in the Central Valley Region; and  
15 supports many other businesses including farm inputs (e.g., fertilizer, seed,  
16 machinery, and fuel) and processing of food and fiber grown on farms. As a  
17 result, employment both directly on farm and indirectly dependent on farming is  
18 higher than the values displayed in Table 19.10.

1 **19.3.3.1.3 Income**

2 The average per capita personal incomes for the counties in the Sacramento  
 3 Valley portion of the Central Valley Region are presented in Table 19.11. Per  
 4 capita personal incomes increased by an average annual rate of between 3 and  
 5 6 percent from 2000 to 2008. Following the economic downturn that started in  
 6 2007, the average annual growth in per capita personal income slowed between  
 7 2008 and 2012, except in Tehama County.

8 **Table 19.11 Per Capita Personal Income in Central Valley Region –**  
 9 **Sacramento Valley**

Area	Per Capita Personal Income			Average Annual Growth Rate (percent)

11 **19.3.3.1.4 Local Government Finances**

12 As of April 1, 2014, the county sales tax rates in the counties within the  
 13 Sacramento Valley portion of the Central Valley Region was 7.5 percent for all  
 14 counties except Nevada County (BOE 2014). The Nevada County sales tax rate  
 15 was 7.625 percent. These rates include the state, county, local and district taxes.

16 The total annual taxable sales in the Sacramento Valley portion of the Central  
 17 Valley Region in 2000, 2008, and 2012 are presented in Table 19.12. The total  
 18 taxable sales represent about 3 percent of total annual state taxable sales. The  
 19 lower rates of growth for the period 2008 to 2012 may be attributable to the  
 20 effects of the recession that started in 2007 and a decline in employment, as  
 21 discussed above.

1 **Table 19.12 Total Taxable Sales in Central Valley Region – Sacramento Valley**

1 **19.3.3.2 San Joaquin Valley**

2 The San Joaquin Valley includes the counties of Stanislaus, Merced, Madera,  
 3 Fresno, Kings, Tulare, and Kern counties. San Joaquin County also is located  
 4 within the San Joaquin Valley; however, this county is discussed below as part of  
 5 the Delta and Suisun Marsh subsection. Other counties in the San Joaquin Valley  
 6 are not anticipated to be affected by changes in CVP and SWP operations, and are  
 7 not discussed here, including: Calaveras, Mariposa, and Tuolumne counties.

8 The San Joaquin Valley includes the major agricultural counties, of Fresno, Kern,  
 9 Kings and Tulare, as described in Chapter 12, Agricultural Resources.

10 **19.3.3.2.1 Population**

11 Population characteristics in the San Joaquin Valley portion of the Central Valley  
 12 Region are presented in Table 19.14. Among the counties in the San Joaquin  
 13 Valley portion of the Central Valley Region, Kern County had the highest average  
 14 annual population growth rate between 2000 and 2012; and Stanislaus and Kings  
 15 counties had the lowest growth rate.

16 **Table 19.14 Population Characteristics in Central Valley – San Joaquin Valley**

Area	Population		Average Annual Growth Rate (percent)
	2000	2012	2000-2012
Stanislaus County	446,997	519,339	1.3
Madera County	123,109	152,325	1.8
Merced County	210,554	260,029	1.8

18 **19.3.3.2.2 Employment**

19 Civilian labor force characteristics for the counties in the San Joaquin Valley  
 20 portion of the Central Valley Region are presented in Table 19.15. The civilian  
 21 labor force increased between 2001 and 2012. The data for 2008 represents the  
 22 employment situation immediately following the recession that started in 2007.  
 23 The average unemployment rate in the civilian labor force increased from 2001 to  
 24 2012. The average unemployment rates for the San Joaquin Valley portion of the  
 25 Central Valley Region between 2001 and 2012 have been higher than for the  
 26 entire Central Valley Region and the state.

1 **Table 19.15 Civilian Labor Force and Unemployment Rates in Central Valley**  
 2 **Region – San Joaquin Valley**

Area	Civilian Labor Force (subject to unemployment insurance)			Unemployment Rate (percent)		
	2001	2008	2012	2001	2008	2012

4 Total employment and farm employment in 2001, 2008 and 2012 in the San  
 5 Joaquin Valley portion of the Central Valley Region are presented in Table 19.16.  
 6 The contribution of farm employment to the total employment declined between  
 7 2001 and 2008, and then increased slightly in 2012, except in Tulare County. In  
 8 Tulare County, farm employment increased between 2001 and 2008 and  
 9 decreased between 2008 and 2012.

10 **Table 19.16 Employment in Central Valley Region – San Joaquin Valley**

12 Note:

13 Farm employment includes employment numbers in forestry, fishing, and related activities.

1 Annual farm employment for the San Joaquin Valley portion of the Central  
2 Valley Region declined in 2004 and continued to fluctuate through 2012, as  
3 shown in Figure 19.2. Farm employment in the San Joaquin Valley portion of the  
4 Central Valley Region represents a major portion of the overall farm employment  
5 in the Central Valley.

6 Within the counties in the San Joaquin Valley portion of the Central Valley  
7 Region, farm employment declined between 2003 and 2006 and remained about  
8 the same between 2007 and 2012. The overall trend in farm employment is  
9 influenced by the farm employment trends in Fresno, Kern, and Tulare counties,  
10 as shown in Figure 19.4. The decrease in farm employment is related to the  
11 reduction in cultivated acreage during this period, as described in Chapter 12,  
12 Agricultural Resources.

13 The farm employment numbers presented in Table 19.16 include only workers  
14 directly involved in farming, forestry, and fishing activities. However, farming is  
15 one of the most important basic industries in the Central Valley; and supports  
16 many other businesses including farm inputs (e.g., fertilizer, seed, machinery, and  
17 fuel) and processing of food and fiber grown on farms. As a result, employment  
18 both directly on farm and indirectly dependent on farming is higher than the  
19 values displayed in Table 19.16.

20 Total farm-dependent employment is not reported in the U.S. Bureau of  
21 Economic Analysis or the U.S. Bureau of Labor Statistics; however, the  
22 employment values can be estimated by studies of local economies. A study of  
23 the local economy in four counties of the San Joaquin Valley found that, for every  
24 on-farm job, about two and one-half additional jobs are supported because of  
25 inputs purchased for farming operations (NEA 1997). This estimate includes the  
26 associated effects of workers on those farms and businesses spending their  
27 incomes on other purchases; however, the estimated values do not include  
28 employment in the processing sector. Another study indicated that the  
29 employment multiplier of the agricultural production and processing industry is  
30 1.92, or that for every 100 agricultural production and processing jobs in the  
31 San Joaquin Valley, 92 other jobs were created in the San Joaquin Valley  
32 (UCAIC 2009).

33 San Joaquin Valley employment also includes employment associated with adult  
34 prison facilities. The San Joaquin Valley portion of the Central Valley Region  
35 includes eight (or about 24 percent) of the 33 adult prison facilities operated by  
36 the California Department of Corrections and Rehabilitation. These prisons are  
37 home to about a quarter of the total prison population in the state and employ  
38 about a quarter of the total prison staff in the state. Employment for these prisons  
39 is summarized in Table 19.17.

1 **Table 19.17 California State Prisons in Central Valley Region - San Joaquin Valley**

Prison Facility	Location	Staff
Central California Women's Facility	Chowchilla, Madera County	1,064
Valley State Prison	Chowchilla, Madera County	1,021
Pleasant Valley State Prison	Coalinga, Fresno County	1,357
Avenal State Prison	Avenal, Kings County	1,475
California State Prison	Corcoran, Kings County	2,003
Wasco State Prison	Wasco, Kern County	1,523
North Kern State Prison	Delano, Kern County	1,393
Kern Valley State Prison	Delano, Kern County	1,545

3 Federal prisons are located at Atwater in Merced County, Mendota in Fresno  
4 County, and Taft in Kern County within the San Joaquin Valley portion of the  
5 Central Valley Region (BOP 2014).

6 **19.3.3.2.3 Income**

7 The average per capita personal income in the San Joaquin Valley portion of the  
8 Central Valley Region was lower than that for the entire Central Valley Region,  
9 as presented in Table 19.18. The average per capita personal income in the San  
10 Joaquin Valley portion of the Central Valley Region was a little more than two-  
11 thirds of the average per capita personal income in the Central Valley Region and  
12 the state. With the exception of Stanislaus County, most counties in the San  
13 Joaquin Valley portion of the Central Valley Region had higher annual average  
14 growth in per capita personal income between 2000 and 2008 than the entire  
15 Central Valley Region and the state.

16 **Table 19.18 Per Capita Personal Income in Central Valley Region –**  
17 **San Joaquin Valley**

Area	Per Capita Personal Income			Average Annual Growth Rate (percent)	
	2000	2008	2012	2000-2008	2008-2012
Stanislaus County	\$24,284	\$31,093	\$34,138	3.1	2.4

1 **19.3.3.2.4 Local Government Finances**

2 As of April 1, 2014, the county sales tax rates in the counties within the San  
 3 Joaquin Valley portion of the Central Valley ranged from 7.5 percent in Merced,  
 4 Kern, and Kings counties to 8.225 percent in Fresno County (BOE 2014).

5 The total annual taxable sales for the counties in the San Joaquin Valley portion  
 6 of the Central Valley Region in 2000, 2008, and 2012 are presented in  
 7 Table 19.19. The contribution of the area to California total annual taxable sales  
 8 increased between 2000 and 2012. The lower rates of growth for the period 2008  
 9 to 2012 may be attributable to the effects of the recession that started in 2007 and  
 10 a decline in employment, as discussed above.

11 **Table 19.19 Total Taxable Sales in Central Valley Region – San Joaquin Valley**

Area	Total Taxable Sales (millions)			Average Annual Growth Rate (percent)	
	2000	2008	2012	2000-2008	2008-2012
Stanislaus County	\$5,195	\$6,729	\$7,178	3.3	1.6
Madera County	\$881	\$1,327	\$1,356	5.2	0.5
Merced County	\$1,740	\$2,388	\$2,512	4.0	1.3

4 **19.3.3.3 Delta and Suisun Marsh**

5 The Delta and Suisun Marsh portion of the Central Valley Region includes  
 6 Sacramento, Yolo, Solano, San Joaquin, and Contra Costa counties. These  
 7 counties include some of the leading agricultural areas in the state. In addition to  
 8 agriculture, this area includes important transportation infrastructures including  
 9 inland shipping ports (Port of West Sacramento and Port of Stockton); major  
 10 employment centers (cities of Sacramento, West Sacramento, Fairfield, Stockton,  
 11 and Concord); and water-based recreation activities (e.g., boating, fishing, and  
 12 water skiing).

13 **19.3.3.3.1 Population**

14 Population characteristics in the counties of the Delta and Suisun Marsh portion  
 15 of the Central Valley Region are presented in Table 19.21. San Joaquin County  
 16 had the highest average annual population growth rate between 2000 and 2012,  
 17 and Solano County had the lowest growth rate.

1 **Table 19.21 Population Characteristics in Central Valley Region – Delta and**  
 2 **Suisun Marsh**

Area	Population		Average Annual Growth Rate (percent)
	2000	2012	2000-2012

12 Total employment and farm employment in 2001, 2008, and 2012 in the  
 13 Sacramento, Yolo, Solano, San Joaquin, and Contra Costa counties are presented  
 14 in Table 19.23. The contribution of farm employment to the total employment  
 15 declined slightly between 2001 and 2008, and then increased slightly between  
 16 2008 and 2012.

1 **Table 19.23 Employment in Central Valley Region – Delta and Suisun Marsh**

Area	Total Employment			Farm Employment		
	2001	2008	2012	2001	2008	2012
Sacramento County	739,256	806,976	784,386	5,176	4,019	3,924
Yolo County	110,902	122,054	117,609	5,244	5,364	5,745
Solano County	162,874	174,565	169,096	3,321	2,144	2,116
San Joaquin County	260,809	286,171	277,260	21,088	16,939	17,496
Contra Costa County	475,493	497,887	492,144	3,130	910	1,599
Delta and Suisun Marsh Subtotal	1,749,334	1,887,653	1,840,495	37,959	29,376	30,880
Total Central Valley Region	3,616,241	3,997,557	3,923,230	256,672	226,321	230,832
<b>STATE OF CALIFORNIA</b>	<b>19,411,367</b>	<b>20,820,306</b>	<b>20,653,860</b>	<b>479,283</b>	<b>438,013</b>	<b>443,764</b>

2 Source: BEA 2014a

3 Note:

4 Farm employment includes employment numbers in forestry, fishing, and related activities.

5 Annual farm employment for the Sacramento, Yolo, Solano, San Joaquin, and  
6 Contra Costa counties declined in 2004, slightly increased in 2006, and continued  
7 to fluctuate through 2012, as shown in Figure 19.5. Within these counties, farm  
8 employment started to decline in 2004 and began to increase slightly in 2006, as  
9 shown in Figure 19.5. The overall trend in farm employment in the Delta and  
10 Suisun Marsh portion of the Central Valley Region is influenced by the farm  
11 employment trends in San Joaquin County. The decrease in farm employment is  
12 related to the reduction in cultivated acreage during this period, as described in  
13 Chapter 12, Agricultural Resources.

14 The farm employment numbers presented in Table 19.23 include only workers  
15 directly involved in farming, forestry, and fishing activities. However, farming is  
16 one of the most important basic industries in many counties in the Central Valley  
17 Region; and supports many other businesses including farm inputs (e.g., fertilizer,  
18 seed, machinery, and fuel) and processing of food and fiber grown on farms. As a  
19 result, employment both directly on farm and indirectly dependent on farming is  
20 higher than the values displayed in Table 19.23.

### 21 **19.3.3.3 Income**

22 The average per capita personal income in the Sacramento, Yolo, Solano, San  
23 Joaquin, and Contra Costa counties was about 15 percent higher than the average  
24 per capita personal income in the entire Central Valley Region, as presented in  
25 Table 19.24. San Joaquin and Contra Costa counties experienced the lowest  
26 average annual growth rates in per capita personal income between 2000 and  
27 2008. Between 2008 and 2012, Yolo County was the only county with a slightly  
28 higher average annual growth rate as compared to the entire Central Valley  
29 Region.

1 **Table 19.24 Per Capita Personal Income in Central Valley Region – Delta and**  
 2 **Suisun Marsh**

Area	Per Capita Personal Income			Average Annual Growth Rate (percent)	
	2000	2008	2012	2000-2008	2008-2012

4 **19.3.3.3.4 Local Government Finances**

5 As of April 1, 2014, the county sales tax rates in the Sacramento, Yolo, Solano,  
 6 San Joaquin, and Contra Costa counties ranged between 7.5 percent in Yolo to  
 7 8 percent in San Joaquin (BOE 2014).

8 Total annual taxable sales for Sacramento, Yolo, Solano, San Joaquin, and Contra  
 9 Costa counties in 2000, 2008, and 2012 are presented in Table 19.25. Between  
 10 2000 and 2008 Yolo, Solano, and San Joaquin counties experienced average  
 11 annual growth in total taxable sales that were higher than the entire Central Valley  
 12 Region and the state. Between 2008 and 2012, Sacramento County experienced  
 13 negative average annual growth in total taxable sales.

14 **Table 19.25 Total Taxable Sales in Central Valley Region – Delta and Suisun Marsh**

Area	Total Taxable Sales (millions)			Average Annual Growth Rate (percent)	
	2000	2008	2012	2000-2008	2008-2012
Sacramento County	\$16,594	\$19,332	\$19,090	1.9	-0.3
Yolo County	\$2,416	\$3,347	\$3,475	4.2	0.9
Solano County	\$4,424	\$6,033	\$6,038	4.0	0.0

### 8 **19.3.4 San Francisco Bay Area Region**

9 The San Francisco Bay Area Region includes portions of Napa, Alameda, Santa  
 10 Clara, and San Benito counties that are within the CVP and SWP service areas.  
 11 Contra Costa County also is part of the San Francisco Bay Area Region.  
 12 However, for this chapter, Contra Costa County is discussed under  
 13 Section 19.3.4.3, Delta and Suisun Marsh.

#### 14 **19.3.4.1 Population**

15 Population characteristics in the San Francisco Bay Area Region are presented in  
 16 Table 19.27. The population of the San Francisco Bay Area Region grew slightly  
 17 less than a quarter million, or at an average annual growth rate of less than one  
 18 half of one percent between 2000 and 2012.

19 **Table 19.27 Population Characteristics in San Francisco Bay Area Region**

Area	Population		Average Annual Growth Rate (percent)
	2000	2012	2000-2012
Alameda County	1,443,939	1,530,176	0.5
Santa Clara County	1,682,585	1,813,696	0.6
San Benito County	53,234	56,137	0.4
Napa County	124,279	137,731	0.9

1 **19.3.4.2 Employment**

2 Civilian labor force characteristics for the counties in the San Francisco Bay Area  
 3 Region are presented in Table 19.28. The civilian labor force in the counties  
 4 within the San Francisco Bay Area Region declined between 2001 and 2008, and  
 5 then increased between 2008 and 2012. The data for 2008 represents the  
 6 employment situation immediately following the onset of the recession in 2007.

7 **Table 19.28 Civilian Labor Force and Unemployment Rates in San Francisco Bay**  
 8 **Area Region**

Area	Civilian Labor Force (subject to unemployment insurance)			Unemployment Rate (percent)		
	2001	2008	2012	2001	2008	2012
Alameda County	778,472	757,566	775,855	4.8	6.2	9.0
Santa Clara County	939,501	870,251	910,983	5.1	6.0	8.4

9 Source: BLS 2014

10 Total employment and farm employment in 2001, 2008 and 2012 in the San  
 11 Francisco Bay Area Region are presented in Table 19.29. The contribution of  
 12 farm employment to total employment in the San Francisco Bay Area Region  
 13 declined slightly between 2001 and 2008, and remained relatively stable between  
 14 2008 and 2012.

15 **Table 19.29 Employment in San Francisco Bay Area Region**

Area	Total Employment			Farm Employment		
	2001	2008	2012	2001	2008	2012
Alameda County	886,316	906,403	894,625	1,704	1,475	1,291
Santa Clara County	1,226,987	1,176,129	1,187,799	5,969	4,436	2,643
San Benito County	21,722	21,827	21,116	1,969	1,244	1,073
Napa County	84,369	91,837	93,050	4,835	5,730	3,148

<b>STATE OF CALIFORNIA</b>	<b>19,411,367</b>	<b>20,820,306</b>	<b>20,653,860</b>	<b>479,283</b>	<b>438,013</b>	<b>443,764</b>

16 Source: BEA 2014a

17 Note:

18 Farm employment includes employment numbers in forestry, fishing, and related activities.

1 As shown in Table 19.29, overall farm employment has declined by 45 percent  
 2 between 2001 and 2012, as presented in Figure 19.1. The decrease in farm  
 3 employment is related to the reduction in cultivated acreage during this period, as  
 4 described in Chapter 12, Agricultural Resources.

#### 5 **19.3.4.3 Income**

6 The average per capita personal incomes for the counties in the San Francisco  
 7 Bay Area Region are presented in Table 19.30. Among the four counties in this  
 8 region, San Benito County had the lowest per capita personal income. Santa  
 9 Clara County had the lowest average annual per capita growth rate between 2000  
 10 and 2008. All counties experienced smaller average annual per capita growth  
 11 rates between 2008 and 2012 compared to the 2000 to 2008 period.

12 **Table 19.30 Per Capita Personal Income in San Francisco Bay Area Region**

Area	Per Capita Personal Income			Average Annual Growth Rate (percent)	
	2000	2008	2012	2000-2008	2008-2012
Alameda County	\$39,613	\$50,302	\$54,683	3.0	2.1
Santa Clara County	\$55,588	\$59,927	\$66,535	0.9	2.6
San Benito County	\$29,608	\$36,100	\$38,030	2.5	1.3
Napa County	\$38,854	\$51,712	\$54,807	3.6	1.5

#### 14 **19.3.4.4 Local Government Finances**

15 As of April 1, 2014, the county sales tax rates in the San Francisco Bay Area  
 16 region ranged between 7.5 percent in San Benito and 9.0 percent in Alameda  
 17 (BOE 2014).

18 Total annual taxable sales for the counties in the San Francisco Bay Area Region  
 19 in 2000, 2008, and 2012 are presented in Table 19.31. Between 2000 and 2008  
 20 all counties in the region, except Santa Clara County, experienced small increases  
 21 in average annual growth in total taxable sales. All counties experienced  
 22 increasing growth rates between 2008 and 2012. Santa Clara County had the  
 23 highest annual average growth rate in total taxable sales among all the counties in  
 24 the region during this period.

1 **Table 19.31 Total Taxable Sales in San Francisco Bay Area Region**

Area	Total Taxable Sales (Millions)			Average Annual Growth Rate (percent)	
	2000	2008	2012	2000-2008	2008-2012
Alameda County	\$23,764	\$23,863	\$25,182	0.1	1.4
Santa Clara County	\$37,304	\$32,274	\$36,220	-1.8	2.9

10 **19.3.5 Central Coast Region**

11 The Central Coast Region includes portions of San Luis Obispo and Santa  
 12 Barbara counties served by the SWP. San Luis Obispo and Santa Barbara  
 13 counties are among the top 15 counties in total agricultural production in the state.

14 **19.3.5.1 Population**

15 Population characteristics in the Central Coast Region are presented in Table  
 16 19.33. The population of the Central Coast Region grew by an average annual  
 17 growth rate of about one half of one percent between 2000 and 2012.

1 **Table 19.33 Population Characteristics in Central Coast Region**

Area	Population		Average Annual Growth Rate (percent)
	2000	2012	2000-2012
San Luis Obispo County	246,681	271,502	0.8

9 Total employment and farm employment in 2001, 2008, and 2012 in the Central  
10 Coast Region are presented in Table 19.35. Farm employment accounted for less  
11 than ten percent of total employment during this period.

12 **Table 19.35 Employment in Central Coast Region**

Area	Total Employment			Farm Employment		
	2001	2008	2012	2001	2008	2012
San Luis Obispo County	140,320	155,093	156,757	7,775	6,866	7,374
Santa Barbara County	243,955	260,056	257,841	15,228	16,483	18,075
Total Central Coast Region	384,275	415,149	414,598	23,003	23,349	25,449
<b>STATE OF CALIFORNIA</b>	<b>19,411,367</b>	<b>20,820,306</b>	<b>20,653,860</b>	<b>479,283</b>	<b>438,013</b>	<b>443,764</b>

13 Source: BEA 2014a

14 Note: Farm employment includes employment numbers in forestry, fishing, and related activities.

15 The farm employment numbers presented in Table 19.35 include only workers  
16 directly involved in farming, forestry, and fishing activities. However, farming is  
17 one of the most important basic industries in many counties in the Central Coast  
18 Region; and supports many other businesses including farm inputs (e.g., fertilizer,  
19 seed, machinery, and fuel) and processing of food and fiber grown on farms. As a

1 result, employment both directly on farm and indirectly dependent on farming is  
 2 higher than the values displayed in Table 19.35.

3 **19.3.5.3 Income**

4 Per capita personal incomes for the counties in the Central Coast Region are  
 5 lower than those for the state. Both San Luis Obispo and Santa Barbara had  
 6 average annual per capita personal income growth rates between 2000 and 2008  
 7 that were among the highest in the state. Per capita personal income for each of  
 8 the two counties in the Central Coast Region in 2000, 2008 and 2012 are  
 9 presented in Table 19.36.

10 **Table 19.36 Per Capita Personal Income in Central Coast Region**

Area	Per Capita Personal Income			Average Annual Growth Rate (percent)	
	2000	2008	2012	2000-2008	2008-2012

#### 4 **19.3.6 Southern California Region**

5 The Southern California Region includes portions of Ventura, Los Angeles,  
 6 Orange, San Diego, Riverside, and San Bernardino counties served by the SWP.

##### 7 **19.3.6.1 Population**

8 Population characteristics in Southern California Region are presented in  
 9 Table 19.39. Among the counties in the Southern California Region, Riverside  
 10 County had the highest average annual population growth rate, and Los Angeles  
 11 County had the lowest average annual population growth rate between 2000  
 12 and 2012.

13 **Table 19.39 Population Characteristics in Southern California Region**

Area	Population		Average Annual Growth Rate (percent)
	2000	2012	2000-2012
Ventura County	753,197	829,065	0.8

##### 15 **19.3.6.2 Employment**

16 Civilian labor force characteristics for the counties in the Southern California  
 17 Region are presented in Table 19.40. The civilian labor force in the Southern  
 18 California Region increased between 2001 and 2012. The average unemployment  
 19 rates for the Southern California Region have been lower than for the state.

1 **Table 19.40 Civilian Labor Force and Unemployment Rates in Southern**  
 2 **California Region**

Area	Civilian Labor Force (subject to unemployment insurance)			Unemployment Rate (percent)		
	2001	2008	2012	2001	2008	2012
Ventura County	399,325	429,444	440,649	4.8	6.3	9.0
Los Angeles County	4,752,839	4,934,756	4,879,674	5.7	7.5	10.9

9 Note:

10 Farm employment includes employment numbers in forestry, fishing, and related activities.

### 11 **19.3.6.3 Income**

12 Among the six counties in this region, San Bernardino County had the lowest per  
 13 capita personal income in 2000 and 2008, as presented in Table 19.42. In 2012,  
 14 Riverside County had the lowest per capita personal income.

1 **Table 19.42 Per Capita Personal Income in Southern California Region**

Area	Per Capita Personal Income			Average Annual Growth Rate (percent)	
	2000	2008	2012	2000-2008	2008-2012
Ventura County	\$34,296	\$46,634	\$48,837	3.9	1.2
Los Angeles County	\$29,878	\$42,881	\$44,474	4.6	0.9

3 **19.3.6.4 Local Government Finances**

4 As of April 1, 2014, the county sales tax rates in the Southern California Region  
5 ranged from 7.5 percent in Ventura County to 9.0 percent in Los Angeles County  
6 (BOE 2014).

7 Total annual taxable sales for the counties in the Southern California Region in  
8 2000, 2008, and 2012 are presented in Table 19.43. The counties in this region  
9 have had higher average annual growth rates in total taxable retail sales compared  
10 to the state. Between 2000 and 2008, Riverside and San Bernardino led the  
11 region with higher average annual growth rates. However, between 2008 and  
12 2012, the two counties experienced declining growth rates.

13 **Table 19.43 Total Taxable Sales in Southern California Region**

Area	Total Taxable Sales (millions)			Average Annual Growth Rate (percent)	
	2000	2008	2012	2000-2008	2008-2012

6 **19.3.7 Ocean Salmon Fishery**

7 The ocean salmon fishery along the southern Oregon and northern California  
 8 coast are affected by the population of salmon that rely upon the northern  
 9 California rivers, including the Sacramento and San Joaquin rivers. Changes in  
 10 CVP and SWP water operations would affect the flow patterns and water quality  
 11 of the Sacramento and San Joaquin rivers; and the survivability of the salmon that  
 12 use those rivers for habitat, as described in Chapter 9, Fish and Aquatic  
 13 Resources. This section discusses the economic contributions of the Pacific Coast  
 14 salmon fishery.

15 Management of the California ocean salmon fishery is a combined effort of the  
 16 California Department of Fish and Wildlife (CDFW) and the Pacific Fishery  
 17 Management Council (PFMC), a regional council of the National Oceanic and  
 18 Atmospheric Administration. The California Department of Fish and Wildlife  
 19 manages salmon harvest from the shoreline to three nautical miles off the  
 20 California coast. From three nautical miles to two hundred nautical miles  
 21 offshore is managed by the PFMC. The PFMC is responsible for developing the  
 22 Pacific Coast Salmon Fishery Management Plan (FMP) that guides management  
 23 of the ocean commercial and recreational fishery in California, Oregon, and  
 24 Washington (PFMC 2014a). The annual ocean salmon fishery regulations  
 25 promote the maximum amount of harvest while ensuring that suitable population  
 26 levels are maintained (NOAA 2014).

27 **19.3.7.1 Commercial Ocean Fisheries for Salmon along the Southern**  
 28 **Oregon and Northern California Coasts**

29 The commercial ocean salmon fishery plays a large role in the overall California  
 30 commercial ocean industry, as shown in Table 19.45. The total harvest value for  
 31 Chinook salmon ranked fourth among all commercially harvested ocean species  
 32 in 2012. The harvest value rank of Chinook salmon in California between 2001

1 and 2012 as compared to the other commercially harvested ocean species are  
 2 presented in Table 19.46.

3 **Table 19.45 Top Ten Species by Total Value for Commercially Harvested Ocean**  
 4 **Species in California in 2012**

Rank	Species	Total Value
1	Dungeness Crab	\$85,643,530
2	California Market Squid	\$63,883,456
3	California Spiny Lobster	\$13,706,721
<b>4</b>	<b>Chinook Salmon</b>	<b>\$12,841,853</b>
5	Sablefish	\$8,987,599
6	Pacific Oyster	\$8,736,923
7	Sea Urchins	\$8,320,111
8	Spot Shrimp	\$4,462,204
9	Pacific Sardine	\$4,248,504
10	Kumamoto Oyster	\$3,170,760

9 Annual revenues from commercial ocean salmon fishery in California have  
 10 fluctuated with changes in salmon prices and total landings. The dollar per  
 11 dressed pound for Chinook salmon paid to the commercial operator can change  
 12 within a season, across seasons, and at different ports, as presented in  
 13 Table 19.47. Prices for Chinook salmon have increased over the past years;  
 14 however, the costs for fuel, labor, and equipment maintenance also have  
 15 increased.

1 **Table 19.47 Average Annual Commercial Chinook Salmon Prices**

Year	Average Annual California Price (dollar per dressed pound)	Average Annual Oregon Price (dollar per dressed pound)
2001	\$1.98	\$1.61
2002	\$1.55	\$1.54
2003	\$1.91	\$1.97
2004	\$2.87	\$3.45

8 The economic contribution of the California commercial ocean salmon fishery  
9 extends beyond the revenues received by fishermen. Supporting industries  
10 include fish processors, boat manufacturers, repair and maintenance. The  
11 economic contribution of the commercial ocean salmon fishery can be estimated  
12 through the use of Input-Output models. Economic contributions are estimated by  
13 PFMC using an Input-Output model, the Fishery Economic Assessment Model  
14 (FEAM), as summarized in Table 19.49 for the commercial ocean salmon fishery  
15 by management area.

1 **Table 19.49 Estimated Total Economic Impact for the Commercial Fishery by PFMC**

## 3 Notes:

4 All values estimated using the Fishery Economic Assessment Model, and presented as 2013 dollars.

5 Southern Oregon values include data for Brookings, Oregon which may include values from landings outside of the KMZ.

6 a. KMZ –Oregon represents the area from Humbug Mountain to the Oregon-California Border, and includes landings at the Brookings port and season length and quota values for the entire area including Chetco River Ocean Terminal Area between Twin Rocks and the Oregon-California border.

7 b. KMZ –California represents the area from Oregon-California Border to Humboldt South Jetty, and includes landings at the Crescent City and Eureka ports.

12 Fisherman and industries that rely on the commercial ocean salmon fishery have  
13 access to financial assistance from the federal government in years of low revenue  
14 or closure. The fishery can be declared a failure by the Department of Commerce  
15 after requests are sent by state or local officials and certain criteria have been met.  
16 After a fishery failure is declared, disaster relief can be provided in the form of  
17 monetary compensation, community grants, low-interest loans, habitat restoration,  
18 or fishery capacity reduction. Disaster relief related to the California commercial  
19 ocean salmon fishery has occurred six times between 1994 and 2009, as  
20 summarized in Table 19.50 (CRS 2013). Direct payments may involve a  
21 minimum amount to any permit holder and additional amounts based upon past  
22 landing values (Hackett and Hansen 2008). Disaster relief funds distribution is  
23 conducted by the PFMC and the California Salmon Council.

1 **Table 19.50 Disaster Relief Monies and Programs for the Commercial Ocean**  
 2 **Salmon Fishery in California**

Year	Programs	Dollar Value
1994	Fishery capacity reduction, habitat restoration jobs, and data collection jobs	\$12 Million
1995	Similar programs as in 1994	\$13 Million
1998	Fishery capacity reduction	\$3.5 Million
2007	Direct payments to fisherman and businesses dependent on the Klamath River salmon	\$60.4 Million
2008	Direct payments to fisherman and businesses dependent on the Sacramento River salmon	\$170 Million
2009-2010	Continuation of 2008 programs	Remainder of the 2008 \$170 Million

6 **19.3.8 Ocean Salmon Fisheries for the Yurok and Hoopa Valley**  
 7 **Tribes**

8 The salmon populations are extremely important to the Yurok Tribe and Hoopa  
 9 Valley Tribe as part of their lives, cultural traditions, ceremonies, and community  
 10 health (Reclamation 2012). Fifty percent of the total available salmon in the  
 11 Trinity River is the federally protected harvest for the Yurok and Hoopa Valley  
 12 tribes (DOI 1993). Each tribe determines the use of the harvest. Historical  
 13 landing data for the Yurok and Hoopa Valley tribes are presented in Table 19.52  
 14 (Reclamation 2012).

15 **Table 19.52 Salmon Landings by the Yurok Tribe and Hoopa Valley Tribe**

Year	Spring Run Chinook Salmon	Fall Run Chinook Salmon	Total
2001	19,640	39,044	58,684
2002	15,136	24,700	39,836

- 16 Source: PFMC 2014b (Table B-5)
- 17 Note:
- 18 a. 2013 data are preliminary.
- 19 Includes landings at the Klamath River estuary, along the Klamath River from the estuary to Weitchpec (at the
- 20 confluence of the Klamath and Trinity rivers), and along the Trinity River.

21 **19.4 Impact Analysis**

22 This section describes the potential mechanisms and analytical methods for  
 23 change in socioeconomic factors; results of the impact analysis; potential  
 24 mitigation measures; and cumulative effects.

25 This Chapter includes the analysis of overall regional economic changes and  
 26 economic changes related to changes in CVP and SWP water supplies for M&I  
 27 water users. More detailed discussions of changes in agricultural production are  
 28 presented in Chapter 12, Agricultural Resources.

1 **19.4.1 Potential Mechanisms and Analytical Methods**

2 As described in Chapter 4, Approach to Environmental Analysis, the impact  
3 assessment considers changes in socioeconomic factors related to changes in CVP  
4 and SWP operations under the alternatives as compared to the No Action  
5 Alternative and Second Basis of Comparison.

6 Changes in CVP and SWP operations under the alternatives as compared to the  
7 No Action Alternative and Second Basis of Comparison could change water  
8 supply availability for CVP and SWP water users, recreational opportunities at  
9 reservoirs that store CVP and SWP water, and salmon from the Delta watershed  
10 that are relied upon by commercial, sport, and tribal fisherman.

11 **19.4.1.1 Regional Changes in Irrigated Agricultural Production Value**

12 Changes in CVP and SWP operations could change the extent of total agricultural  
13 production value as compared to the No Action Alternative and the Second Basis  
14 of Comparison. As described in Chapter 12, Agricultural Resources, there was no  
15 changes in agricultural production in the Central Valley under long-term  
16 conditions (over the 81-year model simulation period). Therefore, this analysis  
17 only addresses regional economic changes during dry and critical dry years.

18 This analysis uses model output from the Statewide Agricultural Production  
19 (SWAP) model and the IMPLAN model. The SWAP model, as described in  
20 Chapter 12, is a regional model of irrigated agricultural production and economics  
21 that simulates the decisions of producers (farmers) in the Central Valley Region.  
22 The model selects the crops, water supplies, and other inputs that maximize profit  
23 subject to constraints on water and land, and subject to economic conditions  
24 regarding prices, yields, and costs. The SWAP model incorporates CVP and  
25 SWP water supplies, other local water supplies represented in the CalSim II  
26 model, and groundwater. As conditions change within a SWAP subregion  
27 (e.g., the quantity of available project water supply declines), the model optimizes  
28 production by adjusting the crop mix, water sources and quantities used, and other  
29 inputs. The model also fallows land when that appears to be the most cost-  
30 effective response to resource conditions. The analysis only reduces groundwater  
31 withdrawals based upon an optimization of agricultural production costs. The  
32 analysis does not restrict groundwater withdrawals based upon groundwater  
33 overdraft or groundwater quality conditions.

34 As described in Chapter 7, Groundwater Resources and Groundwater Quality,  
35 The Sustainable Groundwater Management Act (SGMA) requires preparation of  
36 Groundwater Sustainability Plans (GSPs) by 2020 or 2022 for most of the  
37 groundwater basins. The GSPs will identify methods to implement measures that  
38 will achieve sustainable groundwater operations by 2040 or 2042. The analysis in  
39 this Chapter is focused on conditions that would occur in 2030. If local agencies  
40 fully implement GSPs prior to the regulatory deadline, increasing groundwater  
41 use would be less of an option for agricultural water users. However, to achieve  
42 sustainable conditions, some measures could require several years to design and  
43 construct new water supply facilities, and sustainable groundwater conditions are  
44 not required until the 2040s. Therefore, it was assumed that Central Valley

1 agriculture water users would not reduce groundwater use by 2030, and that  
2 groundwater use would increase in response to reduced CVP and SWP  
3 water supplies.

4 As described in Chapter 12, the impact to irrigated acreage and agricultural  
5 production is relatively small. Most of the change in CVP or SWP irrigation  
6 supplies would be offset by changes in groundwater pumping, with only small  
7 changes in crop acreage in production. However, this is an aggregate result for  
8 the Central Valley. Individual growers that rely on CVP or SWP supply and have  
9 no access to groundwater would have their irrigated acreage affected by larger  
10 amounts. Some of their change in production can and would be offset by changes  
11 on other farms that have access to groundwater or other surface supplies. Over  
12 time, growers without the buffer of access to groundwater could be driven to sell  
13 to or merge with other farming operations. From the larger, regional perspective,  
14 total value of production is estimated to change relatively little.

15 The regional economic analysis was conducted using the results of the impact  
16 analysis on agricultural production and M&I water use. The incremental impact  
17 results, estimated by the SWAP and CWEST economic models, were input into  
18 the regional IMPLAN models as the direct change caused by each of  
19 Alternative as compared to the No Action Alternative and the Second Basis of  
20 Comparison. Changes in economic effects depend upon loss of production or  
21 expenditures for water supplies, interactions within the regional economy, and  
22 “leakage” of economic activity between regions. Economic linkages create  
23 multiplier effects in a regional economy in the IMPLAN input-output model  
24 based upon estimates of county-level final demands and final payments developed  
25 from published data, national average matrix of technical coefficients, and  
26 mathematical relationships. IMPLAN uses information from the U.S. Department  
27 of Commerce’s Bureau of Economic Analysis, U.S. Department of Labor’s  
28 Bureau of Labor Statistics, and other federal and state government agencies. Data  
29 is collected for 440 different industrial sectors of the national economy per the  
30 North American Industry Classification System based on the primary commodity  
31 or service produced. Data sets are provided for the IMPLAN model for each  
32 county in the United States. In this analysis counties were grouped into the  
33 Central Valley Region (does not include Contra Costa County), San Francisco  
34 Bay Area Region (does include Contra Costa County), Central Coast Region, and  
35 Southern California Region.

36 IMPLAN is a static model that estimates impacts for a snapshot in time when the  
37 impacts are expected to occur, based on the makeup of the economy at the time of  
38 the underlying IMPLAN data. IMPLAN measures the initial impact to the  
39 economy based on average expenditure patterns, but does not consider long-term  
40 adjustments if labor and capital move into alternative uses.

41 Irrigated acreage occurs in the San Francisco Bay Area, Central Coast, and  
42 Southern California regions that use CVP and SWP water. This irrigated acreage  
43 is not included in the SWAP model simulation; and therefore, is not evaluated  
44 quantitatively in this EIS. However, changes in irrigated acreage in response to

1 reductions in CVP and SWP water deliveries are assumed to occur in a similar  
2 manner as projected for the Central Valley Region.

3 As described in this chapter, the SWAP and IMPLAN models are annual-time  
4 step models that use information from the monthly-time step model. The model  
5 results represent long-term responses and must be used in a comparative manner  
6 to reduce the effects of use of monthly assumptions and other assumptions that  
7 are indicative of real-time operations, but do not specific match real-time  
8 observations. The CalSim II model output includes minor fluctuations of up to  
9 5 percent due to model assumptions and approaches. Therefore, if the  
10 quantitative changes between a specific alternative and the No Action  
11 Alternative and/or Second Basis of Comparison are 5 percent or less, the  
12 conditions under the specific alternative would be considered to be “similar” to  
13 conditions under the No Action Alternative and/or Second Basis of Comparison.

14 **19.4.1.2 Regional Changes in Municipal and Industrial Water Supplies and**  
15 **Water Supply Costs**

16 Changes in CVP and SWP operations could change availability of water supplies  
17 for M&I water in the study area, related costs of additional supplies or shortages,  
18 and changes in regional economics as compared to the No Action Alternative and  
19 the Second Basis of Comparison. The quantitative analyses of regional changes  
20 related to changes in M&I water supplies and associated costs, employment, and  
21 economic output are analyzed using the California Water Economics Spreadsheet  
22 Tool (CWEST) model and the IMPLAN model.

23 Changes in M&I water supplies were evaluated using a regional economic model  
24 that was specifically modified to address water supply and cost changes to CVP  
25 and SWP M&I water users. The CWEST is a regional model that considers the  
26 economic costs to M&I water users including the cost of CVP and SWP water  
27 supplies, regional surface water supplies (including recycled water), conveyance  
28 costs, shortage costs, and changes in groundwater pumping costs. The model  
29 operations on an annual time step. Annual supplies are calculated for each water  
30 user based upon annual CVP and/or SWP water supplies, local surface water and  
31 groundwater supplies, surface water and groundwater storage, wastewater effluent  
32 and stormwater recycling water treatment, and desalination water treatment.

33 CVP and SWP water supply inputs are provided for the 81-year hydrologic period  
34 from the CalSim II model. The CWEST model analyzes the changes in annual  
35 conditions over the 81-long-term condition, and averages the overall costs for  
36 each Alternative over the 81-long-term condition. The CWEST model evaluates  
37 responses to changes in CVP and SWP water supplies differently for wet, above  
38 normal, and below normal water year types as compared to dry and critical dry  
39 water year types.

40 The goal of the CWEST model is to minimize the cost for the water providers and  
41 end-users to meet 2030 water demand. In years when the combination of average  
42 existing water supplies (either for the wetter or drier conditions) are greater than  
43 the 2030 water demand, the CWEST model assumes any overage water amount  
44 would be placed into surface water or groundwater storage, if available. If

1 storage is not available, groundwater pumping would be reduced so that the other  
 2 available supplies can be utilized. The CWEST model assumes that local surface  
 3 water, other imported water supplies, recycled water use, and desalinated water  
 4 use would not be reduced. However, during wet years, total CVP and SWP water  
 5 deliveries may not be delivered if groundwater pumping is reduced to zero and  
 6 local storage facilities are full.

7 In years when annual supplies are less than the 2030 water demand, the model  
 8 assumes that water users with local surface water and groundwater storage would  
 9 first fully utilize those supplies, and participate in temporary water transfers or a  
 10 similar annual option if necessary. If shortage and transfer costs occur frequently,  
 11 the model can select to purchase additional fixed-yield supplies, such as  
 12 additional recycled water, desalination water treatment, or groundwater capacity.  
 13 The model optimizes these long-term supply decisions to provide the lowest-cost  
 14 water supply portfolio to meet 2030 demands throughout the 81-year hydrologic  
 15 period.

16 The CWEST model local supply amounts and costs for this EIS are primarily  
 17 based upon information presented in 2010 Urban Water Management Plans  
 18 (UWMPs) developed by the CVP and SWP contractors (see Appendix 5D,  
 19 Municipal and Industrial Water Demands and Supplies). The assumptions related  
 20 to future water supplies presented in the UWMPs were evaluated to determine if  
 21 the projects were reasonable and certain to occur by 2030. Projects that had  
 22 undergone environmental review, were under design, or under construction were  
 23 considered to exist in 2030 water supply assumptions in the CWEST model.  
 24 Projects described in the UWMPs were considered as options to increase fixed-  
 25 yield supplies. Existing and future water supplies considered for municipalities  
 26 by 2030 are presented in Appendix 5B, Future Municipal Water Supplies for CVP  
 27 and SWP Water Users. For smaller water users that are not addressed in an  
 28 UWMP, information was obtained from water master plans and integrated  
 29 regional water management plans.

30 CWEST calculates the change in the cost of water supplies plus end-user shortage  
 31 costs. It does not calculate the total cost of water supplies. To provide a basis for  
 32 understanding the relative importance of a change in costs, annual operating  
 33 expenses were obtained from the fiscal year 2011-12 reports for special districts,  
 34 counties, and cities published by the State Controllers' office (2013, 2014,  
 35 2014a). These operating expenses were updated to 2014 dollars using the  
 36 California urban consumer price index. The cost change from CWEST, divided  
 37 by the operating expense, provides a reasonable indication of the relative  
 38 importance of cost changes for urban water providers.

39 The level of 2014 operating expense for each region includes:

- 40 • Central Valley Region
  - 41 – Sacramento Valley - \$257 million
  - 42 – San Joaquin Valley - \$297 million
- 43 • San Francisco Bay Area Region - \$415 million
- 44 • Central Coast Region - \$38 million

1 • Southern California Region (also known as “South Coast”) - \$1,613 million  
2 The CWEST model assumes that groundwater pumping would occur up to the  
3 amounts included in the UWMPs for wetter and drier conditions. As described  
4 above for agricultural production, it is assumed that full implementation of  
5 SGMA would not occur by 2030. Therefore, it was assumed that water users that  
6 are not currently operating groundwater resources in accordance with adjudication  
7 or other types of agreements, would not reduce groundwater use by 2030.

8 The IMPLAN model, described above, also is used to analyze changes in regional  
9 economics related to M&I water supplies. Increased costs of water supply are  
10 estimated from CWEST results. It is assumed that these costs must be passed on  
11 to regional water users. Regional water users are assumed to reduce their  
12 spending by an amount equal to the water supply cost increase. This reduced  
13 spending is distributed over regional industries according to coefficients provided  
14 by IMPLAN.

15 As described in this chapter, the CWEST and IMPLAN models are annual-time  
16 step models that use information from the monthly-time step model. The model  
17 results represent long-term responses and must be used in a comparative manner  
18 to reduce the effects of use of monthly assumptions and other assumptions that  
19 are indicative of real-time operations, but do not specific match real-time  
20 observations. The CalSim II model output includes minor fluctuations of up to  
21 5 percent due to model assumptions and approaches. Therefore, if the  
22 quantitative changes between a specific alternative and the No Action  
23 Alternative and/or Second Basis of Comparison are 5 percent or less, the  
24 conditions under the specific alternative would be considered to be “similar” to  
25 conditions under the No Action Alternative and/or Second Basis of Comparison.

26 **19.4.1.3 Changes in Local Government Finances**

27 Changes in CVP and SWP operations would not result in major changes in land  
28 use, as described in Chapter 13, Land Use. Therefore, changes to collection of  
29 local taxes and fees are not anticipated under the alternatives as compared to the  
30 No Action Alternative and the Second Basis of Comparison. Therefore, changes  
31 in local government finances are not evaluated in this EIS.

32 **19.4.1.4 Changes in Recreational Economics**

33 Reservoirs that store CVP and SWP water provide a wide diversity of recreational  
34 experiences on the water surface, as described in Chapter 15, Recreational  
35 Resources. However, changes to recreational economic opportunities under the  
36 alternatives primarily would occur due to changes in surface water elevations at  
37 San Luis Reservoir and reduced Striped Bass fishing opportunities under  
38 Alternatives 3 and 4.

