a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

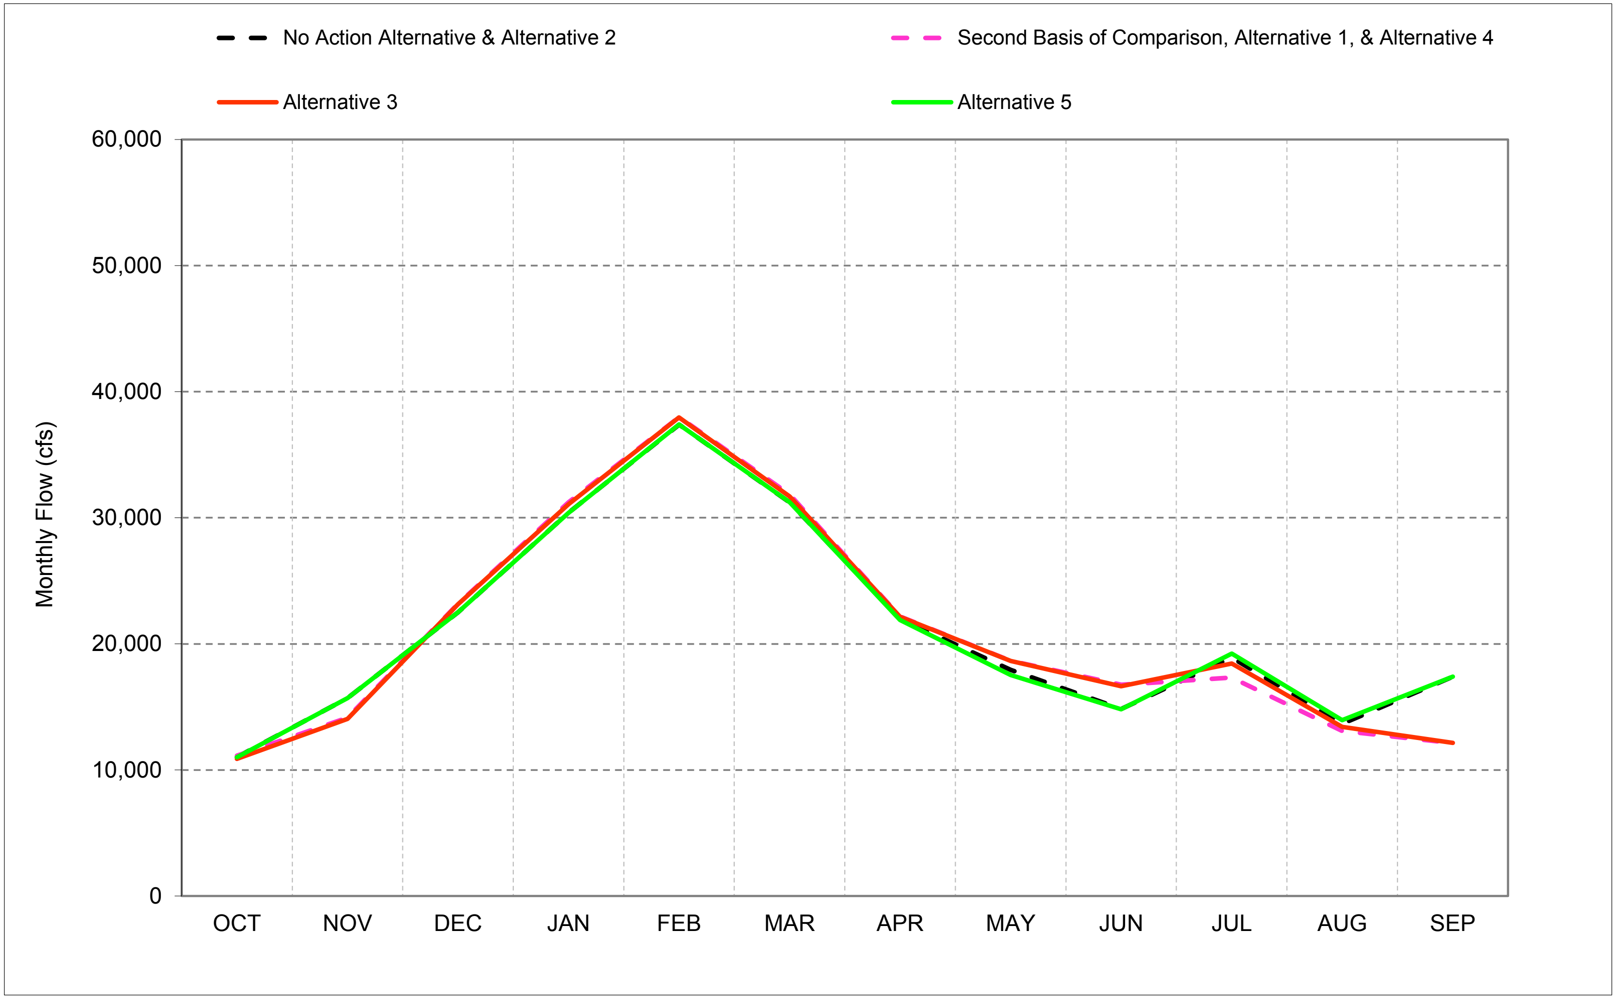
C.28. Sacramento River Flow at Freeport

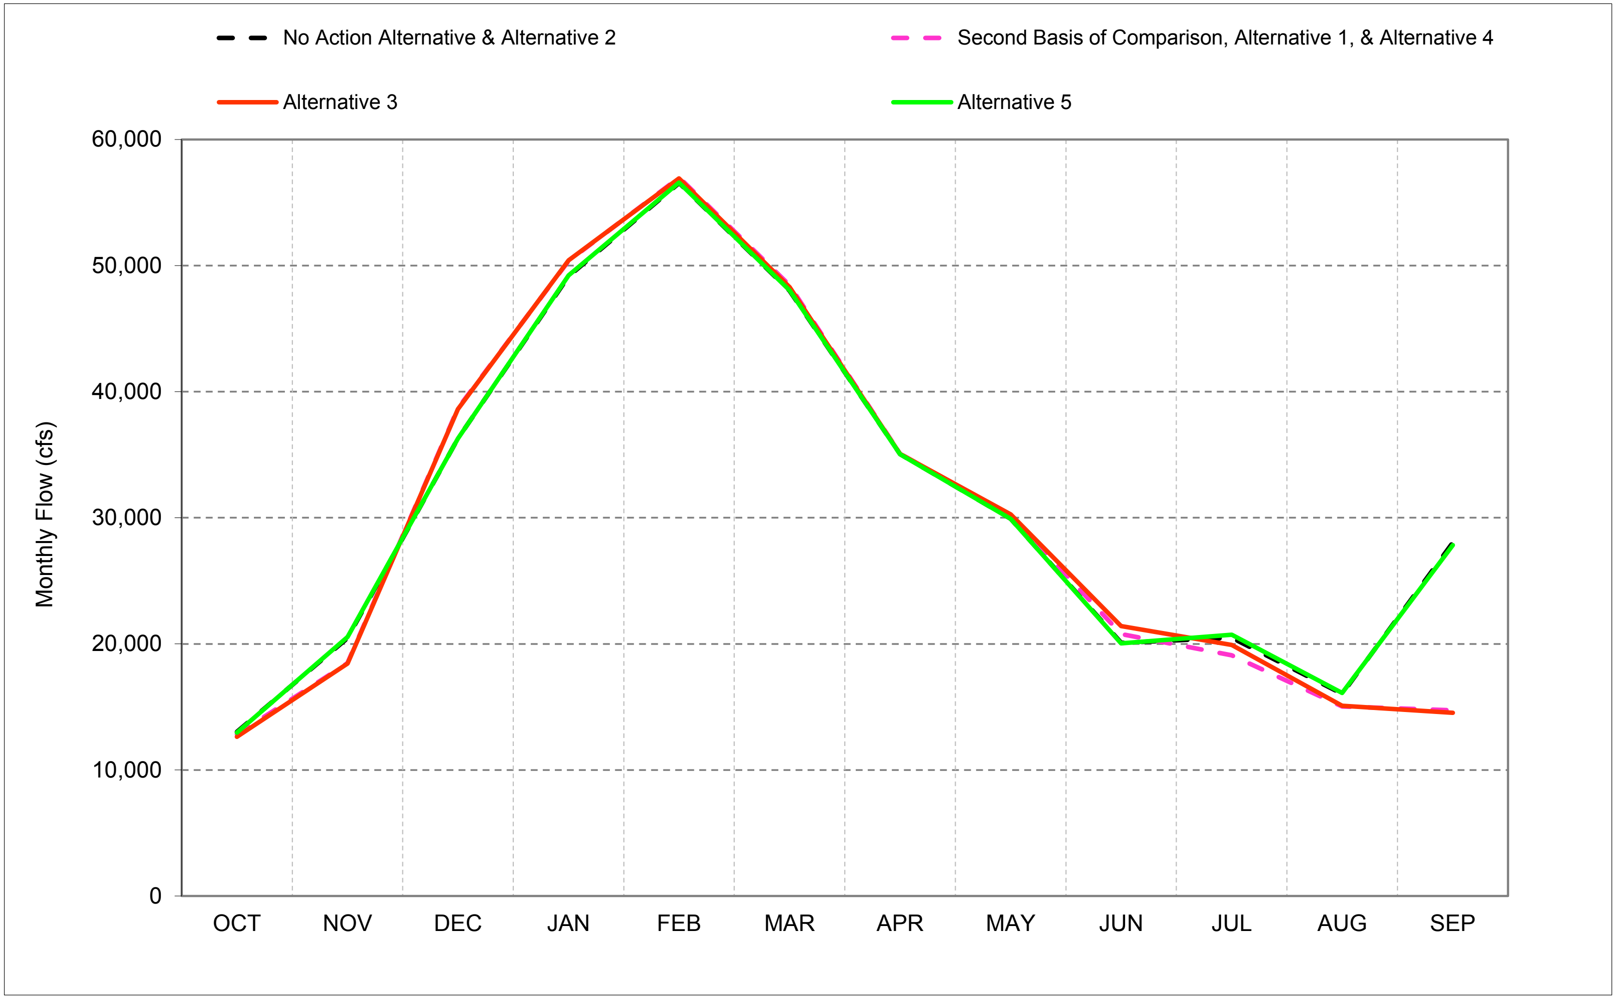
Figure C-28-1. Sacramento River at Freeport, Long-Term* Average Flow



*Based on the 82-year simulation period.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure C-28-2. Sacramento River at Freeport, Wet Year* Long-Term Average Flow**



*As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

**Based on the 82-year simulation period.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

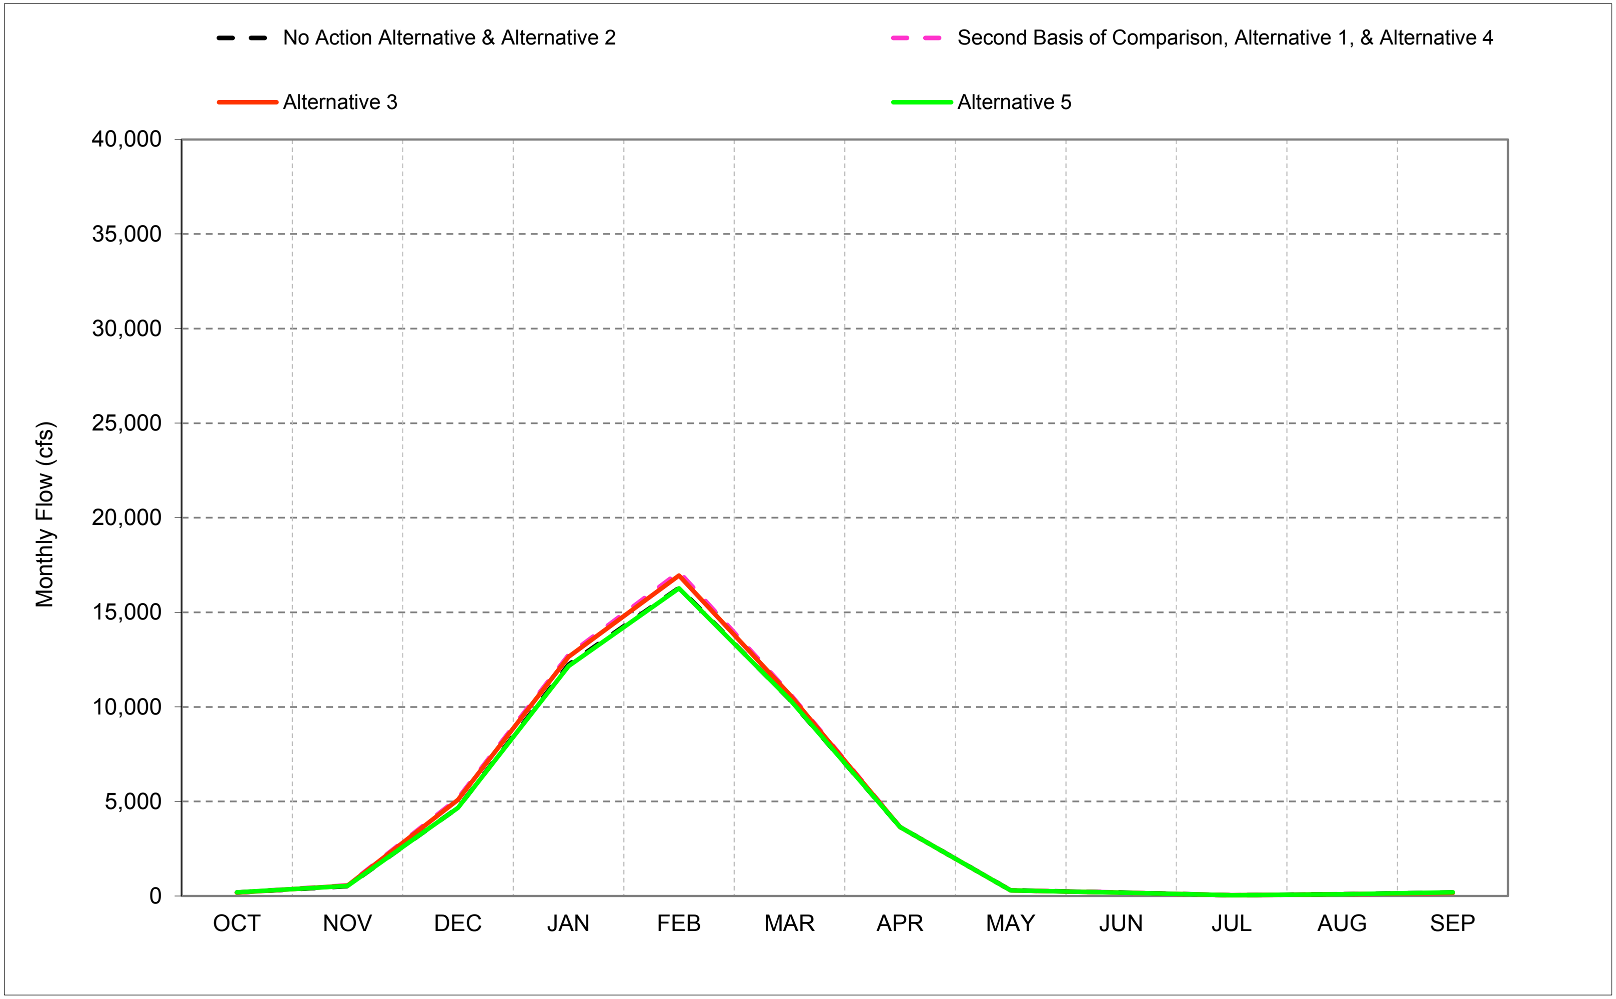
C.29. Yolo Bypass Flow

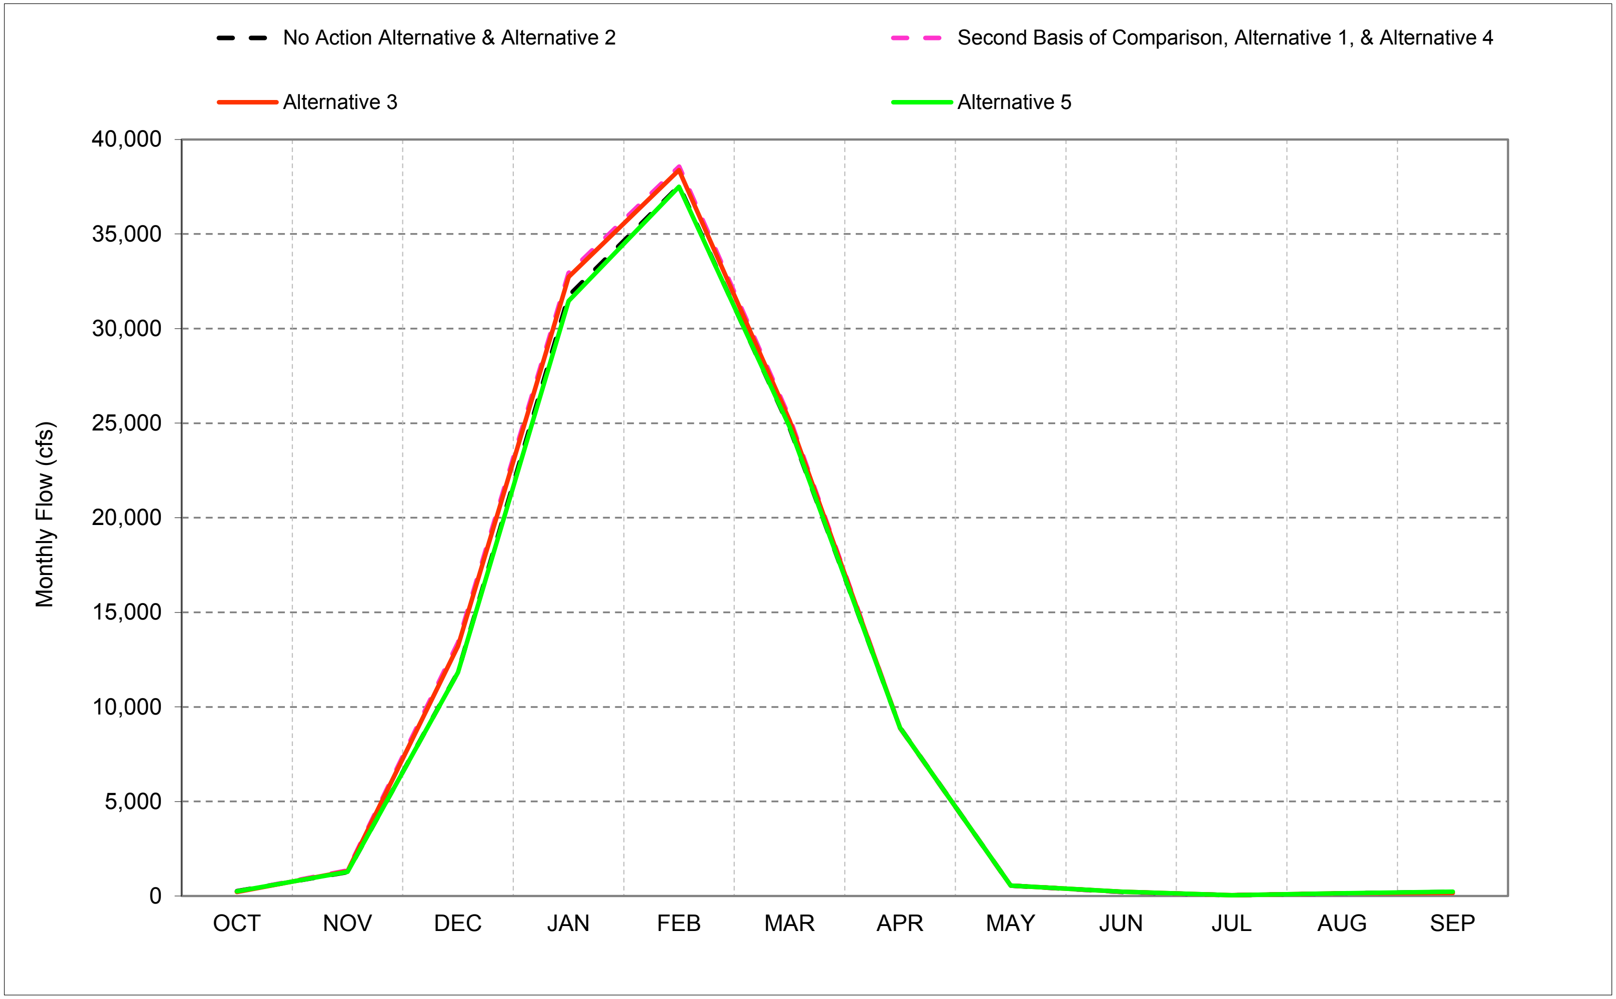
Figure C-29-1. Yolo Bypass, Long-Term* Average Flow



*Based on the 82-year simulation period.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure C-29-2. Yolo Bypass, Wet Year* Long-Term Average Flow**

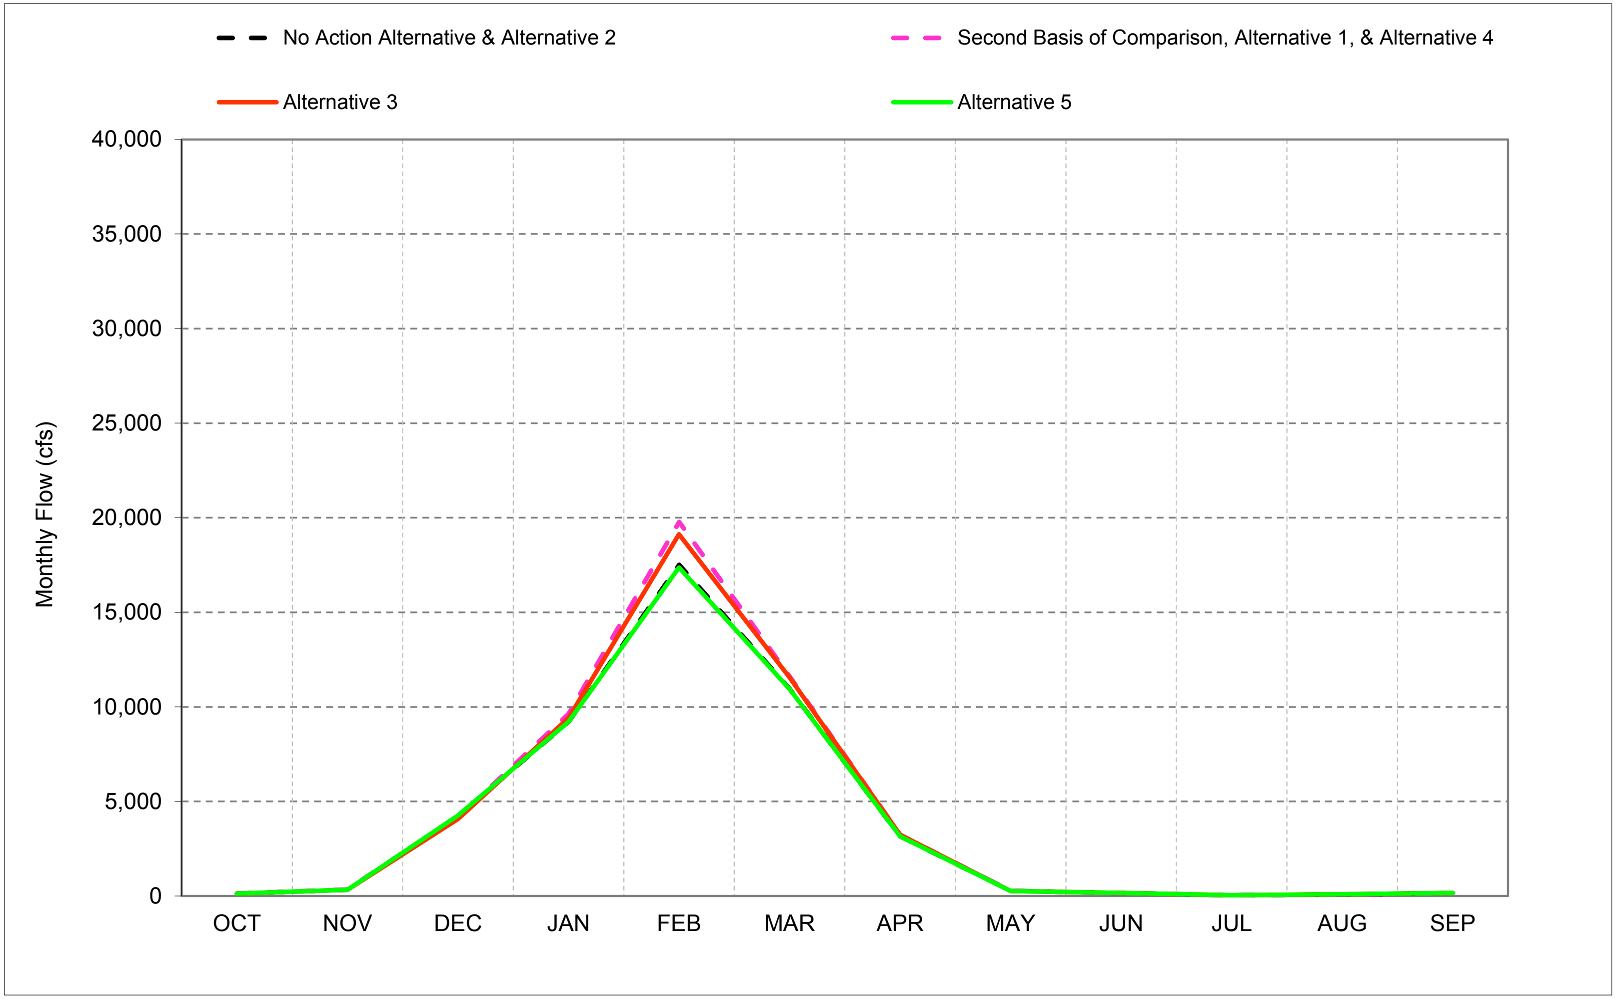


*As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

**Based on the 82-year simulation period.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure C-29-3. Yolo Bypass, Above Normal Year* Long-Term Average Flow**

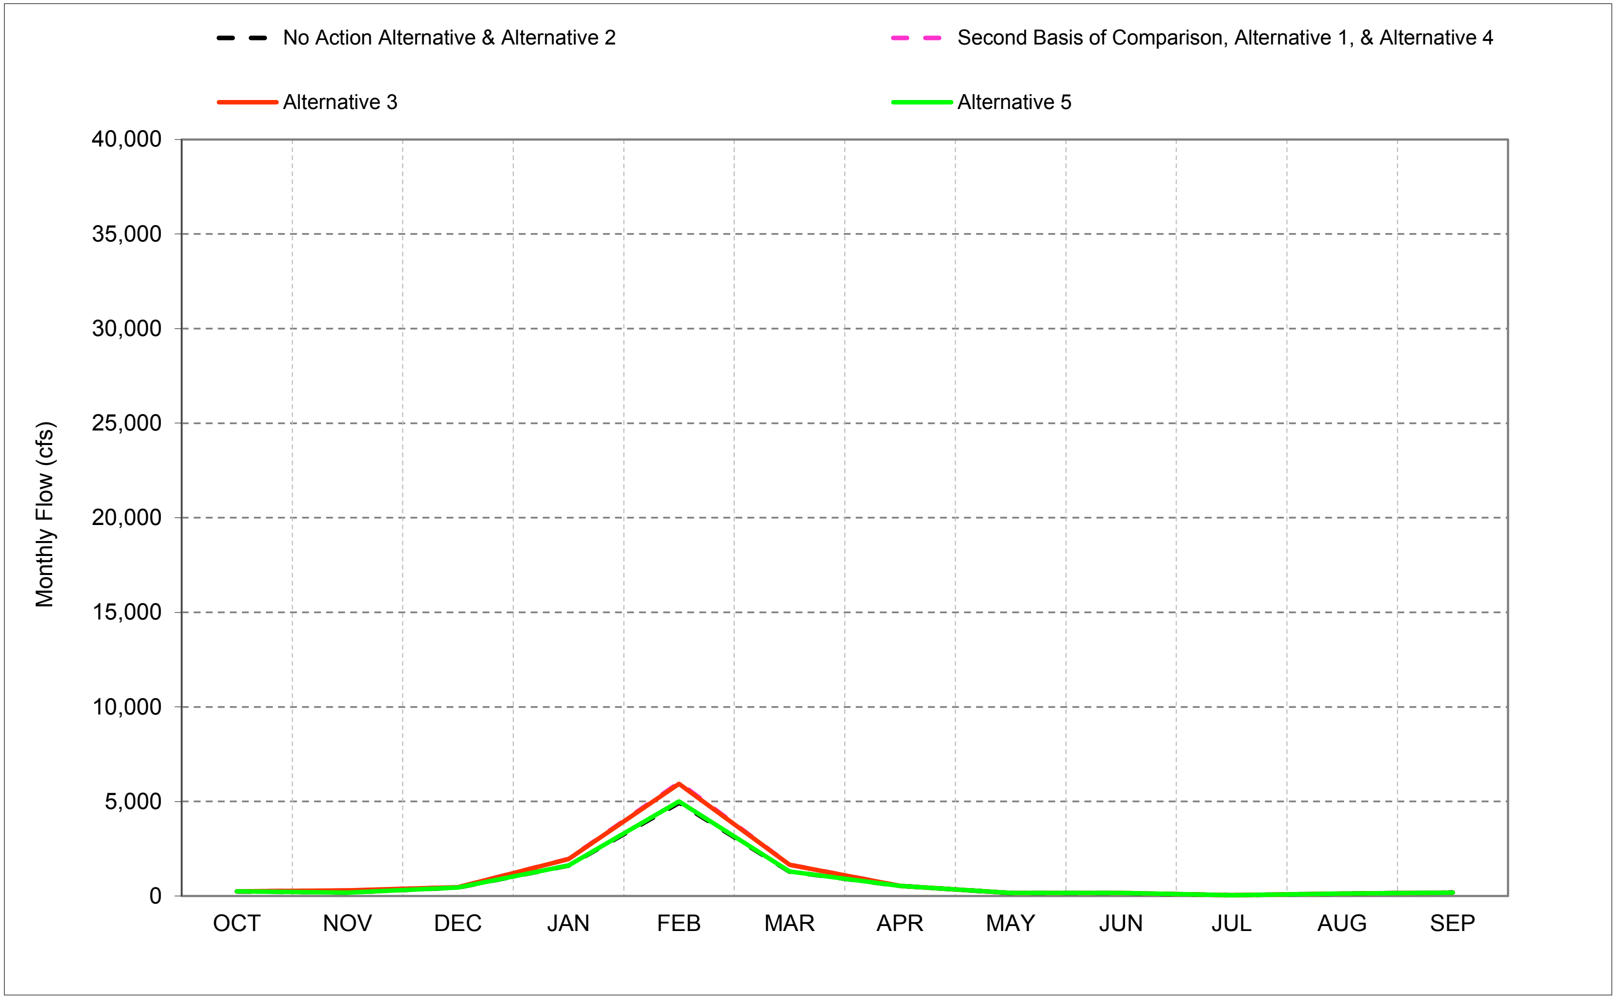


*As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

**Based on the 82-year simulation period.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure C-29-4. Yolo Bypass, Below Normal Year* Long-Term Average Flow**

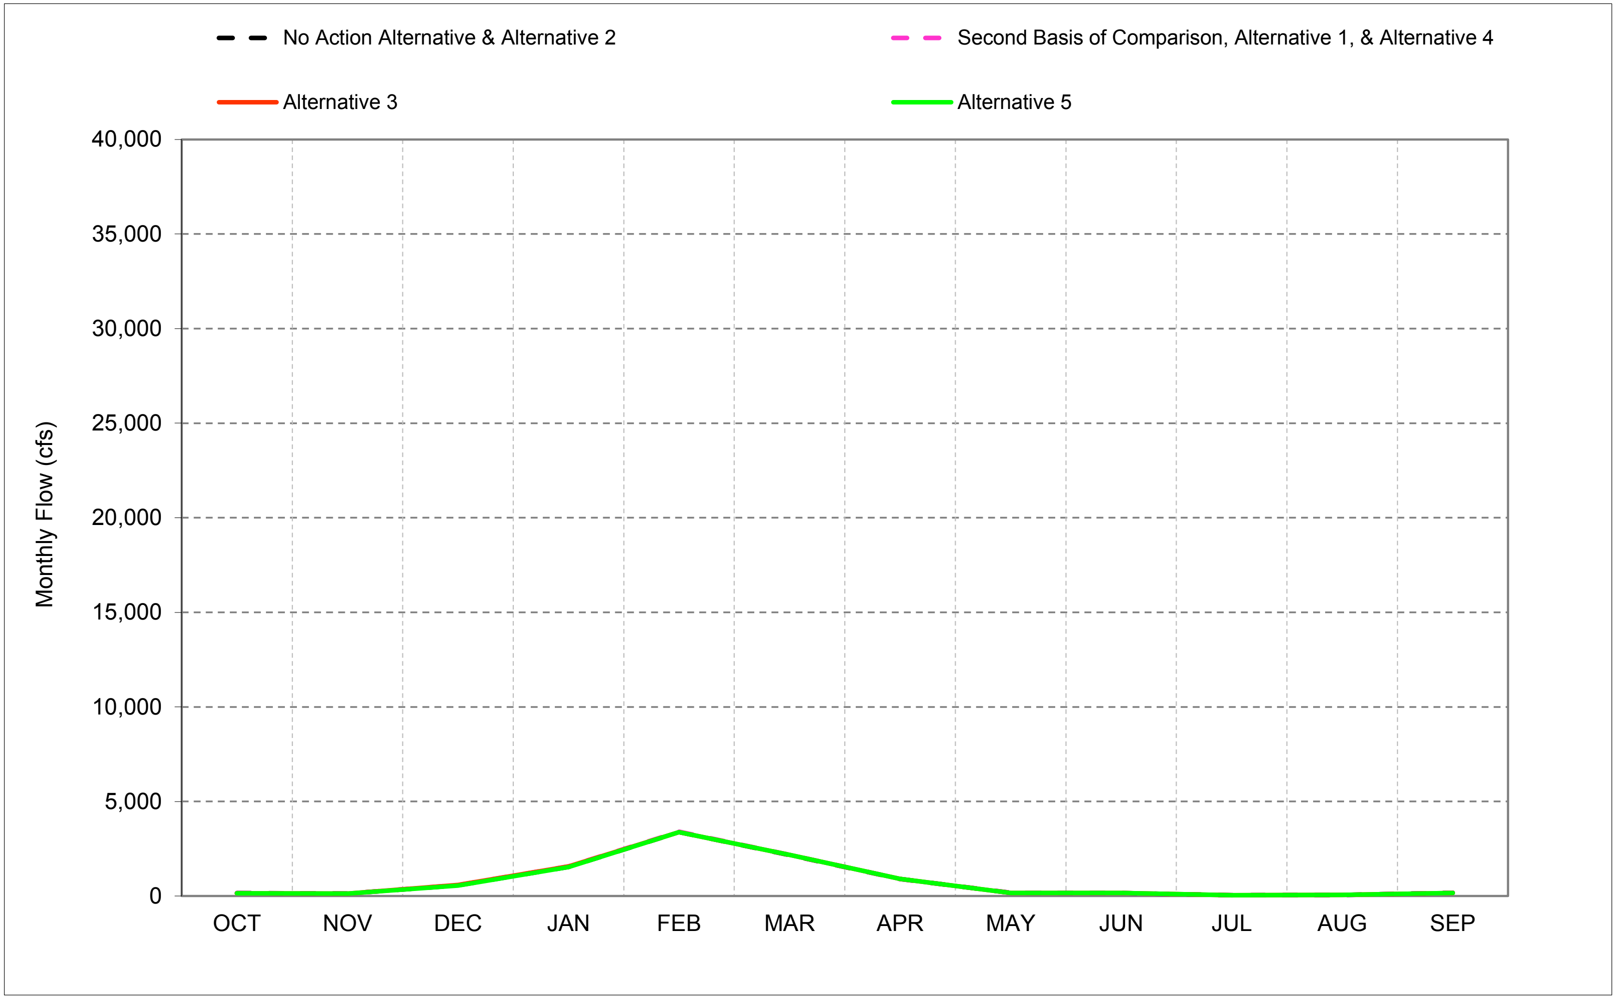


*As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

**Based on the 82-year simulation period.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure C-29-5. Yolo Bypass, Dry Year* Long-Term Average Flow**

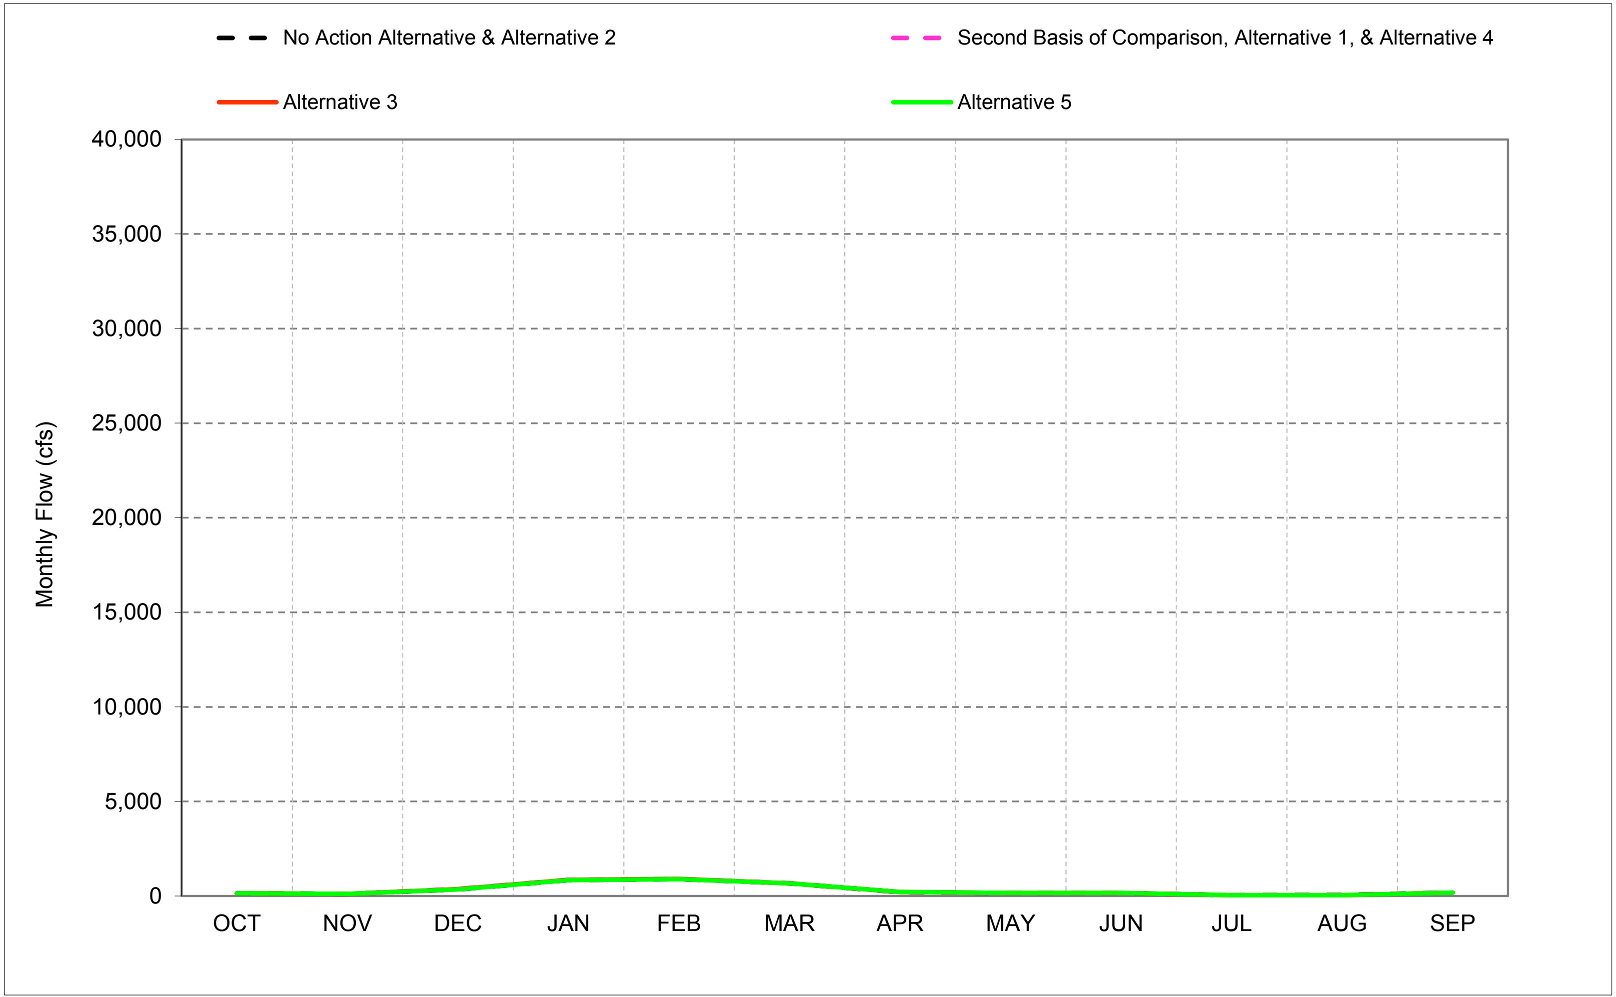


*As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

**Based on the 82-year simulation period.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure C-29-6. Yolo Bypass, Critical Year* Long-Term Average Flow**



*As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

**Based on the 82-year simulation period.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Critical (15%)	0	0	19	9	7	12	0	0	0	0	0	0

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

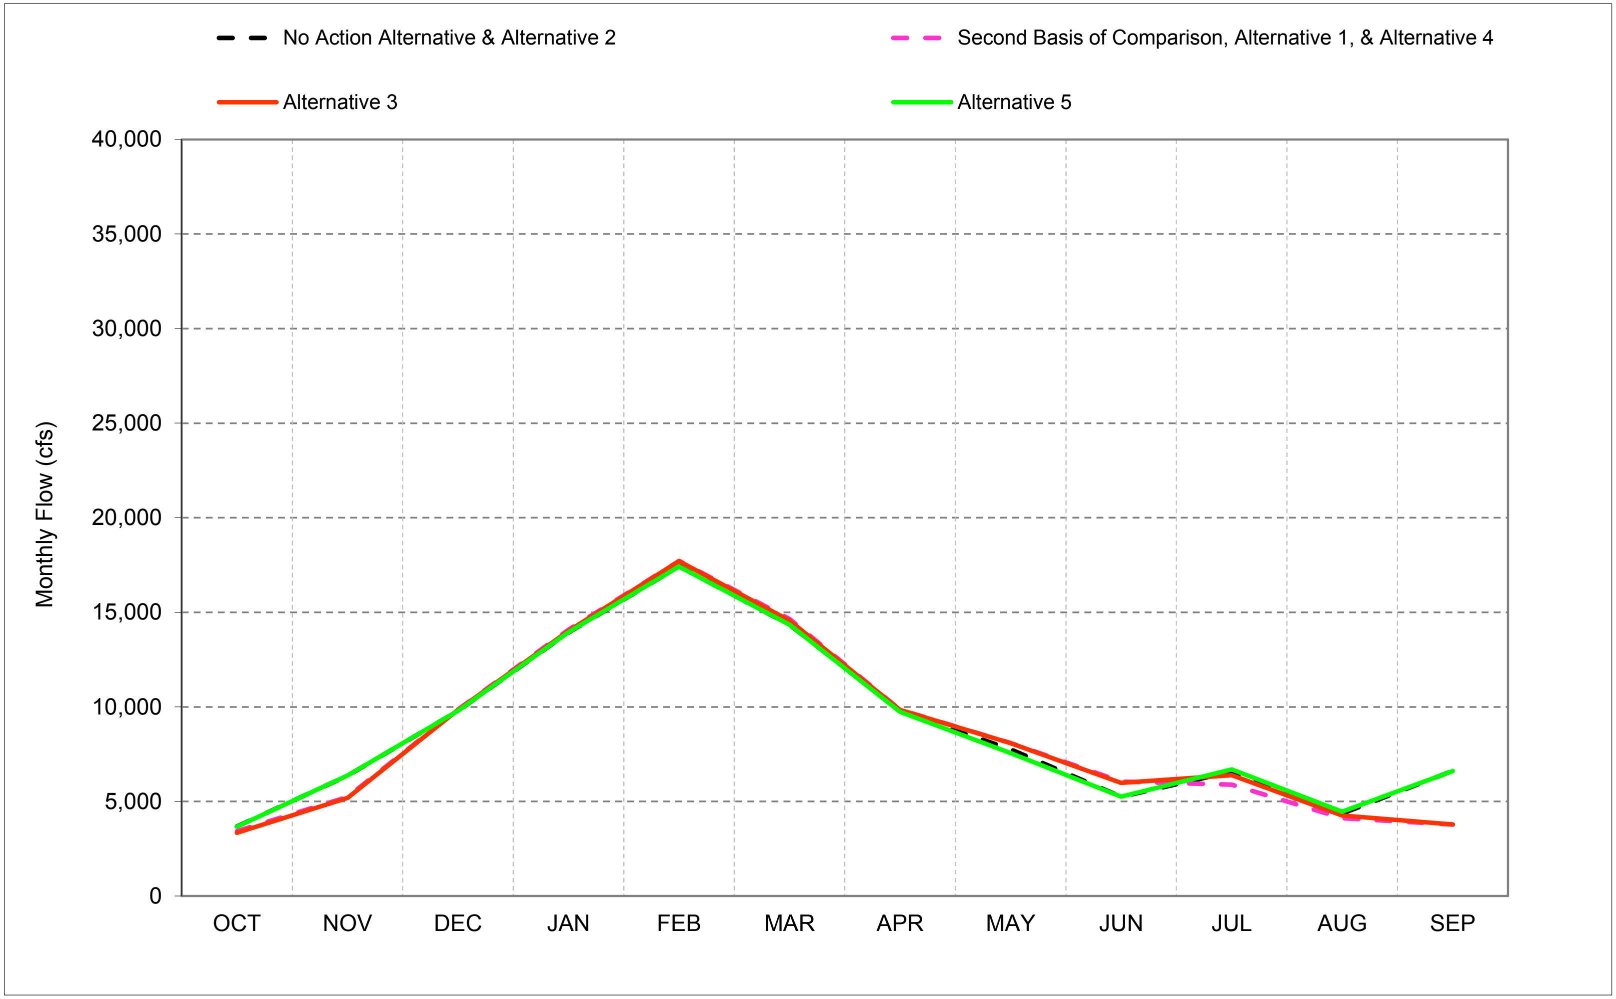
C.32. Sutter and Steamboat Slough Flows

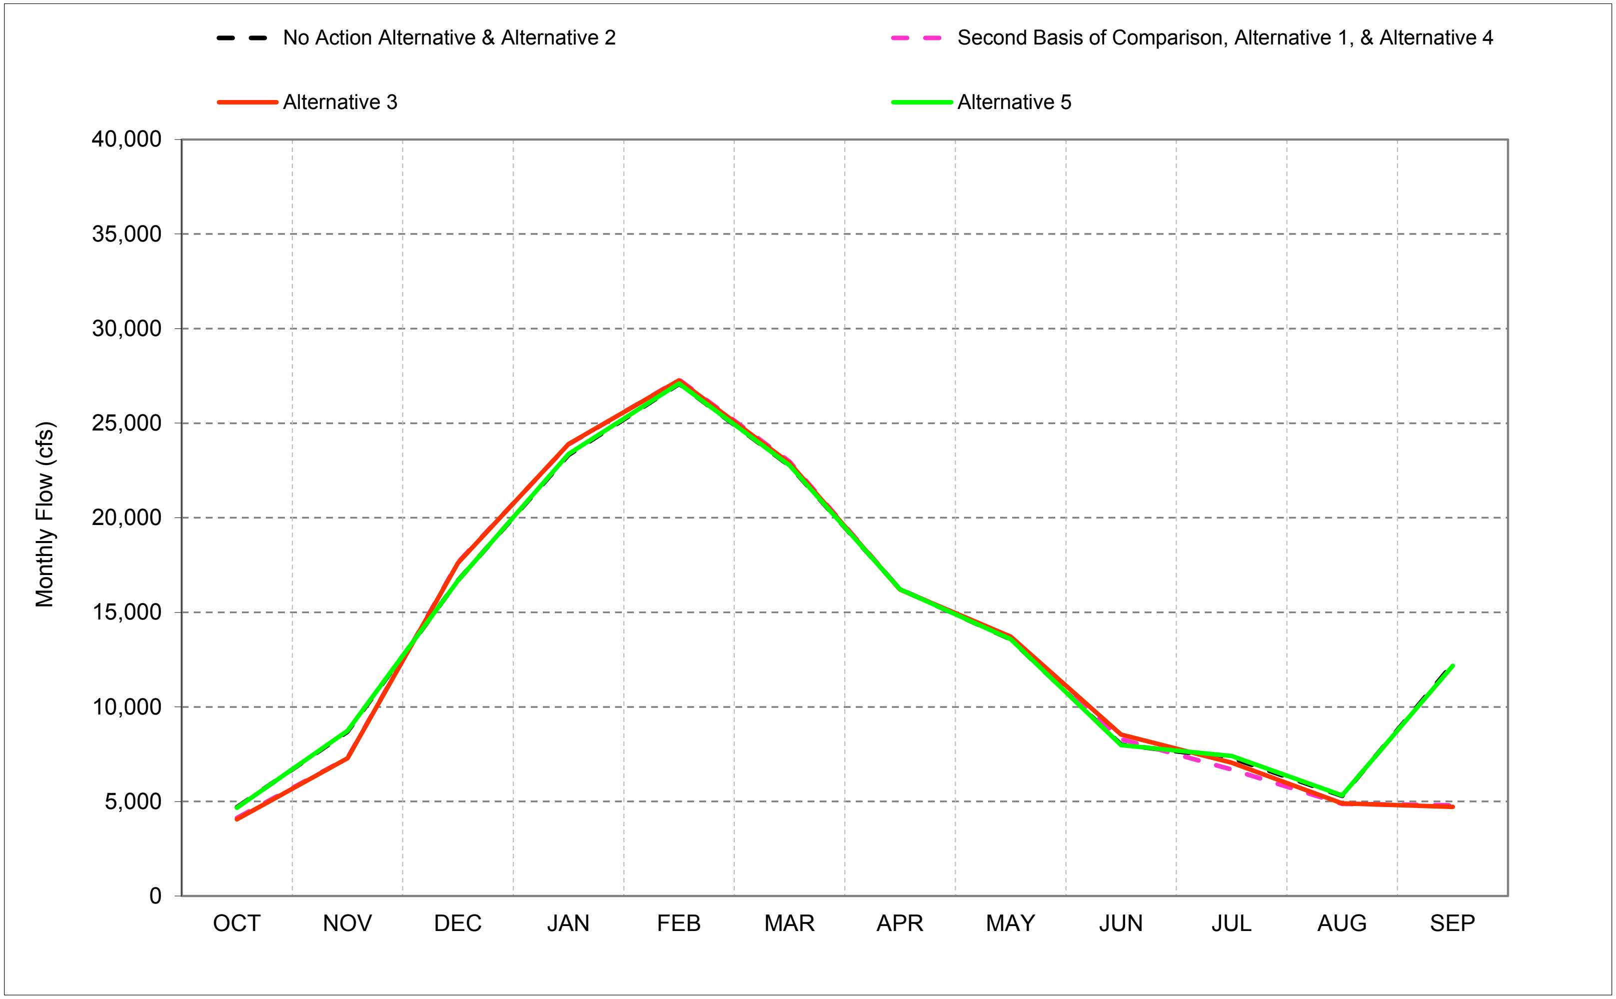
Figure C-32-1. Sutter and Steamboat Slough, Long-Term* Average Flow



*Based on the 82-year simulation period.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure C-32-2. Sutter and Steamboat Slough, Wet Year* Long-Term Average Flow**

