Official Public Comment 3673

Dear EIS/EIR Team Members:

I support a diversion of no more that 30 percent of the natural water flow from the Trinity River Basin. While I support the science and study that produced the Flow Evaluation Report, the recommendations were limited by an assumption about the amount of water that could be available for the river. Legislation creating the Trinity River Division, and additional legislation clearly gives Trinity fish and wildlife priority over the diversion of any water to the CVP. Therefore, the Preferred Alternative does not go far enough to achieve a legally mandated restoration of the ecosystem.

Thank You,

Name: Leo Prosser

Official Public Comment 3710

Dear EIS/EIR Team Members:

I support a diversion of no more that 30 percent of the natural water flow from the Trinity River Basin. While I support the science and study that produced the Flow Evaluation Report, the recommendations were limited by an assumption about the amount of water that could be available for the river. Legislation creating the Trinity River Division, and additional legislation clearly gives Trinity fish and wildlife priority over the diversion of any water to the CVP. Therefore, the Preferred Alternative does not go far enough to achieve a legally mandated restoration of the ecosystem.

Thank You,

Arcata, CA 95521

Dear Mr. Polos,

I encourage you to support a plan for the Trinity River which will allow it to maintain at least 70% of its flow. The Trinity River is a great natural asset in an overcrowded state where species such as salmon have vanished for the most part. I have never been to the Trinity River, but I will travel there eventually and I hope to see it flowing when I get there. } 3724-1

Sincerely Yours,
Rudy K. Beran

I support a diversion of no more that 30 percent of the natural water flow from the Trinity River Basin. While I support the science and study that produced the Flow Evaluation Report, the recommendations were limited by an assumption about the amount of water that could be available for the river. Legislation creating the Trinity River Division, and additional legislation clearly gives Trinity fish and wildlife priority over the diversion of any water to the CVP. Therefore, the Preferred Alternative does not go far enough to achieve a legally mandated restoration of the ecosystem.

Dear Mr. Polos,

The science that led to the Flow Evaluation Report is sound, but the recommendations and the Preferred Alternative fall short of what is needed to restore the legally mandated restoration of the Trinity River Basin ecosystem.. The Trinity River/Klamath River drainage is rugged yet beautiful country, and many communities depend on the lower Trinity for their livelihood as well as water supply. Significant populations of steelhead and salmon still ascend the river to spawn, although not in the numbers that were present before the dam was built. Diversion of more water to the Central Valley Project would seriously impact the remaining salmon and steelhead runs. Please help prevent further detrimental impact on the ecology of the lower Trinity and Klamath rivers by limiting the diversion of Trinity River water to less than 30% of its natural flow.

to: the members of the Environmental Impact Statement
team, Trinity River

Dear EIS/EIR Team members;

This fall, while fishing for steelhead on the Klamath near Weitchepec, I learned for the first time how much water is diverted from the Trinity River, and how much damming & water diversion has altered a magnificent ecosystem.

I value the fishery in the Trinity, and am ready to contribute my vote & tax dollars towards restoring water flows more favorable to not only salmonid fishing, but the river as a whole below Lewiston Lake.

Many past water-management decisions were made without placing a value on wild species propagating themselves in their natural habitat. I belive such decisions should and will be altered.

Flow levels & consistency are especially important at low water periods to allow smolts to not only live long enough to migrate downstream, but to ensure they can move downriver to the sea. The scouring action of high water in the winter is neccessary to keep gravel beds from silting up; ensuring spawning areas. Please support a water flow diversion cap of not more than 30%. 3758-1

Thank you,

Sara Myers