39 This EIS does not quantitatively analyze potential changes in recreation user days  
40 or recreation spending because specific projects or responses to the changes in  
41 reservoir elevations are not considered under the purpose and need of this EIS.  
42 The qualitative analysis presented in this Chapter is based upon potential changes  
43 in recreational use related to changes under the alternatives as compared to the No

1 Action Alternative and the Second Basis of Comparison, as described in  
2 Chapter 15, Recreational Resources.

3 **19.4.1.5 Changes in Commercial, Sport, and Tribal Salmon Fishing**  
4 **Opportunities**

5 Changes in CVP and SWP operations under the alternatives could change the  
6 salmon population as compared to the No Action Alternative and the Second  
7 Basis of Comparison. Commercial, sport, and tribal fishing primarily relies upon  
8 Fall-run Chinook Salmon because the populations of other runs of salmon are  
9 substantially lower. Specific population changes for Fall-run Chinook Salmon are  
10 not projected in this EIS. Therefore, this Chapter presents a qualitative analysis  
11 of potential changes in socioeconomic factors under the alternatives as compared  
12 to the No Action Alternative and the Second Basis of Comparison.

13 **19.4.1.6 Effects of Cross Delta Water Transfers**

14 Historically water transfer programs have been developed on an annual basis.  
15 The demand for water transfers is dependent upon the availability of water  
16 supplies to meet water demands. Water transfer transactions have increased over  
17 time as CVP and SWP water supply availability has decreased, especially during  
18 drier water years.

19 Parties seeking water transfers generally acquire water from sellers who have  
20 available surface water who can make the water available through releasing  
21 previously stored water, pump groundwater instead of using surface water  
22 (groundwater substitution); idle crops; or substitute crops that uses less water in  
23 order to reduce normal consumptive use of surface water.

24 Water transfers using CVP and SWP Delta pumping plants and south of Delta  
25 canals generally occur when there is unused capacity in these facilities. These  
26 conditions generally occur drier water year types when the flows from upstream  
27 reservoirs plus unregulated flows are adequate to meet the Sacramento Valley  
28 water demands and the CVP and SWP export allocations. In non-wet years, the  
29 CVP and SWP water allocations would be less than full contract amounts;  
30 therefore, capacity may be available in the CVP and SWP conveyance facilities to  
31 move water from other sources.

32 Projecting future socioeconomic conditions related to water transfer activities is  
33 difficult because specific water transfer actions required to make the water  
34 available, convey the water, and/or use the water would change each year due to  
35 changing hydrological conditions, CVP and SWP water availability, specific local  
36 agency operations, and local cropping patterns. Reclamation recently prepared a  
37 long-term regional water transfer environmental document which evaluated  
38 potential changes in conditions related to water transfer actions (Reclamation  
39 2014c). Results from this analysis were used to inform the impact assessment of  
40 potential effects of water transfers under the alternatives as compared to the No  
41 Action Alternative and the Second Basis of Comparison.

1 **19.4.2 Conditions in Year 2030 without Implementation of**  
2 **Alternatives 1 through 5**

3 This EIS includes two bases of comparison, as described in Chapter 3,  
4 Description of Alternatives: the No Action Alternative and the Second Basis of  
5 Comparison. Both of these bases are evaluated at 2030 conditions. Changes that  
6 would occur over the next 15 years without implementation of the alternatives are  
7 not analyzed in this EIS. However, the changes to socioeconomics that are  
8 assumed to occur by 2030 under the No Action Alternative and the Second Basis  
9 of Comparison are summarized in this section. Many of the changed conditions  
10 would occur in the same manner under both the No Action Alternative and the  
11 Second Basis of Comparison.

12 **19.4.2.1 Common Changes in Conditions under the No Action**  
13 **Alternative and Second Basis of Comparison**

14 Conditions in 2030 would be different than existing conditions due to:

- 15 • Climate change and sea level rise  
16 • General plan development throughout California, including increased water  
17 demands in portions of Sacramento Valley  
18 • Implementation of reasonable and foreseeable water resources management  
19 projects to provide water supplies

20 It is anticipated that climate change would result in more short-duration high-  
21 rainfall events and less snowpack in the winter and early spring months. The  
22 reservoirs would be full more frequently by the end of April or May by 2030 than  
23 in recent historical conditions. However, as the water is released in the spring,  
24 there would be less snowpack to refill the reservoirs. This condition would  
25 reduce reservoir storage and available water supplies to downstream uses in the  
26 summer. The reduced end of September storage also would reduce the ability to  
27 release stored water to downstream regional reservoirs. These conditions would  
28 occur for all reservoirs in the California foothills and mountains, including  
29 non-CVP and SWP reservoirs.

30 These changes would result in a decline of the long-term average CVP and SWP  
31 water supply deliveries by 2030 as compared to recent historical long-term  
32 average deliveries under the No Action Alternative and the Second Basis of  
33 Comparison. However, the CVP and SWP water deliveries would be less under  
34 the No Action Alternative as compared to the Second Basis of Comparison, as  
35 described in Chapter 5, Surface Water Resources and Water Supplies, which  
36 could result in more crop idling.

37 Under the No Action Alternative and the Second Basis of Comparison, land uses  
38 in 2030 would occur in accordance with adopted general plans.

39 The No Action Alternative and the Second Basis of Comparison assumes  
40 completion of water resources management and environmental restoration  
41 projects that would have occurred without implementation of Alternatives 1  
42 through 5, including regional and local recycling projects, surface water and

1 groundwater storage projects, conveyance improvement projects, and desalination  
 2 projects, as described in Chapter 3, Description of Alternatives. The No Action  
 3 Alternative and the Second Basis of Comparison also assumes implementation of  
 4 actions included in the 2008 U.S. Fish and Wildlife Service (USFWS) Biological  
 5 Opinion (BO) and 2009 National Marine Fisheries Service (NMFS) BO that  
 6 would have been implemented without the BOs by 2030, as described in  
 7 Chapter 3, Description of Alternatives.

#### 8 **19.4.2.2 Population Projections under the No Action Alternative and** 9 **Second Basis of Comparison**

10 The 2030 population projections for each region addressed in this EIS are  
 11 presented in Tables 19.53 through 19.59.

12 **Table 19.53 Population Projections in Trinity River Region**

Area	Population		Average Annual Growth Rate (percent)
	2012	2030	2012-2030
Trinity County	13,471	15,309	0.7

6 Sources: DOF 2013a, 2013b, 2014

1 **19.4.3 Evaluation of Alternatives**

2 Alternatives 1 through 5 have been compared to the No Action Alternative; and  
3 the No Action Alternative and Alternatives 1 through 5 have been compared to  
4 the Second Basis of Comparison.

5 During review of the numerical modeling analyses used in this EIS, an error was  
6 determined in the CalSim II model assumptions related to the Stanislaus River  
7 operations for the Second Basis of Comparison, Alternative 1, and Alternative 4  
8 model runs. Appendix 5C includes a comparison of the CalSim II model run  
9 results presented in this Chapter and CalSim II model run results with the error  
10 corrected. Appendix 5C also includes a discussion of changes in the comparison  
11 of groundwater conditions for the following Alternative analyses.

- 12 • No Action Alternative compared to the Second Basis of Comparison
- 13 • Alternative 1 compared to the No Action Alternative
- 14 • Alternative 3 compared to the Second Basis of Comparison
- 15 • Alternative 5 compared to the Second Basis of Comparison.

16 **19.4.3.1 No Action Alternative**

17 The No Action Alternative is compared to the Second Basis of Comparison.

18 **19.4.3.1.1 Trinity River Region**

19 *Regional Changes to Irrigated Agriculture*

20 There are no agricultural lands irrigated with CVP and SWP water supplies in the  
21 Trinity River Region. Therefore, there would be no changes in irrigated lands  
22 under the No Action Alternative as compared to the Second Basis of Comparison.

23 *Regional Changes to Municipal and Industrial Water Supplies*

24 The CVP would continue to release water in Trinity River for downstream  
25 beneficial uses, including water supplies under the No Action Alternative and the  
26 Second Basis of Comparison. There are no municipal and industrial CVP or SWP  
27 water service contractors in the Trinity River Region.

28 *Regional Changes to Recreational Opportunities*

29 Recreational opportunities would be similar in the Trinity River Region under the  
30 No Action Alternative as compared to the Second Basis of Comparison as  
31 described in Chapter 15, Recreational Resources.

32 *Regional Changes related to Changes in Salmon Fishing*

33 Trinity River flows would be similar under the No Action Alternative as  
34 compared to the Second Basis of Comparison. This could result in similar salmon  
35 harvest conditions by the Yurok and Hoopa Valley tribes.

36 **19.4.3.1.2 Central Valley Region**

37 *Regional Changes to Irrigated Agriculture*

38 As described in Chapter 5, Surface Water Resources and Water Supplies, CVP  
39 and SWP water supplies would be less under the No Action Alternative than  
40 under the Second Basis of Comparison. It is anticipated that groundwater use

1 would increase in response to reduced CVP and SWP water supplies in 2030  
 2 because sustainable groundwater management plans would not be fully  
 3 implemented until the 2040s, as discussed in Chapter 12, Agricultural Resources.

4 The agricultural production value under long-term average conditions would be  
 5 reduced by less than 1 percent (\$1.6 million/year in the Sacramento Valley and  
 6 \$0.5 million/year in the San Joaquin Valley) primarily due to an increase in  
 7 groundwater pumping of approximately 6 percent. The agricultural production  
 8 value under dry and critical dry conditions also would be reduced by less than  
 9 1 percent (\$11.3 million/year in the Sacramento Valley and \$20.3 million/year in  
 10 the San Joaquin Valley) primarily due to an increase in groundwater pumping.

11 The overall reduction in agricultural production values are less than 0.05 percent  
 12 under long-term conditions; and, changes in employment and regional economic  
 13 output would be minimal. Therefore, the analysis of employment and regional  
 14 economic output is focused on dry and critical dry years.

15 The direct changes in agricultural production would result in changes to  
 16 employment and regional economic output in the Sacramento and San Joaquin  
 17 valleys, as summarized in Tables 19.60 and 19.61, respectively.

18 **Table 19.60 Changes in Agricultural-Related Employment and Regional Economic**

4 As described in Chapter 11, Geology and Soils Resources, increased groundwater  
 5 pumping under the long-term average conditions may result in an additional  
 6 increment of subsidence in those areas within the Central Valley. The additional  
 7 amount of subsidence and the economic costs associated with it have not been  
 8 quantified in this EIS. However, total subsidence-related costs have been shown  
 9 to be substantial, as reported by Borchers et al. (2014) who estimated that the cost  
 10 of subsidence in San Joaquin Valley between 1955 and 1972 was more than  
 11 \$1.3 billion (in 2013 dollars). These estimates are based on the impacts to major  
 12 infrastructure in the region including the San Joaquin River, Delta Mendota  
 13 Canal, Friant-Kern Canal and San Luis Canal in addition to privately owned  
 14 infrastructure. The incremental subsidence-related costs, expressed on an annual  
 15 basis, could be an unknown fraction of that cumulative cost.

#### 16 *Regional Changes to Municipal and Industrial Water Supplies*

17 As described in Chapter 5, Surface Water Resources and Water Supplies, CVP  
 18 and SWP water supplies would be less under the No Action Alternative than  
 19 under the Second Basis of Comparison. The analysis assumed CVP and SWP  
 20 water deliveries, as described in Chapter 5, and determined the need for new  
 21 water supplies, changes in water storage and groundwater pumping, water  
 22 transfers, water shortage costs, and excess water savings. The factors and basis of  
 23 the analysis are described in detail in Appendix 19A, CWEST Model. The  
 24 analysis assumes that no new annual transfer supplies would be implemented until  
 25 shortages were greater than 5 percent. The costs of these shortages are included

1 in the analysis. It is assumed that some communities that do not have  
 2 alternative water supplies (e.g., cities of Huron and Coalinga) and would utilize  
 3 water transfers.

4 The average annual water supply costs over the 81-year hydrologic period for  
 5 M&I water supplies are presented in Tables 19.62 and 19.63 for the Sacramento  
 6 and San Joaquin Valley, respectively.

7 **Table 19.62 Changes in Municipal and Industrial Water Supply Costs for the**  
 8 **Sacramento Valley under the No Action Alternative as Compared to the Second**  
 9 **Basis of Comparison**

Shortage Costs (\$1,000)	\$115	\$102	\$13
Groundwater Pumping Savings (due to reductions in Groundwater Pumping) (\$1,000)	-\$15,377	-\$16,011	\$634
Excess Water Savings (\$1,000)	-\$1,029	-\$1,318	\$289
<b>Average Annual Changes in Water Supply Costs (\$1,000)</b>	<b>-\$8,427</b>	<b>-\$9,593</b>	<b>\$1,166</b>

14 Note: In 2012 dollars

15 The changes in M&I water supply costs would result in changes to employment  
 16 and regional economic output in the Sacramento and San Joaquin valleys, as

1 summarized in Tables 19.64 and 19.65, respectively. The M&I average annual  
 2 water supply operating expenses would increase by 0.11 and 0.39 percent in the  
 3 Sacramento Valley and the San Joaquin Valley, respectively; and therefore, the  
 4 results would be similar.

12 Note:  
 13 In 2012 dollars

1 *Regional Changes to Recreational Opportunities*

2 Recreational opportunities would decrease at San Luis Reservoir by 6 percent  
3 under the No Action Alternative as compared to the Second Basis of Comparison,  
4 as described in Chapter 15, Recreation Resources. Therefore, it is anticipated that  
5 recreational economic factors would be reduced under the No Action  
6 Alternative as compared to the Second Basis of Comparison.

7 *Effects Related to Cross Delta Water Transfers*

8 Potential effects to socioeconomic factors could be similar to those identified in a  
9 recent environmental analysis conducted by Reclamation for long-term water  
10 transfers from the Sacramento to San Joaquin valleys (Reclamation 2014c).  
11 Potential effects to socioeconomic factors were identified as adverse in the  
12 seller's service area related to loss of income to farm workers and the associated  
13 agriculturally-related businesses and retail enterprises if crop idling methods were  
14 used to provide transfer water. The analysis also identified that local sales taxes  
15 could decline due to the loss of household income. If groundwater substitution  
16 was used to provide transfer water, agricultural production values could decline  
17 due to additional cost of pumping. However, income from the water transfer  
18 could increase operating income for the sellers. The regional impact would  
19 depend upon the extent of lands involved in the water transfer program in any  
20 specific year.

21 Under the No Action Alternative, the timing of cross Delta water transfers would  
22 be limited to July through September and include annual volumetric limits, in  
23 accordance with the 2008 USFWS BO and 2009 NMFS BO. Under the Second  
24 Basis of Comparison, water could be transferred throughout the year without an  
25 annual volumetric limit. Overall, the potential for cross Delta water transfers  
26 would be less under the No Action Alternative than under the Second Basis of  
27 Comparison.

28 **19.4.3.1.3 San Francisco Bay Area Region**

29 *Regional Changes to Irrigated Agriculture*

30 It is anticipated that as in the Central Valley Region, reductions in CVP and SWP  
31 water supplies within the San Francisco Bay Area Region would not result in  
32 reductions in long-term irrigated acreage or land use changes due to the use of  
33 other water supplies. However, there could be a reduction in irrigated acreage in  
34 dry and critical dry years under the No Action Alternative as compared to the  
35 Second Basis of Comparison.

36 *Regional Changes to Municipal and Industrial Water Supplies*

37 As described in Chapter 5, Surface Water Resources and Water Supplies, CVP  
38 and SWP water supplies would be less under the No Action Alternative than  
39 under the Second Basis of Comparison. The analysis assumed CVP and SWP  
40 water deliveries, as described in Chapter 5, and determined the need for new  
41 water supplies, changes in water storage and groundwater pumping, water  
42 transfers, water shortage costs, and excess water savings. The factors and basis of  
43 the analysis is described in detail in Appendix 19A, CWEST Model. The analysis

1 assumes that no new annual transfer supplies would be implemented until  
 2 shortages were greater than 5 percent. The costs of these shortages are included  
 3 in the analysis.

4 The average annual water supply operating expenses over the 81-year hydrologic  
 5 period for M&I water supplies would increase by \$7.276 million, or 1.75 percent,  
 6 as presented in Table 19.66; and therefore, the results would be similar under the  
 7 No Action Alternative and Second Basis of Comparison.

8 **Table 19.66 Changes in Municipal and Industrial Water Supply Costs for the San**  
 9 **Francisco Bay Area Region under the No Action Alternative as Compared to the**  
 10 **Second Basis of Comparison**

Differences in Total	No Action Alternative	Second Basis of Comparison	Changes
Average Annual CVP/SWP Deliveries (TAF)	396	445	-48
Delivery Cost (\$1,000)	\$11,044	\$12,515	-\$1,471
Assumed New Supply Deliveries (TAF)	18	16	2
Annualized New Supply Costs (\$1,000)	\$599	\$234	\$365
Water Storage Costs (\$1,000)	\$1,577	\$1,963	-\$386
Lost Water Sales Revenues (\$1,000)	\$4,286	\$1,595	\$2,691
Transfer Costs (\$1,000)	\$5,722	\$1,154	\$4,568
Shortage Costs (\$1,000)	\$1,410	\$523	\$887
Groundwater Pumping Savings (due to reductions in Groundwater Pumping) (\$1,000)	-\$493	-\$792	\$298
Excess Water Savings (\$1,000)	-\$225	-\$549	\$324
<b>Average Annual Changes in Water Supply Costs (\$1,000)</b>	<b>\$23,919</b>	<b>\$16,643</b>	<b>\$7,276</b>

11 Note: In 2012 dollars

12 The changes in M&I water supply costs would result in changes to employment  
 13 and regional economic output, as summarized in Table 19.67.

1 **Table 19.67 Changes in Municipal and Industrial Water Supply Related**  
 2 **Employment and Regional Economic Output for the San Francisco Bay Area**  
 3 **Region under the No Action Alternative as Compared to the Second Basis of**  
 4 **Comparison**

Economic Sectors	Employment				Economic Output (\$ thousands)			
	Direct	Indirect	Induced	Total	Direct	Indirect	Induced	Total
Agriculture	0	0	0	0	0.0	0.1	-7.9	-7.8

Construction	0	1	0	1	0.0	158.8	-37.1	121.7
Manufacturing	0	0	0	0	0.0	28.8	-478.0	-449.1
Transportation, Warehousing & Utilities	5	0	-1	4	1,492.4	11.2	-183.5	1,320.1
Wholesale Trade	0	0	-1	-1	0.0	5.0	-350.6	-345.7
Retail Trade	0	0	-6	-6	0.0	4.2	-567.2	-563.0
Information	0	0	-1	-1	0.0	16.8	-306.6	-289.8
Financial Activities	0	0	-5	-4	0.0	55.8	-1,740.5	-1,684.7
Services	0	1	-20	-19	0.0	133.7	-2,162.8	-2,029.1
Government	0	0	0	0	0.0	0.7	-55.1	-54.4
<b>Total</b>	<b>5</b>	<b>3</b>	<b>-35</b>	<b>-27</b>	<b>1,492.4</b>	<b>416.7</b>	<b>-5,894.3</b>	<b>-3,985.2</b>

5 Note: In 2012 dollars

6 *Regional Changes to Recreational Opportunities*

7 Changes in CVP and SWP water supplies and operations under the No Action  
 8 Alternative as compared to the Second Basis of Comparison generally would  
 9 result in lower reservoir elevations in reservoirs (up to 10 to 18 percent) that store  
 10 CVP and SWP water; and would result in reduced recreational economic factors  
 11 under the No Action Alternative as compared to the Second Basis of Comparison.

12 *Regional Changes to Salmon Fishing*

13 Changes in commercial and sport ocean salmon fishing primarily would be  
 14 related to the presence of fall-run Chinook Salmon from Central Valley  
 15 hatcheries. It is assumed that the production of hatchery fish would be similar  
 16 under the No Action Alternative and the Second Basis of Comparison. However,  
 17 survival of the fall-run Chinook Salmon hatchery fish to the Pacific Ocean could  
 18 be related to changes in CVP and SWP operations. As described in Chapter 9,  
 19 Fish and Aquatic Resources, there would be little change in through-Delta  
 20 survival by emigrating natural juvenile fall-run Chinook Salmon under the No  
 21 Action Alternative as compared to the Second Basis of Comparison. It is  
 22 assumed that the survival of the hatchery juvenile fall-run Chinook Salmon would  
 23 be similar to the survival of the natural juvenile fall-run Chinook Salmon.  
 24 Therefore, the availability of fish for commercial and sport ocean salmon fishing  
 25 and the associated economic conditions for the fishing industry would be similar  
 26 under the No Action Alternative and the Second Basis of Comparison.

1 **19.4.3.1.4 Central Coast Region**

2 *Regional Changes to Irrigated Agriculture*

3 It is anticipated that as in the Central Valley Region, reductions in CVP and SWP  
 4 water supplies within the Central Coast Region would not result in reductions in  
 5 long-term irrigated acreage or land use changes due to the use of other water  
 6 supplies. However, there could be a reduction in irrigated acreage in dry and  
 7 critical dry years under the No Action Alternative as compared to the Second  
 8 Basis of Comparison.

9 *Regional Changes to Municipal and Industrial Water Supplies*

10 As described in Chapter 5, Surface Water Resources and Water Supplies, CVP  
 11 and SWP water supplies would be less under the No Action Alternative than  
 12 under the Second Basis of Comparison. The analysis assumed CVP and SWP  
 13 water deliveries, as described in Chapter 5, and determined the need for new  
 14 water supplies, changes in water storage and groundwater pumping, water  
 15 transfers, water shortage costs, and excess water savings. The factors and basis of  
 16 the analysis is described in detail in Appendix 19A, CWEST Model. The analysis  
 17 assumes that no new annual transfer supplies would be implemented until  
 18 shortages were greater than 5 percent. The costs of these shortages are included  
 19 in the analysis. It is assumed that some communities that do not have  
 20 alternative water supplies would utilize water transfers.

21 The average annual water supply operating expenses over the 81-year hydrologic  
 22 period for M&I water supplies would increase by 0.7 percent, as presented in  
 23 Table 19.68; and therefore, the results would be similar under the No Action  
 24 Alternative and Second Basis of Comparison.

25 **Table 19.68 Changes in Municipal and Industrial Water Supply Costs for the**  
 26 **Central Coast Region under the No Action Alternative as Compared to the Second**  
 27 **Basis of Comparison**

Differences in Total	No Action Alternative	Second Basis of Comparison	Changes
Average Annual CVP/SWP Deliveries (TAF)	44	54	-10
Delivery Cost (\$1,000)	\$6,663	\$8,174	-\$1,510
Assumed New Supply Deliveries (TAF)	0	0	0
Annualized New Supply Costs (\$1,000)	\$0	\$0	\$0
Water Storage Costs (\$1,000)	\$0	\$0	\$0
Lost Water Sales Revenues (\$1,000)	\$0	\$0	\$0

6 Note: In 2012 dollars

7 *Regional Changes to Recreational Opportunities*

8 Changes in CVP and SWP water supplies and operations under the No Action  
 9 Alternative as compared to the Second Basis of Comparison generally would  
 10 result in lower reservoir elevations in reservoirs that store CVP and SWP water  
 11 (up to 10 to 18 percent) that store CVP and SWP water; and would result in  
 12 reduced recreational economic factors under the No Action Alternative as  
 13 compared to the Second Basis of Comparison..

14 **19.4.3.1.5 Southern California Region**

15 *Regional Changes to Irrigated Agriculture*

16 It is anticipated that as in the Central Valley Region, reductions in CVP and SWP  
 17 water supplies within the Southern California Region would not result in  
 18 reductions in long-term irrigated acreage or land use changes due to the use of  
 19 other water supplies. However, there could be a reduction in irrigated acreage in  
 20 dry and critical dry years under the No Action Alternative as compared to the  
 21 Second Basis of Comparison.

22 *Regional Changes to Municipal and Industrial Water Supplies*

23 As described in Chapter 5, Surface Water Resources and Water Supplies, CVP  
 24 and SWP water supplies would be less under the No Action Alternative than  
 25 under the Second Basis of Comparison. The analysis assumed CVP and SWP

1 water deliveries, as described in Chapter 5, and determined the need for new  
 2 water supplies, changes in water storage and groundwater pumping, water  
 3 transfers, water shortage costs, and excess water savings. The factors and basis of  
 4 the analysis is described in detail in Appendix 19A, CWEST Model. The analysis  
 5 assumes that no new annual transfer supplies would be implemented until  
 6 shortages were greater than 5 percent. The costs of these shortages are included  
 7 in the analysis. It is assumed that some communities that do not have  
 8 alternative water supplies would utilize water transfers.

9 The average annual water supply costs over the 81-year hydrologic period for  
 10 M&I water supplies would increase by 2.14 percent, as presented in Table 19.70;  
 11 and therefore, the results would be similar under the No Action Alternative and  
 12 Second Basis of Comparison.

13 **Table 19.70 Changes in Municipal and Industrial Water Supply Costs for the**  
 14 **Southern California Region under the No Action Alternative as Compared to the**  
 15 **Second Basis of Comparison**

Differences in Total	No Action Alternative	Second Basis of Comparison	Changes
Average Annual CVP/SWP Deliveries (TAF)	1,932	2,394	-461
Delivery Cost (\$1,000)	\$239,692	\$296,795	-\$57,103
Assumed New Supply Deliveries (TAF)	47	11	35
Annualized New Supply Costs (\$1,000)	\$12,688	\$4,032	\$8,656
Water Storage Costs (\$1,000)	\$7,598	\$2,824	\$4,774
Lost Water Sales Revenues (\$1,000)	\$14,614	\$1,119	\$13,495
Transfer Costs (\$1,000)	\$11,484	\$3,705	\$7,779
Shortage Costs (\$1,000)	\$17,319	\$353	\$16,966
Groundwater Pumping Savings (due to reductions in Groundwater Pumping) (\$1,000)	-\$57,474	-\$91,507	\$34,033
Excess Water Savings (\$1,000)	-\$4,629	-\$10,573	\$5,944
<b>Average Annual Changes in Water Supply Costs (\$1,000)</b>	<b>\$241,291</b>	<b>\$206,749</b>	<b>\$34,542</b>

16 Note: In 2012 dollars

17 The changes in M&I water supply costs would result in changes to employment  
 18 and regional economic output, as summarized in Table 19.71.

1 **Table 19.71 Changes in Municipal and Industrial Water Supply Related**  
 2 **Employment and Regional Economic Output for the Southern California Region**  
 3 **under the No Action Alternative as Compared to the Second Basis of Comparison**

Economic Sectors	Employment				Economic Output (\$ thousands)

4 Note: In 2012 dollars

5 *Regional Changes to Recreational Opportunities*

6 Changes in CVP and SWP water supplies and operations under the No Action  
 7 Alternative as compared to the Second Basis of Comparison generally would  
 8 result in lower reservoir elevations in reservoirs that store CVP and SWP water,  
 9 (up to 10 to 18 percent) that store CVP and SWP water; and would result in  
 10 reduced recreational economic factors under the No Action Alternative as  
 11 compared to the Second Basis of Comparison..

12 **19.4.3.2 Alternative 1**

13 As described in Chapter 3, Description of Alternatives, Alternative 1 is identical  
 14 to the Second Basis of Comparison. As described in Chapter 4, Approach to  
 15 Environmental Analysis, Alternative 1 as compared to the No Action  
 16 Alternative and the Second Basis of Comparison. However, because  
 17 socioeconomic factors under Alternative 1 are identical to socioeconomic factors  
 18 under the Second Basis of Comparison; Alternative 1 is only compared to the No  
 19 Action Alternative.

20 **19.4.3.2.1 Alternative 1 Compared to the No Action Alternative**

21 *Trinity River Region*

22 *Regional Changes to Irrigated Agriculture*

23 There are no agricultural lands irrigated with CVP and SWP water supplies in the  
 24 Trinity River Region. Therefore, there would be no changes in irrigated lands  
 25 under Alternative 1 as compared to the No Action Alternative.

1        *Regional Changes to Municipal and Industrial Water Supplies*

2        The CVP would continue to release water in Trinity River for downstream  
3        beneficial uses, including water supplies under Alternative 1 as compared to the  
4        No Action Alternative. There are no CVP or SWP water contractors in the  
5        Trinity River Region.

6        *Regional Changes to Recreational Opportunities*

7        Recreational opportunities would be similar in the Trinity River Region under  
8        Alternative 1 as compared to the No Action Alternative as described in  
9        Chapter 15, Recreational Resources.

10       *Regional Changes to Salmon Fishing*

11       Trinity River flows would be similar under Alternative 1 as compared to the No  
12       Action Alternative. This could result in similar salmon harvest conditions by the  
13       Yurok and Hoopa Valley tribes.

14       *Central Valley Region*

15       *Regional Changes to Irrigated Agriculture*

16       As described in Chapter 5, Surface Water Resources and Water Supplies, CVP  
17       and SWP water supplies would be greater under Alternative 1 as compared to the  
18       No Action Alternative. It is anticipated that groundwater use would decrease in  
19       response to increased CVP and SWP water supplies in 2030; and sustainable  
20       groundwater management plans would not be fully implemented until the 2040s,  
21       as discussed in Chapter 12, Agricultural Resources.

22       The agricultural production value under long-term average conditions would be  
23       increased by less than 1 percent (\$1.6 million/year in the Sacramento Valley and  
24       \$0.5 million/year in the San Joaquin Valley) primarily due to a decrease in  
25       groundwater pumping of approximately 7 percent. The agricultural production  
26       value under dry and critical dry conditions also would be increased by less than  
27       1 percent (\$11.3 million/year in the Sacramento Valley and \$20.3 million/year in  
28       the San Joaquin Valley) primarily due to a decrease in groundwater pumping.

29       The overall increase in agricultural production values are less than 0.05 percent  
30       under long-term conditions; and, changes in employment and regional economic  
31       output would be minimal. Therefore, the analysis of employment and regional  
32       economic output is focused on dry and critical dry years.

33       The direct changes in agricultural production would result in changes to  
34       employment and regional economic output in the Sacramento and San Joaquin  
35       valleys, as summarized in Tables 19.72 and 19.73, respectively.

1 **Table 19.72 Changes in Agricultural-Related Employment and Regional Economic**  
 2 **Output for the Sacramento Valley under Alternative 1 as compared to the No**  
 3 **Action Alternative in Dry and Critical Dry Years**

Services	0	5	21	26	0	0.5	1.7	2.2
Government	0	1	0	1	0	0.2	0.1	0.3
<b>Total</b>	<b>139</b>	<b>79</b>	<b>35</b>	<b>254</b>	<b>20.3</b>	<b>9.2</b>	<b>4.9</b>	<b>34.4</b>

8 Note: In 2012 dollars.

1 As described in Chapter 11, Geology and Soils Resources, increased groundwater  
2 pumping under the long-term average conditions may result in an additional  
3 increment of subsidence in those areas within the Central Valley. The additional  
4 amount of subsidence and the economic costs associated with it have not been  
5 quantified in this EIS. However, total subsidence-related costs have been shown  
6 to be substantial, as reported by Borchers et al. (2014) who estimated that the cost  
7 of subsidence in San Joaquin Valley between 1955 and 1972 was more than  
8 \$1.3 billion (in 2013 dollars). These estimates are based on the impacts to major  
9 infrastructure in the region including the San Joaquin River, Delta Mendota  
10 Canal, Friant-Kern Canal and San Luis Canal in addition to privately owned  
11 infrastructure. The incremental subsidence-related costs, expressed on an annual  
12 basis, could be an unknown fraction of that cumulative cost.

13 *Regional Changes to Municipal and Industrial Water Supplies*

14 As described in Chapter 5, Surface Water Resources and Water Supplies, CVP  
15 and SWP water supplies would increase under Alternative 1 as compared to the  
16 No Action Alternative. The analysis assumed CVP and SWP water deliveries, as  
17 described in Chapter 5, and determined the need for new water supplies, changes  
18 in water storage and groundwater pumping, water transfers, water shortage costs,  
19 and excess water savings. The factors and basis of the analysis are described in  
20 detail in Appendix 19A, CWEST Model. The analysis assumes that no new  
21 annual transfer supplies would be implemented until shortages were greater than  
22 5 percent. The costs of these shortages are included in the analysis. It is assumed  
23 that some communities that do not have alternative water supplies would utilize  
24 water transfers.

25 The average annual water supply costs over the 81-year hydrologic period for  
26 M&I water supplies are presented in Tables 19.74 and 19.75 for the Sacramento  
27 and San Joaquin Valley, respectively. The average annual water supply operating  
28 expenses would decrease by 0.11 and 0.39 percent in the Sacramento Valley and  
29 the San Joaquin Valley, respectively; and therefore, the results would be similar  
30 under Alternative 1 and the No Action Alternative.

1 **Table 19.74 Changes in Municipal and Industrial Water Supply Costs for the**  
 2 **Sacramento Valley under Alternative 1 as compared to the No Action Alternative**

Differences in Total	Alternative 1	No Action Alternative	Changes

9 *Regional Changes to Recreational Opportunities*

10 Recreational opportunities would increase at San Luis Reservoir by 6 percent  
 11 under Alternative 1 as compared to the No Action Alternative, as described in  
 12 Chapter 15, Recreation Resources. Therefore, it is anticipated that recreational

1 economic factors would be increased under Alternative 1 as compared to the No  
2 Action Alternative.

3 *Effects Related to Cross Delta Water Transfers*

4 Potential effects to socioeconomic factors could be similar to those identified in a  
5 recent environmental analysis conducted by Reclamation for long-term water  
6 transfers from the Sacramento to San Joaquin valleys (Reclamation 2014c) as  
7 described above under the No Action Alternative compared to the Second Basis  
8 of Comparison. For the purposes of this EIS, it is anticipated that similar  
9 conditions would occur during implementation of cross Delta water transfers  
10 under Alternative 1 and the No Action Alternative, and that impacts on  
11 socioeconomic factors could be adverse in the seller's service area.

12 Under Alternative 1, water could be transferred throughout the year without an  
13 annual volumetric limit. Under the No Action Alternative, the timing of cross  
14 Delta water transfers would be limited to July through September and include  
15 annual volumetric limits, in accordance with the 2008 USFWS BO and 2009  
16 NMFS BO. Overall, the potential for cross Delta water transfers would be  
17 increased under Alternative 1 as compared to the No Action Alternative.

18 *San Francisco Bay Area Region*

19 *Regional Changes to Irrigated Agriculture*

20 It is anticipated that as in the Central Valley Region, increases in CVP and SWP  
21 water supplies within the San Francisco Bay Area Region would not result in  
22 changes in long-term irrigated acreage or land use changes due to the use of other  
23 water supplies. However, there could be an increase in irrigated acreage in dry  
24 and critical dry years under Alternative 1 as compared to the No Action  
25 Alternative.

26 *Regional Changes to Municipal and Industrial Water Supplies*

27 As described in Chapter 5, Surface Water Resources and Water Supplies, CVP  
28 and SWP water supplies would increase under Alternative 1 as compared to the  
29 No Action Alternative. The analysis assumed CVP and SWP water deliveries, as  
30 described in Chapter 5, and determined the need for new water supplies, changes  
31 in water storage and groundwater pumping, water transfers, water shortage costs,  
32 and excess water savings. The factors and basis of the analysis is described in  
33 detail in Appendix 19A, CWEST Model. The analysis assumes that no new  
34 annual transfer supplies would be implemented until shortages were greater than  
35 5 percent. The costs of these shortages are included in the analysis.

36 The average annual water supply operating expenses over the 81-year hydrologic  
37 period for M&I water supplies would decrease by 1.75 percent, as presented in  
38 Table 19.78; and therefore, the results would be similar under Alternative 1 and  
39 the No Action Alternative.

1 **Table 19.78 Changes in Municipal and Industrial Water Supply Costs for the San**  
 2 **Francisco Bay Area Region under Alternative 1 as compared to the No Action**  
 3 **Alternative**

Differences in Total	Alternative 1	No Action Alternative	Changes
Average Annual CVP/SWP Deliveries (TAF)	445	396	48
Delivery Cost (\$1,000)	\$12,515	\$11,044	\$1,471
Assumed New Supply Deliveries (TAF)	16	18	-2
Annualized New Supply Costs (\$1,000)	\$234	\$599	-\$365
Water Storage Costs (\$1,000)	\$1,963	\$1,577	\$386
Lost Water Sales Revenues (\$1,000)	\$1,595	\$4,286	-\$2,691
Transfer Costs (\$1,000)	\$1,154	\$5,722	-\$4,568
Shortage Costs (\$1,000)	\$523	\$1,410	-\$887
Groundwater Pumping Savings (due to reductions in Groundwater Pumping) (\$1,000)	-\$792	-\$493	-\$298
Excess Water Savings (\$1,000)	-\$549	-\$225	-\$324
<b>Average Annual Changes in Water Supply Costs (\$1,000)</b>	<b>\$16,643</b>	<b>\$23,919</b>	<b>-\$7,276</b>

4 Note: In 2012 dollars

5 The changes in M&I water supply costs would result in changes to employment  
 6 and regional economic output, as summarized in Table 19.79.

7 **Table 19.79 Changes in Municipal and Industrial Water Supply Related**  
 8 **Employment and Regional Economic Output for the San Francisco Bay Area**  
 9 **Region under Alternative 1 as compared to the No Action Alternative**

Government	0	0	0	0	0.0	-0.7	55.1	54.4
<b>Total</b>	<b>-5</b>	<b>-3</b>	<b>35</b>	<b>27</b>	<b>-1,492.4</b>	<b>-416.7</b>	<b>5,894.3</b>	<b>3,985.2</b>

10 Note: In 2012 dollars

1        *Regional Changes to Recreational Opportunities*

2        Changes in CVP and SWP water supplies and operations under Alternative 1 as  
3        compared to the No Action Alternative generally would result in higher reservoir  
4        elevations in reservoirs that store CVP and SWP water (up to 11 to 21 percent);  
5        and would result in increased recreational economic factors under Alternative 1 as  
6        compared to the No Action Alternative.

7        *Regional Changes to Salmon Fishing*

8        Changes in commercial and sport ocean salmon fishing primarily would be  
9        related to the presence of fall-run Chinook Salmon from Central Valley  
10       hatcheries. It is assumed that the production of hatchery fish would be similar  
11       under Alternative 1 and the No Action Alternative. However, survival of the fall-  
12       run Chinook Salmon hatchery fish to the Pacific Ocean could be related to  
13       changes in CVP and SWP operations. As described in Chapter 9, Fish and  
14       Aquatic Resources, there would be little change in through-Delta survival by  
15       emigrating natural juvenile fall-run Chinook Salmon under Alternative 1 and the  
16       No Action Alternative. It is assumed that the survival of the hatchery juvenile  
17       fall-run Chinook Salmon would be similar to the survival of the natural juvenile  
18       fall-run Chinook Salmon. Therefore, the availability of fish for commercial and  
19       sport ocean salmon fishing and the associated economic conditions for the fishing  
20       industry would be similar under Alternative 1 and the No Action Alternative.

21       *Central Coast Region*

22       *Regional Changes to Irrigated Agriculture*

23       It is anticipated that as in the Central Valley Region, increases in CVP and SWP  
24       water supplies within the Central Coast Region would not result in increases in  
25       long-term irrigated acreage or land use changes due to the use of other water  
26       supplies. However, there could be increased irrigated acreage in dry and critical  
27       dry years under Alternative 1 as compared to the No Action Alternative.

28       *Regional Changes to Municipal and Industrial Water Supplies*

29       As described in Chapter 5, Surface Water Resources and Water Supplies, CVP  
30       and SWP water supplies would be higher under Alternative 1 as compared to the  
31       No Action Alternative. The analysis assumed CVP and SWP water deliveries, as  
32       described in Chapter 5, and determined the need for new water supplies, changes  
33       in water storage and groundwater pumping, water transfers, water shortage costs,  
34       and excess water savings. The factors and basis of the analysis is described in  
35       detail in Appendix 19A, CWEST Model. The analysis assumes that no new  
36       annual transfer supplies would be implemented until shortages were greater than  
37       5 percent. The costs of these shortages are included in the analysis. It is assumed  
38       that some communities that do not have alternative water supplies would utilize  
39       water transfers.

40       The average annual water supply operating expenses over the 81-year hydrologic  
41       period for M&I water supplies would increase 0.7 percent, as presented in  
42       Table 19.80; and therefore, the results would be similar under Alternative 1 and  
43       the No Action Alternative.

1 **Table 19.80 Changes in Municipal and Industrial Water Supply Costs for the**  
 2 **Central Coast Region under Alternative 1 as compared to the No Action Alternative**

Differences in Total	Alternative 1	No Action Alternative	Changes
Average Annual CVP/SWP Deliveries (TAF)	54	44	10
Delivery Cost (\$1,000)	\$8,174	\$6,663	\$1,510
Assumed New Supply Deliveries (TAF)	0	0	0
Annualized New Supply Costs (\$1,000)	\$0	\$0	\$0
Water Storage Costs (\$1,000)	\$0	\$0	\$0

Services	0	-2	5	3	0.0	-167.1	447.4	280.3
Government	0	0	0	0	0.0	-0.9	13.2	12.3
<b>Total</b>	<b>-6</b>	<b>-4</b>	<b>8</b>	<b>-2</b>	<b>-1,510.8</b>	<b>-512.7</b>	<b>1,159.9</b>	<b>-863.6</b>

9 Note: In 2012 dollars

1           *Regional Changes to Recreational Opportunities*

2   Changes in CVP and SWP water supplies and operations under Alternative 1 as  
3   compared to the No Action Alternative generally would result in higher reservoir  
4   elevations in reservoirs that store CVP and SWP water (up to 11 to 21 percent);  
5   and would result in increased recreational economic factors under Alternative 1 as  
6   compared to the No Action Alternative.

7           *Southern California Region*

8           *Regional Changes to Irrigated Agriculture*

9   It is anticipated that as in the Central Valley Region, increases in CVP and SWP  
10   water supplies within the Southern California Region would not result in  
11   increases in long-term irrigated acreage or land use changes due to the use of  
12   other water supplies. However, there could be increased irrigated acreage in dry  
13   and critical dry years under Alternative 1 as compared to the No Action  
14   Alternative.

15           *Regional Changes to Municipal and Industrial Water Supplies*

16   As described in Chapter 5, Surface Water Resources and Water Supplies, CVP  
17   and SWP water supplies would be higher under Alternative 1 as compared to the  
18   No Action Alternative. The analysis assumed CVP and SWP water deliveries, as  
19   described in Chapter 5, and determined the need for new water supplies, changes  
20   in water storage and groundwater pumping, water transfers, water shortage costs,  
21   and excess water savings. The factors and basis of the analysis is described in  
22   detail in Appendix 19A, CWEST Model. The analysis assumes that no new  
23   annual transfer supplies would be implemented until shortages were greater than  
24   5 percent. The costs of these shortages are included in the analysis. It is assumed  
25   that some communities that do not have alternative water supplies would utilize  
26   water transfers.

27   The average annual water supply operating expenses over the 81-year hydrologic  
28   period for M&I water supplies would decrease 2.14 percent, as presented in  
29   Table 19.82; and therefore, the results would be similar under Alternative 1 and  
30   the No Action Alternative.

1 **Table 19.82 Changes in Municipal and Industrial Water Supply Costs for the**  
 2 **Southern California Region under Alternative 1 as compared to the No Action**  
 3 **Alternative**

Differences in Total	Alternative 1	No Action Alternative	Changes
Average Annual CVP/SWP Deliveries (TAF)	2,394	1,932	461

Government	0	0	-3	-3	0.0	29.8	-587.3	-557.5
<b>Total</b>	<b>175</b>	<b>108</b>	<b>-378</b>	<b>-95</b>	<b>43,673.4</b>	<b>16,611.0</b>	<b>-61,677.8</b>	<b>-1,393.5</b>

10 Note: In 2012 dollars

1        *Regional Changes to Recreational Opportunities*

2        Changes in CVP and SWP water supplies and operations under Alternative 1 as  
3        compared to the No Action Alternative generally would result in higher reservoir  
4        elevations in reservoirs that store CVP and SWP water (up to 11 to 21 percent);  
5        and would result in increased recreational economic factors under Alternative 1 as  
6        compared to the No Action Alternative.

7        **19.4.3.2.2 Alternative 1 Compared to the Second Basis of Comparison**

8        As described in Chapter 3, Description of Alternatives, Alternative 1 is identical  
9        to the Second Basis of Comparison.

10       **19.4.3.3 Alternative 2**

11       The CVP and SWP operations under Alternative 2 are identical to the CVP and  
12       SWP operations under the No Action Alternative, therefore, Alternative 2 is only  
13       compared to the Second Basis of Comparison.

14       **19.4.3.3.1 Alternative 2 Compared to the Second Basis of Comparison**

15       The CVP and SWP operations under Alternative 2 are identical to the CVP and  
16       SWP operations under the No Action Alternative. Therefore, changes to  
17       socioeconomic factors under Alternatives 2 as compared to the Second Basis of  
18       Comparison would be the same as the impacts described in Section 12.4.3.1, No  
19       Action Alternative.

20       **19.4.3.4 Alternative 3**

21       As described in Chapter 3, Description of Alternatives, CVP and SWP operations  
22       under Alternative 3 are similar to the Second Basis of Comparison with modified  
23       Old and Middle River flow criteria and New Melones Reservoir operations and  
24       reductions in Striped Bass fishing opportunities. As described in Chapter 4,  
25       Approach to Environmental Analysis, Alternative 3 is compared to the No Action  
26       Alternative and the Second Basis of Comparison.

27       **19.4.3.4.1 Alternative 3 Compared to the No Action Alternative**

28       *Trinity River Region*

29              *Regional Changes to Irrigated Agriculture*

30       There are no agricultural lands irrigated with CVP and SWP water supplies in the  
31       Trinity River Region. Therefore, there would be no changes in irrigated lands  
32       under Alternative 3 as compared to the No Action Alternative.

33              *Regional Changes to Municipal and Industrial Water Supplies*

34       The CVP would continue to release water in Trinity River for downstream  
35       beneficial uses, including water supplies under Alternative 3 as compared to the  
36       No Action Alternative. There are no CVP or SWP water contractors in the  
37       Trinity River Region.

1        *Regional Changes to Recreational Opportunities*

2 Recreational opportunities would be similar in the Trinity River Region under  
3 Alternative 3 as compared to the No Action Alternative as described in  
4 Chapter 15, Recreational Resources.

5        *Regional Changes to Salmon Fishing*

6 Trinity River flows would be similar under Alternative 3 as compared to the No  
7 Action Alternative. This could result in similar salmon harvest conditions by the  
8 Yurok and Hoopa Valley tribes.

9        *Central Valley Region*

10       *Regional Changes to Irrigated Agriculture*

11 As described in Chapter 5, Surface Water Resources and Water Supplies, CVP  
12 and SWP water supplies would be greater under Alternative 3 as compared to the  
13 No Action Alternative. It is anticipated that groundwater use would decrease in  
14 response to increased CVP and SWP water supplies in 2030; and sustainable  
15 groundwater management plans would not be fully implemented until the 2040s,  
16 as discussed in Chapter 12, Agricultural Resources.

17 The agricultural production value under long-term average conditions would be  
18 increased by less than 1 percent (\$1.2 million/year in the Sacramento Valley and  
19 \$0.3 million/year in the San Joaquin Valley) primarily due to a decrease in  
20 groundwater pumping of approximately 4 percent. The agricultural production  
21 value under dry and critical dry conditions also would be increased by less than  
22 1 percent (\$9.2 million/year in the Sacramento Valley and \$11.4 million/year in  
23 the San Joaquin Valley), primarily due to a decrease in groundwater pumping.

24 The overall increase in agricultural production values are less than 0.05 percent  
25 under long-term conditions; and, changes in employment and regional economic  
26 output would be minimal. Therefore, the analysis of employment and regional  
27 economic output is focused on dry and critical dry years.