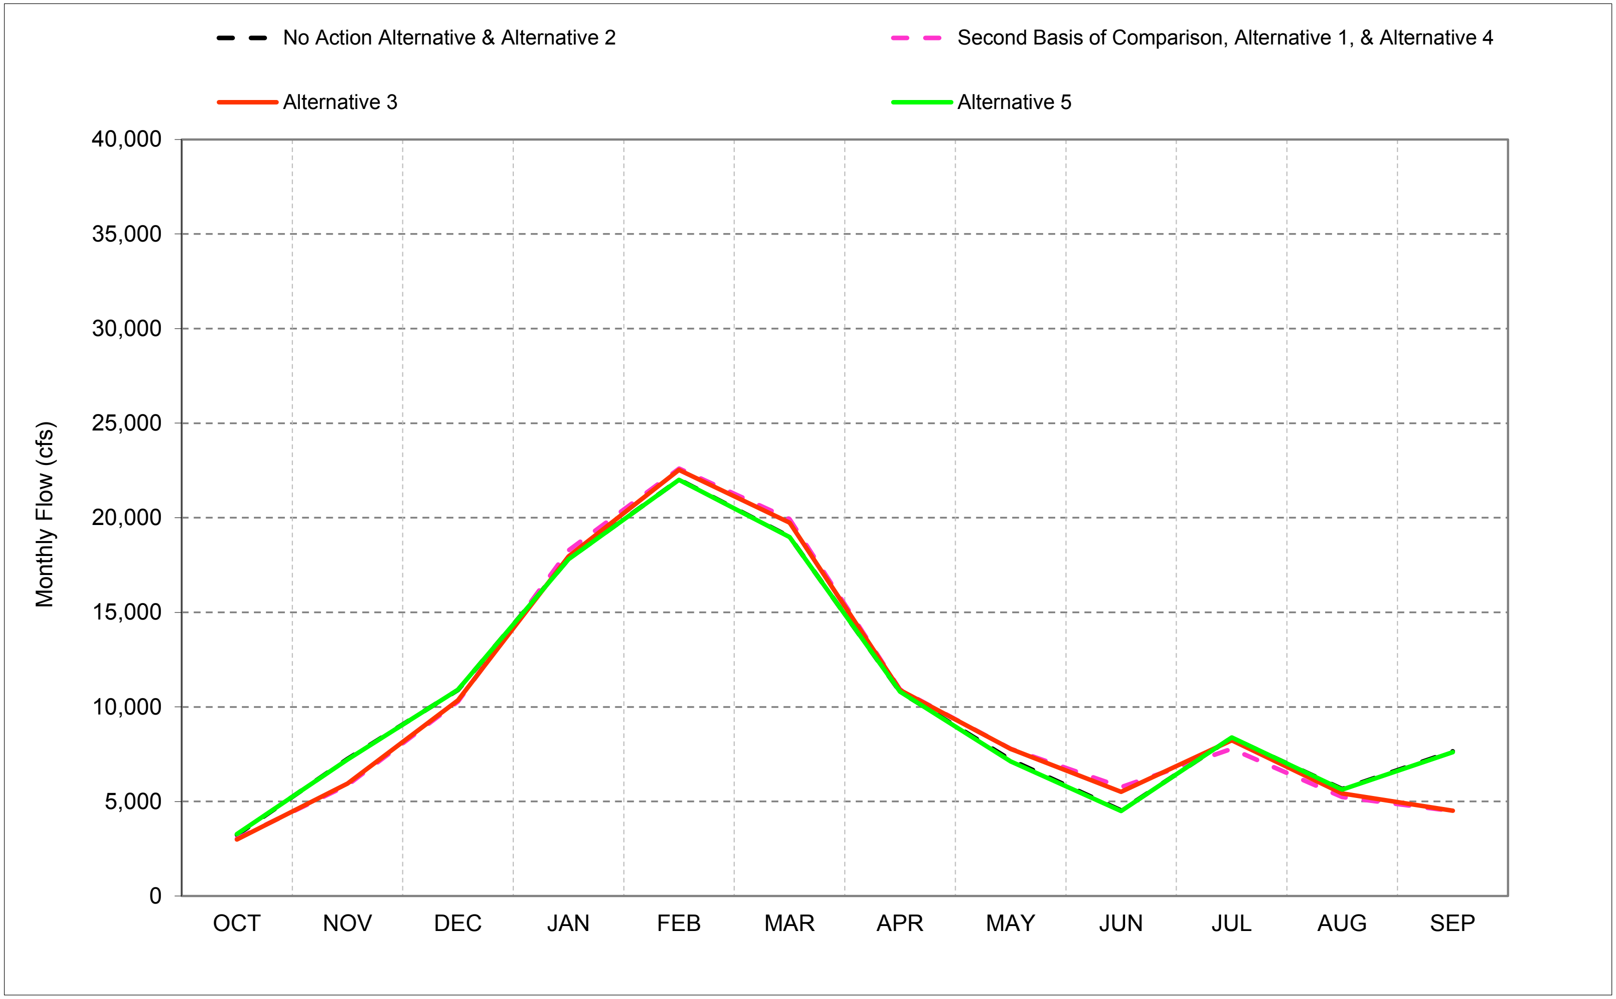


*As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

**Based on the 82-year simulation period.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure C-32-3. Sutter and Steamboat Slough, Above Normal Year* Long-Term Average Flow**

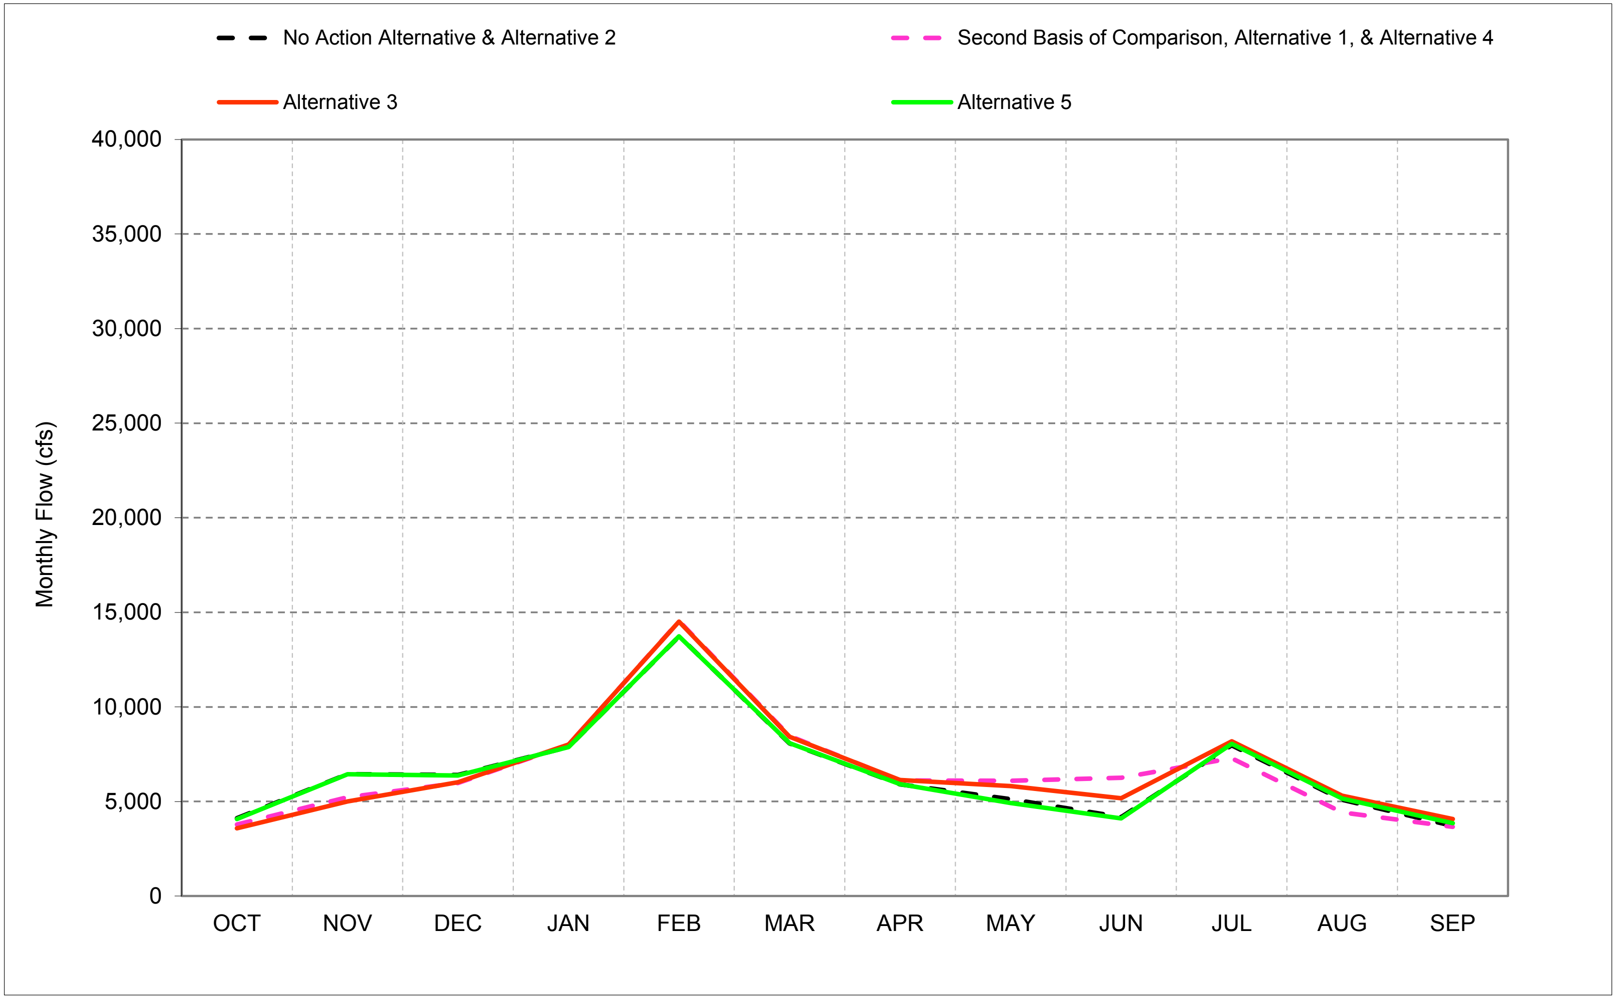


*As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

**Based on the 82-year simulation period.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure C-32-4. Sutter and Steamboat Slough, Below Normal Year* Long-Term Average Flow**

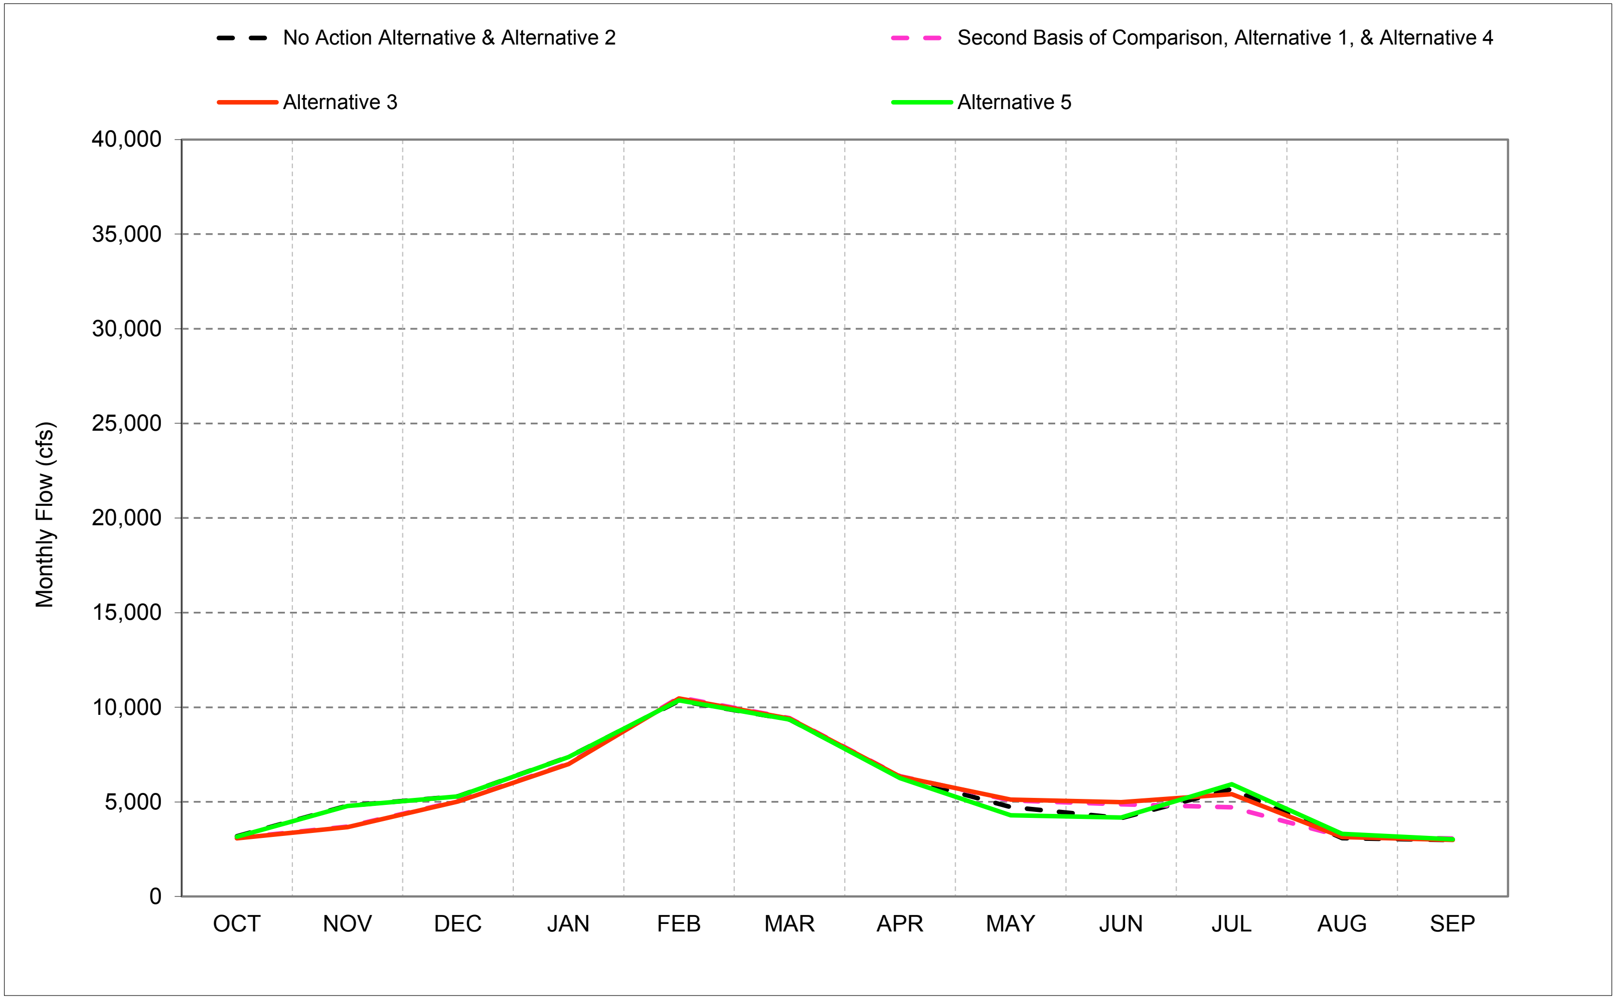


*As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

**Based on the 82-year simulation period.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure C-32-5. Sutter and Steamboat Slough, Dry Year* Long-Term Average Flow**

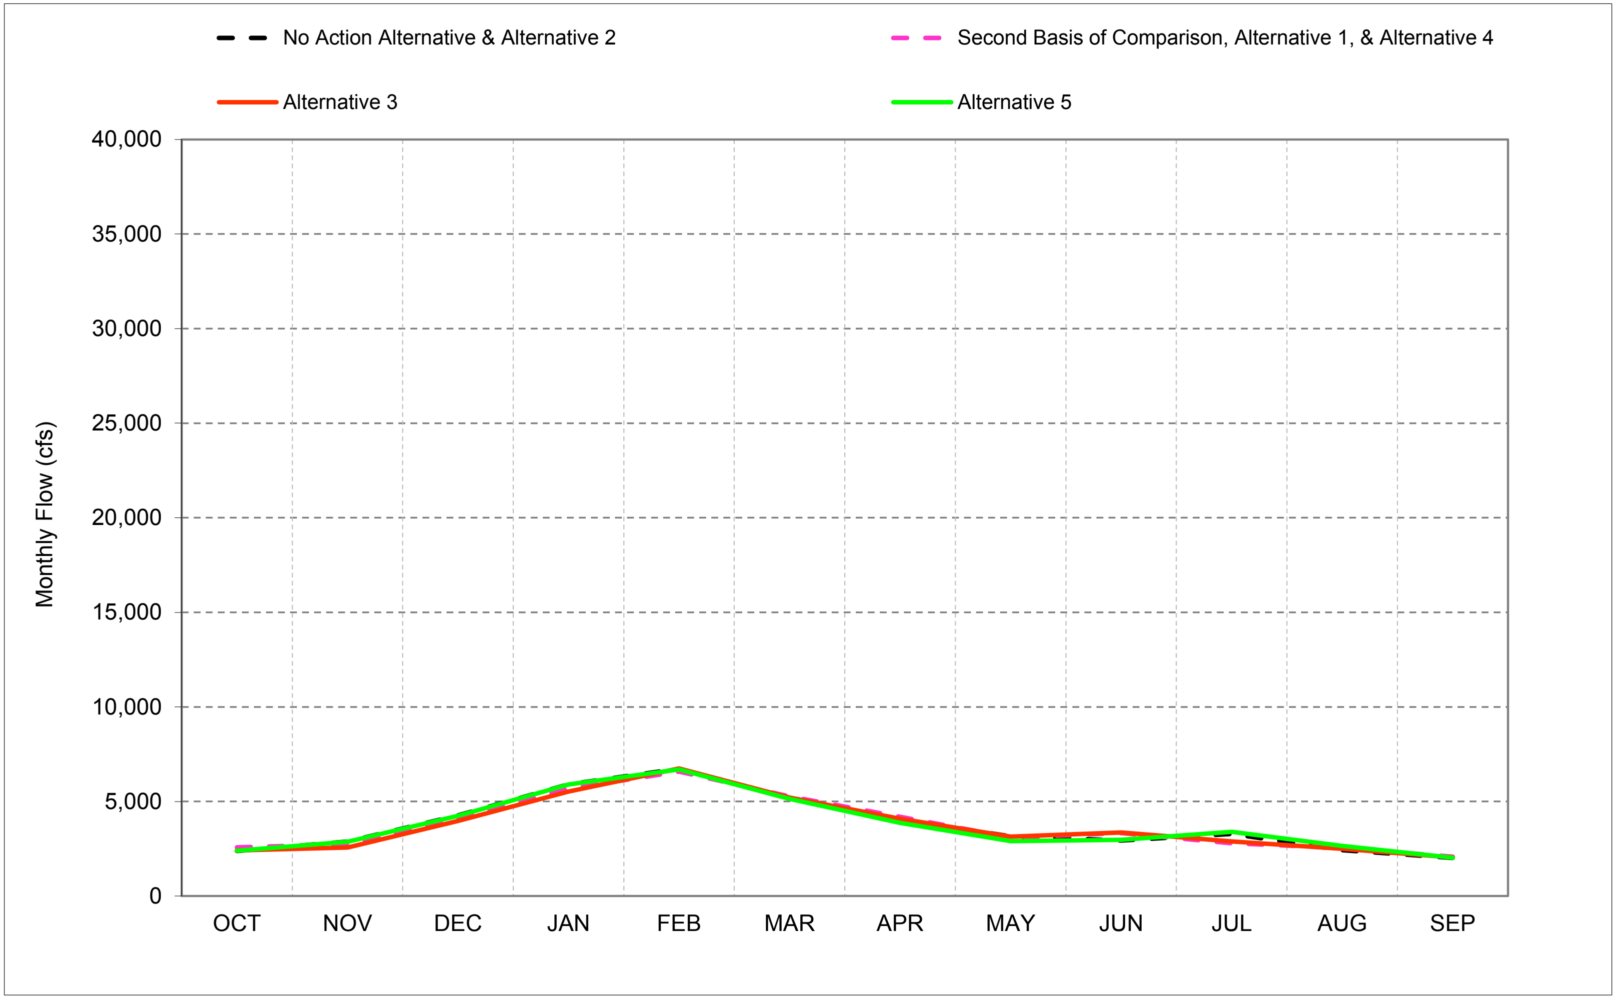


*As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

**Based on the 82-year simulation period.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure C-32-6. Sutter and Steamboat Slough, Critical Year* Long-Term Average Flow**



*As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

**Based on the 82-year simulation period.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Appendix 5B

Sensitivity Analysis on Representation of EID's Warren Act and EDCWA's Water Service Contracts with Reclamation in Alternatives 3 and 5

During internal review of the CalSim II models, it was discovered that the demands for the El Dorado Irrigation District (EID) and El Dorado County Water Agency (EDCWA) contracts were not included in Alternatives 3 and 5, as intended. In an effort to address this oversight, this appendix provides information on and findings from a sensitivity analysis of potential effects of including EID's Warren Act contract and EDCWA's water service contract with Reclamation. The sensitivity analysis includes system operations (CalSim II) and temperature (HEC-5Q) model runs with inclusion of these demands at Folsom Lake. It is apparent from this analysis that inclusion of these contracts would not change the previous conclusions in Chapters 5 through 21.

The following summary focuses on the differences seen within Folsom Lake and the American River. As will be discussed further in this appendix, addition of these demands did not show sensitivity to the rest of the CVP and SWP system and no further model simulations were necessary to capture potential effects.

5B.1 Background

This section provides brief background on EID and EDCWA's Warren Act contracts with Reclamation.

EID Power to Consumptive Use Transfer and Warren Act Contract

EID has requested to execute a Warren Act contract with Reclamation for use of Folsom Reservoir to convey 17,000 acre-feet annually of non-Central Valley Project (CVP) water from EID's El Dorado Hydroelectric Project (FERC Project 184); a 20 megawatt power project with four small storage reservoirs providing flows to the South Fork of the American River. The Contract was originally negotiated and completed in 2005, but was not executed because of potential operational impacts and difficulties in securing concurrence from the National Marine Fisheries Service (NMFS) that this action is "not likely to adversely affect" threatened and endangered species. In 2014, the Section 7 consultation for the EID Warren Act contract was completed with NMFS. The Section 7 consultation allowed EID to transfer up to 7,500 AF without a temperature control device (to target warmer diversions) and could transfer the full volume of 17,000 AF after construction and implementation of a temperature control device.

Execution of the contract will result in the diversion of flow out of Folsom Reservoir. Due to the anticipated effect of this reduction in historical inflow, the depletion of Folsom inflow was accounted for in the 2008 Biological Assessment future conditions modeling, but not referenced in the proposed action.

El Dorado County Water Agency Water Service Contract

Public Law 101-514, Section 206(b) (1) (B) directed the Secretary to enter into a M&I water supply contract with EDCWA for up to 15,000 AF of CVP water diverted from Folsom Reservoir.

5B.2 Methodology

CalSim II model simulations of Alternatives 3 and 5 were rerun with inclusion of these Warren Act contracts (specifically CalSim II parameters: dem_dsa70_pmi, np_dr70_imi, prj_dr70_imi, DEM_D8F_WR_ANN, DEM_D8I_PMI_ANN, ElDorIDPL table values) as diversions from Folsom Lake. Subsequently, HEC-5Q temperature model was rerun for the American River. The results of Alternatives 3 and 5 are compared with and without representation of the Warren Act and water service contracts. The comparisons represent the changes solely due to inclusion of these diversions at the Folsom Lake.

5B.3 Results

This section presents select CalSim II model results and American River temperature model results.

Results for Shasta, Trinity and Oroville show that changes in reservoir storage were less than 2% by month and when averaged by water year types. This minor change was considered minor and not substantial to the system outside of the American River basin. These results were consistent for both Alternative 3 and Alternative 5.

Folsom Storage showed a less than 3% difference when averaged by water year types, but larger differences between 3-6% were seen in month to month comparisons. Although this is slightly higher than the differences seen elsewhere in the system, the new values do not change any of the conclusions presented in Chapters 5 through 21. Results at Folsom were similar for both Alternative 3 and Alternative 5.

American River flows showed the most difference with reductions in the drier water years. Alternative 3 shows more differences than Alternative 5 with differences as high as 6% in August of critical years. Although these results show some differences with inclusion of the contracts, these new values do not change any of the conclusions presented in Chapters 5 through 21.

American River temperatures below Nimbus Dam and at Watt Avenue for Alternative 5 showed a slight decrease in October of the drier years, but was within 5% when averaged by water year type. Although these results show some improvement in temperature with inclusion of the contracts, these new values do not change any of the conclusions presented in Chapters 5 through 21.

Alternative 3 did not show any differences above 1% with the inclusion of these contracts.

Temperature threshold exceedances in the American River show 1 to 2% differences in Alternatives 3 and 5 with and without inclusion of the EID and ECWA diversions; which is considered similar in this EIS.

These results confirm that inclusion of EID's Warren Act contract and ECWA's water service contract that result in increased diversions from Folsom Lake do not cause many changes greater than 5% in model results and hence do not change any of the conclusions presented in Chapters 5 through 21.

The following results for Alternatives 3 and 5 are presented:

- 5B.3.1 Trinity Storage
- 5B.3.2. Shasta Storage
- 5B.3.3. Oroville Storage
- 5B.3.4. Folsom Storage
- 5B.3.5. Folsom Elevation
- 5B.3.6. American River below Nimbus Flow
- 5B.3.7. Sacramento River at Freeport Flow
- 5B.3.8. Delta Outflow
- 5B.3.9. Jones and Banks Export Volume
- 5B.3.10. American River below Nimbus Temperature
- 5B.3.11. American River at Watt Temperature
- 5B.3.12. American River at Mouth Temperature
- 5B.3.13 Temperature Threshold Exceedances – American River

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Note: All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Note: All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Note: All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Note: All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Note: All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Note: All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Note: All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions.

Appendix 5C

Revised Second Basis of Comparison

A CalSim II model error was identified in New Melones operations in the Second Basis of Comparison simulation. The model error is due to use of an incorrect lookup table for one month and causes New Melones to release increased fishery flows in May. This appendix provides findings from an analysis of potential effects of this model error.

5C.1 Methodology

CalSim II model simulation representing the Second Basis of Comparison is rerun with the corrected New Melones Operations. The results are analyzed in two different sections. First, the Revised Second Basis of Comparison (SBC_R) is compared against the Second Basis of Comparison (SBC) to identify the extent of the effects of this model error. As presented in the next section, the results show that the effects of this model error is contained within the Stanislaus River. Secondly, the No Action Alternative (model results same as Alternative 2), Alternative 3, and Alternative 5 are compared against the Revised Second Basis of Comparison (SBC_R) and the Alternative 1 (same as Revised Second Basis of Comparison (SBC_R) is compared against the No Action Alternative. Results analysis in this appendix identifies between similar results (less than 5%) and results with noticeable changes (greater than 5%).

5C.2 Analysis

5C.2.1 Revised Second Basis of Comparison Compared to the Second Basis of Comparison

Model results comparing Revised Second Basis of Comparison (SBC_R) to the Second Basis of Comparison (SBC) presented in Section 5C.3.1 of this document show that the effect of the CalSim II model error is confined to Stanislaus River basin and do not cause any significant change in the overall system operations.

5C.2.2 Revised Second Basis of Comparison Compared to the Alternatives

This section provides analysis of effects of the identified CalSim II model error on the Stanislaus River Basin. The section is organized by alternative comparison and by each parameter that is likely to change.

The changes described in this section are due to increased storage in New Melones and decrease and change in patter of flows in Stanislaus River downstream of New Melones under the Revised Second Basis of Comparison (Revised Alternative 1) compared to the Second Basis of Comparison (Alternative 1).

5C.2.2.1 Revised Alternative 1 Compared to the No Action Alternative

5C.2.2.1.1 New Melones Storage

Alternative 1 showed increased storage in October and November of above normal years (up to 6%), October and April of below normal years (slightly above 5%), October of dry years (slightly above 5%), and October through June of critically dry years (up to 7%) when compared to the No Action Alternative. Revised Alternative 1 shows increased storage in all months of all water year types when compared to the No Action Alternative (from approximately 6 to 44%).

5C.2.2.1.2 New Melones Elevation

Alternative 1 showed similar elevation (within 5% change) in all months of all water year types when compared to the No Action Alternative. Revised Alternative 1 shows increased reservoir elevation in all months of all water year types (from approximately 8 to 13%) when compared to the No Action Alternative.

5C.2.2.1.3 Stanislaus River Flow below Goodwin

Flow patterns are different between the Second Basis of Comparison and the Revised Second Basis of Comparison and the changes between alternatives reflect the change in patterns.

- In wet years, Alternative 1 showed lower flows (from approximately 5 to 54%) in October, March, May, July, and August, higher flows (from approximately 6 to 103%) in November, December, January, June, and September), and similar flows (within 5% change) in February and April when compared to the No Action Alternative.

  Revised Alternative 1 shows lower flows (from approximately 8 to 57%) in October, March, and May, higher flows (from approximately 12 to 59%) in November, December, February, June, July, August, and September, and similar flows (within 5% change) in January and April when compared to the No Action Alternative.

- In above normal years, Alternative 1 showed lower flows (from approximately 19 to 58%) in October, March, and April months, higher flows (from approximately 7 to 54%) in November, December, January, February, May, and June), and similar flows (within 5% change) in July through September when compared to the No Action Alternative.

  Revised Alternative 1 shows lower flows (from approximately 7 to 65%) in October, March, April, and May, higher flows (from approximately 5 to 25%) in November, December, and February, and similar flows (within 5% change) in January and June through September when compared to the No Action Alternative.

- In below normal years, Alternative 1 showed lower flows (from approximately 14 to 61%) in October, March, and April months, higher flows (from approximately 5 to 66%) in November through February, May, June, and September), and similar flows (within 5% change) in July and August when compared to the No Action Alternative.

Revised Alternative 1 shows lower flows (from approximately 13 to 66%) in October, March, April, May, and June, higher flows (from approximately 19 to 54%) in November through February, and similar flows (within 5% change) in July through September when compared to the No Action Alternative.

- In dry years, Alternative 1 showed lower flows (approximately 61 and 44%) in October and April months, higher flows (from approximately 7 to 56%) in November through March, May, and June), and similar flows (within 5% change) in July through September when compared to the No Action Alternative.

  Revised Alternative 1 shows lower flows (from approximately 7 to 65%) in October, March, April, May, and June, higher flows (from approximately 8 to 36%) in November through February, and similar flows (within 5% change) in July through September when compared to the No Action Alternative.

- In critically dry years, Alternative 1 showed lower flows (approximately 66 and 37%) in October and April months, higher flows (from approximately 5 to 41%) in November through March, May, and July), and similar flows (within 5% change) in June, August, and September when compared to the No Action Alternative.

  Revised Alternative 1 shows lower flows (from approximately 10 to 74%) in October, January, March, April, and May, higher flows (from approximately 6 to 18%) in November, December, July, and August, and similar flows (within 5% change) in February, June, and September when compared to the No Action Alternative.

5C.2.2.1.4 Stanislaus River Flow at Mouth

- In wet years, Alternative 1 showed higher flows (from approximately 5 to 81%) in November, December, January, and June, lower flows (from approximately 7 to 44%) in October, March, May, and August, and similar flows (within 5% change) in February, April, July, and September when compared to the No Action Alternative.

  Revised Alternative 1 shows lower flows (from approximately 7 to 47%) in October, March, and May, higher flows (from approximately 11 to 46%) in November, December, February, June, July, August, and September, and similar flows (within 5% change) in January and April when compared to the No Action Alternative.

- In above normal years, Alternative 1 showed higher flows (from approximately 6 to 33%) in November through February, May, and June, lower flows (from approximately 15 to 46%) in October, March, and April, and similar flows (within 5% change) in July through September when compared to the No Action Alternative.

Revised Alternative 1 shows lower flows (from approximately 7 to 51%) in October, March, April, and May, higher flows (from approximately 14 to 15%) in November and December, and similar flows (within 5% change) in January, February, and June through September when compared to the No Action Alternative.

- In below normal years, Alternative 1 showed higher flows (from approximately 5 to 42%) in November through February and June, lower flows (from approximately 9 to 49%) in October, March, and April, and similar flows (within 5% change) in May, July, August, and September when compared to the No Action Alternative.

  Revised Alternative 1 shows lower flows (from approximately 9 to 52%) in October and March through June, higher flows (from approximately 13 to 36%) in November through February, and similar flows (within 5% change) in July through September when compared to the No Action Alternative.

- In dry years, Alternative 1 showed higher flows (approximately 14 and 38%) in November through March and May, lower flows (approximately 47% and 42%) in October and April, and similar flows (within 5% change) in June through September when compared to the No Action Alternative.

  Revised Alternative 1 shows lower flows (from approximately 5 to 50%) in October, April, May, and June, higher flows (from approximately 5 to 25%) in November through February, and similar flows (within 5% change) in March and July through September when compared to the No Action Alternative.

- In critically dry years, Alternative 1 showed higher flows (approximately 8 and 30%) in November through March and May, lower flows (approximately 54% and 37%) in October and April, and similar flows (within 5% change) in June through September when compared to the No Action Alternative.

  Revised Alternative 1 shows lower flows (from approximately 7 to 60%) in October, January, March, April, and May, higher flows (from approximately 7 to 14%) in November, December, and July, and similar flows (within 5% change) in February, June, August, and September when compared to the No Action Alternative.

5C.2.2.1.5 Stanislaus River Water Temperature below Goodwin Dam

Alternative 1 showed similar temperatures at Goodwin except for higher temperatures in November of critically dry years (average increase of 0.7 °F) and lower temperatures in June and September of critically dry years (up to 1.3 °F) when compared to the No Action Alternative. Difference in temperature threshold exceedances were all within 5% (varied from 2% less to 3% more exceedances in January through May).

Revised Alternative 1 shows similar temperatures at Goodwin except for lower temperatures (from approximately 0.5 to 1.1 °F) in October and September of above normal years, August and September of dry years, and October, June, July, and September of critically dry years. Difference in temperature threshold exceedances are mostly within 5% (3% to 4% more in January through April) and 5% more in May.

In general, Revised Alternative 1 shows higher temperatures for Steelhead smolts in Stanislaus when compared to the No Action Alternative.

5C.2.2.1.6 Stanislaus River Water Temperature at Orange Blossom Bridge

Alternative 1 showed similar temperatures at Orange Blossom Bridge except for higher temperatures in October of wet years, October and April of above normal, below normal, dry, and critically dry years (from approximately 0.6 to 1.9°F) and lower temperatures in June of wet years, March and June of below normal years, and May and July of critically dry years (approximately from 0.6 to 0.7°F) when compared to the No Action Alternative. Difference in temperature threshold exceedances showed 28% more exceedance in October (adult migration threshold), 6% more exceedance in April (smoltification threshold), 17% more exceedance in April (spawning threshold), 8% less exceedance in May (smoltification threshold), and 5% less in November (adult migration threshold) and March and May (spawning threshold).

Revised Alternative 1 shows similar temperatures at Orange Blossom Bridge except for higher temperatures (from approximately 0.5 to 2.1°F) in October and March of wet years, October and April of above normal years, October and June of below normal years, October, April, and May of dry years, and October, March, and April of critically dry years; and lower temperatures (from approximately 0.5 to 1.2°F) in September of wet years, August and September of dry years, and July, August, and September of critically dry years when compared to the No Action Alternative. Difference in temperature threshold exceedances showed 29% more exceedance in October (adult migration threshold), 10% more exceedance in March (smoltification threshold), 5% more exceedance in April (smoltification threshold), 14% more exceedance in March and April (spawning threshold), 9% more exceedance in May (spawning threshold), and 6% less in November (adult migration threshold) , 8% less in August (rearing threshold).

In general, Revised Alternative 1 shows higher temperatures for Steelhead lifestages in Stanislaus when compared to the No Action Alternative.

5C.2.2.1.7 CVP Stanislaus Deliveries

Under Alternative 1, annual CVP service contract deliveries were increased by 4.5 TAF and annual water rights deliveries were increased by 2.3 TAF when compared to the No Action Alternative.

Under Revised Alternative 1, annual CVP service contract deliveries are increased by 14.8 TAF and annual water rights deliveries are increased by 6.2 TAF when compared to the No Action Alternative.

In general, Revised Alternative 1 shows increased CVP Stanislaus deliveries when compared to the No Action Alternative.

5C.2.2.1.8 CVP Power Generation

Long-term average power capacity and energy generation under Alternative 1 were 3% and 1% higher than the No Action Alternative. The energy use at the CVP pumping facilities was 16% higher than the No Action Alternative; which resulted in a 4% lower net generation.

In dry and critical years, long-term average power capacity and energy generation under Alternative 1 were 6% and 3% higher than the No Action Alternative. The energy use at the CVP pumping facilities was 11% higher than the No Action Alternative; which resulted in similar net generation.

Under the revised Alternative 1, long-term average power capacity and energy generation are 4% and 1% higher than the No Action Alternative. The energy use at the CVP pumping facilities is 15% higher than the No Action Alternative; which results in a 3% lower net generation.

In dry and critical years, long-term average power capacity and energy generation under Revised Alternative 1 are 10% and 5% higher than the No Action Alternative. The energy use at the CVP pumping facilities is 15% higher than the No Action Alternative; which results 3% higher net generation.

5C.2.2.1.9 New Melones Large Mouth Bass Nest Survival Percentage

Monthly pattern of reservoir storage is different between the Second Basis of Comparison and the Revised Second Basis of Comparison and the changes between alternatives reflect the change in this pattern.

- In wet years, Alternative 1 showed lower percentage of nest survival in June (approximately 13%), higher percentage of nest survival (48% and 11%) in October and April when compared to the No Action Alternative.

  The Revised Alternative 1 shows lower percentage of nest survival (from approximately 7 to 14%) in July through September, higher percentage of nest survival (approximately 49 and 10%) in October and April when compared to the No Action Alternative.

- In above normal years, Alternative 1 showed lower percentage of nest survival in June (approximately 5%), higher percentage of nest survival (29% and 9%) in October and April when compared to the No Action Alternative.

  The Revised Alternative 1 shows higher percentage of nest survival (from approximately 6 to 31%) in October, April, July, and August when compared to the No Action Alternative.

- In below normal years, Alternative 1 showed lower percentage of nest survival (approximately 9%) in June; and higher percentage of nest survival (from approximately 5% and 55%) in October, March, April, and July when compared to the No Action Alternative.

The Revised Alternative 1 shows higher percentage of nest survival (from approximately 5 to 59%) in October and March through August when compared to the No Action Alternative.

- In dry years, Alternative 1 showed lower percentage of nest survival (approximately 9%) in May; and higher percentage of nest survival (from approximately 12% and 44%) in October, April, and July when compared to the No Action Alternative.

  The Revised Alternative 1 shows higher percentage of nest survival (from approximately 7 to 51%) in October and April through September when compared to the No Action Alternative.

- In critically dry years, Alternative 1 showed lower percentage of nest survival (from approximately 12 to 23%) in May, July, and August; and higher percentage of nest survival (from approximately 7% and 53%) in October, April, and September when compared to the No Action Alternative.

  The Revised Alternative 1 shows lower percentage of nest survival (from approximately 7 to 45%) in June through August; and higher percentage of nest survival (from approximately 34 to 53%) in October, April, and May when compared to the No Action Alternative.

In general, Revised Alternative 1 shows higher percentage of nest survival for the New Melones Large Mouth Bass when compared to the No Action Alternative.

5C.2.2.1.10 New Melones Small Mouth Bass Nest Survival Percentage

Monthly pattern of reservoir storage is different between the Second Basis of Comparison and the Revised Second Basis of Comparison and the changes between alternatives reflect the change in this pattern.

- In wet years, Alternative 1 showed lower percentage of nest survival in June (approximately 15%), higher percentage of nest survival (59% and 9%) in October and April when compared to the No Action Alternative.

  The Revised Alternative 1 shows lower percentage of nest survival (from approximately 6 to 14%) in July through September, higher percentage of nest survival (approximately 61 and 9%) in October and April when compared to the No Action Alternative.

- In above normal years, Alternative 1 showed higher percentage of nest survival (41% and 10%) in October and April when compared to the No Action Alternative.

  The Revised Alternative 1 shows higher percentage of nest survival (from approximately 8 to 44%) in October, April, July, and August when compared to the No Action Alternative.

- In below normal years, Alternative 1 showed lower percentage of nest survival (approximately 10 and 14%) in June and July; and higher percentage of nest survival (from approximately 6% to 57%) in October, March, and April when compared to the No Action Alternative.

The Revised Alternative 1 shows higher percentage of nest survival (from approximately 5 to 61%) in October and March through August when compared to the No Action Alternative.

- In dry years, Alternative 1 showed lower percentage of nest survival (approximately 8% and 5%) in May and November; and higher percentage of nest survival (from approximately 11% to 52%) in October, April, and July when compared to the No Action Alternative.

  The Revised Alternative 1 shows higher percentage of nest survival (from approximately 6 to 59%) in October and April through September when compared to the No Action Alternative.

- In critically dry years, Alternative 1 showed lower percentage of nest survival (from approximately 5 to 22%) in November, May, July, and August; and higher percentage of nest survival (from approximately 6% to 58%) in October, April, and September when compared to the No Action Alternative.

  The Revised Alternative 1 shows lower percentage of nest survival (from approximately 7 to 50%) in June through September; and higher percentage of nest survival (from approximately 44 to 69%) in October, and April when compared to the No Action Alternative.

In general, Revised Alternative 1 shows higher percentage of nest survival for the New Melones Small Mouth Bass when compared to the No Action Alternative except for the summer months of critically dry years.

5C.2.2.1.11 New Melones Spotted Bass Nest Survival Percentage

Monthly pattern of reservoir storage is different between the Second Basis of Comparison and the Revised Second Basis of Comparison and the changes between alternatives reflect the change in this pattern.

- In wet years, Alternative 1 showed higher percentage of nest survival (from approximately 6% to 13%) in October, April, July and August when compared to the No Action Alternative.

  The Revised Alternative 1 shows higher percentage of nest survival (from approximately 11% to 13%) in October, April, and July when compared to the No Action Alternative.

- In above normal years, Alternative 1 showed similar percentage of nest survival when compared to the No Action Alternative.

  The Revised Alternative 1 shows higher percentage of nest survival (from approximately 6% to 8%) in July and August when compared to the No Action Alternative.

- In below normal years, Alternative 1 showed higher percentage of nest survival (from approximately 5% to 11%) in October, April, and July when compared to the No Action Alternative.

The Revised Alternative 1 shows higher percentage of nest survival (from approximately 6 to 10%) in October, April, and August when compared to the No Action Alternative.

- In dry years, Alternative 1 showed lower percentage of nest survival (approximately 5%) in May when compared to the No Action Alternative.

  The Revised Alternative 1 shows higher percentage of nest survival (from approximately 5% to 13%) in May, July and August when compared to the No Action Alternative.

- In critically dry years, Alternative 1 showed lower percentage of nest survival (from approximately 10% to 17%) in May and July; and higher percentage of nest survival (approximately 20% to 9%) in April and June when compared to the No Action Alternative.

  The Revised Alternative 1 shows lower percentage of nest survival (approximately 7%) in July; and higher percentage of nest survival (from approximately 5% to 21%) in April through June, and September when compared to the No Action Alternative.

In general, Revised Alternative 1 shows higher percentage of nest survival for the New Melones Spotted Bass when compared to the No Action Alternative.

5C.2.2.2 No Action Alternative Compared to the Revised Second Basis of Comparison

5C.2.2.2.1 New Melones Storage

No Action Alternative showed decreased storage in October and November of above normal years (up to 6%), October and April of below normal years (slightly above 5%), October of dry years (slightly above 5%), and October through June of critically dry years (up to 7%) when compared to the Second Basis of Comparison. When compared to the Revised Second Basis of Comparison, the No Action Alternative shows decreased storage (from approximately 6 to 44%) in all months of all water year types.

5C.2.2.2.2 New Melones Elevation

No Action Alternative showed similar reservoir elevation (within 5% change) in all months of all water year types when compared to the Second Basis of Comparison. When compared to the Revised Second Basis of Comparison, the No Action Alternative shows decreased reservoir elevation in all months of all water year types (from approximately 8 to 13%).

5C.2.2.2.3 Stanislaus River Flow below Goodwin

Flow patterns are different between the Second Basis of Comparison and the Revised Second Basis of Comparison and the changes between alternatives reflect the change in patterns.

- In wet years, the No Action Alternative showed lower flows (from approximately 5 to 51%) in November, December, January, June, and

September months, higher flows (from approximately 10 to 117%) in October, March, May, July, and August, and similar flows (within 5% change) in February and April when compared to the Second Basis of Comparison.

When compared to the Revised Second Basis of Comparison, the No Action Alternative shows lower flows (from approximately 11 to 37%) in November, December, February, June, July, August, and September, higher flows (from approximately 9 to 134%) in October, March, and May, and similar flows (within 5% change) in January and April when compared to the No Action Alternative.

- In above normal years, the No Action Alternative showed lower flows (from approximately 6 to 35%) in November, December, January, February, May, and June months, higher flows (from approximately 23 to 137%) in October, March, and April, and similar flows (within 5% change) in July through September when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, the No Action Alternative shows lower flows (from approximately 5 to 20%) in November, December, and February, higher flows (from approximately 8 to 188%) in October, March, April, and May, and similar flows (within 5% change) in January and June through September when compared to the No Action Alternative.

- In below normal years, the No Action Alternative showed lower flows (from approximately 5 to 40%) in November through February, May, June, and September) months, higher flows (from approximately 16 to 157%) in October, March, and April, and similar flows (within 5% change) in July and August when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, the No Action Alternative shows lower flows (from approximately 16 to 35%) in November through February, higher flows (from approximately 15 to 192%) in October, March, April, May, and June, and similar flows (within 5% change) in July through September.

- In dry years, the No Action Alternative showed lower flows (approximately 6 to 36%) in November through March, May, and June, higher flows (from approximately 154 and 77%) in October and April months, and similar flows (within 5% change) in July through September when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, the No Action Alternative shows lower flows (from approximately 8 to 26%) in November through February, higher flows (from approximately 8 to 189%) in October, March, April, May, and June, and similar flows (within 5% change) in July through September.

- In critically dry years, the No Action Alternative showed lower flows (approximately 9 to 29%) in November through March, and May, higher flows (approximately 197 and 60%) in October and April months, and similar flows (within 5% change) in June through September when compared to the Second Basis of Comparison.

When compared to the Revised Second Basis of Comparison, the No Action Alternative shows lower flows (from approximately 6 to 15%) in November, December, July, and August, higher flows (from approximately 12 to 277%) in October, January, March, April, and May, and similar flows (within 5% change) in February, June, and September.

5C.2.2.2.4 Stanislaus River Flow at Mouth

Flow patterns are different between the Second Basis of Comparison and the Revised Second Basis of Comparison and the changes between alternatives reflect the change in patterns.

- In wet years, No Action Alternative showed lower flows (from approximately 5 to 45%) in November, December, January, and June, higher flows (from approximately 8 to 79%) in October, March, May, and August, and similar flows (within 5% change) in February, April, July, and September when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, No Action Alternative shows lower flows (from approximately 10 to 32%) in November, December, February, and June through September, higher flows (from approximately 8 to 88%) in October, March, and May, and similar flows (within 5% change) in January and April when compared to No Action Alternative.

- In above normal years, No Action Alternative showed lower flows (from approximately 6 to 25%) in November through February and May and June, higher flows (from approximately 18 to 84%) in October, March, and April, and similar flows (within 5% change) in July, August, and September when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, No Action Alternative shows lower flows (approximately 13 and 12%) in November and December, higher flows (from approximately 7 to 106%) in October, March, April, and May, and similar flows (within 5% change) in January, February, and June through September when compared to the No Action Alternative.

- In below normal years, No Action Alternative showed lower flows (from approximately 12 to 29%) in November through February and June, higher flows (from approximately 10 to 94%) in October, March, and April, and similar flows (within 5% change) in May, and July through September when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, No Action Alternative shows lower flows (from approximately 11 to 26%) in November through February, higher flows (from approximately 10 to 109%) in October and March through June, and similar flows (within 5% change) in July through September.

- In dry years, No Action Alternative showed lower flows (approximately 5 to 28%) in, November through March and May and June, higher flows (approximately 88% and 73%) in October and April, and similar flows (within 5% change) in June through September when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, No Action Alternative shows lower flows (approximately 5 to 20%) in November through February, higher flows (from approximately 6 to 102%) in October, April, May, and June, and similar flows (within 5% change) in March and July through September.

- In critically dry years, No Action Alternative showed lower flows (approximately 7 to 23%) in November through March, and May, higher flows (approximately 118 and 58%) in October and April and similar flows (within 5% change) in June through September when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, No Action Alternative shows lower flows (from approximately 6 to 12%) in November, December, and July, higher flows (from approximately 27 to 149%) in October, January, March, April, May, and July, and similar flows (within 5% change) in February, June, August, and September.

5C.2.2.2.5 Stanislaus River Water Temperature below Goodwin Dam

No Action Alternative showed similar temperatures at Goodwin except for higher temperatures in June and September critically dry years (average increase of 0.8 and 1.3°F) and lower temperatures in November of critically dry years (up to 0.7°F) when compared to the Second Basis of Comparison. Difference in temperature threshold exceedances were all within 5% (varied from 3% less to 2% more exceedances in January through May).

No Action Alternative shows similar temperatures at Goodwin except for higher temperatures (from approximately 0.5 to 1.1 °F) in October and September of above normal years, August and September of dry years, and October, June, July, and September of critically dry years when compared to the Revised Second Basis of Comparison. Difference in temperature threshold exceedances are mostly within 5% (2% to 4% less in January through April) and 5% less in May.

In general, No Action Alternative shows lower temperatures for Steelhead smolts in Stanislaus when compared to the Revised Second Basis of Comparison.

5C.2.2.2.6 Stanislaus River Water Temperature at Orange Blossom Bridge

No Action Alternative showed similar temperatures at Orange Blossom Bridge except for lower temperatures in October of wet years, October and April of above normal, below normal, dry, and critically dry years (from approximately 0.6 to 1.9°F) and higher temperatures in June of wet years, March and June of below normal years, and May and July of critically dry years (approximately from 0.6 to 0.7°F) when compared to the Second Basis of Comparison. Difference in temperature threshold exceedances showed 28% less exceedance in October (adult migration threshold), 6% less exceedance in April (smoltification threshold), 17% less exceedance in April (spawning threshold), 8% more exceedance in May (smoltification threshold), and 5% more in November (adult migration threshold) and March and May (spawning threshold).

No Action Alternative shows similar temperatures at Orange Blossom Bridge except for lower temperatures (from approximately 0.5 to 2.1°F) in October and March of wet years, October and April of above normal years, October and June of below normal years, October, April, and May of dry years, and October, March, and April of critically dry years; and higher temperatures (from approximately 0.5 to 1.2°F) in September of wet years, August and September of dry years, and July, August, and September of critically dry years when compared to the Revised Second Basis of Comparison. Difference in temperature threshold exceedances showed 29% less exceedance in October (adult migration threshold), 10% less exceedance in March (smoltification threshold), 5% less exceedance in April (smoltification threshold), 14% less exceedance in March and April (spawning threshold), 9% less exceedance in May (spawning threshold), and 6% more in November (adult migration threshold) , 8% more in August (rearing threshold).

In general, No Action Alternative shows lower temperatures for Steelhead lifestages in Stanislaus when compared to the Revised Second Basis of Comparison.

5C.2.2.2.7 CVP Stanislaus Deliveries

Under the No Action Alternative, annual CVP service contract deliveries were decreased by 4.5 TAF and annual water rights deliveries were decreased by 2.3 TAF when compared to the Second Basis of Comparison.

When compared to the Revised Second Basis of Comparison, annual CVP service contract deliveries are decreased by 14.8 TAF and annual water rights deliveries are decreased by 6.2 TAF under the No Action Alternative.

In general, the No Action Alternative shows decreased CVP Stanislaus deliveries when compared to the Revised Second Basis of Comparison.

5C.2.2.2.8 CVP Power Generation

Long-term average power capacity and energy generation under the No Action Alternative were 3% and 1% lower than the Second Basis of Comparison. The energy use at the CVP pumping facilities was 14% lower than the Second Basis of Comparison; which resulted in a 4% higher net generation.

In dry and critical years, long-term average power capacity and energy generation under the No Action Alternative were 6% and 3% lower than the Second Basis of Comparison. The energy use at the CVP pumping facilities was 10% lower than the Second Basis of Comparison; which resulted in similar net generation.

When compares to the Revised Second Basis of Comparison, long-term average power capacity and energy generation are 4% and 1% lower under the No Action

Alternative. The energy use at the CVP pumping facilities is 13% lower than the Revised Second Basis of Comparison; which results in a 3% higher net generation.

In dry and critical years, long-term average power capacity and energy generation under the No Action Alternative are 9% and 4% lower than the Revised Second Basis of Comparison. The energy use at the CVP pumping facilities is 9% lower than the Revised Second Basis of Comparison; which results 3% lower net generation.

5C.2.2.2.9 New Melones Large Mouth Bass Nest Survival Percentage

Monthly pattern of reservoir storage is different between the Second Basis of Comparison and the Revised Second Basis of Comparison and the changes between alternatives reflect the change in this pattern.

- In wet years, the No Action Alternative showed higher percentage of nest survival in June (approximately 16%); and lower percentage of nest survival (32% and 10%) in October and April when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, the No Action Alternative shows higher percentage of nest survival (from approximately 8 to 16%) in July through September; and lower percentage of nest survival (approximately 33 and 9%) in October and April.

- In above normal years, the No Action Alternative showed higher percentage of nest survival in June (approximately 5%); and lower percentage of nest survival (22% and 8%) in October and April when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, the No Action Alternative shows lower percentage of nest survival (from approximately 6 to 23%) in October, April, July, and August.

- In below normal years, the No Action Alternative showed higher percentage of nest survival (approximately 10%) in June; and lower percentage of nest survival (from approximately 5% and 35%) in October, March, April, and July when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, the No Action Alternative shows lower percentage of nest survival (from approximately 5 to 37%) in October and March through August.

- In dry years, the No Action Alternative showed higher percentage of nest survival (approximately 10%) in May; and lower percentage of nest survival (from approximately 11% and 31%) in October, April, May, July and August when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, the No Action Alternative shows lower percentage of nest survival (from approximately 7 to 34%) in October and April through September.

- In critically dry years, the No Action Alternative showed higher percentage of nest survival (from approximately 13 to 30%) in May, July, and August; and lower percentage of nest survival (from approximately 6% and 35%) in October, April, and September when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, the No Action Alternative shows higher percentage of nest survival (from approximately 7 to 81%) in June through August; and lower percentage of nest survival (from approximately 25 to 35%) in October, April, and May.

In general, the No Action Alternative shows lower percentage of nest survival for the New Melones Large Mouth Bass when compared to the Revised Second Basis of Comparison.

5C.2.2.2.10 New Melones Small Mouth Bass Nest Survival Percentage

Monthly pattern of reservoir storage is different between the Second Basis of Comparison and the Revised Second Basis of Comparison and the changes between alternatives reflect the change in this pattern.

- In wet years, the No Action Alternative showed higher percentage of nest survival in June (approximately 17%); and lower percentage of nest survival (37% and 9%) in October and April when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, the No Action Alternative shows higher percentage of nest survival (from approximately 8 to 16%) in July through September; and lower percentage of nest survival (approximately 38 and 8%) in October and April.

- In above normal years, the No Action Alternative showed lower percentage of nest survival (29% and 9%) in October and April when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, the No Action Alternative shows lower percentage of nest survival (from approximately 7 to 30%) in October, April, July, and August.

- In below normal years, the No Action Alternative showed higher percentage of nest survival (approximately 11%) in June; and lower percentage of nest survival (from approximately 6% to 37%) in October, March, April, and July when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, the No Action Alternative shows lower percentage of nest survival (from approximately 6 to 38%) in October, March through May, July, and August.

- In dry years, the No Action Alternative showed higher percentage of nest survival (approximately 5% and 8%) in November and May; and lower percentage of nest survival (from approximately 10% to 34%) in October, April, and July when compared to the Second Basis of Comparison.

When compared to the Revised Second Basis of Comparison, the No Action Alternative shows lower percentage of nest survival (from approximately 6 to 37%) in October and April through.

- In critically dry years, the No Action Alternative showed higher percentage of nest survival (from approximately 5 to 28%) in November, May, July, and August; and lower percentage of nest survival (from approximately 6% to 37%) in October, April, and September when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, the No Action Alternative shows higher percentage of nest survival (from approximately 8 to 100%) in June through September; and lower percentage of nest survival (from approximately 23 to 41%) in October, April, and May.

In general, the No Action Alternative shows lower percentage of nest survival for the New Melones Small Mouth Bass when compared to the Revised Second Basis of Comparison except for the summer months of critically dry years.

5C.2.2.2.11 New Melones Spotted Bass Nest Survival Percentage

Monthly pattern of reservoir storage is different between the Second Basis of Comparison and the Revised Second Basis of Comparison and the changes between alternatives reflect the change in this pattern.

- In wet years, the No Action Alternative showed lower percentage of nest survival (from approximately 5% to 12%) in October, April, July, and August when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, the No Action Alternative shows lower percentage of nest survival (from approximately 10% to 12%) in October, April, and July.

- In above normal years, the No Action Alternative showed similar percentage of nest survival when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, the No Action Alternative shows lower percentage of nest survival (from approximately 5 to 7%) in July and August.

- In below normal years, the No Action Alternative showed lower percentage of nest survival (from approximately 5% to 10%) in October, April, and July when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, the No Action Alternative shows lower percentage of nest survival (from approximately 5 to 9%) in October, April, and August.

- In dry years, the No Action Alternative showed higher percentage of nest survival (approximately 5%) in May when compared to the Second Basis of Comparison.

When compared to the Revised Second Basis of Comparison, the No Action Alternative shows lower percentage of nest survival (from approximately 8% to 12%) in July and August.

- In critically dry years, the No Action Alternative showed higher percentage of nest survival (from approximately 11% to 21%) in May and July; and lower percentage of nest survival (from approximately 8% to 17%) in April and June when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, the No Action Alternative shows higher percentage of nest survival (from approximately 5% to 8%) in July and August; and lower percentage of nest survival (from approximately 5% to 18%) in April through June, and September.

In general, the No Action Alternative shows lower percentage of nest survival for the New Melones Spotted Bass when compared to the Revised Second Basis of Comparison.

5C.2.2.3 Alternative 3 Compared to the Revised Second Basis of Comparison

5C.2.2.3.1 New Melones Storage

Alternative 3 showed increased storage (from approximately 8 to 32%) almost all months of all water year types except for February through May of wet years (less than 5% increase). When compared to the Revised Second Basis of Comparison, Alternative 3 shows similar storage in all months of all water year types (changes within 5%).

5C.2.2.3.2 New Melones Elevation

Alternative 3 showed similar reservoir elevation in all months of all water year types (changes within 5%). When compared to the Revised Second Basis of Comparison, Alternative 3 still shows similar reservoir elevation in all months of all water year types (changes within 5%).

5C.2.2.3.3 Stanislaus River Flow below Goodwin

Flow patterns are different between the Second Basis of Comparison and the Revised Second Basis of Comparison and the changes between alternatives reflect the change in patterns.

- In wet years, Alternative 3 showed lower flows (from approximately 40 to 45%) in May and June, higher flows (from approximately 9 to 67%) in December, February, March, July, August, and September, and similar flows (within 5% change) in October, November, January, and April when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, Alternative 3 shows lower flows (from approximately 17 to 30%) in May and June, higher flows (from approximately 5 to 19%) in October, December, February, and

July, and similar flows (within 5% change) in November, January, March, April, August, and September when compared to Alternative 3.

- In above normal years, Alternative 3 showed lower flows (from approximately 14 to 79%) in November, May, June, and July months, higher flows (from approximately 5 to 23%) in October, March, and April, and similar flows (within 5% change) in December, January, February, August, and September when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, Alternative 3 shows lower flows (from approximately 10 to 74%) in May through July, higher flows (from approximately 6 to 30%) in October through January, March, and April, and similar flows (within 5% change) in February, August, and September when compared to Alternative 3.

- In below normal years, Alternative 3 showed lower flows (from approximately 7 to 58%) in October, November, December, March, May, June, and September, higher flows (from approximately 18 to 32%) in January, February, and April, and similar flows (within 5% change) in August and September when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, Alternative 3 shows lower flows (from approximately 7 to 38%) in November, December, March, May, and June, higher flows (from approximately 6 to 44%) in October and January, and similar flows (within 5% change) in February, April, July, August, and September.

- In dry years, Alternative 3 showed lower flows (approximately 5 to 36%) in, November through March, May, and June, higher flows (approximately 40%) in April, and similar flows (within 5% change) in October and July through September when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, Alternative 3 shows lower flows (approximately 26%) in June, higher flows (from approximately 8 to 19%) in October, March, and April, and similar flows (within 5% change) in November through February, May, and July through September.

- In critically dry years, Alternative 3 showed lower flows (approximately 8 to 31%) in November through March and May through July, higher flows (approximately 5 to 47%) in October, April, and September, and similar flows (within 5% change) in August when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, Alternative 3 shows lower flows (from approximately 6 to 19%) in January, February, June, and July, higher flows (from approximately 9 to 36%) in October, November, December, March, April, and May, and similar flows (within 5% change) in August and September.

5C.2.2.3.4 Stanislaus River Flow at Mouth

- In wet years, Alternative 3 showed lower flows (from approximately 12 to 39%) in May and June, higher flows (from approximately 8 to 58%) in December, February, March, July, August, and September, and similar flows (within 5% change) in October, November, January, and April when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, Alternative 3 shows lower flows (from approximately 15 to 25%) in May and June, higher flows (from approximately 6 to 17%) in October, December, February, and July, and similar flows (within 5% change) in November, January, March, April, August, and September when compared to Alternative 3.

- In above normal years, Alternative 3 showed lower flows (from approximately 10 to 63%) in November, May, June, and July, higher flows (approximately 19%) in April, and similar flows (within 5% change) in October, December, January, February, March, August, and September when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, Alternative 3 shows lower flows (from approximately 9 to 57%) in May through July, higher flows (from approximately 8 to 17%) in October, December, March, and April, and similar flows (within 5% change) in November, February, August, and September when compared to Alternative 3.

- In below normal years, Alternative 3 showed lower flows (from approximately 9 to 44%) in November, December, March, May, June, and September, higher flows (from approximately 16 to 23%) in January, February, and April, and similar flows (within 5% change) in July, August, and September when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, Alternative 3 shows lower flows (from approximately 7 to 26%) in November, December, May, and June, higher flows (approximately 30%) in January, and similar flows (within 5% change) in October, February, March, April, July, August, and September.

- In dry years, Alternative 3 showed lower flows (approximately 9 to 26%) in, November December, January, March, May, and June, higher flows (approximately 38%) in April, and similar flows (within 5% change) in October, February, and July through September when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, Alternative 3 shows lower flows (approximately 18%) in June, higher flows (from approximately 9 to 18%) in October and April, and similar flows (within 5% change) in November through March, May, and July through September.

- In critically dry years, Alternative 3 showed lower flows (approximately 6 to 28%) in November through March and May through July, higher flows (approximately 45%) in April, and similar flows (within 5% change) in October, August, and September when compared to the Second Basis of Comparison.

When compared to the Revised Second Basis of Comparison, Alternative 3 shows lower flows (from approximately 10 to 15%) in February, June, and July, higher flows (from approximately 6 to 32%) in October, November, December, March, April, and May, and similar flows (within 5% change) in January, August, and September.

5C.2.2.3.5 Stanislaus River Water Temperature below Goodwin Dam

Alternative 3 showed similar temperatures at Goodwin except for lower temperatures in October of above normal years, October and November of below normal years, September of dry years, and October, November, May, and July through September of critically dry years (varied from 0.5 to 1.5°F)when compared to the Second Basis of Comparison. Difference in temperature threshold exceedances were all within 5% (varied from 3% less to 3% more exceedances in March through May).

Alternative 3 shows similar temperatures at Goodwin except for higher temperatures in June (approximately 0.6°F) and lower temperatures in September (approximately 0.6°F) of critically dry years when compared to the Revised Second Basis of Comparison. Difference in temperature threshold exceedances are mostly within 5% (1% to 4% less in January, February, and April) and 5% less in May.

In general, Alternative 3 shows lower temperatures for Steelhead smolts in Stanislaus when compared to the Revised Second Basis of Comparison.

5C.2.2.3.6 Stanislaus River Water Temperature at Orange Blossom Bridge

Alternative 3 showed similar temperatures at Orange Blossom Bridge except for higher temperatures in June of wet years, May through July of above normal, March and June of below normal years, March, May, and June of dry years, and February and June of critically dry years (from approximately 0.5 to 4.3°F) and lower temperatures in August wet years, April of below normal and dry years, and October, November, April, August, and September of critically dry years (approximately from 0.5 to 1.2°F) when compared to the Second Basis of Comparison. Difference in temperature threshold exceedances showed 16% less exceedance in April (spawning threshold), 7% more exceedance in May (smoltification threshold), and 8% more in March (spawning threshold) and 10% more in May (spawning threshold).

Alternative 3 showed similar temperatures at Orange Blossom Bridge except for higher temperatures in June of wet years, June and July of above normal, June of below normal and dry years, and June and July of critically dry years (from approximately 0.6 to 5.1°F) and lower temperatures in October of wet and above normal years, October and April of dry years, and October, March, April, and September of critically dry years (approximately from 0.5 to 1.2°F) when compared to the Revised Second Basis of Comparison. Difference in temperature threshold exceedances showed 10% less exceedance in March (smoltification threshold), 5% less exceedance in May (smoltification threshold), 11 and 12% less in March and April (spawning threshold), and 5% more exceedance in July (rearing threshold).

In general, Alternative 3 shows lower temperatures for Steelhead lifestages in Stanislaus when compared to the Revised Second Basis of Comparison.

5C.2.2.3.7 CVP Stanislaus Deliveries

Under Alternative 3, annual CVP service contract deliveries were increased by 15.1 TAF and annual water rights deliveries were increased by 2.6 TAF when compared to the Second Basis of Comparison.

When compared to the Revised Second Basis of Comparison, annual CVP service contract deliveries are increased by 4.8 TAF; however annual water rights deliveries are decreased by 1.2 TAF under Alternative 3.

In general, the Alternative 3 shows increased Stanislaus deliveries to CVP service contractors and similar (slightly decreased) deliveries to water right holders when compared to the Revised Second Basis of Comparison.

5C.2.2.3.8 CVP Power Generation

Under Alternative 3, long-term average power capacity was 1% higher and energy generation was similar when compared to the Second Basis of Comparison. The energy use at the CVP pumping facilities was 4% lower than the Second Basis of Comparison; which resulted in a 1% higher net generation.

In dry and critical years, long-term average power capacity and energy generation under Alternative 3 were both 1% lower than the Second Basis of Comparison. The energy use at the CVP pumping facilities was 8% lower than the Second Basis of Comparison; which resulted in 4% higher net generation.

When compared to the Revised Second Basis of Comparison, long-term average power capacity and energy generation are both 1% lower under Alternative 3. The energy use at the CVP pumping facilities is 4% lower than the Revised Second Basis of Comparison; which results in similar net generation.

In dry and critical years, long-term average power capacity and energy generation under Alternative 3 are 3% and 1% lower than the Revised Second Basis of Comparison. The energy use at the CVP pumping facilities is 7% lower than the Revised Second Basis of Comparison; which results 1% higher net generation.

5C.2.2.3.9 New Melones Large Mouth Bass Nest Survival Percentage

Monthly pattern of reservoir storage is different between the Second Basis of Comparison and the Revised Second Basis of Comparison and the changes between alternatives reflect the change in this pattern.

- In wet years, Alternative 3 showed higher percentage of nest survival in July through September (from approximately 5% and 45%); and lower percentage of nest survival (7% and 6%) in May and June when compared to the Second Basis of Comparison.

When compared to the Revised Second Basis of Comparison, Alternative 3 shows higher percentage of nest survival (from approximately 12 to 62%) in July through September; and lower percentage of nest survival (approximately 7 and 20%) in May and June.

- In above normal years, Alternative 3 showed higher percentage of nest survival in June through August (from approximately 10% to 38 when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, Alternative 3 shows lower percentage of nest survival in June (approximately 6 %) in August; and higher percentage of nest survival (approximately 24% and 17%) in June and July.

- In below normal years, Alternative 3 showed higher percentage of nest survival (approximately 15%) in May and June; and lower percentage of nest survival (from approximately 9% and 21%) in December, April, and July when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, Alternative 3 shows lower percentage of nest survival (from approximately 7 to 18%) in December, April, July, and August.

- In dry years, Alternative 3 showed higher percentage of nest survival (from approximately 5% to 21%) in February, June, and August; and lower percentage of nest survival (approximately 20% and 17%) in April and September when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, Alternative 3 shows lower percentage of nest survival (from approximately 7 to 23%) in October, April, May, July, and September.

- In critically dry years, Alternative 3 showed higher percentage of nest survival (approximately 7% to 56%) in February and May; and lower percentage of nest survival (from approximately 5% and 37%) in, April, and June through September when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, Alternative 3 shows higher percentage of nest survival (approximately 25%) in August; and lower percentage of nest survival (from approximately 10 to 28%) in April, May, July, and September.

In general, the Alternative 3 shows lower percentage of nest survival for the New Melones Large Mouth Bass when compared to the Revised Second Basis of Comparison except for summer months of wet years.

5C.2.2.3.10 New Melones Small Mouth Bass Nest Survival Percentage

Monthly pattern of reservoir storage is different between the Second Basis of Comparison and the Revised Second Basis of Comparison and the changes between alternatives reflect the change in this pattern.

- In wet years, Alternative 3 showed higher percentage of nest survival in July and August (approximately 53% and 24%); and lower percentage of nest survival (approximately 7%) in May when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, Alternative 3 shows higher percentage of nest survival (from approximately 12 to 72%) in July through September; and lower percentage of nest survival (approximately 8 and 18%) in May and June.

- In above normal years, Alternative 3 showed higher percentage of nest survival in June through August (from approximately 8% to 35%) when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, Alternative 3 shows lower percentage of nest survival (approximately 7%) in August; and higher percentage of nest survival (approximately 28% and 16%) in June and July.

- In below normal years, the Alternative 3 showed higher percentage of nest survival (from approximately 7% to 16%) in November, May, and June; and lower percentage of nest survival (from approximately 9% to 23%) in December, April, and July when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, the Alternative 3 shows lower percentage of nest survival (from approximately 8 to 18%) in December, April, July, and August.

- In dry years, the Alternative 3 showed higher percentage of nest survival (from approximately 5% to 19%) in February, June, and August; and lower percentage of nest survival (approximately 20% and 16%) in April, and September when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, the Alternative 3 shows lower percentage of nest survival (from approximately 7 to 22%) in October, April, May, July, and September.

- In critically dry years, the Alternative 3 showed higher percentage of nest survival (from approximately 8 to 51%) in February and May; and lower percentage of nest survival (from approximately 8% to 40%) in April, and June through September when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, the Alternative 3 shows higher percentage of nest survival (from approximately 5 to 31%) in February and August; and lower percentage of nest survival (from approximately 8% to 27%) in October, April, May, July, and September.

In general, the Alternative 3 shows lower percentage of nest survival for the New Melones Small Mouth Bass when compared to the Revised Second Basis of Comparison.

5C.2.2.3.11 New Melones Spotted Bass Nest Survival Percentage

Monthly pattern of reservoir storage is different between the Second Basis of Comparison and the Revised Second Basis of Comparison and the changes between alternatives reflect the change in this pattern.

- In wet years, Alternative 3 showed lower percentage of nest survival (from approximately 8% to 22%) in May and June when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, Alternative 3 shows higher percentage of nest survival (from approximately 5% to 8%) in August and September; and lower percentage of nest survival (approximately 8% and 23%) in May and June.

- In above normal years, Alternative 3 showed lower percentage of nest survival (from approximately 8% to 35%) in August and September when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, Alternative 3 shows lower percentage of nest survival (from approximately 8% to 18%) in August and September.

- In below normal years, the Alternative 3 showed higher percentage of nest survival (from approximately 5% to 6%) in May and June; and lower percentage of nest survival (from approximately 9% to 18%) in December, April, July, and August when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, the Alternative 3 shows lower percentage of nest survival (from approximately 9% to 18%) in December, April, July, and August.

- In dry years, the Alternative 3 showed lower percentage of nest survival (from approximately 6% to 21%) in April, May, July and September when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, the Alternative 3 shows lower percentage of nest survival (from approximately 7 to 24%) in April, May, and July through September.

- In critically dry years, the Alternative 3 showed higher percentage of nest survival (from approximately 5% to 26%) in May and June; and lower percentage of nest survival (from approximately 7% to 10%) in March, April, and September when compared to the Second Basis of Comparison.

When compared to the Revised Second Basis of Comparison, the Alternative 3 shows lower percentage of nest survival (from approximately 6% to 10%) in March through May, July, and September.

In general, the Alternative 3 shows lower percentage of nest survival for the New Melones Spotted Bass when compared to the Revised Second Basis of Comparison.

5C.2.2.4 Alternative 5 Compared to the Revised Second Basis of Comparison

5C.2.2.4.1 New Melones Storage

Alternative 5 showed decreased storage (from approximately 6 to 23%) almost all months of all water year types except for June through September of wet years (less than 5% decrease). When compared to the Revised Second Basis of Comparison, Alternative 5 shows further decreased storage (from approximately 8 to 43%) in all months of all water year types.

5C.2.2.4.2 New Melones Elevation

Alternative 5 showed similar reservoir elevation (changes within 5%) in all months of all water year types. When compared to the Revised Second Basis of Comparison, Alternative 5 shows decreased storage in all months of all water year types (from approximately 9 to 13%).

5C.2.2.4.3 Stanislaus River Flow below Goodwin

Flow patterns are different between the Second Basis of Comparison and the Revised Second Basis of Comparison and the changes between alternatives reflect the change in patterns.

- In wet years, Alternative 5 showed lower flows (from approximately 6 to 53%) in November, December, January, and June through September, higher flows (from approximately 16 to 113%) in October, March, and May, and similar flows (within 5% change) in February and April when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, Alternative 5 shows lower flows (from approximately 14 to 40%) in November, December, February, and June through September, higher flows (from approximately 11 to 129%) in October, March, and May, and similar flows (within 5% change) in January and April when compared to Alternative 5.

- In above normal years, Alternative 5 showed lower flows (from approximately 7 to 37%) in November through February and June, higher flows (from approximately 23 to 134%) in October, March, April, and May, and similar flows (within 5% change) in July, August, and September when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, Alternative 5 shows lower flows (from approximately 7 to 22%) in November, December, and February, higher flows (from approximately 11 to 185%) in October, March, April, and May, and similar flows (within 5% change) in January and June through September when compared to Alternative 5.

- In below normal years, Alternative 5 showed lower flows (from approximately 5 to 40%) in November through February, June, and September, higher flows (from approximately 16 to 155%) in October, March, and April, and similar flows (within 5% change) in May, July, and August when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, Alternative 5 shows lower flows (from approximately 16 to 35%) in November through February, higher flows (from approximately 11 to 189%) in October and March through June, and similar flows (within 5% change) in July through September.

- In dry years, Alternative 5 showed lower flows (approximately 8 to 36%) in, November through March and June, higher flows (approximately 25 to 148%) in October, April, and May, and similar flows (within 5% change) in July through September when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, Alternative 5 shows lower flows (approximately 8 to 26%) in November through February, higher flows (from approximately 8 to 182%) in October and March through June, and similar flows (within 5% change) in July through September.

- In critically dry years, Alternative 5 showed lower flows (approximately 8 to 30%) in November through March, Jun, and July, higher flows (approximately 7 to 193%) in October, April, and May, and similar flows (within 5% change) in August and September when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, Alternative 5 shows lower flows (from approximately 5 to 17%) in November, December, February, June, July, and August, higher flows (from approximately 8 to 272%) in October, January, March, April, and May, and similar flows (within 5% change) in September.

5C.2.2.4.4 Stanislaus River Flow at Mouth

Flow patterns are different between the Second Basis of Comparison and the Revised Second Basis of Comparison and the changes between alternatives reflect the change in patterns.

- In wet years, Alternative 5 showed lower flows (from approximately 5 to 47%) in November, December, January, and June through September, higher flows (from approximately 14 to 77%) in October, March, and May, and similar flows (within 5% change) in February and April when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, Alternative 5 shows lower flows (from approximately 12 to 34%) in November, December, February, and June through September, higher flows (from approximately 10 to 86%) in October, March, and May, and similar flows (within 5% change) in January and April when compared to Alternative 5.

- In above normal years, Alternative 5 showed lower flows (from approximately 6 to 26%) in November through February and June, higher flows (from approximately 18 to 82%) in October, March, April, and May, and similar flows (within 5% change) in July, August, and September when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, Alternative 5 shows lower flows (from approximately 6 to 15%) in November, December, and February, higher flows (from approximately 8 to 104%) in October, March, April, and May, and similar flows (within 5% change) in January and June through September when compared to Alternative 5.

- In below normal years, Alternative 5 showed lower flows (from approximately 12 to 34%) in November through February and June, higher flows (from approximately 10 to 93%) in October, March, and April, and similar flows (within 5% change) in May, July, August, and September when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, Alternative 5 shows lower flows (from approximately 11 to 27%) in November through February, higher flows (from approximately 8 to 108%) in October and March through June, and similar flows (within 5% change) in July through September.

- In dry years, Alternative 5 showed lower flows (approximately 6 to 28%) in, November through March and June, higher flows (approximately 23 to 142%) in October, April, and May, and similar flows (within 5% change) in July through September when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, Alternative 5 shows lower flows (approximately 6 to 20%) in November through February, higher flows (from approximately 77 to 107%) in October, April, and May, and similar flows (within 5% change) in March and June through September.

- In critically dry years, Alternative 5 showed lower flows (approximately 7 to 24%) in November through March, Jun, and July, higher flows (approximately 7 to 149%) in October, April, and May, and similar flows (within 5% change) in August and September when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, Alternative 5 shows lower flows (from approximately 6 to 13%) in November, December, June, July, and August, higher flows (from approximately 6 to 147%) in October, January, March, April, and May, and similar flows (within 5% change) in February and September.

5C.2.2.4.5 Stanislaus River Water Temperature below Goodwin Dam

Alternative 5 showed similar temperatures at Goodwin except for higher temperatures in October of wet years, October, July, August, and September of below normal years, October, November, July, August, and September of dry years, October, April, May, August, and September of critically dry years (varied from 0.5 to 1.9°F), and lower temperatures in December and February of critically dry years (approximately 0.5°F) when compared to the Second Basis of Comparison. Difference in temperature threshold exceedances were within 5% (varied from 1% less to 2% more exceedances in February, March, and May) and higher (approximately 6%) in April.

Alternative 5 shows similar temperatures at Goodwin except for higher temperatures in October of wet years, October, November, August and September of above normal years, October, August, and September of below normal years, October through December and July through September of dry years, October, November, May, and July through September of critically dry years (varied from 0.5 to 2.5°F) when compared to the Revised Second Basis of Comparison. Difference in temperature threshold exceedances are within 5% (varied from 4% less to 3% more exceedances in January through April).

In general, Alternative 5 shows lower temperatures for Steelhead smolts in Stanislaus when compared to the Revised Second Basis of Comparison.

5C.2.2.4.6 Stanislaus River Water Temperature at Orange Blossom Bridge

Alternative 5 showed similar temperatures at Orange Blossom Bridge except for lower temperatures in October of wet years, October and April of above normal, below normal, dry, and critically dry years (from approximately 0.7 to 1.6°F) and higher temperatures in November and June of wet years, June and September of below normal years, August and September of dry years, and June through September of critically dry years (approximately from 0.5 to 1.3°F) when compared to the Second Basis of Comparison. Difference in temperature threshold exceedances showed 27% less exceedance in October (adult migration threshold), 8% less exceedance in April (smoltification threshold), 26% less exceedance in April (spawning threshold), 8% more exceedance in November (adult migration threshold), 6% more exceedance in April (smoltification threshold), and 6 % more exceedance in July (rearing threshold), and 8% more in August and September (rearing threshold).

Alternative 5 shows similar temperatures at Orange Blossom Bridge except for lower temperatures (from approximately 0.5 to 1.7°F) in October and March of wet years, October, March, and May of above normal years, October of below normal years, October, April, and May of dry years, and October, March, April, and May of critically dry years; and higher temperatures (from approximately 0.6 to 1.7°F) in July through September of wet years, November and September of above normal years, September of below normal years, November, and July through September of dry years, and November and June through September of critically dry years when compared to the Revised Second Basis of Comparison. Difference in temperature threshold exceedances showed 28% less exceedance in

October (adult migration threshold), 10% less exceedance in March (smoltification threshold), 7% less exceedance in April (smoltification threshold), 15% less exceedance in May (smoltification threshold), 15, 23, and 17% less exceedance in March, April, and May respectively (spawning threshold), and 9% more in November (adult migration threshold) , and 7, 13, and 11% more in July, August, and September respectively (rearing threshold).

In general, Alternative 5 shows lower temperatures for Steelhead lifestages in Stanislaus except for higher temperatures when Steelhead is rearing in summer; when compared to the Revised Second Basis of Comparison.

5C.2.2.4.7 CVP Stanislaus Deliveries

Under Alternative 5, annual CVP service contract deliveries were decreased by 8.4 TAF and annual water rights deliveries were decreased by 8.1 TAF when compared to the Second Basis of Comparison.

When compared to the Revised Second Basis of Comparison, annual CVP service contract deliveries are decreased by 18.6 TAF and annual water rights deliveries are decreased by 11.9 TAF under Alternative 5.

In general, the Alternative 5 shows decreased CVP Stanislaus deliveries when compared to the Revised Second Basis of Comparison.

5C.2.2.4.8 CVP Power Generation

Under Alternative 5, long-term average power capacity and energy generation were 4% and 1% lower when compared to the Second Basis of Comparison. The energy use at the CVP pumping facilities was 14% lower than the Second Basis of Comparison; which resulted in a 4% higher net generation.

In dry and critical years, long-term average power capacity and energy generation under Alternative 5 were both 1% lower than the Second Basis of Comparison. The energy use at the CVP pumping facilities was 8% lower than the Second Basis of Comparison; which resulted in 4% higher net generation.

When compared to the Revised Second Basis of Comparison, long-term average power capacity and energy generation are 5% and 1% lower under Alternative 5. The energy use at the CVP pumping facilities is 14% lower than the Revised Second Basis of Comparison; which results in 3% higher net generation.

In dry and critical years, long-term average power capacity and energy generation under Alternative 5 are 12% and 5% lower than the Revised Second Basis of Comparison. The energy use at the CVP pumping facilities is 9% lower than the Revised Second Basis of Comparison; which results 3% lower net generation.

5C.2.2.4.9 New Melones Large Mouth Bass Nest Survival Percentage

Monthly pattern of reservoir storage is different between the Second Basis of Comparison and the Revised Second Basis of Comparison and the changes between alternatives reflect the change in this pattern.

- In wet years, Alternative 5 showed higher percentage of nest survival in June (approximately 19%); and lower percentage of nest survival (from approximately 5% through 28%) in October, April, May, and July through August when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, Alternative 5 shows lower percentage of nest survival (from approximately 5% to 28%) in October, May, and August.

- In above normal years, the Alternative 5 showed lower percentage of nest survival (from 6% to 23%) in October and April through September when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, the Alternative 5 shows lower percentage of nest survival (from approximately 6 to 29%) in October and April through September.

- In below normal years, the Alternative 5 showed higher percentage of nest survival (approximately 6%) in June; and lower percentage of nest survival (from approximately 5% and 38%) in October, March, April, May, and July through September when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, the Alternative 5 shows lower percentage of nest survival (from approximately 5 to 40%) in October and March through September.

- In dry years, the Alternative 5 showed higher percentage of nest survival (approximately 5%) in February; and lower percentage of nest survival (from approximately 11% and 47%) in October, April, May, and July through September when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, Alternative 5 shows lower percentage of nest survival (from approximately 9 to 45%) in October and April through September.

- In critically dry years, Alternative 5 showed higher percentage of nest survival (from approximately 5 to 82%) in February, and June through September and lower percentage of nest survival (approximately 21% and 69%) in October, and April when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, Alternative 5 shows higher percentage of nest survival (from approximately 17 to 148%) in June through September; and lower percentage of nest survival (from approximately 26 to 67%) in October, April, and May.

In general, the Alternative 5 shows lower percentage of nest survival for the New Melones Large Mouth Bass when compared to the Revised Second Basis of Comparison except for summer months of the critically dry years.

5C.2.2.4.10 New Melones Small Mouth Bass Nest Survival Percentage

Monthly pattern of reservoir storage is different between the Second Basis of Comparison and the Revised Second Basis of Comparison and the changes between alternatives reflect the change in this pattern.

- In wet years, Alternative 5 showed higher percentage of nest survival in June (approximately 19%); and lower percentage of nest survival (from approximately 7% through 34%) in October, May, and July through September when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, Alternative 5 shows lower percentage of nest survival (from approximately 5% to 35%) in October, May, and August.

- In above normal years, the Alternative 5 showed lower percentage of nest survival (from 7% to 28%) in October and April through September when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, the Alternative 5 shows lower percentage of nest survival (from approximately 7 to 29%) in October and April through September.

- In below normal years, the Alternative 5 showed higher percentage of nest survival (approximately 8%) in June; and lower percentage of nest survival (from approximately 6% and 39%) in October, March, April, May, and July through September when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, the Alternative 5 shows lower percentage of nest survival (from approximately 6 to 41%) in October and March through September.

- In dry years, the Alternative 5 showed higher percentage of nest survival (approximately 5%) in November and February; and lower percentage of nest survival (from approximately 11% and 45%) in October, April, May, and July through September when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, Alternative 5 shows lower percentage of nest survival (from approximately 9 to 48%) in October, and April through September.

- In critically dry years, Alternative 5 showed higher percentage of nest survival (from approximately 5 to 92%) in November, February, and May through September and lower percentage of nest survival (approximately 26% and 67%) in October and April when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, Alternative 5 shows higher percentage of nest survival (from approximately 28 to 179%) in June through September; and lower percentage of nest survival (from approximately 31 to 65%) in October, April and May.

In general, the Alternative 5 shows lower percentage of nest survival for the New Melones Small Mouth Bass when compared to the Revised Second Basis of Comparison except for summer months of the critically dry years.

5C.2.2.4.11 New Melones Spotted Bass Nest Survival Percentage

Monthly pattern of reservoir storage is different between the Second Basis of Comparison and the Revised Second Basis of Comparison and the changes between alternatives reflect the change in this pattern.

- In wet years, Alternative 5 showed lower percentage of nest survival (approximately 8%) in August when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, Alternative 5 shows lower percentage of nest survival (approximately 6%) in August.

- In above normal years, the Alternative 5 showed lower percentage of nest survival (from 8% to 21%) in April, June, July and September when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, the Alternative 5 shows lower percentage of nest survival (from approximately 8% to 24%) in April, and June through September.

- In below normal years, the Alternative 5 showed lower percentage of nest survival (from approximately 13% and 22%) in October, April, May, and July through September when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, the Alternative 5 shows lower percentage of nest survival (from approximately 6% to 22%) in October, and April through September.

- In dry years, the Alternative 5 showed lower percentage of nest survival (from approximately 6% and 22%) in October, and April through September when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, Alternative 5 shows lower percentage of nest survival (from approximately 6% to 28%) in October, and April through September.

- In critically dry years, Alternative 5 showed higher percentage of nest survival (from approximately 13% to 18%) in July and August; and lower percentage of nest survival (approximately 31% and 57%) in April and May when compared to the Second Basis of Comparison.

  When compared to the Revised Second Basis of Comparison, Alternative 5 shows higher percentage of nest survival (from approximately 5% to 13%) in July and August; and lower percentage of nest survival (from approximately 7% to 56%) in April, May, and September.

In general, the Alternative 5 shows lower percentage of nest survival for the New Melones Spotted Bass when compared to the Revised Second Basis of Comparison except for summer months of the critically dry years.

5C.3 Results

5C.3.1 Revised Second Basis of Comparison vs. Second Basis of Comparison Results

5C.3.1.1 Trinity Storage

5C.3.1.2 Shasta Storage

5C.3.1.3 Oroville Storage

5C.3.1.4 Folsom Storage

5C.3.1.5 New Melones Storage

5C.3.1.6 Trinity Elevation

5C.3.1.7 Shasta Elevation

5C.3.1.8 Oroville Elevation

5C.3.1.9 Folsom Elevation

5C.3.1.10 New Melones Elevation

5C.3.1.11 Delta Outflow

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the San Joaquin Valley 60-20-20 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the San Joaquin Valley 60-20-20 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the San Joaquin Valley 60-20-20 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the San Joaquin Valley 60-20-20 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 81-year simulation period.

c As defined by the San Joaquin Valley 60-20-20 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 81-year simulation period.

c As defined by the San Joaquin Valley 60-20-20 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 81-year simulation period.

c As defined by the San Joaquin Valley 60-20-20 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 81-year simulation period.

c As defined by the San Joaquin Valley 60-20-20 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 81-year simulation period.

c As defined by the San Joaquin Valley 60-20-20 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 81-year simulation period.

c As defined by the San Joaquin Valley 60-20-20 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 81-year simulation period.

c As defined by the San Joaquin Valley 60-20-20 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 81-year simulation period.

c As defined by the San Joaquin Valley 60-20-20 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 81-year simulation period.

c As defined by the San Joaquin Valley 60-20-20 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 81-year simulation period.

c As defined by the San Joaquin Valley 60-20-20 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 81-year simulation period.

c As defined by the San Joaquin Valley 60-20-20 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the San Joaquin Valley 60-20-20 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the San Joaquin Valley 60-20-20 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the San Joaquin Valley 60-20-20 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the San Joaquin Valley 60-20-20 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on an 81-year simulation period.

c As defined by the San Joaquin Valley 60-20-20 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on an 81-year simulation period.

c As defined by the San Joaquin Valley 60-20-20 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on an 81-year simulation period.

c As defined by the San Joaquin Valley 60-20-20 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on an 81-year simulation period.

c As defined by the San Joaquin Valley 60-20-20 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on an 81-year simulation period.

c As defined by the San Joaquin Valley 60-20-20 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on an 81-year simulation period.

c As defined by the San Joaquin Valley 60-20-20 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on an 81-year simulation period.

c As defined by the San Joaquin Valley 60-20-20 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on an 81-year simulation period.

c As defined by the San Joaquin Valley 60-20-20 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on an 81-year simulation period.

c As defined by the San Joaquin Valley 60-20-20 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on an 81-year simulation period.

c As defined by the San Joaquin Valley 60-20-20 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) X2 is defined as the position of the 2% (grams of salt per kilogram of seawater) bottom salinity value along the axis of the estuary; measured in kilometers from the Golden Gate Bridge. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and And Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) X2 is defined as the position of the 2% (grams of salt per kilogram of seawater) bottom salinity value along the axis of the estuary; measured in kilometers from the Golden Gate Bridge. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) X2 is defined as the position of the 2% (grams of salt per kilogram of seawater) bottom salinity value along the axis of the estuary; measured in kilometers from the Golden Gate Bridge. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

5C.3.3.15 CVP Deliveries

Table 5C.3.3.15.1.1 CALSIM II Summary Reporting Metrics, Long-Term Average and Dry and Critical Year Averages, CVP

					Alternative 1	No Action Alternative	Alternative 1 minus No Action Alternative
Water Supply Reliability							
Sacramento River Hydrologic Region							
	CVP Settlement	Contract Delivery (annual average)	(TAF/year)	Long Term	1,858	1,859	-1
				Dry	1,905	1,906	0
				Critical	1,734	1,737	-3
	CVP Refuge Level 2	Contract Delivery (annual average)	(TAF/year)	Long Term	155	146	8
				Dry	151	146	6
				Critical	105	102	3
	CVP M&I	Contract Delivery (annual average)	(TAF/year)	Long Term	214	207	7
				Dry	192	186	6
				Critical	152	152	0
	CVP Ag	Contract Delivery (annual average - does not include Settlement contractors)	(TAF/year)	Long Term	221	185	36
				Dry	124	86	39
				Critical	38	24	14
San Joaquin River Hydrologic Region (not including Friant-Kern and Madera Canal water users and Eastside Contractors deliveries)							
	CVP Exchange	Contract Delivery (annual average)	(TAF/year)	Long Term	852	852	0
				Dry	875	875	0
				Critical	741	741	0
	CVP Refuge Level 2	Contract Delivery (annual average)	(TAF/year)	Long Term	261	261	0
				Dry	268	269	0
				Critical	224	224	0
	CVP M&I	Contract Delivery (annual average)	(TAF/year)	Long Term	0	0	0
				Dry	0	0	0
				Critical	0	0	0
	CVP Ag	Contract Delivery (annual average; does not include Exchange contractors)	(TAF/year)	Long Term	350	269	82
				Dry	206	140	67
				Critical	65	41	24
San Francisco Bay Hydrologic Region							
	CVP M&I	Contract Delivery (annual average)	(TAF/year)	Long Term	289	275	13
				Dry	284	274	10
				Critical	270	264	6
	CVP Ag	Contract Delivery (annual average)	(TAF/year)	Long Term	43	33	11
				Dry	25	17	8
				Critical	8	5	3
Central Coast Hydrologic Region							
Tulare Lake Hydrologic Region (not including Friant-Kern Canal water users)							
	CVP Refuge Level 2	Contract Delivery (annual average)	(TAF/year)	Long Term	12	12	0
				Dry	12	12	0
				Critical	10	10	0
	CVP Ag	Contract Delivery (annual average - includes Cross Valley Canal)	(TAF/year)	Long Term	715	545	169
				Dry	430	288	143
				Critical	137	85	51
Total For All Regions							
	Total Supplies	Contract Delivery (annual average)	(TAF/year)	Long Term	4,971	4,646	325
				Dry	4,475	4,198	277
				Critical	3,484	3,385	99

Notes: 1) Long-term Average is the average quantity for the 82-year simulation period. 2) Dry and Critical Year designations are defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030. 3) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 4) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences are discussed in the text. 5) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

Appendix 5D

Municipal and Industrial Water Demands and Supplies

5D.1 Introduction

Most water supply agencies in California that serve more than 3,000 connections or more than 3,000 acre-feet of water prepare Urban Water Management Plans (UWMPs) for submittal to the California Department of Water Resources. The UWMPs include water demand and water supply projections through at least 2030. The future water demands include assumptions for implementation of water conservation measures to meet the statewide mandate to reduce municipal and industrial (M&I) water demand by 20 percent by 2020.

Information from the UWMPs for Central Valley Project (CVP) and State Water Project (SWP) water users was used as input information in the CWEST model (see Appendix 19A, CWEST Model) to project M&I water supply economic changes. For small water users that did not prepare a UWMP, information was obtained from water master plans and integrated regional water management plans. This information is summarized in the following sections of this appendix. The tabular format is consistent for each water user and was established to be consistent with the input files for the CWEST model; therefore, there are rows in the tabular format that are not used for some M&I water users.

5D.2 Central Valley Region

This section includes summaries of water demand and water supply projections for M&I users of CVP and SWP water supplies in the Central Valley Region, including water rights users on the Sacramento and American rivers. The M&I water users are generally organized geographically in this section from north to south. See Tables 5D.1 through 5D.31.

Table 5D.1 Bella Vista Water District (BVWD)

Items	Water Demand and Supplies (acre-feet)	Notes
Water Demand		
Service Area Water Demand	14,567	BVWD serves portions of Redding. Assumed growth rate from City of Redding *2010 Urban Water Management Plan.*
Water Sales to Others	–	–
Total Demand	**14,567**	–
Water Supplies for No Action Alternative (NAA)		
CVP Water Supplies	14,445	CVP Water Service Contract 24,578 acre-feet, includes 24,000 acre-feet (14-06-200-851A-LTR1) and 578 acre-feet assigned from Shasta County Water Agency initial CVP Water Service Contract (14-06-200-3464A-LTR1).
SWP Water Supplies	–	–
Other Imported Water Supplies	–	–
Local Surface Water Supplies	–	–
Groundwater	122	Assumed no increase in wells.
Recycled Wastewater	–	–
Recycled Stormwater	–	–
Desalination	–	–
Transfers/Exchanges	–	–
Conservation	–	–
Total Water Supplies for NAA	**14,567**	–
Possible Future Water Supplies		**–**
Subtotal Possible Future Water Supplies	–	–
Total Potential Future Water Supplies	–	–

Table 5D.2 Centerville Community Services District

Items	Water Demand and Supplies (acre-feet)	Notes
Water Demand		
Service Area Water Demand	3,185	–
Water Sales to Others	–	–
Total Demand	**3,185**	–
Water Supplies for NAA		
CVP Water Supplies	3,185	CVP Water Exchange Contract 900 acre-feet (pre-1914 water right on Clear Creek) and CVP Water Service Contract 2,900 acre-feet, (14-06-200-3367A-LTR1).
SWP Water Supplies	–	–
Other Imported Water Supplies	–	–
Local Surface Water Supplies	–	–
Groundwater	–	–
Recycled Wastewater	–	–
Recycled Stormwater	–	–
Desalination	–	–
Transfers/Exchanges	–	–
Conservation	–	–
Total Water Supplies for NAA	**3,185**	–
Possible Future Water Supplies	**–**	**–**
Subtotal Possible Future Water Supplies	–	–
Total Potential Future Water Supplies	–	–
Other Information	–	Sanitary Survey states that 25% of 35-mgd Water Treatment Plant is owned by Centerville Community Services District (Redding Area Water Suppliers. 2011. *Redding Area Watershed Sanitary Survey)*.

Note:
mgd = million gallons per day

1 **Table 5D.3 City of Shasta Lake**

Items	Water Demand and Supplies (acre-feet)	Notes
Water Demand		
Service Area Water Demand	2,455	City of Shasta Lake. 2014. *2010 Urban Water Management Plan, Administrative Draft*. July.
Water Sales to Others	470	–
Total Demand	**2,925**	–
Water Supplies for NAA		
CVP Water Supplies	2,885	CVP Water Exchange Contract 900 acre-feet (pre-1914 water right on Clear Creek) and CVP Water Service Contract 2,900 acre-feet, (14-06-200-3367A-LTR1).
SWP Water Supplies	–	–
Other Imported Water Supplies	–	–
Local Surface Water Supplies	–	–
Groundwater	–	–
Recycled Wastewater	112	–
Recycled Stormwater	–	–
Desalination	–	–
Transfers/Exchanges	–	–
Conservation	–	–
Total Water Supplies for NAA	**2,997**	
Possible Future Water Supplies		
Subtotal Possible Future Water Supplies	–	–
Other Information	–	Supplies do not include transfers not approved by Reclamation due to cold water pool issues: Anderson-Cottonwood Irrigation District 2,000 acre-feet, MCM Properties at 325 acre-feet. Future project would develop facilities that would allow these transfers and result in 2,325 acre-feet normal year and 2,093 acre-feet in 3rd multiple dry years per 2010 UWMP (with reference to support from Reclamation).
Total Potential Future Water Supplies	**2,997**	–

1 **Table 5D.4 Clear Creek Community Services District (CCCSD)**

Items	Water Demand and Supplies (acre-feet)	Notes
Water Demand		
Service Area Water Demand	7,410	CCCSD serves areas near Redding. Assumed growth rate from City of Redding *2010 Urban Water Management Plan.*
Water Sales to Others	–	–
Total Demand	**7,410**	–
Water Supplies for NAA		
CVP Water Supplies	7,410	CVP Water Service Contract 15,300 acre-feet, (14-06-200-4894A-LTR1).
SWP Water Supplies	–	–
Other Imported Water Supplies	–	–
Local Surface Water Supplies	–	–
Groundwater	–	–

Total Water Supplies for NAA	**12,350**	–

Items	Water Demand and Supplies (acre-feet)	Notes
Possible Future Water Supplies	–	9,000 acre-feet of the 15,000-acre-foot CVP water service contract authorized by Public Law 101-514 (also known as "Fazio Water") for Georgetown Divide Public Utility District per El Dorado County Water Agency. 2014. *Water Resources Development & Management Plan (December 2007) 2014 West Slope Update, Final Draft*. October. Assumed that 6,000 acre-feet would be used by EID. 150 acre-feet from a new reservoir (not planned) per El Dorado County Water Agency. 2014. *Water Resources Development & Management Plan (December 2007) 2014 West Slope Update, Final Draft*. October. 670 acre-feet from lining canals in Georgetown Divide Public Utilities District per El Dorado County Water Agency. 2014. *Water Resources Development & Management Plan (December 2007) 2014 West Slope Update, Final Draft*. October. 40,000 acre-feet from water rights applications State Water Resources Control Board Filed Applications Nos. 5644 and 5645 for storage of water from Sacramento Municipal Utility District (SMUD) Upper American River Project and diversion at Folsom Lake with an exchange with an upstream water rights holder. To be shared with EID. Per El Dorado County Water Agency. 2014. *Water Resources Development & Management Plan (December 2007) 2014 West Slope Update, Final Draft*. October. 10,300 acre-feet from diversion of water from South Fork of the Rubicon River with a negotiation under the El Dorado-SMUD Cooperation Agreement per El Dorado County Water Agency. 2014. *Water Resources Development & Management Plan (December 2007) 2014 West Slope Update, Final Draft*. October. 1,000 acre-feet from dry year conservation efforts per El Dorado County Water Agency. 2014. *Water Resources Development & Management Plan (December 2007) 2014 West Slope Update, Final Draft*. October.

Items	Water Demand and Supplies (acre-feet)	Notes
Subtotal Possible Future Water Supplies	**9,000**	All future projects not included for M&I No Action Alternative assumptions since some of the future projects are not fully defined or analyzed.
Total Potential Future Water Supplies	**21,350**	It is assumed that not all future projects would be implemented. Therefore, total potential future water supplies would be substantially less.

1 **Table 5D.12 El Dorado Irrigation District**

Items	Water Demand and Supplies (acre-feet)	Notes
Water Demand		
Service Area Water Demand	55,709	Per El Dorado Irrigation District. 2011. *Urban Water Management Plan, 2010 Update*. July.
Water Sales to Others	1,330	–
Total Demand	**57,039**	–
Water Supplies for NAA		
CVP Water Supplies	7,550	CVP Water Service Contract (C 14-06-200-1357A-LTR1) 7,550 acre-feet diverted from Folsom Lake for portion of El Dorado Hills per El Dorado Irrigation District. 2011. *Urban Water Management Plan, 2010 Update*. July.
SWP Water Supplies	–	–
Other Imported Water Supplies	–	–
Local Surface Water Supplies	59,640	23,000 acre-feet from Jenkinson Lake on Park Creek (actually 33,400 acre-foot water right L11835 and L11836, with restriction of 23,000 acre-feet/two years). 4,560 acre-feet from Weber Creek (Farmer's Free Ditch) and Reservoir, Slab Creek (Summerfield Ditch), and Hangtown Creek (Gold Hill Ditch) diverted from Folsom Lake using a 40-year Warren Act Contract (signed March 1, 2011). 17,000 acre-foot El Dorado Hydroelectric Project 184 at Folsom Lake under State Water Resources Control Board Permit 21112. 15,080 acre-feet from Project 184 at El Dorado Forebay pre-1914 water rights. El Dorado Irrigation District. 2011. *Urban Water Management Plan, 2010 Update*. July; and El Dorado Irrigation District. 2012. *United States Bureau of Reclamation Five-Year Water Management Plan, 2010 Update*. July. El Dorado Irrigation District (EID) acquired Project 184 from Pacific Gas & Electric Company in 1999 with water rights from the South Fork American River and conveyed in the El Dorado Canal to El Dorado Forebay and Jenkinson Lake; however, needs a Warren Act Contract to divert at Folsom Reservoir.

Items	Water Demand and Supplies (acre-feet)	Notes
Local Surface Water Supplies (continued)		Jenkinson Lake supply could be reduced from 23,000 to 20,920 acre-feet per El Dorado Irrigation District. 2013. *2013 Water Resources and Service Reliability Report* August 12.
Groundwater	–	–
Recycled Wastewater	3,804	3,804 acre-feet per El Dorado Irrigation District. 2011. *Urban Water Management Plan, 2010 Update*. July.