28 The direct changes in agricultural production would result in changes to  
29 employment and regional economic output in the Sacramento and San Joaquin  
30 valleys, as summarized in Tables 19.84 and 19.85, respectively.

1 **Table 19.84 Changes in Agricultural-Related Employment and Regional Economic**  
 2 **Output for the Sacramento Valley under Alternative 3 as compared to the No**  
 3 **Action Alternative in Dry and Critical Dry Years**

Economic Sectors	Employment				Economic Output (\$ millions)			
	Direct	Indirect	Induced	Total	Direct	Indirect	Induced	Total

<b>Total</b>	<b>103</b>	<b>44</b>	<b>15</b>	<b>161</b>	<b>11.4</b>	<b>5.7</b>	<b>2.1</b>	<b>19.1</b>

8 Note: In 2012 dollars

1 As described in Chapter 11, Geology and Soils Resources, increased groundwater  
2 pumping under the long-term average conditions may result in an additional  
3 increment of subsidence in those areas within the Central Valley. The additional  
4 amount of subsidence and the economic costs associated with it have not been  
5 quantified in this EIS. However, total subsidence-related costs have been shown  
6 to be substantial, as reported by Borchers et al. (2014) who estimated that the cost  
7 of subsidence in San Joaquin Valley between 1955 and 1972 was more than  
8 \$1.3 billion (in 2013 dollars). These estimates are based on the impacts to major  
9 infrastructure in the region including the San Joaquin River, Delta Mendota  
10 Canal, Friant-Kern Canal and San Luis Canal in addition to privately owned  
11 infrastructure. The incremental subsidence-related costs, expressed on an annual  
12 basis, could be an unknown fraction of that cumulative cost.

13 *Regional Changes to Municipal and Industrial Water Supplies*

14 As described in Chapter 5, Surface Water Resources and Water Supplies, CVP  
15 and SWP water supplies would increase under Alternative 3 as compared to the  
16 No Action Alternative. The analysis assumed CVP and SWP water deliveries, as  
17 described in Chapter 5, and determined the need for new water supplies, changes  
18 in water storage and groundwater pumping, water transfers, water shortage costs,  
19 and excess water savings. The factors and basis of the analysis is described in  
20 detail in Appendix 19A, CWEST Model. The analysis assumes that no new  
21 annual transfer supplies would be implemented until shortages were greater than  
22 5 percent. The costs of these shortages are included in the analysis. It is assumed  
23 that some communities that do not have alternative water supplies would utilize  
24 water transfers.

25 The average annual water supply costs over the 81-year hydrologic period for  
26 M&I water supplies are presented in Tables 19.86 and 19.87 for the Sacramento  
27 and San Joaquin Valley, respectively. Average annual water supply operating  
28 expenses would decrease by 0.07 and 0.5 percent in the Sacramento Valley and  
29 the San Joaquin Valley, respectively; and therefore, the results would be similar  
30 under Alternative 3 and the No Action Alternative.

1 **Table 19.86 Changes in Municipal and Industrial Water Supply Costs for the**  
 2 **Sacramento Valley under Alternative 3 as compared to the No Action Alternative**

Differences in Total	Alternative 3	No Action Alternative	Changes
Average Annual CVP/SWP Deliveries (TAF)	461	447	13
Delivery Cost (\$1,000)	\$8,285	\$8,031	\$255
Assumed New Supply Deliveries (TAF)	0	0	0
Annualized New Supply Costs (\$1,000)	\$0	\$0	\$0
Water Storage Costs (\$1,000)	\$0	\$0	\$0
Lost Water Sales Revenues (\$1,000)	\$243	\$213	\$30
Transfer Costs (\$1,000)	\$601	\$739	-\$138
Shortage Costs (\$1,000)	\$77	\$69	\$8

6 Note: In 2012 dollars

7 The changes in M&I water supply costs would result in changes to employment  
 8 and regional economic output in the Sacramento and San Joaquin valleys, as  
 9 summarized in Tables 19.88 and 19.89, respectively.

1 **Table 19.88 Changes in Municipal and Industrial Water Supply Related**  
 2 **Employment and Regional Economic Output for the Sacramento Valley under**  
 3 **Alternative 3 as compared to the No Action Alternative**

Economic Sectors	Employment				Economic Output (\$ thousands)

9 *Regional Changes to Recreational Opportunities*

10 Recreational opportunities would be similar at San Luis Reservoir under  
 11 Alternative 3 as compared to the No Action Alternative, as described in  
 12 Chapter 15, Recreation Resources. Recreational opportunities related to Striped  
 13 Bass fishing would initially be increased when Alternative 3 is implemented.

1 However, by 2030, Striped Bass fishing opportunities would be reduced under  
 2 Alternative 3 as compared to the Second Basis of Comparison due to actions to  
 3 reduce predation. Therefore, it is anticipated that recreational economic factors  
 4 would be reduced under Alternative 3 as compared to the No Action Alternative.

5 *Effects Related to Cross Delta Water Transfers*

6 Potential effects to socioeconomic factors could be similar to those identified in a  
 7 recent environmental analysis conducted by Reclamation for long-term water  
 8 transfers from the Sacramento to San Joaquin valleys (Reclamation 2014c) as  
 9 described above under the No Action Alternative compared to the Second Basis  
 10 of Comparison. For the purposes of this EIS, it is anticipated that similar  
 11 conditions would occur during implementation of cross Delta water transfers  
 12 under Alternative 3 and the No Action Alternative, and that impacts on  
 13 socioeconomic factors could be adverse in the seller's service area.

14 Under Alternative 3, water could be transferred throughout the year without an  
 15 annual volumetric limit. Under the No Action Alternative, the timing of cross  
 16 Delta water transfers would be limited to July through September and include  
 17 annual volumetric limits, in accordance with the 2008 USFWS BO and 2009  
 18 NMFS BO. Overall, the potential for cross Delta water transfers would be  
 19 increased under Alternative 3 as compared to the No Action Alternative.

20 *San Francisco Bay Area Region*

21 *Regional Changes to Irrigated Agriculture*

22 It is anticipated that as in the Central Valley Region, increases in CVP and SWP  
 23 water supplies within the San Francisco Bay Area Region would not result in  
 24 changes in long-term irrigated acreage or land use changes due to the use of other  
 25 water supplies. However, there could be an increase in irrigated acreage in dry  
 26 and critical dry years under Alternative 3 as compared to the No Action  
 27 Alternative.

28 *Regional Changes to Municipal and Industrial Water Supplies*

29 As described in Chapter 5, Surface Water Resources and Water Supplies, CVP  
 30 and SWP water supplies would increase under Alternative 3 as compared to the  
 31 No Action Alternative. The analysis assumed CVP and SWP water deliveries, as  
 32 described in Chapter 5, and determined the need for new water supplies, changes  
 33 in water storage and groundwater pumping, water transfers, water shortage costs,  
 34 and excess water savings. The factors and basis of the analysis is described in  
 35 detail in Appendix 19A, CWEST Model. The analysis assumes that no new  
 36 annual transfer supplies would be implemented until shortages were greater than  
 37 5 percent. The costs of these shortages are included in the analysis.

38 The average annual water supply operating expenses over the 81-year hydrologic  
 39 period for M&I water supplies would decrease by 1.23 percent, as presented in  
 40 Table 19.90; and therefore, the results would be similar under Alternative 3 and  
 41 the No Action Alternative.

1 **Table 19.90 Changes in Municipal and Industrial Water Supply Costs for the San**  
 2 **Francisco Bay Area Region under Alternative 3 as compared to the No Action**  
 3 **Alternative**

Differences in Total	Alternative 3	No Action Alternative	Changes
Average Annual CVP/SWP Deliveries (TAF)	431	396	34
Delivery Cost (\$1,000)	\$12,096	\$11,044	\$1,052
Assumed New Supply Deliveries (TAF)	18	18	0
Annualized New Supply Costs (\$1,000)	\$575	\$599	-\$24
Water Storage Costs (\$1,000)	\$2,303	\$1,577	\$726
Lost Water Sales Revenues (\$1,000)	\$2,381	\$4,286	-\$1,905
Transfer Costs (\$1,000)	\$1,826	\$5,722	-\$3,896
Shortage Costs (\$1,000)	\$743	\$1,410	-\$667
Groundwater Pumping Savings (due to reductions in Groundwater Pumping) (\$1,000)	-\$726	-\$493	-\$232
Excess Water Savings (\$1,000)	-\$393	-\$225	-\$167
<b>Average Annual Changes in Water Supply Costs (\$1,000)</b>	<b>\$18,806</b>	<b>\$23,919</b>	<b>-\$5,113</b>

4 Note: In 2012 dollars

5 The changes in M&I water supply costs would result in changes to employment  
 6 and regional economic output, as summarized in Table 19.91.

7 **Table 19.91 Changes in Municipal and Industrial Water Supply Related**  
 8 **Employment and Regional Economic Output for the San Francisco Bay Area**  
 9 **Region under Alternative 3 as compared to the No Action Alternative**

Economic Sectors	Employment				Economic Output (\$ thousands)			
	Direct	Indirect	Induced	Total	Direct	Indirect	Induced	Total
Agriculture	0	0	0	0	0.0	0.1	-6.0	-5.9
Mining & Logging	0	0	0	0	0.0	1.9	-3.8	-1.9
Construction	0	1	0	1	0.0	186.7	-28.2	158.6
Manufacturing	0	0	0	0	0.0	33.9	-363.5	-329.6

Financial Activities	0	0	-3	-3	0.0	65.6	-1,320.3	-1,254.7
Services	0	1	-15	-14	0.0	157.2	-1,639.6	-1,482.4
Government	0	0	0	0	0.0	0.8	-41.8	-41.0
<b>Total</b>	<b>6</b>	<b>3</b>	<b>-26</b>	<b>-17</b>	<b>1,754.5</b>	<b>489.9</b>	<b>-4,472.7</b>	<b>-2,228.3</b>

10 Note: In 2012 dollars

11 *Regional Changes to Recreational Opportunities*

12 Changes in CVP and SWP water supplies and operations under Alternative 3 as  
 13 compared to the No Action Alternative generally would result in higher reservoir  
 14 elevations in reservoirs that store CVP and SWP water (up to 9 to 17 percent);

1 and would result in increased recreational economic factors under Alternative 3 as  
2 compared to the No Action Alternative.

3 *Regional Changes to Salmon Fishing*

4 Commercial and sport ocean salmon fishing would be reduced under  
5 Alternative 3 and the No Action Alternative due to increased commercial and  
6 sport ocean salmon harvests limits.

7 *Central Coast Region*

8 *Regional Changes to Irrigated Agriculture*

9 It is anticipated that as in the Central Valley Region, increases in CVP and SWP  
10 water supplies within the Central Coast Region would not result in increases in  
11 long-term irrigated acreage or land use changes due to the use of other water  
12 supplies. However, there could be increased irrigated acreage in dry and critical  
13 dry years under Alternative 3 as compared to the No Action Alternative.

14 *Regional Changes to Municipal and Industrial Water Supplies*

15 As described in Chapter 5, Surface Water Resources and Water Supplies, CVP  
16 and SWP water supplies would be higher under Alternative 3 as compared to the  
17 No Action Alternative. The analysis assumed CVP and SWP water deliveries, as  
18 described in Chapter 5, and determined the need for new water supplies, changes  
19 in water storage and groundwater pumping, water transfers, water shortage costs,  
20 and excess water savings. The factors and basis of the analysis is described in  
21 detail in Appendix 19A, CWEST Model. The analysis assumes that no new  
22 annual transfer supplies would be implemented until shortages were greater than  
23 5 percent. The costs of these shortages are included in the analysis. It is assumed  
24 that some communities that do not have alternative water supplies would utilize  
25 water transfers.

26 The average annual water supply operating expenses over the 81-year hydrologic  
27 period for M&I water supplies would decrease by \$125,000, or 0.33 percent, as  
28 presented in Table 19.92; and therefore, the results would be similar under  
29 Alternative 3 and the No Action Alternative.

1 **Table 19.92 Changes in Municipal and Industrial Water Supply Costs for the**  
 2 **Central Coast Region under Alternative 3 as compared to the No Action Alternative**

Differences in Total	Alternative 3	No Action Alternative	Changes
Average Annual CVP/SWP Deliveries (TAF)	51	44	8

Government	0	0	0	0	0.0	0.7	-9.3	-8.6
<b>Total</b>	<b>5</b>	<b>3</b>	<b>-6</b>	<b>2</b>	<b>1,150.6</b>	<b>390.4</b>	<b>-814.8</b>	<b>726.2</b>

9 Note: In 2012 dollars

1        *Regional Changes to Recreational Opportunities*

2        Changes in CVP and SWP water supplies and operations under Alternative 3 as  
3        compared to the No Action Alternative generally would result in higher reservoir  
4        elevations in reservoirs that store CVP and SWP water (up to 9 to 17 percent);  
5        and would result in increased recreational economic factors under Alternative 3 as  
6        compared to the No Action Alternative.

7        *Southern California Region*

8        *Regional Changes to Irrigated Agriculture*

9        It is anticipated that as in the Central Valley Region, increases in CVP and SWP  
10       water supplies within the Southern California Region would not result in  
11       increases in long-term irrigated acreage or land use changes due to the use of  
12       other water supplies. However, there could be increased irrigated acreage in dry  
13       and critical dry years under Alternative 3 as compared to the No Action  
14       Alternative.

15       *Regional Changes to Municipal and Industrial Water Supplies*

16       As described in Chapter 5, Surface Water Resources and Water Supplies, CVP  
17       and SWP water supplies would be higher under Alternative 3 as compared to the  
18       No Action Alternative. The analysis assumed CVP and SWP water deliveries, as  
19       described in Chapter 5, and determined the need for new water supplies, changes  
20       in water storage and groundwater pumping, water transfers, water shortage costs,  
21       and excess water savings. The factors and basis of the analysis is described in  
22       detail in Appendix 19A, CWEST Model. The analysis assumes that no new  
23       annual transfer supplies would be implemented until shortages were greater than  
24       5 percent. The costs of these shortages are included in the analysis. It is assumed  
25       that some communities that do not have alternative water supplies would utilize  
26       water transfers.

27       The average annual water supply costs over the 81-year hydrologic period for  
28       M&I water supplies would be \$4.94 million, or 0.31 percent, as presented in  
29       Table 19.94; and therefore, the results would be similar under Alternative 3 and  
30       the No Action Alternative.

1 **Table 19.94 Changes in Municipal and Industrial Water Supply Costs for the**  
 2 **Southern California Region under Alternative 3 as compared to the No Action**  
 3 **Alternative**

Differences in Total	Alternative 3	No Action Alternative	Changes
Average Annual CVP/SWP Deliveries (TAF)	2,241	1,932	308
Delivery Cost (\$1,000)	\$278,085	\$239,692	\$38,393
Assumed New Supply Deliveries (TAF)	40	47	-7
Annualized New Supply Costs (\$1,000)	\$10,584	\$12,688	-\$2,104
Water Storage Costs (\$1,000)	\$8,154	\$7,598	\$556
Lost Water Sales Revenues (\$1,000)	\$11,409	\$14,614	-\$3,205
Transfer Costs (\$1,000)	\$6,181	\$11,484	-\$5,303
Shortage Costs (\$1,000)	\$12,632	\$17,319	-\$4,687
Groundwater Pumping Savings (due to reductions in Groundwater Pumping) (\$1,000)	-\$81,693	-\$57,474	-\$24,218
Excess Water Savings (\$1,000)	-\$9,005	-\$4,629	-\$4,376
<b>Average Annual Changes in Water Supply Costs (\$1,000)</b>	<b>\$236,347</b>	<b>\$241,291</b>	<b>-\$4,944</b>

4 Note: In 2012 dollars

5 The changes in M&I water supply costs would result in changes to employment  
 6 and regional economic output, as summarized in Table 19.95.

7 **Table 19.95 Changes in Municipal and Industrial Water Supply Related**  
 8 **Employment and Regional Economic Output for the Southern California under**  
 9 **Alternative 3 as compared to the No Action Alternative**

Economic Sectors	Employment				Economic Output (\$ thousands)

Services	0	39	-113	-74	0.0	4,675.7	-10,892.2	-6,216.5
Government	0	0	-2	-1	0.0	25.1	-314.7	-289.6
<b>Total</b>	<b>148</b>	<b>91</b>	<b>-202</b>	<b>37</b>	<b>36,845.0</b>	<b>14,013.9</b>	<b>-33,002.7</b>	<b>17,856.2</b>

10 Note: In 2012 dollars

1        *Regional Changes to Recreational Opportunities*

2 Changes in CVP and SWP water supplies and operations under Alternative 3 as  
3 compared to the No Action Alternative generally would result in higher reservoir  
4 elevations in reservoirs that store CVP and SWP water (up to 9 to 17 percent);  
5 and would result in increased recreational economic factors under Alternative 3 as  
6 compared to the No Action Alternative.

7        **19.4.3.4.2 Alternative 3 Compared to the Second Basis of Comparison**

8        *Trinity River Region*

9        *Regional Changes to Irrigated Agriculture*

10 There are no agricultural lands irrigated with CVP and SWP water supplies in the  
11 Trinity River Region. Therefore, there would be no changes in irrigated lands  
12 under Alternative 3 as compared to the Second Basis of Comparison.

13        *Regional Changes to Municipal and Industrial Water Supplies*

14 The CVP would continue to release water in Trinity River for downstream  
15 beneficial uses, including water supplies under Alternative 3 and the Second Basis  
16 of Comparison. There are no CVP or SWP water contractors in the Trinity River  
17 Region.

18        *Regional Changes to Recreational Opportunities*

19 Recreational opportunities would be similar in the Trinity River Region under  
20 Alternative 3 as compared to the Second Basis of Comparison as described in  
21 Chapter 15, Recreational Resources.

22        *Regional Changes to Salmon Fishing*

23 Trinity River flows would be similar under Alternative 3 as compared to the  
24 Second Basis of Comparison. This could result in similar salmon harvest  
25 conditions by the Yurok and Hoopa Valley tribes.

26        *Central Valley Region*

27        *Regional Changes to Irrigated Agriculture*

28 As described in Chapter 5, Surface Water Resources and Water Supplies, CVP  
29 and SWP water supplies would be less under Alternative 3 than under the Second  
30 Basis of Comparison. It is anticipated that groundwater use would increase in  
31 response to reduced CVP and SWP water supplies in 2030 because sustainable  
32 groundwater management plans would not be fully implemented until the 2040s,  
33 as discussed in Chapter 12, Agricultural Resources.

34 The agricultural production value under long-term average conditions would be  
35 reduced by less than 1 percent (\$0.3 million/year in the Sacramento Valley and  
36 \$0.3 million/year in the San Joaquin Valley) primarily due to an increase in  
37 groundwater pumping of approximately 2 percent. The agricultural production  
38 value under dry and critical dry conditions also would be reduced by less than  
39 1 percent (\$2.1 million/year in the Sacramento Valley and \$8.9 million/year in the  
40 San Joaquin Valley) primarily due to an increase in groundwater pumping.

1 The overall reduction in agricultural production values are less than 0.05 percent  
 2 under long-term conditions; and, changes in employment and regional economic  
 3 output would be minimal. Therefore, the analysis of employment and regional  
 4 economic output is focused on dry and critical dry years.

5 The direct changes in agricultural production would result in changes to  
 6 employment and regional economic output in the Sacramento and San Joaquin  
 7 valleys, as summarized in Tables 19.96 and 19.97, respectively.

8 **Table 19.96 Changes in Agricultural-Related Employment and Regional Economic**  
 9 **Output for the Sacramento Valley under Alternative 3 as Compared to the Second**  
 10 **Basis of Comparison in Dry and Critical Dry Years**

4 Note: In 2012 dollars

5 As described in Chapter 11, Geology and Soils Resources, increased groundwater  
 6 pumping under the long-term average conditions may result in an additional  
 7 increment of subsidence in those areas within the Central Valley. The additional  
 8 amount of subsidence and the economic costs associated with it have not been  
 9 quantified in this EIS. However, total subsidence-related costs have been shown  
 10 to be substantial, as reported by Borchers et al. (2014) who estimated that the cost  
 11 of subsidence in San Joaquin Valley between 1955 and 1972 was more than \$1.3  
 12 billion (in 2013 dollars). These estimates are based on the impacts to major  
 13 infrastructure in the region including the San Joaquin River, Delta Mendota  
 14 Canal, Friant-Kern Canal and San Luis Canal in addition to privately owned  
 15 infrastructure. The incremental subsidence-related costs, expressed on an annual  
 16 basis, could be an unknown fraction of that cumulative cost.

#### 17 *Regional Changes to Municipal and Industrial Water Supplies*

18 As described in Chapter 5, Surface Water Resources and Water Supplies, CVP  
 19 and SWP water supplies would be similar in the Sacramento Valley and greater in  
 20 the San Joaquin Valley under Alternative 3 than under the Second Basis of  
 21 Comparison. The analysis assumed CVP and SWP water deliveries, as described  
 22 in Chapter 5, and determined the need for new water supplies, changes in water  
 23 storage and groundwater pumping, water transfers, water shortage costs, and  
 24 excess water savings. The factors and basis of the analysis is described in detail  
 25 in Appendix 19A, CWEST Model. The analysis assumes that no new annual  
 26 transfer supplies would be implemented until shortages were greater than  
 27 5 percent. The costs of these shortages are included in the analysis. It is assumed

1 that some communities that do not have alternative water supplies would utilize  
 2 water transfers.

3 The average annual water supply operating expenses over the 81-year hydrologic  
 4 period for M&I water supplies are presented in Tables 19.98 and 19.99 for the  
 5 Sacramento and San Joaquin Valley, respectively. Average annual water supply  
 6 operating costs would increase in the Sacramento Valley by 0.05 percent,  
 7 decrease in the San Joaquin Valley by 0.2 percent; and therefore, the results  
 8 would be similar under Alternative 3 and the Second Basis of Comparison.

9 **Table 19.98 Changes in Municipal and Industrial Water Supply Costs for the**  
 10 **Sacramento Valley under Alternative 3 as Compared to the Second Basis of**  
 11 **Comparison**

Differences in Total	Alternative 3	Second Basis of Comparison	Changes
Average Annual CVP/SWP Deliveries (TAF)	461	463	-2

<b>Total</b>	<b>-1</b>	<b>-1</b>	<b>-2</b>	<b>-4</b>	<b>-315.8</b>	<b>-77.0</b>	<b>-283.5</b>	<b>-676.3</b>

11 Note: In 2012 dollars

1            *Regional Changes to Recreational Opportunities*

2 Recreational opportunities would be similar at San Luis Reservoir under  
3 Alternative 3 as compared to the Second Basis of Comparison, as described in  
4 Chapter 15, Recreation Resources. Recreational opportunities related to Striped  
5 Bass fishing would initially be increased when Alternative 3 is implemented.  
6 However, by 2030, Striped Bass fishing opportunities would be reduced under  
7 Alternative 3 as compared to the Second Basis of Comparison due to actions to  
8 reduce predation. Therefore, it is anticipated that recreational economic factors  
9 would be reduced under Alternative 3 as compared to the Second Basis of  
10 Comparison.

11            *Effects Related to Cross Delta Water Transfers*

12 Potential effects to socioeconomic factors could be similar to those identified in a  
13 recent environmental analysis conducted by Reclamation for long-term water  
14 transfers from the Sacramento to San Joaquin valleys (Reclamation 2014c) as  
15 described above under the No Action Alternative compared to the Second Basis  
16 of Comparison. For the purposes of this EIS, it is anticipated that similar  
17 conditions would occur during implementation of cross Delta water transfers  
18 under Alternative 3 and the Second Basis of Comparison, and that impacts on  
19 socioeconomic factors could be adverse in the seller's service area.

20 Under Alternative 3 and Second Basis of Comparison, water could be transferred  
21 throughout the year without an annual volumetric limit. Overall, the potential for  
22 cross Delta water transfers would be similar under Alternative 3 as compared to  
23 the Second Basis of Comparison.

24 *San Francisco Bay Area Region*

25            *Regional Changes to Irrigated Agriculture*

26 It is anticipated that as in the Central Valley Region, reductions in CVP and SWP  
27 water supplies within the San Francisco Bay Area Region would not result in  
28 reductions in long-term irrigated acreage or land use changes due to the use of  
29 other water supplies. However, there could be a reduction in irrigated acreage in  
30 dry and critical dry years under Alternative 3 as compared to the Second Basis of  
31 Comparison.

32            *Regional Changes to Municipal and Industrial Water Supplies*

33 As described in Chapter 5, Surface Water Resources and Water Supplies, CVP  
34 and SWP water supplies would be less under Alternative 3 than under the Second  
35 Basis of Comparison. The analysis assumed CVP and SWP water deliveries, as  
36 described in Chapter 5, and determined the need for new water supplies, changes  
37 in water storage and groundwater pumping, water transfers, water shortage costs,  
38 and excess water savings. The factors and basis of the analysis is described in  
39 detail in Appendix 19A, CWEST Model. The analysis assumes that no new  
40 annual transfer supplies would be implemented until shortages were greater than  
41 5 percent. The costs of these shortages are included in the analysis.

42 The average annual water supply operating expenses over the 81-year hydrologic  
43 period for M&I water supplies would increase by \$2.16 million, or 0.52 percent,

1 as presented in Table 19.102; and therefore, the results would be similar under  
 2 Alternative 3 and the Second Basis of Comparison.

3 **Table 19.102 Changes in Municipal and Industrial Water Supply Costs for the San**  
 4 **Francisco Bay Area Region under Alternative 3 as Compared to the Second Basis**  
 5 **of Comparison**

Differences in Total	Alternative 3	Second Basis of Comparison	Changes
Average Annual CVP/SWP Deliveries (TAF)	431	445	-14
Delivery Cost (\$1,000)	\$12,096	\$12,515	-\$419
Assumed New Supply Deliveries (TAF)	18	16	2
Annualized New Supply Costs (\$1,000)	\$575	\$234	\$342
Water Storage Costs (\$1,000)	\$2,303	\$1,963	\$340
Lost Water Sales Revenues (\$1,000)	\$2,381	\$1,595	\$786
Transfer Costs (\$1,000)	\$1,826	\$1,154	\$672
Shortage Costs (\$1,000)	\$743	\$523	\$221
Groundwater Pumping Savings (due to reductions in Groundwater Pumping) (\$1,000)	-\$726	-\$792	\$66
Excess Water Savings (\$1,000)	-\$393	-\$549	\$156
<b>Average Annual Changes in Water Supply Costs (\$1,000)</b>	<b>\$18,806</b>	<b>\$16,643</b>	<b>\$2,163</b>

6 Note: In 2012 dollars

7 The changes in M&I water supply costs would result in changes to employment  
 8 and regional economic output, as summarized in Table 19.103.

9 **Table 19.103 Changes in Municipal and Industrial Water Supply Related**  
 10 **Employment and Regional Economic Output for the San Francisco Bay Area**  
 11 **Region under Alternative 3 as Compared to the Second Basis of Comparison**

Economic Sectors	Employment				Economic Output (\$ thousands)			
	Direct	Indirect	Induced	Total	Direct	Indirect	Induced	Total
Agriculture	0	0	0	0	0.0	0.0	1.9	1.9
Mining & Logging	0	0	0	0	0.0	0.3	1.2	1.5
Construction	0	0	0	0	0.0	28.0	9.0	36.9
Manufacturing	0	0	0	0	0.0	5.1	114.4	119.5
Transportation, Warehousing & Utilities	1	0	0	1	262.6	2.0	44.3	308.9

Financial Activities	0	0	1	1	0.0	9.8	420.2	430.0
Services	0	0	5	5	0.0	23.5	523.1	546.7
Government	0	0	0	0	0.0	0.1	13.3	13.4
<b>Total</b>	<b>1</b>	<b>0</b>	<b>8</b>	<b>10</b>	<b>262.6</b>	<b>73.3</b>	<b>1,421.3</b>	<b>1,757.2</b>

12 Note: In 2012 dollars

1        *Regional Changes to Recreational Opportunities*

2 Changes in CVP and SWP water supplies and operations under Alternative 3 as  
3 compared to the Second Basis of Comparison generally would result in similar  
4 reservoir elevations in reservoirs that store CVP and SWP water and similar  
5 recreational economic factors under Alternative 3 as compared to the Second  
6 Basis of Comparison.

7        *Regional Changes to Salmon Fishing*

8 Commercial and sport ocean salmon fishing would be reduced under  
9 Alternative 3 and the Second Basis of Comparison due to increased commercial  
10 and sport ocean salmon harvests limits.

11        *Central Coast Region*

12        *Regional Changes to Irrigated Agriculture*

13 It is anticipated that as in the Central Valley Region, reductions in CVP and SWP  
14 water supplies within the Central Coast Region would not result in reductions in  
15 long-term irrigated acreage or land use changes due to the use of other water  
16 supplies. However, there could be a reduction in irrigated acreage in dry and  
17 critical dry years under Alternative 3 as compared to the Second Basis of  
18 Comparison.

19        *Regional Changes to Municipal and Industrial Water Supplies*

20 As described in Chapter 5, Surface Water Resources and Water Supplies, CVP  
21 and SWP water supplies would be less under Alternative 3 than under the Second  
22 Basis of Comparison. The analysis assumed CVP and SWP water deliveries, as  
23 described in Chapter 5, and determined the need for new water supplies, changes  
24 in water storage and groundwater pumping, water transfers, water shortage costs,  
25 and excess water savings. The factors and basis of the analysis is described in  
26 detail in Appendix 19A, CWEST Model. The analysis assumes that no new  
27 annual transfer supplies would be implemented until shortages were greater than  
28 5 percent. The costs of these shortages are included in the analysis. It is assumed  
29 that some communities that do not have alternative water supplies would utilize  
30 water transfers.

31 The average annual water supply operating expenses over the 81-year hydrologic  
32 period for M&I water supplies would increase by \$146,000, or 0.38 percent, as  
33 presented in Table 19.104; and therefore, the results would be similar under  
34 Alternative 3 and the Second Basis of Comparison.

**Table 19.104 Changes in Municipal and Industrial Water Supply Costs for the Central Coast Region under Alternative 3 as Compared to the Second Basis of Comparison**

Differences in Total	Alternative 3	Second Basis of Comparison	Changes
Average Annual CVP/SWP Deliveries (TAF)	51	54	-2
Delivery Cost (\$1,000)	\$7,814	\$8,174	-\$360
Assumed New Supply Deliveries (TAF)	0	0	0
Annualized New Supply Costs (\$1,000)	\$0	\$0	\$0
Water Storage Costs (\$1,000)	\$0	\$0	\$0
Lost Water Sales Revenues (\$1,000)	\$0	\$0	\$0
Transfer Costs (\$1,000)	\$0	\$0	\$0
Shortage Costs (\$1,000)	\$0	\$0	\$0
Groundwater Pumping Savings (due to reductions in Groundwater Pumping) (\$1,000)	-\$8,333	-\$8,643	\$310
Excess Water Savings (\$1,000)	-\$3,980	-\$4,176	\$196
<b>Average Annual Changes in Water Supply Costs (\$1,000)</b>	<b>-\$4,499</b>	<b>-\$4,645</b>	<b>\$146</b>

Note: In 2012 dollars

The changes in M&I water supply costs would result in changes to employment and regional economic output, as summarized in Table 19.105.

**Table 19.105 Changes in Municipal and Industrial Water Supply Related Employment and Regional Economic Output for the Central Coast Region under Alternative 3 as Compared to the Second Basis of Comparison**

Economic Sectors	Employment				Economic Output (\$ thousands)			
	Direct	Indirect	Induced	Total	Direct	Indirect	Induced	Total
Agriculture	0	0	0	0	0.0	-0.1	1.2	1.0

<b>Total</b>	<b>-2</b>	<b>-1</b>	<b>2</b>	<b>0</b>	<b>-359.9</b>	<b>-122.1</b>	<b>345.5</b>	<b>-136.5</b>

Note: In 2012 dollars

#### *Regional Changes to Recreational Opportunities*

Changes in CVP and SWP water supplies and operations under Alternative 3 as compared to the Second Basis of Comparison generally would result in similar reservoir elevations in reservoirs that store CVP and SWP water and similar

1 recreational economic factors under Alternative 3 as compared to the Second  
 2 Basis of Comparison.

3 *Southern California Region*

4 *Regional Changes to Irrigated Agriculture*

5 It is anticipated that as in the Central Valley Region, reductions in CVP and SWP  
 6 water supplies within the Southern California Region would not result in  
 7 reductions in long-term irrigated acreage or land use changes due to the use of  
 8 other water supplies. However, there could be a reduction in irrigated acreage in  
 9 dry and critical dry years under Alternative 3 as compared to the Second Basis of  
 10 Comparison.

11 *Regional Changes to Municipal and Industrial Water Supplies*

12 As described in Chapter 5, Surface Water Resources and Water Supplies, CVP  
 13 and SWP water supplies would be less under Alternative 3 than under the Second  
 14 Basis of Comparison. The analysis assumed CVP and SWP water deliveries, as  
 15 described in Chapter 5, and determined the need for new water supplies, changes  
 16 in water storage and groundwater pumping, water transfers, water shortage costs,  
 17 and excess water savings. The factors and basis of the analysis is described in  
 18 detail in Appendix 19A, CWEST Model. The analysis assumes that no new  
 19 annual transfer supplies would be implemented until shortages were greater than  
 20 5 percent. The costs of these shortages are included in the analysis. It is assumed  
 21 that some communities that do not have alternative water supplies would utilize  
 22 water transfers.

23 The average annual water supply costs over the 81-year hydrologic period for  
 24 M&I water supplies would increase by 1.83 percent, as presented in Table 19.106;  
 25 and therefore, the results would be similar under Alternative 3 and the Second  
 26 Basis of Comparison.

27 **Table 19.106 Changes in Municipal and Industrial Water Supply Costs for the**  
 28 **Southern California Region under Alternative 3 as Compared to the Second Basis**  
 29 **of Comparison**

Differences in Total	Alternative 3	Second Basis of Comparison	Changes
Average Annual CVP/SWP Deliveries (TAF)	2,241	2,394	-153
Delivery Cost (\$1,000)	\$278,085	\$296,795	-\$18,710
Assumed New Supply Deliveries (TAF)	40	11	28
Annualized New Supply Costs (\$1,000)	\$10,584	\$4,032	\$6,552

6 Note: In 2012 dollars

#### 7 *Regional Changes to Recreational Opportunities*

8 Changes in CVP and SWP water supplies and operations under Alternative 3 as  
9 compared to the Second Basis of Comparison generally would result in similar  
10 reservoir elevations in reservoirs that store CVP and SWP water and similar  
11 recreational economic factors under Alternative 3 as compared to the Second  
12 Basis of Comparison.

#### 13 **19.4.3.5 Alternative 4**

14 The CVP and SWP operations under Alternative 4 are identical to the CVP and  
15 SWP operations under the Second Basis of Comparison and Alternative 1, as  
16 described in Chapter 3, Description of Alternatives. In addition, Alternative 4  
17 includes Striped Bass predation control which would reduce recreational  
18 opportunities. The non-recreational socioeconomic factors under Alternative 4  
19 would be identical to the conditions under the Second Basis of Comparison.  
20 Alternative 4 is compared to the No Action Alternative and the Second Basis of  
21 Comparison.

#### 22 **19.4.3.5.1 Alternative 4 Compared to the No Action Alternative**

23 The CVP and SWP operations under Alternative 4 are identical to the CVP and  
24 SWP operations under the Second Basis of Comparison and Alternative 1.  
25 Therefore, changes in non-recreational socioeconomic factors under Alternative 4  
26 as compared to the No Action Alternative would be the similar to impacts  
27 described in Section 12.4.3.2.1, Alternative 1 Compared to the No Action

1 Alternative. Recreational opportunities related to Striped Bass fishing would  
2 initially be increased when Alternative 4 is implemented. However, by 2030,  
3 Striped Bass fishing opportunities would be reduced under Alternative 4 as  
4 compared to the No Action Alternative due to actions to reduce predation.  
5 Commercial and sport ocean salmon fishing opportunities would be reduced  
6 under Alternative 4 as compared to the No Action Alternative due to increased  
7 harvest limitations.

#### 8 **19.4.3.5.2 Alternative 4 Compared to the Second Basis of Comparison**

9 As described in Chapter 3, Description of Alternatives, socioeconomic factors  
10 under Alternative 4 are the same as non-recreational socioeconomic factors under  
11 the Second Basis of Comparison. Recreational opportunities related to Striped  
12 Bass fishing would initially be increased when Alternative 4 is implemented.  
13 However, by 2030, Striped Bass fishing opportunities would be reduced under  
14 Alternative 4 as compared to the Second Basis of Comparison due to actions to  
15 reduce predation. Commercial and sport ocean salmon fishing opportunities  
16 would be reduced under Alternative 4 as compared to the Second Basis of  
17 Comparison due to increased harvest limitations.

#### 18 **19.4.3.6 Alternative 5**

19 As described in Chapter 3, Description of Alternatives, CVP and SWP operations  
20 under Alternative 5 are similar to the No Action Alternative with modified Old  
21 and Middle River flow criteria and New Melones Reservoir operations. As  
22 described in Chapter 4, Approach to Environmental Analysis, Alternative 5 is  
23 compared to the No Action Alternative and the Second Basis of Comparison.

#### 24 **19.4.3.6.1 Alternative 5 Compared to the No Action Alternative**

##### 25 *Trinity River Region*

##### 26 *Regional Changes to Irrigated Agriculture*

27 There are no agricultural lands irrigated with CVP and SWP water supplies in the  
28 Trinity River Region. Therefore, there would be no changes in irrigated lands  
29 under Alternative 5 as compared to the No Action Alternative.

##### 30 *Regional Changes to Municipal and Industrial Water Supplies*

31 The CVP would continue to release water in Trinity River for downstream  
32 beneficial uses, including water supplies under Alternative 5 as compared to the  
33 No Action Alternative. There are no CVP or SWP water contractors in the  
34 Trinity River Region.

##### 35 *Regional Changes to Recreational Opportunities*

36 Recreational opportunities would be similar in the Trinity River Region under  
37 Alternative 5 as compared to the No Action Alternative as described in  
38 Chapter 15, Recreational Resources.

1 *Regional Changes to Salmon Fishing*

2 Trinity River flows would be similar under Alternative 5 as compared to the No  
3 Action Alternative. This could result in similar salmon harvest conditions by the  
4 Yurok and Hoopa Valley tribes.

5 *Central Valley Region*

6 *Regional Changes to Irrigated Agriculture*

7 As described in Chapter 5, Surface Water Resources and Water Supplies, CVP  
8 and SWP water supplies would be similar under Alternative 5 and the No Action  
9 Alternative. It is anticipated that groundwater use would be similar and  
10 sustainable groundwater management plans would not be fully implemented until  
11 the 2040s, as discussed in Chapter 12, Agricultural Resources.

12 The agricultural production value under long-term average conditions would be  
13 the same under Alternative 5 as the No Action Alternative. The agricultural  
14 production value under dry and critical dry conditions also would be reduced by  
15 less than 1 percent (\$0.8 million/year increase in the Sacramento Valley and \$2.7  
16 million/year decrease in the San Joaquin Valley), although groundwater pumping  
17 is not anticipated to change.

18 The overall decrease in agricultural production values are less than 0.05 percent  
19 under long-term conditions; and, changes in employment and regional economic  
20 output would be minimal. Therefore, the analysis of employment and regional  
21 economic output is focused on dry and critical dry years.

22 The direct changes in agricultural production would result in changes to  
23 employment and regional economic output in the Sacramento and San Joaquin  
24 valleys, as summarized in Tables 19.108 and 19.109, respectively.

25 **Table 19.108 Changes in Agricultural-Related Employment and Regional Economic**  
26 **Output for the Sacramento Valley under Alternative 5 as compared to the No**  
27 **Action Alternative in Dry and Critical Dry Years**

Economic Sectors	Employment				Economic Output (\$ millions)			
	Direct	Indirect	Induced	Total	Direct	Indirect	Induced	Total

Government	0	0	0	0	0.0	0.0	0.0	0.0
<b>Total</b>	<b>-5</b>	<b>-11</b>	<b>-7</b>	<b>-24</b>	<b>-2.7</b>	<b>-0.9</b>	<b>-1.0</b>	<b>-4.6</b>

4 Note: In 2012 dollars

5 As described in Chapter 11, Geology and Soils Resources, increased groundwater  
 6 pumping under the long-term average conditions may result in an additional  
 7 increment of subsidence in those areas within the Central Valley. The additional  
 8 amount of subsidence and the economic costs associated with it have not been  
 9 quantified in this EIS. However, total subsidence-related costs have been shown  
 10 to be substantial, as reported by Borchers et al. (2014) who estimated that the cost  
 11 of subsidence in San Joaquin Valley between 1955 and 1972 was more than  
 12 \$1.3 billion (in 2013 dollars). These estimates are based on the impacts to major  
 13 infrastructure in the region including the San Joaquin River, Delta Mendota  
 14 Canal, Friant-Kern Canal and San Luis Canal in addition to privately owned  
 15 infrastructure. The incremental subsidence-related costs, expressed on an annual  
 16 basis, could be an unknown fraction of that cumulative cost.

17 *Regional Changes to Municipal and Industrial Water Supplies*

18 As described in Chapter 5, Surface Water Resources and Water Supplies, CVP  
 19 and SWP water supplies would be similar in the Sacramento Valley and lower in  
 20 the San Joaquin Valley under Alternative 5 and the No Action Alternative. The  
 21 analysis assumed CVP and SWP water deliveries, as described in Chapter 5, and  
 22 determined the need for new water supplies, changes in water storage and  
 23 groundwater pumping, water transfers, water shortage costs, and excess water  
 24 savings. The factors and basis of the analysis is described in detail in  
 25 Appendix 19A, CWEST Model. The analysis assumes that no new annual  
 26 transfer supplies would be implemented until shortages were greater than  
 27 5 percent. The costs of these shortages are included in the analysis. It is assumed  
 28 that some communities that do not have alternative water supplies would utilize  
 29 water transfers.

1 The average annual water supply costs over the 81-year hydrologic period for  
 2 M&I water supplies are presented in Tables 19.110 and 19.111 for the  
 3 Sacramento and San Joaquin Valley, respectively. Average annual water supply  
 4 operating expenses would be similar (within 0.05 percent change) for the  
 5 Sacramento Valley, and increase by 0.07 percent in the San Joaquin Valley; and  
 6 therefore, the results would be similar under Alternative 5 and the No Action  
 7 Alternative.

8 **Table 19.110 Changes in Municipal and Industrial Water Supply Costs for the**  
 9 **Sacramento Valley under Alternative 5 as compared to the No Action Alternative**

Differences in Total	Alternative 5	No Action Alternative	Changes
Average Annual CVP/SWP Deliveries (TAF)	447	447	-1
Delivery Cost (\$1,000)	\$8,022	\$8,031	-\$8
Assumed New Supply Deliveries (TAF)	0	0	0

<b>Total</b>	<b>1</b>	<b>0</b>	<b>1</b>	<b>1</b>	<b>146.6</b>	<b>35.8</b>	<b>88.8</b>	<b>271.2</b>

8 Note: In 2012 dollars

9 *Regional Changes to Recreational Opportunities*

10 Recreational opportunities at San Luis Reservoir would be similar under  
 11 Alternative 5 as compared to the No Action Alternative, as described in  
 12 Chapter 15, Recreation Resources. Therefore, it is anticipated that recreational

1 economic factors would be similar under Alternative 5 as compared to the No  
2 Action Alternative.

3 *Effects Related to Cross Delta Water Transfers*

4 Potential effects to socioeconomic factors could be similar to those identified in a  
5 recent environmental analysis conducted by Reclamation for long-term water  
6 transfers from the Sacramento to San Joaquin valleys (Reclamation 2014c) as  
7 described above under the No Action Alternative compared to the Second Basis  
8 of Comparison. For the purposes of this EIS, it is anticipated that similar  
9 conditions would occur during implementation of cross Delta water transfers  
10 under Alternative 5 and the No Action Alternative, and that impacts on  
11 socioeconomic factors could be adverse in the seller's service area.

12 Under Alternative 5 and the No Action Alternative, the timing of cross Delta  
13 water transfers would be limited to July through September and include annual  
14 volumetric limits, in accordance with the 2008 USFWS BO and 2009 NMFS BO.  
15 Overall, the potential for cross Delta water transfers would be similar under  
16 Alternative 5 and the No Action Alternative.

17 *San Francisco Bay Area Region*

18 *Regional Changes to Irrigated Agriculture*

19 It is anticipated that as in the Central Valley Region, CVP and SWP water  
20 supplies within the San Francisco Bay Area Region would be similar under  
21 Alternative 5 and the No Action Alternative, and would not result in changes in  
22 irrigated acreage or land use changes due to the use of other water supplies.

23 *Regional Changes to Municipal and Industrial Water Supplies*

24 As described in Chapter 5, Surface Water Resources and Water Supplies, CVP  
25 and SWP water supplies would be lower under Alternative 5 and the No Action  
26 Alternative. The analysis assumed CVP and SWP water deliveries, as described  
27 in Chapter 5, and determined the need for new water supplies, changes in water  
28 storage and groundwater pumping, water transfers, water shortage costs, and  
29 excess water savings. The factors and basis of the analysis is described in detail  
30 in Appendix 19A, CWEST Model. The analysis assumes that no new annual  
31 transfer supplies would be implemented until shortages were greater than  
32 5 percent. The costs of these shortages are included in the analysis.

33 The average annual water supply operating expenses over the 81-year hydrologic  
34 period for M&I water supplies would be increase by 0.1 percent, as presented in  
35 Table 19.114; and therefore, the results would be similar under Alternative 5 and  
36 the No Action Alternative.

1 **Table 19.114 Changes in Municipal and Industrial Water Supply Costs for the San**  
 2 **Francisco Bay Area Region under Alternative 5 as compared to the No Action**  
 3 **Alternative**

Differences in Total	Alternative 5	No Action Alternative	Changes
Average Annual CVP/SWP Deliveries (TAF)	394	396	-3
Delivery Cost (\$1,000)	\$10,962	\$11,044	-\$82
Assumed New Supply Deliveries (TAF)	18	18	0
Annualized New Supply Costs (\$1,000)	\$599	\$599	\$0
Water Storage Costs (\$1,000)	\$1,495	\$1,577	-\$81
Lost Water Sales Revenues (\$1,000)	\$4,360	\$4,286	\$74
Transfer Costs (\$1,000)	\$6,156	\$5,722	\$434
Shortage Costs (\$1,000)	\$1,450	\$1,410	\$40
Groundwater Pumping Savings (due to reductions in Groundwater Pumping) (\$1,000)	-\$470	-\$493	\$24
Excess Water Savings (\$1,000)	-\$225	-\$225	\$0
<b>Average Annual Changes in Water Supply Costs (\$1,000)</b>	<b>\$24,328</b>	<b>\$23,919</b>	<b>\$409</b>

4 Note: In 2012 dollars

5 The changes in M&I water supply costs would result in changes to employment  
 6 and regional economic output, as summarized in Table 19.115.