Water Demand		
Service Area Water Demand	21,572	5,712 acre-feet for American Canyon per City of American Canyon. 2011. *Final Urban Water Management Plan, 2010, Final*. September. 1,469 acre-feet for Calistoga per Napa County. 2007. *Draft Environmental Impact Report for Napa County General Plan*. February. 14,391 acre-feet for Napa per City of Napa. 2011. *Urban Water Management Plan, 2010 Update*. June 21.
Water Sales to Others	–	–
Total Demand	**21,572**	–
Water Supplies for NAA		
CVP Water Supplies	–	–
SWP Water Supplies	26,028	3,120 acre-feet for American Canyon per City of American Canyon. 2011. *Final Urban Water Management Plan, 2010, Final*. September. 1,008 acre-feet for Calistoga treated by City of Napa. Total 1,925 acre-foot SWP entitlement in 2010 per Napa County. 2007. *Draft Environmental Impact Report for Napa County General Plan*. February. Total amount available is limited 1,008 acre-feet due to conveyance limitations. 21,900 acre-feet for Napa per City of Napa. 2011. *Urban Water Management Plan, 2010 Update*. June 21. Assume 19,900 acre-feet due to conveyance limitations.
Other Imported Water Supplies	–	–
Local Surface Water Supplies	32,092	392 acre-feet for Calistoga from Kimball Reservoir per Napa County. 2007. *Draft Environmental Impact Report for Napa County General Plan*. February. 31,700 acre-feet for Napa from Lake Hennessey and Milliken Reservoir per City of Napa. 2011. *Urban Water Management Plan, 2010 Update*. June 21.
Groundwater	–	–

Items	Water Demand and Supplies (acre-feet)	Notes
Recycled Wastewater	5,605	1,065 acre-feet for American Canyon per City of American Canyon. 2011. *Final Urban Water Management Plan, 2010, Final*. September. 4,540 acre-feet for Napa per City of Napa. 2011. *Urban Water Management Plan, 2010 Update*. June 21.
Recycled Stormwater	–	–
Desalination	–	–
Transfers/Exchanges	1,527	1,027 acre-foot purchase by American Canyon from City of Vallejo, which diverts water from the Delta. Can be expanded to 1,527 acre-feet when SWP water reliability is reduced per City of American Canyon. 2011. *Final Urban Water Management Plan, 2010, Final*. September.
Conservation	–	–
Total Water Supplies for NAA	**65,252**	–
Possible Future Water Supplies	–	American Canyon can purchase water from Napa during emergencies per City of American Canyon. 2011. *Final Urban Water Management Plan, 2010, Final*. September.
Subtotal Possible Future Water Supplies	–	All future projects not included for M&I No Action Alternative assumptions since some of the future projects are not fully defined or analyzed.
Total Potential Future Water Supplies	**65,252**	–

1 **Table 5D.24 Stockton East Water District**

Items	Water Demand and Supplies (acre-feet)	Notes
Water Demand		
Service Area Water Demand	64,960	64,960 acre-feet of demand met by Stockton East Water District within City of Stockton, California Water Service Company – Stockton District, and San Joaquin County per Stockton East Water District. 2011. *2010 Stockton East Water District Urban Water Management Plan Update*. June.
Water Sales to Others	–	–
Total Demand	**64,960**	–
Water Supplies for NAA		
CVP Water Supplies	24,000	24,000 acre-foot CVP water service contract on Stanislaus River from New Melones Reservoir.
SWP Water Supplies	–	–
Other Imported Water Supplies	–	–
Local Surface Water Supplies	20,000	20,000 acre-foot water rights on Calaveras River diverted from New Hogan Reservoir.

Conservation	–	–
Total Water Supplies for NAA	**151,072**	–
Possible Future Water Supplies	–	Including up to 96,000 acre-feet of transfers with Kern Delta Water District, Kern-Tulare Water District, Rosedale-Rio Bravo Water Storage District, and North Kern Water Storage District.
Subtotal Possible Future Water Supplies	–	All future projects not included for M&I No Action Alternative assumptions since some of the future projects are not fully defined or analyzed.
Total Potential Future Water Supplies	**151,072**	–

5D.3 San Francisco Bay Area Region

This section includes summaries of water demand and water supply projections for M&I users of CVP and SWP water supplies in the San Francisco Bay Area Region (see Tables 5D.32 through 5D.37). The M&I water users are generally organized geographically in this section from north to south.

Table 5D.32 Contra Costa Water District

Items	Water Demand and Supplies (acre-feet)	Notes
Water Demand		
Service Area Water Demand	225,160	Contra Costa Water District. 2011. *Urban Water Management Plan*. June.
Water Sales to Others	–	–
Total Demand	**225,160**	–
Water Supplies for NAA		
CVP Water Supplies	195,000	195,000 acre-foot CVP Water Service Contract (175r-3401A-LTR1).
SWP Water Supplies	–	–
Other Imported Water Supplies	–	–
Local Surface Water Supplies	19,500	3,100 acre-foot water right from Mallard Slough. 6,400 acre-foot water right from San Joaquin River by City of Antioch. 10,000 acre-foot water right from San Joaquin River by industrial water users in Contra Costa Water District (CCWD) service area.
Groundwater	3,000	–
Recycled Wastewater	14,100	–
Recycled Stormwater	–	–
Desalination	–	–
Transfers/Exchanges	8,200	Purchase surplus water from East Contra Costa Irrigation District.
Conservation	–	–
Total Water Supplies for NAA	**239,800**	–
Possible Future Water Supplies		
Subtotal Possible Future Water Supplies	–	–
Total Potential Future Water Supplies	**239,800**	–

Table 5D.33 East Bay Municipal Utility District

Items	Water Demand and Supplies (acre-feet)	Notes
Water Demand		
Service Area Water Demand	349,440 (Projected 2040 Water Demand)	East Bay Municipal Utility District. 2011. *Urban Water Management Plan 2010 Document*. June.
Water Sales to Others	–	–
Total Demand	**349,440**	–
Water Supplies for NAA		
CVP Water Supplies	Dry year supply	Up to 133,000 acre-feet in a dry year, with a maximum of 165,000 acre-feet over three dry years, CVP Water Service Contract (14-08-200-5183A-LTR1) from the American River.
SWP Water Supplies	–	–
Other Imported Water Supplies	Up to 240,800	East Bay Municipal Utility District has up to 364,037 acre-feet of water rights on the Mokelumne River, but available amount varies depending on hydrology per 2011. *Urban Water Management Plan 2010 Document*. June. “Other Imported Water Supplies” include East Bay Municipal Utility District’s entitlements on the Mokelumne River. Although East Bay Municipal Utility District has water rights up to 364,037 acre-feet, the actual amount available in any given year varies depending on hydrology, required releases to senior downstream water rights holders, and releases to meet instream flow requirements.
Local Surface Water Supplies	16,800	Water rights from local watersheds within the East Bay Municipal Utility District (EBMUD) watershed average 16,800 to 28,000 acre-feet per East Bay Municipal Utility District. 2011. *Urban Water Management Plan 2010 Document*.
Groundwater	Dry year supply	Up to 1,120 acre-feet in dry years from Bayside Groundwater Project Phase 1 groundwater recharge facility within EBMUD service area per East Bay Municipal Utility District. 2011. *Urban Water Management Plan 2010 Document*. June.

Items	Water Demand and Supplies (acre-feet)	Notes
Recycled Wastewater	22,400	22,400 acre-feet in East Bay Municipal Utility District. 2011. *Urban Water Management Plan 2010 Document*. June. East Bay Municipal Utility District's goal is to deliver 22,400 acre-feet of recycled water by the year 2040.
Recycled Stormwater	–	–
Desalination		
Transfers/Exchanges[a]	Dry year supply	5,040 to 49,952 acre-feet in dry years transfers from Northern California water users per East Bay Municipal Utility District. 2012. *Water Supply Management Program 2040 Plan*. April.
Conservation	69,440	East Bay Municipal Utility District's Water Conservation Master Plan is based on 69,440 acre-feet conservation in 2040 per East Bay Municipal Utility District. 2011. *Urban Water Management Plan 2010 Document*. June. East Bay Municipal Utility District's goal for conservation is 69,440 acre-feet by the year 2040.
Other Projects: Bayside Groundwater Project Phase 2[a]	Dry year supply	2,240 to 10,080 acre-feet in dry years Bayside Groundwater Project Phase 2 per East Bay Municipal Utility District. 2011. *Urban Water Management Plan 2010 Document*. June.
Total Water Supplies for NAA	**349,440** **Non-Dry year supply**	**Does not include CVP water supply for dry years, up to 15 percent rationing in dry years, or other dry year supply projects.** During normal years, East Bay Municipal Utility District anticipates having sufficient supplies to meet demands. Meeting customer demands during dry years will depend on the use of CVP supplies, rationing, and the implementation of additional water supply projects.
Possible Future Water Supplies		
Other Projects: Groundwater Banking outside of East Bay Municipal Utility District Service Area[a]	Dry year supply	Dry year supply of 4,704 acre-feet of groundwater banking in Sacramento Valley and/or 19,500 acre-feet in San Joaquin Valley; not anticipated until 2040 per East Bay Municipal Utility District. 2012. *Water Supply Management Program 2040 Plan*. April.

Items	Water Demand and Supplies (acre-feet)	Notes
Regional Desalination Facility[a]	Dry year supply–	Up to 22,400 acre-feet from regional desalination facility; however, not anticipated until 2040 per East Bay Municipal Utility District. 2012. *Water Supply Management Program 2040 Plan*. April.
Other Projects: Enlarge Lower Bear Reservoir[a]	Dry year supply–	Up to 4,500 acre-feet in dry years; however, not in plan for 2030 per East Bay Municipal Utility District. 2012. *Water Supply Management Program 2040 Plan*. April.
Other Projects: Expand Los Vaqueros Reservoir[a]	Dry year supply–	Exact amount available to be determined and additional study needed per East Bay Municipal Utility District. 2011. *Urban Water Management Plan 2010 Document*. June.
Subtotal Possible Future Water Supplies	–	All future projects not included for M&I No Action Alternative assumptions since some of the future projects are not fully defined or analyzed, or are scheduled to be completed after 2030.
Total Potential Future Water Supplies	**349,440 Non-Dry year supply**	**Does not include CVP water supply for dry years, up to 15 percent rationing in dry years, or other dry year supply projects.**

[a] East Bay Municipal Utility District has identified a range of water supply projects that it will pursue simultaneously to meet future water needs. By considering a broad mix of projects, with inherent scalability and the ability to adjust implementation schedules for a particular component, East Bay Municipal Utility District will be able to minimize the risks associated with future uncertainties such as project implementation challenges and climate change. If East Bay Municipal Utility District is able to successfully develop one component, this could result in deferral of other additional water supply components over the planning period.

Table 5D.34 Zone 7 Water Agency

Items	Water Demand and Supplies (acre-feet)	Notes
Water Demand		
Service Area Water Demand	66,300	Assume Low Water Demand to serve a portion of Livermore, Pleasanton, Dublin-San Ramon Services District, and Cal-Water Water Company, plus local retail treated and untreated water. Does not include 9,200 acre-feet for groundwater recharge. Zone 7 Water Agency. 2010. *2010 Urban Water Management Plan*. December 15.
Water Sales to Others	–	–
Total Demand	**66,300**	–
Water Supplies for NAA		
CVP Water Supplies	–	–
SWP Water Supplies	51,545	51,400 acre-feet from the 80,619 acre-foot SWP Water Entitlement. 145 acre-feet of SWP water from Yuba Accord. Portions are stored in Semitropic Water Storage District and Cawelo Water District groundwater banks, Lake Del Valle, and local groundwater.
Other Imported Water Supplies	–	–
Local Surface Water Supplies	7,100	Arroyo del Valle water rights.
Groundwater	9,200	Recharged by Zone 7 Water Agency; wells owned and operated by local agencies.
Recycled Wastewater	–	–
Recycled Stormwater	–	–
Desalination	–	–
Transfers/Exchanges	4,500	2,000 to 5,000 acre-feet from Byron-Bethany Irrigation District. Assume 4,500 acre-feet for long-term average.
Conservation	–	–

Items	Water Demand and Supplies (acre-feet)	Notes
Water Demand		
Service Area Water Demand	409,370	Santa Clara Valley Water District. 2011. *Urban Water Management Plan 2010*. June.
Water Sales to Others	–	–
Total Demand	**409,370**	–
Water Supplies for NAA		
CVP Water Supplies	108,120	152,500 acre-foot CVP Water Service Contract (7-07-20-W0023). Assume 108,120 acre-feet on long-term average per Santa Clara Valley Water District. 2011. *Urban Water Management Plan 2010*. April.
SWP Water Supplies	64,000	100,000 acre-foot SWP Water Entitlement. Assume 64,000 acre-feet on long-term average per Santa Clara Valley Water District. 2011. *Urban Water Management Plan 2010*. April.
Other Imported Water Supplies	61,000	61,000 acre-feet per Santa Clara Valley Water District. 2012. *Water Supply and Infrastructure Master Plan*. October. Up to 63,850 acre-feet from San Francisco Public Utility Commission per Santa Clara Valley Water District. 2011. *Urban Water Management Plan 2010*. April.
Local Surface Water Supplies	95,000	102,000 acre-feet per Santa Clara Valley Water District. 2012. *Water Supply and Infrastructure Master Plan*. October. Includes about 11,000 -12,000 acre-feet non-district surface water supplies. 93,500 acre-feet based upon reported local supplies minus groundwater component per Santa Clara Valley Water District. 2011. *Urban Water Management Plan 2010*. April.
Groundwater	61,000	61,000 acre-feet per Santa Clara Valley Water District. 2012. *Water Supply and Infrastructure Master Plan*. October. 60,300 acre-feet of effective natural groundwater recharge in Santa Clara Plain, Coyote Valley, and Llagas Subbasin basins per Santa Clara Valley Water District. 2011. *Urban Water Management Plan 2010*. April.
Recycled Wastewater	29,000	Per Santa Clara Valley Water District. 2012. *Water Supply and Infrastructure Master Plan*. October.

Items	Water Demand and Supplies (acre-feet)	Notes
Recycled Stormwater	–	–
Desalination	–	–
Transfers/Exchanges	4,000	Transfer from Patterson Irrigation District initiated in 2009 extended through 2024. This water is from Replacement Water, CVP Water Service Contract Water, and pre-1914 San Joaquin River water rights per Bureau of Reclamation. 2014. *Draft Findings of No Significant Impact, Patterson Irrigation District 10-Year Transfer and/or Warren Act Contract for up to 36,000 acre-feet of Available Surface Water Supply to Santa Clara Valley Water District*. May. Assume that this transfer is continued through 2030. Purchase of up to 20,000 acre-feet over a 20-year period from Pajaro Valley Water Management Agency during dry years; not included in long-term supply calculations. Assume 108,120 acre-feet on long-term average per Santa Clara Valley Water District. 2011. *Urban Water Management Plan 2010*. April.
Conservation	–	–
Total Water Supplies for NAA	**422,120**	–
Possible Future Water Supplies		
Brackish Groundwater Treatment in Pajaro Watershed	–	Per Santa Clara Valley Water District. 2011. *Urban Water Management Plan 2010*. April. Not included in Santa Clara Valley Water District. 2014. *FY 2014-15 Protection and Augmentation of Water Supplies*. February.
Regional Desalination Facility	–	Per Santa Clara Valley Water District. 2011. *Urban Water Management Plan 2010*. April. Not recommended at this time 61,000 acre-feet per Santa Clara Valley Water District. 2012. *Water Supply and Infrastructure Master Plan*. October; or per Santa Clara Valley Water District. 2014. *FY 2014-15 Protection and Augmentation of Water Supplies*. February.
Subtotal Possible Future Water Supplies	–	All future projects not included for M&I No Action Alternative assumptions since some of the future projects are not fully defined or analyzed.
Total Potential Future Water Supplies	**422,120**	–

Table 5D.37 San Benito County Water District, Zone 6

Items	Water Demand and Supplies (acre-feet)	Notes
Water Demand		
Service Area Water Demand	11,583	Per San Benito County Water District et al. (San Benito County Water District, Sunnyslope County Water District, and City of Hollister). 2011. *Draft Hollister Urban Area 2010 Urban Water Management Plan*. June 14. Does not include agricultural demands or groundwater use in San Juan Bautista, which does not directly use CVP water.
Water Sales to Others	100	–
Total Demand	**11,683**	–
Water Supplies for NAA		
CVP Water Supplies	8,250	43,800 acre-foot CVP Water Service Contract (8-07-20-W0130), including 8,250 acre-feet for Municipal & Industrial uses within Hollister and Sunnyslope County Water District. This use is limited by the Lessalt Water Treatment Plant capacity per San Benito County Water District et al. (San Benito County Water District, Sunnyslope County Water District, and City of Hollister). 2011. *Draft Hollister Urban Area 2010 Urban Water Management Plan*. June 14. Assumes expansion of water treatment plant capacity per Urban Water Management Plan and San Benito County Water District. 2014. *West Hills Water Treatment Plant Project, Draft Environmental Impact Report*. January. Remaining portion of the water supply, up to 35,550 acre-feet, is delivered to agricultural users and for groundwater recharge, which benefits Hollister, Sunnyslope, and San Juan Bautista communities.
SWP Water Supplies	–	–
Other Imported Water Supplies	–	–
Local Surface Water Supplies	–	–

Items	Water Demand and Supplies (acre-feet)	Notes
Groundwater	4,004	Per San Benito County Water District et al. (San Benito County Water District, Sunnyslope County Water District, and City of Hollister). 2011. *Draft Hollister Urban Area 2010 Urban Water Management Plan*. June 14. Storage has been purchased in Semitropic Water Storage District groundwater banking per San Benito County Water District. 2014. *West Hills Water Treatment Plant Project, Draft Environmental Impact Report*. January.
Recycled Wastewater	1,170	Per San Benito County Water District et al. (San Benito County Water District, Sunnyslope County Water District, and City of Hollister). 2011. *Draft Hollister Urban Area 2010 Urban Water Management Plan*. June 14.

5D.4 Central Coast Region

This section includes summaries of water demand and water supply projections for M&I users of SWP water supplies in the Central Coast Region (see Tables 5D.38 and 5D.39). The M&I water users are organized geographically in this section from north to south. The following water users contract with Central Coast Water Agency for SWP water supplies.

Table 5D.38 San Luis Obispo County Flood Control and Water Conservation District

Items	Water Demand and Supplies (acre-feet)	Notes
Water Demand		
Service Area Water Demand	8,250	1,505 acre-feet for City of Morro Bay per City of Morro Bay. 2011. *Final Report, 2010 Urban Water Management Plan* June. 2,364 acre-feet for City of Pismo Beach per City of Pismo Beach. 2011. *2010 Urban Water Management Plan*. September. 1,135 acre-feet for California Men's Colony; 94 acre-feet for County Operations Center; 125 acre-feet for Cuesta College; 1,419 acre-feet for Oceano Community Services District; 393 acre-feet for San Miguelito Mutual Water Company; 170 acre-feet for Avila Beach Community Services District; 32 acre-feet for Avila Valley Mutual Water Company; 7 acre-feet for San Luis Coastal Unified School District through San Luis Obispo County Service Area No. 12; and 1,100 acre-feet for Shandon (San Luis Obispo County Service Area No. 16) per San Luis Obispo County Flood Control and Water Conservation District. 2012. *San Luis Obispo County Master Water Report*. May.
Water Sales to Others	-100	100 acre-feet from Oceano Community Services District to the City of Arroyo Grande.
Total Demand	**8,150**	–
Water Supplies for NAA		
CVP Water Supplies	–	–

Items	Water Demand and Supplies (acre-feet)	Notes
SWP Water Supplies	5,007	1,313 acre-feet for City of Morro Bay of Central Coast Water Authority SWP Water Entitlement per City of Morro Bay. 2011. *Final Report, 2010 Urban Water Management Plan*. June. 1,740 acre-feet for City of Pismo Beach per City of Pismo Beach. 2011. *2010 Urban Water Management Plan*. September. 735 acre-feet for California Men's Colony; 150 acre-feet for County Operations Center; 140 acre-feet Cuesta College; 495 acre-feet for Oceano Community Services District; 275 acre-feet for San Miguelito Mutual Water Company; 66 acre-feet Avila Beach Community Services District; 20 acre-feet for Avila Valley Mutual Water Company; 7 acre-feet for San Luis Coastal Unified School District through San Luis Obispo County Service Area No. 12; and 66 acre-feet for Shandon (San Luis Obispo County Service Area No. 16) per San Luis Obispo County Flood Control and Water Conservation District. 2012. *San Luis Obispo County Master Water Report*. May.
Other Imported Water Supplies	–	–
Local Surface Water Supplies	2,015	896 acre-feet from Lopez Lake Reservoir for City of Pismo Beach per City of Pismo Beach. 2011. *2010 Urban Water Management Plan*. September. 445 acre-feet from Whale Rock Reservoir and Chorro Reservoir for California Men's Colony; 28 acre-feet from Whale Rock Reservoir for County Operations Center; 303 acre-feet from Lopez Lake Reservoir for Oceano Community Services District; 263 acre-feet from San Miguelito Mutual Water Company; 68 acre-feet from Lopez Lake Reservoir for Avila Beach Community Services District; and 12 acre-feet from Lopez Lake Reservoir for Avila Valley Mutual Water Company per San Luis Obispo County Flood Control and Water Conservation District. 2012. *San Luis Obispo County Master Water Report*. May.

Items	Water Demand and Supplies (acre-feet)	Notes
Groundwater	3,588	1,723 acre-feet for City of Morro Bay per City of Morro Bay. 2011. *Final Report, 2010 Urban Water Management Plan*. June. 700 acre-feet for City of Pismo Beach per City of Pismo Beach. 2011. *2010 Urban Water Management Plan*. September. 900 acre-feet for Oceano Community Services District; 118 acre-feet for San Miguelito Mutual Water Company; and 147 acre-feet for Shandon (San Luis Obispo County Service Area No. 16) per San Luis Obispo County Flood Control and Water Conservation District. 2012. *San Luis Obispo County Master Water Report*. May.
Recycled Wastewater	2,040	1,840 acre-feet for City of Pismo Beach per City of Pismo Beach. 2011. *2010 Urban Water Management Plan*. September. 200 acre-feet for California Men's Colony per San Luis Obispo Regional Water Management Group. 2014. *San Luis Obispo Integrated Regional Water Management Plan*. July.
Recycled Stormwater	–	–

Table 5D.39 Santa Barbara County Flood Control and Water Conservation District

Items	Water Demand and Supplies (acre-feet)	Notes
Water Demand		
Service Area Water Demand	72,515	1,635 acre-feet for City of Guadalupe per City of Guadalupe. 2014. *Water Master Plan Update*. May 13. 12,355 acre-feet for City of Santa Barbara per City of Santa Barbara. 2011. *Urban Water Management Plan, 2010 Update*. June. 19,564 acre-feet for City of Santa Maria per City of Santa Maria. 2011. *2010 Urban Water Management Plan*. July. 4,325 acre-feet for Carpinteria Valley Water District per Carpinteria Valley Water District. 2011. *Final 2010 Urban Water Management Plan Update*. June. 14,113 acre-feet for Goleta Water District per Goleta Water District. 2011. *Final 2010 Urban Water Management Plan Update*. November. 8,123 acre-feet for Golden State Water Company per Golden State Water Company. 2011. *Final Report, 2010 Urban Water Management Plan, Orcutt*. August. 1,434 acre-feet for City of Buellton; 1,868 acre-feet for La Cumbre Mutual Water Company; 5,633 acre-feet for Montecito Water District; 1,929 acre-feet for Santa Ynez River Water Conservation District, Improvement District #1; and 1,371 acre-feet for Vandenberg Air Force Base per Santa Barbara County. 2014. *Integrated Regional Water Management Plan 2013*. 33 acre-feet for Raytheon Systems Company and 132 acre-feet for Morehart Land Company (Naples Water Company) for SWP water demand only, per Central Coast Water Authority. 2011. *2010 Urban Water Management Plan*. June.
Water Sales to Others	3,420	3,420 acre-feet for Golden State Water Company, Orcutt community, and Nipomo Community Services District from City of Santa Maria per City of Santa Maria. 2011. *2010 Urban Water Management Plan*. July.
Total Demand	**75,935**	–

Items	Water Demand and Supplies (acre-feet)	Notes
Water Supplies for NAA		
CVP Water Supplies	–	–
SWP Water Supplies	39,440	367 acre-feet of the 550-acre-foot allocation of the Central Coast Water Authority SWP Water Entitlement for City of Guadalupe per City of Guadalupe. 2014. *Water Master Plan Update*. May 13. 1,802 acre-feet of the 3,000-acre-foot allocation of the Central Coast Water Authority SWP Water Entitlement for City of Santa Barbara per City of Santa Barbara. 2011. *Urban Water Management Plan, 2010 Update*. June. 22,936 acre-feet of the 16,200-acre-foot allocation of the Central Coast Water Authority SWP Water Entitlement for City of Santa Maria per City of Santa Maria. 2011. *2010 Urban Water Management Plan*. July. 1,200 acre-feet of the 2,000-acre-foot allocation of the Central Coast Water Authority SWP Water Entitlement for Carpinteria Valley Water District per Carpinteria Valley Water District. 2011. *Final 2010 Urban Water Management Plan Update*. June. 3,800 acre-feet of the 4,500-acre-foot allocation of the Central Coast Water Authority SWP Water Entitlement for Goleta Water District per Goleta Water District. 2011. *Final 2010 Urban Water Management Plan Update*. November. 1,109 acre-feet of the 500-acre-foot allocation of the Central Coast Water Authority SWP Water Entitlement for Golden State Water Company per Golden State Water Company. 2011. *Final Report, 2010 Urban Water Management Plan, Orcutt*. August.

Items	Water Demand and Supplies (acre-feet)	Notes
SWP Water Supplies (continued)	–	386 acre-feet of the 578-acre-foot allocation of the Central Coast Water Authority SWP Water Entitlement for City of Buellton; 667 acre-feet of the 1,000-acre-foot allocation of the Central Coast Water Authority SWP Water Entitlement for La Cumbre Mutual Water Company; 2,002 acre-feet of the 3,000-acre-foot allocation of the Central Coast Water Authority SWP Water Entitlement for Montecito Water District; 1,335 acre-feet of the 2,000-acre-foot allocation of the Central Coast Water Authority SWP Water Entitlement for Santa Ynez River Water Conservation District, Improvement District #1; and 3,670 acre-feet of the 5,500-acre-foot allocation of the Central Coast Water Authority SWP Water Entitlement for Vandenberg Air Force Base per Santa Barbara County. 2014. *Integrated Regional Water Management Plan 2013*. 33 acre-feet of the 50-acre-foot allocation of the Central Coast Water Authority SWP Water Entitlement for Raytheon Systems Company; and 133 acre-feet of the 200-acre-foot allocation of the Central Coast Water Authority SWP Water Entitlement for Morehart Land Company (Naples Water Company) per Central Coast Water Authority. 2011. *2010 Urban Water Management Plan*. June.
Water Supplies from Reclamation Cachuma Project	23,534	6,566 acre-feet for City of Santa Barbara per City of Santa Barbara. 2011. *Urban Water Management Plan, 2010 Update*. June. 2,250 acre-feet for Carpinteria Valley Water District per Carpinteria Valley Water District. 2011. *Final 2010 Urban Water Management Plan Update*. June. 9,322 acre-feet for Goleta Water District per Goleta Water District. 2011. *Final 2010 Urban Water Management Plan Update*. November. 2,777 acre-feet for Montecito Water District; and 2,619 acre-feet for Santa Ynez River Water Conservation District, Improvement District #1 per Santa Barbara County. 2014. *Integrated Regional Water Management Plan 2013*.

Items	Water Demand and Supplies (acre-feet)	Notes
Local Surface Water Supplies	21,742	4,331 acre-feet of water rights on Santa Ynez River and Devils Canyon Creek for City of Santa Barbara per City of Santa Barbara. 2011. *Urban Water Management Plan, 2010 Update*. June. 14,300 acre-feet from Twitchell Reservoir for City of Santa Maria per City of Santa Maria. 2011. *2010 Urban Water Management Plan*. July. 611 acre-feet for City of Buellton; 1,500 acre-feet for Montecito Water District; and 1,000 acre-feet for Santa Ynez River Water Conservation District, Improvement District #1 per Santa Barbara County. 2014. *Integrated Regional Water Management Plan 2013*.
Groundwater	29,664	1,300 acre-feet with well modifications for City of Guadalupe per City of Guadalupe. 2014. *Water Master Plan Update*. May 13. 1,125 acre-feet for City of Santa Barbara per City of Santa Barbara. 2011. *Urban Water Management Plan, 2010 Update*. June. 12,795 acre-feet for City of Santa Maria per City of Santa Maria. 2011. *2010 Urban Water Management Plan*. July. 2,000 acre-feet for Carpinteria Valley Water District per Carpinteria Valley Water District. 2011. *Final 2010 Urban Water Management Plan Update*. June. 2,350 acre-feet for Goleta Water District per Goleta Water District. 2011. *Final 2010 Urban Water Management Plan Update*. November. 10,094 acre-feet for Golden State Water Company per Golden State Water Company. 2011. *Final Report, 2010 Urban Water Management Plan, Orcutt*. August. Not quantified use for City of Buellton; La Cumbre Mutual Water Company; Montecito Water District; Santa Ynez River Water Conservation District, Improvement District #1; and Vandenberg Air Force Base per Santa Barbara County. 2014. *Integrated Regional Water Management Plan 2013*; and Central Coast Water Authority. 2011. *2010 Urban Water Management Plan*. June.

Items	Water Demand and Supplies (acre-feet)	Notes
Recycled Wastewater	2,250	1,100 acre-feet for City of Santa Barbara per City of Santa Barbara. 2011. *Urban Water Management Plan, 2010 Update*. June. 1,150 acre-feet for Goleta Water District per Goleta Water District. 2011. *Final 2010 Urban Water Management Plan Update*. November.
Recycled Stormwater	–	–
Desalination	7,500	7,500 acre-feet Santa Barbara (based on websites accessed in January 2015 for City of Santa Barbara).
Transfers/Exchanges	–	–
Conservation	–	–
Total Water Supplies for NAA	**124,130**	–
Possible Future Water Supplies	–	Modifications in groundwater management, desalination, and expansion of reclamation facilities for City of Santa Barbara per City of Santa Barbara. 2011. *Urban Water Management Plan, 2010 Update*. June. Desalination capacity of 3,125 acre-feet per Santa Barbara County. 2014. *Integrated Regional Water Management Plan 2013.* Additional wells, use of recycled water, increased use of local water rights per Carpinteria Valley Water District. 2011. *Final 2010 Urban Water Management Plan Update*. June. Water system improvements and additional groundwater facilities for cities of Buellton, Guadalupe, Santa Barbara, and Santa Maria, and Goleta Water District per Santa Barbara County. 2014. *Integrated Regional Water Management Plan 2013.*
Subtotal Possible Future Water Supplies	–	All future projects not included for M&I No Action Alternative assumptions since some of the future projects are not fully defined or analyzed.
Total Potential Future Water Supplies	**124,130**	–

5D.5 Southern California Region

This section includes summaries of water demand and water supply projections for M&I users of SWP water supplies in the Southern California Region (see Tables 5D.40 through 5D.50). The M&I water users are generally organized geographically in this section from north to south.

Table 5D.40 Antelope Valley-East Kern Water Agency

Items	Water Demand and Supplies (acre-feet)	Notes
Water Demand		
Service Area Water Demand	96,558	Antelope Valley-East Kern Water Agency. 2011. *2010 Urban Water Management Plan*. June.
Water Sales to Others	–	–
Total Demand	**96,558**	–
Water Supplies for NAA		
CVP Water Supplies	–	–
SWP Water Supplies	87,688	87,688 acre-feet of the 141,400-acre-foot SWP Water Entitlement.

Total Potential Future Water Supplies	**5,052,000**	–

Appendix 5E

Sensitivity Analysis - Revised Second Basis of Comparison with no Fremont Weir Notch

Comment Number 90 from State Water Contractors on the Draft LTO EIS discussed that the Reasonable and Prudent Alternative (RPA) actions from the 2008 USFWS BO and 2009 NMFS BO should not have been included in the Second Basis of Comparison, including a specific reference to restoration of tidal habitat under Component 4 of the RPA in the USFWS BO and restoration of floodplain habitat under Action I.6.1 of the RPA in the NMFS BO.

As described in Section 3.3.1.2 of Chapter 3, Description of Alternatives, in the Draft EIS, tidal wetlands restoration activities under Component 4 of the USFWS BO include actions adopted, initiated, or constructed since 2012 (e.g., Suisun Marsh Habitat Management, Preservation, and Restoration Plan and restoration activities in the Cache Slough area); and therefore, were considered to be included in all of the alternatives and the Second Basis of Comparison.

As described in Section 3.3.1.2, substantial efforts have been completed to develop floodplain restoration activities under Action I.6.1 of the NMFS BO; however, specific details of the floodplain restoration activities have not been completed at this time. Therefore, the EIS analysis used published assumptions related to water operations associated with Action I.6.1, including use of an operable gate to convey water from Sacramento River near Fremont Weir into Yolo Bypass.

Although inclusion of an operable gate at the Fremont Weir is considered reasonable and foreseeable and is included in the Second Basis of Comparison, a sensitivity analysis without the operable gate was conducted to analyze possible effects of the operable gate on overall system operations.

The inclusion of an operable gate at the Fremont Weir would primarily affect flows in the Yolo Bypass and have minimal, if any effects, on flows in the Sacramento River downstream of the Fremont Weir or in the Delta, as shown in this sensitivity analysis. The model results of this sensitivity analysis are presented in Section 5E.3 of this appendix.

5E.1 Methodology

CalSim II model simulation representing the Revised Second Basis of Comparison[1] is rerun without an operable gate (notch) in the Fremont Weir. The Revised Second Basis of Comparison 2 (SBC_R_2) is compared against the

[1] Please refer to Appendix 5C for detailed description of the Revised Second Basis of Comparison.

Revised Second Basis of Comparison (SBC_R) to identify the extent of the effects of this change. As presented in the next section, the results show that the effects of the removal of the Fremont Weir notch are primarily contained within the Yolo Bypass and the Sacramento River downstream of the Fremont Weir.

5E.2 Analysis Results

Model results comparing Revised Second Basis of Comparison without an operable gate (notch) in the Fremont Weir (SBC_R_2) to the Revised Second Basis of Comparison (SBC_R) presented in Section 5E.3.1. Except for flow over Fremont Weir from the Sacramento River, flow in the Yolo Bypass, and Sacramento River flows at Freeport, all of the parameters are similar (less than 5 percent change) under both model runs.

In general, with the removal of the Fremont Weir notch, Fremont Weir spills to Yolo Bypass are reduced. As a results of this, Yolo Bypass flows are reduced, Sacramento River flows at Freeport are increased, and Sacramento River flows at Rio Vista are similar. Because this is a rerouting of high flows, no additional changes are observed in overall system.

5E.3 Model Run Results

Model results for the Revised Second Basis of Comparison compared with Second Basis of Comparison Results are presented on the following pages.

5E.3.1 Trinity Storage

5E.3.2 Shasta Storage

5E.3.3 Oroville Storage

5E.3.4 Folsom Storage

5E.3.5 New Melones Storage

5E.3.6 Delta Outflow

5E.3.7 Exports through Jones and Banks Pumping Plants

5E.3.8 Trinity River below Lewiston Dam

5E.3.9 Clear Creek below Whiskeytown Dam

5E.3.10 Sacramento River downstream of Keswick Dam

5E.3.11 Feather River downstream of Thermalito Afterbay

5E.3.12 Fremont Weir Spills

5E.3.13 American River below Nimbus Dam

5E.3.14 Sacramento River at Freeport

5E.3.15 Yolo Bypass Flow

5E.3.16 Sacramento River at Rio Vista

5E.3.17 San Joaquin River at Vernalis Flow

5E.3.18 San Joaquin River at Vernalis Salinity

5E.3.19 Stanislaus River below Goodwin Flow

5E.3.20 Stanislaus River at Mouth Flow

5E.3.21 CALSIM II Summary Reporting Metrics, Long-Term Average and Dry and Critical Year Averages, CVP Deliveries

5E.3.22 CALSIM II Summary Reporting Metrics, Long-Term Average and Dry and Critical Year Averages, CVP

5E.3.23 CALSIM II Summary Reporting Metrics, Long-Term Average and Dry and Critical Year Averages, SWP Deliveries

5E.3.24 CALSIM II Summary Reporting Metrics, Long-Term Average and Dry and Critical Year Averages, SWP

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the San Joaquin Valley 60-20-20 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the San Joaquin Valley 60-20-20 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in text.

Appendix 6B, Section A

Surface Water Temperature Modeling

This appendix provides information about the methods and assumptions used for the Coordinated Long-Term Operation of the Central Valley Project (CVP) and State Water Project (SWP) Environmental Impact Statement (EIS) analysis on surface water temperature. The appendix also provides temperature model results and interpretation methods used for the impacts analysis and descriptions. Additional information pertaining to the development of the analytical tools, incorporating climate change, and the use of input data from other models, is also provided. This appendix is organized into three sections that are briefly described below:

- Appendix 6B, Section A: Surface Water Temperature Modeling Methodology, Simulations, and Assumptions
  - The water quality impacts analysis uses the HEC-5Q and Reclamation Monthly Temperature models to assess and quantify effects of the alternatives on the environment. This section provides information about the overall analytical framework linkages with other models.
  - This section provides a brief description of the assumptions for the surface water temperature model simulations of the No Action Alternative, Second Basis of Comparison, and other alternatives.
- Appendix 6B, Section B: Surface Water Temperature Modeling Results
  - This section provides model outputs and a description of the model simulation output formats used in the analysis and interpretation of modeling results for the alternatives impacts assessment.
- Appendix 6B, Section C: HEC-5Q Model Update for Surface Water Temperature Modeling
  - This section provides a detailed description of the compilation and updates of the HEC-5Q models performed during development of the EIS for the Trinity-Sacramento, American, and Stanislaus Rivers.

6B.A.1 Surface Water Temperature Modeling Methodology

This section summarizes the surface water temperature modeling methodology used for the No Action Alternative, Second Basis of Comparison, and other alternatives. It describes how temperature modeling fits into the overall analytical framework and contains descriptions of the key analytical and numerical tools and approaches used in the quantitative evaluation of the alternatives.

In the evaluation of the No Action Alternative, Second Basis of Comparison, and other alternatives, climate change assumptions at the Year 2030 are used to develop modified climate input files for the temperature models. The modeling assumptions are provided in Section 6B.A.2.

6B.A.1.1 Overview of the Modeling Approach

To support the water quality and aquatic resources impact analyses of the alternatives, modeling of surface water temperature in the Central Valley is necessary to evaluate changes to conditions affecting surface water temperatures in rivers that are affected by SWP and CVP operations. Two different surface water temperature modeling tools were used for the analysis. The HEC-5Q model simulated daily temperatures for the Trinity River (downstream of Lewiston Dam), Sacramento River (from Keswick Dam to the Feather River confluence), American River (from Nimbus Dam to Sacramento River confluence), and Stanislaus River (from New Melones Dam to the confluence with San Joaquin River). The Reclamation Temperature Model was used for simulating monthly temperatures for the Feather and Lower Sacramento (from the Feather River confluence to Freeport) rivers. Both models used CalSim II outputs as stream flow and reservoir storage inputs. The results from these models are used to inform the understanding of effects on the surface water temperature of each individual alternative considered in the EIS.

6B.A.1.1.1 HEC-5Q

Over the past 15 years, various temperature models were developed to simulate temperature conditions on the rivers affected by CVP and SWP operations (Sacramento River Water Quality Model [SRWQM], San Joaquin River HEC-5Q model) (Reclamation 2008). Recently, these models were compiled and updated into a single modeling package hereafter referred to as the HEC-5Q model. Further updates were performed under the EIS modeling that included improved meteorological data and subsequent validation of the Sacramento and American River models, implementation of the Folsom Temperature Control Devices and low-level outlet, implementation of the Trinity River auxiliary outlet, improved temperature targeting for the Shasta and Folsom Dams, as well as improved documentation and streamlining of the models as well as improved integration with the CalSim II model.

Section 6B.C.4 of this appendix is consistent with the technical memorandum submitted to Reclamation that documented changes in the HEC-5Q compilation and updates for the temperature models.

The HEC-5Q model contains three separate models that simulate reservoir and river temperatures:

- The Trinity River from Trinity Dam to below Lewiston Dam and the Sacramento River from Shasta Dam to the Feather River confluence. Reservoir temperatures are simulated for Trinity Lake, Lewiston Reservoir, Shasta Lake, Keswick Reservoir, and Black Butte Reservoir (see Figure 6B.A.1 for a schematic of the Trinity-Sacramento River HEC-5Q model).

- The American River from Folsom Dam to the confluence with the Sacramento River. Reservoir temperatures were simulated for Folsom Lake and Lake Natoma (see Figure 6B.A.2 for a schematic of the American River HEC-5Q model).
- The Stanislaus River from upstream of New Melones Reservoir to the confluence with the San Joaquin River and the lower San Joaquin River from the Stanislaus River confluence to below Vernalis. Reservoir temperatures were simulated for New Melones Reservoir (see Figure 6B.A.3 for a schematic of the Stanislaus River HEC-5Q model).

The HEC-5Q model was developed using integrated HEC-5 and HEC-5Q models. The HEC-5 component of the model simulates daily reservoir and river flow operations from monthly CalSim II data that are disaggregated to daily data. The HEC-5Q component simulates mean daily reservoir and river temperatures based on the daily flow inputs and meteorological parameters specified on a 6-hour time step.

6B.A.1.1.2 Reclamation Temperature Model

The Reclamation Temperature Model includes reservoir and stream temperature models that simulate monthly reservoir and stream temperatures used for evaluating the effects of CVP and SWP project operations on mean monthly water temperatures in the basin (Reclamation 2008). The model simulates temperatures in seven major reservoirs (Trinity Lake, Whiskeytown Reservoir, Shasta Lake, Oroville Reservoir, Folsom Lake, New Melones Reservoir, and Tulloch Reservoir), four downstream regulating reservoirs (Lewiston, Keswick, and Goodwin reservoirs; Lake Natoma), and five main river systems (Trinity, Sacramento, Feather, American, and Stanislaus rivers). The river component of the Reclamation Temperature Model calculates temperature changes in the regulating reservoirs, below the main reservoirs. With regulating reservoir release temperature as the initial river temperature, the river model computes temperatures at several locations along the rivers. The calculation points for river temperatures generally coincide with tributary inflow locations. The model is one-dimensional in the longitudinal direction and assumes fully mixed river cross sections. The effect of tributary inflow on river temperature is computed by mass balance calculation. The river temperature calculations are based on regulating reservoir release temperatures, river flows, and climatic data.

For the EIS, the Reclamation Temperature Model was used for the Feather River and lower Sacramento River from the Feather River confluence to Freeport. Sacramento, Trinity, American, and Stanislaus rivers temperature effects were analyzed using the daily HEC-5Q models described in the previous section.

For more information on the Reclamation Temperature Model, see Appendix H of the Reclamation's 2008 Operation Criteria and Plan (OCAP) Biological Assessment (BA) (Reclamation 2008).

6B.A.2 Surface Water Temperature Modeling Simulations and Assumptions

This section describes the assumptions for the HEC-5Q and Reclamation Temperature Model monthly temperature simulations of the No Action Alternative, Second Basis of Comparison, and Alternatives 1 through 5.

The following model simulations were performed as the basis of evaluating the impacts of Alternatives 1 through 5 as compared to the No Action Alternative, and the No Action Alternative and Alternatives 1 through 5 as compared to the Second Basis of Comparison:

- No Action Alternative
- Second Basis of Comparison
- Alternative 1 – for simulation purposes, considered the same as Second Basis of Comparison
- Alternative 2 – for simulation purposes, considered the same as No Action Alternative
- Alternative 3
- Alternative 4 – for simulation purposes, considered the same as Second Basis of Comparison.
- Alternative 5

Assumptions for each of these alternatives were developed with the surface water modeling tools and are described in Appendix 5A, Section B.

Alternative 1 modeling assumptions are the same as the Second Basis of Comparison and Alternative 2 modeling assumptions are the same as the No Action Alternative; therefore, the assumptions for those alternatives are not discussed separately in this document.

The general modeling assumptions described below pertain to the model runs for the No Action Alternative, Second Basis of Comparison, and Alternatives 1 through 5.

6B.A.2.1 Input Storage and Streamflow

6B.A.2.1.1 HEC-5Q

Monthly flows simulated by the CalSim II model for an 82-year period (water years 1922 through 2003) are used as input to HEC-5Q. Temporal downscaling is performed[1] on the CalSim II monthly average tributary flows to convert them to

[1] A constant daily flow that is equivalent to monthly average flow simulated in CalSim II is assumed throughout the month for each month of the 82-year CalSim II simulation period. An exception to this is the inflow timeseries to Trinity, Shasta, and New Melones reservoirs, where monthly average inflows are downscaled to a daily timestep by fitting to a cubic-spline. This allows simulation of a daily varying inflow into the reservoirs with a smooth transition between the individual months, while assuming the same monthly volume of inflow consistent with CalSim II.

daily average flows for HEC-5Q input using a pre-processing tool (see Tables 6B.A.1 to 6B.A.3 for a list of all of the CalSim II inputs).

6B.A.2.1.2 Reclamation Temperature Model

Monthly flows that were simulated by the CalSim II model for an 81-year period (January 1922 to December 2002) are used as input to the model. Because of the CalSim II model's complex structure, where applicable, flow arcs were combined at the appropriate temperature nodes to ensure compatibility with the Reclamation Temperature Model.

6B.A.2.2 Climate Change Assumptions

When simulating alternatives with climate change, some of the inputs to the temperature models must be modified. This section presents the assumptions and approaches used for modifying meteorological and inflow temperatures in the temperature models. For the alternative simulations, climate assumptions were established around Year 2030. Therefore, to be consistent with the other water supply and economics models, the climate input data for HEC-5Q and Reclamation Temperature Model were modified to represent approximate conditions at Year 2030.

6B.A.2.2.1 HEC-5Q

HEC-5Q requires meteorological inputs specified in the form of equilibrium temperatures, exchange rates, shortwave radiation and wind speed. The exchange rates and equilibrium temperatures are computed from hourly observed data at the Gerber gauging station. Considering the uncertainties associated with climate change impacts, it was assumed that the equilibrium temperature inputs derived from observed data would be modified by the change in daily average air temperature projected under the climate change scenarios.

The inflow temperatures in HEC-5Q are specified as seasonal curve fit values with diurnal variations superimposed as a function of heat exchange parameters. The seasonal temperature values are derived based on the observed flows and temperatures for each inflow. HEC-5Q superimposes diurnal variations on the seasonal values specified using the heat exchange parameter inputs. The diurnal variations are superimposed by adjusting the equilibrium temperature to reflect the inflow location environment and scaling it based on the heat exchange rate scaling factor and the weighting factor for emphasis on the seasonal values specified. In this fashion, any climate change effects accounted for in the equilibrium temperature are translated to the changes in inflow temperatures in the HEC-5Q. Therefore, for the climate change scenarios, only the equilibrium temperatures were adjusted for the projected change in temperature, and these influence the inflow temperatures; however, independent inflow temperature inputs were not changed.

6B.A.2.2.2 Reclamation Temperature Model

The Reclamation Temperature Model requires mean monthly meteorological inputs of air and equilibrium temperature and heat exchange rates. The heat exchange rates and equilibrium temperatures are computed from the mean monthly air temperature data and long-term estimates of solar radiation, relative humidity, wind speed, cloud cover, solar reflectivity, and river shading. Considering the uncertainties associated with climate change impacts, it was assumed that the equilibrium temperature and heat exchange rate inputs would be modified by the change in mean monthly air temperature in the climate change scenarios.

Reservoir inflow temperatures were derived from the available record of observed data and averaged by month. The mean monthly inflow temperatures are then repeated for each study year. For alternatives modeled with climate change, the inflow temperatures were modified based on the projected long-term average change in mean annual air temperature for each month.

Surface Water Temperature Modeling Results

This appendix provides information about the methods and assumptions used for the Coordinated Long-Term Operation of the Central Valley Project (CVP) and State Water Project (SWP) Environmental Impact Statement (EIS) analysis on surface water temperature. The appendix is organized into three sections that are briefly described below:

- Appendix 6B, Section A: Surface Water Temperature Modeling Methodology, Simulations, and Assumptions
  - The water quality impacts analysis uses the HEC-5Q and Reclamation Monthly Temperature models to assess and quantify effects of the alternatives on the environment. This section provides information about the overall analytical framework linkages with other models.
  - This section provides a brief description of the assumptions for the surface water temperature model simulations of the No Action Alternative, Second Basis of Comparison, and other alternatives.
- Appendix 6B, Section B: Surface Water Temperature Modeling Results
  - This section provides model outputs and a description of the model simulation output formats used in the analysis and interpretation of modeling results for the alternatives impact assessment.
- Appendix 6B, Section C: HEC-5Q Model Update for Surface Water Temperature Modeling
  - This section provides a detailed description of the compilation and updates of the HEC-5Q models performed during development of the EIS for the Trinity-Sacramento, American, and Stanislaus Rivers.

6B.B.1 Introduction

This section provides surface water temperature model (HEC-5Q and Reclamation Temperature Model) simulation results for alternatives evaluated for the EIS. The sections provided for each parameter include figures and tables in various formats to provide the reader with tools for multiple ways of analysis.

The different types of presentations are explained as follows:

- **Probability of Exceedance Plots:** Probability of exceedance plots provide the frequency of occurrence of values of a parameter that exceed a reference value. For this appendix, the calculation of exceedance probability is done by ranking the data. For example, for Shasta storage end-of-September exceedance plot, Shasta storage values at the end of September for each simulated year are sorted in ascending order. The smallest value would have a probability of exceedance of 100 percent since all other values would be greater than that value; and the largest value would have a probability of exceedance of 0 percent. All of the values are plotted with probability of exceedance on the x-axis and the value of the parameter on the y-axis. Following the same example, if for one scenario, Shasta Lake end-of-September storage of 2,000 thousand acre-feet (TAF) corresponds to 80 percent probability, it implies that Shasta end-of-September storage is higher than 2,000 TAF in 80 percent of the years under the simulated conditions.

- **Long-Term Average Summary and Year-Type-Based Statistics Summary Tables**: These tables provide parameter values for each 10 o increment of exceedance probability (rows) for each month (columns) as well as long-term and year-type averages (using the Sacramento Valley 40-30-30 Index developed by the State Water Resources Control Board for projected climate at Year 2030) for each month. For a few parameters, such as Delta outflow, annual total or average values are added to the tables (for volume and rates, respectively).

All plots and tables are prepared to accommodate following comparisons:

- No Action Alternative (with climate change and sea-level rise at Year 2030) compared to the Second Basis of Comparison (with climate change and sea-level rise at Year 2030)
- Alternatives (with climate change and sea-level rise at Year 2030) compared to the No Action Alternative
- Alternatives (with climate change and sea-level rise at Year 2030) compared to the Second Basis of Comparison

6B.B.1.1 Appropriate Use of Model Results

The physical models developed and applied in the EIS analysis are generalized and simplified representations of a complex water resources system. A brief description of the appropriate use of the model results to compare two scenarios or to compare against threshold values or standards is presented below.

6B.B.1.1.1 Absolute vs. Relative Use of the Model Results

The models are not predictive models (in how they are applied in this project), and therefore the results cannot be considered as absolute with and within a quantifiable confidence interval. The model results are only useful in a comparative analysis and can only serve as an indicator of condition (e.g., compliance with a standard) and of trend (e.g., generalized impacts).

6B.B.1.2 Appropriate Reporting Time-Step

Due to the assumptions involved in the input data sets and model logic, care must be taken to select the most appropriate time-step for the reporting of model results. Sub-monthly (e.g., weekly or daily) reporting of model results is inappropriate for all models and the results should be presented on a monthly basis.

6B.B.1.3 Statistical Comparisons Are Preferred

Absolute differences computed at a point in time between model results from an alternative and a baseline to evaluate impacts is an inappropriate use of model results (e.g., computing differences between the results from a baseline and an alternative for a particular day or month and year within the period of record of simulation). Likewise computing absolute differences between an alternative (or a baseline) and a specific threshold value or standard is an inappropriate use of model results. Statistics computed based on the absolute differences at a point in time (e.g., average of monthly differences) are an inappropriate use of model results. By computing the absolute differences in this way, disregards the changes in antecedent conditions between individual scenarios and distorts the evaluation of impacts of a specific action.

Reporting seasonal patterns from long-term averages and water year-type averages is appropriate. Statistics computed based on long-term and water year-type averages are an appropriate use of model results. Computing differences between long-term or water year type averages of model results from two scenarios are appropriate. Care should be taken to use the appropriate water year type for presenting water year-type average statistics of model results (e.g., D1641 Sacramento River 40-30-30 index or San Joaquin River 60-20-20 index based on climate modifications). For this study, water year-types are based on the projected climate and hydrology at Year 2030.

The most appropriate presentation of monthly and annual model results is in the form of probability distributions and comparisons of probability distributions (e.g., cumulative probabilities). If necessary, comparisons of model results against threshold or standard values should be limited to comparisons based on cumulative probability distributions.

6B.B.2 Results

The results are presented in the following figures.

- B.1. Trinity River below Lewiston Temperature
- B.2. Clear Creek below Whiskeytown Temperature
- B.3. Clear Creek at Igo Temperature
- B.4. Clear Creek at Mouth Temperature
- B.5. Sacramento River below Keswick Temperature
- B.6. Sacramento River at Balls Ferry Temperature
- B.7. Sacramento River at Jellys Ferry Temperature
- B.8. Sacramento River at Bend Bridge Temperature
- B.9. Sacramento River at Red Bluff Temperature
- B.10. Sacramento River at Hamilton City Temperature
- B.11. Sacramento River at Knights Landing Temperature

- B.12. American River below Nimbus Temperature
- B.13. American River at Watt Avenue Temperature
- B.14. American River at Mouth Temperature
- B.15. Stanislaus River below New Melones Temperature
- B.16. Stanislaus River below Tulloch Temperature
- B.17. Stanislaus River below Goodwin Temperature
- B.18. Stanislaus River at Orange Blossom Bridge Temperature
- B.19. Stanislaus River at Mouth Temperature
- B.20. Feather River Low Flow Channel
- B.21. Feather River at Robinson Riffle
- B.22. Feather River at Gridley Bridge

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Qualitative differences, if applicable, are discussed in the text.

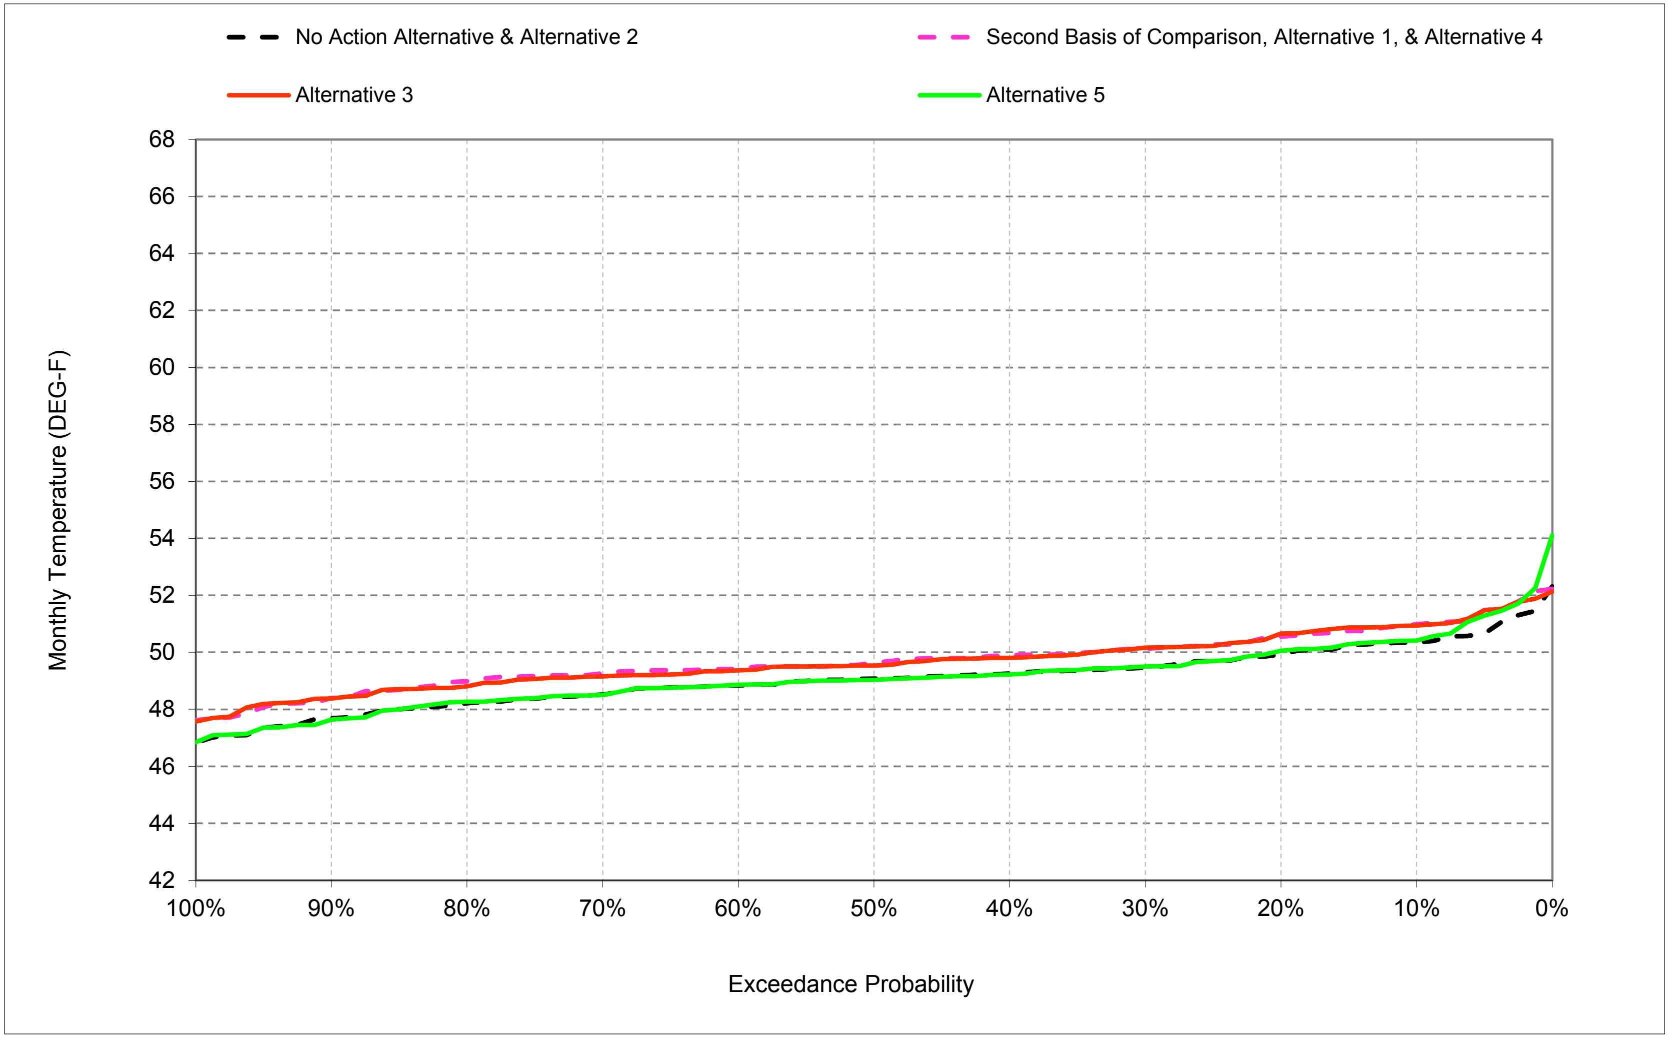
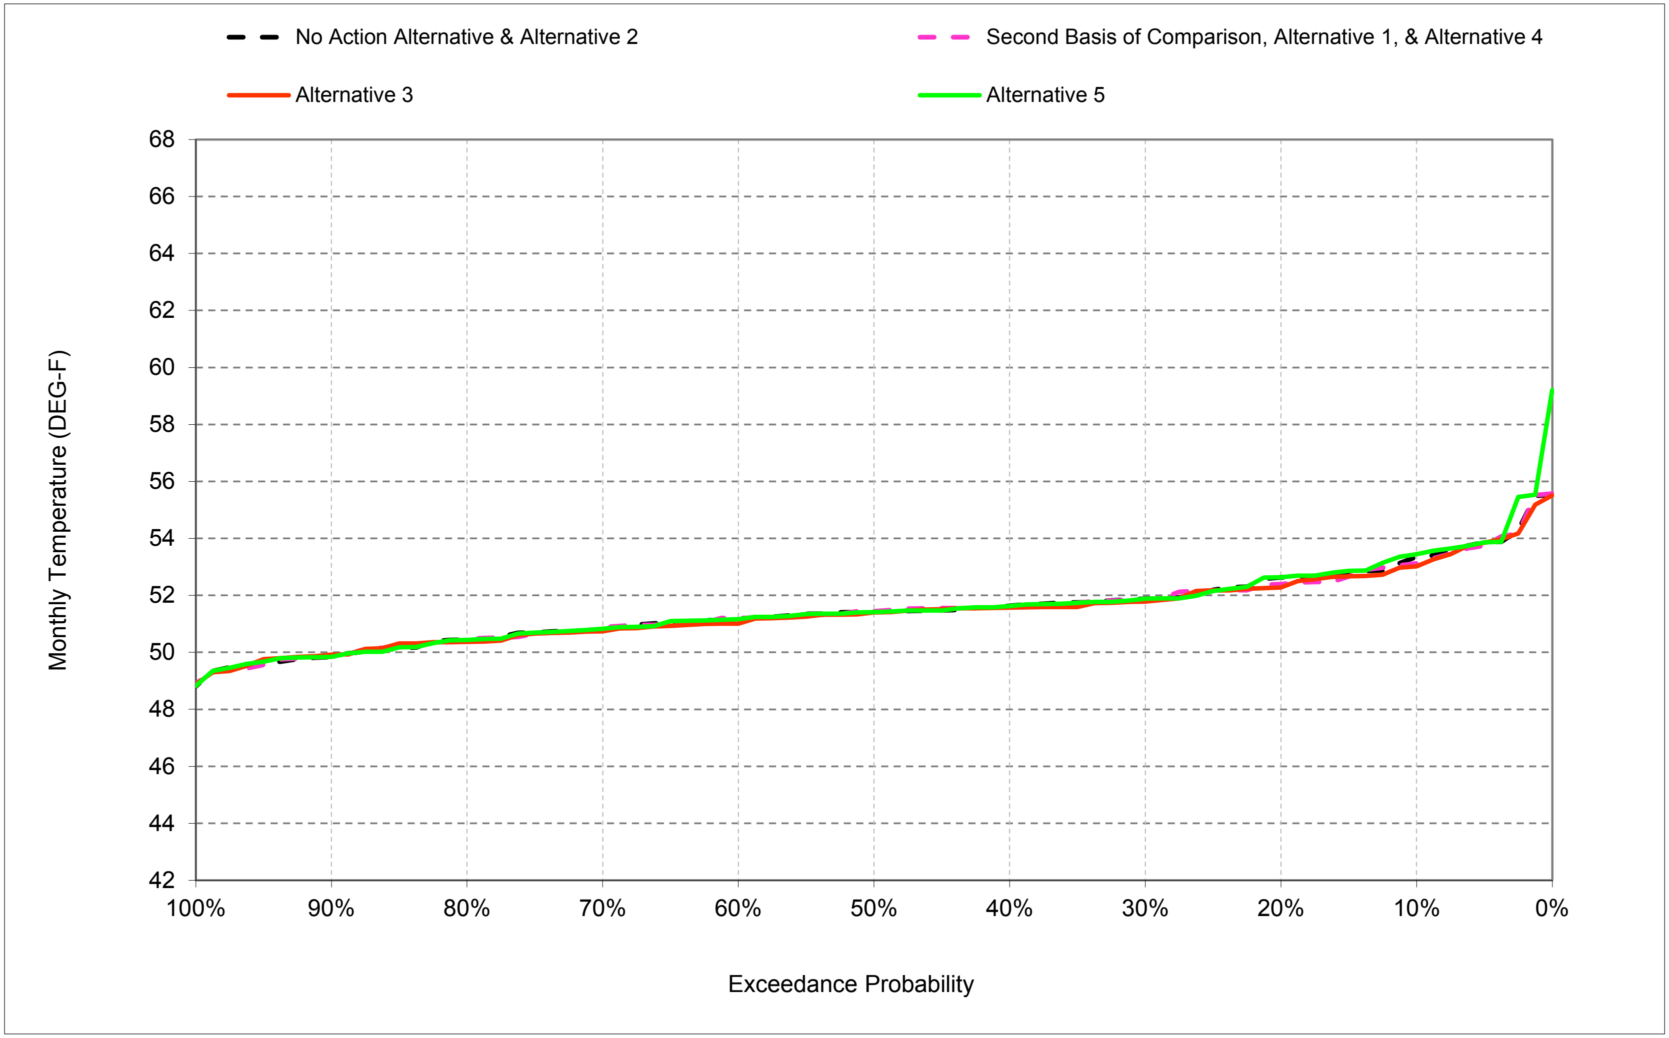
Figure B-3-8. Clear Creek at Igo, May



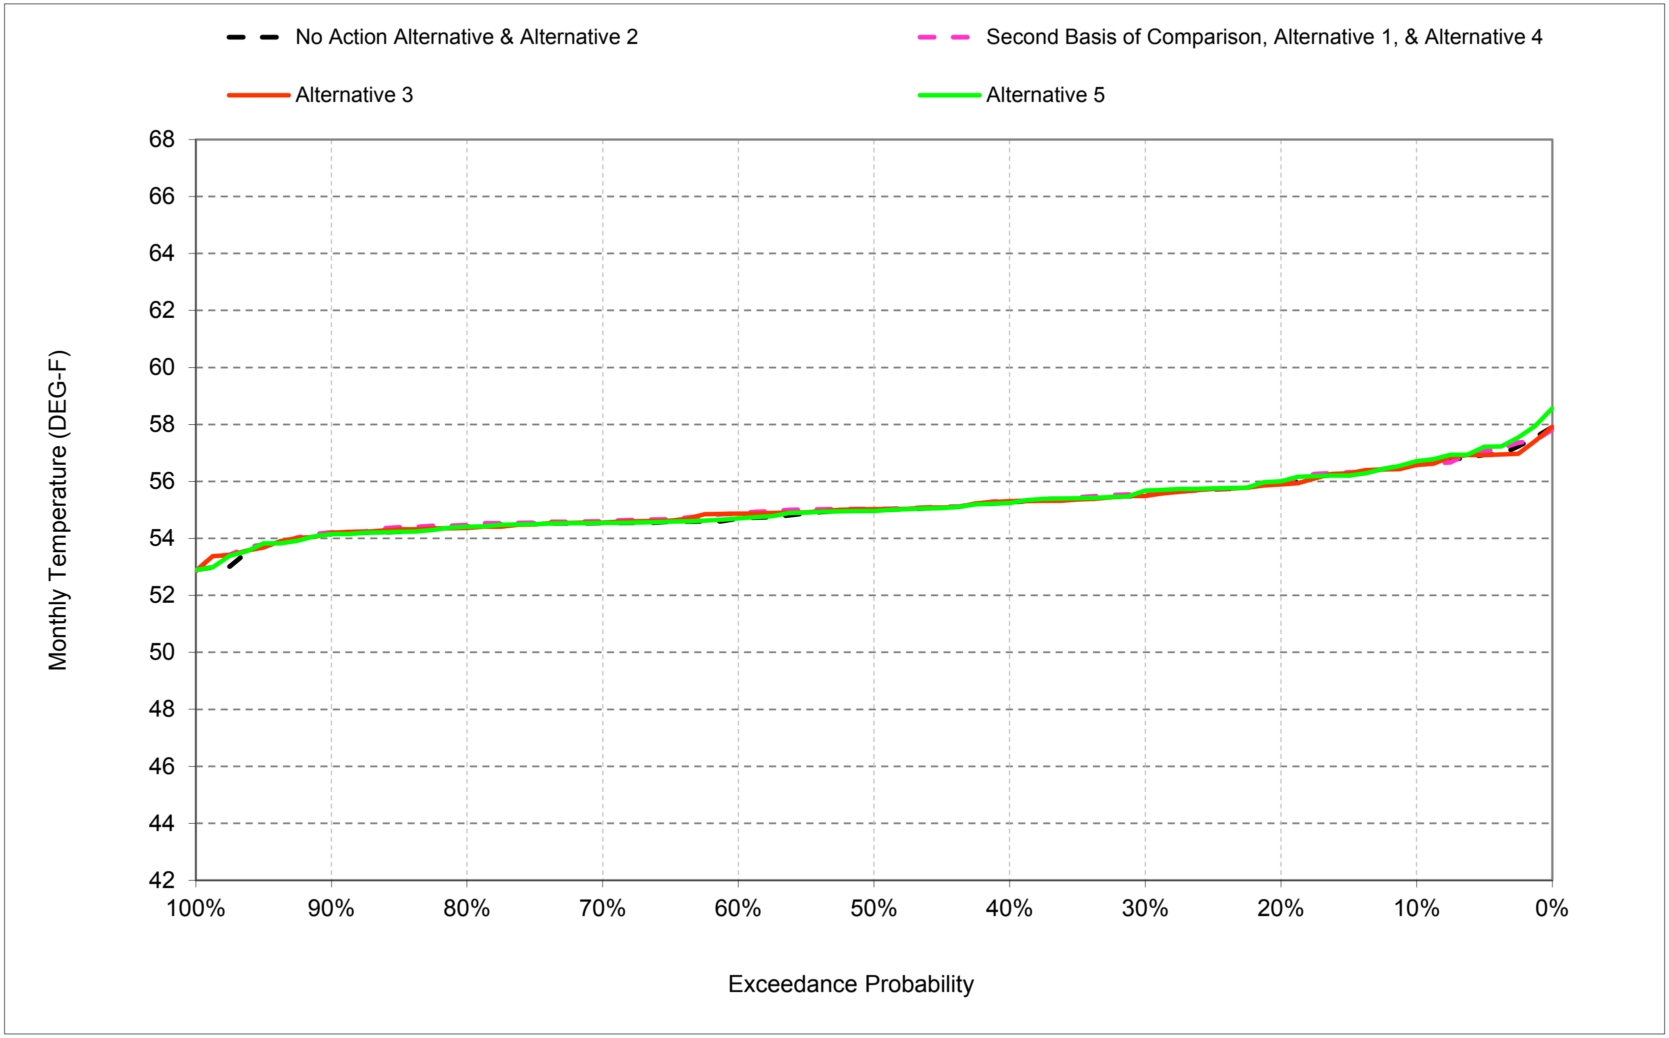
Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-3-9. Clear Creek at Igo, June



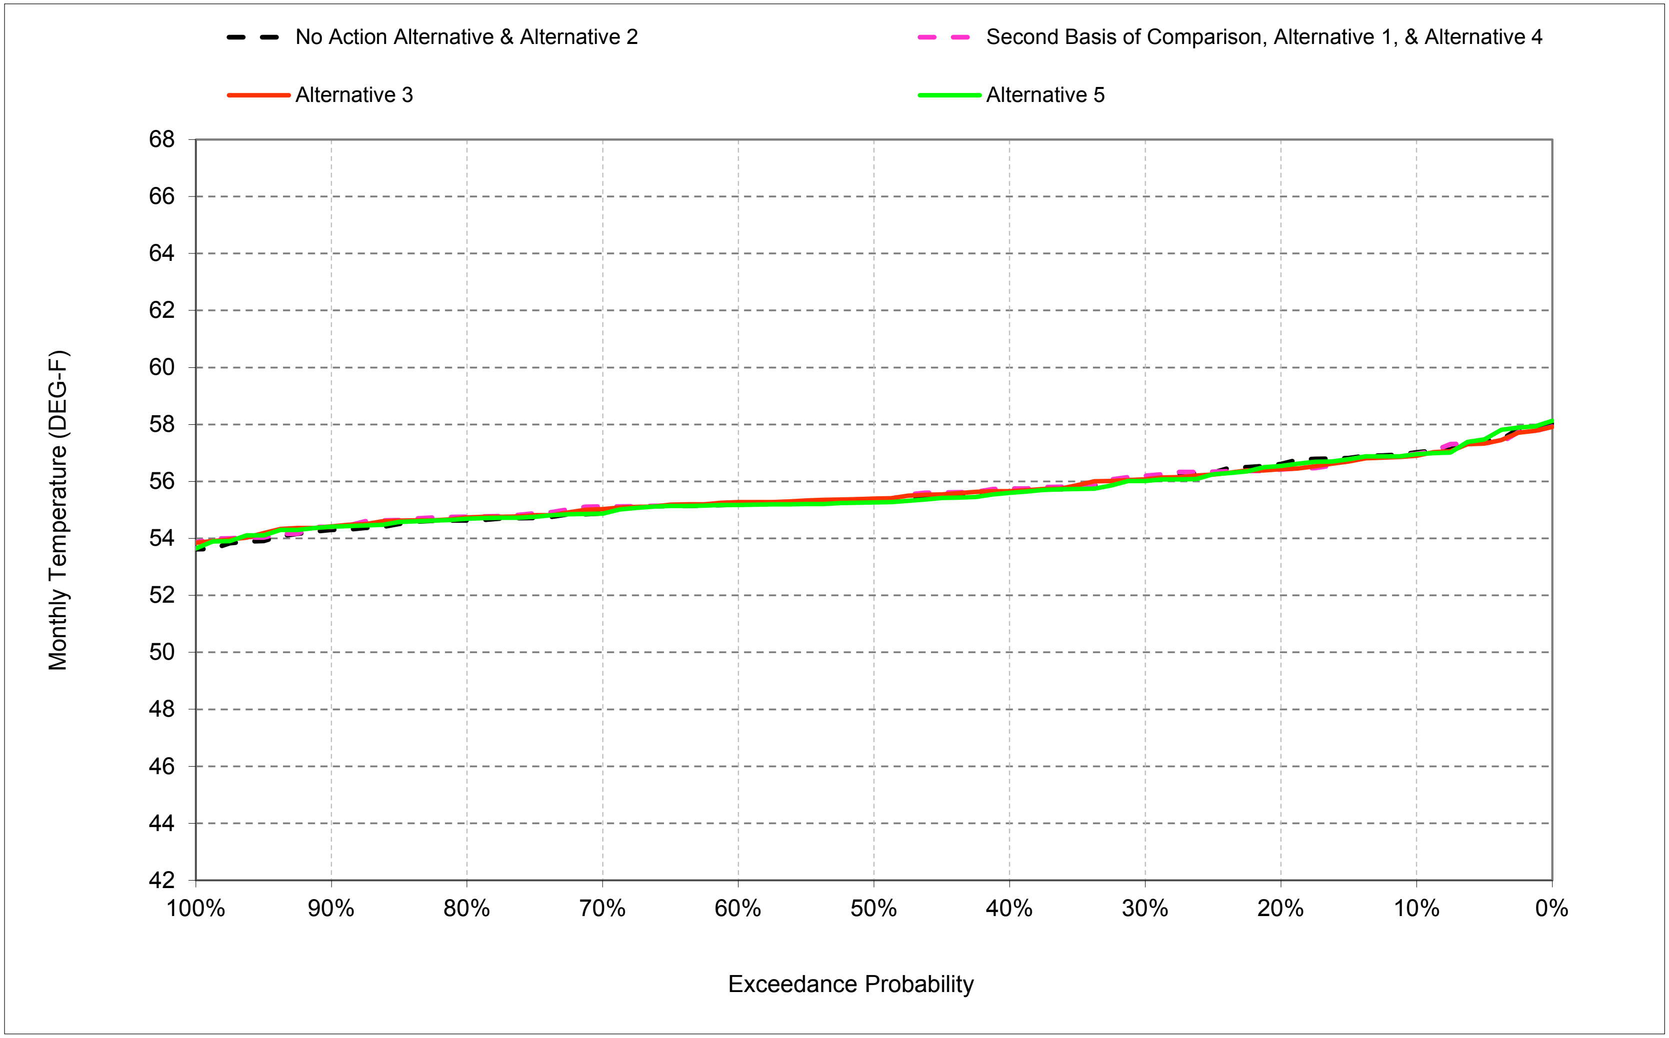
Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-3-10. Clear Creek at Igo, July



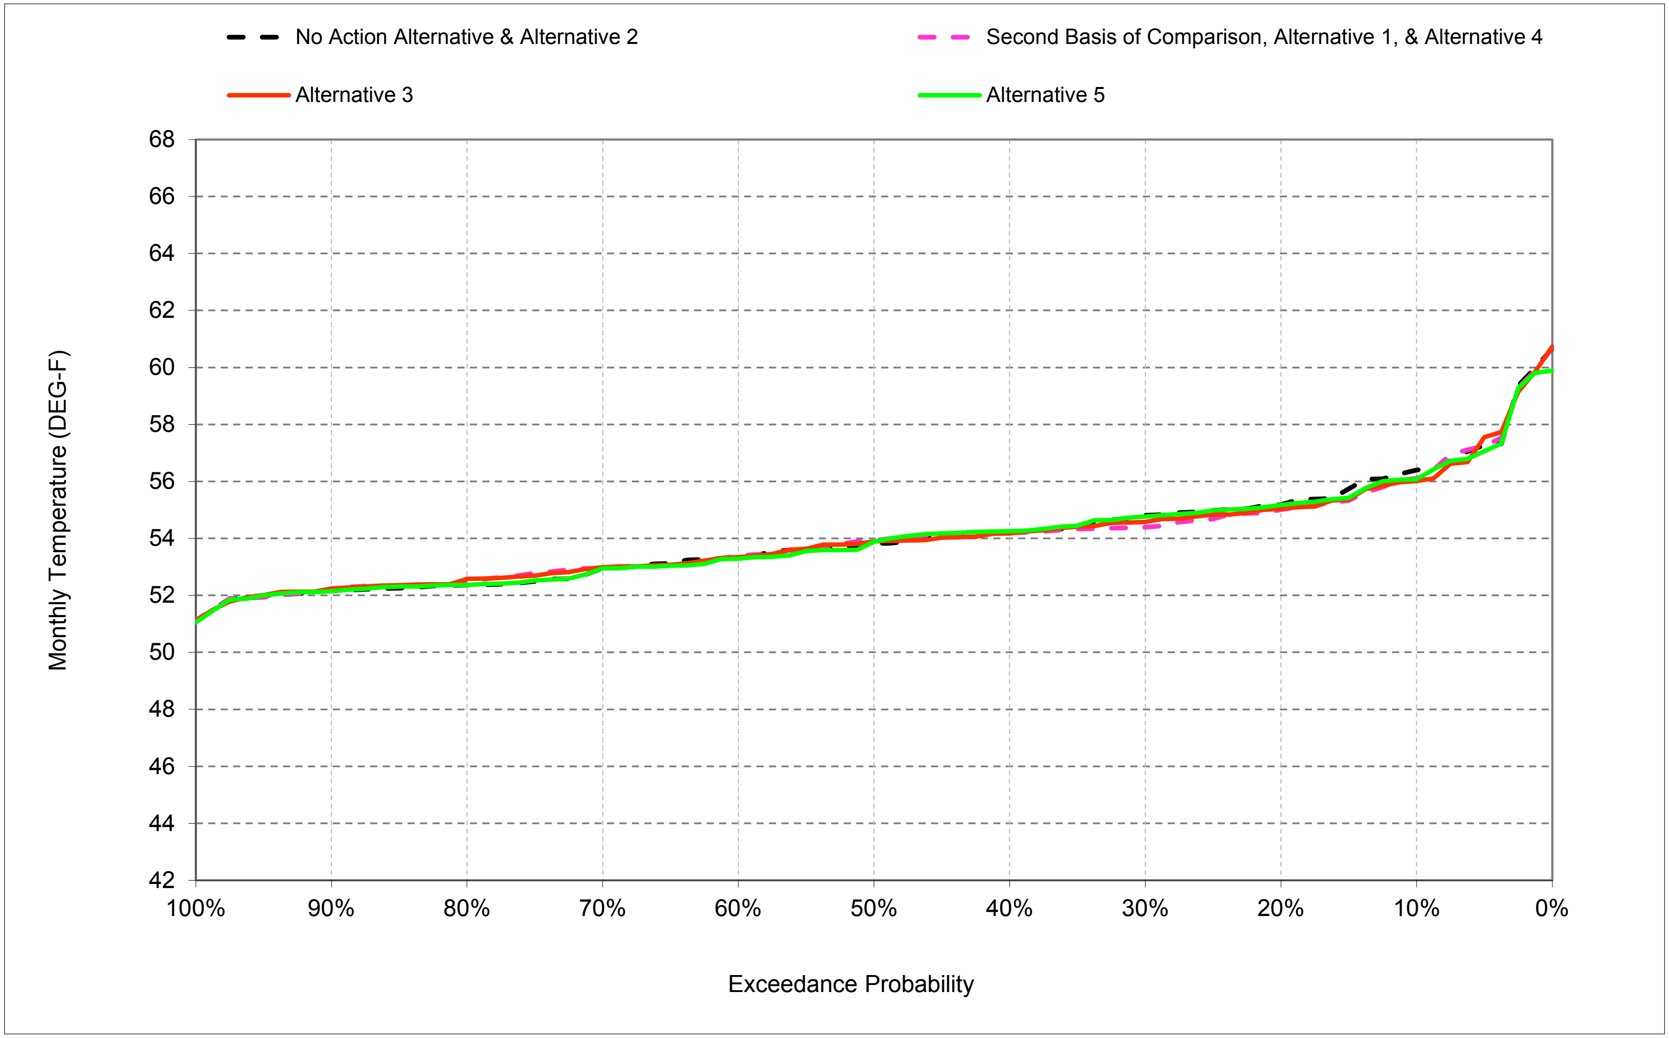
Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-3-11. Clear Creek at Igo, August



Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-3-12. Clear Creek at Igo, September



Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

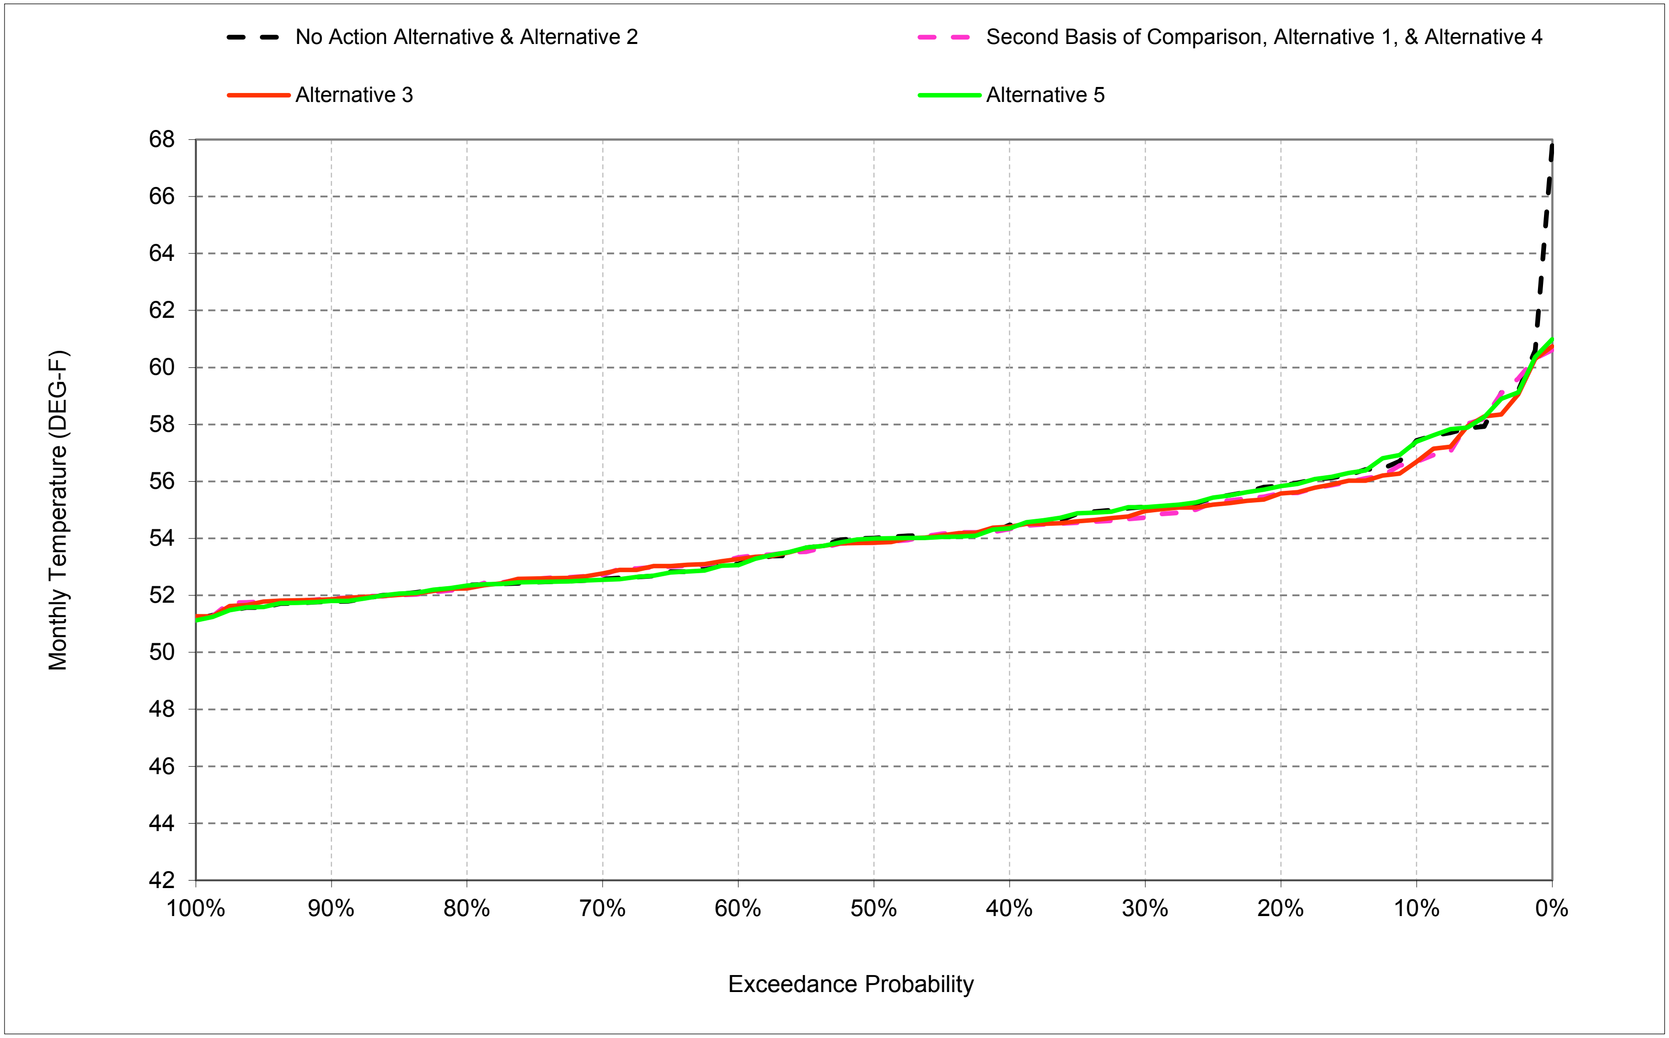
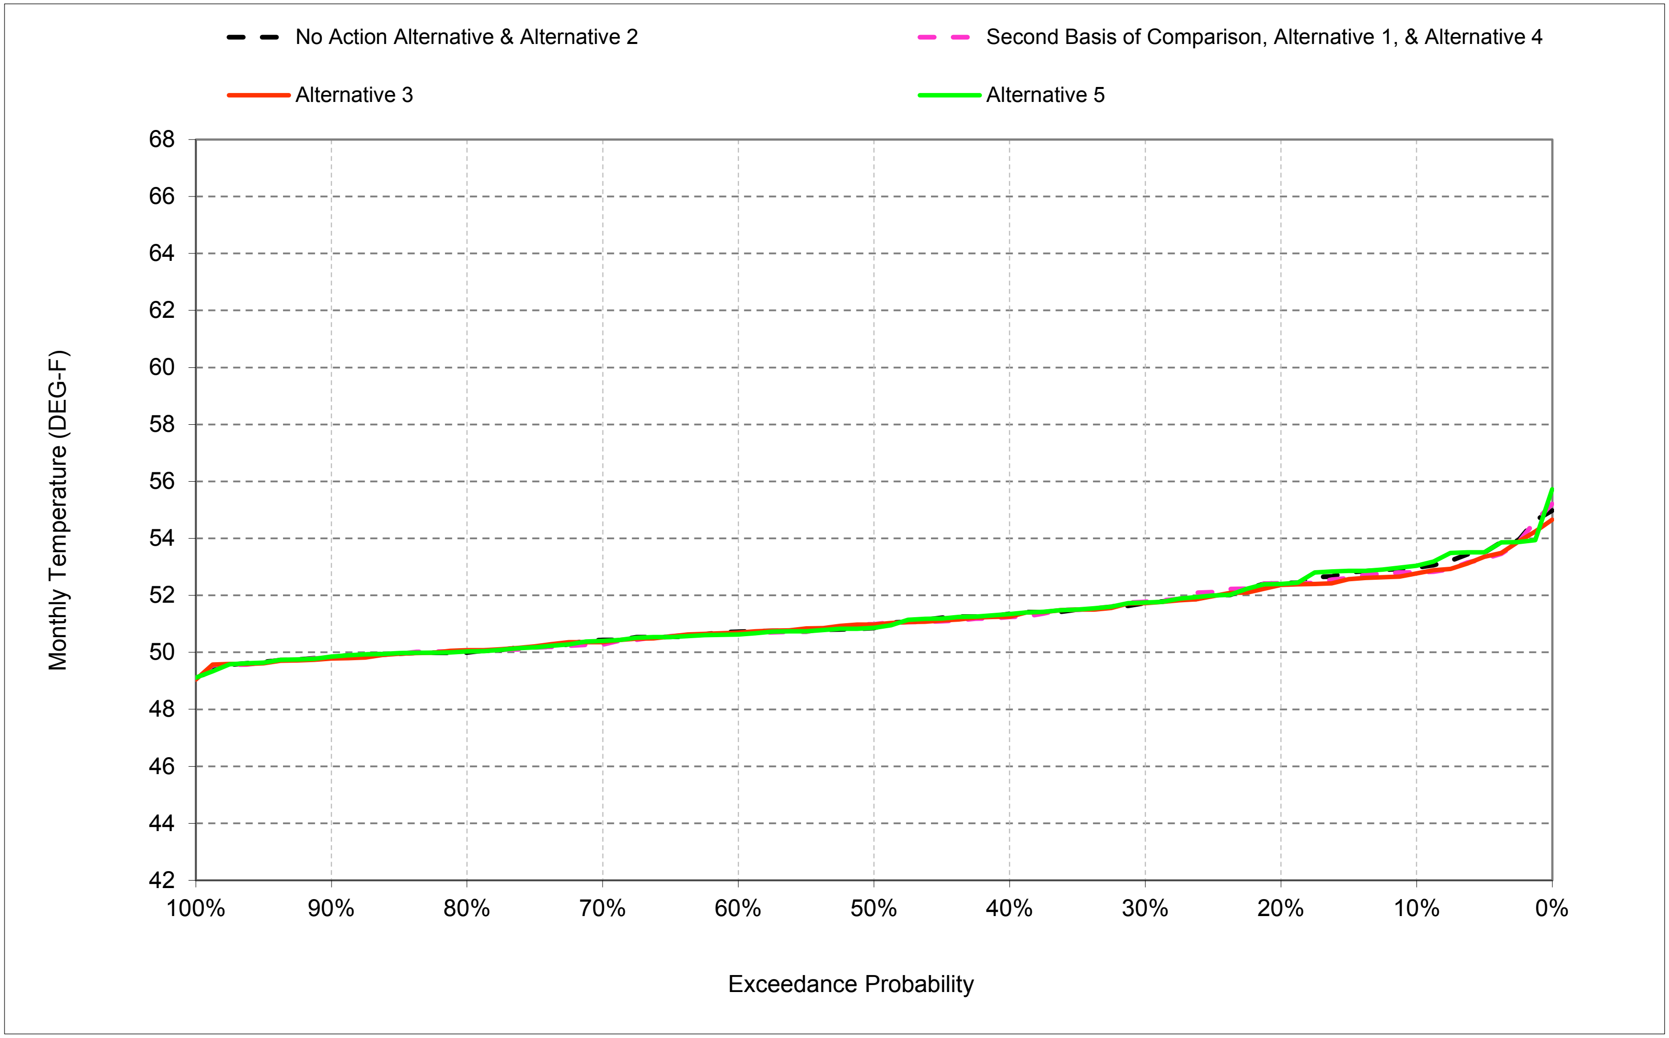
B.4. Clear Creek at Mouth Temperature

Figure B-4-1. Clear Creek at mouth, October



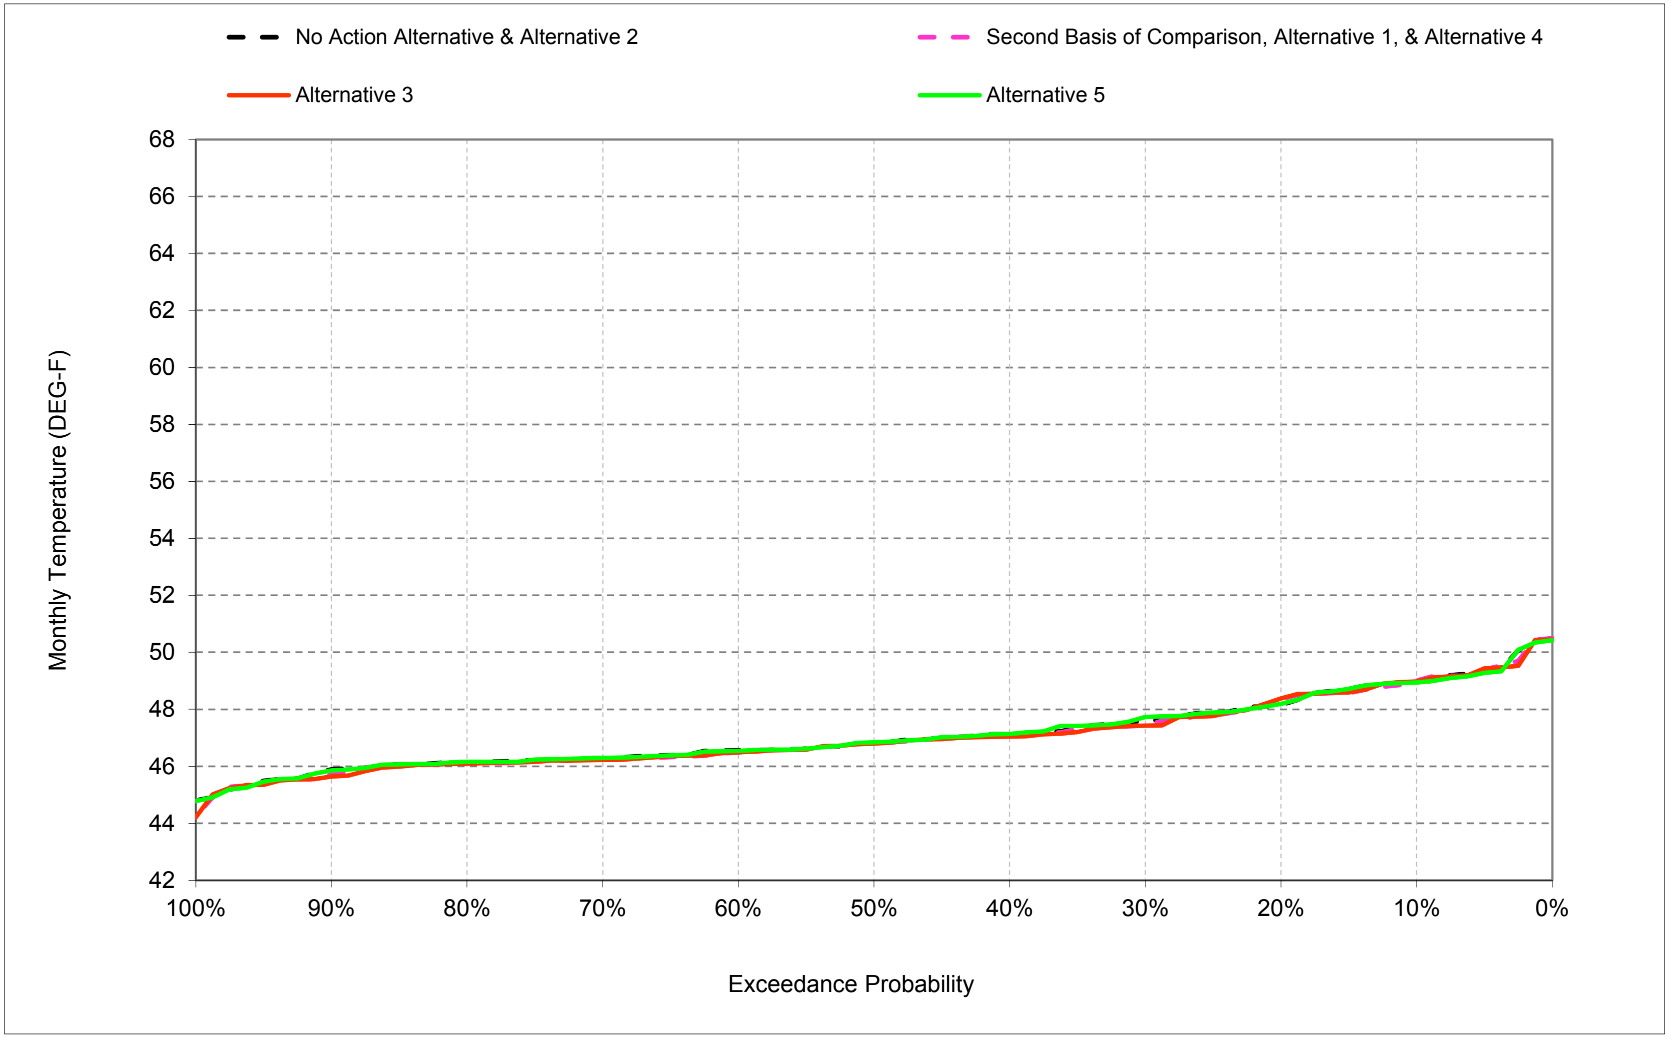
Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-4-2. Clear Creek at mouth, November



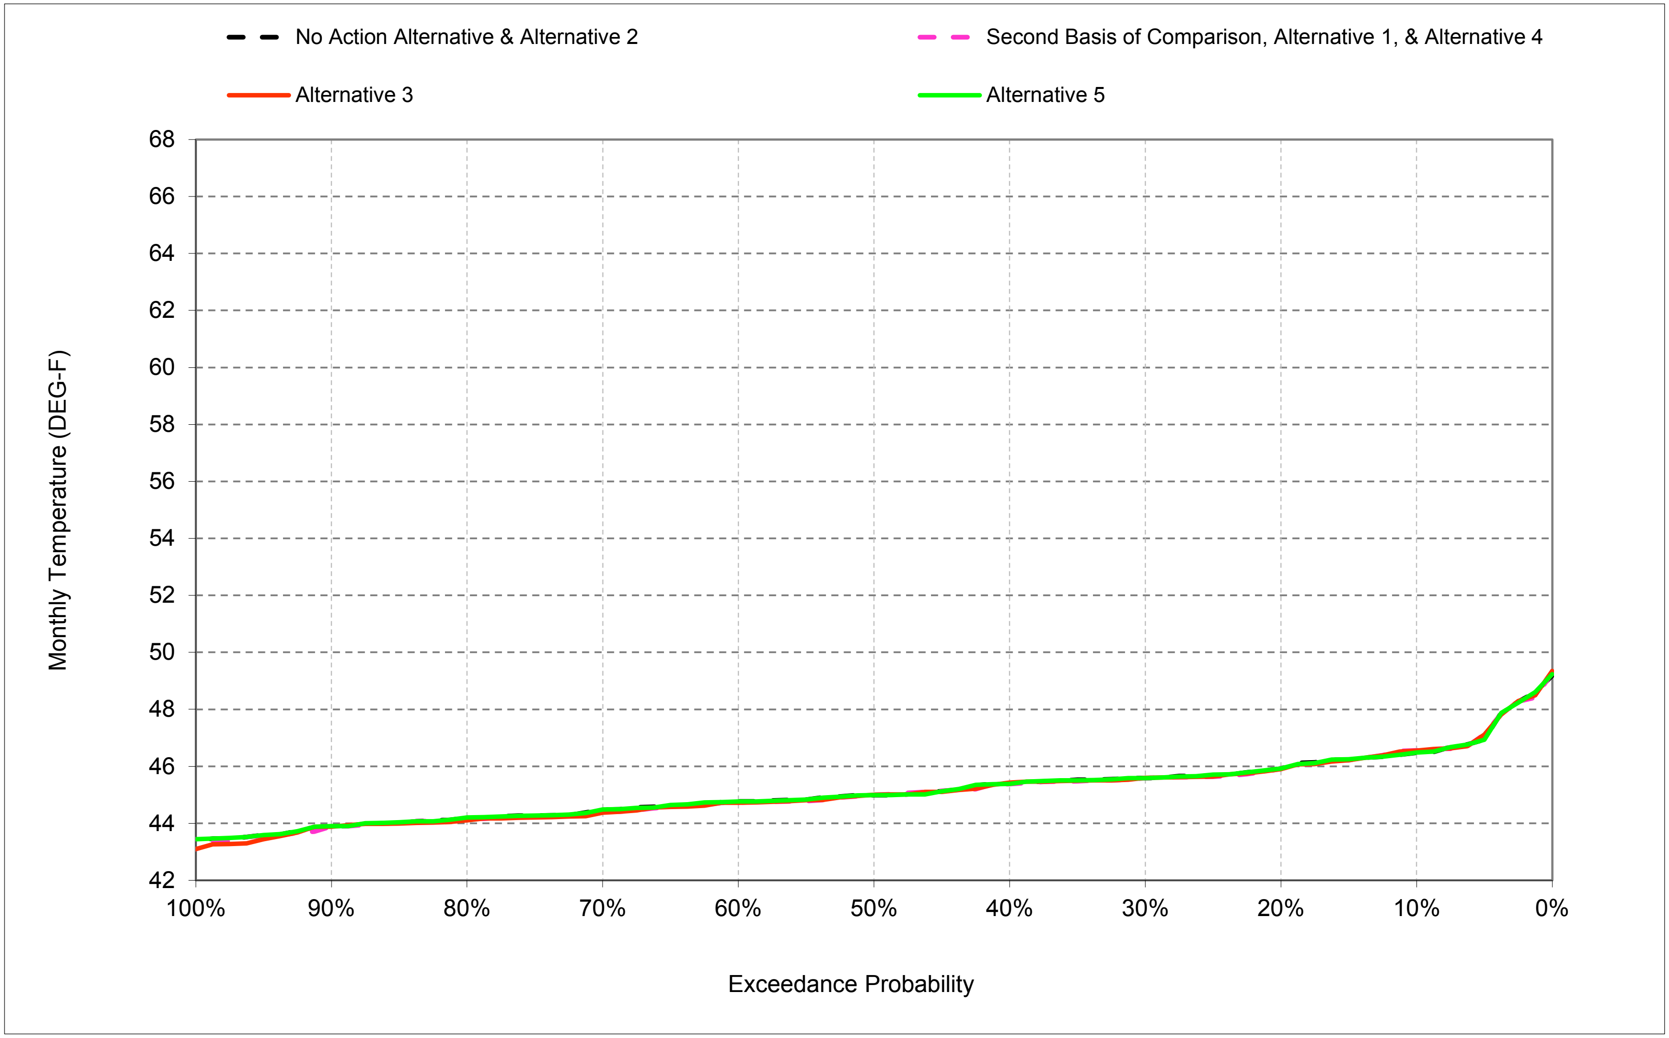
Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-4-3. Clear Creek at mouth, December



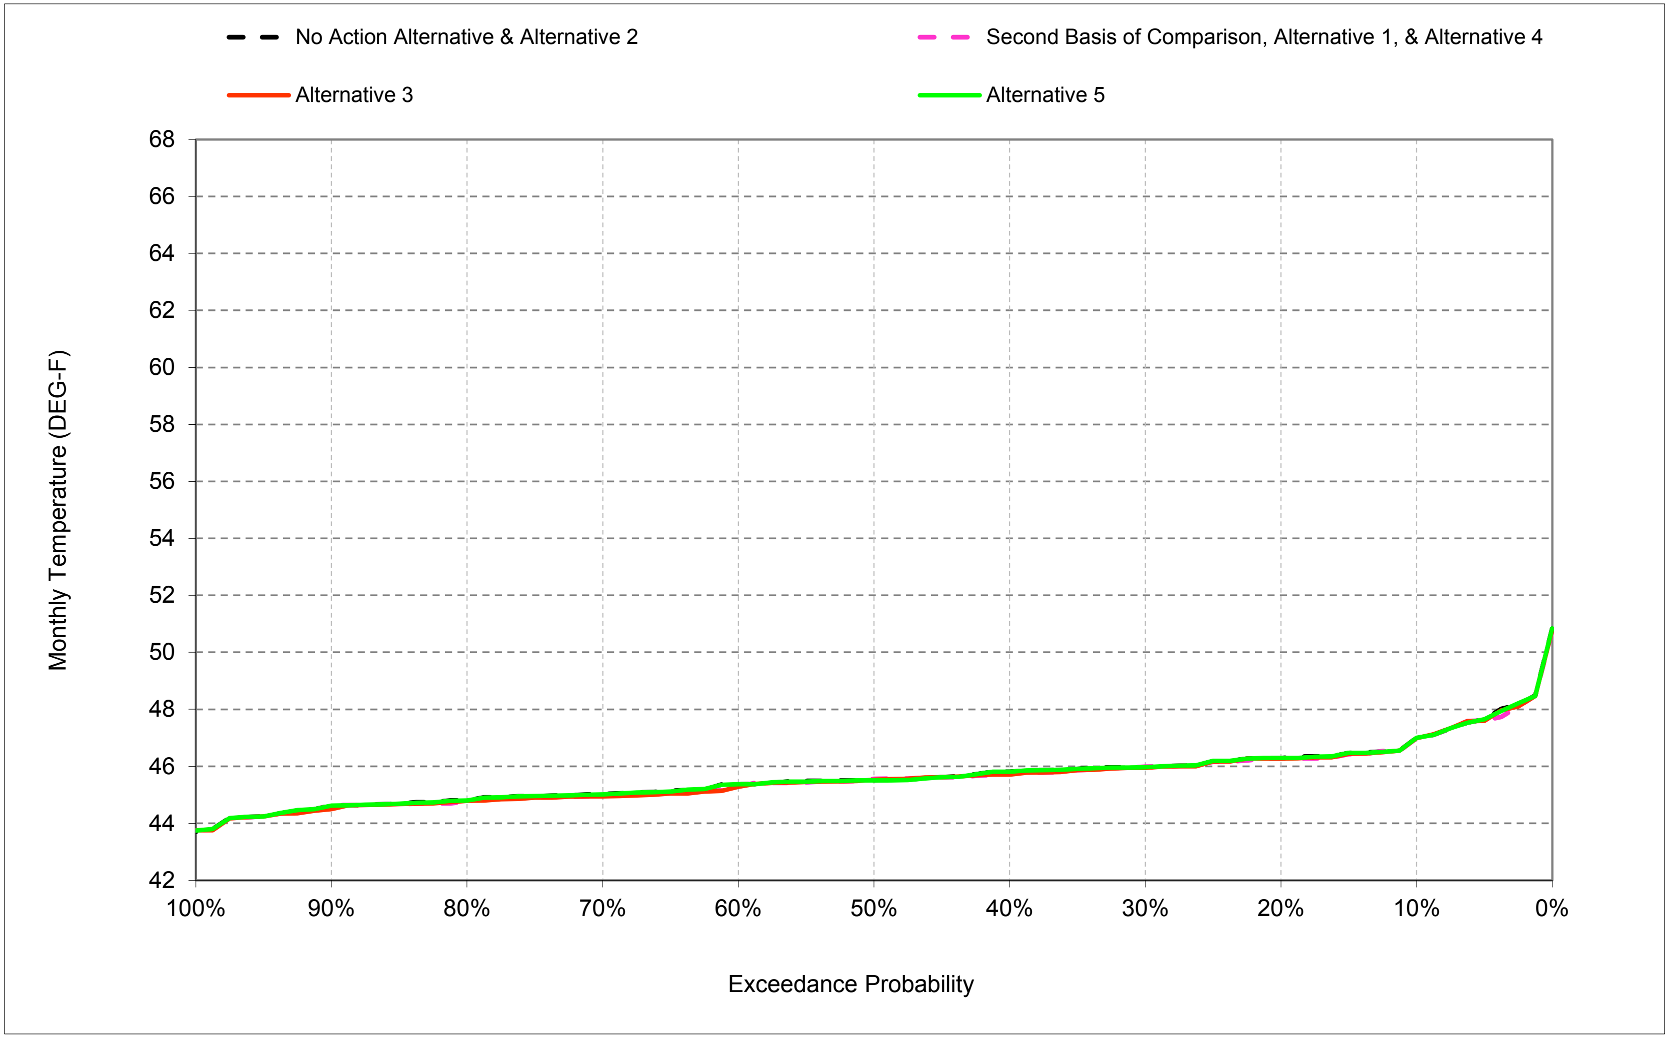
Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-4-4. Clear Creek at mouth, January