7 **Table 19.115 Changes in Municipal and Industrial Water Supply Related**  
 8 **Employment and Regional Economic Output for the San Francisco Bay Area**  
 9 **Region under Alternative 5 as compared to the No Action Alternative**

Economic Sectors	Employment				Economic Output (\$ thousands)			
	Direct	Indirect	Induced	Total	Direct	Indirect	Induced	Total
Agriculture	0	0	0	0	0.0	0.0	0.5	0.5
Mining & Logging	0	0	0	0	0.0	-0.2	0.3	0.1
Construction	0	0	0	0	0.0	-17.4	2.4	-15.0
Manufacturing	0	0	0	0	0.0	-3.2	30.9	27.8
Transportation, Warehousing & Utilities	-1	0	0	-1	-163.1	-1.2	11.8	-152.5
Wholesale Trade	0	0	0	0	0.0	-0.5	22.9	22.4
Retail Trade	0	0	0	0	0.0	-0.5	36.4	35.9
Information	0	0	0	0	0.0	-1.8	19.8	18.0
Financial Activities	0	0	0	0	0.0	-6.1	112.3	106.2
Services	0	0	1	1	0.0	-14.6	139.4	124.8
Government	0	0	0	0	0.0	-0.1	3.6	3.5
<b>Total</b>	<b>-1</b>	<b>0</b>	<b>2</b>	<b>1</b>	<b>-163.1</b>	<b>-45.5</b>	<b>380.3</b>	<b>171.7</b>

10 Note: In 2012 dollars

1        *Regional Changes to Recreational Opportunities*

2        Changes in CVP and SWP water supplies and operations under Alternative 5 as  
3        compared to the No Action Alternative generally would result in similar reservoir  
4        elevations in reservoirs that store CVP and SWP water and similar recreational  
5        economic factors under Alternative 5 as compared o the No Action Alternative.

6        *Regional Changes to Salmon Fishing*

7        Changes in commercial and sport ocean salmon fishing primarily would be  
8        related to the presence of fall-run Chinook Salmon from Central Valley  
9        hatcheries. It is assumed that the production of hatchery fish would be similar  
10       under Alternative 15 and the No Action Alternative. However, survival of the  
11       fall-run Chinook Salmon hatchery fish to the Pacific Ocean could be related to  
12       changes in CVP and SWP operations. As described in Chapter 9, Fish and  
13       Aquatic Resources, there would be little change in through-Delta survival by  
14       emigrating natural juvenile fall-run Chinook Salmon under Alternative 5 and the  
15       No Action Alternative. It is assumed that the survival of the hatchery juvenile  
16       fall-run Chinook Salmon would be similar to the survival of the natural juvenile  
17       fall-run Chinook Salmon. Therefore, the availability of fish for commercial and  
18       sport ocean salmon fishing and the associated economic conditions for the fishing  
19       industry would be similar under Alternative 5 and the No Action Alternative.

20       *Central Coast Region*

21       *Regional Changes to Irrigated Agriculture*

22       It is anticipated that as in the Central Valley Region, increases in CVP and SWP  
23       water supplies within the Central Coast Region would be lower under  
24       Alternative 5 and the No Action Alternative, and would not result in changes in  
25       irrigated acreage or land use changes due to the use of other water supplies.

26       *Regional Changes to Municipal and Industrial Water Supplies*

27       As described in Chapter 5, Surface Water Resources and Water Supplies, CVP  
28       and SWP water supplies would be similar under Alternative 5 and the No Action  
29       Alternative. The analysis assumed CVP and SWP water deliveries, as described  
30       in Chapter 5, and determined the need for new water supplies, changes in water  
31       storage and groundwater pumping, water transfers, water shortage costs, and  
32       excess water savings. The factors and basis of the analysis is described in detail  
33       in Appendix 19A, CWEST Model. The analysis assumes that no new annual  
34       transfer supplies would be implemented until shortages were greater than  
35       5 percent. The costs of these shortages are included in the analysis. It is assumed  
36       that some communities that do not have alternative water supplies would utilize  
37       water transfers.

38       The average annual water supply operating expenses over the 81-year hydrologic  
39       period for M&I water supplies would increase by 0.06 percent, as presented in  
40       Table 19.116; and therefore, the results would be similar under Alternative 5 and  
41       the No Action Alternative.

1 **Table 19.116 Changes in Municipal and Industrial Water Supply Costs for the**  
 2 **Central Coast Region under Alternative 5 as compared to the No Action Alternative**

Differences in Total	Alternative 5	No Action Alternative	Changes
Average Annual CVP/SWP Deliveries (TAF)	43	44	-1
Delivery Cost (\$1,000)	\$6,567	\$6,663	-\$97
Assumed New Supply Deliveries (TAF)	0	0	0
Annualized New Supply Costs (\$1,000)	\$0	\$0	\$0
Water Storage Costs (\$1,000)	\$0	\$0	\$0
Lost Water Sales Revenues (\$1,000)	\$0	\$0	\$0
Transfer Costs (\$1,000)	\$0	\$0	\$0
Shortage Costs (\$1,000)	\$0	\$0	\$0
Groundwater Pumping Savings (due to reductions in Groundwater Pumping) (\$1,000)	-\$8,018	-\$8,068	\$50
Excess Water Savings (\$1,000)	-\$2,899	-\$2,970	\$70
<b>Average Annual Changes in Water Supply Costs (\$1,000)</b>	<b>-\$4,350</b>	<b>-\$4,374</b>	<b>\$23</b>

3 Note: In 2012 dollars

4 The changes in M&I water supply costs would result in changes to employment  
 5 and regional economic output, as summarized in Table 19.117.

6 **Table 19.117 Changes in Municipal and Industrial Water Supply Related**  
 7 **Employment and Regional Economic Output for the Central Coast Region under**  
 8 **Alternative 5 as compared to the No Action Alternative**

Economic Sectors	Employment				Economic Output (\$ thousands)			
	Direct	Indirect	Induced	Total	Direct	Indirect	Induced	Total

<b>Total</b>	<b>0</b>	<b>0</b>	<b>1</b>	<b>0</b>	<b>-97.1</b>	<b>-32.9</b>	<b>79.5</b>	<b>-50.5</b>

9 Note: In 2012 dollars

10 *Regional Changes to Recreational Opportunities*

11 Changes in CVP and SWP water supplies and operations under Alternative 5 as  
 12 compared to the No Action Alternative generally would result in similar reservoir

1 elevations in reservoirs that store CVP and SWP water and similar recreational  
 2 economic factors under Alternative 5 as compared to the No Action Alternative.

3 *Southern California Region*

4 *Regional Changes to Irrigated Agriculture*

5 It is anticipated that as in the Central Valley Region, increases in CVP and SWP  
 6 water supplies within the Southern California Region would be similar under  
 7 Alternative 5 and the No Action Alternative, and would not result in changes in  
 8 irrigated acreage or land use changes due to the use of other water supplies.

9 *Regional Changes to Municipal and Industrial Water Supplies*

10 As described in Chapter 5, Surface Water Resources and Water Supplies, CVP  
 11 and SWP water supplies would be lower under Alternative 5 and the No Action  
 12 Alternative. The analysis assumed CVP and SWP water deliveries, as described  
 13 in Chapter 5, and determined the need for new water supplies, changes in water  
 14 storage and groundwater pumping, water transfers, water shortage costs, and  
 15 excess water savings. The factors and basis of the analysis is described in detail  
 16 in Appendix 19A, CWEST Model. The analysis assumes that no new annual  
 17 transfer supplies would be implemented until shortages were greater than  
 18 5 percent. The costs of these shortages are included in the analysis. It is assumed  
 19 that some communities that do not have alternative water supplies would utilize  
 20 water transfers.

21 The average annual water supply operating expenses over the 81-year hydrologic  
 22 period for M&I water supplies would be increase by 0.37 percent, as presented in  
 23 Table 19.118; and therefore, the results would be similar under Alternative 5 and  
 24 the No Action Alternative.

25 **Table 19.118 Changes in Municipal and Industrial Water Supply Costs for the**  
 26 **Southern California Region under Alternative 5 as compared to the No Action**  
 27 **Alternative**

Differences in Total	Alternative 5	No Action Alternative	Changes
Average Annual CVP/SWP Deliveries (TAF)	1,912	1,932	-20
Delivery Cost (\$1,000)	\$237,118	\$239,692	-\$2,575
Assumed New Supply Deliveries (TAF)	81	47	34
Annualized New Supply Costs (\$1,000)	\$24,191	\$12,688	\$11,503
Water Storage Costs (\$1,000)	\$7,474	\$7,598	-\$124
Lost Water Sales Revenues (\$1,000)	\$14,206	\$14,614	-\$408
Transfer Costs (\$1,000)	\$10,505	\$11,484	-\$979
Shortage Costs (\$1,000)	\$16,662	\$17,319	-\$657
Groundwater Pumping Savings (due to reductions in Groundwater Pumping) (\$1,000)	-\$58,323	-\$57,474	-\$849

<b>Total</b>	<b>35</b>	<b>22</b>	<b>6</b>	<b>63</b>	<b>8,804.2</b>	<b>3,348.6</b>	<b>827.3</b>	<b>12,980.1</b>

6 Note: In 2012 dollars

7 *Regional Changes to Recreational Opportunities*

8 Changes in CVP and SWP water supplies and operations under Alternative 5 as  
 9 compared to the No Action Alternative generally would result in similar reservoir  
 10 elevations in reservoirs that store CVP and SWP water and similar recreational  
 11 economic factors under Alternative 5 as compared to the No Action Alternative.

12 **19.4.3.6.2 Alternative 5 Compared to the Second Basis of Comparison**

13 *Trinity River Region*

14 *Regional Changes to Irrigated Agriculture*

15 There are no agricultural lands irrigated with CVP and SWP water supplies in the  
 16 Trinity River Region. Therefore, there would be no changes in irrigated lands  
 17 under Alternative 5 as compared to the Second Basis of Comparison.

18 *Regional Changes to Municipal and Industrial Water Supplies*

19 The CVP would continue to release water in Trinity River for downstream  
 20 beneficial uses, including water supplies under Alternative 5 and the Second Basis  
 21 of Comparison. There are no CVP or SWP water contractors in the Trinity River  
 22 Region.

23 *Regional Changes to Recreational Opportunities*

24 Recreational opportunities would be similar in the Trinity River Region under  
 25 Alternative 5 as compared to the Second Basis of Comparison as described in  
 26 Chapter 15, Recreational Resources.

1        *Regional Changes to Salmon Fishing*

2        Trinity River flows would be similar under Alternative 5 as compared to the  
3        Second Basis of Comparison. This could result in similar salmon harvest  
4        conditions by the Yurok and Hoopa Valley tribes.

5        *Central Valley Region*

6        *Regional Changes to Irrigated Agriculture*

7        As described in Chapter 5, Surface Water Resources and Water Supplies, CVP  
8        and SWP water supplies would be less under Alternative 5 than under the Second  
9        Basis of Comparison. It is anticipated that groundwater use would increase in  
10       response to reduced CVP and SWP water supplies in 2030 because sustainable  
11       groundwater management plans would not be fully implemented until the 2040s,  
12       as discussed in Chapter 12, Agricultural Resources.

13       The agricultural production value under long-term average conditions would be  
14       reduced by less than 1 percent (\$1.5 million/year in the Sacramento Valley and  
15       \$0.7 million/year in the San Joaquin Valley) primarily due to an increase in  
16       groundwater pumping of approximately 6 percent. The agricultural production  
17       value under dry and critical dry conditions also would be reduced by less than  
18       1 percent (\$10.5 million/year in the Sacramento Valley and \$22.9 million/year in  
19       the San Joaquin Valley) primarily due to an increase in groundwater pumping.

20       The overall reduction in agricultural production values are less than 0.05 percent  
21       under long-term conditions; and, changes in employment and regional economic  
22       output would be minimal. Therefore, the analysis of employment and regional  
23       economic output is focused on dry and critical dry years.

24       The direct changes in agricultural production would result in changes to  
25       employment and regional economic output in the Sacramento and San Joaquin  
26       valleys, as summarized in Tables 19.120 and 19.121, respectively.

1 **Table 19.120 Changes in Agricultural-Related Employment and Regional Economic**  
 2 **Output for the Sacramento Valley under Alternative 5 as Compared to the Second**

<b>Total</b>	<b>-145</b>	<b>-90</b>	<b>-42</b>	<b>-277</b>	<b>-22.9</b>	<b>-10.2</b>	<b>-5.9</b>	<b>-39.0</b>

8 Note: In 2012 dollars

9 As described in Chapter 11, Geology and Soils Resources, increased groundwater  
 10 pumping under the long-term average conditions may result in an additional  
 11 increment of subsidence in those areas within the Central Valley. The additional

1 amount of subsidence and the economic costs associated with it have not been  
 2 quantified in this EIS. However, total subsidence-related costs have been shown  
 3 to be substantial, as reported by Borchers et al. (2014) who estimated that the cost  
 4 of subsidence in San Joaquin Valley between 1955 and 1972 was more than  
 5 \$1.3 billion (in 2013 dollars). These estimates are based on the impacts to major  
 6 infrastructure in the region including the San Joaquin River, Delta Mendota  
 7 Canal, Friant-Kern Canal and San Luis Canal in addition to privately owned  
 8 infrastructure. The incremental subsidence-related costs, expressed on an annual  
 9 basis, could be an unknown fraction of that cumulative cost.

10 *Regional Changes to Municipal and Industrial Water Supplies*

11 As described in Chapter 5, Surface Water Resources and Water Supplies, CVP  
 12 and SWP water supplies would be less under Alternative 5 than under the Second  
 13 Basis of Comparison. The analysis assumed CVP and SWP water deliveries, as  
 14 described in Chapter 5, and determined the need for new water supplies, changes  
 15 in water storage and groundwater pumping, water transfers, water shortage costs,  
 16 and excess water savings. The factors and basis of the analysis is described in  
 17 detail in Appendix 19A, CWEST Model. The analysis assumes that no new  
 18 annual transfer supplies would be implemented until shortages were greater than  
 19 5 percent. The costs of these shortages are included in the analysis. It is assumed  
 20 that some communities that do not have alternative water supplies would utilize  
 21 water transfers.

22 The average annual water supply costs over the 81-year hydrologic period for  
 23 M&I water supplies are presented in Tables 19.122 and 19.123 for the  
 24 Sacramento and San Joaquin Valley, respectively. Average annual water supply  
 25 operating expenses would increase by 0.11 and 0.47 percent in the Sacramento  
 26 Valley and the San Joaquin Valley, respectively; and therefore, the results would  
 27 be similar under Alternative 5 and the Second Basis of Comparison.

28 **Table 19.122 Changes in Municipal and Industrial Water Supply Costs for the**  
 29 **Sacramento Valley under Alternative 5 as Compared to the Second Basis of**

<b>Total</b>	<b>1</b>	<b>1</b>	<b>6</b>	<b>8</b>	<b>287.4</b>	<b>70.1</b>	<b>930.8</b>	<b>1,288.4</b>

4 Note: In 2012 dollars

5 *Regional Changes to Recreational Opportunities*

6 Recreational opportunities would decrease by 6 to 9 percent under Alternative 5  
 7 as compared to the Second Basis of Comparison, depending upon water year type,  
 8 , as described in Chapter 15, Recreation Resources. Therefore, it is anticipated  
 9 that recreational economic factors would be reduced under Alternative 5 as  
 10 compared to the Second Basis of Comparison.

11 *Effects Related to Cross Delta Water Transfers*

12 Potential effects to socioeconomic factors could be similar to those identified in a  
 13 recent environmental analysis conducted by Reclamation for long-term water  
 14 transfers from the Sacramento to San Joaquin valleys (Reclamation 2014c) as  
 15 described above under the No Action Alternative compared to the Second Basis  
 16 of Comparison. For the purposes of this EIS, it is anticipated that similar  
 17 conditions would occur during implementation of cross Delta water transfers  
 18 under Alternative 5 and the Second Basis of Comparison, and that impacts on  
 19 socioeconomic factors could be adverse in the seller's service area.

20 Under Alternative 5, the timing of cross Delta water transfers would be limited to  
 21 July through September and include annual volumetric limits, in accordance with  
 22 the 2008 USFWS BO and 2009 NMFS BO. Under Second Basis of Comparison,  
 23 water could be transferred throughout the year without an annual volumetric limit.  
 24 Overall, the potential for cross Delta water transfers would be decreased under  
 25 Alternative 5 as compared to the Second Basis of Comparison.

1 *San Francisco Bay Area Region*

2 *Regional Changes to Irrigated Agriculture*

3 It is anticipated that as in the Central Valley Region, reductions in CVP and SWP  
 4 water supplies within the San Francisco Bay Area Region would not result in  
 5 reductions in long-term irrigated acreage or land use changes due to the use of  
 6 other water supplies. However, there could be a reduction in irrigated acreage in  
 7 dry and critical dry years under Alternative 5 as compared to the Second Basis of  
 8 Comparison.

9 *Regional Changes to Municipal and Industrial Water Supplies*

10 As described in Chapter 5, Surface Water Resources and Water Supplies, CVP  
 11 and SWP water supplies would be less under Alternative 5 than under the Second  
 12 Basis of Comparison. The analysis assumed CVP and SWP water deliveries, as  
 13 described in Chapter 5, and determined the need for new water supplies, changes  
 14 in water storage and groundwater pumping, water transfers, water shortage costs,  
 15 and excess water savings. The factors and basis of the analysis is described in  
 16 detail in Appendix 19A, CWEST Model. The analysis assumes that no new  
 17 annual transfer supplies would be implemented until shortages were greater than  
 18 5 percent. The costs of these shortages are included in the analysis.

19 The average annual water supply costs over the 81-year hydrologic period for  
 20 M&I water supplies would increase by 1.85 percent, as presented in Table 19.126;  
 21 and therefore, the results would be similar under Alternative 5 and the Second  
 22 Basis of Comparison.

23 **Table 19.126 Changes in Municipal and Industrial Water Supply Costs for the San**  
 24 **Francisco Bay Area Region under Alternative 5 as Compared to the Second Basis**  
 25 **of Comparison**

Differences in Total	Alternative 5	Second Basis of Comparison	Changes
Average Annual CVP/SWP Deliveries (TAF)	394	445	-51
Delivery Cost (\$1,000)	\$10,962	\$12,515	-\$1,553
Assumed New Supply Deliveries (TAF)	18	16	2
Annualized New Supply Costs (\$1,000)	\$599	\$234	\$365
Water Storage Costs (\$1,000)	\$1,495	\$1,963	-\$467
Lost Water Sales Revenues (\$1,000)	\$4,360	\$1,595	\$2,765
Transfer Costs (\$1,000)	\$6,156	\$1,154	\$5,002
Shortage Costs (\$1,000)	\$1,450	\$523	\$927
Groundwater Pumping Savings (due to reductions in Groundwater Pumping) (\$1,000)	-\$470	-\$792	\$322
Excess Water Savings (\$1,000)	-\$225	-\$549	\$324
<b>Average Annual Changes in Water Supply Costs (\$1,000)</b>	<b>\$24,328</b>	<b>\$16,643</b>	<b>\$7,686</b>

26 Note: In 2012 dollars

27 The changes in M&I water supply costs would result in changes to employment  
 28 and regional economic output, as summarized in Table 19.127.

1 **Table 19.127 Changes in Municipal and Industrial Water Supply Related**  
 2 **Employment and Regional Economic Output for the San Francisco Bay Area**  
 3 **Region under Alternative 5 as Compared to the Second Basis of Comparison**

5 *Regional Changes to Recreational Opportunities*

6 Changes in CVP and SWP water supplies and operations under Alternative 5 as  
 7 compared to the Second Basis of Comparison generally would result in lower  
 8 reservoir elevations in reservoirs that store CVP and SWP water (up to 10 to  
 9 18 percent); and would result in decreased recreational economic factors under  
 10 Alternative 5 as compared to the Second Basis of Comparison.

11 *Regional Changes to Salmon Fishing*

12 Changes in commercial and sport ocean salmon fishing primarily would be  
 13 related to the presence of fall-run Chinook Salmon from Central Valley  
 14 hatcheries. It is assumed that the production of hatchery fish would be similar  
 15 under Alternative 5 and the Second Basis of Comparison. However, survival of  
 16 the fall-run Chinook Salmon hatchery fish to the Pacific Ocean could be related to  
 17 changes in CVP and SWP operations. As described in Chapter 9, Fish and  
 18 Aquatic Resources, there would be little change in through-Delta survival by  
 19 emigrating natural juvenile fall-run Chinook Salmon under Alternative 5 as  
 20 compared to the Second Basis of Comparison. It is assumed that the survival of  
 21 the hatchery juvenile fall-run Chinook Salmon would be similar to the survival of  
 22 the natural juvenile fall-run Chinook Salmon. Therefore, the availability of fish  
 23 for commercial and sport ocean salmon fishing and the associated economic  
 24 conditions for the fishing industry would be similar under Alternative 5 and the  
 25 Second Basis of Comparison.

1 *Central Coast Region*

2 *Regional Changes to Irrigated Agriculture*

3 It is anticipated that as in the Central Valley Region, reductions in CVP and SWP  
 4 water supplies within the Central Coast Region would not result in reductions in  
 5 long-term irrigated acreage or land use changes due to the use of other water  
 6 supplies. However, there could be a reduction in irrigated acreage in dry and  
 7 critical dry years under Alternative 5 as compared to the Second Basis of  
 8 Comparison.

9 *Regional Changes to Municipal and Industrial Water Supplies*

10 As described in Chapter 5, Surface Water Resources and Water Supplies, CVP  
 11 and SWP water supplies would be less under Alternative 5 than under the Second  
 12 Basis of Comparison. The analysis assumed CVP and SWP water deliveries, as  
 13 described in Chapter 5, and determined the need for new water supplies, changes  
 14 in water storage and groundwater pumping, water transfers, water shortage costs,  
 15 and excess water savings. The factors and basis of the analysis is described in  
 16 detail in Appendix 19A, CWEST Model. The analysis assumes that no new  
 17 annual transfer supplies would be implemented until shortages were greater than  
 18 5 percent. The costs of these shortages are included in the analysis. It is assumed  
 19 that some communities that do not have alternative water supplies would utilize  
 20 water transfers.

21 The average annual water supply operating expenses over the 81-year hydrologic  
 22 period for M&I water supplies would increase by 0.77 percent, as presented in  
 23 Table 19.128; and therefore, the results would be similar under Alternative 5 and  
 24 the Second Basis of Comparison.

25 **Table 19.128 Changes in Municipal and Industrial Water Supply Costs for the**  
 26 **Central Coast Region under Alternative 5 as Compared to the Second Basis of**  
 27 **Comparison**

Differences in Total	Alternative 5	Second Basis of Comparison	Changes
Average Annual CVP/SWP Deliveries (TAF)	43	54	-11
Delivery Cost (\$1,000)	\$6,567	\$8,174	-\$1,607
Assumed New Supply Deliveries (TAF)	0	0	0
Annualized New Supply Costs (\$1,000)	\$0	\$0	\$0
Water Storage Costs (\$1,000)	\$0	\$0	\$0
Lost Water Sales Revenues (\$1,000)	\$0	\$0	\$0
Transfer Costs (\$1,000)	\$0	\$0	\$0
Shortage Costs (\$1,000)	\$0	\$0	\$0
Groundwater Pumping Savings (due to reductions in Groundwater Pumping) (\$1,000)	-\$8,018	-\$8,643	\$625
Excess Water Savings (\$1,000)	-\$2,899	-\$4,176	\$1,277
<b>Average Annual Changes in Water Supply Costs (\$1,000)</b>	<b>-\$4,350</b>	<b>-\$4,645</b>	<b>\$295</b>

28 Note: In 2012 dollars

1 The changes in M&I water supply costs would result in changes to employment  
2 and regional economic output, as summarized in Table 19.129.

3 **Table 19.129 Changes in Municipal and Industrial Water Supply Related**  
4 **Employment and Regional Economic Output for the Central Coast Region under**  
5 **Alternative 5 as Compared to the Second Basis of Comparison**

Economic Sectors	Employment				Economic Output (\$ thousands)

<b>Total</b>	<b>-7</b>	<b>-4</b>	<b>9</b>	<b>-2</b>	<b>-1,606.9</b>	<b>-545.3</b>	<b>1,239.6</b>	<b>-912.6</b>

6 Note: In 2012 dollars

#### 7 *Regional Changes to Recreational Opportunities*

8 Changes in CVP and SWP water supplies and operations under Alternative 5 as  
9 compared to the Second Basis of Comparison generally would result in lower  
10 reservoir elevations in reservoirs that store CVP and SWP water (up to 10 to  
11 18 percent); and would result in decreased recreational economic factors under  
12 Alternative 5 as compared to the Second Basis of Comparison.

#### 13 *Southern California Region*

##### 14 *Regional Changes to Irrigated Agriculture*

15 It is anticipated that as in the Central Valley Region, reductions in CVP and SWP  
16 water supplies within the Southern California Region would not result in  
17 reductions in long-term irrigated acreage or land use changes due to the use of  
18 other water supplies. However, there could be a reduction in irrigated acreage in  
19 dry and critical dry years under Alternative 5 as compared to the Second Basis of  
20 Comparison.

##### 21 *Regional Changes to Municipal and Industrial Water Supplies*

22 As described in Chapter 5, Surface Water Resources and Water Supplies, CVP  
23 and SWP water supplies would be less under Alternative 5 than under the Second  
24 Basis of Comparison. The analysis assumed CVP and SWP water deliveries, as  
25 described in Chapter 5, and determined the need for new water supplies, changes  
26 in water storage and groundwater pumping, water transfers, water shortage costs,  
27 and excess water savings. The factors and basis of the analysis is described in  
28 detail in Appendix 19A, CWEST Model. The analysis assumes that no new

1 annual transfer supplies would be implemented until shortages were greater than  
 2 5 percent. The costs of these shortages are included in the analysis. It is assumed  
 3 that some communities that do not have alternative water supplies would utilize  
 4 water transfers.

5 The average annual water supply operating expenses over the 81-year hydrologic  
 6 period for M&I water supplies would increase by 2.5 percent, as presented in  
 7 Table 19.130; and therefore, the results would be similar under Alternative 5 and  
 8 the Second Basis of Comparison.

9 **Table 19.130 Changes in Municipal and Industrial Water Supply Costs for the**  
 10 **Southern California Region under Alternative 5 as Compared to the Second Basis**  
 11 **of Comparison**

Differences in Total	Alternative 5	Second Basis of Comparison	Changes
Average Annual CVP/SWP Deliveries (TAF)	1,912	2,394	-482
Delivery Cost (\$1,000)	\$237,118	\$296,795	-\$59,677
Assumed New Supply Deliveries (TAF)	81	11	70
Annualized New Supply Costs (\$1,000)	\$24,191	\$4,032	\$20,159
Water Storage Costs (\$1,000)	\$7,474	\$2,824	\$4,649
Lost Water Sales Revenues (\$1,000)	\$14,206	\$1,119	\$13,087
Transfer Costs (\$1,000)	\$10,505	\$3,705	\$6,800
Shortage Costs (\$1,000)	\$16,662	\$353	\$16,309
Groundwater Pumping Savings (due to reductions in Groundwater Pumping) (\$1,000)	-\$58,323	-\$91,507	\$33,183
Excess Water Savings (\$1,000)	-\$4,588	-\$10,573	\$5,985
<b>Average Annual Changes in Water Supply Costs (\$1,000)</b>	<b>\$247,243</b>	<b>\$206,749</b>	<b>\$40,495</b>

12 Note: In 2012 dollars

13 The changes in M&I water supply costs would result in changes to employment  
 14 and regional economic output, as summarized in Table 19.131.

1 **Table 19.131 Changes in Municipal and Industrial Water Supply Related**  
 2 **Employment and Regional Economic Output for the Southern California Region**  
 3 **under Alternative 5 as Compared to the Second Basis of Comparison**

4 Note: In 2012 dollars

5 *Regional Changes to Recreational Opportunities*

6 Changes in CVP and SWP water supplies and operations under Alternative 5 as  
 7 compared to the Second Basis of Comparison generally would result in lower  
 8 reservoir elevations in reservoirs that store CVP and SWP water (up to 10 to  
 9 18 percent); and would result in decreased recreational economic factors under  
 10 Alternative 5 as compared to the Second Basis of Comparison.

11 **19.4.3.7 Summary of Environmental Consequences**

12 The results of the environmental consequences of implementation of Alternatives  
 13 1 through 5 as compared to the No Action Alternative and the Second Basis of  
 14 Comparison are presented in Tables 19.132 and 19.133.

1 **Table 19.132 Comparison of Alternatives 1 through 5 to No Action Alternative**

Alternative	Potential Change	Consideration for Mitigation Measures
Alternative 1	Agricultural and M&I water-related employment would be similar. M&I water supply operating expenses would be similar. Recreational economic factors would increase or be similar related to use of reservoirs that store CVP and SWP water.	None needed
Alternative 2	No effects on socioeconomic factors.	None needed
Alternative 3	Agricultural and M&I water-related employment would be similar. M&I water supply operating expenses would be similar. Recreational economic factors would increase or be similar related to use of reservoirs that store CVP and SWP water. Reduced recreational economic factors related to Striped Bass fishing. Reduced commercial and sport ocean salmon fishing due to increased harvest limitations.	None identified at this time to reduce economic effects of reduced Striped Bass fishing and ocean salmon.
Alternative 4	Same effects as described for Alternative 1 compared to the No Action Alternative for non-recreational economic factors. Reduced recreational economic factors related to Striped Bass fishing. Reduced commercial and sport ocean salmon fishing due to increased harvest limitations.	None identified at this time to reduce economic effects of reduced Striped Bass fishing or ocean salmon fishing.
Alternative 5	Agricultural and M&I water-related employment would be similar. M&I water supply operating expenses would be similar. Recreational economic factors would be similar related to use of reservoirs that store CVP and SWP water.	None needed

2 Note: Due to the limitations and uncertainty in the CalSim II monthly model and other analytical tools,  
 3 incremental differences of 5 percent or less between alternatives and the No Action Alternative are considered  
 4 to be "similar."

1 **Table 19.133 Comparison of No Action Alternative and Alternatives 1 through 5 to**  
 2 **Second Basis of Comparison**

Alternative	Potential Change	Consideration for Mitigation Measures
No Action Alternative	Agricultural and M&I water-related employment would be similar. M&I water supply operating expenses would be similar. Recreational economic factors would decrease at San Luis Reservoir and at of reservoirs that store CVP and SWP water in the San Francisco Bay Area and Central Coast regions.	Not considered for this comparison.
Alternative 1	No effects on socioeconomic factors.	Not considered for this comparison.
Alternative 2	Same effects as described for No Action Alternative as compared to the Second Basis of Comparison.	Not considered for this comparison.
Alternative 3	Agricultural and M&I water-related employment would be similar. M&I water supply operating expenses would be similar. Recreational economic factors would be similar related to use of reservoirs that store CVP and SWP water. Reduced recreational economic factors related to Striped Bass fishing. Reduced commercial and sport ocean salmon fishing due to increased harvest limitations. Recreational economic factors would be similar.	Not considered for this comparison.
Alternative 4	No effects on non-recreational socioeconomic factors. Reduced recreational economic factors related to Striped Bass fishing. Reduced commercial and sport ocean salmon fishing due to increased harvest limitations.	Not considered for this comparison.
Alternative 5	Agricultural and M&I water-related employment would be similar. M&I water supply operating expenses would be similar. Recreational economic factors would decrease at San Luis Reservoir and at of reservoirs that store CVP and SWP water in the San Francisco Bay Area, Central Coast, and Southern California regions. Reduced recreational economic factors related to Striped Bass fishing. Reduced commercial and sport ocean salmon fishing due to increased harvest limitations.	Not considered for this comparison.

3 Note: Due to the limitations and uncertainty in the CalSim II monthly model and other analytical tools,  
 4 incremental differences of 5 percent or less between alternatives and the No Action Alternative are considered  
 5 to be "similar."

1     **19.4.3.8 Potential Mitigation Measures**

2 Mitigation measures are presented in this section to avoid, minimize, rectify,  
3 reduce, eliminate, or compensate for adverse environmental effects of  
4 Alternatives 1 through 5 as compared to the No Action Alternative. Mitigation  
5 measures were not included to address adverse impacts under the alternatives as  
6 compared to the Second Basis of Comparison because this analysis was included  
7 in this EIS for information purposes only.

8 Changes in CVP and SWP operations under Alternatives 1 through 5 as compared  
9 to the No Action Alternative would not result in adverse changes in  
10 socioeconomic factors related to the average annual agricultural production or  
11 M&I water supply operating expenses as compared to the No Action Alternative.  
12 However, implementation of Alternatives 3 and 4 would result in adverse changes  
13 in recreational Striped Bass and sport ocean salmon fishing opportunities.

14     **19.4.3.8.1 Recreational Fishing Opportunities**

15 Under Alternatives 3 and 4, fishing opportunities for Striped Bass and commercial  
16 and sport ocean salmon fishing would be reduced as compared to the No Action  
17 Alternative. Mitigation measures are not identified at this time to reduce the  
18 impact to the Striped Bass and ocean salmon fishing opportunities.

19     **19.4.3.9 Cumulative Effects Analysis**

20 As described in Chapter 3, the cumulative effects analysis considers projects,  
21 programs, and policies that are not speculative; and are based upon known or  
22 reasonably foreseeable long-range plans, regulations, operating agreements, or  
23 other information that establishes them as reasonably foreseeable.

24 The cumulative effects analysis Alternatives 1 through 5 for Socioeconomics are  
25 summarized in Table 19.134.

1 **Table 19.134 Summary of Cumulative Effects on Socioeconomics of Alternatives 1**  
 2 **through 5 as Compared to the No Action Alternative**

Scenarios	Actions	Cumulative Effects of Actions
<p>Past &amp; Present, and Future Actions included in the No Action Alternative and in all Alternatives in Year 2030</p>	<p>Consistent with Affected Environment conditions plus:</p> <p>Actions in the 2008 USFWS BO and 2009 NMFS BO that would have occurred without implementation of the Biological Opinions, as described in Section 3.3.1.2 (of Chapter 3, Descriptions of Alternatives), including climate change and sea level rise</p> <p>Actions not included in the 2008 USFWS BO and 2009 NMFS BO that would have occurred without implementation of the Biological Opinions, as described in Section 3.3.1.3 (of Chapter 3, Descriptions of Alternatives):</p> <ul style="list-style-type: none"> <li>• Implementation of Federal and state policies and programs, including Clean Water Act (e.g., Total Maximum Daily Loads); Safe Drinking Water Act; Clean Air Act; and flood management programs</li> <li>• General plans for 2030.</li> <li>• Trinity River Restoration Program.</li> <li>• Central Valley Project Improvement Act programs</li> <li>• Folsom Dam Water Control Manual Update</li> <li>• FERC Relicensing for the Middle Fork of the American River Project</li> <li>• San Joaquin River Restoration Program</li> <li>• Contra Loma Recreation Resource Management Plan</li> <li>• San Luis Reservoir State Recreation Area Resource Management Plan/General Plan</li> </ul>	<p><u>These effects would be the same in all alternatives.</u></p> <p>Climate change and sea level rise and development under the general plans are anticipated to reduce carryover storage in reservoirs in a manner that would reduce CVP and SWP water supply availability and recreational opportunities at some reservoirs that store CVP and SWP water, and could reduce the opportunities for ocean salmon fishing.</p> <p>Other actions, including restoration projects, FERC relicensing projects, and some future projects to improve water quality and/or habitat are anticipated to improve recreational opportunities and salmon populations that could improve ocean salmon fishing.</p>
<p>Future Actions considered as Cumulative Effects Actions in all Alternatives in Year 2030</p>	<p>Actions as described in Section 3.5 (of Chapter 3, Descriptions of Alternatives):</p> <ul style="list-style-type: none"> <li>• Bay-Delta Water Quality Control Plan Update</li> <li>• FERC Relicensing Projects</li> <li>• Bay Delta Conservation Plan (including the California WaterFix alternative)</li> <li>• Shasta Lake Water Resources, North-of-the-Delta Offstream Storage, Los Vaqueros Reservoir Expansion Phase 2, and Upper San Joaquin River Basin Storage Investigations</li> </ul>	<p><u>These effects would be the same in all alternatives.</u></p> <p>Some of the future reasonably foreseeable actions to improve water quality and FERC Relicensing projects could improve recreational opportunities and salmon populations that could improve ocean salmon fishing.</p> <p>Other actions, such as expanded or new reservoirs would improve water supply availability and recreational opportunities.</p>

Scenarios	Actions	Cumulative Effects of Actions
	<ul style="list-style-type: none"> <li>• El Dorado Water and Power Authority Supplemental Water Rights Project</li> <li>• Semitropic Water Storage District Delta Wetlands</li> <li>• North Bay Aqueduct Alternative Intake</li> <li>• Irrigated Lands Regulatory Program</li> </ul>	
<p>No Action Alternative with Associated Cumulative Effects Actions in Year 2030</p>	<p>Full implementation of the 2008 USFWS BO and 2009 NMFS BO</p>	<p>Implementation of No Action Alternative would result in changes stream flows. Changes in stream flows would in turn in changes in water supply availability, recreational opportunities, and salmon populations. Changes in salmon populations would affect ocean salmon fishing as compared to historical conditions prior to the BOs.</p>
<p>Alternative 1 with Associated Cumulative Effects Actions in Year 2030</p>	<p>No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant)</p>	<p>Implementation of Alternative 1 with reasonably foreseeable actions would result in similar agricultural and M&amp;I water supply economics, and similar or improved reservoir recreational opportunities compared to the No Action Alternative with these added actions.</p>
<p>Alternative 2 with Associated Cumulative Effects Actions in Year 2030</p>	<p>Full implementation of the 2008 USFWS BO and 2009 NMFS BO CVP and SWP operational actions No implementation of structural improvements or other actions that require further study to develop a more detailed action description.</p>	<p>Implementation of Alternative 2 with reasonably foreseeable actions for recreational opportunities would be the same as for the No Action Alternative with these added actions.</p>
<p>Alternative 3 with Associated Cumulative Effects Actions in Year 2030</p>	<p>No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant) Slight increase in positive Old and Middle River flows in the winter and spring months Increased bag limits for Striped Bass and Pikeminnow Increased ocean salmon fishing harvest limitations</p>	<p>Implementation of Alternative 3 with reasonably foreseeable actions would result in similar agricultural and M&amp;I water supply economics, and similar or improved reservoir recreational opportunities as for the No Action Alternative with these added actions. Recreational opportunities related to Striped Bass fishing would initially be increased; however by 2030 recreational fishing related to Striped Bass would be reduced. Opportunities related to commercial and sport ocean salmon fishing would be reduced.</p>

<b>Scenarios</b>	<b>Actions</b>	<b>Cumulative Effects of Actions</b>
Alternative 4 with Associated Cumulative Effects in Year 2030	<p>No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant)</p> <p>Increased bag limits for Striped Bass and Pikeminnow</p> <p>Increased ocean salmon fishing harvest limitations</p>	<p>Implementation of Alternative 4 with these reasonably foreseeable actions would result in similar agricultural and M&amp;I water supply economics, and similar or improved reservoir recreational opportunities as for the No Action Alternative with these added actions.</p> <p>Recreational opportunities related to Striped Bass fishing would initially be increased; however by 2030 recreational fishing related to Striped Bass would be reduced.</p> <p>Opportunities related to commercial and sport ocean salmon fishing would be reduced.</p>
Alternative 5 with Associated Cumulative Effects in Year 2030	<p>Full implementation of the 2008 USFWS BO and 2009 NMFS BO</p> <p>Positive Old and Middle River flows and increased Delta outflow in spring months</p>	<p>Implementation of Alternative 5 with reasonably foreseeable actions would result in similar agricultural and M&amp;I water supply economics, and similar reservoir recreational opportunities as for the No Action Alternative with these added actions.</p>

## Chapter 20

# 1 Indian Trust Assets

## 2 20.1 Introduction

3 This chapter describes Indian Trust Assets (ITAs) in the study area and potential  
 4 changes that could occur as a result of implementing the alternatives evaluated in  
 5 this Environmental Impact Statement (EIS). Implementation of the alternatives  
 6 could affect ITAs through potential changes to the operation of the Central Valley  
 7 Project (CVP) and State Water Project (SWP) and ecosystem restoration.

## 8 20.2 Regulatory Environment and Compliance 9 Requirements

10 Potential actions that could be implemented under the alternatives evaluated in  
 11 this EIS could affect ITAs in the areas along the rivers and reservoirs directly  
 12 impacted by changes in the operation of CVP or SWP reservoirs and in the  
 13 vicinity of lands served by CVP and SWP water supplies. Actions located on  
 14 public agency lands, or implemented, funded, or approved by Federal and state  
 15 agencies, would need to be compliant with appropriate Federal and state agency  
 16 policies and regulations, as summarized in Chapter 4, Approach to Environmental  
 17 Analyses.

18 The Federal Indian Trust Asset policies, summarized below and in Chapter 4,  
 19 have been used to identify potential areas of change to ITAs that could occur due  
 20 to changes in long-term operation of the CVP and/or SWP facilities.

21 The ITAs are legal interests in property held in trust by the U.S. for federally-  
 22 recognized Indian tribes or individual Indians. An Indian trust has three  
 23 components: (1) the trustee, (2) the beneficiary, and (3) the trust asset. ITAs can  
 24 include land, minerals, federally-reserved hunting and fishing rights, federally-  
 25 reserved water rights, and in-stream flows associated with trust land.  
 26 Beneficiaries of the Indian trust relationship are federally-recognized Indian tribes  
 27 with trust land; the U.S. is the trustee. By definition, ITAs cannot be sold, leased,  
 28 or otherwise encumbered without approval of the U.S. The characterization and  
 29 application of the U.S. trust relationship have been defined by case law that  
 30 interprets Congressional acts, executive orders, and historic treaty provisions.

31 The federal government, through treaty, statute or regulation, may take on  
 32 specific, enforceable fiduciary obligations that give rise to a trust responsibility to  
 33 federally recognized tribes and individual Indians possessing trust assets. Courts  
 34 have recognized an enforceable federal fiduciary duty with respect to federal  
 35 supervision of Indian money or natural resources, held in trust by the federal  
 36 government, where specific treaties, statutes or regulations create such a  
 37 fiduciary duty.

1 Consistent with President William J. Clinton’s 1994 memorandum, “Government-  
 2 to-Government Relations with Native American Tribal Governments,” Bureau of  
 3 Reclamation (Reclamation) assesses the effect of its programs on tribal trust  
 4 resources and federally-recognized tribal governments. Reclamation is tasked to  
 5 actively engage federally-recognized tribal governments and consult with such  
 6 tribes on government-to-government level when its actions affect ITAs (Federal  
 7 Register, Vol. 59, No. 85, May 4, 1994, pages 22951-22952). The U.S.  
 8 Department of the Interior (DOI) Departmental Manual Part 512.2 ascribes the  
 9 responsibility for ensuring protection of ITAs to the heads of bureaus and offices.  
 10 DOI is required to carry out activities in a manner that protects ITAs and avoids  
 11 adverse effects whenever possible.

12 **20.3 Affected Environment**

13 The U.S. Government's trust responsibility for Indian resources requires  
 14 Reclamation and other agencies to take measures to protect and maintain trust  
 15 resources. These responsibilities include taking reasonable actions to preserve  
 16 and restore tribal resources.

17 In compliance with 36 Code of Federal Register 800.4(a) (4), Reclamation sent  
 18 letters to the federally-recognized Indian tribes in the study area, including most  
 19 of the tribes listed in Table 20.1, to request their input regarding the identification  
 20 of any properties to which they might attach religious and cultural significance to  
 21 within the area of potential effect.

22 **Table 20.1 Federally Recognized Tribes in the Vicinity of the Study Area**

Federally Recognized Tribe	EIS Geographical Region	County	In the Vicinity of this Community
Hoopa Valley Tribal Council	Trinity River	Trinity and Humboldt	Hoopa
Resighini Rancheria Tribe	Trinity River	Del Norte	Klamath
Yurok Tribe of the Yurok Reservation	Trinity River	Trinity, Humboldt, and Del Norte	Klamath
Pit River Tribe	Central Valley	Shasta	Burney
Redding Rancheria Tribe	Central Valley	Shasta	Redding
Paskenta Band of Nomlaki Indians of California	Central Valley	Tehama and Glenn	Corning and Orland
Grindstone Indian Rancheria of Wintun-Wailaki Indians of California	Central Valley	Glenn	Elk Creek

<b>Federally Recognized Tribe</b>	<b>EIS Geographical Region</b>	<b>County</b>	<b>In the Vicinity of this Community</b>
Cachil Dehe Band of Wintun Indians of the Colusa Indian Community of the Colusa Rancheria	Central Valley	Colusa	Colusa
Cortina Indian Rancheria of Wintun Indians of California	Central Valley	Colusa	Williams
Tyme Maidu of Berry Creek Rancheria	Central Valley	Butte	Oroville
Konkow Maidu of Mooretown Rancheria	Central Valley	Butte	Oroville
Enterprise Rancheria of Maidu Indians of California	Central Valley	Butte	Oroville
Mechoopda Indian Tribe of Chico Rancheria	Central Valley	Butte	Chico
Miwok Maidu United Auburn Indian Community of the Auburn Rancheria	Central Valley	Placer	Placer
United Auburn Indian Community of the Auburn Rancheria of California	Central Valley	Placer	Rocklin
Shingle Springs Band of Miwok Indians, including Shingle Springs Rancheria	Central Valley	El Dorado and Nevada County	Shingle Springs
Buena Vista Rancheria of Me-Wuk	Central Valley	Sacramento	Sacramento
Wilton Miwok Indians of the Wilton Rancheria	Central Valley	Sacramento	Elk Grove
Yocha Dehe Wintun Nation	Central Valley	Yolo	Brooks
Northfork Rancheria of Mono Indians of California	Central Valley	Madera	North Fork
Picayune Rancheria of Chukchansi Indians of California	Central Valley	Madera	Coarsegold
California Valley Miwok Tribe	Central Valley	San Joaquin	Stockton
Big Sandy Rancheria of Mono Indians of California	Central Valley	Fresno	Auberry

Chapter 20: Indian Trust Assets

<b>Federally Recognized Tribe</b>	<b>EIS Geographical Region</b>	<b>County</b>	<b>In the Vicinity of this Community</b>
Table Mountain Rancheria	Central Valley	Fresno	Friant
Santa Rosa Indian Community of Santa Rosa Rancheria	Central Valley	Kings	Lemoore
Tule River Indian Tribe of the Tule River Reservation of the Yokut Indians	Central Valley	Tulare	Porterville
Santa Ynez Band of Chumash Mission Indians of Santa Ynez Reservation	Central Coast	Santa Barbara	Santa Ynez
Cahuilla Band of Mission Indians of the Cahuilla Reservation	Southern California	San Diego	Anza
Campo Band of Diegueno Mission Indians of the Campo Indian Reservation	Southern California	San Diego	Campo
Capitan Grande Band of Diegueno Mission Indians of California (Barona Reservation and Viejas Reservation)	Southern California	San Diego	Alpine
Ewiiapaayp Band of Kumeyaay Indians	Southern California	San Diego	Alpine
Iipay Nation of Santa Ysabel	Southern California	San Diego	Santa Ysabel
Inaja Band of Diegueno Mission Indians of the Inaja and Cosmit Reservation	Southern California	San Diego	Escondido
Jamul Indian Village of California	Southern California	San Diego	Jamul
La Jolla Band of Luiseño Indians	Southern California	San Diego	Pauma Valley
La Posta Band of Diegueno Mission Indians of the La Posta Indian Reservation	Southern California	San Diego	Boulevard
Los Coyotes Band of Cahuilla and Cupeno Indians	Southern California	San Diego	Warner Springs

<b>Federally Recognized Tribe</b>	<b>EIS Geographical Region</b>	<b>County</b>	<b>In the Vicinity of this Community</b>
Manzanita Band of Diegueno Mission Indians of the Manzanita Reservation	Southern California	San Diego	Boulevard
Mesa Grande Band of Diegueno Mission Indians of the Mesa Grande Reservation	Southern California	San Diego	Santa Ysabel
Pala Band of Luiseño Mission Indians of the Pala Reservation	Southern California	San Diego	Pala
Pauma Band of Luiseño Mission Indians of the Pauma & Yuima Reservation	Southern California	San Diego	Pauma Valley
Rincon Band of Luiseño Mission Indians of the Rincon Reservation	Southern California	San Diego	Valley Center
San Pasqual Band of Diegueno Mission Indians of California	Southern California	San Diego	Valley Center
Sycuan Band of the Kumeyaay Nation	Southern California	San Diego	El Cajon
Agua Caliente Band of Cahuilla Indians of the Agua Caliente Indian Reservation	Southern California	Riverside	Palm Springs
Augustine Band of Cahuilla Indians	Southern California	Riverside	Coachella
Cabazon Band of Mission Indians	Southern California	Riverside	Indio
Morongo Band of Mission Indians	Southern California	Riverside	Banning
Pechanga Band of Luiseño Mission Indians of the Pechanga Reservation	Southern California	Riverside	Temecula
Ramona Band of Cahuilla	Southern California	Riverside	Anza
Santa Rosa Band of Cahuilla Indians	Southern California	Riverside	Mountain Center
Soboba Band of Luiseño Indians	Southern California	Riverside	San Jacinto

<b>Federally Recognized Tribe</b>	<b>EIS Geographical Region</b>	<b>County</b>	<b>In the Vicinity of this Community</b>
Torres-Martinez Desert Cahuilla Indians	Southern California	Riverside	Thermal
Twenty-Nine Palms Band of Mission Indians of California	Southern California	Riverside and San Bernardino	Coachella
Chemehuevi Indian Tribe of the Chemehuevi Reservation	Southern California	San Bernardino	Needles
San Manuel Band of Mission Indians	Southern California	San Bernardino	Highland
Big Lagoon Rancheria	Not within study area	Humboldt	Arcata
Blue Lake Rancheria	Not within study area	Humboldt	Blue Lake
Karuk Tribe	Not within study area	Siskiyou	Happy Camp
Greenville Rancheria of Maidu Indians	Not within study area	Plumas and Tehama	Greenville
Susanville Indian Rancheria	Not within study area	Lassen	Susanville
Lytton Rancheria	Not within study area	Sonoma	Santa Rosa
Chicken Ranch Rancheria of Me-Wuk Indians of California	Not within study area	Tuolumne	Jamestown
Cold Springs Rancheria of Mono Indians	Not within study area	Fresno	Tollhouse
Colorado River Indian Tribes of the Colorado River Indian Reservation	Not within study area	Riverside	Parker, Arizona

1 **20.4 Impact Analysis**

2 This section describes the potential mechanisms for change to ITAs, quantitative  
 3 and qualitative analytical methods, effects of the analyses, potential mitigation  
 4 measures, and cumulative effects.

1 **20.4.1 Potential Mechanisms for Change and Analytical Tools**

2 As described in Chapter 4, Approach to Environmental Analysis, the  
3 environmental consequences assessment considers changes in conditions related  
4 to changes in CVP and SWP operation under the alternatives as compared to the  
5 No Action Alternative and Second Basis of Comparison.

6 Changes in CVP and SWP operation under the alternatives as compared to the No  
7 Action Alternative and Second Basis of Comparison could change water  
8 elevations within the CVP and SWP reservoirs, flow patterns in the rivers  
9 downstream of CVP and SWP reservoirs, and CVP and SWP water deliveries.  
10 Impacts to existing ITAs would be considered adverse if the action:

- 11 • Interfered with the exercise of a federally reserved water right, or degrade  
12 water quality where there is a federally reserved water right
- 13 • Interfered with the use, value, occupancy, character or enjoyment of an ITA
- 14 • Failed to protect ITAs from loss, damage, waste, depletion, or other negative  
15 effects

16 **20.4.1.1 Changes in CVP and SWP Reservoir Elevation**

17 There are no ITAs within any of the reservoir inundation areas (DWR 2005;  
18 Reclamation 2010, 2012, 2013a, 2014a; Reclamation et al. 2011; USACE et al.  
19 2012). Therefore, the changes in reservoir elevations would not affect ITAs and  
20 are not analyzed in this EIS.

21 **20.4.1.2 Changes in Rivers Downstream of CVP and SWP Reservoirs**

22 There are no ITAs within the rivers downstream of CVP and SWP reservoirs  
23 (DWR 2005; Reclamation 2010, 2012, 2013a, 2014a; Reclamation et al. 2011;  
24 USACE et al. 2012). Therefore, changes in river flow patterns would not directly  
25 affect any ITAs. However, changes in river flow patterns in the Trinity River  
26 could indirectly affect several ITAs, including the Hoopa Valley Tribe, Resighini  
27 Rancheria Tribe, and Yurok Tribe of the Yurok Reservation. Changes in the river  
28 flow patterns could affect use of the Trinity River for boats, access to adjacent  
29 lands, and fish in the Trinity River that are important to the tribes.

30 As described in Chapter 5, Surface Water Resources and Water Supplies,  
31 implementation of Alternatives 1 through 5 as compared to the No Action  
32 Alternative and the Second Basis of Comparison, and the No Action Alternative  
33 as compared to the Second Basis of Comparison could affect change river flow  
34 patterns in the Trinity River.

35 **20.4.1.3 Changes due to CVP and SWP Water Deliveries**

36 There are no ITAs that directly receive CVP or SWP water. As described in  
37 Chapter 19, Socioeconomics, municipalities that use CVP or SWP water supplies,  
38 including agencies that serve ITAs, would continue to meet water demands in  
39 2030 if CVP and SWP water supplies are reduced through the increased use of  
40 non-CVP and SWP water supplies. Therefore, changes in CVP and SWP water

1 deliveries would not affect water supplies to ITAs and are not analyzed in this  
2 EIS.

3 **20.4.1.4 Effects Related to Cross Delta Water Transfers**

4 Cross Delta water transfers involving the CVP and SWP facilities or water  
5 supplies would be required to be implemented in accordance with all existing  
6 regulations and requirements, including not causing adverse impacts to other  
7 water users in accordance with the requirements of Reclamation, California  
8 Department of Water Resources (DWR), and the State Water Resources Control  
9 Board (SWRCB).

10 Reclamation recently prepared a long-term regional water transfer environmental  
11 document which evaluated potential changes in surface water conditions related to  
12 water transfer actions (Reclamation 2014d). Results from this analysis were used  
13 to inform the impact assessment of potential effects of water transfers under the  
14 alternatives as compared to the No Action Alternative and the Second Basis of  
15 Comparison.

16 The transfers could change flow patterns in rivers downstream of CVP and SWP  
17 reservoirs. Surface water elevations in CVP and SWP reservoirs due to transfer  
18 programs under the alternatives and Second Basis of Comparison could be  
19 affected for a short-time during a water year; however, because the transferred  
20 water would have been released for the seller's use, the end of September storage  
21 elevations would be similar with or without the transfer.

22 **20.4.2 Conditions in Year 2030 without Implementation of**  
23 **Alternatives 1 through 5**

24 The impact analysis in this EIS is based upon the comparison of the alternatives to  
25 the No Action Alternative and the Second Basis of Comparison in the Year 2030.  
26 Many of the changed conditions would occur in the same manner under both the  
27 No Action Alternative and the Second Basis of Comparison (e.g., climate change,  
28 sea-level rise, general plan development, and implementation of reasonable and  
29 foreseeable projects). Due to these changes, especially climate change and sea-  
30 level rise, it is anticipated that reservoir elevations at the end of September would  
31 be lower and flows patterns in the rivers downstream of the reservoirs would be  
32 different than under recent condition, as described in Chapter 5, Surface Water  
33 Resources and Water Supplies.

34 **20.4.3 Evaluation of Alternatives**

35 As described in Chapter 4, Approach to Environmental Analysis, Alternatives 1  
36 through 5 have been compared to the No Action Alternative, and the No Action  
37 Alternative and Alternatives 1 through 5 have been compared to the Second Basis  
38 of Comparison. The evaluation of alternatives is focused on the Trinity River  
39 Region because, as discussed above, potential changes that could affect ITAs are  
40 located along the Trinity River.

41 During review of the numerical modeling analyses used in this EIS, an error was  
42 determined in the CalSim II model assumptions related to the Stanislaus River

1 operation for the Second Basis of Comparison, Alternative 1, and Alternative 4  
 2 model runs. Appendix 5C includes a comparison of the CalSim II model run  
 3 results presented in this chapter and CalSim II model run results with the error  
 4 corrected. Appendix 5C also includes a discussion of changes in the comparison  
 5 of four alternative analyses:

- 6 • No Action Alternative compared to the Second Basis of Comparison
- 7 • Alternative 1 compared to the No Action Alternative
- 8 • Alternative 3 compared to the Second Basis of Comparison
- 9 • Alternative 5 compared to the Second Basis of Comparison

#### 10 **20.4.3.1 No Action Alternative**

11 As described in Chapter 4, Approach to Environmental Analysis, the No Action  
 12 Alternative is compared to the Second Basis of Comparison.

##### 13 **20.4.3.1.1 Potential Changes in Trinity River downstream of Lewiston Dam**

14 As described in Chapter 5, Surface Water Resources and Water Supplies, the  
 15 following changes would occur on the Trinity River under the No Action  
 16 Alternative as compared to the Second Basis of Comparison.

- 17 • Over long-term conditions (over the 82-year analysis period), flows would be  
 18 similar (within 5 percent) from March through November, and reduced from  
 19 December through February (up to 9.5 percent; 70 cubic feet per second  
 20 [cfs]).
- 21 • In wet years, flows would be similar from April through November, and  
 22 reduced from December through March (up to 11.2 percent; 160 cfs).
- 23 • In above normal years, flows would be similar from March through  
 24 November, and reduced in January and February (up to 19.9 percent; 74 cfs).
- 25 • In below normal years, flows would be similar from March through January,  
 26 and reduced in February (30.4 percent, 192 cfs).
- 27 • In dry and Critical dry years, flows would be similar all months.

28 The changes in river flows would occur in the winter months of wetter years when  
 29 potential use of the rivers would be less for transportation and ceremonies  
 30 (USFWS et al. 1999). As described in Chapter 9, Fish and Aquatic Resources,  
 31 these changes in river flows would result in similar conditions for salmonids using  
 32 Trinity River. Therefore, there would be no effect the ITAs.

##### 33 **20.4.3.1.2 Effects Related to Cross Delta Water Transfers**

34 As described in Chapter 5, Surface Water Resources and Water Supplies, and  
 35 Chapter 7, Groundwater Resources and Groundwater Quality, potential effects on  
 36 surface water resources could be similar to those identified in a recent  
 37 environmental analysis conducted by Reclamation for long-term water transfers  
 38 from the Sacramento Valley to San Joaquin Valley (Reclamation 2014d).  
 39 Potential effects were identified as reduced surface water storage in upstream  
 40 reservoirs; changes in flow patterns in rivers downstream of the reservoirs if water

1 was released from the reservoirs in patterns that were different than would have  
2 been used by the sellers; and groundwater elevation reductions if groundwater  
3 substitution was used to provide the water for the transfers. All water transfers  
4 would be required to avoid adverse impacts on other water users and biological  
5 resources; and water transfer programs would include groundwater mitigation and  
6 monitoring plans (see Section 3.A.6.3, Transfers). Therefore, water transfer  
7 programs would need to be implemented in a manner that would avoid impacts  
8 associated with changes in Trinity Lake storage, Trinity River flow patterns, and  
9 groundwater elevation reductions in the Central Valley that could affect ITAs.  
10 For the purposes of this EIS, it is anticipated that similar conditions would occur  
11 due to cross Delta water transfers under the No Action Alternative as compared to  
12 the Second Basis of Comparison, and there would be no effect on the ITAs due to  
13 cross Delta water transfers.

#### 14 **20.4.3.2 Alternative 1**

15 Alternative 1 is identical to the Second Basis of Comparison. Alternative 1 is  
16 compared to the No Action Alternative and the Second Basis of Comparison.  
17 However, because conditions under Alternative 1 are identical to conditions under  
18 the Second Basis of Comparison, Alternative 1 is only compared to the No Action  
19 Alternative.

#### 20 **20.4.3.2.1 Alternative 1 Compared to the No Action Alternative**

##### 21 *Potential Changes in Trinity River downstream of Lewiston Dam*

22 As described in Chapter 5, Surface Water Resources and Water Supplies, the  
23 following changes would occur on the Trinity River under Alternative 1 and the  
24 No Action Alternative.

- 25 • Over long-term conditions, flows would be similar from March through  
26 November, and increased from December through February (up to  
27 10.5 percent, 86 cfs).
- 28 • In wet years, flows would be similar from April through November, and  
29 increased from December through March (up to 12.6 percent, 160 cfs).
- 30 • In above normal years, flows would be similar from March through  
31 November, and increased in January and February (up to 24.8 percent; 74 cfs).
- 32 • In below normal years, flows would be similar from March through January,  
33 and increased in February (30.4 percent, 192 cfs).
- 34 • In dry and critical dry years, flows would be similar all months.

35 The changes in river flows would increase flows in the Trinity River under  
36 Alternative 1 as compared to the No Action Alternative. As described in  
37 Chapter 9, Fish and Aquatic Resources, these changes in river flows would result  
38 in similar conditions for salmonids using Trinity River. Therefore, there would be  
39 no effect on the ITAs.

1 *Effects Related to Cross Delta Water Transfers*  
 2 As described in Chapter 5, Surface Water Resources and Water Supplies, and  
 3 Chapter 7, Groundwater Resources and Groundwater Quality, potential effects on  
 4 surface water resources could be similar to those identified in a recent  
 5 environmental analysis conducted by Reclamation for long-term water transfers  
 6 from the Sacramento to San Joaquin valleys (Reclamation 2014d). Potential  
 7 effects were identified as reduced surface water storage in upstream reservoirs;  
 8 changes in flow patterns in rivers downstream of the reservoirs if water was  
 9 released from the reservoirs in patterns that were different than would have been  
 10 used by the seller; and groundwater elevation reductions if groundwater  
 11 substitution was used to provide the water for the transfers. All water transfers  
 12 would be required to avoid adverse impacts on other water users and biological  
 13 resources; and water transfer programs would include groundwater mitigation and  
 14 monitoring plans (see Section 3.A.6.3, Transfers). Therefore, water transfer  
 15 programs would need to be implemented in a manner that would avoid impacts  
 16 associated with changes in Trinity Lake storage, Trinity River flow patterns, and  
 17 groundwater elevation reductions in the Central Valley that could affect ITAs.  
 18 For the purposes of this EIS, it is anticipated that similar conditions would occur  
 19 due to cross Delta water transfers under Alternative 1 as compared to the No  
 20 Action Alternative, and there would be no effect on the ITAs due to cross Delta  
 21 water transfers.

#### 22 **20.4.3.2.2 Alternative 1 Compared to the Second Basis of Comparison**

23 Alternative 1 is identical to the Second Basis of Comparison.

#### 24 **20.4.3.3 Alternative 2**

25 The ITA conditions under Alternative 2 would be identical to the conditions under  
 26 the No Action Alternative; therefore, Alternative 2 is only compared to the  
 27 Second Basis of Comparison.

#### 28 **20.4.3.3.1 Alternative 2 Compared to the Second Basis of Comparison**

29 Changes to ITAs under Alternative 2 as compared to the Second Basis of  
 30 Comparison would be the same as the impacts described in Section 20.4.3.1,  
 31 No Action Alternative.

#### 32 **20.4.3.4 Alternative 3**

33 CVP and SWP operation under Alternative 3 are similar to the Second Basis of  
 34 Comparison with modified Old and Middle River flow criteria and New Melones  
 35 Reservoir operation.

36 Alternative 3 would include changed water demands for American River water  
 37 supplies as compared to the No Action Alternative and Second Basis of  
 38 Comparison. Alternative 3 would provide water supplies of up to 17 thousand  
 39 acre feet (TAF)/year under a Warren Act Contract for El Dorado Irrigation  
 40 District and 15 TAF/year under a CVP water service contract for El Dorado  
 41 County Water Agency. These demands are not included in the analysis presented

1 in this section of the EIS. A sensitivity analysis comparing the results of the  
2 analysis with and without these demands is presented in Appendix 5B of this EIS.

3 **20.4.3.4.1 Alternative 3 Compared to the No Action Alternative**

4 *Potential Changes in Trinity River downstream of Lewiston Dam*

5 As described in Chapter 5, Surface Water Resources and Water Supplies, the  
6 following changes would occur on the Trinity River under Alternative 3 as  
7 compared to the No Action Alternative.

- 8 • Over long-term conditions, flows would be similar from March through  
9 November, and increased from December through February (up to  
10 11.8 percent, 79 cfs).
- 11 • In wet years, flows would be similar from April through October, reduced in  
12 November (7.0 percent, 36 cfs), and increased from December through March  
13 (up to 15.0 percent, 193 cfs).
- 14 • In above normal years, flows would be similar from March through  
15 November, and increased in January and February (up to 24.8 percent; 74 cfs).
- 16 • In dry years, flows would be similar in all months.

17 However, as described in Chapter 9, Fish and Aquatic Resources, these changes  
18 in river flows would result in similar conditions for salmonids using Trinity River,  
19 and there would be no effect on the ITAs.

- 20 • In above normal years, flows would be similar from March through  
21 December, and increased in January and February (up to 22.5 percent; 67 cfs).
- 22 • In below normal years, flows would be similar from March through January,  
23 and increased in February (43.3 percent, 192 cfs).
- 24 • In dry years, flows would be similar all months.
- 25 • In Critical dry years, flows would be similar from December through October,  
26 and increased in November (20.0 percent, 50 cfs).

27 The changes in river flows would increase flows in the Trinity River under  
28 Alternative 3 as compared to the No Action Alternative. As described in  
29 Chapter 9, Fish and Aquatic Resources, these changes in river flows would result  
30 in similar conditions for salmonids using Trinity River. Therefore, there would be  
31 no effect on the ITAs.

32 *Effects Related to Cross Delta Water Transfers*

33 As described in Chapter 5, Surface Water Resources and Water Supplies, and  
34 Chapter 7, Groundwater Resources and Groundwater Quality, potential effects on  
35 surface water resources could be similar to those identified in a recent  
36 environmental analysis conducted by Reclamation for long-term water transfers  
37 from the Sacramento to San Joaquin valleys (Reclamation 2014d). Potential  
38 effects were identified as: reduced surface water storage in upstream reservoirs;  
39 changes in flow patterns in river downstream of the reservoirs if water was  
40 released from the reservoirs in patterns that were different than would have been

1 used by the sellers; and groundwater elevation reductions if groundwater  
 2 substitution was used to provide the water for the transfers. All water transfers  
 3 would be required to avoid adverse impacts on other water users and biological  
 4 resources; and water transfer programs would include groundwater mitigation and  
 5 monitoring plans (see Section 3.A.6.3, Transfers). Therefore, water transfer  
 6 programs would need to be implemented in a manner that would avoid impacts  
 7 associated with changes in Trinity Lake storage, Trinity River flow patterns, and  
 8 groundwater elevation reductions in the Central Valley that could affect ITAs.  
 9 For the purposes of this EIS, it is anticipated that similar conditions would occur  
 10 due to cross Delta water transfers under Alternative 3 as compared to the No  
 11 Action Alternative, and there would be no effect on the ITAs due to cross Delta  
 12 water transfers.

#### 13 **20.4.3.4.2 Alternative 3 Compared to the Second Basis of Comparison**

##### 14 *Potential Changes in Trinity River downstream of Lewiston Dam*

15 As described in Chapter 5, Surface Water Resources and Water Supplies, under  
 16 Alternative 3 as compared to the Second Basis of Comparison, flows would be  
 17 similar under long-term conditions and all water year types. As described in  
 18 Chapter 9, Fish and Aquatic Resources, there would be similar conditions for  
 19 salmonids using Trinity River. Therefore, there would be no effect on the ITAs.

##### 20 *Effects Related to Cross Delta Water Transfers*

21 As described in Chapter 5, Surface Water Resources and Water Supplies, and  
 22 Chapter 7, Groundwater Resources and Groundwater Quality, potential effects on  
 23 surface water resources could be similar to those identified in a recent  
 24 environmental analysis conducted by Reclamation for long-term water transfers  
 25 from the Sacramento to San Joaquin valleys (Reclamation 2014d). Potential  
 26 effects were identified as: reduced surface water storage in upstream reservoirs;  
 27 changes in flow patterns in river downstream of the reservoirs if water was  
 28 released from the reservoirs in patterns that were different than would have been  
 29 used by the sellers; and groundwater elevation reductions if groundwater  
 30 substitution was used to provide the water for the transfers. All water transfers  
 31 would be required to avoid adverse impacts on other water users and biological  
 32 resources; and water transfer programs would include groundwater mitigation and  
 33 monitoring plans (see Section 3.A.6.3, Transfers). Therefore, water transfer  
 34 programs would need to be implemented in a manner that would avoid impacts  
 35 associated with changes in Trinity Lake storage, Trinity River flow patterns, and  
 36 groundwater elevation reductions in the Central Valley that could affect ITAs.  
 37 For the purposes of this EIS, it is anticipated that similar conditions would occur  
 38 due to cross Delta water transfers under Alternative 3 as compared to the Second  
 39 Basis of Comparison, and there would be no effect on the ITAs due to cross Delta  
 40 water transfers.

#### 41 **20.4.3.5 Alternative 4**

42 The ITA conditions under Alternative 4 would be identical to the ITA conditions  
 43 under the Second Basis of Comparison; therefore, Alternative 4 is only compared  
 44 to the No Action Alternative.

1 **20.4.3.5.1 Alternative 4 Compared to the No Action Alternative**

2 Changes in ITA conditions under Alternative 4 as compared to the No Action  
3 Alternative would be the same as the impacts described in Section 20.4.3.2.1,  
4 Alternative 1 Compared to the No Action Alternative.

5 **20.4.3.6 Alternative 5**

6 The CVP and SWP operation under Alternative 5 are similar to the No Action  
7 Alternative with modified Old and Middle River flow criteria and New Melones  
8 Reservoir operation. Alternative 5 would include changed water demands for  
9 American River water supplies as compared to the No Action Alternative or  
10 Second Basis of Comparison. Alternative 5 would provide water supplies of up to  
11 17 TAF/year under a Warren Act Contract for El Dorado Irrigation District and  
12 15 TAF/year under a CVP water service contract for El Dorado County Water  
13 Agency. These demands are not included in the analysis presented in this section  
14 of the EIS. A sensitivity analysis comparing the results of the analysis with and  
15 without these demands is presented in Appendix 5B of this EIS.

16 **20.4.3.6.1 Alternative 5 Compared to the No Action Alternative**

17 *Potential Changes in Trinity River downstream of Lewiston Dam*

18 As described in Chapter 5, Surface Water Resources and Water Supplies, flows  
19 under Alternative 5 and the No Action Alternative would be similar under  
20 long-term conditions and all water year types. As described in Chapter 9, Fish  
21 and Aquatic Resources, there would be similar conditions for salmonids using  
22 Trinity River. Therefore, there would be no effect on the ITAs.

23 *Effects Related to Cross Delta Water Transfers*

24 As described in Chapter 5, Surface Water Resources and Water Supplies, and  
25 Chapter 7, Groundwater Resources and Groundwater Quality, potential effects on  
26 surface water resources could be similar to those identified in a recent  
27 environmental analysis conducted by Reclamation for long-term water transfers  
28 from the Sacramento to San Joaquin valleys (Reclamation 2014d). Potential  
29 effects were identified as: reduced surface water storage in upstream reservoirs;  
30 changes in flow patterns in river downstream of the reservoirs if water was  
31 released from the reservoirs in patterns that were different than would have been  
32 used by the sellers; and groundwater elevation reductions if groundwater  
33 substitution was used to provide the water for the transfers. All water transfers  
34 would be required to avoid adverse impacts on other water users and biological  
35 resources; and water transfer programs would include groundwater mitigation and  
36 monitoring plans (see Section 3.A.6.3, Transfers). Therefore, water transfer  
37 programs would need to be implemented in a manner that would avoid impacts  
38 associated with changes in Trinity Lake storage, Trinity River flow patterns, and  
39 groundwater elevation reductions in the Central Valley that could affect ITAs.  
40 For the purposes of this EIS, it is anticipated that similar conditions would occur  
41 due to cross Delta water transfers under Alternative 5 as compared to the No  
42 Action Alternative, and there would be no effect on the ITAs due to cross Delta  
43 water transfers.

1 **20.4.3.6.2 Alternative 5 Compared to the Second Basis of Comparison**

2 *Potential Changes in Trinity River downstream of Lewiston Dam*

3 As described in Chapter 5, Surface Water Resources and Water Supplies, the  
4 following changes would occur on the Trinity River flows under Alternative 5 and  
5 Second Basis of Comparison

- 6 • Over long-term conditions, flows would be similar from March through  
7 November and January, and reduced in December and February (up to  
8 9.6 percent, 200 cfs).
- 9 • In wet years, flows would be similar from April through November, and  
10 reduced in December through March (up to 13.9 percent).
- 11 • In above normal years, flows would be similar from April through December,  
12 and reduced in January and February (up to 19.9 percent, 74 cfs).
- 13 • In below normal years, flows would be similar from March through January,  
14 and reduced in February (up to 21.5 percent, 135 cfs).
- 15 • In dry and critical dry years, flows would be similar in all months.

16 However, as described in Chapter 9, Fish and Aquatic Resources, these changes  
17 in river flows would result in similar conditions for salmonids using Trinity River;  
18 and there would be no effect the ITAs.

19 *Effects Related to Cross Delta Water Transfers*

20 As described in Chapter 5, Surface Water Resources and Water Supplies, and  
21 Chapter 7, Groundwater Resources and Groundwater Quality, potential effects on  
22 surface water resources could be similar to those identified in a recent  
23 environmental analysis conducted by Reclamation for long-term water transfers  
24 from the Sacramento to San Joaquin valleys (Reclamation 2014d). Potential  
25 effects were identified as reduced surface water storage in upstream reservoirs  
26 and changes in flow patterns in river downstream of the reservoirs if water was  
27 released from the reservoirs in patterns that were different than would have been  
28 used by the water seller's; and groundwater elevation reductions if groundwater  
29 substitution was used to provide the water for the transfers. All water transfers  
30 would be required to avoid adverse impacts on other water users and biological  
31 resources; and water transfer programs would include groundwater mitigation and  
32 monitoring plans (see Section 3.A.6.3, Transfers). Therefore, water transfer  
33 programs would need to be implemented in a manner that would avoid impacts  
34 associated with changes in Trinity Lake storage, Trinity River flow patterns, and  
35 groundwater elevation reductions in the Central Valley that could affect ITAs.  
36 For the purposes of this EIS, it is anticipated that similar conditions would occur  
37 due to cross Delta water transfers under Alternative 5 as compared to the Second  
38 Basis of Comparison, and there would be no effect on the ITAs due to cross Delta  
39 water transfers.

1 **20.4.3.7 Summary of Impact Analysis**

2 The results of the impact analysis of implementation of Alternatives 1 through 5  
3 as compared to the No Action Alternative and the Second Basis of Comparison  
4 are presented in Tables 20.2 and 20.3.

5 **Table 20.2 Comparison of Alternatives 1 through 5 to No Action Alternative**

Alternative	Potential Change	Consideration for Mitigation Measures
Alternative 1	No effects to ITAs	None needed
Alternative 2	No effects to ITAs	None needed
Alternative 3	No effects to ITAs	None needed
Alternative 4	No effects to ITAs	None needed
Alternative 5	No effects to ITAs	None needed

6 **Table 20.3 Comparison of No Action Alternative and Alternatives 1 through 5 to**  
7 **Second Basis of Comparison**

Alternative	Potential Change	Consideration for Mitigation Measures
No Action Alternative	No effects to ITAs	None needed
Alternative 1	No effects to ITAs	None needed
Alternative 2	No effects to ITAs	None needed
Alternative 3	No effects to ITAs	None needed
Alternative 4	No effects to ITAs	None needed
Alternative 5	No effects to ITAs	None needed

8 **20.4.3.8 Potential Mitigation Measures**

9 Mitigation measures are presented in this section to avoid, minimize, rectify,  
10 reduce, eliminate, or compensate for adverse environmental effects of  
11 Alternatives 1 through 5 as compared to the No Action Alternative. Mitigation  
12 measures were not included to address adverse impacts under the alternatives as  
13 compared to the Second Basis of Comparison because this analysis was included  
14 in this EIS for information purposes only.

15 Changes under Alternatives 1 through 5 as compared to the No Action Alternative  
16 would result in similar or increased flows in the Trinity River, and  
17 implementation of cross Delta water transfers would not result in adverse impacts  
18 to ITAs. Therefore, there would be no adverse impacts to ITAs, and no  
19 mitigation measures are needed.

20 **20.4.3.9 Cumulative Effects Analysis**

21 As described in Chapter 3, the cumulative effects analysis considers projects,  
22 programs, and policies that are not speculative, and are based upon known or

1 reasonably foreseeable long-range plans, regulations, operating agreements, or  
 2 other information that establishes them as reasonably foreseeable.

3 The cumulative effects analysis for Alternatives 1 through 5 to Indian Trust  
 4 Assets are summarized in Table 20.4. As described in this chapter, potential  
 5 changes to Indian Trust Assets would be associated with changes in flows in the  
 6 Trinity River.

7 **Table 20.4 Summary of Cumulative Effects on Indian Trust Assets with**  
 8 **Implementation of Alternatives 1 through 5 as Compared to the No Action**  
 9 **Alternative**

Scenarios	Actions	Cumulative Effects of Actions
Past & Present, and Future Actions included in the No Action Alternative and All Alternatives in Year 2030	Consistent with Affected Environment conditions plus: Actions in the 2008 USFWS BO and 2009 NMFS BO that would have occurred without implementation of the BOs, as described in Section 3.3.1.2 (of Chapter 3, Descriptions of Alternatives), including climate change and sea level rise Actions not included in the 2008 USFWS BO and 2009 NMFS BO that would have occurred without implementation of the BOs, as described in Section 3.3.1.3 (of Chapter 3, Descriptions of Alternatives): - Trinity River Restoration Program. - Central Valley Project Improvement Act programs	<u>These effects would be the same under all alternatives.</u> Climate change and sea level rise are anticipated to reduce carryover storage in reservoirs, including Trinity Lake, and changes in stream flow patterns, including Trinity River, in a manner that would change beneficial use of the Trinity River, including salmon fishing. Other ongoing actions, including Trinity River Restoration Program, would improve water quality and/or habitat along the Trinity River.
Future Actions considered as Cumulative Effects Actions in All Alternatives in Year 2030	Actions as described in Section 3.5 (of Chapter 3, Descriptions of Alternatives): - Bay-Delta Water Quality Control Plan Update - FERC Relicensing Projects - Bay Delta Conservation Plan (including the California WaterFix alternative) - Shasta Lake Water Resources, North-of-the-Delta Offstream Storage, Los Vaqueros Reservoir Expansion Phase 2, and Upper San Joaquin River Basin Storage Investigations - El Dorado Water and Power Authority Supplemental Water Rights Project - Semitropic Water Storage District Delta Wetlands - North Bay Aqueduct Alternative Intake	<u>These effects would be the same under all alternatives.</u> Based upon environmental documents prepared for these programs, changes to the Trinity River flows are not anticipated due to implementation of these programs.

Scenarios	Actions	Cumulative Effects of Actions
No Action Alternative with Associated Cumulative Effects Actions in Year 2030	Full implementation of the 2008 USFWS BO and 2009 NMFS BO	Implementation of No Action Alternative with reasonably foreseeable actions would result in changes Trinity Lake carryover storage and Trinity River flows which would result in changes to beneficial use opportunities for Indian Trust Assets as compared to historical conditions prior to the BOs.
Alternative 1 with Associated Cumulative Effects Actions in Year 2030	No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant)	Implementation of Alternative 1 with reasonably foreseeable actions would result in similar conditions for Indian Trust Assets as for the No Action Alternative with the added actions.
Alternative 2 with Associated Cumulative Effects Actions in Year 2030	Full implementation of the 2008 USFWS BO and 2009 NMFS BO CVP and SWP operational actions  No implementation of structural improvements or other actions that require further study to develop a more detailed action description.	Implementation of Alternative 2 with reasonably foreseeable actions would result in similar conditions for Indian Trust Assets as for the No Action Alternative with the added actions.
Alternative 3 with Associated Cumulative Effects Actions in Year 2030	No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant)  Slight increase in positive Old and Middle River flows in the winter and spring months	Implementation of Alternative 3 with reasonably foreseeable actions would result in similar conditions for Indian Trust Assets as for the No Action Alternative with the added actions.
Alternative 4 with Associated Cumulative Effects Actions in Year 2030	No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant)	Implementation of Alternative 4 with reasonably foreseeable actions would result in similar conditions for Indian Trust Assets as for the No Action Alternative with the added actions.
Alternative 5 with Associated Cumulative Effects Actions in Year 20530	Full implementation of the 2008 USFWS BO and 2009 NMFS BO  Positive Old and Middle River flows and increased Delta outflow in spring months	Implementation of Alternative 5 with reasonably foreseeable actions would result in similar conditions for Indian Trust Assets as for the No Action Alternative with the added actions.

## Chapter 21

# 1 Environmental Justice

## 2 21.1 Introduction

3 This chapter describes the presence of environmental justice populations in the  
 4 study area and potential changes that could have disproportionately high and  
 5 adverse human health or environmental effects on minority and/or low-income  
 6 populations as a result of implementing the alternatives evaluated in this  
 7 Environmental Impact Statement (EIS). Implementation of the alternatives could  
 8 affect conditions through potential changes in operation of the Central Valley  
 9 Project (CVP) and State Water Project (SWP) and ecosystem restoration.

## 10 21.2 Regulatory Environment and Compliance 11 Requirements

12 This chapter was prepared in compliance with Presidential Executive Order  
 13 12898, *Federal Actions to Address Environmental Justice in Minority Populations*  
 14 *and Low-Income Populations*, dated February 11, 1994 and Title VI of the Civil  
 15 Rights Act of 1964.

16 Potential actions that could be implemented under the alternatives evaluated in  
 17 this EIS could have disproportionately high and adverse human health or  
 18 environmental effects on minority and/or low-income populations. Actions  
 19 located on public agency lands; or implemented, funded, or approved by Federal  
 20 and state agencies would need to be compliant with appropriate Federal and state  
 21 agency policies and regulations, as summarized in Chapter 4, Approach to  
 22 Environmental Analyses.

## 23 21.3 Affected Environment

24 This section describes changes that could result in disproportionately high and  
 25 adverse human health or environmental effects on minority and/or low-income  
 26 populations due to changes in CVP and SWP operations. The conditions  
 27 described in this chapter are related to the distribution of minority populations and  
 28 populations below poverty levels.

### 29 21.3.1 Area of Analysis

30 A summary of conditions are described in this section of the EIS for the following  
 31 regions that could be affected by implementation of alternatives analyzed in this  
 32 EIS, as described in Chapter 4, Approach to Environmental Analysis.

- 33 • Trinity River Region
- 34 • Central Valley Region

- 1 • San Francisco Bay Area Region
- 2 • Central Coast Region
- 3 • Southern California Region

### 4 **21.3.2 Characterization of Conditions Considered in the** 5 **Environmental Justice Analysis**

6 Characterization of the conditions within the Study Area is based upon publically  
7 available data from government websites and other data sources. The data  
8 sources used include the 2010 U.S. Census Bureau data on minority populations  
9 and the 2010 American Community Survey (ACS) 5-year population estimates on  
10 populations below the poverty level.

#### 11 **21.3.2.1 Determination of Minority Populations**

12 The U.S. Census Bureau provides a total population value for each county, which  
13 are also used by the State Department of Finance, as presented in Chapter 14,  
14 Socioeconomics. The U.S. Census Bureau also provides a definition of minority  
15 and low income populations. Minority populations are defined by the  
16 U.S. Census as racial and ethnic minorities. Racial minorities, as defined by the  
17 U.S. Census, include people who identified themselves in the census as belonging  
18 to one of the following categories:

- 19 • Single Race
  - 20 – Black/African American
  - 21 – American Indian and Alaskan Native
  - 22 – Asian
  - 23 – Native Hawaiian and Other Pacific Islander
  - 24 – Some Other Race
- 25 • Two or More Races (inclusive the races listed above and White).

26 Ethnic minorities, as defined by the U.S. Census, include individuals who  
27 identified themselves as being of Hispanic or Latino origin by responding to one  
28 of the following categories in the census:

- 29 • Mexican
- 30 • Mexican American
- 31 • Chicano
- 32 • Puerto Rican
- 33 • Cuban
- 34 • Other Spanish/Hispanic/Latino

35 Individuals who identified themselves of Hispanic or Latino origin maybe of one  
36 or more races according to the U.S. Census.

#### 37 **21.3.2.2 Determination of Populations below the Poverty Level**

38 Populations below the Federal poverty level can be identified using several  
39 methodologies. The information presented in this chapter has been developed in  
40 ACS reports by the U.S. Census Bureau based upon 48 different sets of dollar

1 value thresholds related to family size and ages. The poverty level is assigned at  
 2 the family-level and affects every member of the family. The thresholds are  
 3 consistent throughout the United States and do not consider geographic  
 4 differentials. The thresholds are updated each year based on the Consumer Price  
 5 Index. For the five-year ACS reporting period used in this chapter, separate  
 6 thresholds are applied to each year in this continuous survey. Other federal  
 7 agencies rely upon different poverty statistics including the Current Population  
 8 Survey Annual Social and Economic Supplement and the U.S. Department of  
 9 Health and Human Services poverty guidelines.

10 The population for whom poverty level is estimated by ACS is smaller value than  
 11 the total population values presented in Chapter 14, Socioeconomics, for each  
 12 county and the equivalent population values used for the distribution of the  
 13 population by race and ethnicity. The population values to determine poverty  
 14 rates do not include institutionalized individuals (e.g., military personnel that live  
 15 in group quarters, students that live in college dormitories, and prison inmates.  
 16 The U.S. Census Bureau designates geographical areas with poverty rates at and  
 17 above 20 percent as “poverty areas.”

#### 18 **21.3.2.3 Social Services**

19 The need for and delivery of social services within each county is another  
 20 indication of social conditions, including Federal grants to the state and local  
 21 agencies for Medicaid, other health related activities, and nutrition and family  
 22 welfare; and Federal direct payments made to individuals under the CalFresh  
 23 (previously referred to as “Food Stamps”) and supplemental social security  
 24 income.

#### 25 **21.3.2.4 Limited English Proficiency**

26 Another consideration related to environmental justice is the ability of the Federal  
 27 government to provide access to federally conducted and assisted programs and  
 28 activities to all people who, as a result of their national origin, are limited in their  
 29 English proficiency (LEP). These individuals are not able to speak, read, write, or  
 30 understand the English language at a level that permits them to interact effectively  
 31 with Federal employees who provide Federal services. Therefore, these  
 32 individuals are often excluded from Federal programs, do not receive all available  
 33 Federal services, and/or experience delays when interacting with Federal  
 34 programs. The Executive Order 13166 became effective on August 11, 2000 to  
 35 ensure meaningful participation by individuals who have limited English  
 36 proficiency in federally conducted and federally assisted programs and activities.  
 37 This information is compiled and reported by the U.S. Census Bureau.

#### 38 **21.3.3 Trinity River Region**

39 The Trinity River Region includes the area in Trinity County along the Trinity  
 40 River from Trinity Lake to the confluence with the Klamath River; and in  
 41 Humboldt and Del Norte counties along the Lower Klamath River from the  
 42 confluence with the Trinity River to the Pacific Ocean. Tribal lands along the  
 43 Trinity or Lower Klamath River within the Trinity River Region include the

1 Hoopa Valley Indian Reservation, Yurok Indian Reservation, and Resighini  
2 Rancheria.

3 **21.3.3.1 Minority Populations**

4 As recorded in the 2010 Census, the Trinity River Region had a total population  
5 of 177,019 (U.S. Census 2014a). About 24.3 percent of this population identified  
6 themselves as a racial minority and/or of Hispanic or Latino origin, regardless of  
7 race, as presented in Table 21.1 (U.S. Census 2014a, 2014b, 2014c, 2014d).  
8 There are fewer minorities in the Trinity River Region than in the entire State of  
9 California.

10 **21.3.3.2 Poverty Levels**

11 Poverty levels presented in Table 21.2 are calculated on a subset of the total  
12 population of a county, as described above in section 21.3.2, Characterization of  
13 Conditions Considered in the Environmental Justice Analysis. Of the total  
14 population for whom poverty is determined in the Trinity River Region,  
15 167,987 individuals (or 18.2 percent) were below the poverty level based on the  
16 2006–2010 ACS 5-year dataset (U.S. Census 2014e). The U.S. Census Bureau  
17 defines geographical areas with more than 20 percent of the population below the  
18 poverty level as a “poverty areas.” Both Humboldt and Del Norte counties are  
19 defined as poverty areas.

20 Poverty rates based upon the 2000 census were reported as 40 percent for Indians  
21 on the Yurok Indian Reservation, 34 percent of the Indians on the Hoopa Valley  
22 Indian Reservation, and 54 percent of the Indians on and off Karuk Reservation  
23 trust lands (NMFS 2012a, 2012b, 2012c). The Yurok Tribe has reported an  
24 average poverty rate of 80 percent of the Indians on the Yurok Indian Reservation  
25 (Yurok Tribe 2014a). Average per capita income of residents on the Resighini  
26 Rancheria (not limited to Resighini Rancheria members) in 1999 was reported to  
27 be approximately 46 percent of the average per capita income in Del Norte  
28 County (NMFS 2012d).

29 **21.3.3.3 Social Services**

30 Federal grants to the state and local agencies for Medicaid, other health related  
31 activities, and nutrition and family welfare; and Federal direct payments made to  
32 individuals under the CalFresh (previously referred to as “Food Stamps”) and  
33 supplemental social security income within counties in the Trinity River Region  
34 are summarized in Table 21.3.

35 Social services to tribal members are funded by the tribe and/or the federal  
36 government (DOI and DFG 2012). The Hoopa Valley Tribe provides food  
37 distribution and other social services, including Temporary Assistance for Needy  
38 Families (TANF) which receives some assistance from Humboldt County social  
39 services to provide cash assistance, utility billing assistance, childcare,  
40 educational assistance, job development, substance abuse assistance, and family  
41 assistance (Hoopa Tribe 2014 a, 2014b). The Yurok Tribe provides a wide range  
42 of services, including general assistance, food distribution, Indian Child welfare,  
43 low income energy assistance, Yurok Youth Program, emergency and temporary

1 assistance, and Yurok Domestic Violence/Sexual Assault Project (Yurok  
2 Tribe 2014b).

3 **21.3.3.4 Limited English Proficiency**

4 The percent of the population that speaks English and other languages at home  
5 and the percent of the population that speak English “less than very well” based  
6 on the language they speak at home are presented in Tables 21.4 and 21.5.

7 **21.3.4 Central Valley Region**

8 The Central Valley Region includes the Sacramento Valley, San Joaquin Valley,  
9 and Delta and Suisun Marsh subregions.

10 **21.3.4.1 Sacramento Valley**

11 The Sacramento Valley includes the counties of Shasta, Plumas, Tehama, Glenn,  
12 Colusa, Butte, Sutter, Yuba, Nevada, Placer, and El Dorado counties.  
13 Sacramento, Yolo, and Solano counties also are located within the Sacramento  
14 Valley; however, these counties are discussed below as part of the Delta and  
15 Suisun Marsh subsection. Other counties in this region are not anticipated to be  
16 affected by changes in CVP and SWP operations, and are not discussed here,  
17 including: Alpine, Sierra, Lassen, and Amador counties.

18 **21.3.4.1.1 Minority Populations**

19 As recorded in the 2010 U.S. Census, the Sacramento Valley portion of the  
20 Central Valley Region had a total population of 1,325,380 in 2010. About  
21 25.8 percent of this population identified themselves as a racial minority and/or of  
22 Hispanic or Latino origin, regardless of race, as presented in Table 21.6. The  
23 table also shows the minority population distribution for the entire Central Valley  
24 Region and the State of California.

1 **Table 21.1 Minority Population Distribution in Trinity River Region in 2010**

Areas	Total Population	Races							Hispanic or Latino Origin	Total Minority <sup>a</sup>
		White	Black/ African American	American Indian and Native Alaskan	Asian	Native Hawaiian and Other Pacific Islander	Some Other Race	Two or More Races

2 Sources: U.S. Census 2014a, 2014g, 2014h, 2014i, 2014j, 2014k, 2014l, 2014m, 2014n, 2014o, 2014p, 2014q

3 Note:

4 a. Total Minority is an aggregation of all non-white racial groups and includes all individuals of Hispanic or Latino origin, regardless of race.

1    **21.3.4.1.2 Poverty Levels**

2    Poverty levels presented in Table 21.7 are calculated on a subset of the total  
3    population of a county, as described above in section 21.3.2, Characterization of  
4    Conditions Considered in the Environmental Justice Analysis. Of the total  
5    population for whom poverty status is determined within the Sacramento Valley  
6    portion of the Central Valley Region, 1,288,594 individuals, 12.6 percent were  
7    below the poverty level based on the 2006–2010 ACS 5-year dataset (U.S. Census  
8    2014e).

9    The U.S. Census Bureau defines geographical areas with more than 20 percent of  
10   the population below the poverty level as a “poverty areas.” There are no  
11   counties in this area defined as poverty areas; although, 20 percent of the  
12   populations in Tehama and Yuba counties are below the poverty level.

13   **21.3.4.1.3 Social Services**

14   Federal grants to the state and local agencies for Medicaid, other health related  
15   activities, and nutrition and family welfare; and Federal direct payments made to  
16   individuals under the CalFresh and supplemental social security income within  
17   counties in the Sacramento Valley portion of the Central Valley Region are  
18   summarized in Table 21.8.

19   **21.3.4.1.4 Limited English Proficiency**

20   The percent of the population that speaks English and other languages at home  
21   and the percent of the population that speak English “less than very well” based  
22   on the language they speak at home are presented in Tables 21.9 and 21.10.

23   **21.3.4.2 San Joaquin Valley**

24   The San Joaquin Valley includes the counties of Stanislaus, Merced, Madera,  
25   Fresno, Kings, Tulare, and Kern counties. San Joaquin County also is located  
26   within the San Joaquin Valley; however, this county is discussed below as part of  
27   the Delta and Suisun Marsh subsection. Other counties in this region are not  
28   anticipated to be affected by changes in CVP and SWP operations, and are not  
29   discussed here, including: Calaveras, Mariposa, and Tuolumne counties.

30   **21.3.4.2.1 Minority Populations**

31   As recorded in the 2010 U.S. Census, the San Joaquin Valley portion of the  
32   Central Valley Region had a total population of 3,286,353 in 2010. About  
33   63.3 percent of this population identified themselves as a racial minority and/or of  
34   Hispanic or Latino origin, regardless of race, as presented in Table 21.11. The  
35   table also shows the minority population distribution for the entire Central Valley  
36   Region and the State of California.

2 Sources: U.S. Census 2014a, 2014r, 2014s, 2014t, 2014u, 2014v, 2014w, 2014x

3 Note:

4 a. Total Minority is an aggregation of all non-white racial groups and includes all individuals of Hispanic or Latino origin, regardless of race.

1     **21.3.4.2.2 Poverty Levels**

2     Poverty levels presented in Table 21.12 are calculated on a subset of the total  
3     population of a county, as described above in section 21.3.2, Characterization of  
4     Conditions Considered in the Environmental Justice Analysis. Of the total  
5     population for whom poverty status is determined within the San Joaquin Valley  
6     portion of the Central Valley Region, 3,111,943 individuals, 20.8 percent, were  
7     below the poverty level based on the 2006–2010 ACS 5-year dataset (U.S. Census  
8     2014e). The U.S. Census Bureau defines geographical areas with more than  
9     20 percent of the population below the poverty level as a “poverty areas.”  
10    Merced, Fresno, Tulare, and Kern counties are defined as poverty areas because  
11    more than 20 percent of the populations in these counties are below the  
12    poverty level.