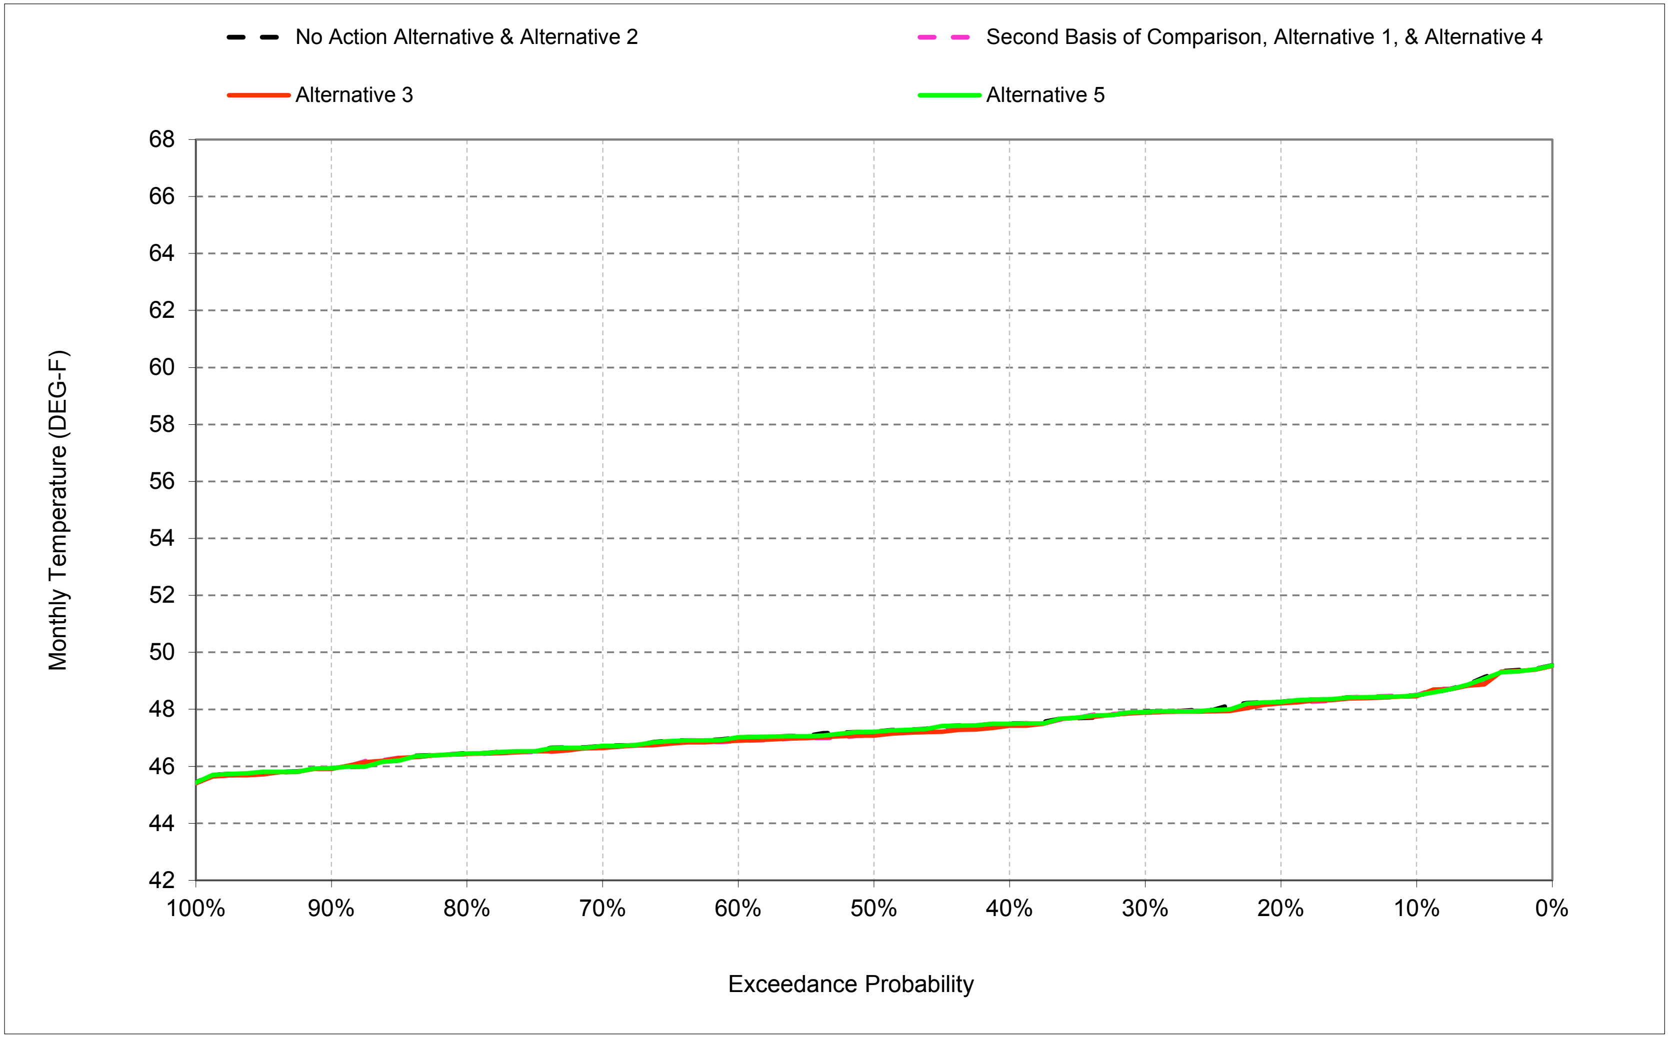
Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-4-5. Clear Creek at mouth, February



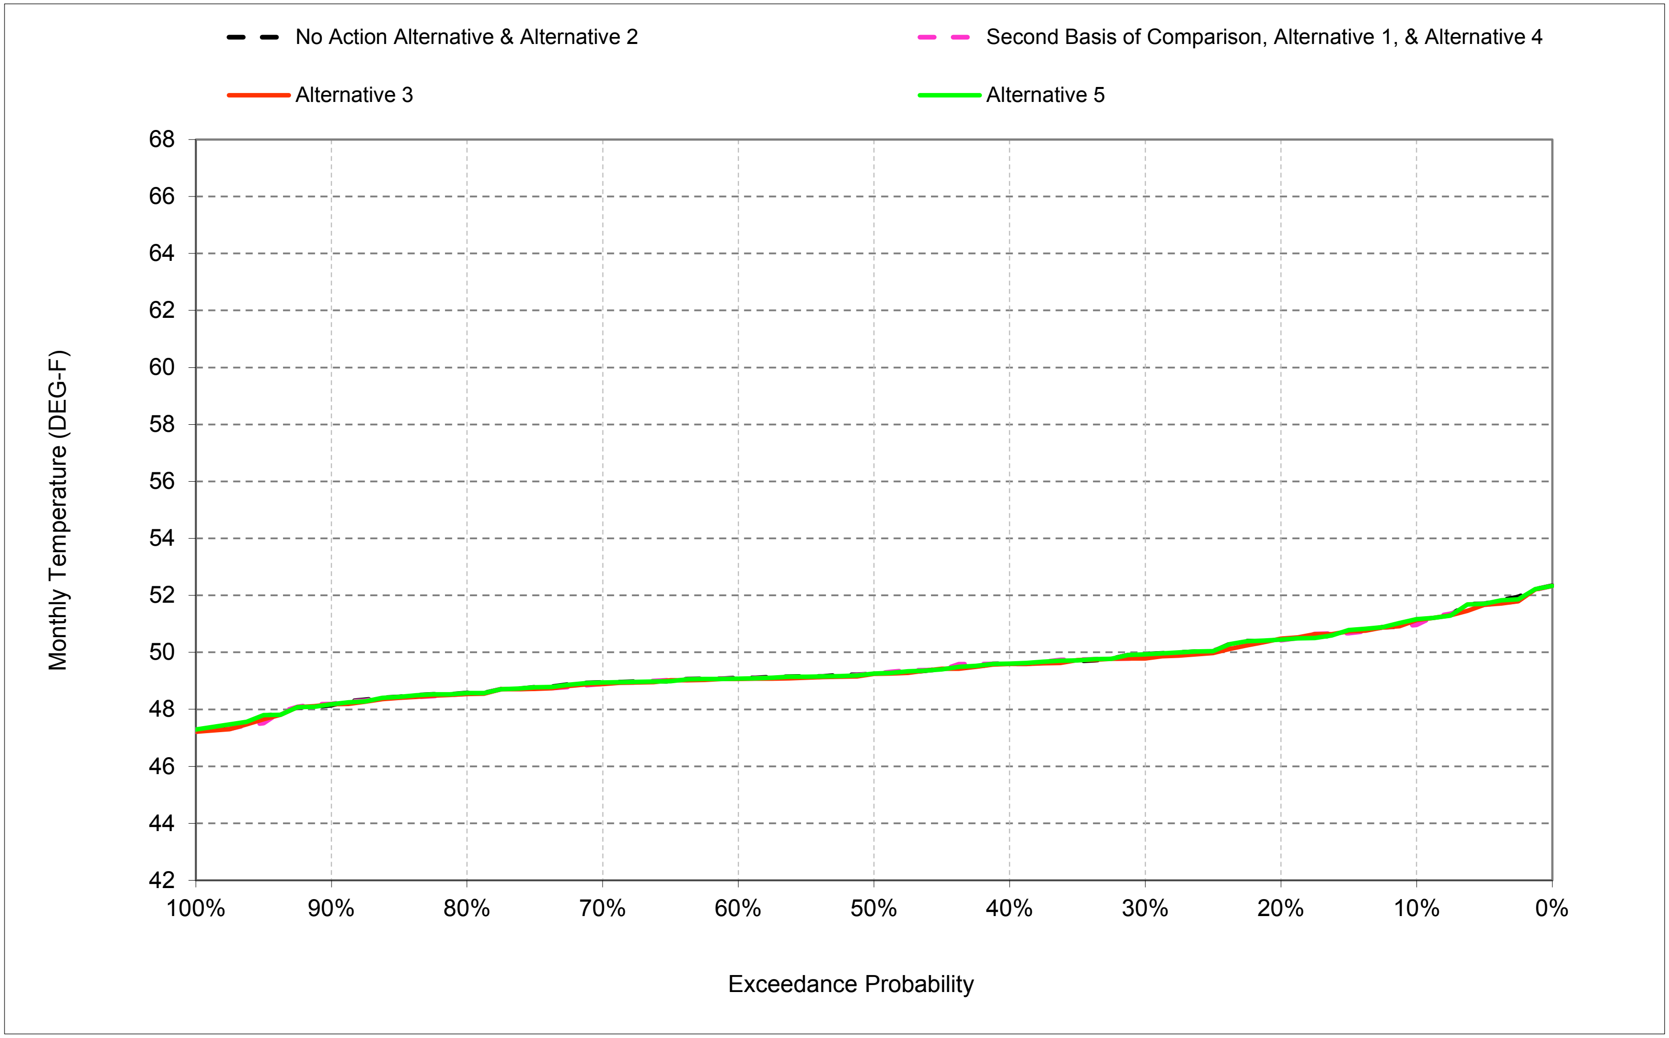
Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-4-6. Clear Creek at mouth, March



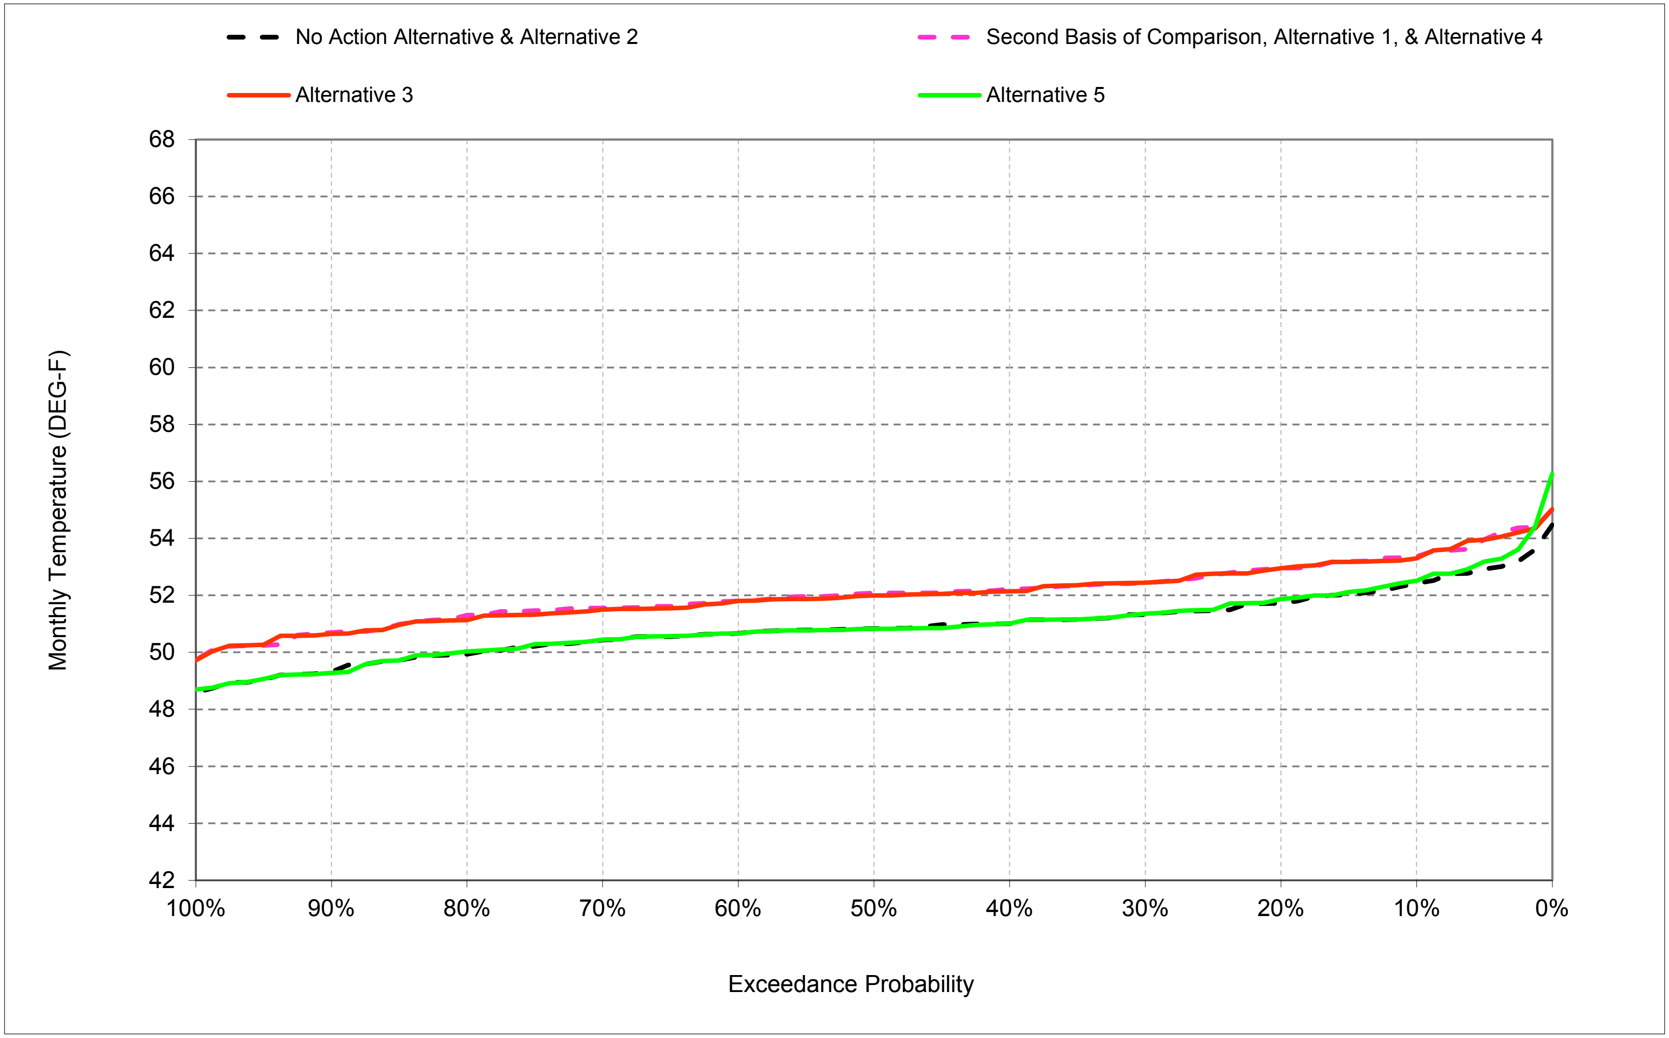
Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-4-7. Clear Creek at mouth, April



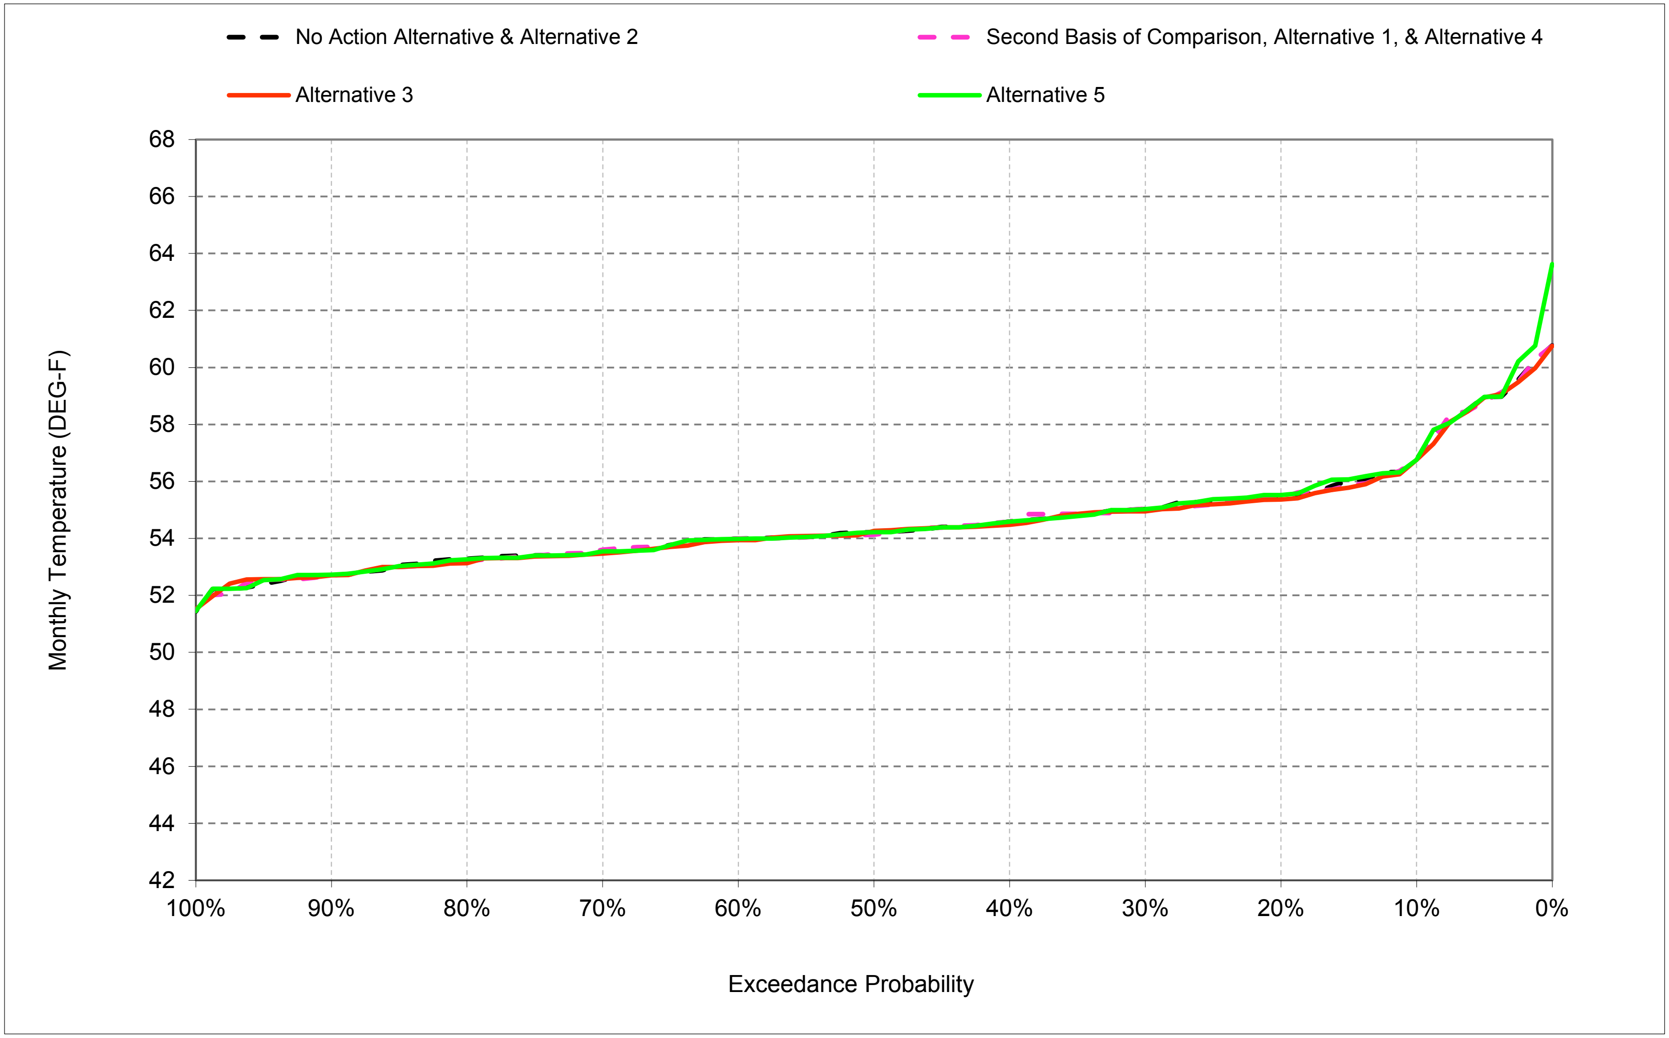
Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-4-8. Clear Creek at mouth, May



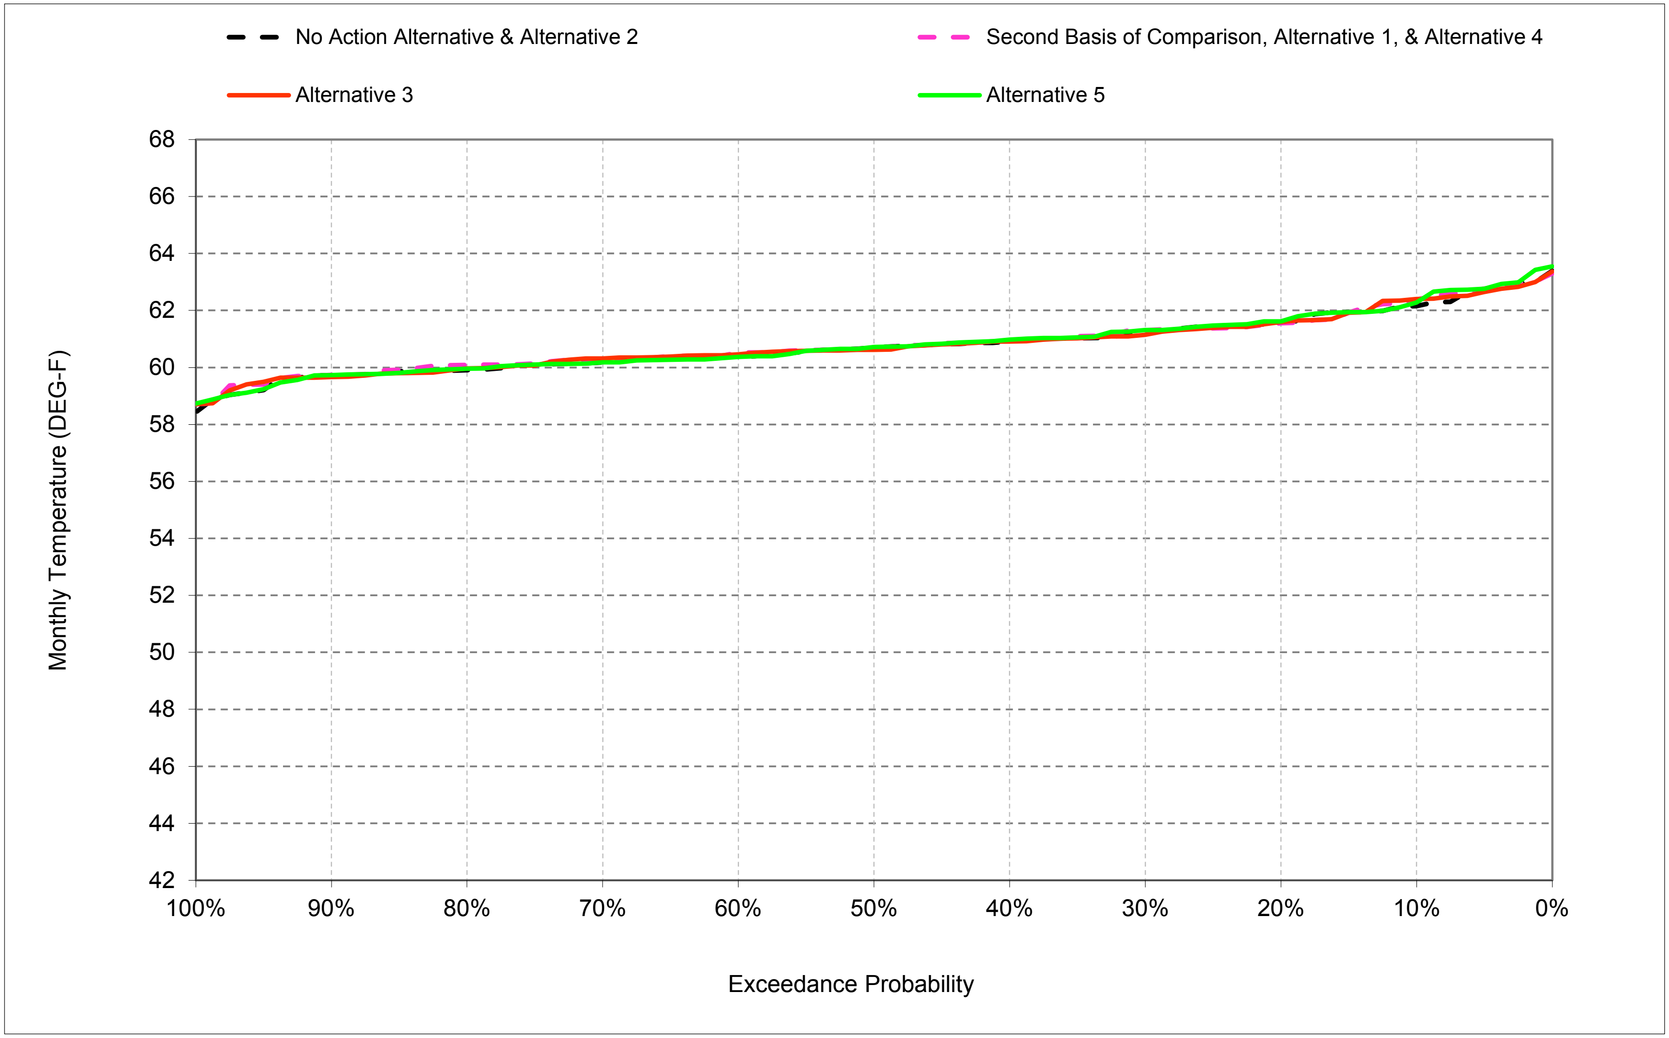
Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-4-9. Clear Creek at mouth, June



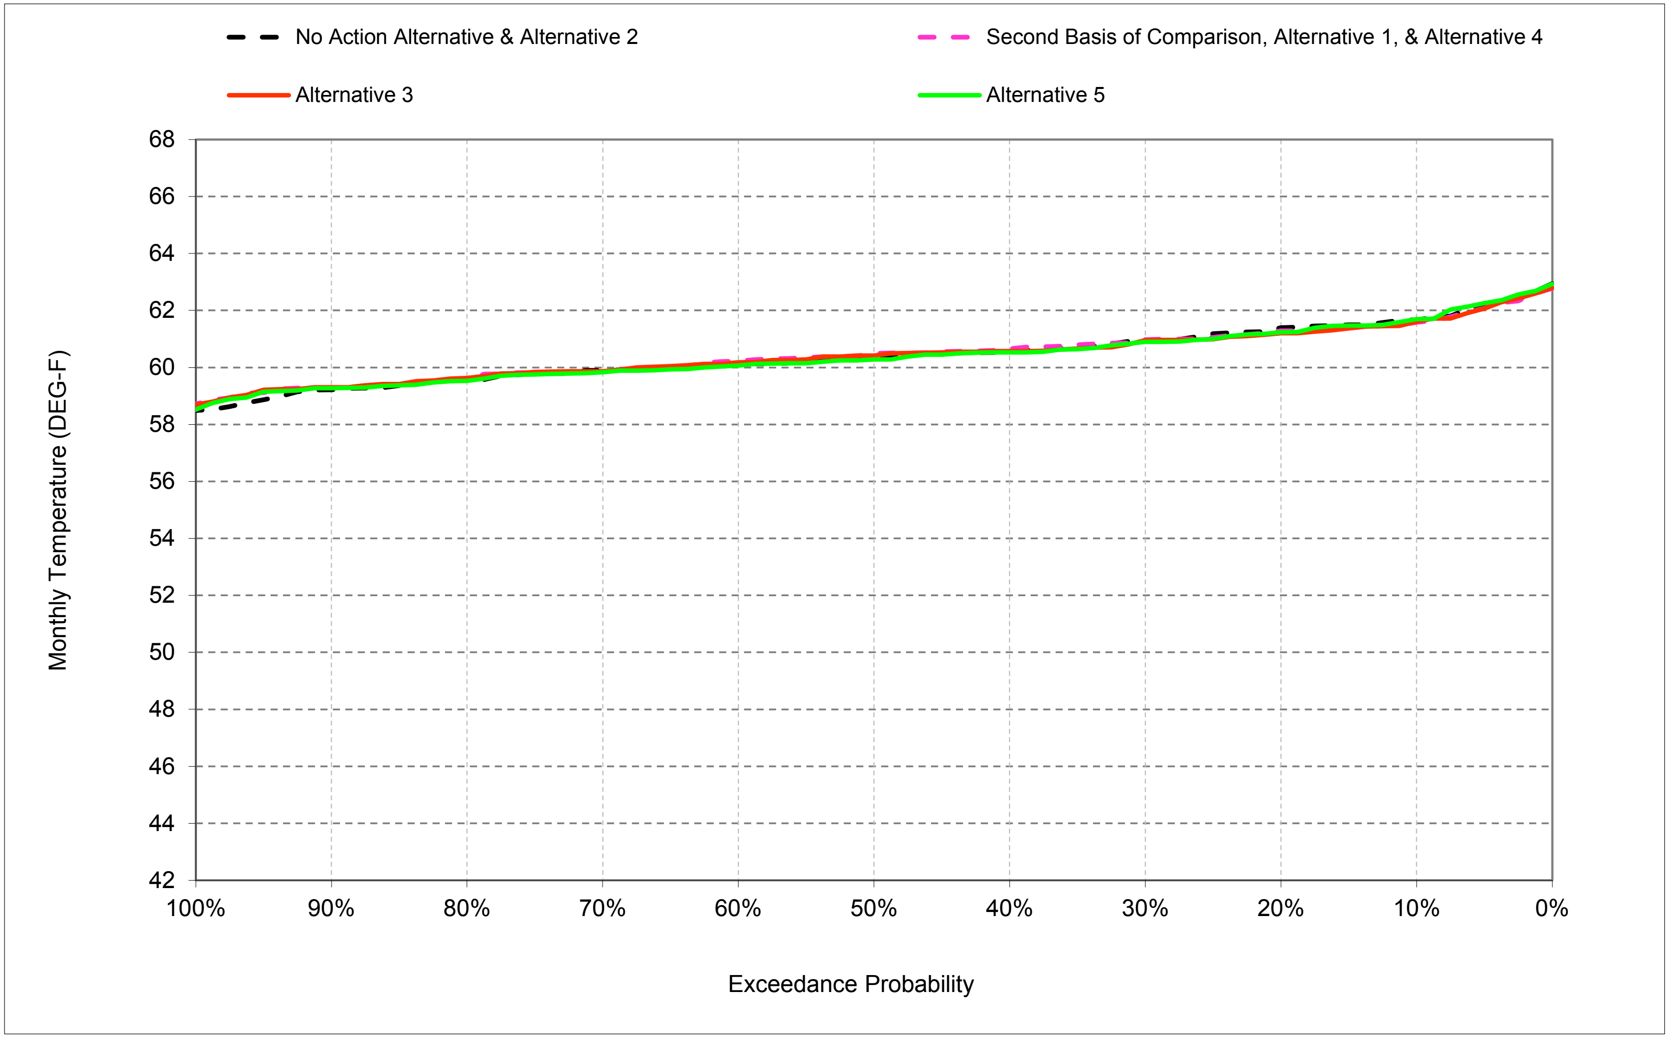
Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-4-10. Clear Creek at mouth, July



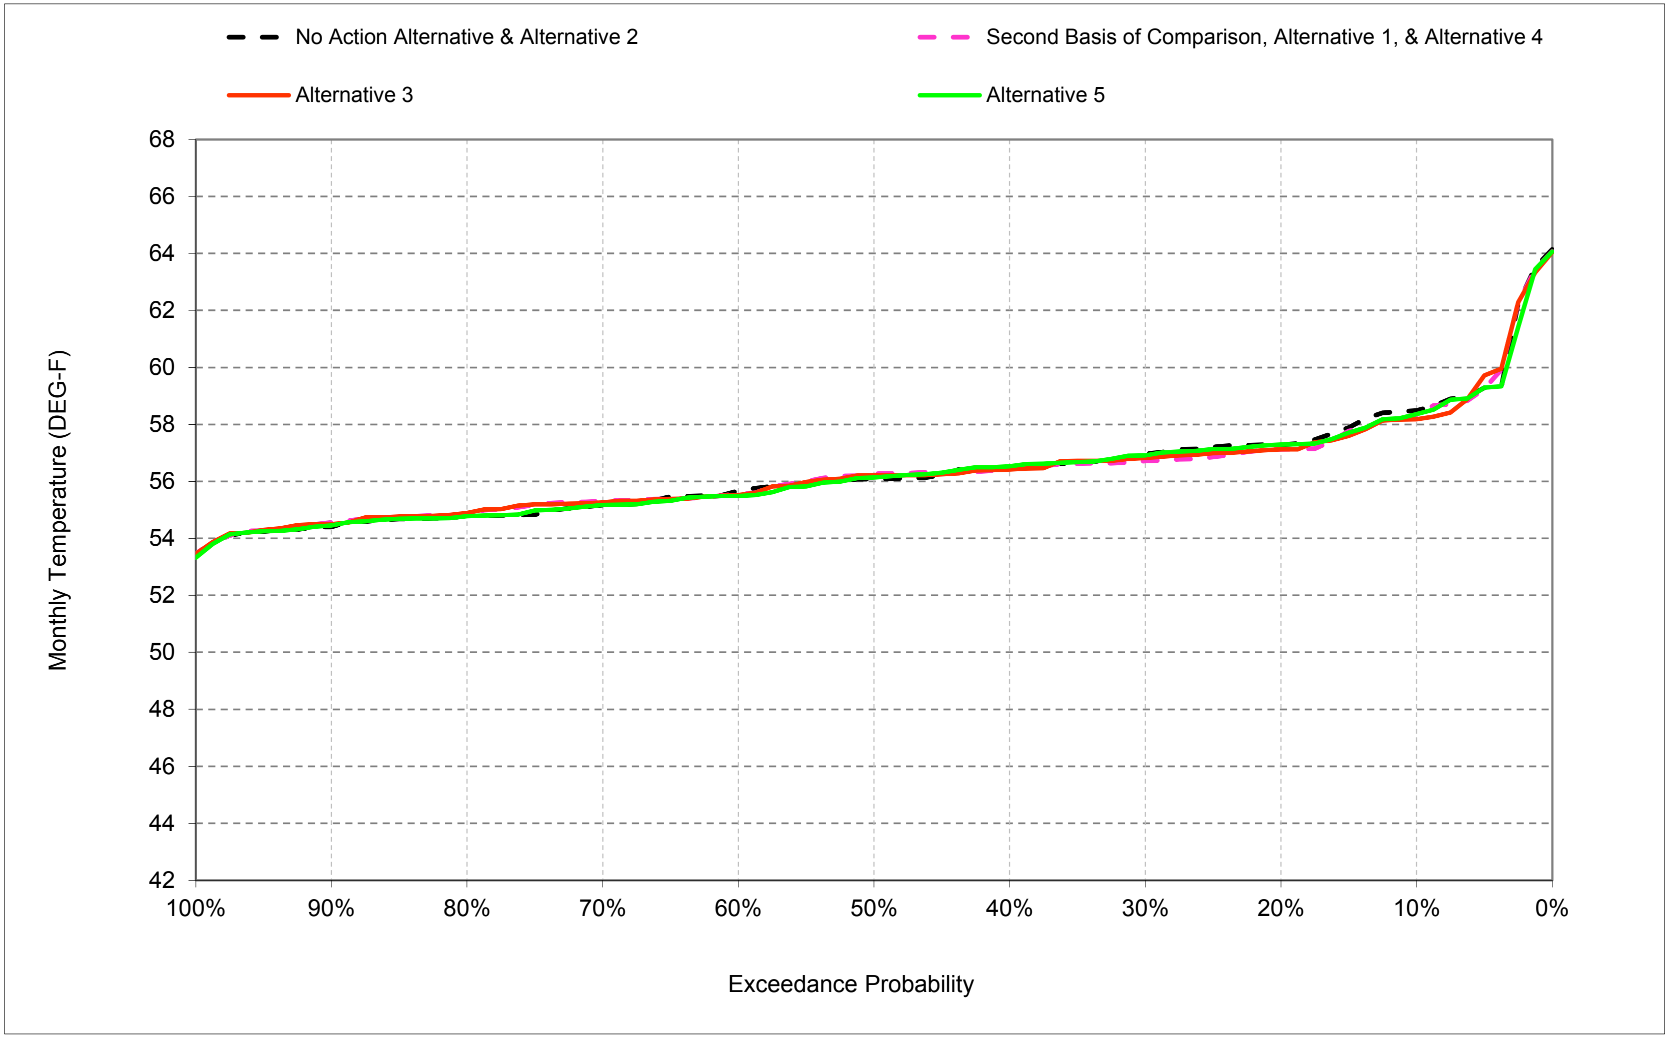
Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-4-11. Clear Creek at mouth, August



Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-4-12. Clear Creek at mouth, September



Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

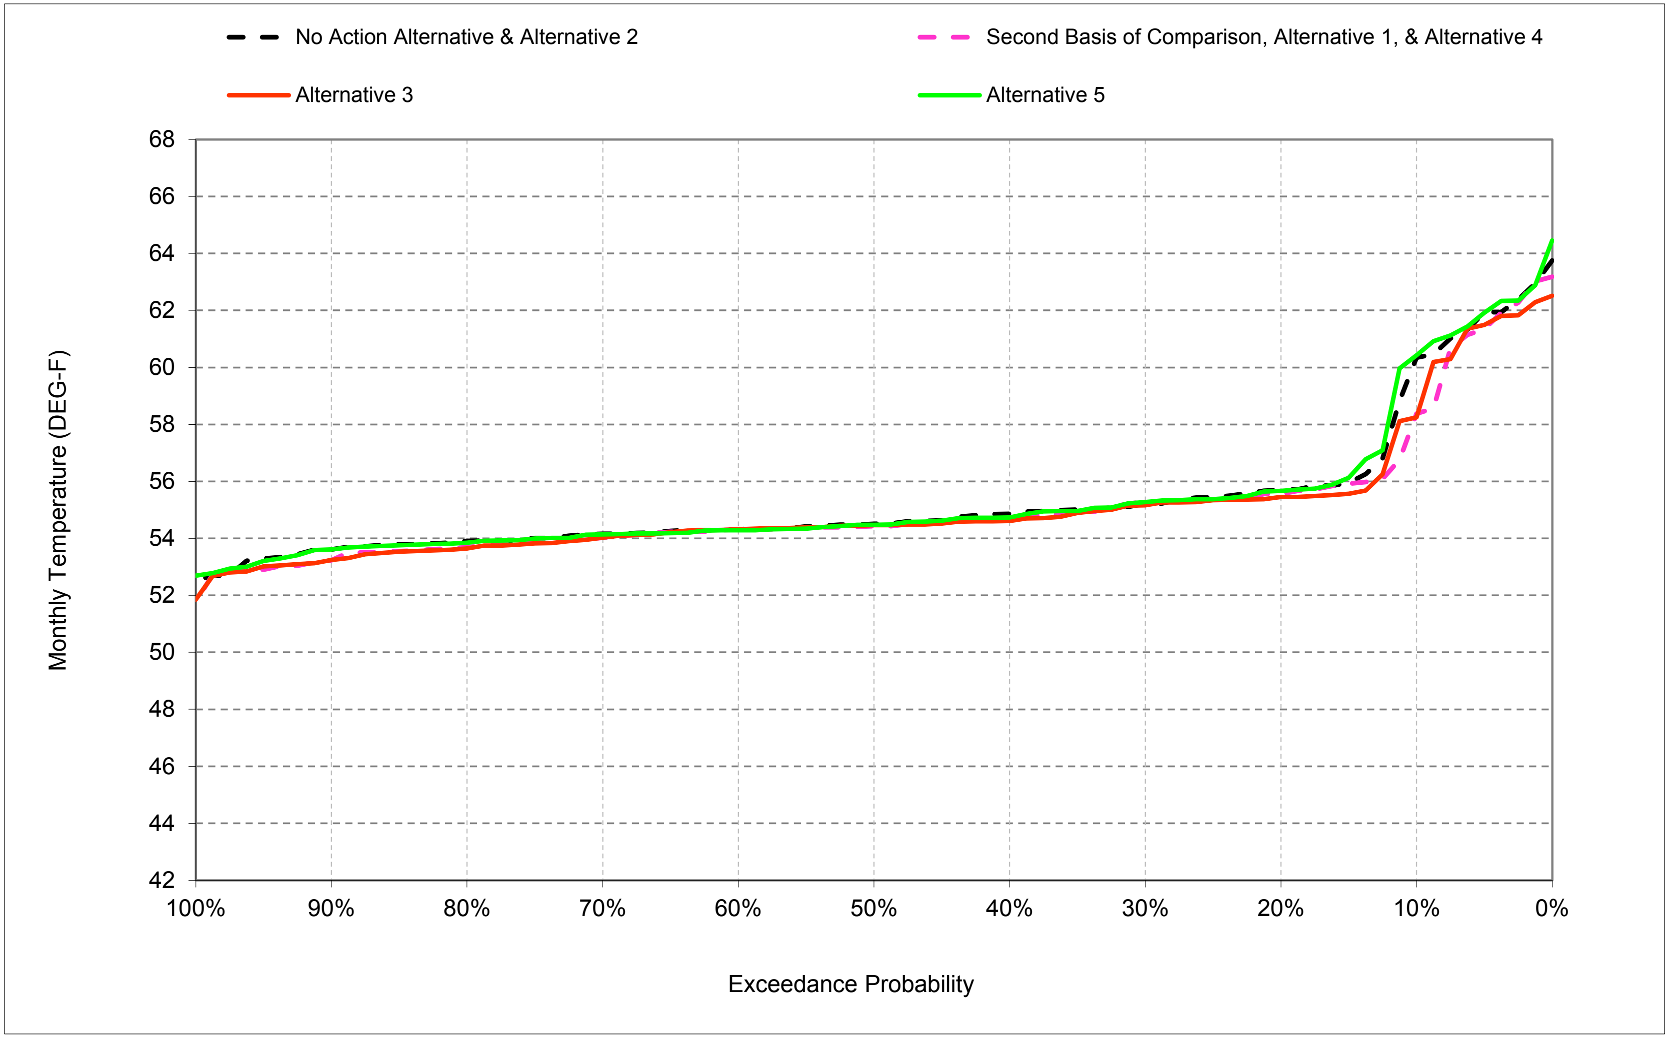
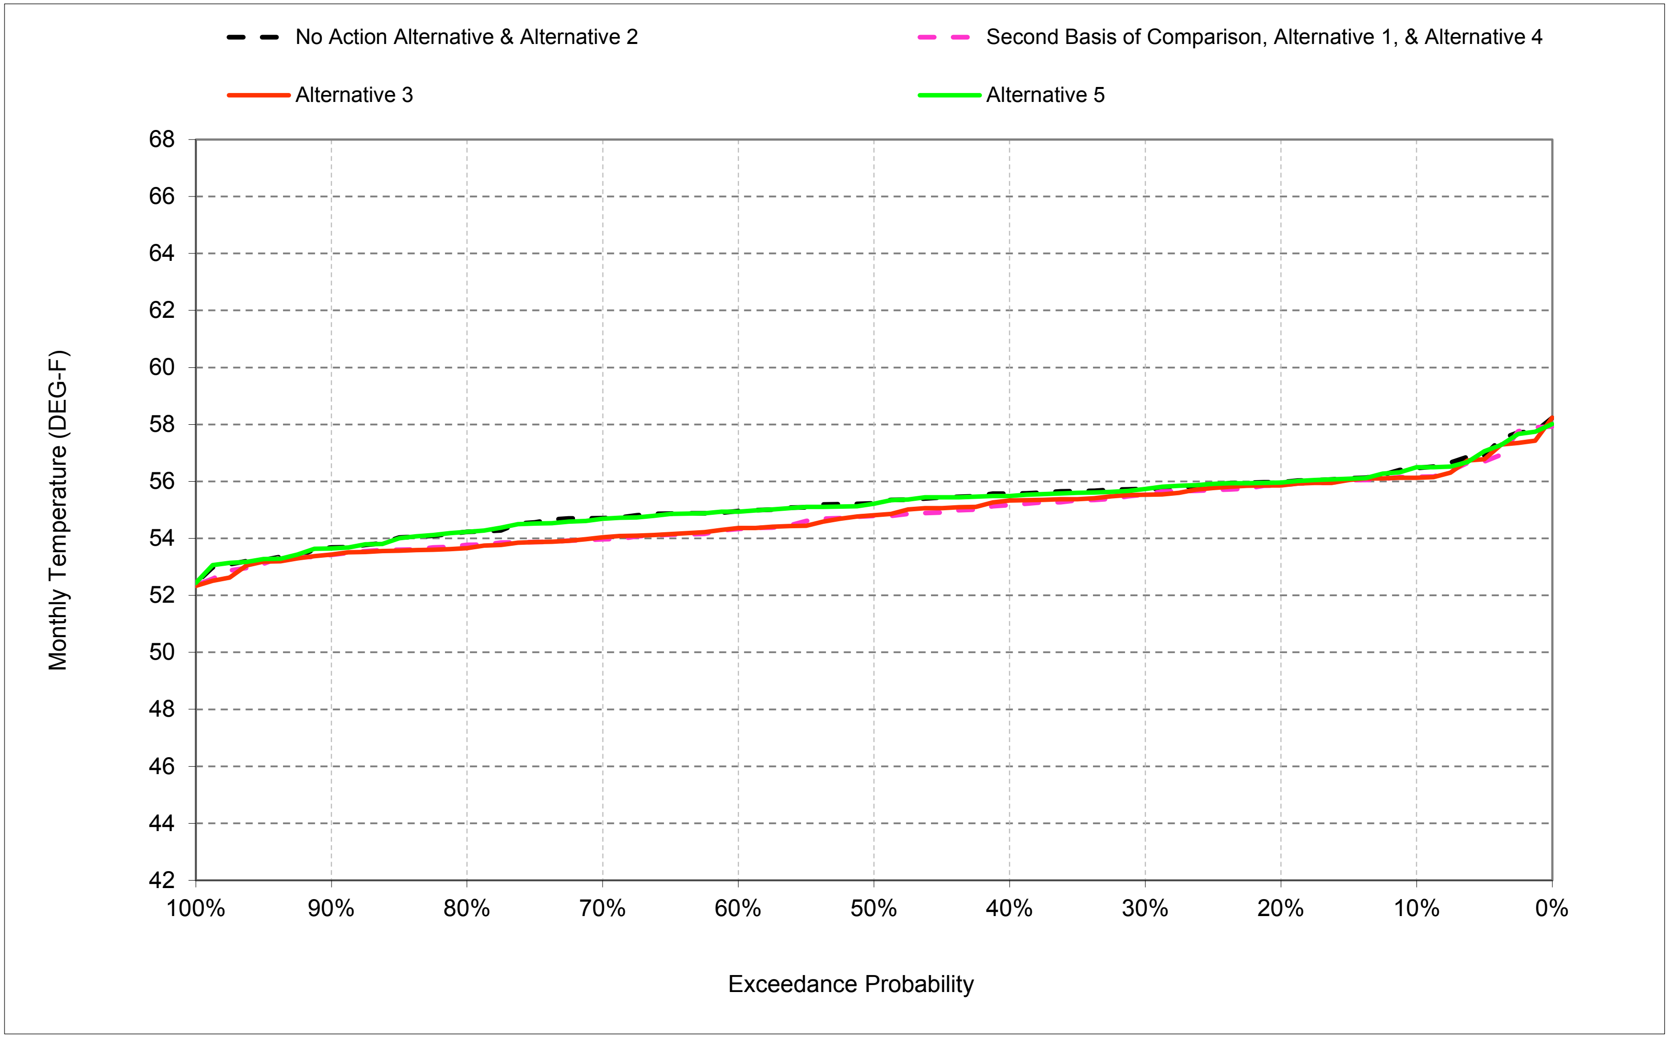
B.5. Sacramento River below Keswick Temperature