13    **21.3.4.2.3 Social Services**

14    Distribution of social services varies for each county. Federal grants to the state  
15    and local agencies for Medicaid, other health related activities, and nutrition and  
16    family welfare; and Federal direct payments made to individuals under the  
17    CalFresh and supplemental social security income within counties in the San  
18    Joaquin Valley portion of the Central Valley Region are summarized in  
19    Table 21.13.

20    **21.3.4.2.4 Limited English Proficiency**

21    The percent of the population that speaks English and other languages at home  
22    and the percent of the population that speak English “less than very well” based  
23    on the language they speak at home are presented in Tables 21.14 and 21.15.

24    **21.3.4.2.5 Effects of Recent Drought in Two San Joaquin Valley**  
25    **Communities**

26    The San Joaquin Valley portion of the Central Valley Region includes about  
27    8.8 percent of the state’s total population, 9.3 percent of the state’s population that  
28    identified themselves as a racial minority and/or of Hispanic or Latino origin, and  
29    about 13.1 percent of the state’s population below the poverty level. Merced,  
30    Fresno, and Tulare counties had the highest concentration of total minority  
31    populations and the highest concentration of individuals living below the poverty  
32    level. There are communities within these counties that have higher  
33    concentrations of minority populations and/or populations below the poverty  
34    level. These communities are mainly farming communities that have been  
35    impacted by loss in agricultural employment, as described in Chapter 12,  
36    Agricultural Resources, and Chapter 19, Socioeconomics. The impacts have  
37    increased recently during the current drought.

3 Source: U.S. Census 2014f

1 Conditions in this geographic area have been the focus of recent newspaper  
2 articles describing conditions in these communities. According to AgAlert  
3 (2014), a weekly newspaper for California agriculture, increased levels of land  
4 fallowing on irrigated cropland in the San Joaquin Valley has resulted in  
5 significant economic losses in small farming communities. Higher than typical  
6 unemployment rates has resulted in increased food insecurity. As a result, food  
7 banks are facing increased demand. Another article in the Fresno Bee Newspaper  
8 (2014) described the food insecurity issue in the City of Mendota, a community in  
9 Fresno County.

10 Although there are emergency programs such as those administered through the  
11 U.S. Department of Agriculture (USDA), many of these programs are specific in  
12 their targets, require a long time to implement, or are of limited duration. For  
13 example, the 2014 Farm Bill includes \$100 million in livestock disaster  
14 assistance; \$15 million in assistance to farmers and ranchers to implement water  
15 conservation practices; and \$60 million for food banks in the State of California  
16 (USDA 2014a). The USDA February 14, 2014 news release announcing these  
17 programs acknowledges that previous implementation of assistance programs  
18 were hampered by long processing times and emphasizes that the USDA is  
19 committed to reduce the response times by more than 80 percent. The USDA also  
20 is working with California Department of Education to expand the number of  
21 Summer Food Service Program meal sites. The U.S. Department of Homeland  
22 Security also provides assistance with food and related expenses through the  
23 Emergency Food and Shelter National Board Program (USDHS 2014); however  
24 this assistance is limited to one month. There also are many California-based  
25 programs, including the California Department of Social Services that provided in  
26 2014 up to \$25 million in food assistance for counties affected by employment  
27 losses due to the drought that has reduced agriculturally-related jobs  
28 (CDSS 2014). This program is specifically targeted for counties where the  
29 unemployment rate in 2013 was higher than the statewide average, including  
30 Fresno, Merced, and Tulare counties. This aid includes pre-packaged food boxes  
31 to be delivered to local food banks. Families and individuals that expected to  
32 experience long-term impacts due to the drought also were provided assistance to  
33 apply for the CalFresh Program to supplement funding for the food budget.

#### 34 *Huron and Mendota*

35 The cities of Huron and Mendota are both located in Fresno County. Economic  
36 activities in both cities and surrounding communities are based on agriculture. Of  
37 the 25 major employers in Fresno County, only one, Stamoules Produce  
38 Company, is located in the City of Mendota (CEDD 2013). None of the 25 major  
39 employers in Fresno County are located in Huron. Another major employer in the  
40 City of Mendota is a medium security Federal prison for men (BOP 2014).

41 In 2010, the number of people that identified themselves as a racial minority  
42 and/or of Hispanic or Latino origin and the portion of the population below the  
43 poverty level in these two cities were significantly higher than the distribution of  
44 these populations in Fresno County and the State of California, as presented in  
45 Tables 21.16 and 21.17. Although the two communities became more racially

1 diverse in 2010 than they were in the 2000 Census, both communities became  
 2 poorer. While Huron and Mendota have experienced increases in poverty levels,  
 3 the proportion of the population below the poverty level has been relatively stable  
 4 in Fresno County.

5 **Table 21.16 Racial and Ethnic Minority Population in Huron and Mendota in 2010**

Areas	Total Population	Racial Minority	Hispanic or Latino Origin	Below Poverty Level
Huron City	6,754	65.9%	96.6%	54.5%
Mendota City	11,014	47.1%	96.6%	44.6%
Fresno County	930,450	44.6%	50.3%	22.5%
<b>State of California</b>	<b>37,253,956</b>	<b>42.4%</b>	<b>37.6%</b>	<b>13.7%</b>

6 Source: U.S. Census Bureau, 2013a, 2013b, 2014e, 2014u

7 **Table 21.17 Racial and Ethnic Minority Population in Huron and Mendota in 2000**

Areas	Total Population	Racial Minority	Hispanic or Latino Origin	Below Poverty Level
Huron City	6,306	79.6%	98.3%	39.4%
Mendota City	7,890	72.7%	94.7%	41.9%
Fresno County	799,407	45.7%	44.0%	22.9%
<b>State of California</b>	<b>33,871,648</b>	<b>40.5%</b>	<b>32.4%</b>	<b>14.2%</b>

8 Sources: U.S. Census Bureau, 2013c, 2013d, 2013e, 2013f

9 *Other Indicators of Economic Conditions*

10 Other indicators of economic struggles within these communities are the number  
 11 of individuals who are on poverty alleviation programs, including CalFresh, the  
 12 Federal Supplemental Nutrition Assistance Program administered by the State of  
 13 California, California Work Opportunity and Responsibility to Kids  
 14 (CalWORKs), and National School Lunch Program (NSLP).

15 Both CalFresh and CalWORKs are administered by the California Department of  
 16 Social Services. The CalFresh Program issues monthly electronic benefits that  
 17 can be used to buy most foods. The program's purpose is to help improve the  
 18 health and well-being of qualified households and individuals. CalWORKs is a  
 19 social welfare program that provides cash aid and services to eligible needy  
 20 California families. Figure 21.1 shows the trend in the average annual population  
 21 on public assistance (both the CalFresh Program and CalWORKs program)  
 22 between 2006 and 2012, the years for which electronic data were available for the  
 23 cities of Huron and Mendota. The populations in Huron and Mendota have higher  
 24 levels of participations in the two public assistance programs compared to the  
 25 levels in Fresno County and the state. Additionally, the rates of participation in

1 the two communities have been growing at a faster rate than growth in these  
2 programs in Fresno County and the state. Eligibility in the CalFresh Program is  
3 based upon several factors, including a poverty threshold requirement and  
4 citizenship/immigration status. Eligibility for CalWORKs is determined on the  
5 basis of citizenship, age, income, resources, assets and other factors  
6 (CDSS 2013j).

7 The NSLP program includes students that are eligible for assistance under  
8 CalFresh and other federal assistance programs, such as the Temporary  
9 Assistance for Needy Families and the Food Distribution Program on Indian  
10 Reservations; and students who are eligible under the Other Source Categorically  
11 Eligible Programs. A student is eligible under the Other Source Categorically  
12 Eligible Programs if that student is: (1) homeless, runaway or migrant; (2) a foster  
13 child; or (3) enrolled in a Federally-funded Head Start Program or a comparable  
14 State-funded Head Start Program or pre-kindergarten programs, or in an Even  
15 Start Program (USDA 2014b). Students enrolled in the NSLP are eligible for  
16 either free or reduced price meals (FRPM). Figure 21.2 shows the proportion of  
17 students enrolled in the FRPM program in the two communities, Fresno County,  
18 and the state. Participation on FRPM in Fresno County is higher than in the entire  
19 state; and lower than within Huron and Mendota.

20 Relatively large participation in the social services programs is related to low  
21 employment in Huron and Mendota. Annual unemployment rates in Huron and  
22 Mendota between 2006 and 2012 have consistently remained higher than for  
23 Fresno County and the state, as presented in Figure 21.3. The pattern of  
24 unemployment has been similar to unemployment patterns in Fresno County, and  
25 increased following the economic recession that started in 2007. The increase in  
26 unemployment also occurred at a time when both agricultural cultivated acreage  
27 and farm employment in the area declined; and included five consecutive years  
28 with reduced water availability, as described in Chapter 12, Agricultural  
29 Resources, and Chapter 19, Socioeconomics.

### 30 **21.3.4.3 Delta and Suisun Marsh**

31 The Delta and Suisun Marsh portion of the Central Valley Region includes  
32 Sacramento, Yolo, Solano, San Joaquin, and Contra Costa counties.

#### 33 **21.3.4.3.1 Minority Populations**

34 As recorded in the 2010 U.S. Census, the Delta and Suisun Marsh portion of the  
35 Central Valley Region had a total population of 2,718,287 in 2010. About  
36 54.8 percent of this population identified themselves as a racial minority and/or of  
37 Hispanic or Latino origin, regardless of race, as presented in Table 21.18. The  
38 table also shows the minority population distribution for the entire Central Valley  
39 Region and the State of California.

#### 40 **21.3.4.3.2 Poverty Levels**

41 Poverty levels presented in Table 21.19 are calculated on a subset of the total  
42 population of a county, as described above in section 21.3.2, Characterization of  
43 Conditions Considered in the Environmental Justice Analysis.

1 **Table 21.18 Minority Population Distribution in the Central Valley Region – Delta and Suisun Marsh in 2010**

Areas	Total Population	Races							Hispanic or Latino Origin	Total Minority <sup>a</sup>
		White	Black/ African American	American Indian and Native Alaskan	Asian	Native Hawaiian and Other Pacific Islander	Some Other Race	Two or More Races		
Sacramento County	1,418,788	57.5%	10.4%	1.0%	14.3%	1.0%	9.3%	6.6%	21.6%	51.6%
Yolo County	200,849	63.2%	2.6%	1.1%	13.0%	0.5%	13.9%	5.8%	30.3%	50.1%
Solano County	413,344	51.0%	14.7%	0.8%	14.6%	0.9%	10.5%	7.6%	24.0%	59.2%
San Joaquin County	685,306	51.0%	7.6%	1.1%	14.4%	0.5%	19.1%	6.4%	38.9%	64.1%
Contra Costa County	1,049,025	58.6%	9.3%	0.6%	14.4%	0.5%	10.7%	5.9%	24.4%	52.2%
Total Delta and Suisun Marsh Valley	3,767,312	56.2%	9.6%	0.9%	14.3%	0.7%	11.9%	6.4%	26.2%	54.8%
Central Valley Region	8,379,045	61.4%	6.3%	1.3%	9.5%	0.4%	15.7%	5.4%	42.6%	53.5%
STATE OF CALIFORNIA	37,253,956	57.6%	6.2%	1.0%	13.0%	0.4%	17.0%	4.9%	37.6%	59.9%

2 Sources: U.S. Census 2014a, 2014y, 2014z, 2014aa, 2014ab, 2014ac

3 Note:

4 a. Total Minority is an aggregation of all non-white racial groups and includes all individuals of Hispanic or Latino origin, regardless of race.

1 **Table 21.19 Population below Poverty Level in the Central Valley Region – Delta**  
 2 **and Suisun Marsh, 2006–2010**

Areas	Total Population <sup>a</sup>	Population Below Poverty Level	Percent of Population Below Poverty Level
Sacramento County	1,368,693	190,768	13.9%
Yolo County	186,800	31,895	17.1%
Solano County	397,576	41,158	10.4%
San Joaquin County	657,594	105,502	16.0%
Contra Costa County	1,013,854	91,142	9.0%
Total Delta and Suisun Marsh Valley	3,624,517	460,465	12.7%
Central Valley Region	8,025,054	1,268,984	15.8%
<b>STATE OF CALIFORNIA</b>	<b>35,877,036</b>	<b>4,919,945</b>	<b>13.7%</b>

3 Source: U.S. Census 2014e

4 Note:

5 a. Population numbers are only those for whom poverty status was determined and exclude  
 6 institutionalized individuals

7 Of the total population for whom poverty status is determined within the Delta  
 8 and Suisun Marsh portion of the Central Valley Region, 3,624,517 individuals,  
 9 12.7 percent were below the poverty level based on the 2006–2010 ACS 5-year  
 10 dataset (U.S. Census 2014e). The U.S. Census Bureau defines geographical areas  
 11 with more than 20 percent of the population below the poverty level as a “poverty  
 12 areas.” None of the counties in this area are defined as poverty areas.

### 13 **21.3.4.3.3 Social Services**

14 Distribution of social services varies for each county. Federal grants to the state  
 15 and local agencies for Medicaid, other health related activities, and nutrition and  
 16 family welfare; and Federal direct payments made to individuals under the  
 17 CalFresh and supplemental social security income within counties in the Delta  
 18 and Suisun Marsh portion of the Central Valley Region are summarized in  
 19 Table 21.20.

### 20 **21.3.4.3.4 Limited English Proficiency**

21 The percent of the population that speaks English and other languages at home  
 22 and the percent of the population that speak English “less than very well” based  
 23 on the language they speak at home are presented in Tables 21.21 and 21.22.

### 24 **21.3.5 San Francisco Bay Area Region**

25 The San Francisco Bay Area Region includes portions of Napa, Alameda, Santa  
 26 Clara, and San Benito counties that are within the CVP and SWP service areas.  
 27 Contra Costa County also is part of the San Francisco Bay Area Region.  
 28 However, for this chapter, Contra Costa County is discussed under  
 29 Section 14.3.4.3, Delta Suisun Marsh.

1 **21.3.5.1 Minority Populations**

2 As recorded in the 2010 U.S. Census, the San Francisco Bay Area Region had a  
 3 total population of 3,483,666 in 2010. About 64.4 percent of this population  
 4 identified themselves as a racial minority and/or of Hispanic or Latino origin,  
 5 regardless of race, as presented in Table 21.23. The table also shows the minority  
 6 population distribution for the State of California.

7 **21.3.5.2 Poverty Levels**

8 Poverty levels presented in Table 21.24 are calculated on a subset of the total  
 9 population of a county, as described above in section 21.3.2, Characterization of  
 10 Conditions Considered in the Environmental Justice Analysis. Of the total  
 11 population for whom poverty status is determined within the San Francisco Bay  
 12 Area Region, 3,344,994 individuals, 10.1 percent were below the poverty level  
 13 based on the 2006–2010 ACS 5-year dataset (U.S. Census 2014e). The  
 14 U.S. Census Bureau defines geographical areas with more than 20 percent of the  
 15 population below the poverty level as a “poverty areas.” None of the counties in  
 16 the San Francisco Bay Area Region are defined as poverty areas.

17 **Table 21.20 Federal Funds Distributed for Social Programs in the Central Valley**  
 18 **Region – Delta and Suisun Marsh in 2010**

Areas	Grants (millions of dollars)		Distributed to Individuals (millions of dollars)
	Medicaid and Other Health-Related Items	Nutrition and Family Welfare	CalFresh Benefits and Supplemental Security Income

Napa County	130,057	12,948	10.0
San Francisco Bay Area Region	3,344,994	336,754	10.1
<b>STATE OF CALIFORNIA</b>	<b>35,877,036</b>	<b>4,919,945</b>	<b>13.7%</b>

3 Source: U.S. Census 2014e

4 Note:

5 a. Population numbers are only those for whom poverty status was determined and exclude  
 6 institutionalized individuals

7 **21.3.5.3 Social Services**

8 Distribution of social services varies for each county. Federal grants to the state  
 9 and local agencies for Medicaid, other health related activities, and nutrition and  
 10 family welfare; and Federal direct payments made to individuals under the  
 11 CalFresh and supplemental social security income within counties in the San  
 12 Francisco Bay Area Region are summarized in Table 21.25.

13 **21.3.5.4 Limited English Proficiency**

14 The percent of the population that speaks English and other languages at home  
 15 and the percent of the population that speak English “less than very well” based  
 16 on the language they speak at home are presented in Tables 21.26 and 21.27.

17 **21.3.6 Central Coast Region**

18 The Central Coast Region includes portions of San Luis Obispo and Santa  
 19 Barbara counties served by the SWP. SWP water supplies are used directly by  
 20 municipal and industrial water users, and as part of groundwater replenishment  
 21 plans to meet municipal, industrial, and agricultural water demands.

22 **21.3.6.1 Minority Populations**

23 As recorded in the 2010 U.S. Census, the Central Coast Region had a total  
 24 population of 693,532 in 2010. About 43.1 percent of this population identified  
 25 themselves as a racial minority and/or of Hispanic or Latino origin, regardless of  
 26 race, as presented in Table 21.28. The table also shows the minority population  
 27 distribution for the State of California.

28 **21.3.6.2 Poverty Levels**

29 Poverty levels presented in Table 21.29 are calculated on a subset of the total  
 30 population of a county, as described above in section 21.3.2, Characterization of  
 31 Conditions Considered in the Environmental Justice Analysis. Of the total  
 32 population for whom poverty status is determined within the Central Coast

1 Region, 649,348 individuals, 13.8 percent were below the poverty level based on  
 2 the 2006–2010 ACS 5-year dataset (U.S. Census 2014e). The U.S. Census  
 3 Bureau defines geographical areas with more than 20 percent of the population  
 4 below the poverty level as a “poverty areas.” None of the counties in the Central  
 5 Coast Region are defined as poverty areas.

6 **21.3.6.3 Social Services**

7 Distribution of social services varies for each county. Federal grants to the state  
 8 and local agencies for Medicaid, other health related activities, and nutrition and  
 9 family welfare; and Federal direct payments made to individuals under the  
 10 CalFresh and supplemental social security income within counties in the Central  
 11 Coast Region are summarized in Table 21.30.

11 The percent of the population that speaks English and other languages at home  
 12 and the percent of the population that speak English “less than very well” based  
 13 on the language they speak at home are presented in Tables 21.31 and 21.32.

14 **21.3.7 Southern California Region**

15 The Southern California Region includes portions of Ventura, Los Angeles,  
 16 Orange, San Diego, Riverside, and San Bernardino counties served by the SWP.

17 **21.3.7.1 Minority Populations**

18 As recorded in the 2010 U.S. Census, the Southern California Region had a total  
 19 population of 20,972,319 in 2010. About 64.2 percent of this population  
 20 identified themselves as a racial minority and/or of Hispanic or Latino origin,  
 21 regardless of race, as presented in Table 21.33. The table also shows the minority  
 22 population distribution for the State of California.

1    **21.3.7.2    Poverty Levels**

2    Poverty levels presented in Table 21.34 are calculated on a subset of the total  
3    population of a county, as described above in section 21.3.2, Characterization of  
4    Conditions Considered in the Environmental Justice Analysis. Of the total  
5    population for whom poverty status is determined within the Southern California  
6    Region, 20,296,879 individuals, 13.8 percent, were below the poverty level based  
7    on the 2006–2010 ACS 5-year dataset (U.S. Census 2014e). The U.S. Census  
8    Bureau defines geographical areas with more than 20 percent of the population  
9    below the poverty level as a “poverty areas.” None of the counties in the  
10   Southern California Region are defined as poverty areas.

11   **21.3.7.3    Social Services**

12   Distribution of social services varies for each county. Federal grants to the state  
13   and local agencies for Medicaid, other health related activities, and nutrition and  
14   family welfare; and Federal direct payments made to individuals under the  
15   CalFresh and supplemental social security income within counties in the Southern  
16   California Region are summarized in Table 21.35.

17   **21.3.7.4    Limited English Proficiency**

18   The percent of the population that speaks English and other languages at home  
19   and the percent of the population that speak English “less than very well” based  
20   on the language they speak at home are presented in Tables 21.36 and 21.37.

## 1 **21.4 Impact Analysis**

2 This section describes the potential mechanisms for change in conditions and  
3 analytical methods; results of impact analyses; potential mitigation measures; and  
4 cumulative effects.

### 5 **21.4.1 Potential Mechanisms for Change and Analytical Methods**

6 As described in Chapter 4, Approach to Environmental Analysis, the impact  
7 analysis considers changes in factors that affect environmental justice or minority  
8 and low-income populations specifically related to changes in CVP and SWP  
9 operations under the alternatives as compared to the No Action Alternative and  
10 Second Basis of Comparison.

11 The Council of Environmental Quality (CEQ) and U.S. Environmental Protection  
12 Agency (USEPA) established guidelines to assist federal agencies in the analysis  
13 of environmental justice defines minority and low-income areas summarized in  
14 Section 21.3, Affected Environment (CEQ, 1997). The following guidelines are  
15 used to determine if minority populations are present in a study area:

- 16 • The minority population of the affected area exceeds 50 percent, or
- 17 • The population percentage of the affected area is meaningfully greater than  
18 the minority population percentage in the general population or other  
19 appropriate unit of geographical analysis.

20 The CEQ guidelines do not specifically state the percentage considered  
21 meaningful in the case of low-income populations. For this analysis, the  
22 assumptions set forth in the CEQ guidelines for identifying and evaluating  
23 impacts on minority populations also are used to identify and evaluate impacts on  
24 low-income populations, including a determination that a low-income population  
25 is present if the project area if 50 percent or more of the population is living  
26 below the poverty level.

27 The alternatives considered in this EIS do not include project-specific  
28 construction activities. In most portions of the study area, the availability of CVP  
29 and SWP water supplies directly or indirectly affects most of the population  
30 within a county. Therefore, the entire population of each counties within the  
31 study area is considered to determine whether minority or low-income areas could  
32 be affected by implementation of the alternatives. In the study area, populations  
33 below the poverty level do not include 50 percent or more of the population. The  
34 highest proportion of populations below the poverty level occurs in Fresno and  
35 Tulare counties in which approximately 23 percent of the populations are below  
36 the poverty level. However, minority populations contribute more than  
37 50 percent of the total county populations in 24 of the 35 counties. The following  
38 counties have 50 percent or more of the total population as minority populations.

- 39 • Central Valley Region: Colusa, Sacramento, Solano, Sutter, Yolo, Fresno,  
40 Kern, Kings, Madera, Merced, San Joaquin, Stanislaus, and Tulare counties

- 1 • Central Coast Region; Santa Barbara.
- 2 • Southern California Region: Los Angeles, Orange, Riverside, San Bernardino,
- 3 San Diego, and Ventura.

4 Although, the majority of the populations in the Trinity River Region counties are  
5 not minority populations, these counties do include the Hoopa Valley Indian  
6 Reservation, Yurok Indian Reservation, and Resighini Rancheria. Therefore, the  
7 Trinity River Region counties are also included in the environmental justice  
8 analysis.

9 The CEQ guidance provides the following three factors to be considered for  
10 determination if disproportionately high and adverse impacts may accrue to  
11 minority or low-income populations.

12 The following criteria were used to evaluate the impacts to minority and  
13 low-income populations resulting from the operational changes following the  
14 implementation of each of the alternatives as compared to the No Action  
15 Alternative and the Second Basis of Comparison:

- 16 • Whether there is or would be an impact that results in a disproportionately  
17 high and adverse human health and environmental impact, including social  
18 and economic effects on environmental justice populations.
- 19 • Whether the environmental effects are significant and are, or may be, having  
20 an adverse impact on environmental justice populations that appreciably  
21 exceeds or is likely to appreciably exceed those on the general population or  
22 other appropriate comparison group.
- 23 • Whether the environmental effects occur or would occur in an environmental  
24 justice population affected by cumulative or multiple adverse exposures from  
25 environmental hazards.

26 To determine whether the operational changes resulting from implementation of  
27 each of the alternatives as compared to the No Action Alternative and the Second  
28 Basis of Comparison will have a “disproportionately high and adverse impact” on  
29 minority and low-income populations, various factors were considered, including  
30 potential adverse impacts, mitigation, and enhancement measures that will be  
31 incorporated into the alternatives; and offsetting benefits.

32 The environmental justice guidance documents do not specifically define  
33 conditions that would result in “high and adverse human health and  
34 environmental impact.” For this analysis, the potential changes in air quality,  
35 cultural resources, public health, and socioeconomics were considered within the  
36 counties that had a minority population of 50 percent or greater of the total  
37 population.

38 The changes were then determined if the impacts would be disproportionately high  
39 on the minority populations. Potential adverse impacts were evaluated with  
40 regard to air quality, public health, and socioeconomics.

1 Changes in CVP and SWP operations under the alternatives as compared to the  
2 No Action Alternative and Second Basis of Comparison could result in  
3 disproportionately high effects on minority or tribal populations related to changes  
4 in air quality, public health, and socioeconomics.

5 **21.4.1.1 Changes in Emissions of Criteria Air Pollutants and Precursors,**  
6 **and/or Exposure of Sensitive Receptors to Substantial**  
7 **Concentrations of Air Contaminants Related to Changes in**  
8 **Groundwater Pumping**

9 Changes in CVP and SWP operations under the alternatives could change the use  
10 of individual engines to operate groundwater wells. To evaluate the potential for  
11 changes in emissions of criteria air pollutants and precursors, and/or exposure of  
12 sensitive receptors to substantial concentrations of air contaminants, results from  
13 the CVHM model that indicate changes in groundwater withdrawals due to  
14 changes in CVP and SWP operations were analyzed. However, it is not known  
15 how many of the groundwater pumps use electricity and how many use diesel  
16 engines. The diesel engines have the potential to emit criteria air pollutants and  
17 precursors, and toxic air contaminants, as described in Chapter 16, Air Quality  
18 and Greenhouse Gas Emissions.

19 Most of the groundwater wells in the Central Valley use electrical pumps. As  
20 reported in a recent environmental assessment, approximately 14 to 15 percent of  
21 the pumps used diesel fuel in 2003 (Reclamation 2013a). It is assumed for this  
22 EIS, that the portion of groundwater pumps that use electricity would remain  
23 approximately at 85 percent. Therefore, it is assumed that increases or decreases  
24 in groundwater pumping would be indicative of an increase or decrease in the use  
25 of diesel engines in the Central Valley as well as in the San Francisco Bay Area,  
26 Central Coast, and Southern California regions. Changes in CVP and SWP  
27 operations would not result in changes in groundwater pumping in the Trinity  
28 River Region; therefore, this analysis does not address Trinity River Region.

29 **21.4.1.2 Changes in Public Health Related to Changes in Potential**  
30 **Exposure to Mercury in Fish Used in Human Consumption**

31 Changes in CVP and SWP operations under the alternatives could change public  
32 health factors related to mercury concentrations in fish used for human  
33 consumption as compared to the No Action Alternative and Second Basis of  
34 Comparison, as described in Chapter 18, Public Health.

35 **21.4.1.3 Changes in Socioeconomics**

36 Changes in CVP and SWP operations under the alternatives could change  
37 socioeconomic factors related to employment related to irrigated agriculture and  
38 municipal and industrial (M&I) water supplies and tribal salmon harvest in the  
39 Trinity River Region as compared to the No Action Alternative and Second Basis  
40 of Comparison, as described in Chapter 19, Socioeconomics. However, changes  
41 in employment related to irrigated agriculture and M&I water supplies would be  
42 similar. Therefore, these changes are not analyzed in this EIS.

#### 1 **21.4.1.4 Effects due to Cross Delta Water Transfers**

2 Historically water transfer programs have been developed on an annual basis.  
3 The demand for water transfers is dependent upon the availability of water  
4 supplies to meet water demands. Water transfer transactions have increased over  
5 time as CVP and SWP water supply availability has decreased, especially during  
6 drier water years.

7 Parties seeking water transfers generally acquire water from sellers who have  
8 available surface water who can make the water available through releasing  
9 previously stored water, pump groundwater instead of using surface water  
10 (groundwater substitution); idle crops; or substitute crops that uses less water in  
11 order to reduce normal consumptive use of surface water.

12 Water transfers using CVP and SWP Delta pumping plants and south of Delta  
13 canals generally occur when there is unused capacity in these facilities. These  
14 conditions generally occur during drier water year types when the flows from  
15 upstream reservoirs plus unregulated flows are adequate to meet the Sacramento  
16 Valley water demands and the CVP and SWP export allocations. In non-wet  
17 years, the CVP and SWP water allocations would be less than full contract  
18 amounts; therefore, capacity may be available in the CVP and SWP conveyance  
19 facilities to move water from other sources.

20 Projecting future environmental justice conditions related to water transfer  
21 activities is difficult because specific water transfer actions required to make the  
22 water available, convey the water, and/or use the water would change each year  
23 due to changing hydrological conditions, CVP and SWP water availability,  
24 specific local agency operations, and local cropping patterns. Reclamation  
25 recently prepared a long-term regional water transfer environmental document  
26 which evaluated potential changes in conditions related to water transfer actions  
27 (Reclamation 2014c). Results from this analysis were used to inform the impact  
28 assessment of potential effects of water transfers under the alternatives as  
29 compared to the No Action Alternative and the Second Basis of Comparison.

#### 30 **21.4.2 Conditions in Year 2030 without Implementation of** 31 **Alternatives 1 through 5**

32 This EIS includes two bases of comparison, as described in Chapter 3,  
33 Description of Alternatives: the No Action Alternative and the Second Basis of  
34 Comparison. Both of these bases are evaluated at 2030 conditions.

35 Changes that would occur over the next 15 years without implementation of the  
36 alternatives are not analyzed in this EIS. However, the changes to environmental  
37 justice factors that are assumed to occur by 2030 under the No Action Alternative  
38 and the Second Basis of Comparison are summarized in this section. Many of the  
39 changed conditions would occur in the same manner under both the No Action  
40 Alternative and the Second Basis of Comparison.

1 **21.4.2.1 Common Changes in Conditions under the No Action Alternative**  
2 **and Second Basis of Comparison**

3 Conditions in 2030 would be different than existing conditions due to:

- 4 • Climate change and sea level rise
- 5 • General plan development throughout California, including increased water  
6 demands in portions of Sacramento Valley
- 7 • Implementation of reasonable and foreseeable water resources management  
8 projects to provide water supplies

9 It is anticipated that climate change would result in more short-duration high-  
10 rainfall events and less snowpack in the winter and early spring months. The  
11 reservoirs would be full more frequently by the end of April or May by 2030 than  
12 in recent historical conditions. However, as the water is released in the spring,  
13 there would be less snowpack to refill the reservoirs. This condition would  
14 reduce reservoir storage and available water supplies to downstream uses in the  
15 summer. The reduced end of September storage also would reduce the ability to  
16 release stored water to downstream regional reservoirs. These conditions would  
17 occur for all reservoirs in the California foothills and mountains, including non-  
18 CVP and SWP reservoirs.

19 These changes would result in a decline of the long-term average CVP and SWP  
20 water supply deliveries by 2030 as compared to recent historical long-term  
21 average deliveries under the No Action Alternative and the Second Basis of  
22 Comparison. However, the CVP and SWP water deliveries would be less under  
23 the No Action Alternative as compared to the Second Basis of Comparison, as  
24 described in Chapter 5, Surface Water Resources and Water Supplies. Due to  
25 climate change and related lower snowfall, end of September low reservoir  
26 storage would be lower in critical dry years by 2030 as compared to recent  
27 historical conditions in Shasta Lake, Lake Oroville, Folsom Lake, New Melones  
28 Reservoir, and San Luis Reservoir. Therefore, the potential for reduced reservoir  
29 water supplies for wildland firefighting would be greater under the No Action  
30 Alternative and Second Basis of Comparison as compared to recent historical  
31 conditions.

32 Under the No Action Alternative and the Second Basis of Comparison, land uses  
33 in 2030 would occur in accordance with adopted general plans.

34 The No Action Alternative and the Second Basis of Comparison assumes  
35 completion of water resources management and environmental restoration  
36 projects that would have occurred without implementation of Alternatives 1  
37 through 5, including regional and local recycling projects, surface water and  
38 groundwater storage projects, conveyance improvement projects, and desalination  
39 projects, as described in Chapter 3, Description of Alternatives. The No Action  
40 Alternative and the Second Basis of Comparison also assumes implementation of  
41 actions included in the 2008 U.S. Fish and Wildlife Service (USFWS) Biological  
42 Opinion (BO) and 2009 National Marine Fisheries Service (NMFS) BO that

1 would have been implemented without the BOs by 2030, as described in  
2 Chapter 3, Description of Alternatives.

3 Under the No Action Alternative and Second Basis of Comparison, it is  
4 anticipated that mercury concentrations in fish tissue within the Delta will be  
5 either similar or greater than recent historical conditions. Phase 1 of the Delta  
6 Mercury Program mandated by the Central Valley Regional Water Quality  
7 Control Board (RWQCB) is currently being completed to protect people eating  
8 one meal per week of larger fish from the Delta, including Largemouth Bass.  
9 Phase 1 is focused on studies and pilot projects to develop and evaluate  
10 management practices to control methylmercury from mercury sources in the  
11 Delta and Yolo Bypass; and to reduce total mercury loading to the San Francisco  
12 Bay. Following completion of Phase 1 in 2019, Phase 2 will be implemented  
13 through 2030. Phase 2 will focus on methylmercury control programs and  
14 reduction programs for total inorganic mercury. Due to the extent of these  
15 studies, it is not anticipated that changes in methylmercury or total mercury  
16 concentrations in fish tissue will be reduced by 2030. Future mercury reduction  
17 and control programs will reduce mercury sources and related fish tissue  
18 concentrations; however, that will occur after 2030.

### 19 **21.4.3 Evaluation of Alternatives**

20 Alternatives 1 through 5 have been compared to the No Action Alternative; and  
21 the No Action Alternative and Alternatives 1 through 5 have been compared to  
22 the Second Basis of Comparison.

23 During review of the numerical modeling analyses used in this EIS, an error was  
24 determined in the CalSim II model assumptions related to the Stanislaus River  
25 operations for the Second Basis of Comparison, Alternative 1, and Alternative 4  
26 model runs. Appendix 5C includes a comparison of the CalSim II model run  
27 results presented in this chapter and CalSim II model run results with the error  
28 corrected. Appendix 5C also includes a discussion of changes in the comparison  
29 of groundwater conditions for the following alternative analyses.

- 30 • No Action Alternative compared to the Second Basis of Comparison
- 31 • Alternative 1 compared to the No Action Alternative
- 32 • Alternative 3 compared to the Second Basis of Comparison
- 33 • Alternative 5 compared to the Second Basis of Comparison.

#### 34 **21.4.3.1 No Action Alternative**

35 The No Action Alternative is compared to the Second Basis of Comparison.

##### 36 **21.4.3.1.1 Central Valley Region**

37 *Changes in Emissions of Criteria Air Pollutants and Precursors, and/or Exposure*  
38 *of Sensitive Receptors to Substantial Concentrations of Air Contaminants Related*  
39 *to Changes in Groundwater Pumping*

40 Groundwater pumping in the San Joaquin Valley portion of the Central Valley  
41 Region would increase by 8 percent under the No Action Alternative as compared  
42 to the Second Basis of Comparison. It is not known if the additional groundwater

1 pumping would rely upon electricity or diesel to drive the pump engines. Under  
2 the worst case analysis, it is assumed that the increased use of diesel engines  
3 would be proportional to the increased use of groundwater. Therefore, under the  
4 No Action Alternative, there would be a potential increase in emissions of criteria  
5 air pollutants and precursors, and/or exposure of sensitive receptors to substantial  
6 concentrations of air contaminants as compared to the Second Basis of  
7 Comparison.

8 *Changes in Public Health Factors Related to Mercury in Fish used for Human*  
9 *Consumption*

10 Mercury concentrations in Largemouth Bass would be similar (within 5 percent  
11 change) in most locations in the Delta, except for Rock Slough, San Joaquin River  
12 near Antioch, and Montezuma Slough in Suisun Marsh. In these areas, the  
13 mercury concentrations would increase by 7 percent over long-term conditions  
14 under the No Action Alternative as compared to the Second Basis of Comparison.  
15 Under dry and critical dry years, mercury concentrations would increase by 7 to  
16 8 percent at Rock Slough, intakes of the Banks and Jones pumping plants, and  
17 Victoria Canal. All values exceed the threshold of 0.24 mg/kg ww for mercury.

18 *Effects Related to Cross Delta Water Transfers*

19 Potential effects to environmental justice factors could be similar to those  
20 identified in a recent environmental analysis conducted by Reclamation for long-  
21 term water transfers from the Sacramento to San Joaquin valleys (Reclamation  
22 2014c). Potential effects to environmental justice were identified as loss of  
23 employment in the seller's service area if crop idling was used to provide transfer  
24 water. The analysis indicated that the proportion of crop idled acreage would be  
25 small as compared to the overall regional irrigated acreage, and that this change  
26 would not result in in disproportionately high or adverse effects. In addition,  
27 beneficial effects could occur in the purchaser's service area if more acreage was  
28 cultivated with the water transfer program than without the water transfer  
29 program.

30 Under the No Action Alternative, the timing of cross Delta water transfers would  
31 be limited to July through September and include annual volumetric limits, in  
32 accordance with the 2008 USFWS BO and 2009 NMFS BO. Under the Second  
33 Basis of Comparison, water could be transferred throughout the year without an  
34 annual volumetric limit. Overall, the potential for cross Delta water transfers  
35 would be less under the No Action Alternative than under the Second Basis of  
36 Comparison.

37 **21.4.3.1.2 San Francisco Bay Area, Central Coast, and Southern**  
38 **California Regions**

39 *Changes in Emissions of Criteria Air Pollutants and Precursors, and/or Exposure*  
40 *of Sensitive Receptors to Substantial Concentrations of Air Contaminants Related*  
41 *to Changes in Groundwater Pumping*

42 It is anticipated that CVP and SWP water supplies would be decreased by  
43 10 percent and 18 percent, respectively, in the San Francisco Bay Area, Central

1 Coast, and Southern California regions under No Action Alternative as compared  
 2 to the Second Basis of Comparison. The decrease in surface water supplies could  
 3 result in additional use of groundwater pumps and emissions of air pollutants and  
 4 contaminants if the use of diesel engines is also increased.

#### 5 **21.4.3.2 Alternative 1**

6 As described in Chapter 3, Description of Alternatives, Alternative 1 is identical  
 7 to the Second Basis of Comparison. As described in Chapter 4, Approach to  
 8 Environmental Analysis, Alternative 1 is compared to the No Action Alternative  
 9 and the Second Basis of Comparison. However, because CVP and SWP  
 10 operations under Alternative 1 are identical to conditions under the Second Basis  
 11 of Comparison; Alternative 1 is only compared to the No Action Alternative.

#### 12 **21.4.3.2.1 Alternative 1 Compared to the No Action Alternative**

##### 13 *Central Valley Region*

##### 14 *Changes in Emissions of Criteria Air Pollutants and Precursors, and/or* 15 *Exposure of Sensitive Receptors to Substantial Concentrations of Air* 16 *Contaminants Related to Changes in Groundwater Pumping*

17 Groundwater pumping in the San Joaquin Valley portion of the Central Valley  
 18 Region would decrease by 8 percent under Alternative 1 as compared to the No  
 19 Action Alternative. It is not known if the reduction in groundwater pumping  
 20 would result in a reduction of the use of electricity or diesel to drive the pump  
 21 engines. For this analysis, it is assumed that the decreased use of diesel engines  
 22 would be proportional to the decreased use of groundwater. Therefore, under  
 23 Alternative 1, there would be a potential decrease in emissions of criteria air  
 24 pollutants and precursors, and/or exposure of sensitive receptors to substantial  
 25 concentrations of air contaminants as compared to the No Action Alternative.

##### 26 *Changes in Public Health Factors Related to Mercury in Fish used for Human* 27 *Consumption*

28 Mercury concentrations in Largemouth Bass would be similar in most locations in  
 29 the Delta, except for Rock Slough, San Joaquin River near Antioch, and  
 30 Montezuma Slough in Suisun Marsh. In these areas, the mercury concentrations  
 31 would decrease by 6 percent over the long-term conditions under Alternative 1 as  
 32 compared to the No Action Alternative. Under dry and critical dry years, mercury  
 33 concentrations would decrease by 6 to 8 percent at Rock Slough, intakes of the  
 34 Banks and Jones pumping plants, and Victoria Canal. All values exceed the  
 35 threshold of 0.24 mg/kg ww for mercury.

##### 36 *Effects Related to Cross Delta Water Transfers*

37 Potential effects to environmental justice conditions could be similar to those  
 38 identified in a recent environmental analysis conducted by Reclamation for long-  
 39 term water transfers from the Sacramento to San Joaquin valleys (Reclamation  
 40 2014c) as described above under the No Action Alternative compared to the  
 41 Second Basis of Comparison. For the purposes of this EIS, it is anticipated that  
 42 similar conditions would occur during implementation of cross Delta water  
 43 transfers under Alternative 1 and the No Action Alternative, and that impacts on

1 environmental justice factors would not be substantial due to implementation  
2 requirements of the transfer programs.

3 Under Alternative 1, water could be transferred throughout the year without an  
4 annual volumetric limit. Under the No Action Alternative, the timing of cross  
5 Delta water transfers would be limited to July through September and include  
6 annual volumetric limits, in accordance with the 2008 USFWS BO and 2009  
7 NMFS BO. Overall, the potential for cross Delta water transfers would be  
8 increased under Alternative 1 as compared to the No Action Alternative.

9 *San Francisco Bay Area, Central Coast, and Southern California Regions*  
10 *Changes in Emissions of Criteria Air Pollutants and Precursors, and/or*  
11 *Exposure of Sensitive Receptors to Substantial Concentrations of Air*  
12 *Contaminants Related to Changes in Groundwater Pumping*

13 It is anticipated that CVP and SWP water supplies would be increased by  
14 11 percent and 21 percent, respectively, in the San Francisco Bay Area, Central  
15 Coast, and Southern California regions under Alternative 1 as compared to the No  
16 Action Alternative. The increase in surface water supplies could result in the  
17 reduction in use of groundwater pumps and emissions of air pollutants and  
18 contaminants if the use of diesel engines is also decreased.

19 **21.4.3.2 Alternative 1 Compared to the Second Basis of Comparison**

20 Alternative 1 is identical to the Second Basis of Comparison.

21 **21.4.3.3 Alternative 2**

22 The CVP and SWP operations under Alternative 2 are identical to the CVP and  
23 SWP operations under the No Action Alternative, as described in Chapter 3,  
24 Description of Alternatives; therefore Alternative 2 is only compared to the  
25 Second Basis of Comparison.

26 **21.4.3.3.1 Alternative 2 Compared to the Second Basis of Comparison**

27 The CVP and SWP operations under Alternative 2 are identical to the CVP and  
28 SWP operations under the No Action Alternative. Therefore, changes to  
29 environmental justice factors under Alternatives 2 as compared to the Second  
30 Basis of Comparison would be the same as the impacts described in  
31 Section 18.4.3.1, No Action Alternative.

32 **21.4.3.4 Alternative 3**

33 As described in Chapter 3, Description of Alternatives, CVP and SWP operations  
34 under Alternative 3 are similar to the Second Basis of Comparison with modified  
35 Old and Middle River flow criteria and New Melones Reservoir operations. As  
36 described in Chapter 4, Approach to Environmental Analysis, Alternative 3 is  
37 compared to the No Action Alternative and the Second Basis of Comparison.

1 **21.4.3.4.1 Alternative 3 Compared to the No Action Alternative**

2 *Central Valley Region*

3 *Changes in Emissions of Criteria Air Pollutants and Precursors, and/or*  
 4 *Exposure of Sensitive Receptors to Substantial Concentrations of Air*  
 5 *Contaminants Related to Changes in Groundwater Pumping*

6 Groundwater pumping in the San Joaquin Valley portion of the Central Valley  
 7 Region would decrease by 6 percent under Alternative 3 as compared to the No  
 8 Action Alternative. It is not known if the reduction in groundwater pumping  
 9 would result in a reduction of the use of electricity or diesel to drive the pump  
 10 engines. For this analysis, it is assumed that the decreased use of diesel engines  
 11 would be proportional to the decreased use of groundwater. Therefore, under  
 12 Alternative 3, there would be a potential decrease in emissions of criteria air  
 13 pollutants and precursors, and/or exposure of sensitive receptors to substantial  
 14 concentrations of air contaminants as compared to the No Action Alternative.

15 *Changes in Public Health Factors Related to Mercury in Fish used for Human*  
 16 *Consumption*

17 Mercury concentrations in Largemouth Bass would be similar (within 5 percent  
 18 change) in most locations in the Delta, except for San Joaquin River near Antioch  
 19 and Montezuma Slough in Suisun Marsh. In these areas, the mercury  
 20 concentrations would decrease by 6 percent over the long-term conditions under  
 21 Alternative 3 as compared to the No Action Alternative. Mercury concentrations  
 22 under the dry and critical dry years would be similar throughout the Delta. All  
 23 values exceed the threshold of 0.24 mg/kg ww for mercury.

24 *Effects Related to Cross Delta Water Transfers*

25 Potential effects to environmental justice factors could be similar to those  
 26 identified in a recent environmental analysis conducted by Reclamation for long-  
 27 term water transfers from the Sacramento to San Joaquin valleys (Reclamation  
 28 2014c) as described above under the No Action Alternative compared to the  
 29 Second Basis of Comparison. For the purposes of this EIS, it is anticipated that  
 30 similar conditions would occur during implementation of cross Delta water  
 31 transfers under Alternative 3 and the No Action Alternative, and that impacts on  
 32 environmental justice factors would not be substantial due to implementation  
 33 requirements of the transfer programs.

34 Under Alternative 3, water could be transferred throughout the year without an  
 35 annual volumetric limit. Under the No Action Alternative, the timing of cross  
 36 Delta water transfers would be limited to July through September and include  
 37 annual volumetric limits, in accordance with the 2008 USFWS BO and 2009  
 38 NMFS BO. Overall, the potential for cross Delta water transfers would be  
 39 increased under Alternative 3 as compared to the No Action Alternative.

1 *San Francisco Bay Area, Central Coast, and Southern California Regions*  
2 *Changes in Emissions of Criteria Air Pollutants and Precursors, and/or*  
3 *Exposure of Sensitive Receptors to Substantial Concentrations of Air*  
4 *Contaminants Related to Changes in Groundwater Pumping*

5 It is anticipated that CVP and SWP water supplies would be increased by  
6 9 percent and 17 percent, respectively, in the San Francisco Bay Area, Central  
7 Coast, and Southern California regions under Alternative 3 as compared to the No  
8 Action Alternative. The increase in surface water supplies could result in the  
9 reduction in use of groundwater pumps and emissions of air pollutants and  
10 contaminants if the use of diesel engines is also decreased.

11 **21.4.3.4.2 Alternative 3 Compared to the Second Basis of Comparison**

12 *Central Valley Region*

13 *Changes in Emissions of Criteria Air Pollutants and Precursors, and/or*  
14 *Exposure of Sensitive Receptors to Substantial Concentrations of Air*  
15 *Contaminants Related to Changes in Groundwater Pumping*

16 Groundwater pumping in the San Joaquin Valley portion of the Central Valley  
17 Region would be similar (within a 5 percent change) under Alternative 3 as  
18 compared to the Second Basis of Comparison. Therefore, the emissions of  
19 criteria air pollutants and precursors, and/or exposure of sensitive receptors to  
20 substantial concentrations of air contaminants would be similar under  
21 Alternative 3 as compared to the Second Basis of Comparison.

22 *Changes in Public Health Factors Related to Mercury in Fish Used for*  
23 *Human Consumption*

24 Mercury concentrations in Largemouth Bass would be similar throughout the  
25 Delta under Alternative 3 as compared to the Second Basis of Comparison, as  
26 summarized in Chapter 6, Surface Water Quality. All values exceed the threshold  
27 of 0.24 mg/kg ww for mercury.

28 *Effects Related to Cross Delta Water Transfers*

29 Potential effects to environmental justice factors could be similar to those  
30 identified in a recent environmental analysis conducted by Reclamation for  
31 long-term water transfers from the Sacramento to San Joaquin valleys  
32 (Reclamation 2014c) as described above under the No Action Alternative  
33 compared to the Second Basis of Comparison. For the purposes of this EIS, it is  
34 anticipated that similar conditions would occur during implementation of cross  
35 Delta water transfers under Alternative 3 and the Second Basis of Comparison,  
36 and that impacts on environmental justice factors would not be substantial in the  
37 seller's service area due to implementation requirements of the transfer programs.

38 Under Alternative 3 and the Second Basis of Comparison, water could be  
39 transferred throughout the year without an annual volumetric limit. Overall, the  
40 potential for cross Delta water transfers would be similar under Alternative 3 and  
41 the Second Basis of Comparison.

1 *San Francisco Bay Area, Central Coast, and Southern California Regions*  
 2 *Changes in Emissions of Criteria Air Pollutants and Precursors, and/or*  
 3 *Exposure of Sensitive Receptors to Substantial Concentrations of Air*  
 4 *Contaminants Related to Changes in Groundwater Pumping*

5 It is anticipated that CVP and SWP water supplies and emissions from diesel  
 6 engines used for groundwater pumping would be similar in the San Francisco Bay  
 7 Area, Central Coast, and Southern California regions under Alternative 3 as  
 8 compared to the Second Basis of Comparison.

9 **21.4.3.5 Alternative 4**

10 The environmental justice conditions under Alternative 4 would be identical to  
 11 the conditions under the Second Basis of Comparison; therefore, Alternative 4 is  
 12 only compared to the No Action Alternative.

13 **21.4.3.5.1 Alternative 4 Compared to the No Action Alternative**

14 The CVP and SWP operations under Alternative 4 are identical to the CVP and  
 15 SWP operations under the Second Basis of Comparison and Alternative 1.  
 16 Therefore, changes in environmental justice conditions under Alternative 4 as  
 17 compared to the No Action Alternative would be the same as the impacts  
 18 described in Section 12.4.3.2.1, Alternative 1 Compared to the No Action  
 19 Alternative.

20 **21.4.3.6 Alternative 5**

21 As described in Chapter 3, Description of Alternatives, CVP and SWP operations  
 22 under Alternative 5 are similar to the No Action Alternative with modified Old  
 23 and Middle River flow criteria and New Melones Reservoir operations. As  
 24 described in Chapter 4, Approach to Environmental Analysis, Alternative 5 is  
 25 compared to the No Action Alternative and the Second Basis of Comparison.

26 **21.4.3.6.1 Alternative 5 Compared to the No Action Alternative**

27 *Central Valley Region*

28 *Changes in Emissions of Criteria Air Pollutants and Precursors, and/or*  
 29 *Exposure of Sensitive Receptors to Substantial Concentrations of Air*  
 30 *Contaminants Related to Changes in Groundwater Pumping*

31 Groundwater pumping in the San Joaquin Valley portion of the Central Valley  
 32 Region would be similar under Alternative 5 as compared to the No Action  
 33 Alternative. Therefore, the emissions of criteria air pollutants and precursors,  
 34 and/or exposure of sensitive receptors to substantial concentrations of air  
 35 contaminants would be similar under Alternative 5 as compared to the No Action  
 36 Alternative.

1        *Changes in Public Health Factors Related to Mercury in Fish used for Human*  
2        *Consumption*

3 Mercury concentrations in Largemouth Bass would be similar throughout the  
4 Delta under Alternative 5 as compared to the No Action Alternative, as  
5 summarized in Chapter 6, Surface Water Quality. All values exceed the threshold  
6 of 0.24 mg/kg ww for mercury.

7        *Effects Related to Cross Delta Water Transfers*

8 Potential effects to environmental justice factors could be similar to those  
9 identified in a recent environmental analysis conducted by Reclamation for long-  
10 term water transfers from the Sacramento to San Joaquin valleys (Reclamation  
11 2014c) as described above under the No Action Alternative compared to the  
12 Second Basis of Comparison. For the purposes of this EIS, it is anticipated that  
13 similar conditions would occur during implementation of cross Delta water  
14 transfers under Alternative 5 and the No Action Alternative, and that impacts on  
15 environmental justice factors would not be substantial in the seller's service area  
16 due to implementation requirements of the transfer programs.

17 Under Alternative 5 and the No Action Alternative, the timing of cross Delta  
18 water transfers would be limited to July through September and include annual  
19 volumetric limits, in accordance with the 2008 USFWS BO and 2009 NMFS BO.  
20 Overall, the potential for cross Delta water transfers would be similar under  
21 Alternative 5 and the No Action Alternative.

22 *San Francisco Bay Area, Central Coast, and Southern California Regions*  
23        *Changes in Emissions of Criteria Air Pollutants and Precursors, and/or*  
24        *Exposure of Sensitive Receptors to Substantial Concentrations of Air*  
25        *Contaminants Related to Changes in Groundwater Pumping*

26 It is anticipated that CVP and SWP water supplies and emissions from diesel  
27 engines used for groundwater pumping would be similar in the San Francisco Bay  
28 Area, Central Coast, and Southern California regions under Alternative 5 as  
29 compared to the No Action Alternative.

30 **21.4.3.6.2 Alternative 5 Compared to the Second Basis of Comparison**

31 *Central Valley Region*

32        *Changes in Emissions of Criteria Air Pollutants and Precursors, and/or*  
33        *Exposure of Sensitive Receptors to Substantial Concentrations of Air*  
34        *Contaminants Related to Changes in Groundwater Pumping*

35 Groundwater pumping in the San Joaquin Valley portion of the Central Valley  
36 Region would increase by 8 percent under Alternative 5 as compared to the  
37 Second Basis of Comparison. It is not known if the additional groundwater  
38 pumping would rely upon electricity or diesel to drive the pump engines. Under  
39 the worst case analysis, it is assumed that the increased use of diesel engines  
40 would be proportional to the increased use of groundwater. Therefore, under  
41 Alternative 5, there would be a potential increase in emissions of criteria air  
42 pollutants and precursors, and/or exposure of sensitive receptors to substantial

1 concentrations of air contaminants as compared to the Second Basis of  
2 Comparison.

3 *Changes in Public Health Factors Related to Mercury in Fish used for Human*  
4 *Consumption*

5 Mercury concentrations in Largemouth Bass would be similar in most locations in  
6 the Delta, except for Rock Slough, San Joaquin River near Antioch, and  
7 Montezuma Slough in Suisun Marsh. In these areas, the mercury concentrations  
8 would increase by 7 to 8 percent over long-term conditions under Alternative 5 as  
9 compared to the Second Basis of Comparison. During dry and critical dry years,  
10 mercury concentrations also would increase by 7 percent at intakes to Banks  
11 Pumping Plant and Jones Pumping Plant; and 13 percent at Rock Slough. All  
12 values exceed the threshold of 0.24 mg/kg ww for mercury.

13 *Effects Related to Cross Delta Water Transfers*

14 Potential effects to environmental justice factors could be similar to those  
15 identified in a recent environmental analysis conducted by Reclamation for long-  
16 term water transfers from the Sacramento to San Joaquin valleys (Reclamation  
17 2014c) as described above under the No Action Alternative compared to the  
18 Second Basis of Comparison. For the purposes of this EIS, it is anticipated that  
19 similar conditions would occur during implementation of cross Delta water  
20 transfers under Alternative 5 and the Second Basis of Comparison, and that  
21 impacts on environmental justice factors would not be substantial in the seller's  
22 service area due to implementation requirements of the transfer programs.

23 Under Alternative 5, the timing of cross Delta water transfers would be limited to  
24 July through September and include annual volumetric limits, in accordance with  
25 the 2008 USFWS BO and 2009 NMFS BO. Under the Second Basis of  
26 Comparison, water could be transferred throughout the year without an annual  
27 volumetric limit. Overall, the potential for cross Delta water transfers would be  
28 reduced under Alternative 5 as compared to the Second Basis of Comparison.

29 *San Francisco Bay Area, Central Coast, and Southern California Regions*

30 *Changes in Emissions of Criteria Air Pollutants and Precursors, and/or*  
31 *Exposure of Sensitive Receptors to Substantial Concentrations of Air*  
32 *Contaminants Related to Changes in Groundwater Pumping*

33 It is anticipated that CVP and SWP water supplies would be decreased by  
34 10 percent and 18 percent, respectively, in the San Francisco Bay Area, Central  
35 Coast, and Southern California regions under Alternative 5 as compared to the  
36 Second Basis of Comparison. The decrease in surface water supplies could result  
37 in increased use of groundwater pumps and emissions of air pollutants and  
38 contaminants if the use of diesel engines is also increased.

39 **21.4.3.7 Summary of Environmental Consequences**

40 The results of the environmental consequences of implementation of  
41 Alternatives 1 through 5 as compared to the No Action Alternative and the  
42 Second Basis of Comparison are presented in Tables 21.38 and 21.39.

1 **Table 21.38 Comparison of Alternatives 1 through 5 to No Action Alternative**

Alternative	Potential Change	Consideration for Mitigation Measures
Alternative 1	Decrease potential for emissions of criteria air pollutants and precursors, and/or exposure of sensitive receptors to substantial concentrations of air contaminants by 8 percent in the Central Valley, 11 to 21 percent in the San Francisco Bay Area Region, and by 21 percent in the Central Coast and Southern California regions.  Similar mercury concentrations in Largemouth Bass in the most of the Delta; and a 6 percent decrease near Rock Slough, San Joaquin River at Antioch, and Montezuma Slough over the long-term conditions.	None needed
Alternative 2	No effects on environmental justice factors.	None needed
Alternative 3	Decrease potential for emissions of criteria air pollutants and precursors, and/or exposure of sensitive receptors to substantial concentrations of air contaminants by 6 percent in the Central Valley, 9 to 17 percent in the San Francisco Bay Area Region, and by 17 percent in the Central Coast and Southern California regions.  Similar mercury concentrations in Largemouth Bass in the most of the Delta; and a 6 percent decrease near San Joaquin River at Antioch and Montezuma Slough over the long-term conditions.	None needed
Alternative 4	Same effects as described for Alternative 1 compared to the No Action Alternative.	None needed
Alternative 5	Similar potential for emissions of criteria air pollutants and precursors, and/or exposure of sensitive receptors to substantial concentrations of air contaminants in the Central Valley, San Francisco Bay Area, Central Coast, and Southern California regions.  Similar mercury concentrations in Largemouth Bass throughout the Delta.	None needed

2 Note: Due to the limitations and uncertainty in the CalSim II monthly model and other analytical  
 3 tools, incremental differences of 5 percent or less between alternatives and the Second Basis of  
 4 Comparison are considered to be “similar.”

5 **Table 21.39 Comparison of Alternatives 1 through 5 to Second Basis of**  
 6 **Comparison**

Alternative	Potential Change	Consideration for Mitigation Measures
No Action Alternative	Increase potential for emissions of criteria air pollutants and precursors, and/or exposure of sensitive receptors to substantial concentrations of air contaminants by 8 percent in the Central Valley, 10 to 18 percent in the San Francisco Bay Area Region, and by 18 percent in the Central Coast and Southern California regions.  Similar mercury concentrations in Largemouth Bass in the most of the Delta; and a 7 percent increase near Rock Slough, San Joaquin River at Antioch, and Montezuma Slough over the long-term conditions.	Not considered for this comparison.
Alternative 1	No effects on environmental justice factors.	Not considered for this comparison.

Alternative	Potential Change	Consideration for Mitigation Measures
Alternative 2	Same effects as described for No Action Alternative as compared to the Second Basis of Comparison.	Not considered for this comparison.
Alternative 3	Similar potential for emissions of criteria air pollutants and precursors, and/or exposure of sensitive receptors to substantial concentrations of air contaminants in the Central Valley, San Francisco Bay Area, Central Coast, and Southern California regions.  Similar mercury concentrations in Largemouth Bass throughout the Delta.	Not considered for this comparison.
Alternative 4	No effects on environmental justice factors.	Not considered for this comparison.
Alternative 5	Increase potential for emissions of criteria air pollutants and precursors, and/or exposure of sensitive receptors to substantial concentrations of air contaminants by 8 percent in the Central Valley, 10 to 18 percent in the San Francisco Bay Area Region, and by 18 percent in the Central Coast and Southern California regions.  Similar mercury concentrations in Largemouth Bass in the most of the Delta; and a 7 percent increase near Rock Slough, San Joaquin River at Antioch, and Montezuma Slough over the long-term conditions.	Not considered for this comparison.

1 Note: Due to the limitations and uncertainty in the CalSim II monthly model and other analytical  
2 tools, incremental differences of 5 percent or less between alternatives and the Second Basis of  
3 Comparison are considered to be "similar."

#### 4 **21.4.3.8 Potential Mitigation Measures**

5 Mitigation measures are presented in this section to avoid, minimize, rectify,  
6 reduce, eliminate, or compensate for adverse environmental effects of  
7 Alternatives 1 through 5 as compared to the No Action Alternative. Mitigation  
8 measures were not included to address adverse impacts under the alternatives as  
9 compared to the Second Basis of Comparison because this analysis was included  
10 in this EIS for information purposes only.

11 Changes in CVP and SWP operations under Alternatives 1 through 5 as compared  
12 to the No Action Alternative would not result in changes in air quality or public  
13 health that are related to environmental justice factors. Therefore, there would be  
14 no disproportionately high or adverse environmental justice effects; and no  
15 mitigation measures are required.

#### 16 **21.4.3.9 Cumulative Effects Analysis**

17 As described in Chapter 3, the cumulative effects analysis considers projects,  
18 programs, and policies that are not speculative; and are based upon known or  
19 reasonably foreseeable long-range plans, regulations, operating agreements, or  
20 other information that establishes them as reasonably foreseeable.

21 The cumulative effects analysis Alternatives 1 through 5 for Environmental  
22 Justice are summarized in Table 21.40.

1  
2

**Table 21.4 Summary of Cumulative Effects on Environmental Justice of Alternatives 1 through 5 as Compared to the No Action Alternative**

Scenarios	Actions	Cumulative Effects of Actions
<p>Past &amp; Present, and Future Actions included in the No Action Alternative and in all Alternatives in Year 2030</p>	<p>Consistent with Affected Environment conditions plus:</p> <p>Actions in the 2008 USFWS BO and 2009 NMFS BO that Would Have Occurred without Implementation of the Biological Opinions, as described in Section 3.3.1.2 (of Chapter 3, Descriptions of Alternatives), including climate change and sea level rise</p> <p>Actions not included in the 2008 USFWS BO and 2009 NMFS BO that Would Have Occurred without Implementation of the Biological Opinions, as described in Section 3.3.1.3 (of Chapter 3, Descriptions of Alternatives):</p> <ul style="list-style-type: none"> <li>• Implementation of Federal and state policies and programs, including Clean Water Act (e.g., Total Maximum Daily Loads); Safe Drinking Water Act; Clean Air Act; and flood management programs</li> <li>• General plans for 2030.</li> <li>• Trinity River Restoration Program.</li> <li>• Central Valley Project Improvement Act programs</li> <li>• Folsom Dam Water Control Manual Update</li> <li>• FERC Relicensing for the Middle Fork of the American River Project</li> <li>• Lower Mokelumne River Spawning Habitat Improvement Project</li> <li>• Dutch Slough Tidal Marsh Restoration</li> <li>• Suisun Marsh Habitat Management, Preservation, and Restoration Plan Implementation</li> <li>• Tidal Wetland Restoration: Yolo Ranch, Northern Liberty Island Fish Restoration Project, Prospect Island Restoration Project, and Calhoun Cut/Lindsey Slough Tidal Habitat Restoration Project</li> <li>• San Joaquin River Restoration Program</li> <li>• Future water supply projects, including water recycling, desalination, groundwater banks and wellfields, and conveyance facilities (projects with completed environmental documents)</li> </ul>	<p><u>These effects would be the same in all alternatives.</u></p> <p>Climate change and sea level rise, development under the general plans, FERC relicensing projects, and some future projects to improve water quality and/or habitat are anticipated to reduce the availability of surface water, including CVP and SWP water supplies. This could result in increased groundwater withdrawals; and a portion of those groundwater pumps would rely upon diesel engines. Therefore, there would be an increased potential for emissions of criteria air pollutants and precursors, and/or exposure of sensitive receptors that could cause a disproportionately high and adverse impact on minority and low-income populations.</p> <p>Mercury concentrations in fish tissue within the Delta will be either similar or greater than recent historical conditions because Phases 1 and 2 of the Delta Mercury Program would be completed by 2030, as mandated by the Central Valley RWQCB, including methylmercury control programs and reduction programs for total inorganic mercury. Due to the extent of these programs, it is anticipated that the programs would be initiated; however, future reductions in mercury sources and related reductions of mercury and methylmercury concentrations in fish tissue would actually occur after 2030.</p>

Scenarios	Actions	Cumulative Effects of Actions
<p>Future Actions considered as Cumulative Effects Actions in with all Alternatives in Year 2030</p>	<p>Actions as described in Section 3.5 (of Chapter 3, Descriptions of Alternatives):</p> <ul style="list-style-type: none"> <li>• Bay-Delta Water Quality Control Plan Update</li> <li>• FERC Relicensing Projects</li> <li>• Bay Delta Conservation Plan (including the California WaterFix alternative)</li> <li>• Shasta Lake Water Resources, North-of-the-Delta Offstream Storage, Los Vaqueros Reservoir Expansion Phase 2, and Upper San Joaquin River Basin Storage Investigations</li> <li>• El Dorado Water and Power Authority Supplemental Water Rights Project</li> <li>• Sacramento River Water Reliability Project</li> <li>• Semitropic Water Storage District Delta Wetlands</li> <li>• North Bay Aqueduct Alternative Intake</li> <li>• San Luis Reservoir Low Point Improvement Project</li> <li>• Future water supply projects, including water recycling, desalination, groundwater banks and wellfields, and conveyance facilities (projects that did not have completed environmental documents during preparation of the EIS)</li> </ul>	<p><u>These effects would be the same in all alternatives.</u></p> <p>Future reasonably foreseeable storage and water supply projects would improve surface water reliability. These actions would reduce the potential for increased groundwater withdrawals; and reduce the potential for emissions of criteria air pollutants and precursors, and/or exposure of sensitive receptors that could cause a disproportionately high and adverse impact on minority and low-income populations.</p>
<p>No Action Alternative with Associated Cumulative Effects Actions in Year 2030</p>	<p>Full implementation of the 2008 USFWS BO and 2009 NMFS BO</p>	<p>Climate change and sea level rise, FERC relicensing projects, and some future projects to improve water quality and/or habitat are anticipated to reduce the availability of surface water, including CVP and SWP water supplies. This could result in increased groundwater withdrawals; and a portion of those groundwater pumps would rely upon diesel engines. Therefore, there would be an increased potential for emissions of criteria air pollutants and precursors, and/or exposure of sensitive receptors that could cause a disproportionately high and adverse impact on minority and low-income populations.</p> <p>Mercury concentrations in fish tissue within the Delta will be</p>

Scenarios	Actions	Cumulative Effects of Actions
		<p>either similar or greater than recent historical conditions because Phases 1 and 2 of the Delta Mercury Program would be completed by 2030, as mandated by the Central Valley RWQCB, including methylmercury control programs and reduction programs for total inorganic mercury. Due to the extent of these programs, it is anticipated that the programs would be initiated; however, future reductions in mercury sources and related reductions of mercury and methylmercury concentrations in fish tissue would actually occur after 2030.</p>
<p>Alternative 1 with Associated Cumulative Effects Actions in Year 2030</p>	<p>No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant)</p>	<p>Implementation of Alternative 1 with reasonably foreseeable actions would result in similar changes as under the No Action Alternative with these added actions.</p>
<p>Alternative 2 with Associated Cumulative Effects Actions in Year 2030</p>	<p>Full implementation of the 2008 USFWS BO and 2009 NMFS BO CVP and SWP operational actions No implementation of structural improvements or other actions that require further study to develop a more detailed action description.</p>	<p>Implementation of Alternative 2 with reasonably foreseeable actions would result in similar changes as under the No Action Alternative with these added actions.</p>
<p>Alternative 3 with Associated Cumulative Effects Actions in Year 2030</p>	<p>No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant) Slight increase in positive Old and Middle River flows in the winter and spring months</p>	<p>Implementation of Alternative 3 with reasonably foreseeable actions would result in similar changes as under the No Action Alternative with these added actions.</p>
<p>Alternative 4 with Associated Cumulative Effects Actions in Year 2030</p>	<p>No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant)</p>	<p>Implementation of Alternative 4 with reasonably foreseeable actions would result in similar changes as under the No Action Alternative with these added actions.</p>
<p>Alternative 5 with Associated Cumulative Effects Actions in Year 2030</p>	<p>Full implementation of the 2008 USFWS BO and 2009 NMFS BO Positive Old and Middle River flows and increased Delta outflow in spring months</p>	<p>Implementation of Alternative 5 with reasonably foreseeable actions would result in similar changes as under the No Action Alternative with these added actions.</p>

**Chapter 22****1 Other NEPA Requirements****2 22.1 Introduction**

3 In addition to the factors described in Chapters 5 through 21, the National  
4 Environmental Policy Act (NEPA) requires consideration of the relationship of  
5 short-term uses and long-term productivity, consideration of irreversible and  
6 irretrievable commitments of resources, and growth-inducing impacts as  
7 compared to the No Action Alternative (40 Code of Federal Regulations  
8 [CFR] 1508.8). These considerations are described in the following sections of  
9 this chapter.

**10 22.2 Relationship between Short-term Uses and**  
**11 Long-term Productivity**

12 NEPA requires that an Environmental Impact Statement (EIS) prepared by  
13 Federal agencies disclose "...the relationship between short-term uses of man's  
14 environment and the maintenance and enhancement of long-term productivity..."  
15 (40 CFR 1502.16). As discussed in Chapter 1, Introduction, this EIS evaluates  
16 long-term potential direct, indirect, and cumulative impacts on the environment  
17 that could result from implementation of alternatives for the continued long-term  
18 operation of the Central Valley Project (CVP) and State Water Project (SWP) and  
19 implementation of ecosystem restoration. This EIS does not evaluate short-term  
20 impacts related to implementing project-specific actions, such as impacts during  
21 construction and/or start-up periods for actions that are not fully defined at this  
22 time and that may be implemented by Reclamation or other agencies as part of the  
23 alternatives. It is recognized that numerous projects would be planned, designed,  
24 and constructed under the No Action Alternative and the Second Basis of  
25 Comparison, including tidal wetlands and floodplain restoration, as described in  
26 Chapter 3, Description of Alternatives. It also recognized that facilities to  
27 implement fish passage at CVP reservoirs would be implemented under the No  
28 Action Alternative and Alternative 5; and facilities to implement a trap and haul  
29 program for steelhead from the San Joaquin River under Alternative 4.  
30 Project-specific construction impacts would be addressed in project-specific  
31 environmental documents prepared at the time the projects are proposed for  
32 approval. At this time, however, the need for, and the nature, magnitude, and  
33 extent of specific impacts are not known.

34 Potential long-term effects (beneficial and adverse) of implementation of  
35 Alternatives 1 through 5 as compared to the No Action Alternative with respect to  
36 each environmental resource are summarized in Table 22.1.

- 1 There would be no long-term effects related to geology and soils resources,  
 2 agricultural resources, land use, cultural resources, and Indian Trust Assets  
 3 because the conditions under Alternatives 1 through 5 would be similar to  
 4 conditions under the No Action Alternative and to the Second Basis of  
 5 Comparison.  
 6 A complete listing of the effects of implementation of Alternatives 1 through 5 as  
 7 compared to the No Action Alternative and to the Second Basis of Comparison  
 8 are included Chapter 3, Description of Alternatives.

9 **Table 22.1 Long-term Effects of Implementation of the No Action Alternative and**  
 10 **Alternatives 1 through 5**

Environmental Resources	Comparison of Alternatives 1 through 5 and the No Action Alternative
<b>Surface Water</b>	
Trinity Lake	Water surface elevations similar in Alternatives 1 through 5 and the No Action Alternative. Storage under Alternatives 1, 3, and 4 is higher than under Alternatives 2 and 5 and the No Action Alternative.
Trinity River at Lewiston Dam	Flows similar or higher in November-December under Alternatives 1, 3, and 4 than under Alternatives 2 and 5 and the No Action Alternative. Similar flows in other months.
Shasta Lake	Water surface elevations similar in Alternatives 1 through 5 and the No Action Alternative. Storage under Alternatives 1, 3, and 4 is higher than under Alternatives 2 and 5 and the No Action Alternative.
Sacramento River at Keswick Dam	Flows similar or higher in December-August under Alternatives 1, 3, and 4 than under Alternatives 2 and 5 and the No Action Alternative. Flows higher in September-November under Alternatives 2 and 5 and the No Action Alternative than under Alternatives 1, 3, and 4.
Sacramento River at Freeport	Flows similar or higher under Alternatives 1 and 4 than under Alternative 3; and flows higher under Alternative 3 than under Alternatives 2 and 5 and the No Action Alternative in May-June. Flows higher in July-December under Alternatives 2 and 5 and the No Action Alternative than under Alternative 3; and flows higher under Alternative 3 than under Alternatives 1 and 4.
Clear Creek near Igo	Flows are similar under Alternatives 1 through 5 and the No Action Alternative in June-April. Flows under Alternatives 2 and 5 and the No Action Alternative are higher in May than under Alternatives 1, 3, and 4.
Lake Oroville	Water surface elevations similar in Alternatives 1 through 5 and the No Action Alternative. Storage under Alternatives 1, 3, and 4 is higher than under Alternatives 2 and 5 and the No Action Alternative.
Feather River downstream of Thermalito Complex	Flows under Alternatives 1, 3, and 4 similar or higher than under Alternatives 2 and 5 and the No Action Alternative.

<b>Environmental Resources</b>	<b>Comparison of Alternatives 1 through 5 and the No Action Alternative</b>
Folsom Lake	<p>Water surface elevations similar in Alternatives 1 through 5 and the No Action Alternative.</p> <p>Storage under Alternatives 1, 3, and 4 is higher in October-January than under Alternatives 2 and 5 and the No Action Alternative.</p> <p>Storage under Alternatives 2 and 5 and the No Action Alternative are higher in August-September than under Alternatives 1, 3, and 4.</p> <p>Storage similar under February-July in Alternatives 1 through 5 and the No Action Alternative.</p>
American River at Nimbus Dam	<p>Flows under Alternatives 1, 3, and 4 similar or higher than under Alternatives 2 and 5 and the No Action Alternative.</p>
New Melones Reservoir	<p>Water surface elevations similar in Alternatives 1 through 5 and the No Action Alternative.</p> <p>Storage under Alternative 3 is higher than under Alternatives 1 and 4; and storage under Alternatives 1 and 4 are higher than under Alternatives 2 and 5 and the No Action Alternative.</p>
Stanislaus River at Goodwin Dam	<p>Flows higher under Alternatives 1 and 4 than under Alternative 3; and flows under Alternative 3 are higher than under Alternative 5 and the No Action Alternative.</p> <p>Flows under Alternative 5 higher than under the No Action Alternative in April-May.</p>
San Joaquin River at Vernalis	<p>Flows higher in October under the Alternatives 2 and 5 and the No Action Alternative than under Alternatives 1, 3, and 4.</p> <p>Flows higher in April under Alternative 5 than under all other alternatives.</p> <p>Flows higher in May under Alternatives 1 and 4 than under Alternatives 3 and 5 and the No Action Alternative.</p> <p>Flows similar during other months.</p>
San Luis Reservoir	<p>Water surface elevations similar in Alternatives 1 through 5 and the No Action Alternative.</p> <p>Storage under Alternatives 1 and 4 higher than under Alternative 3; and storage under Alternatives 2 and 5 and the No Action Alternative.</p> <p>Storage under Alternatives 2 and the No Action Alternative higher than under Alternative 5 in dry and critical dry years.</p>
Flows into Yolo Bypass	<p>Flows entering the Yolo Bypass at Fremont Weir higher under Alternatives 1, 3, and 4 than under Alternatives 2 and 5 and the No Action Alternative.</p>
Delta Outflow	<p>Delta outflow higher under Alternatives 2 and 5 and the No Action Alternative than under Alternatives 1, 3, and 4.</p>
Reverse Flows in Old and Middle Rivers	<p>Old and Middle River flows in April-May more positive under Alternative 5 than under Alternative 2 and the No Action Alternative.</p> <p>Old and Middle River flows in July more positive under Alternatives 1 and 4 than under Alternative 3; and under Alternative 3 than under Alternatives 2 and 5 and the No Action Alternative.</p> <p>Old and Middle River flows in other months higher under Alternatives 2 and 5 and the No Action Alternative than Alternative 3; and higher under Alternative 3 than under Alternatives 1 and 4.</p>
<b>Water Supplies</b>	
Non-CVP and Non-SWP Deliveries	<p>Water deliveries under Alternatives 1 through 5 and the No Action Alternative.</p>
CVP Water Deliveries	<p>Water deliveries higher under Alternatives 1 and 4 than under Alternative 3; and higher under Alternative 3 than under Alternatives 2 and 5 and the No Action Alternative.</p>

Chapter 22: Other NEPA Requirements

<b>Environmental Resources</b>	<b>Comparison of Alternatives 1 through 5 and the No Action Alternative</b>
SWP Water Deliveries	Water deliveries higher under Alternatives 1 and 4 than under Alternative 3; and higher under Alternative 3 than under Alternatives 2 and 5 and the No Action Alternative.
<b>Surface Water Quality</b>	
Salinity in Northern Delta (near Emmaton)	Salinity in September-January under Alternatives 1, 3, and 4 than under Alternatives 2 and 5 and the No Action Alternative. Salinity in February-August under Alternatives 2 and 5 and the No Action Alternative higher than under Alternatives 1, 3, and 4.
Salinity in Western Delta (near Port Chicago)	Salinity in September-January under Alternatives 1, 3, and 4 than under Alternatives 2 and 5 and the No Action Alternative. Salinity in February-August under Alternatives 2 and 5 and the No Action Alternative higher than under Alternatives 1, 3, and 4.
Salinity in Western Central Delta (near Antioch)	Salinity in September-January under Alternatives 1, 3, and 4 than under Alternatives 2 and 5 and the No Action Alternative. Salinity in February-August under Alternatives 2 and 5 and the No Action Alternative higher than under Alternatives 1, 3, and 4.
Salinity in Western Central Delta (near Contra Costa Water District Intakes)	Salinity in September-January under Alternatives 1, 3, and 4 than under Alternatives 2 and 5 and the No Action Alternative. Salinity in February-August under Alternatives 2 and 5 and the No Action Alternative higher than under Alternatives 1, 3, and 4.
Salinity in Southern Delta (near CVP and SWP intakes)	Salinity under Alternatives 1 and 4 higher than under Alternative 3; and salinity under Alternative 3 higher than under Alternatives 2 and 5 and the No Action Alternative.
Mercury in Delta Fish	<p>Mercury concentrations in fish tissue of large fish in the Delta used for human consumption would exceed guidelines established by the State of California under Alternatives 1 through 5 and the No Action Alternative.</p> <p>In the interior Delta along the San Joaquin River and at the CVP Contra Costa Canal Pumping Plant, mercury concentrations in the tissue of large fish used for human consumption would be the higher under Alternative 5 than under Alternative 3. Mercury under Alternative 3 would be higher than under Alternative 2 and the No Action Alternative. Mercury under Alternative 2 and the No Action Alternative would be higher than under Alternatives 1 and 4.</p> <p>Near Suisun Marsh and Cache Slough, mercury concentrations would be higher under Alternative 2 and the No Action Alternative than under Alternatives 1 and 4. Mercury under Alternatives 1 and 4 would be higher than under Alternative 5; and concentrations under Alternative 5 would be higher than under Alternative 3.</p> <p>Along Old River near Clifton Court, mercury concentrations in the tissue of large fish used for human consumption would be higher under Alternative 2 and the No Action Alternative than under Alternative 5. Mercury under Alternative 5 would be higher than under Alternative 3. Mercury under Alternative 3 would be higher than under Alternatives 1 and 4.</p> <p>Near the CVP Jones Pumping Plant intake, mercury concentrations in the tissue of large fish used for human consumption would be higher under Alternative 2 and the No Action Alternative than under Alternative 3. Mercury under Alternative 3 would be higher than under Alternatives 1 and 4. Mercury under Alternatives 1 and 4 would be higher than under Alternative 5.</p>
Selenium in Delta and Delta Fish	Selenium concentrations similar under Alternatives 1 through 5 and the No Action Alternative.

<b>Environmental Resources</b>	<b>Comparison of Alternatives 1 through 5 and the No Action Alternative</b>
<b>Groundwater Resources</b>	
Trinity River Region	Similar groundwater conditions under Alternatives 1 through 5 and the No Action Alternative.
Central Valley Region: Sacramento Valley	Similar groundwater conditions under Alternatives 1 through 5 and the No Action Alternative.
Central Valley Region: San Joaquin Valley	Groundwater pumping would be higher under Alternative 5 than under Alternative 2 and the No Action Alternative. Pumping would be higher under Alternative 2 and the No Action Alternative than under Alternative 3. Pumping would be higher under Alternative 3 than under Alternatives 1 and 4. Increased groundwater pumping would result in lower groundwater elevations and increased subsidence potential.
San Francisco Bay Area, Central Coast, and Southern California Region	Groundwater pumping would be higher under Alternative 5 than under Alternative 2 and the No Action Alternative. Pumping would be higher under Alternative 2 and the No Action Alternative than under Alternative 3. Pumping would be higher under Alternative 3 than under Alternatives 1 and 4. Increased groundwater pumping would result in lower groundwater elevations and increased subsidence potential.
<b>CVP and SWP Energy Resources</b>	
Energy Generated and Used by CVP and SWP Water Users	<p>CVP net energy generation would be higher under Alternative 2 and the No Action Alternative than under Alternatives 1 and 4. Net energy generation would be higher under Alternatives 1 and 4 than under Alternative 3. Net energy generation would be higher under Alternative 3 than under Alternative 5.</p> <p>SWP net energy generation would be higher under Alternative 2 and the No Action Alternative than under Alternative 5. Net energy generation would be higher under Alternative 5 than under Alternative 3. Net energy generation would be higher under Alternative 3 than under Alternatives 1 and 4.</p> <p>Energy use by CVP and SWP water users for alternative water supplies would be higher under Alternative 5 than under Alternative 2 and the No Action Alternative. Energy use would be higher under Alternative 2 and the No Action Alternative than under Alternative 3. Energy use would be higher under Alternative 3 than under Alternatives 1 and 4.</p>
<b>Aquatic Resources</b>	
Trinity River: Coho Salmon	Habitat conditions would be similar under Alternatives 1 through 5 and the No Action Alternative.
Trinity River: Spring-run Chinook Salmon	Habitat conditions would be similar under Alternatives 1 through 5 and the No Action Alternative.
Trinity River: Fall-run Chinook Salmon	Habitat conditions would be similar under Alternatives 1 through 5 and the No Action Alternative.
Trinity River: Steelhead	Habitat conditions would be similar under Alternatives 1 through 5 and the No Action Alternative.
Trinity River: Green Sturgeon	Habitat conditions would be similar under Alternatives 1 through 5 and the No Action Alternative.
Trinity Lake and Lewiston Reservoir: Reservoir Fish	Habitat conditions would be similar under Alternatives 1 through 5 and the No Action Alternative.
Trinity River: Pacific Lamprey	Habitat conditions would be similar under Alternatives 1 through 5 and the No Action Alternative.
Trinity River: Eulachon	Habitat conditions would be similar under Alternatives 1 through 5 and the No Action Alternative.

Chapter 22: Other NEPA Requirements

<b>Environmental Resources</b>	<b>Comparison of Alternatives 1 through 5 and the No Action Alternative</b>
Sacramento River System: Winter-run Chinook Salmon	Habitat conditions would be better under Alternative 5 and the No Action Alternative than under Alternative 2. Conditions under Alternative 2 would be better than under Alternatives 3 and 4. Conditions under Alternative 3 and 4 would be better than under Alternative 1.
Sacramento River System: Spring-run Chinook Salmon	Habitat conditions would be better under Alternative 5 and the No Action Alternative than under Alternative 2. Conditions under Alternative 2 would be better than under Alternatives 3 and 4. Conditions under Alternative 3 and 4 would be better than under Alternative 1.
Sacramento River System: Fall-run Chinook Salmon	Habitat conditions under Alternatives 1, 3, 4, and 5 and the No Action Alternative would be better than under Alternative 2.
Sacramento River System: Late Fall-run Chinook Salmon	Habitat conditions under Alternatives 1, 3, 4, and 5 and the No Action Alternative would be better than under Alternative 2.
Sacramento River System: Steelhead	Habitat conditions would be better under Alternative 5 and the No Action Alternative than under Alternative 2. Conditions under Alternative 2 would be better than under Alternatives 3 and 4. Conditions under Alternative 3 and 4 would be better than under Alternative 1.
Sacramento River System: Green Sturgeon and White Sturgeon	Habitat conditions would be better under Alternative 3 than under Alternatives 1 and 4. Conditions under Alternative 4 would be better than under Alternatives 2 and 5 and the No Action Alternative.
Delta: Delta Smelt	Habitat conditions would better under Alternatives 2 and 5 and the No Action Alternative than under Alternatives 1, 3, and 4.
Delta: Longfin Smelt	Habitat conditions would better under Alternatives 2 and 5 and the No Action Alternative than under Alternatives 1, 3, and 4.
Delta: Sacramento Splittail	Habitat conditions would better under Alternatives 2 and 5 and the No Action Alternative than under Alternatives 1, 3, and 4.
Sacramento River System: Reservoir Fish	Habitat conditions would be similar under Alternatives 1 through 5 and the No Action Alternative.
Sacramento River System: Pacific Lamprey	Habitat conditions would be similar under Alternatives 1 through 5 and the No Action Alternative.
Sacramento River System: Striped Bass, American Shad, and Hardhead	Habitat conditions for Hardhead and American Shad would be similar under Alternatives 1 through 5 and the No Action Alternative. Habitat conditions for Striped Bass would better under Alternatives 1, 2, and 5 and the No Action Alternative than under Alternatives 3 and 4 due to increased harvest limits.
Stanislaus River: Fall-run Chinook Salmon	Habitat conditions better under Alternatives 3 and 4 than under Alternatives 1, 2, and 5 and the No Action Alternative.
Stanislaus River: Steelhead	Habitat conditions better under Alternative 5 and the No Action Alternative than under Alternatives 3 and 4. Conditions under Alternatives 3 and 4 are better than under Alternatives 1 and 2.
Stanislaus River: White Sturgeon	Habitat conditions better under Alternatives 2 and 5 and the No Action Alternative than under Alternatives 1, 3, and 4.
New Melones Reservoir; Reservoir Fish	Habitat conditions would be similar under Alternatives 1 through 5 and the No Action Alternative.
Stanislaus River: Other Fish	Habitat conditions for Hardhead and American Shad would be similar under Alternatives 1 through 5 and the No Action Alternative. Habitat conditions for Striped Bass would better under Alternatives 1, 2, and 5 and the No Action Alternative than under Alternatives 3 and 4 due to increased harvest limits.

<b>Environmental Resources</b>	<b>Comparison of Alternatives 1 through 5 and the No Action Alternative</b>
Pacific Ocean: Killer Whale	Habitat conditions would be similar under Alternatives 1 through 5 and the No Action Alternative.
<b>Terrestrial Resources</b>	
Terrestrial Resources along Shoreline of CVP and SWP Reservoirs	Habitat conditions would be similar under Alternatives 1 through 5 and the No Action Alternative.
Terrestrial Resources along Rivers Downstream of CVP and SWP Reservoirs	Habitat conditions along Trinity, Sacramento, American, and Feather rivers would be similar under Alternatives 1 through 5 and the No Action Alternative. Habitat conditions along the Stanislaus River would be better under Alternatives 2 and 5 and the No Action Alternative than under Alternatives 1, 3, and 4.
Terrestrial Resources in Yolo Bypass	Habitat conditions would be similar under Alternatives 1 through 5 and the No Action Alternative.
Terrestrial Resources in Western Delta	Freshwater habitat in the western Delta would be better under Alternatives 2 and 5 and the No Action Alternative than under Alternatives 1, 3, and 4.
<b>Geology and Soils Resources</b>	
Geology and Soils Resources	Geology and soils conditions would be similar under Alternatives 1 through 5 and the No Action Alternative.
<b>Agricultural Resources</b>	
Agricultural Production and Employment	Agricultural production and employment conditions would be similar under Alternatives 1 through 5 and the No Action Alternative.
<b>Land Use</b>	
Municipal and Industrial Land Use	Municipal and industrial land use conditions would be similar under Alternatives 1 through 5 and the No Action Alternative.
<b>Visual Resources</b>	
Visual Resources of Land Irrigated with CVP and SWP Water	Visual resource conditions would be similar under Alternatives 1 through 5 and the No Action Alternative.
Visual Resources at Reservoirs that Store CVP and SWP Water	Visual resource conditions would be similar under Alternatives 1 through 5 and the No Action Alternative.
<b>Recreation Resources</b>	
Recreation Resources at Reservoirs that Store CVP and SWP Water	Recreational resource conditions at the reservoirs would be similar under Alternatives 1 through 5 and the No Action Alternative.
Recreation Resources in Rivers downstream of CVP and SWP Reservoirs	Recreational resource conditions at the along the rivers would be similar under Alternatives 1 through 5 and the No Action Alternative. Recreational resource conditions related to Striped Bass fishing and sport ocean salmon fishing would be better under Alternatives 1, 2, and 5 and the No Action Alternative than under Alternatives 3 and 4 due to increased harvest limitations.

Chapter 22: Other NEPA Requirements

<b>Environmental Resources</b>	<b>Comparison of Alternatives 1 through 5 and the No Action Alternative</b>
<b>Air Quality and Greenhouse Gas Emissions</b>	
Emissions of Criteria Air Pollutants and Precursors and/or Exposure of Sensitive Receptors to Substantial Concentrations of Air Contaminants from Diesel Engines at Groundwater Wells	In the San Joaquin Valley and the San Francisco Bay Area, Central Coast, and Southern California regions, potential emissions from diesel engines used for groundwater pumping would be higher under Alternative 5 than under Alternative 2 and the No Action Alternative. Emissions would be higher under Alternative 2 and the No Action Alternative than under Alternative 3. Emissions would be higher under Alternative 3 than under Alternatives 1 and 4.
Increased Greenhouse Gas Emissions (GHG) due to Changes in Energy Resources Related to CVP and SWP Water Use	Overall changes are not known at this time due to complexity of energy demands associated with alternative water supplies. However, GHG emissions could increase due to energy use related to alternative water supplies. Energy use by CVP and SWP water users for alternative water supplies would be higher under Alternative 5 than under Alternative 2 and the No Action Alternative. Energy use would be higher under Alternative 2 and the No Action Alternative than under Alternative 3. Energy use would be higher under Alternative 3 than under Alternatives 1 and 4.
<b>Cultural Resources</b>	
Potential for Disturbance of Cultural Resources	Cultural resource conditions would be similar under Alternatives 1 through 5 and the No Action Alternative.
<b>Public Health</b>	
Water Supply Availability for Wildland Firefighting	Water supply conditions for fighting wildland firefighting would be similar under Alternatives 1 through 5 and the No Action Alternative.
Potential Exposure to Mercury in Fish in Delta	<p>Mercury concentrations in fish tissue of large fish in the Delta used for human consumption would exceed guidelines established by the State of California under Alternatives 1 through 5 and the No Action Alternative.</p> <p>In the interior Delta along the San Joaquin River and at the CVP Contra Costa Canal Pumping Plant, mercury concentrations in the tissue of large fish used for human consumption would be the higher under Alternative 5 than under Alternative 3. Mercury under Alternative 3 would be higher than under Alternative 2 and the No Action Alternative. Mercury under Alternative 2 and the No Action Alternative would be higher than under Alternatives 1 and 4.</p> <p>Near Suisun Marsh and Cache Slough, mercury concentrations would be higher under Alternative 2 and the No Action Alternative than under Alternatives 1 and 4. Mercury under Alternatives 1 and 4 would be higher than under Alternative 5; and concentrations under Alternative 5 would be higher than under Alternative 3.</p> <p>Along Old River near Clifton Court, mercury concentrations in the tissue of large fish used for human consumption would be higher under Alternative 2 and the No Action Alternative than under Alternative 5. Mercury under Alternative 5 would be higher than under Alternative 3. Mercury under Alternative 3 would be higher than under Alternatives 1 and 4.</p> <p>Near the CVP Jones Pumping Plant intake, mercury concentrations in the tissue of large fish used for human consumption would be higher under Alternative 2 and the No Action Alternative than under Alternative 3. Mercury under Alternative 3 would be higher than under Alternatives 1 and 4. Mercury under Alternatives 1 and 4 would be higher than under Alternative 5.</p>
<b>Socioeconomics</b>	
Agricultural and Municipal and Industrial Employment	Agricultural, municipal, and industrial employment would be similar under Alternatives 1 through 5 and the No Action Alternative.

<b>Environmental Resources</b>	<b>Comparison of Alternatives 1 through 5 and the No Action Alternative</b>
Municipal and Industrial Water Supply Operating Expenses	Municipal and industrial water supply operating expenses would be similar under Alternatives 1 through 5 and the No Action Alternative.
Recreational Economics CVP and SWP Reservoirs	Recreational economic conditions would be similar under Alternatives 1 through 5 and the No Action Alternative.
Recreational Economics Related to Striped Bass Fishing in Delta	Recreational economic conditions related to Striped Bass fishing would be better under Alternatives 1, 2, and 5 and the No Action Alternative than under Alternatives 3 and 4 due to changes in harvest limitations.
Commercial and Sport Ocean Salmon Fishing	Recreational economic conditions related to commercial and sport ocean salmon fishing would be better under Alternatives 1, 2, and 5 and the No Action Alternative than under Alternatives 3 and 4 due to changes in harvest limitations.
<b>Indian Trust Assets</b>	
Potential for Disturbance of Indian Trust Assets	Indian Trust Asset conditions would be similar under Alternatives 1 through 5 and the No Action Alternative.
<b>Environmental Justice</b>	
Emissions of Criteria Air Pollutants and Precursors and/or Exposure of Sensitive Receptors to Substantial Concentrations of Air Contaminants from Diesel Engines at Groundwater Wells	In the San Joaquin Valley, potential emissions from diesel engines used for groundwater pumping would be higher under Alternative 5 than under Alternative 2 and the No Action Alternative. Emissions would be higher under Alternative 2 and the No Action Alternative than under Alternative 3. Emissions would be higher under Alternative 3 than under Alternatives 1 and 4.
Potential Exposure to Mercury in Fish in Delta	<p>Mercury concentrations in fish tissue of large fish in the Delta used for human consumption would exceed guidelines established by the State of California under Alternatives 1 through 5 and the No Action Alternative.</p> <p>In the interior Delta along the San Joaquin River and at the CVP Contra Costa Canal Pumping Plant, mercury concentrations in the tissue of large fish used for human consumption would be the higher under Alternative 5 than under Alternative 3. Mercury under Alternative 3 would be higher than under Alternative 2 and the No Action Alternative. Mercury under Alternative 2 and the No Action Alternative would be higher than under Alternatives 1 and 4.</p> <p>Near Suisun Marsh and Cache Slough, mercury concentrations would be higher under Alternative 2 and the No Action Alternative than under Alternatives 1 and 4. Mercury under Alternatives 1 and 4 would be higher than under Alternative 5; and concentrations under Alternative 5 would be higher than under Alternative 3.</p> <p>Along Old River near Clifton Court, mercury concentrations in the tissue of large fish used for human consumption would be higher under Alternative 2 and the No Action Alternative than under Alternative 5. Mercury under Alternative 5 would be higher than under Alternative 3. Mercury under Alternative 3 would be higher than under Alternatives 1 and 4.</p> <p>Near the CVP Jones Pumping Plant intake, mercury concentrations in the tissue of large fish used for human consumption would be higher under Alternative 2 and the No Action Alternative than under Alternative 3. Mercury under Alternative 3 would be higher than under Alternatives 1 and 4. Mercury under Alternatives 1 and 4 would be higher than under Alternative 5.</p>

1 **22.3 Irreversible and Irretrievable Commitments**  
2 **of Resources**

3 NEPA requires that an EIS prepared by Federal agencies disclose "...any  
4 irreversible and irretrievable commitments of resources which would be involved  
5 in the proposed action should it be implemented..." (40 CFR 1502.16). An  
6 irreversible and irretrievable commitment of resources includes use of natural or  
7 depletable resources, including consumption of construction materials and  
8 nonrenewable energy sources, and permanent conversion of land uses or habitat.

9 As described in Chapter 3, Description of Alternatives, there are several ongoing  
10 projects that are assumed to be implemented by 2030, such as Grasslands Bypass  
11 Project which is currently under construction. It is assumed that these projects  
12 would be included in the No Action Alternative, all other alternatives, and Second  
13 Basis of Comparison. The 2030 conditions assume the projected long-term  
14 conditions for each ongoing project as described in their respective environmental  
15 documents. This analysis does not address the construction activities of each  
16 ongoing project because those impacts were addressed in separate environmental  
17 documents for each project.

18 The alternatives include several future actions that would require construction,  
19 such as implementation of tidal wetlands and floodplains, fish passage facilities,  
20 or temperature control devices at CVP dams. Specific details for location and  
21 construction of these future projects are not identified at this time and are not  
22 addressed in this EIS. Future environmental documents would be prepared to  
23 analyze potential environmental consequences related to specific construction and  
24 operations. This EIS analyzes implementation of the alternatives with the  
25 assumption that these projects would be implemented by 2030; however, this EIS  
26 does not address irreversible and irretrievable commitment of resources  
27 associated with consumption of construction materials and permanent conversion  
28 of land uses or habitat.

29 Changes in nonrenewable energy resources would occur through implementation  
30 of the No Action Alternative and Alternatives 1 through 5. Under the  
31 alternatives, energy would be generated by CVP and SWP operations and used to  
32 convey water in CVP and SWP facilities. As discussed in Chapter 8, Energy,  
33 changes in CVP and SWP energy generation and use would result in the ability to  
34 provide additional energy for use by others or the need to purchase additional  
35 energy from others to operate the CVP and SWP facilities. Under both long-term  
36 average conditions and dry/critical dry water years, Alternative 5 would result in  
37 the least demand for electrical generation by others which would generally be  
38 produced using fossil fuels. The No Action Alternative and Alternative 2 would  
39 require more electrical generation by non-CVP and SWP facilities than  
40 Alternative 5; and less electrical generation than under Alternatives 1, 3, and 4.  
41 Alternative 1 would require the most electrical generation as compared to other  
42 alternatives.

## 22.4 Growth-Inducing Impacts

NEPA requires that an EIS prepared by Federal agencies evaluate indirect growth-inducing effects (40 CFR 1508.8). A project could result in growth-inducing impacts through several measures, including the removal of obstacles to population growth, or actions that encourage and facilitate other activities beyond those proposed by the project. The availability of adequate water supplies, employment opportunities, and improved cultural amenities are examples of actions that could be growth-inducing impacts. Growth inducement may or may not be detrimental, beneficial, or significant. However, if the induced growth impacted the environment, or the ability of agencies to provide public services to an extent not envisioned due to the project actions, the impacts would be considered to be adverse.

As described in Chapter 13, Land Use, and Chapter 19, Socioeconomics, land use and growth projections are not anticipated to change under Alternatives 1 through 5 as compared to the No Action Alternative and the Second Basis of Comparison. Municipal and industrial water users that use CVP and SWP water have prepared Urban Water Management Plans (UWMPs) that project water demand and future water supplies to meet the demands by 2030, including water conservation measures. Projects that had undergone environmental review, were under design, or under construction were considered to exist in 2030 water supply assumptions in the No Action Alternative, Alternatives 1 through 5, and the Second Basis of Comparison. Future projects described in the UWMPs that are under evaluation are considered as options to increase fixed-yield supplies, including additional groundwater pumping, water transfers, recycling water treatment, and desalination water treatment. Existing and future water supplies considered for municipalities by 2030 are presented in Appendix 5B, Future Municipal Water Supplies for CVP and SWP Water Users. For smaller water users that are not addressed in a UWMP, information was obtained from water master plans and integrated regional water management plans. The analysis presented in Chapter 19, indicated that use of the existing and planned future projects would be adequate to meet the water demands in 2030 with or without the CVP and SWP water supply availability under the alternatives considered in this EIS.

Alternatives 1, 3, and 4 would result in higher CVP and SWP water deliveries than the No Action Alternative and Alternatives 2 and 5. However, the additional water supplies under Alternatives 1, 3, and 4 would result in less groundwater pumping and less water transfers which could result in less potential for groundwater overdraft and soil subsidence, and less potential impacts in the service area of the seller for the transfer water. None of the alternatives considered in this EIS would increase the total water supplies to meet 2030 water demands; and therefore, none of the alternatives considered in this EIS are considered to be growth inducing.

This page left blank intentionally.

## Chapter 23

# 1 Consultation and Coordination

## 2 23.1 Introduction

3 This chapter summarizes completed, ongoing, and anticipated public outreach and  
4 agency involvement efforts related to preparation of the Environmental Impact  
5 Statement (EIS) for the coordinated long-term operation of the Central Valley  
6 Project (CVP) and State Water Project (SWP).

## 7 23.2 Consultation with the Public and Interested 8 Parties

9 Consultation activities were initiated in 2012 with the scoping process and  
10 continued through the preparation of the Final EIS. In this section, the term  
11 “interested parties” includes representatives from agencies, utilities, agencies,  
12 organizations, and other entities.

### 13 23.2.1 Scoping Process

14 As described in Chapters 1 and 3, the scoping process was initiated on  
15 March 28, 2012, with the publication of the Notice of Intent (NOI) in the Federal  
16 Register and continued through June 28, 2012. Initially the public scoping  
17 process was to be completed on May 29, 2012. During the public scoping  
18 process, other agencies and interested persons requested an extension of the  
19 public scoping process to allow additional opportunities to provide scoping  
20 comments. In response to these requests, U.S. Department of the Interior, Bureau  
21 of Reclamation (Reclamation) published a notice on May 25, 2012, to extend the  
22 public scoping period through June 28, 2012.

23 Scoping meetings were held to inform the public and interested stakeholders  
24 about the project, and to solicit comments and input on the EIS. The scoping  
25 meetings were held in the following locations and resulted in the following level  
26 of public participation:

- 27 • Madera, California on April 25, 2012 (6 participants)
- 28 • Diamond Bar, California on April 26, 2012 (3 participants)
- 29 • Sacramento, California on May 2, 2012 (15 participants)
- 30 • Marysville, California on May 3, 2012 (2 participants)
- 31 • Los Banos, California on May 22, 2012 (230 participants)

32 Reclamation posted the scoping notices in the Federal Register, on its website,  
33 and in newspapers that served areas where the scoping meetings were held.  
34 Reclamation also published press releases to news organizations and others that  
35 have requested notifications for all press releases.

1 Each participant in the scoping meetings was invited to sign an attendance sheet  
2 and provided with an agenda, fact sheet, comment card, and speaker card. The  
3 agenda, fact sheet, and comment card were available in both English and Spanish.

4 Each scoping meeting began with a presentation by Reclamation. The  
5 presentation described the purpose of the meeting and the public scoping process,  
6 an overview of the reasons that Reclamation was preparing the EIS, description of  
7 the process and schedule that Reclamation will use to complete the EIS, and  
8 methods to provide comments at the scoping meeting and subsequently until the  
9 end of the public scoping period. The participants were encouraged to submit  
10 written comments by mail, email, or fax until the close of the public scoping  
11 comment period. During the presentation, Reclamation responded to questions as  
12 they arose from the meeting participants. Following the presentation,  
13 Reclamation heard testimony from those who presented oral comments. Oral  
14 comments were recorded by a transcriber. Reclamation offered to provide  
15 Spanish translation of the presentation and oral comments at each scoping  
16 meeting; however, the translation service was only requested and provided at the  
17 scoping meeting in Los Banos, California.

18 The scoping comments included suggestions related to:

- 19 • Purpose and need for the action.
- 20 • Geographical extent of the Project Area.
- 21 • Definition and assumptions of the No Action Alternative.
- 22 • Definition and assumptions of the action alternatives.
- 23 • Important considerations either for description of the affected environment or  
24 for the methods of analyses for the following resources:
  - 25 – Water resources.
  - 26 – Biological resources.
  - 27 – Land use and socioeconomics.
  - 28 – Air quality.
  - 29 – Recreation and visual resources.

30 Scoping comments were used in the development of a reasonable range of  
31 alternatives and identification of key issues that would require analysis in the  
32 Environmental Consequences sections of this EIS, as described in Chapters 3.

33 Scoping comments also were used in development of the level of detail and  
34 methods of analyses for water resources, biological resources, land use,  
35 socioeconomics, recreation, air quality, and visual resources. These resources are  
36 discussed in Chapters 5 through 10, 12 through 17, and 19 through 21.

37 Reclamation also posted on its website an initial range of alternatives discussed at  
38 the meeting on October 19, 2012 of invited stakeholders. As described in  
39 Chapter 3, Description of Alternatives, comments received during that process  
40 were used to refine the description of the alternatives.

1 Project status meetings were held with cooperating agencies and other  
 2 stakeholders during preparation of the Draft EIS, including meetings in  
 3 Sacramento, California on January 16, May 29, and November 5, 2014;  
 4 February 20, 2015; and June 24, 2015.

5 The scoping report is included in Appendix 23A, Scoping Report.

### 6 **23.2.2 Other Activities**

7 Reclamation established a website which includes the background material related  
 8 to the purpose and need for the action, materials used in the scoping process,  
 9 scoping comments, and information related to meetings with invited stakeholders  
 10 and interest groups to discuss assumptions to be considered in the development of  
 11 the No Action Alternative and action alternatives. As described in Chapter 3,  
 12 comments received on the information posted on Reclamation's website during  
 13 that process were used to refine the description of the alternatives.

### 14 **23.2.3 Stakeholder and Public Involvement during Preparation of** 15 **the Final EIS**

16 The Draft EIS was published for public review in July 2015. The Notice of  
 17 Availability was published by Reclamation in the Federal Register on  
 18 July 31, 2015 (Federal Register, Vol 80, No. 147, 45681). A copy of the Notice  
 19 of Availability is included in Appendix 23B, Public Review of Draft  
 20 Environmental Impact Statement.

21 Newspaper advertisements providing the dates and locations of the public  
 22 meetings for the Draft EIS were published in the following newspapers on the  
 23 specified dates.

- 24 • Sacramento Bee, Sacramento, California – August 26, 2015
- 25 • Oakland Tribune, Oakland, California – August 26, 2015
- 26 • San Jose Mercury, San Jose, California – August 26, 2015
- 27 • Contra Costa Times, Walnut Creek, California – August 26, 2015
- 28 • Record Searchlight, Redding, California – August 27, 2015
- 29 • Los Banos Enterprise, Los Banos, California – August 28, 2015
- 30 • Fresno Bee, Fresno, California – September 1, 2015
- 31 • Los Angeles Times, California – September 3, 2015

32 The distribution list for the Draft EIS is included in Chapter 24, Environmental  
 33 Impact Statement Distribution List. Reclamation posted notification of the  
 34 availability of the Draft EIS and the location and timing of public meetings on its  
 35 website and through press releases.

1 Four public meetings were held during the public review period for the Draft EIS  
2 in the following locations, with the following level of public participation:

- 3 • Sacramento, California on September 9, 2015 (9 participants)
- 4 • Red Bluff, California on September 10, 2015 (9 participants)
- 5 • Los Banos, California on Tuesday, September 15, 2015 (9 participants)
- 6 • Irvine, California on September 17, 2015 (2 participants)

7 The public meetings included an open house preceding a presentation by  
8 Reclamation. The open house portion of the meetings included several project  
9 information stations staffed by project team members available to respond to  
10 attendee's questions. The open house stations included:

- 11 • Welcome Station with display boards that described the public meeting format
- 12 • Purpose and Need of the Project
- 13 • Surface Water and Groundwater Resources
- 14 • Aquatic, Wildlife, and Botanical Resources
- 15 • Socioeconomics
- 16 • Comments with a court reporter to record verbal comments

17 Fact sheets were provided at each of the open house stations.

18 Following the open house portion of the public meeting, Reclamation staff led a  
19 brief presentation. The open house portion of the public meeting was resumed  
20 after the presentation.

21 Copies of the display boards, fact sheets, and the presentation are included in  
22 Appendix 23B, Public Review of Draft Environmental Impact Statement.

23 Only attendees at the meeting in Red Bluff chose to provide verbal comments to  
24 the court reporter. The transcript of those comments also is included in  
25 Appendix 23B. Responses to those comments are included in Appendix 1E.

26 Approximately 860 written and verbal comments were received on the Draft EIS.  
27 All of the comments received on the Draft EIS were considered in preparation of  
28 the Final EIS. Written responses to all substantial comments received are  
29 included in Appendices 1A through 1E of the Final EIS.

### 30 **23.3 Consultation with U.S. Fish and Wildlife Service** 31 **and National Marine Fisheries Service**

32 As described in Chapter 1, federal agencies also have an obligation pursuant to  
33 the Endangered Species Act (ESA) to "...ensure that any discretionary action  
34 authorized, funded, or carried out by such an agency is not likely to jeopardize the  
35 continued existence of any endangered or threatened species or result in the  
36 destruction or adverse modification..." of such species' designated "critical  
37 habitat," "...unless such agency has been granted an exemption for such  
38 action..." by the Endangered Species Committee which the ESA creates  
39 (16 United States Code (U.S.C.) section 1536 (a)(2). A discretionary agency

1 action jeopardizes the continued existence of a listed species if it “reasonably  
2 would be expected, directly or indirectly, to reduce appreciably the likelihood of  
3 both the survival and recovery of a listed species in the wild by reducing the  
4 reproduction, numbers, or distribution of that species” (50 Code of Federal  
5 Regulations [CFR] section 402.02). Such action results in the destruction or  
6 adverse modification of designated critical habitat if there is “... a direct or  
7 indirect alteration that appreciably diminishes the value of critical habitat for both  
8 the survival and recovery of a listed species” (50 CFR section 402.02).

9 In carrying out its obligations, Reclamation must consult with the appropriate  
10 regulatory agency or agencies (e.g., U.S. Fish and Wildlife Service [USFWS] and  
11 National Marine Fisheries Service [NMFS]). At the conclusion of this  
12 consultation process, those agencies render written statements (known as  
13 biological opinions) setting forth their opinion as to how an action being proposed  
14 by Reclamation would affect a listed species and its designated critical habitat. If  
15 these agencies conclude that an action will jeopardize the continued existence of a  
16 listed species or result in the destruction or adverse modification of their  
17 designated critical habitat, then they must suggest a reasonable and prudent  
18 alternative to the action being proposed by Reclamation.

19 Pursuant to ESA Section 7(a)(1), Reclamation also considers which it could take  
20 under its existing authorities to benefit listed species. However, Section 7(a)(1)  
21 does not give Reclamation additional authority to undertake any particular action,  
22 regardless of its potential benefit for threatened and endangered species.

23 The Fish and Wildlife Coordination Act requires that Reclamation consult with  
24 fish and wildlife agencies (federal and state) on all water development projects  
25 that could affect biological resources. As part of this project, Reclamation has  
26 been in continuous consultation with USFWS and NMFS. This continuous  
27 consultation also satisfies any applicable requirements of the Fish and Wildlife  
28 Coordination Act.

## 29 **23.4 Consultation with Cooperating Agencies and** 30 **Other Entities**

31 In accordance with requirements of the National Environmental Policy Act  
32 (NEPA), Reclamation invited eligible governmental agencies to participate as a  
33 cooperating agency. The federal cooperating agencies include the USFWS,  
34 NMFS, U.S. Environmental Protection Agency (USEPA), U.S. Army Corps of  
35 Engineers (USACE), and Bureau of Indian Affairs (BIA).

36 Reclamation also provided non-federal agencies with the opportunity to  
37 participate in the NEPA process if they qualified under NEPA (as described  
38 above) as a cooperating agency. In August of 2012, Reclamation mailed  
39 invitations to 747 non-federal entities to be cooperating agencies for this EIS,  
40 including:

- 41 • California Department of Water Resources

- 1 • State Water Resources Control Board
- 2 • California Department of Fish and Wildlife
- 3 • Agencies that have contracts with the CVP or SWP for water delivery, water
- 4 service repayment, exchange or settlement, or use of CVP or SWP facilities
- 5 for conveyance
- 6 • State and Federal Contractors Water Agency
- 7 • Cities and counties within the CVP and SWP service areas
- 8 • Federally-recognized tribes within the CVP and SWP service area or areas
- 9 affected by CVP or SWP operations
- 10 Non-federal entities that meet the specified criteria for cooperating agencies are
- 11 required to enter into a Memorandum of Understanding (MOU) with Reclamation
- 12 to memorialize their participation as a cooperating agency.
- 13 Reclamation has signed cooperating agency MOUs with the following entities:
- 14 • Anderson-Cottonwood Irrigation District
- 15 • California Department of Water Resources
- 16 • California Valley Miwok Tribe
- 17 • City of Hesperia
- 18 • Contra Costa Water District
- 19 • Friant Water Authority
- 20 • Glenn-Colusa Irrigation District
- 21 • Metropolitan Water District of Southern California
- 22 • Oakdale Irrigation District
- 23 • Reclamation District 108
- 24 • San Diego County Water Authority
- 25 • San Juan Water District
- 26 • San Luis & Delta-Mendota Water Authority
- 27 • Stockton East Water District
- 28 • Sutter Mutual Water District
- 29 • Tehama Colusa Canal Authority
- 30 • Zone 7 Water Agency
- 31 These agencies have participated in preliminary review of written materials that
- 32 were used to prepare this Draft EIS.
- 33 Reclamation also received a request from an interested party to include the
- 34 Federal Emergency Management Agency (FEMA) as a cooperating agency.
- 35 However, Reclamation concluded that FEMA does not have special expertise
- 36 related to environmental issue that would not be addressed by other cooperating
- 37 federal agencies.
- 38 Reclamation also received a request from the State Water Contractors, a non-
- 39 profit association of 27 public agencies from northern, central, and southern
- 40 California that purchase water under contract from the SWP (SWC 2015).

1 However, Reclamation concluded that the State Water Contractors was not a  
 2 public agency; and therefore, could not be cooperating agency. However, this  
 3 group and several other non-profit groups (including the Natural Resources  
 4 Defense Council and The Bay Institute) have participated in preliminary review  
 5 of written materials that were used to prepare this Draft EIS.

## 6 **23.5 Consultation with Other Federal, State, and** 7 **Local Agencies**

8 This EIS was prepared in accordance with policies and regulations adopted by  
 9 federal and state agencies. Brief discussions of relevant policies and regulations  
 10 for each resource are included in Appendix 4A, Federal and State Policies and  
 11 Regulations. Reclamation considered the requirements of these policies and  
 12 regulations during preparation of the EIS and consultation with the related  
 13 agencies, including the major regulations summarized below.

### 14 **23.5.1 Federal Water Pollution Control Act Amendments of 1972** 15 **(Clean Water Act)**

16 The Federal Water Pollution Control Act Amendments of 1972, also known as the  
 17 Clean Water Act (CWA), established the institutional structure for the  
 18 U.S. Environmental Protection Agency (USEPA) to regulate discharges of  
 19 pollutants into the waters of the United States, establish water quality standards,  
 20 conduct planning studies, and provide funding for specific grant projects. The  
 21 Clean Water Act was further amended through the Clean Water Act of 1977 and  
 22 the Water Quality Act of 1987. The California State Water Resources Control  
 23 Board (SWRCB) has been designated by the USEPA along with the nine  
 24 Regional Water Quality Control Boards (RWQCBs) to develop and enforce water  
 25 quality objectives and implementation plans in California. The provisions of the  
 26 Clean Water Act which affect water resources in the project area are described  
 27 below.

- 28 • Section 401 of the Clean Water Act requires water discharges into navigable  
 29 waters of the United States to apply for a Federal license or permit and to  
 30 certify that the discharge will be in compliance with specified provisions of  
 31 the Clean Water Act. Federal permits that are issued related to disturbance of  
 32 waters of the United States (such as streams and wetlands) also require a  
 33 Water Quality Certification in accordance with Clean Water Act section 401.
- 34 • Section 402 established the National Pollutant Discharge Elimination System  
 35 (NPDES) permit program to regulate point source and non-point source  
 36 discharges of pollutants into waters of the United States. An NPDES permit  
 37 sets specific discharge limits for point and non-point sources discharging  
 38 pollutants into waters of the United States and establishes monitoring and  
 39 reporting requirements. The NPDES permits are issued for long-term  
 40 discharges, including discharges from treatment plants, and temporary

1 discharges, such as discharges during construction activities (e.g., General  
2 Permit for Storm Water Discharges Associated with Construction Activities).

- 3 • Section 404 requires the U.S. Army Corps of Engineers (USACE) to issue  
4 permits for discharge of dredge or fill material into navigable waters, their  
5 tributaries, and associated wetlands. Activities regulated by 404 permits  
6 include, but are not limited to, dredging, bridge construction, flood control  
7 actions, and some fishing operations.
- 8 • Section 303 requires preparation of basins plans. The SWRCB has approved  
9 water quality control plans (basin plans) for each watershed basin in the State.  
10 The basin plans designate the beneficial uses of waters within each watershed  
11 basin, and water quality objectives designed to protect those uses pursuant to  
12 Section 303 of the Clean Water Act. The beneficial uses together with the  
13 water quality objectives that are contained in the basin plans constitute State  
14 water quality standards.
- 15 • Under the CWA section 303(d), the SWRCB and USEPA identifies and ranks  
16 water bodies for which existing pollution controls are insufficient to attain or  
17 maintain water quality standards based upon information prepared by all  
18 states, territories, and authorized Indian tribes. Each state must establish  
19 priority rankings and develop Total Maximum Daily Loads (TMDLs) for all  
20 impaired waters. TMDLs calculate the greatest pollutant load that a  
21 waterbody can receive and still meet water quality standards and designated  
22 beneficial uses.

### 23 **23.5.2 Rivers and Harbors Act**

24 The navigable waters of the United States in the Study Area, including the major  
25 rivers in Sacramento and San Joaquin rivers watersheds and waterways in these  
26 watersheds affected by tidal action, are subject to the requirements of the Rivers  
27 and Harbors Act. “Navigable waters of the United States” are defined as those  
28 waters subject to the ebb and flow of the tide shoreward to the mean high-water  
29 mark or those that are used, have been used in the past, or may be susceptible to  
30 use in interstate or foreign commerce. Sections 9 and 10 of the River and Harbors  
31 Act are applicable to the coordinated long-term operation of the CVP and SWP.

32 Under the reauthorization of the Rivers and Harbor Act of 1937, Reclamation  
33 took responsibility for the operation of the CVP.

#### 34 **23.5.2.1 Section 9 of the Rivers and Harbors Act**

35 Section 9 of the Rivers and Harbors Act prohibits construction of any dike or dam  
36 across any navigable waters without approvals from the Chief of Engineers and  
37 the Secretary of the Army.

#### 38 **23.5.2.2 Section 10 of the Rivers and Harbors Act**

39 Section 10 of the Rivers and Harbors Act of 1899 prohibits alterations of any  
40 navigable waters, including construction of structures in, over, or under;  
41 excavation of material from; and deposition of material into navigable waters of  
42 the United States without permission from the USACE. The approval process

1 generally is completed simultaneously with the approval process under the Clean  
2 Water Act Section 404.

### 3 **23.5.3 Federal Safe Drinking Water Act**

4 The Safe Drinking Water Act (SDWA) protects public health by regulating the  
5 nation's public drinking water supply. The SDWA authorizes USEPA to set  
6 national health-based standards for drinking water to protect against both  
7 naturally occurring and human-made contaminants that may be found in drinking  
8 water and its sources, including rivers, lakes, reservoirs, springs, and  
9 groundwater wells.

### 10 **23.5.4 Wild and Scenic Rivers Act**

11 Congress created the National Wild and Scenic Rivers Act in 1968 (Public  
12 Law 90-542; USC 1271 et seq.) to preserve rivers and outstanding natural,  
13 cultural, or recreational features in a free-flowing condition. High priority is  
14 place on visual resource management of these rivers to preserve or restore their  
15 scenic characteristics. Under this act, a Federal agency may not assist the  
16 construction of a water resources project that would have a direct and adverse  
17 effect on the free-flowing, scenic, and natural values of a wild or scenic river. If  
18 the project would affect the free-flowing characteristics of a designated river or  
19 unreasonably diminish the scenic, recreational, and fish and wildlife values  
20 present in the area, such activities should be undertaken in a manner that would  
21 minimize adverse impacts and should be developed in consultation with the  
22 National Park Service.

23 Within the study area, the following portions of the rivers have been designated as  
24 Wild and Scenic Rivers.

- 25 • The Klamath River from the confluence with the Trinity River to the Pacific  
26 Ocean was designated to be part of the National Wild and Scenic Rivers  
27 System on January 19, 1981.
- 28 • The Middle Fork Feather River (from Beckwourth downstream of Lake Davis  
29 to Lake Oroville) was designated to be part of the National Wild and Scenic  
30 Rivers System on October 2, 1968.
- 31 • The American River between Nimbus Dam and the confluence with the  
32 Sacramento River was designated to be part of the National Wild and Scenic  
33 Rivers System on January 19, 1981.

### 34 **23.5.5 Fish and Wildlife Coordination Act (16 USC Section 651** 35 **et seq.)**

36 The Fish and Wildlife Coordination Act, as amended in 1964, was enacted to  
37 protect fish and wildlife when federal actions result in the control or modification  
38 of a natural stream or body of water. The statute requires federal agencies to take  
39 into consideration the effect that water-related projects would have on fish and  
40 wildlife resources. Consultation and coordination with USFWS and State fish and  
41 game agencies are required to address ways to prevent loss of and damage to fish  
42 and wildlife resources and to further develop and improve these resources.

1     **23.5.6     Marine Mammal Protection Act (16 USC 1361-1421h)**

2     The Marine Mammal Protection Act (MMPA) was enacted in 1972. All marine  
3     mammals are protected under the MMPA. The MMPA prohibits, with certain  
4     exceptions, the “take” of marine mammals in U.S. waters and by U.S. citizens on  
5     the high seas, and the importation of marine mammals and marine mammal  
6     products into the United States. It defines “take” to mean “to hunt harass,  
7     capture, or kill” any marine mammal or attempt to do so. Exceptions to the  
8     moratorium can be made through permitting actions for take incidental to  
9     commercial fishing and other nonfishing activities; for scientific research; and for  
10    public display at licensed institutions such as aquaria and science centers.

11    **23.5.7     Migratory Bird Treaty Act**

12    The Migratory Bird Treaty Act (MBTA) implements a series of international  
13    treaties that provide migratory bird protection. The MBTA authorizes the  
14    Secretary of the Interior to regulate the taking of migratory birds, and the act  
15    provides that it shall be unlawful, except as permitted by regulations, “to pursue,  
16    take, or kill any migratory bird, or any part, nest or egg of any such bird” (16 USC  
17    section 703). This prohibition includes both direct and indirect acts, although  
18    harassment and habitat modification are not included unless they result in direct  
19    loss of birds, nests, or eggs. The current list of species protected by the MBTA  
20    was published in the March 10, 2010 *Federal Register* (*Federal Register*,  
21    Volume 75, page 9282 [75 FR 9282]).

22    **23.5.8     Executive Order 13186: Responsibilities of Federal**  
23    **Agencies to Protect Migratory Birds**

24    Executive Order 13186 (January 10, 2001) directs federal agencies that have, or  
25    are likely to have, a measurable negative effect on migratory bird populations to  
26    develop and implement a Memorandum of Understanding with USFWS to  
27    promote the conservation of migratory bird populations. The Memorandum of  
28    Understanding should include implementation actions and reporting procedures  
29    that would be followed through each agency’s formal planning process, such as  
30    resource management plans and fisheries management plans.

31    **23.5.9     Executive Order 11990: Protection of Wetlands**

32    Executive Order 11990 (May 24, 1977) established the protection of wetlands and  
33    riparian systems as the official policy of the federal government. It requires all  
34    federal agencies to consider wetland protection as an important part of their  
35    policies and take action to minimize the destruction, loss, or degradation of  
36    wetlands and to preserve and enhance the natural and beneficial values  
37    of wetlands.

38    **23.5.10    Federal Clean Air Act**

39    National air quality policies are regulated through the Federal Clean Air Act  
40    (FCAA) of 1970 and its 1977 and 1990 amendments. Basic elements of the  
41    FCAA include national ambient air quality standards for criteria air pollutants,  
42    hazardous air pollutants standards, state attainment plans, motor vehicle emissions

1 standards, stationary source emissions standards and permits, acid rain control  
2 measures, stratospheric ozone protection, and enforcement provisions.

### 3 **23.5.11 National Historic Preservation Act of 1966**

4 Section 106 of the NHPA and its implementing regulations (36 Code of Federal  
5 Regulations (CFR) Part 800) require Federal agencies to consider the effects of  
6 their undertakings on cultural resources that are, or that may be, eligible for listing  
7 in the National Register of Historic Places (NRHP) and to afford the Advisory  
8 Council on Historic Preservation an opportunity to comment. NRHP-eligible  
9 resources are considered to be “significant.” The criteria used to evaluate  
10 eligibility for listing on the NRHP are further discussed in the next subsection.

11 The Section 106 process that is typically associated with NEPA compliance  
12 requires consultation of the federal lead agency with other federal, state, and local  
13 agencies, the Advisory Council on Historic Preservation, the State Historic  
14 Preservation Officer (SHPO), Indian tribes, and interested members of the public,  
15 such as historical societies. Throughout the Section 106 process, the federal lead  
16 agency and consulting parties work together to identify adverse impacts on sites  
17 of cultural significance or historic properties, and seek ways to avoid, minimize,  
18 or mitigate the adverse effects. A Memorandum of Agreement or Programmatic  
19 Agreement is issued by the participating parties that includes the measures agreed  
20 upon to avoid or reduce (i.e., mitigate) adverse effects. For large or complex  
21 undertakings, a Programmatic Agreement may also be negotiated to develop a  
22 phased approach to historic properties management or alternative Section 106  
23 processes through consultations. Thus, impacts to cultural resources that are  
24 identified in a NEPA document are addressed through Section 106.

25 Section 110 of the NHPA sets out the broad responsibilities of Federal agencies  
26 for identifying and protecting historic properties under their jurisdiction, and for  
27 avoiding unnecessary damage to them. It is intended to ensure that an historic  
28 preservation program is fully integrated into the ongoing program of each Federal  
29 agency. Section 110 allows the costs of preservation activities as eligible project  
30 costs in all undertakings conducted or assisted by a Federal agency. Federal  
31 agencies are directed to withhold grants, licenses, approvals, or other assistance to  
32 applicants who intentionally damage or adversely affect historic properties in an  
33 effort to avoid the Section 106 process.

### 34 **23.5.12 American Indian Religious Freedom Act**

35 The American Indian Religious Freedom Act of 1978 protects the rights of Native  
36 Americans to freedom of expression of traditional religions (24 U.S. Code  
37 section 1996). This act established “the policy of the United States to protect and  
38 preserve for American Indians their inherent right of freedom to believe, express,  
39 and exercise the traditional religions...including but not limited to access to sites,  
40 use and possession of sacred objects, and the freedom to worship through  
41 ceremonials and traditional rites.”

1    **23.5.13 Indian Sacred Sites on Federal Land**

2    Executive Order 13007 provides that in managing Federal lands, each Federal  
3    agency with statutory or administrative responsibility for management of Federal  
4    lands shall, to the extent practicable and as permitted by law, accommodate access  
5    to and ceremonial use of Indian sacred sites by Indian religious practitioners, and  
6    avoid adversely affecting the physical integrity of such sacred sites.

7    **23.6 Consultation with Tribal Governments**

8    Consistent with President Clinton’s April 29, 1994 Memorandum and President  
9    Obama’s November 5, 2009 Memorandum, Reclamation contacted federally-  
10    recognized tribal governments to participate in preparation of this EIS.  
11    Reclamation met with the California Valley Miwok Tribe in 2012 and the Miwok  
12    Maidu United Auburn Indian Community of the Auburn Rancheria in 2013.

13    Reclamation will continue to consult with each tribe on a government-to-  
14    government basis before taking any action that could affect a tribal government.  
15    Under the Federal Trust responsibility, Reclamation will provide full disclosure of  
16    the beneficial and adverse impacts of a project to the tribal government in a  
17    manner that provides adequate time for review and response. Reclamation will  
18    review comments received and consult with the tribal government prior to  
19    decisions related to a project.

20    Tribes and Indian Trust Assets were considered during preparation of this EIS, in  
21    accordance with environmental justice considerations identified in Executive  
22    Order 12898 (February 11, 1994), as summarized in Chapter 20, Indian Trust  
23    Assets, and Chapter 21, Environmental Justice.

# **Environmental Impact Statement Distribution List**

3

4

This chapter provides locations where the Draft and Final Environmental Impact Statement (EIS) are available for review and a list of governmental entities, organizations, and interested parties that received copies of this EIS.

5

6

7

## **24.1 Document Availability**

8

The public distribution of this Draft and Final EIS emphasizes the use of electronic media to ensure cost-effective, broad availability to the public and interested parties. The Draft and Final EIS are available on the Internet at Reclamation's website.

9

10

11

12

Printed copies of the Draft and Final EIS are available for review at the following locations.

13

14

U.S. Department of the Interior, Bureau of Reclamation Library

15

2800 Cottage Way

16

Sacramento, CA 95825

17

U.S. Department of the Interior, Bureau of Reclamation, Bay-Delta Office

18

801 I Street, Suite 140

19

Sacramento, CA 95814

20

Electronic copies of the Draft and Final EIS are available on compact disc for viewing at the following libraries.

21

22

Alameda County Library

23

1247 Marin Avenue

24

Albany CA 94706

25

Alameda County Library

16 **24.2 Agencies and Organizations Receiving Copies**  
17 **of the Draft Environmental Impact Statement**

18 All persons, agencies, and organizations listed in this chapter have been informed  
19 of the availability of and locations to obtain the Draft and Final EIS. Parties listed  
20 below have received an electronic copy on a compact disc of the Draft and Final  
21 EIS.

22 **24.2.1 Federal Agencies**

- 23 • Bureau of Indian Affairs  
24 • National Marine Fisheries Service  
25 • U.S. Army Corps of Engineers  
26 • U.S. Environmental Protection Agency  
27 • U.S. Fish and Wildlife Service  
28 • Western Area Power Administration

29 **24.2.2 Tribal Interests**

- 30 • California Valley Miwok Tribe  
31 • United Auburn Indian Community

32 **24.2.3 State Agencies**

- 33 • California Department of Fish & Wildlife  
34 • California Department of Water Resources  
35 • Delta Stewardship Council

36 **24.2.4 Regional and Local Entities**

- 37 • Alameda County Zone 7

- 1 • Anderson-Cottonwood Irrigation District
- 2 • Central Delta Water Agency
- 3 • Contra Costa Water District
- 4 • East Bay Municipal Utility District
- 5 • El Dorado County Water Agency
- 6 • El Dorado Irrigation District
- 7 • El Dorado Water and Power Authority
- 8 • Folsom, City of
- 9 • Friant Water Authority
- 10 • Glenn-Colusa Irrigation District
- 11 • Hesperia, City of
- 12 • Lower Tule River Irrigation District
- 13 • Oakdale Irrigation District
- 14 • Placer County Water Agency
- 15 • Reclamation District 108
- 16 • Roseville, City of
- 17 • Sacramento, City of
- 18 • San Diego County Water Authority
- 19 • San Juan Water District
- 20 • San Luis & Delta Mendota Water Authority
- 21 • Santa Clara Valley Water District
- 22 • South Delta Water Agency
- 23 • South San Joaquin Irrigation District
- 24 • Stanislaus, County of
- 25 • Stockton East Water District
- 26 • Sutter Mutual Water Company
- 27 • Tehama-Colusa Canal Authority
- 28 • Westlands Water District
  
- 29 **24.2.5 Other Interested Parties**
- 30 • AquAlliance
- 31 • The Bay Institute
- 32 • California Farm Bureau Federation
- 33 • Coalition for a Sustainable Delta
- 34 • California Water Impact Network
- 35 • California Sportfishing Protection Alliance
- 36 • The Center for Environmental Science Accuracy and Reliability
- 37 • Environmental Water Caucus
- 38 • Friends of the River
- 39 • Golden Gate Salmon Association
- 40 • Kern County Water Agency
- 41 • Northern California Water Agency
- 42 • Natural Resources Defense Council
- 43 • North Coast Rivers Alliance

## Chapter 24: Environmental Impact Statement Distribution List

- 1 • Pacific Coast Federation of Fisherman's Associations
- 2 • Restore the Delta
- 3 • South Valley Water Association
- 4 • State and Federal Contractors Water Authority
- 5 • State Water Contractors
- 6 • Water 4 Fish
- 7

**Chapter 25****1 List of Preparers**

2 The following individuals contributed to the preparation of this Environmental  
3 Impact Statement.

**4 Bureau of Reclamation**

<b>Name</b>	<b>Title</b>	<b>Years of Experience</b>
Theresa Olson	Chief, Conservation and Conveyance Division	23
Amy Aufdemberge	Assistant Regional Solicitor	More than 20
Andrew Shultz	Fish Biologist	20
Ann Stine	Natural Resources Specialist	32
Ben Nelson	Natural Resources Specialist	5
Bonnie Van Pelt	Natural Resources Specialist	9
Carolyn Bragg	Natural Resources Specialist	8
David O'Connor	Water Resource Modeler	9
David van Rijn	Chief, Science Division	22
Donna Garcia	Project Manager	–
Erwin Van Nieuwenhuysse	Supervisory Fish Biologist	15
Greg Krzys	Natural Resources Specialist	20
Janice Piñero	Endangered Species Act Compliance Specialist	15
Jason Hassrick	Fish Biologist	17
Joel Sturm	Geologist	40
John Dealy	Project Manager	More than 30
John Hannon	Fisheries Biologist	25
Josh Israel	Fish Biologist	11
Kaylee Allen	Assistant Regional Solicitor	16
Kirk Nelson	Civil Engineer (Hydraulic)	11
Kristin White	Hydraulic Engineer	11
Laureen Perry	Regional Archaeologist	25
Michael Mosley	Physical Scientist	7
Michael Tansey	Climate Change Coordinator	40
Michele Palmer	Fisheries Biologist	20
Michelle Banonis	BDCP Program Manager	16

Chapter 25: List of Preparers

<b>Name</b>	<b>Title</b>	<b>Years of Experience</b>
Nancy Parker	Hydraulic Engineer (Water Resources Engineer)	25
Patti Idlof	Supervisory Natural Resources Specialist	30
Paul Zedonis	Supervisory Natural Resource Specialist	25
Rain Emerson	Supervisory Natural Resource Specialist	6
Rebecca Victorine	Natural Resource Specialist	18
Ronald Silva	Chief, Engineering and O&M Division	30
Russell Grimes	Chief, Environmental Compliance and Habitat Conservation Branch	24
Scott Springer	Outdoor Recreation Planner	21
Stanley Parrott	Geologist	29
Steve Pavich	Agricultural Economist	18
Traci Michel	Water Management Goal Supervisor	22

1 **CH2M HILL**

<b>Name</b>	<b>Project Role</b>	<b>Education</b>
Gwendolyn Buchholz, Professional Engineer (P.E.)	Project Manager	M.S., Civil Engineering, 1976 B.A., Physics, 1974
Derya Sumer, P.E.	Deputy Project Manager, Modeling Lead	Ph.D., Civil Engineering–Water Resources, 2007 M.S., Civil Engineering–Water Resources, 2002 B.S., Civil Engineering, 1999
Robert Antel	Graphics	B.A., Art, 1990
Nathan Brown, Professional Geologist (PG)	Groundwater	M.S., Hydrogeology, 1995 B.S., Geology, 1993
Earl Byron	Water Quality	Ph.D., Ecology and Limnology, 1979 B.A., Marine Biology, 1973
Chandra Chilmakuri, P.E.	Water Supply, Surface Water, Water Quality	Ph.D., Hydrodynamics and Environmental Modeling, 2005 M.S., Civil and Environmental Engineering, 2002 B.S., Civil Engineering, 2000

<b>Name</b>	<b>Project Role</b>	<b>Education</b>
Heidi Chou, P.E.	Water Supply, Surface Water	M.S., Civil Engineering, B.S., Civil Engineering, 2010
David Christophel	Biological Resources	M.S., Biological Sciences, 1989 B.S., Biological Sciences, 1979
Tapash Das	Water Supply, Surface Water, Groundwater	Ph.D., Hydrology, 2006 M.T., Water Resources Development and Management, 2002 B.S., Agricultural Engineering, 1999
Tyson Daus	Graphics	B.S., Graphic Design, 2008
Rosemarie Dimacali	Water Quality	M.S., Civil Engineering B.S. 2009
Fawn Elhadidi	GIS Mapping	Certificate in Business Management and Accounting, 1989
Al Farber	Cultural Resources	M.A., Anthropology, 1982 B.A., Anthropology, 1976
Tyler Hatch, P.E.	Groundwater	Ph.D., Civil and Environmental Engineering, 2013 M.S., Civil and Environmental Engineering, 2011 B.S., Civil Engineering, 2008
Steven Hatchett	Agriculture, Socioeconomics	Ph.D., Agricultural Economics, 1984 M.A., Administration, 1980 B.S., Forestry, 1977
David Julian	Water Supply, Surface Water, Water Quality	M.S. Civil Engineering, 2013 B.S., Civil Engineering, 2011
Kevin Kasberg	Agriculture, Socioeconomics	M.S., Agricultural and Resources Economics, 2012 B.A., Environmental Studies/Economics, 2009
Justin LaNier	Groundwater	M.S., Civil Engineering, 2006 B.S., Civil Engineering, 2002
Peter Lawson, P.G.	Groundwater	M.S., Hydrology, 1988 B.S., Geology, 1985
Robert Leaf, P.E.	Water Supply Surface Water, Water Quality	M.S., Civil Engineering, 1994 B.S., Civil Engineering, 1992 B.S., Forest and Resource Management, 1987
Chakri Malakpet, P.E.	Water Supply	M.S., Civil Engineering, 2007 B.S., Civil Engineering, 2005

Chapter 25: List of Preparers

<b>Name</b>	<b>Project Role</b>	<b>Education</b>
Armin Munévar, P.E.	Water Supply Surface Water, Water Quality	M.S., Civil Engineering, 1997 B.S., Civil Engineering, 1991
Neil Nikirk	Biological Resources	M.S., Fisheries Science, 1992 B.S., Fisheries Science, 1987
Harry Ohlendorf	Water Quality	Ph.D., Wildlife Science, 1971 M.S., Wildlife Science, 1969 B.S., Wildlife Management, 1962
Lisa Porta, P.E.	Groundwater, Water Quality	M.S., Environmental Science and Engineering, 2007 B.S., Biological Systems Engineering, 2004
Reed Thayer	Water Supply, Surface Water	M.S., Civil Engineering, 2015 B.S., Civil Engineering, 2013
Elisabeth Towers	GIS Mapping	B.A., Human Geography and Planning, 2013
Robert Tull, P.E.	Water Supply, Surface Water	M.S., Environmental Engineering, 10986 B.S., Environmental Planning, 1981
Jeff Tupen	Biological Resources	B.S., Environmental and Systematic Biology, 1989
Pamela Vanderbilt	Air Quality and Biological Resources	M.A., Biology, 1979 B.A., Biology, 1977
Brian Van Lienden, P.E.	Water Supply, Energy Resources	M.S., Civil Engineering, 2000 B.S., Civil Engineering, 1998
Kyle Winslow, P.E.	Water Quality	Ph.D., Environmental Fluid Mechanics, 2001 M.S., Environmental Water Resources, 1996 B.S., Civil Engineering, 1995
Fatuma Yusuf	Socioeconomics	Ph.D., Agricultural Economics, 2000 M.S., Statistics, 1999 M.A., Agricultural Economics, 1994 B.S., Range Management, 1990

1 **Ag-Recon**

<b>Name</b>	<b>Project Role</b>	<b>Education</b>
David Olson	Agricultural Resources	B.S., Agricultural Engineering, 1985

1 **Cramer Fish Sciences**

<b>Name</b>	<b>Project Role</b>	<b>Education</b>
Paul Bergman	Aquatic Resources	M.S., Fisheries, 2007 B.S., Fisheries and Biology, 1994
Brad Cavallo	Aquatic Resources	M.S., Aquatic Ecology, 1997 B.S. Wildlife and Fisheries Biology, 1994
Travis Hinkelman	Aquatic Resources	Ph.D., Biological Sciences, 2012 M.S., Aquaculture, Fisheries and Wildlife, 2004 B.S., Fisheries and Wildlife, 2001
Steven Zeug	Aquatic Resources	Ph.D., Wildlife and Fisheries Sciences, 2007 B.S., Fisheries Biology, 2001

2 **ERA Economics**

<b>Name</b>	<b>Project Role</b>	<b>Education</b>
Duncan MacEwan	Agricultural Resources	Ph.D., Economics, 2012 M.S., Economics, 2008 B.S., Economics, 2006

3 **InCommunications**

<b>Name</b>	<b>Project Role</b>	<b>Education</b>
Christine Kohn	Consultation and Coordination	M.S., Journalism and Public Affairs, 1993 B.A., Journalism, 1991

4 **Kearns and West**

<b>Name</b>	<b>Project Role</b>	<b>Education</b>
Michael Harty	Consultation and Coordination	J.D., Georgetown University Law Center, 1986 B.A., Political Philosophy, 1978

5 **QEDA**

<b>Name</b>	<b>Project Role</b>	<b>Education</b>
Noble Hendrix	Aquatic Resources	Ph.D., Aquatic and Fisheries Sciences, 2003 M.S., Aquatic and Fisheries Sciences, 2000

1 **Resource Management Associates**

<b>Name</b>	<b>Project Role</b>	<b>Education</b>
Stacie Grinbergs, P.E.	Surface Water Modeling	M.S., Civil Engineering, 1998
Donald Smith, P.E.	Water Temperature Modeling	B.S., Civil Engineering, 1968

2 **RMann Economics**

<b>Name</b>	<b>Project Role</b>	<b>Education</b>
Roger Mann	Socioeconomics	Ph.D., Agricultural Economics, 1978

3 **Stillwater Associates**

<b>Name</b>	<b>Project Role</b>	<b>Education</b>
Ethan Bell	Aquatic Resources	M.S., Biology, 2001
Joshua Strange	Aquatic Resources	Ph.D., Fisheries Biologist, 2001