Figure B-5-1. Sacramento River below Keswick, October



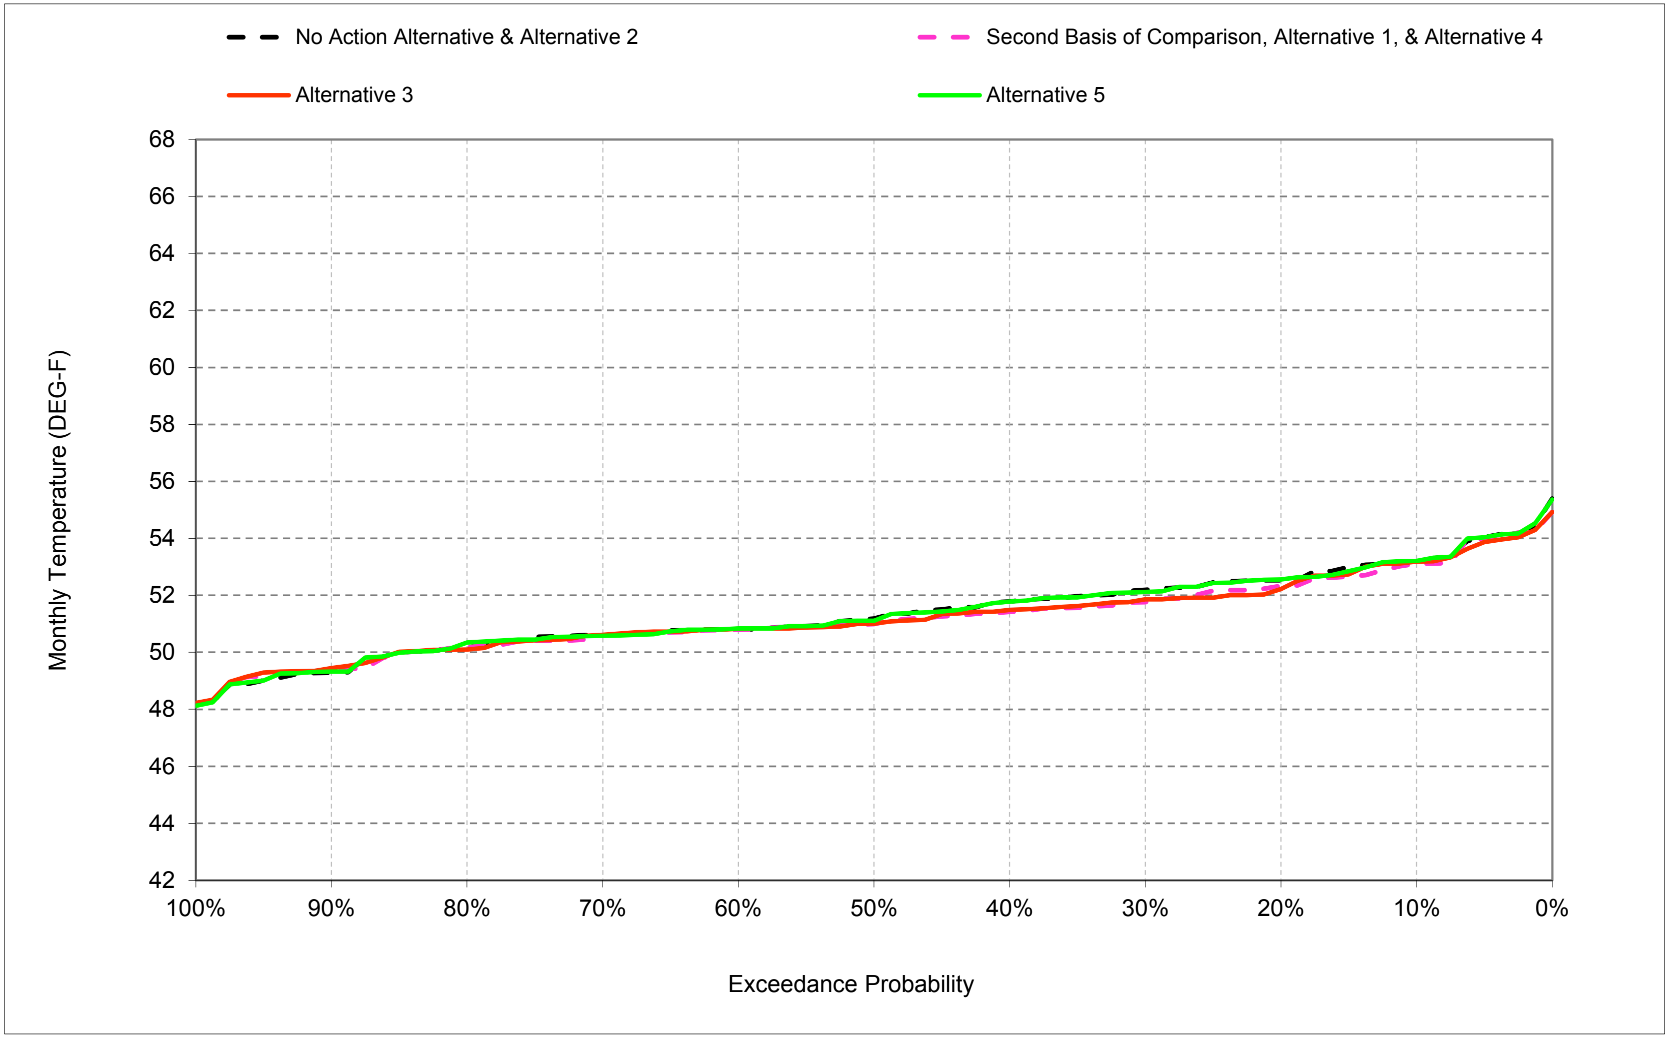
Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-5-2. Sacramento River below Keswick, November



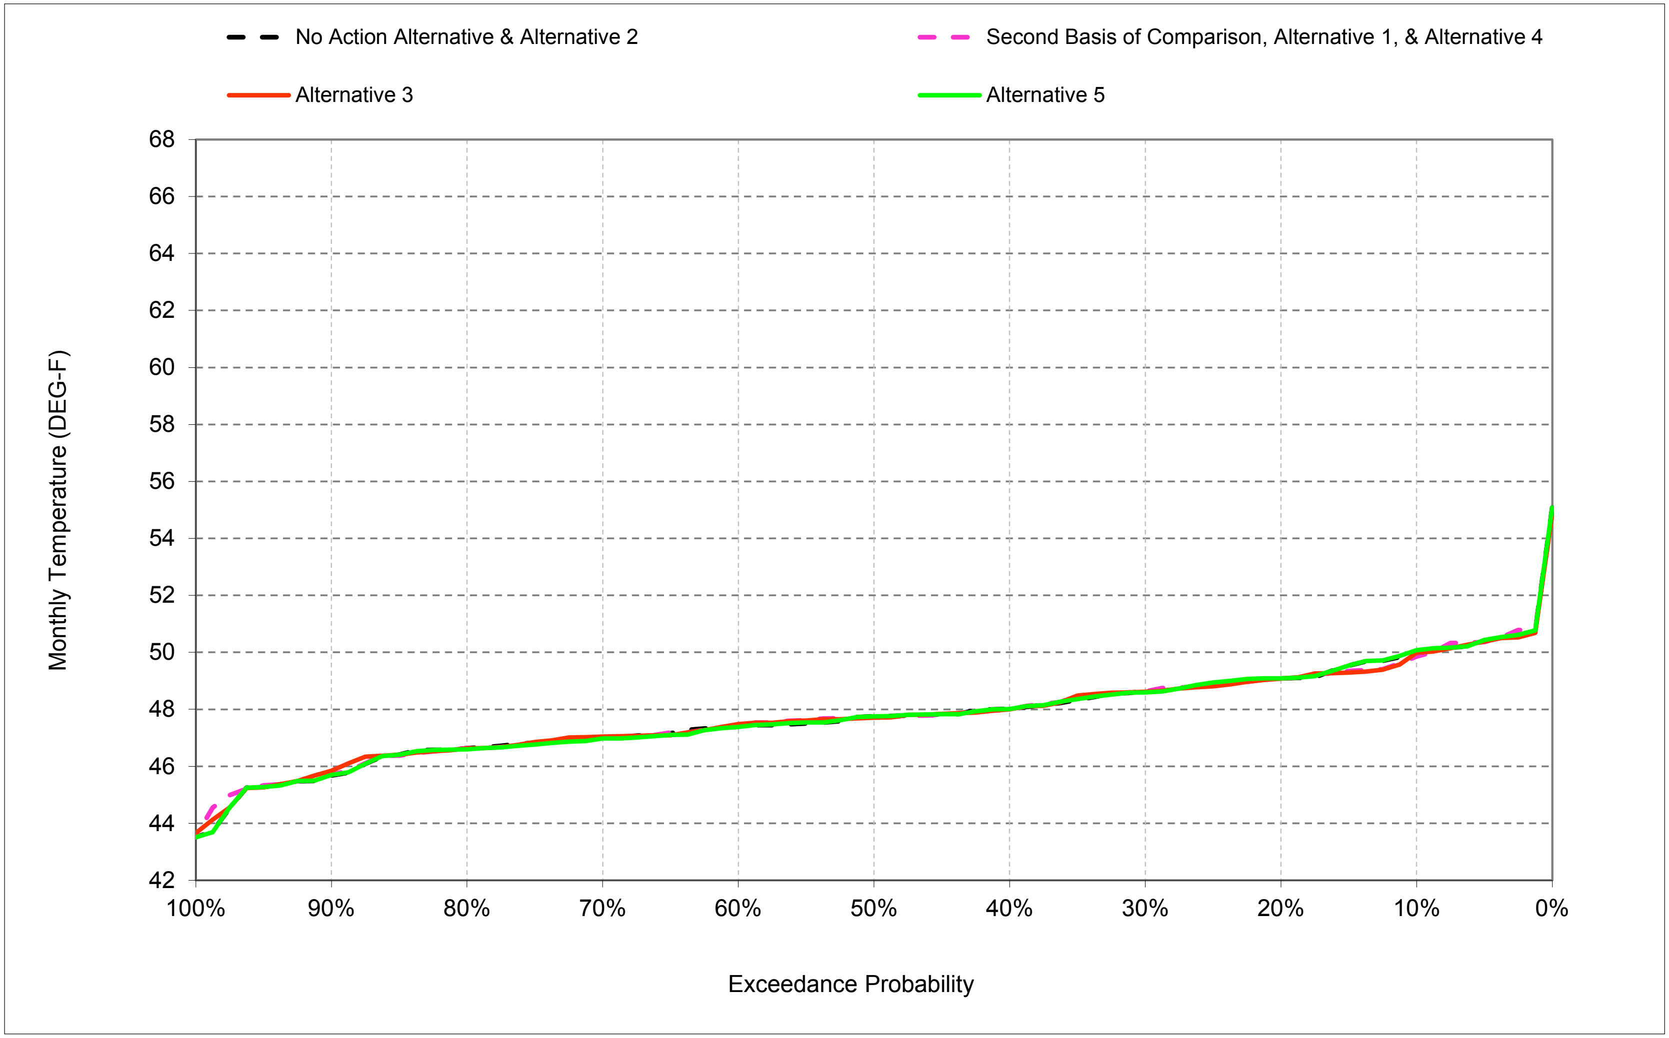
Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-5-3. Sacramento River below Keswick, December



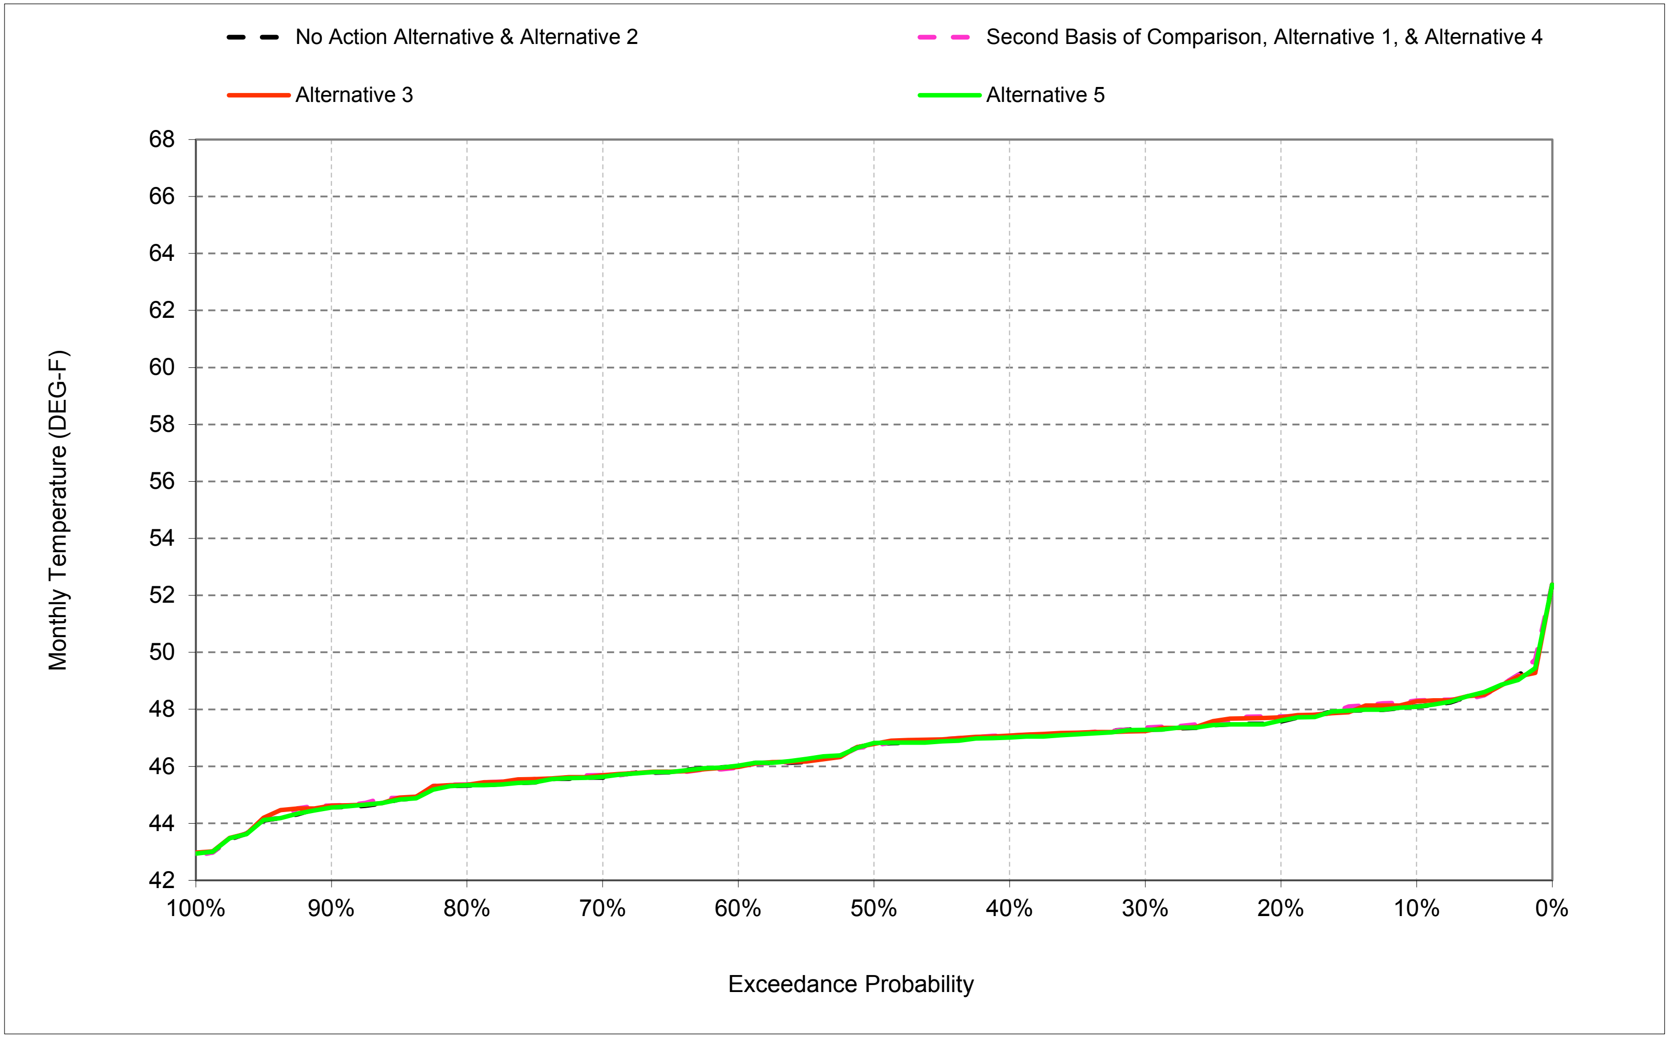
Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-5-4. Sacramento River below Keswick, January



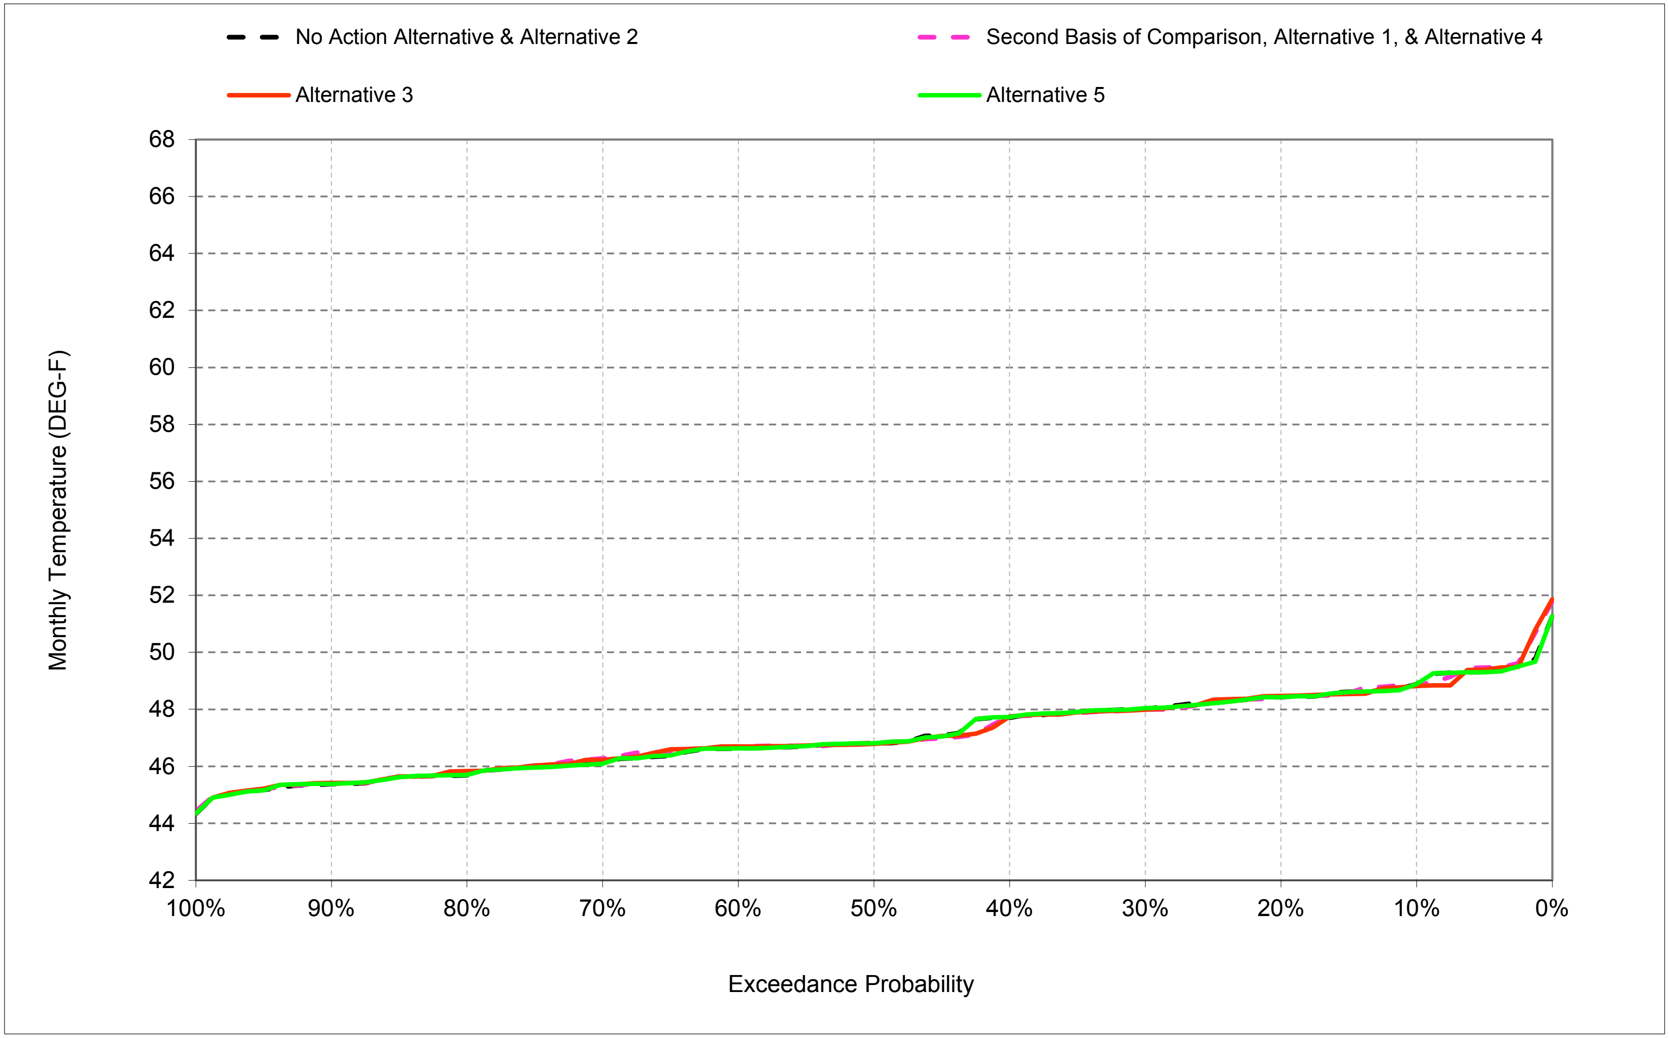
Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-5-5. Sacramento River below Keswick, February



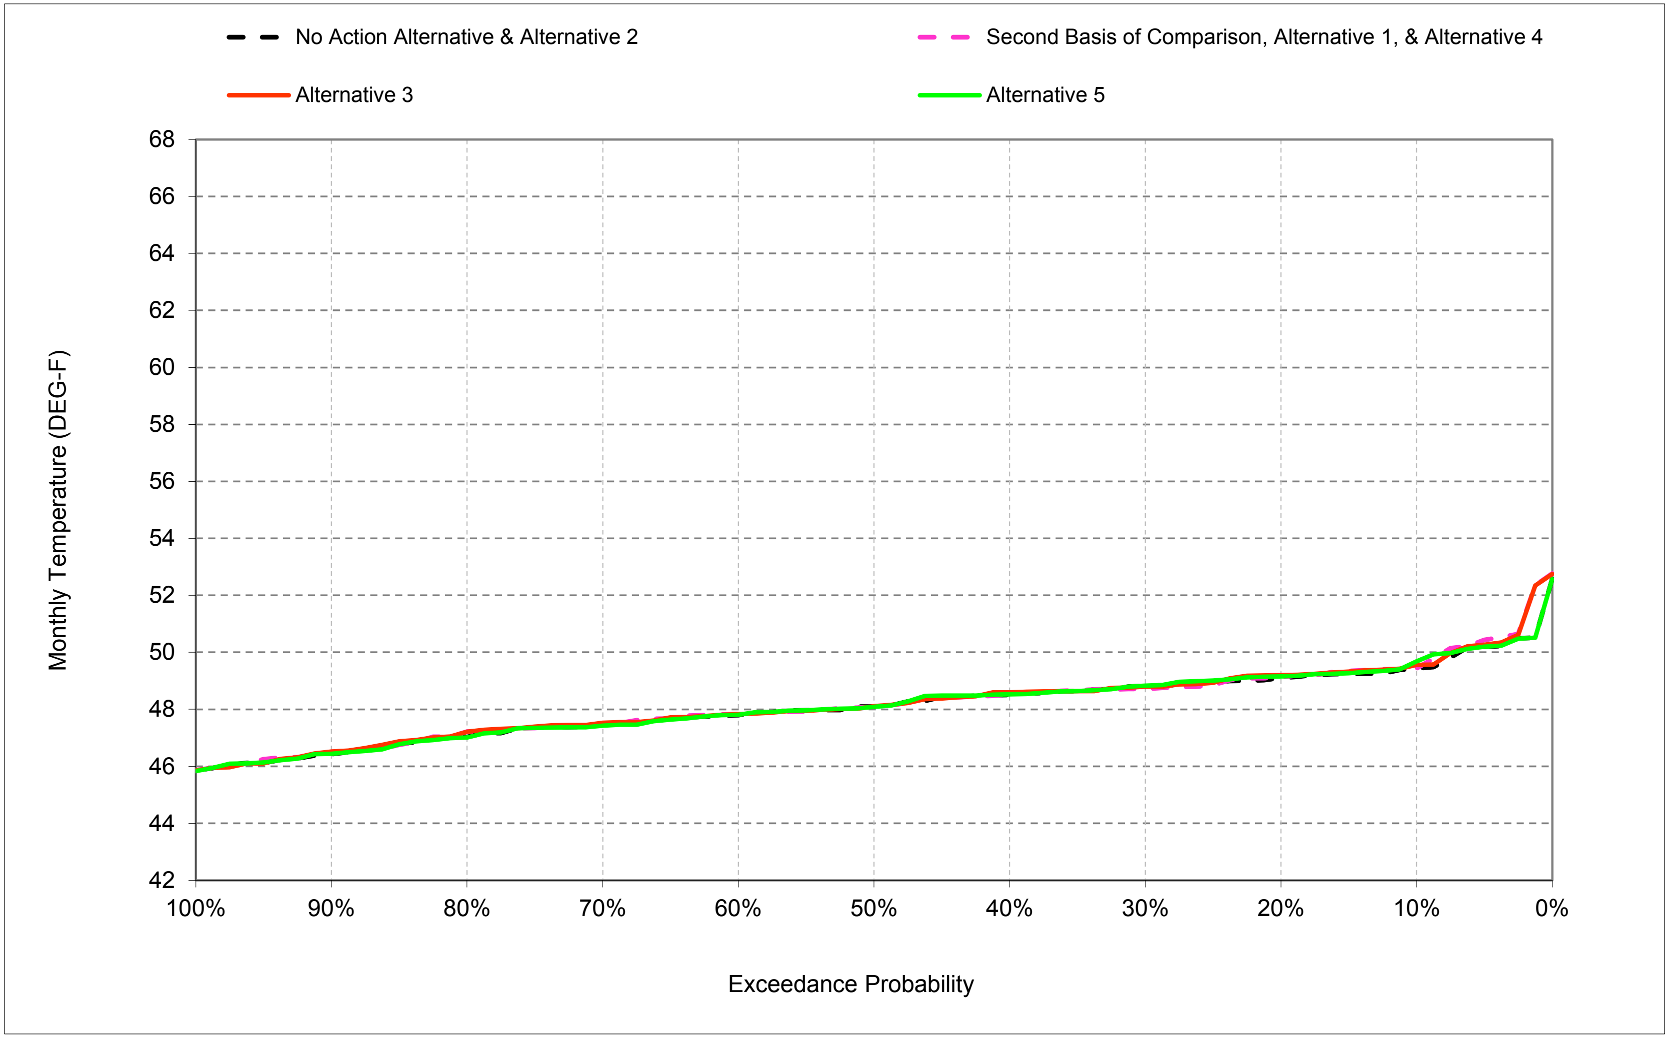
Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-5-6. Sacramento River below Keswick, March



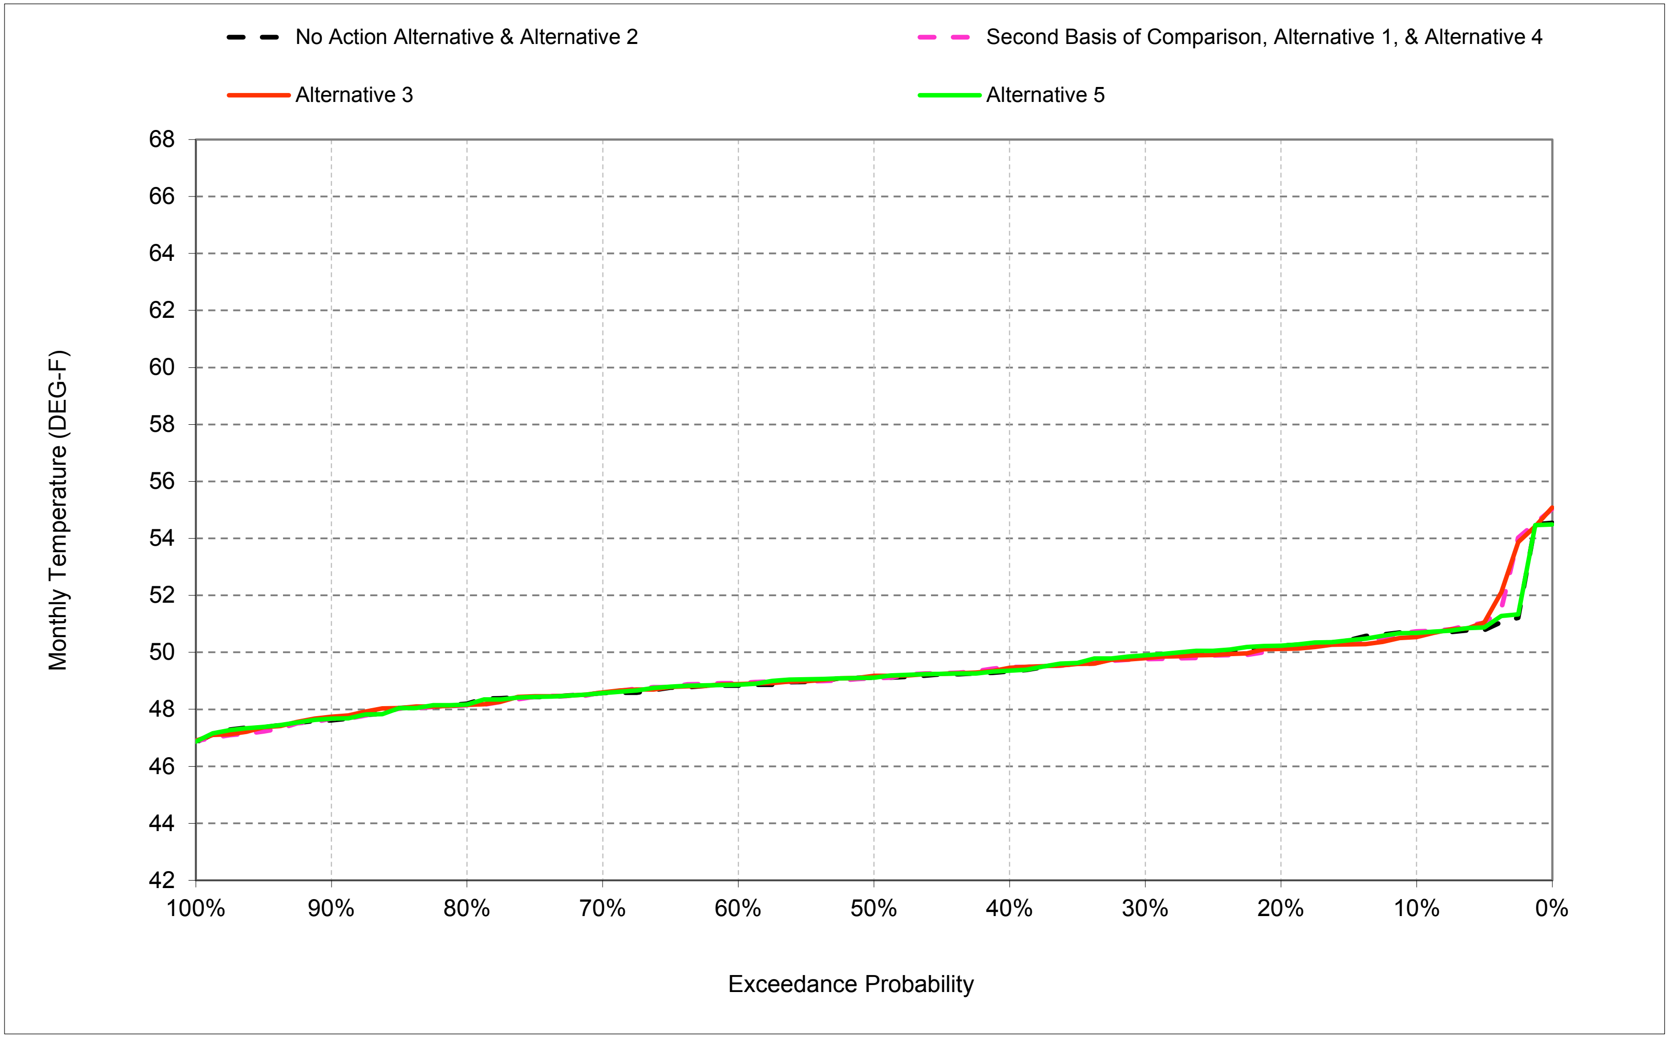
Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-5-7. Sacramento River below Keswick, April



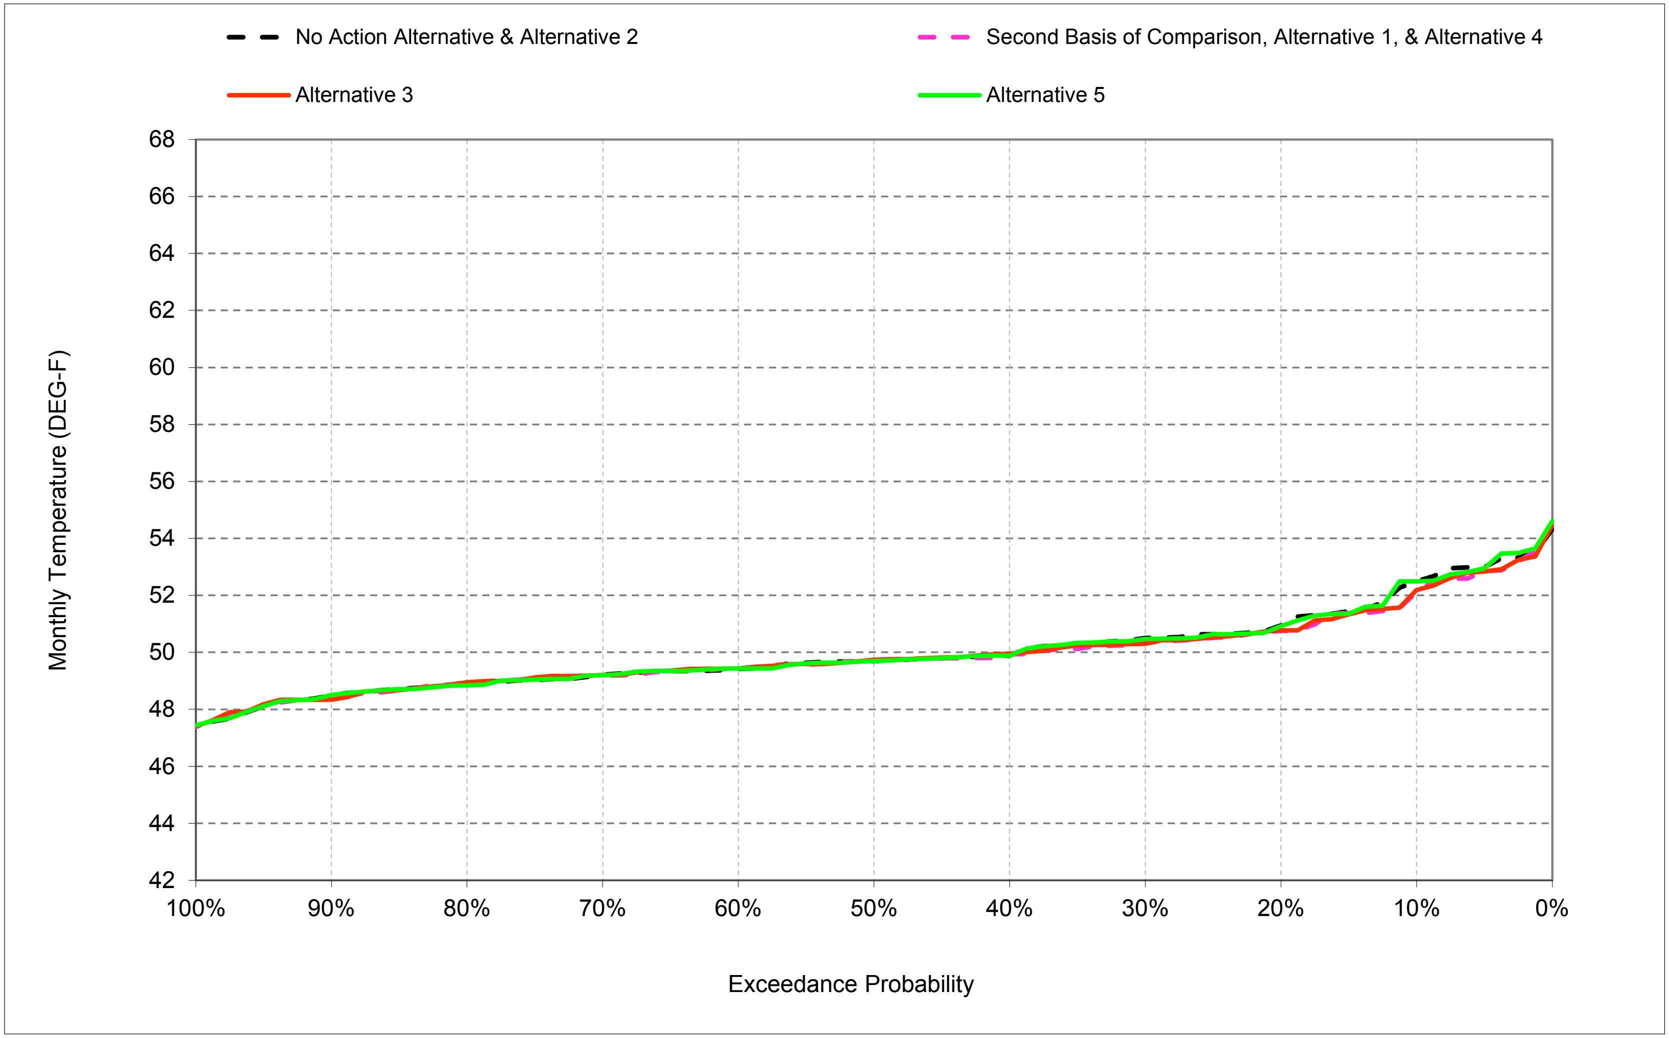
Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-5-8. Sacramento River below Keswick, May



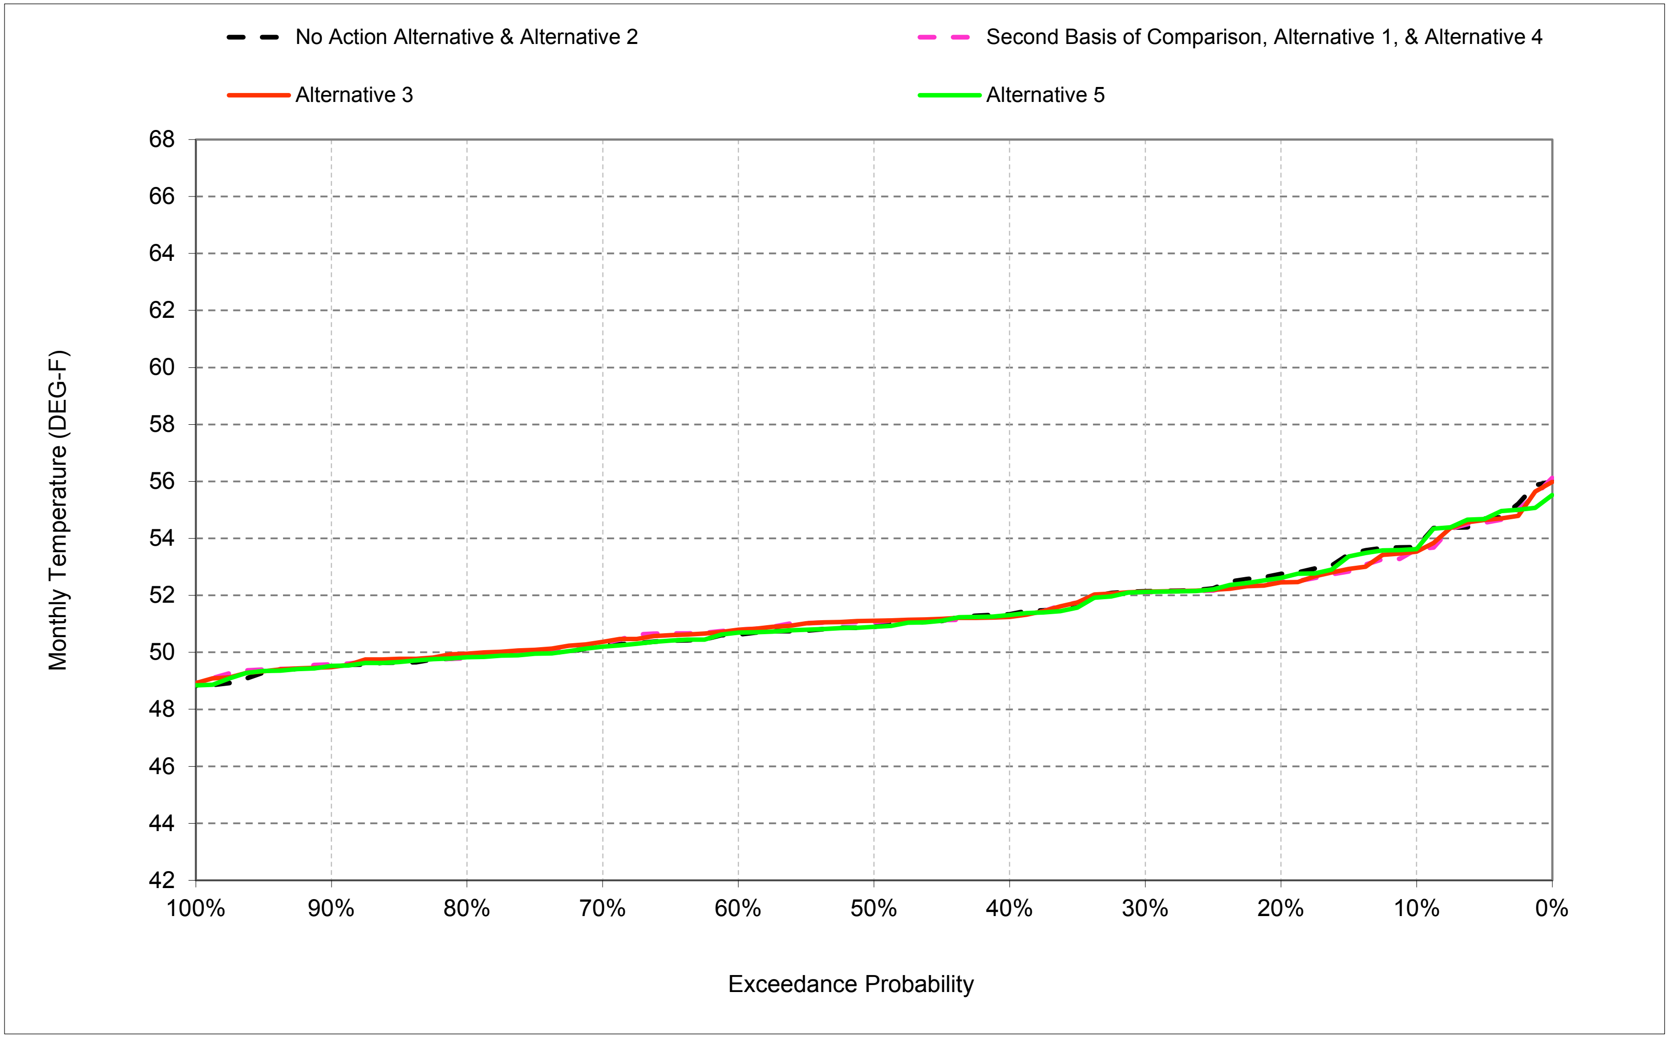
Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-5-9. Sacramento River below Keswick, June



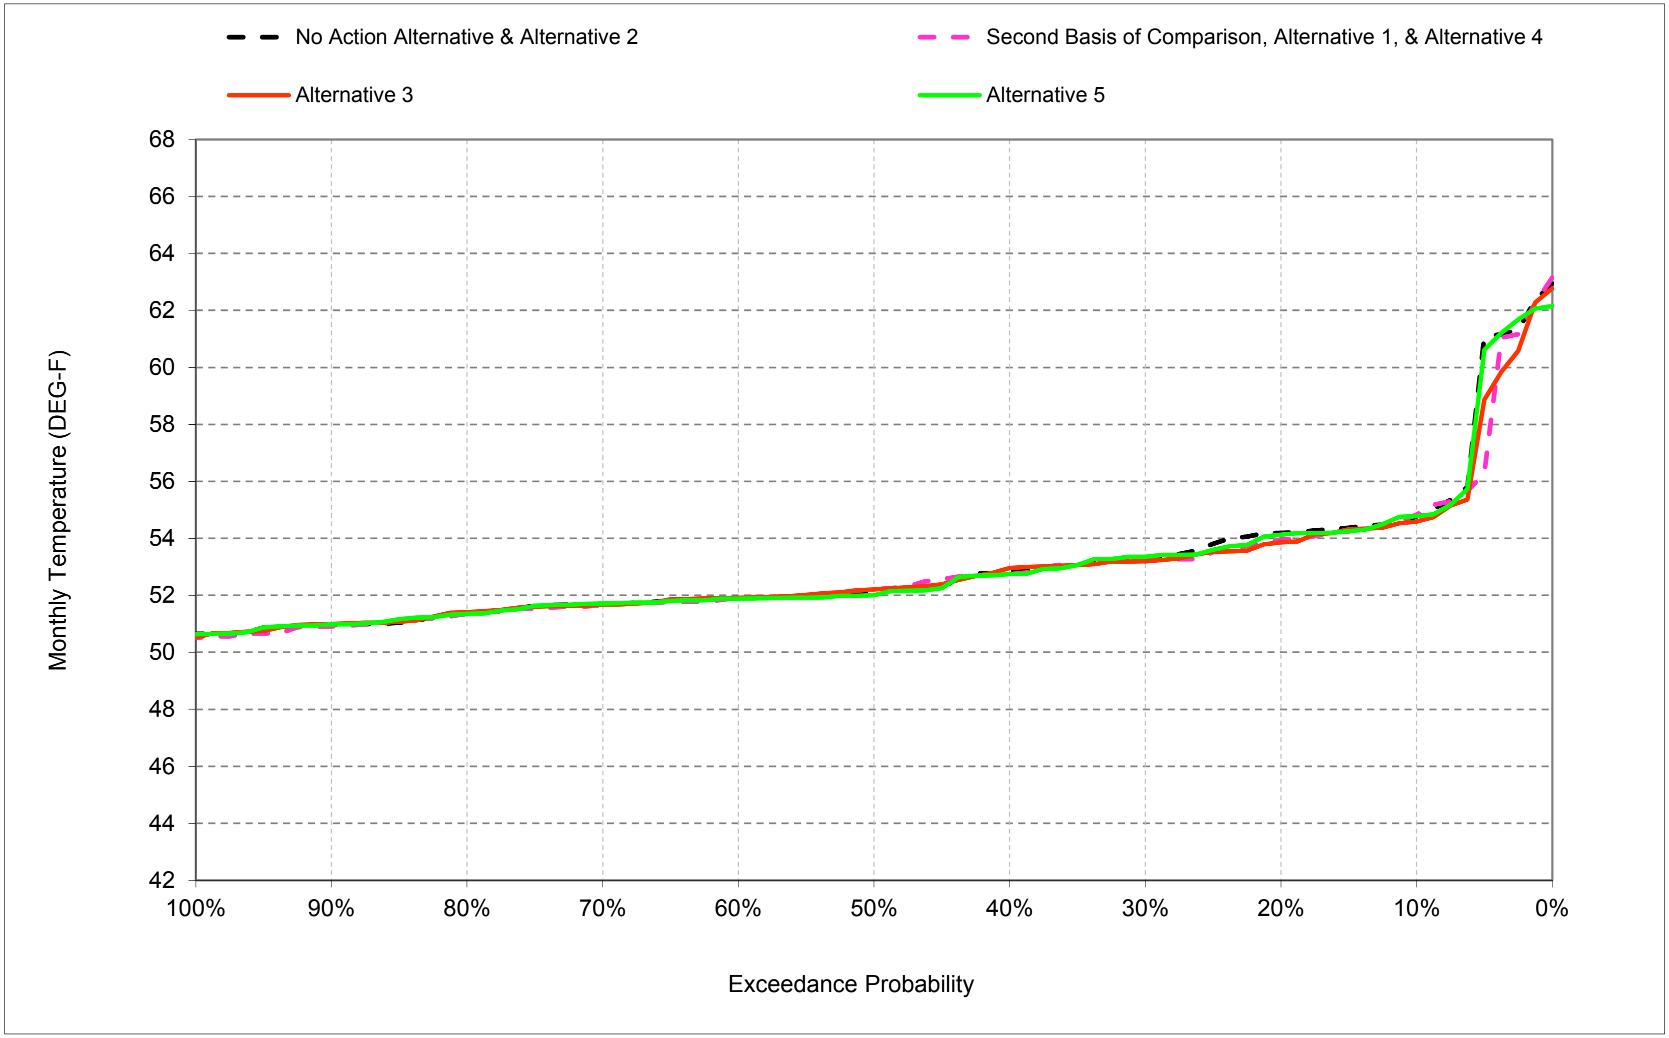
Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-5-10. Sacramento River below Keswick, July



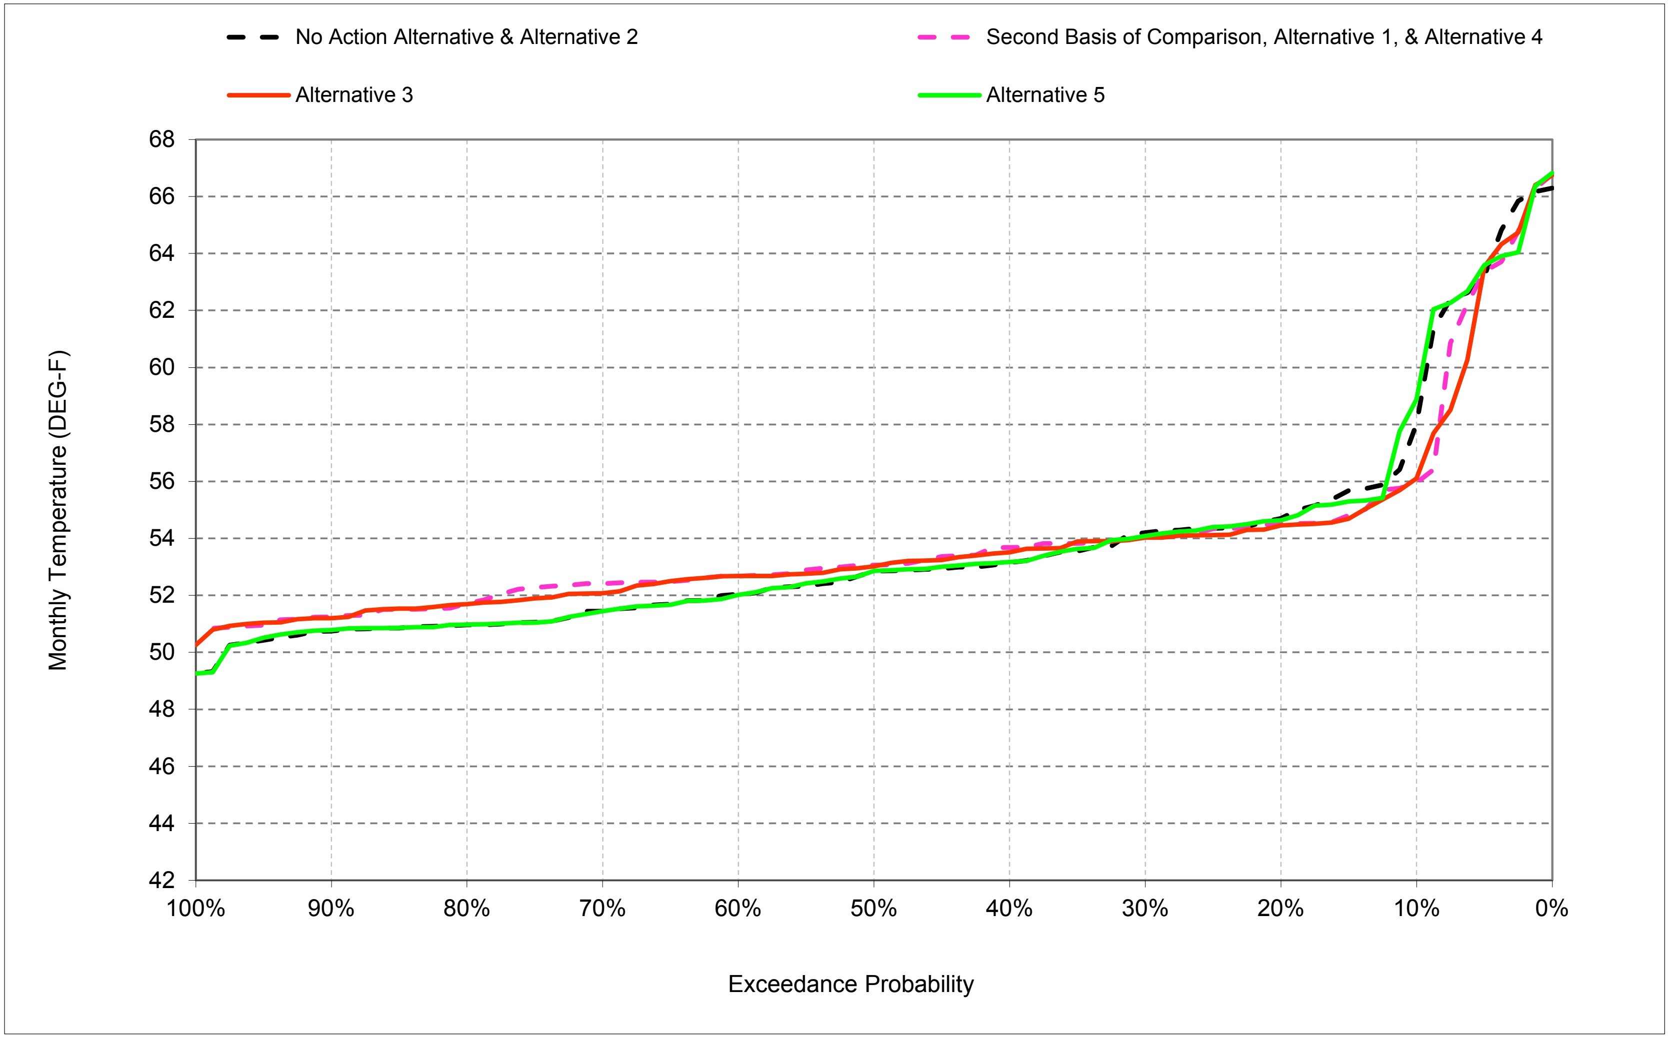
Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-5-11. Sacramento River below Keswick, August



Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-5-12. Sacramento River below Keswick, September



Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

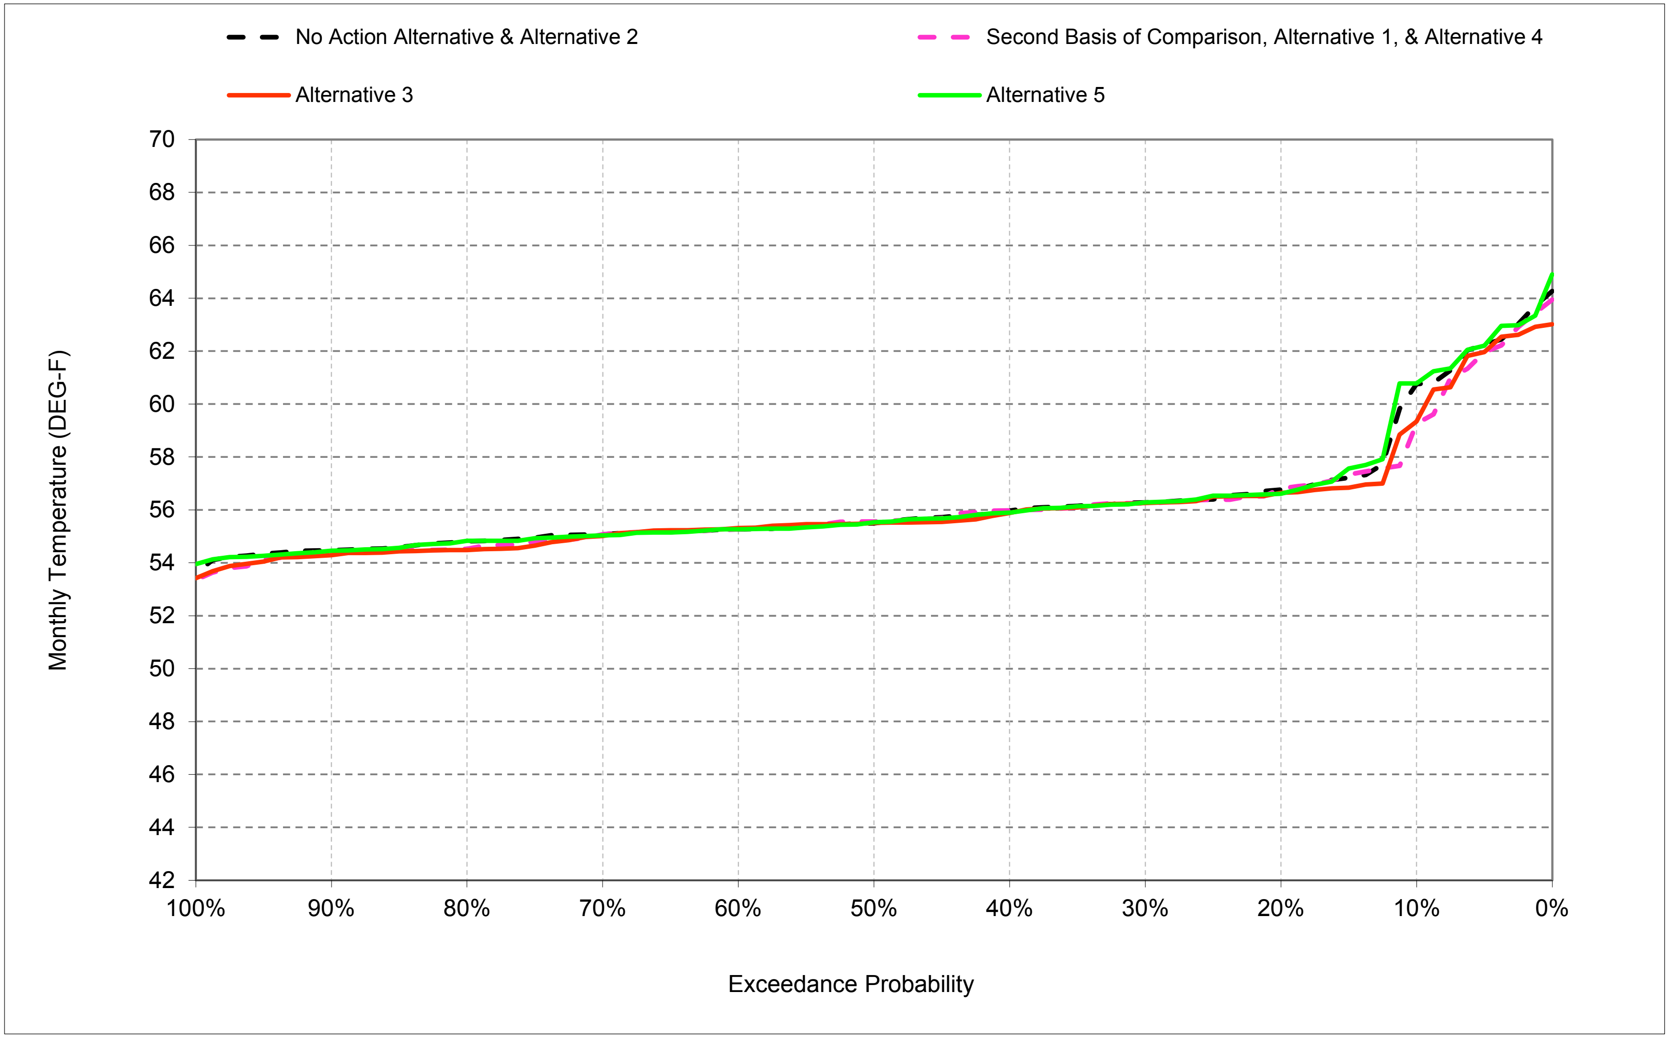
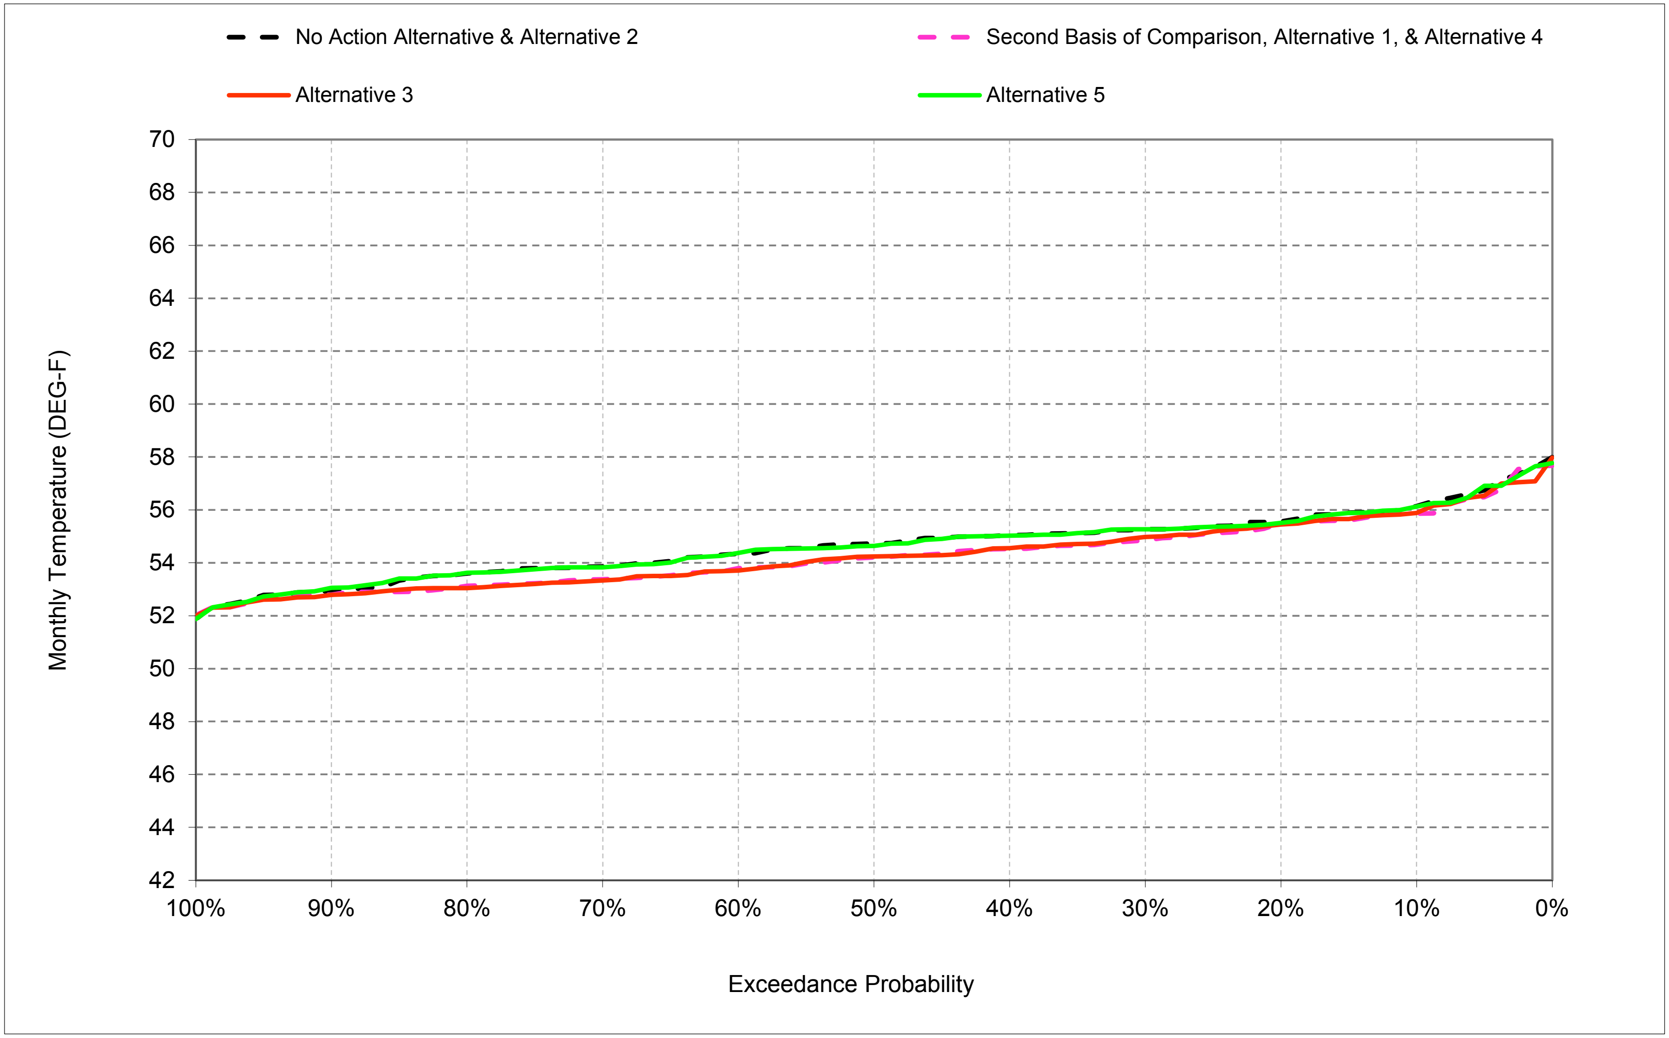
B.6. Sacramento River at Balls Ferry Temperature

Figure B-6-1. Sacramento River at Balls Ferry, October



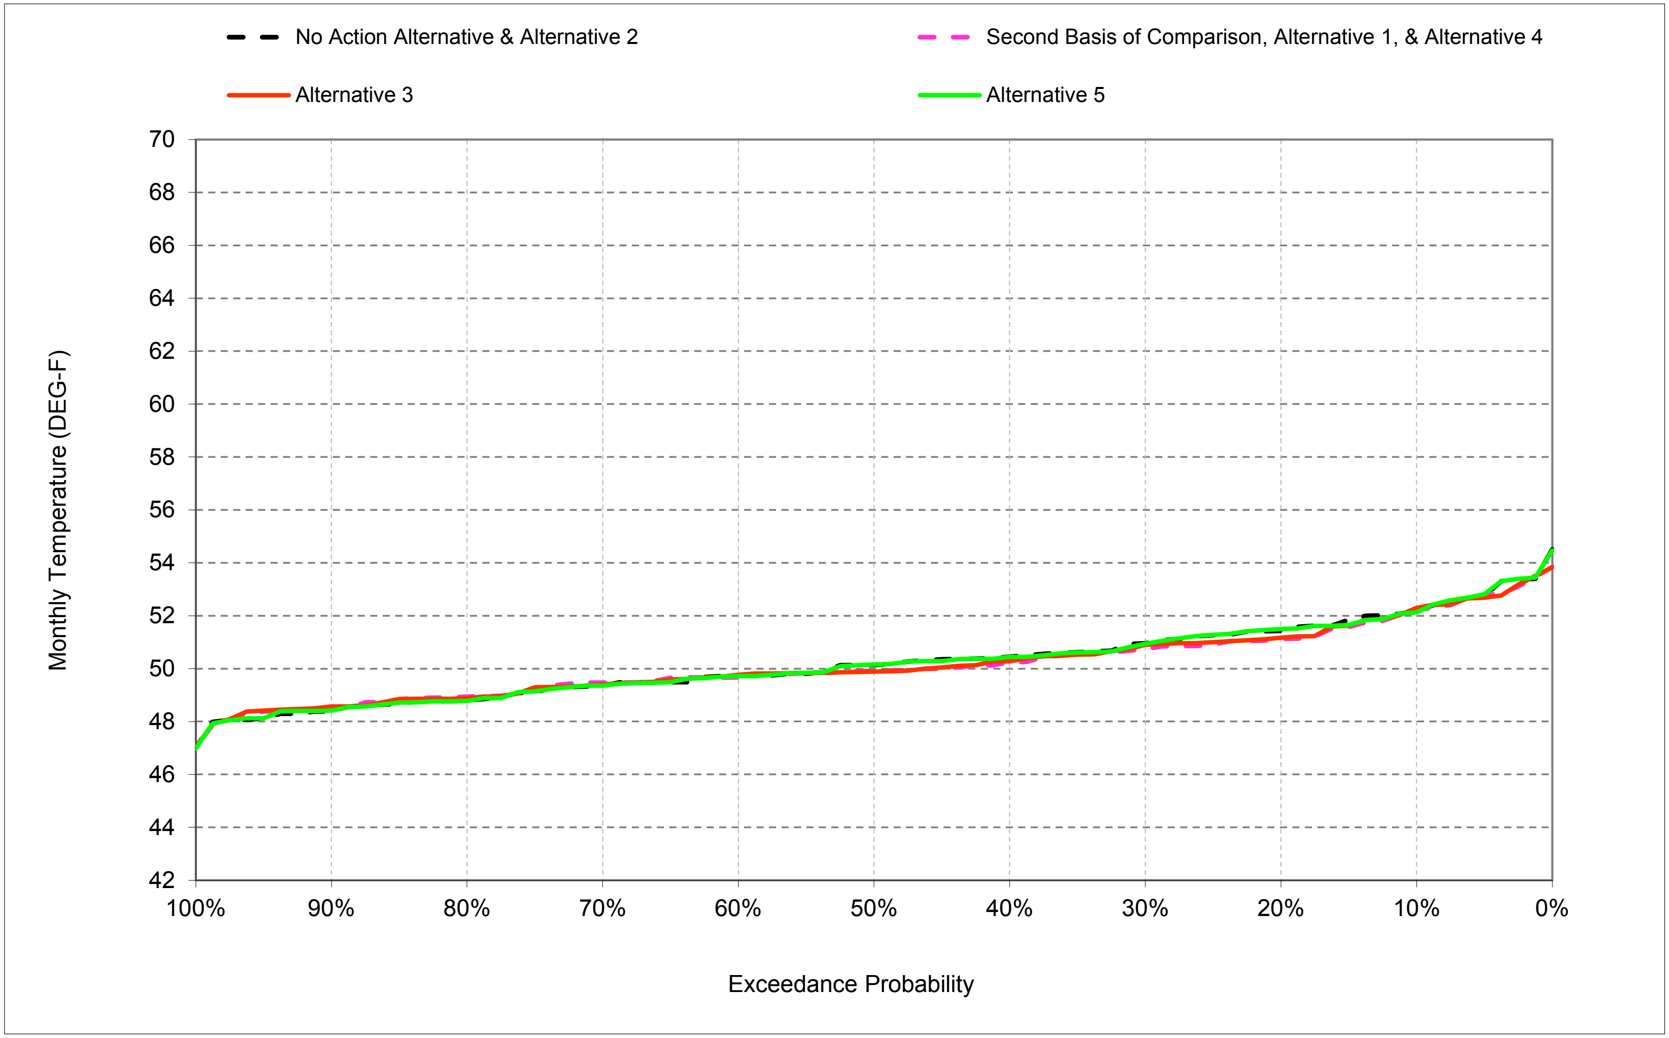
Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-6-2. Sacramento River at Balls Ferry, November



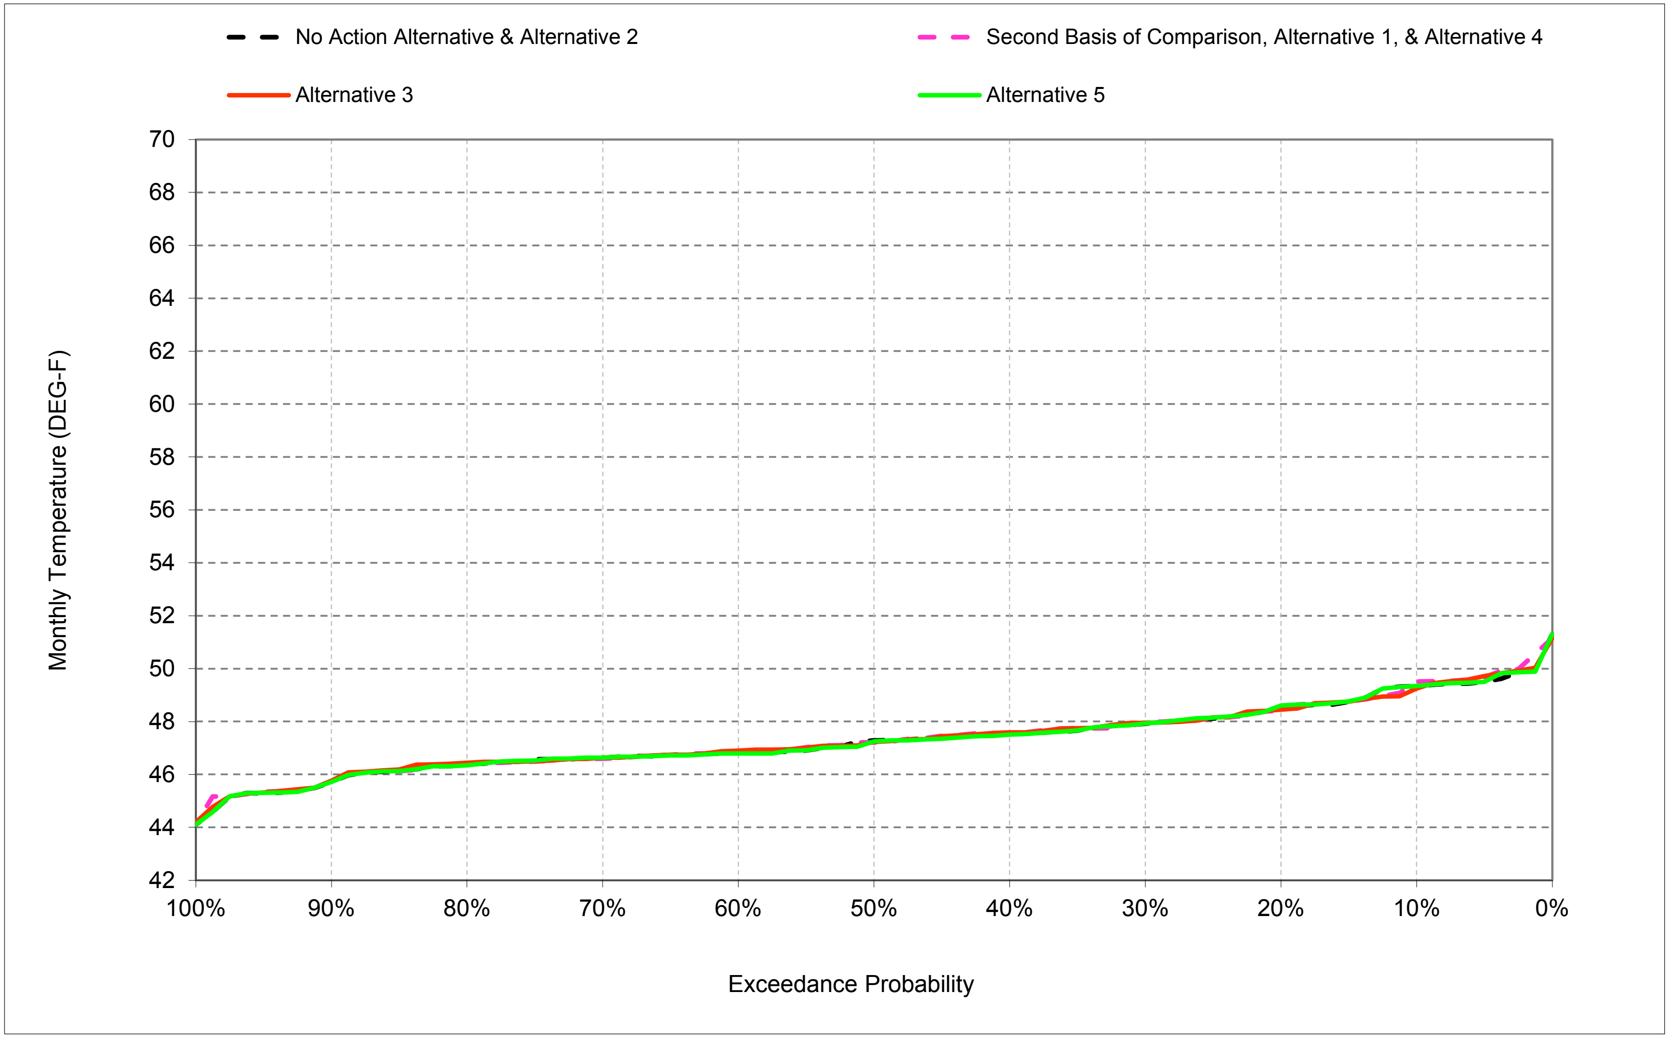
Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-6-3. Sacramento River at Balls Ferry, December



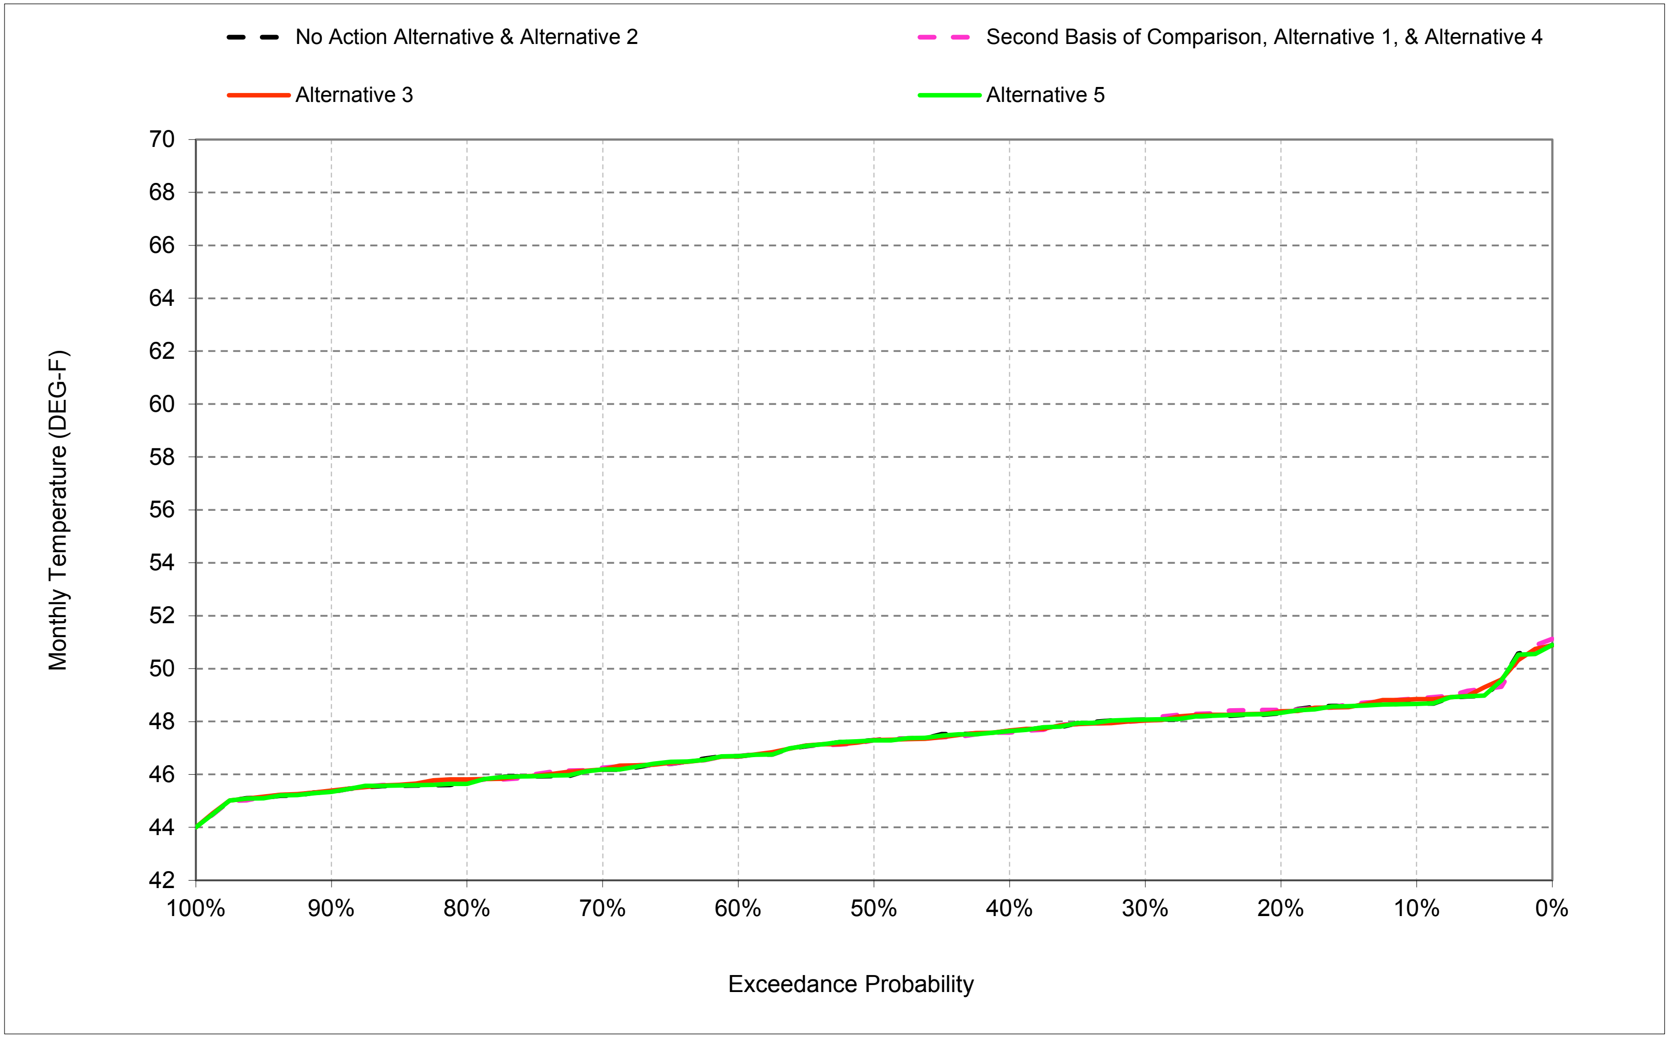
Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-6-4. Sacramento River at Balls Ferry, January



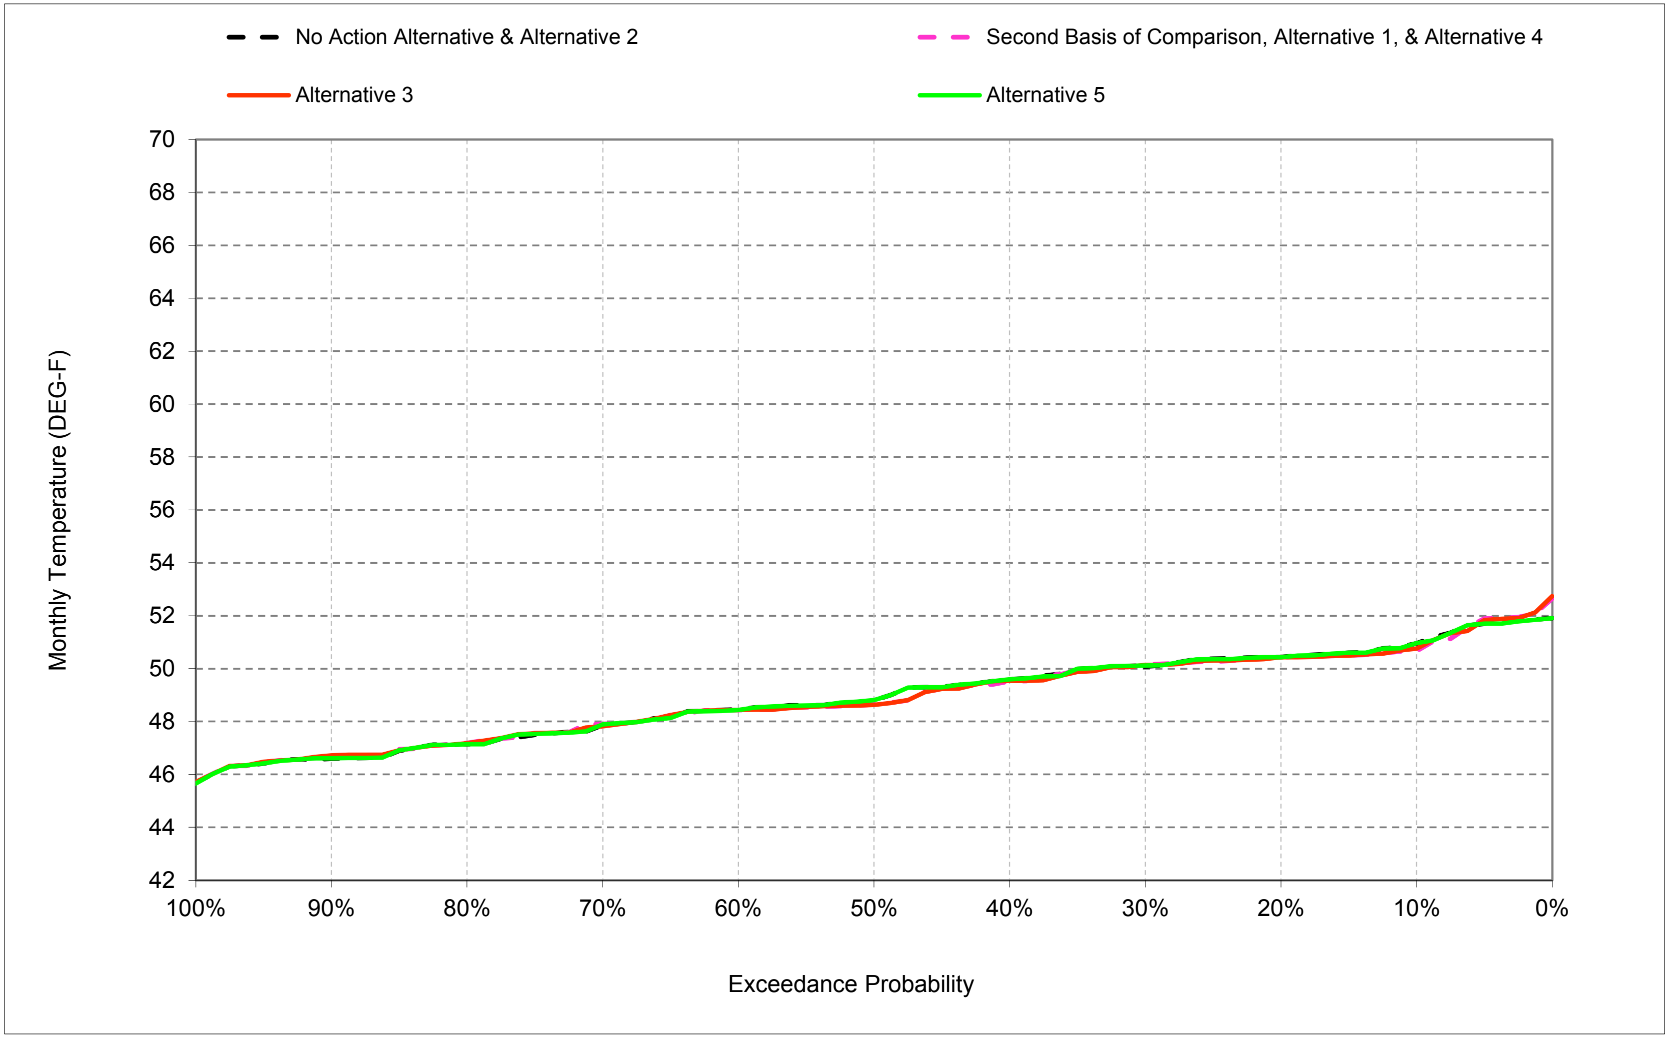
Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-6-5. Sacramento River at Balls Ferry, February



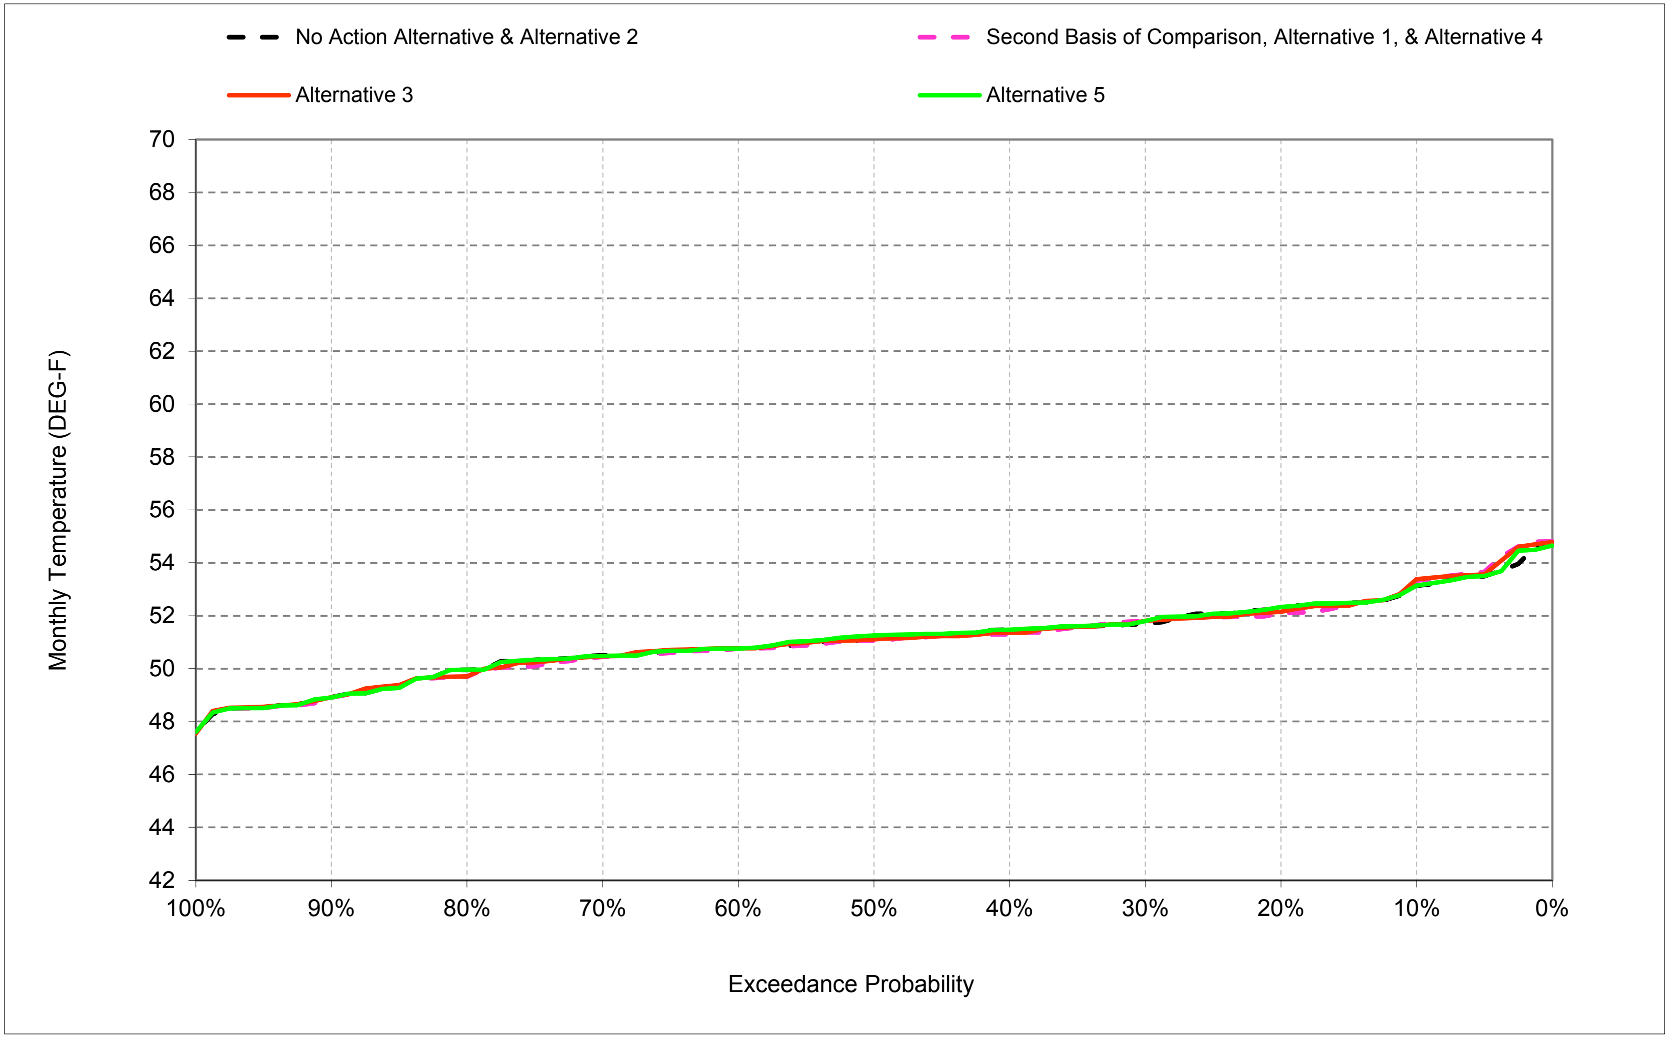
Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-6-6. Sacramento River at Balls Ferry, March



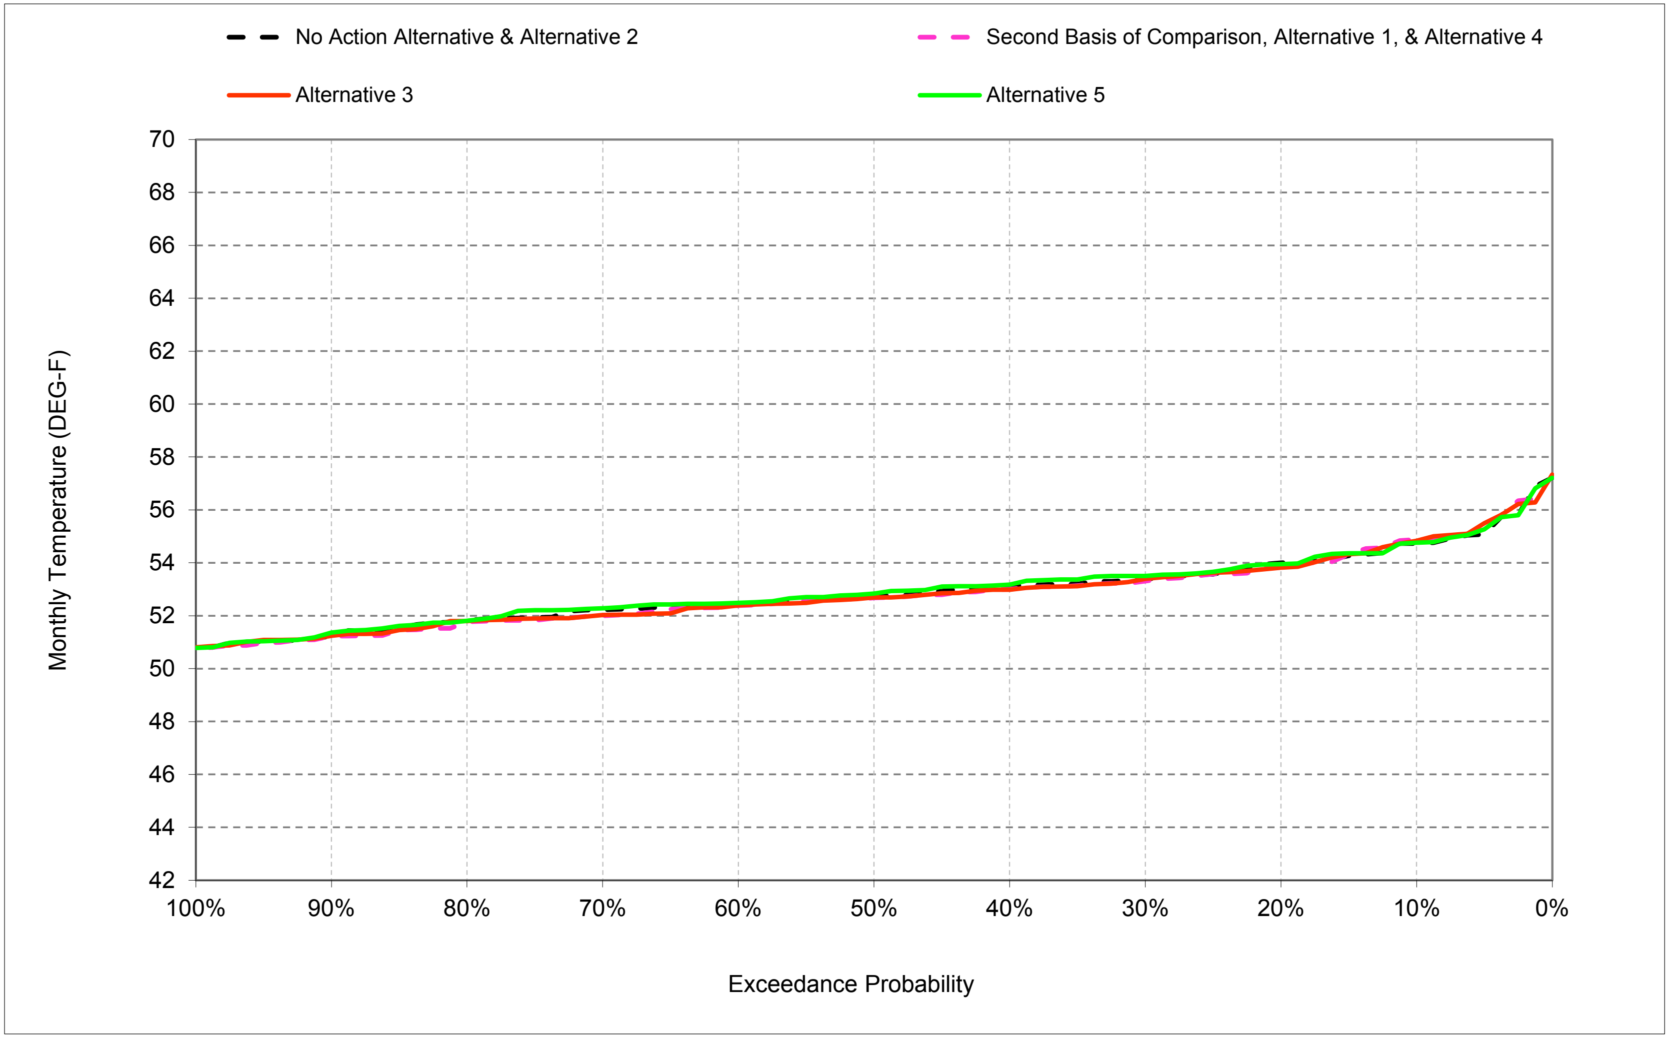
Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-6-7. Sacramento River at Balls Ferry, April



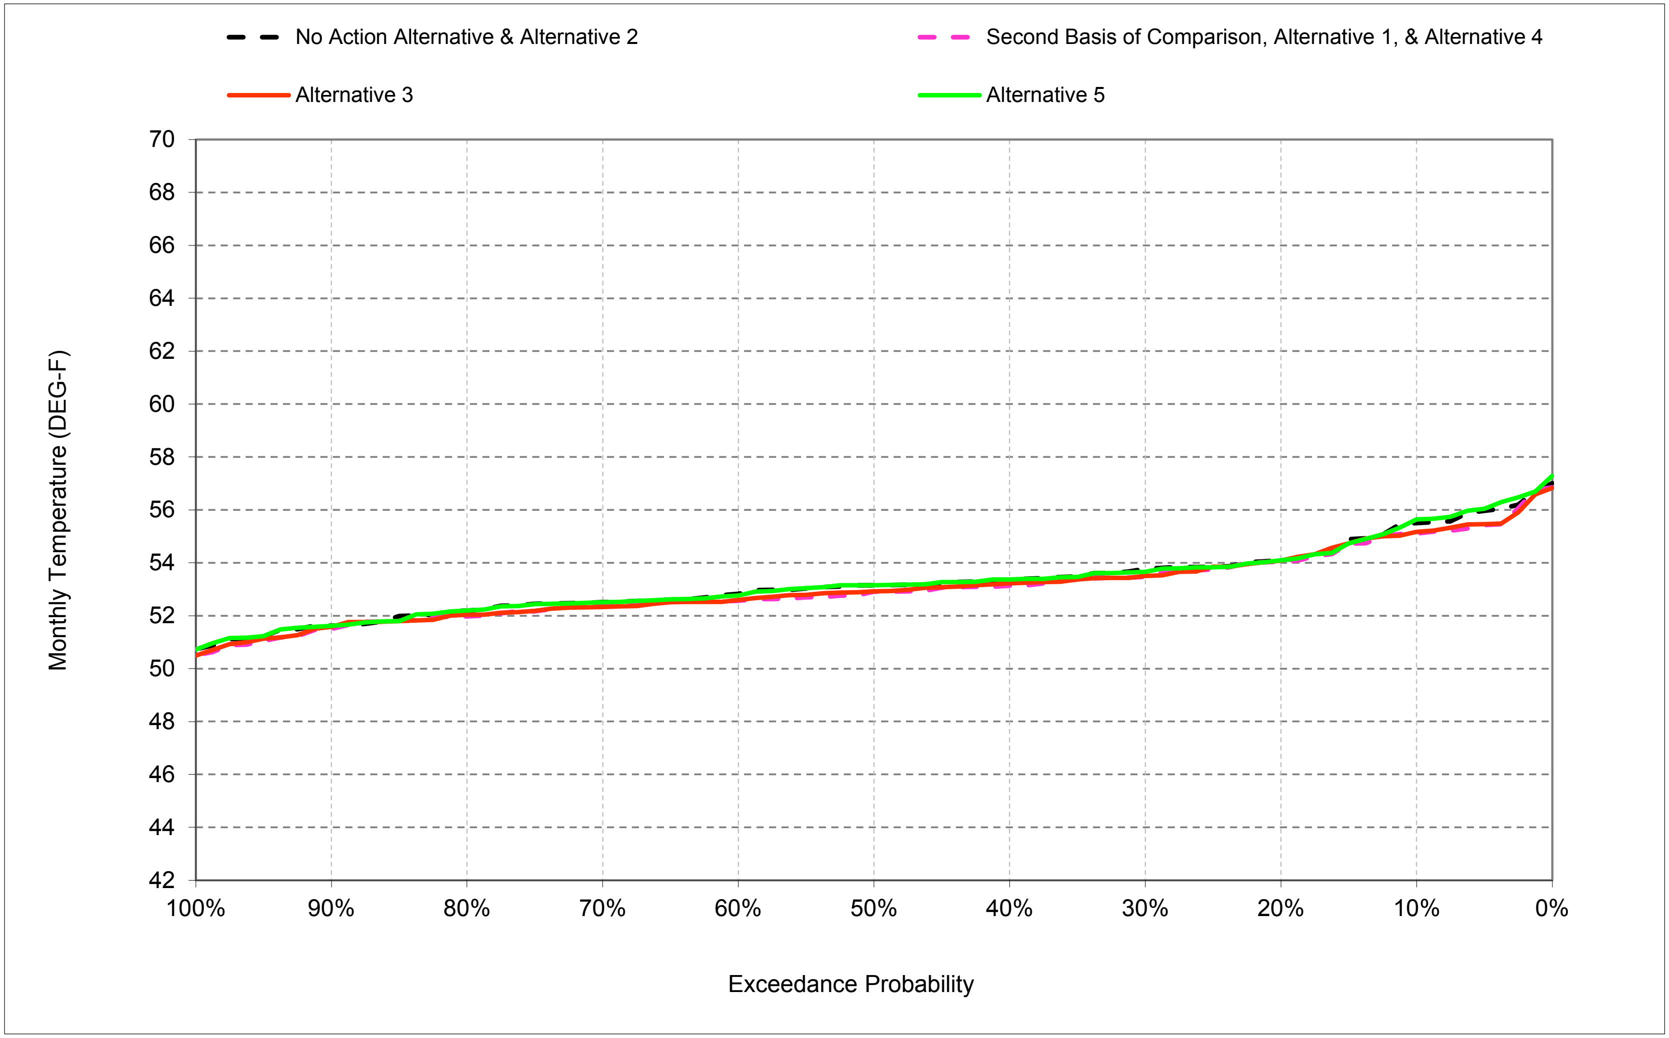
Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-6-8. Sacramento River at Balls Ferry, May



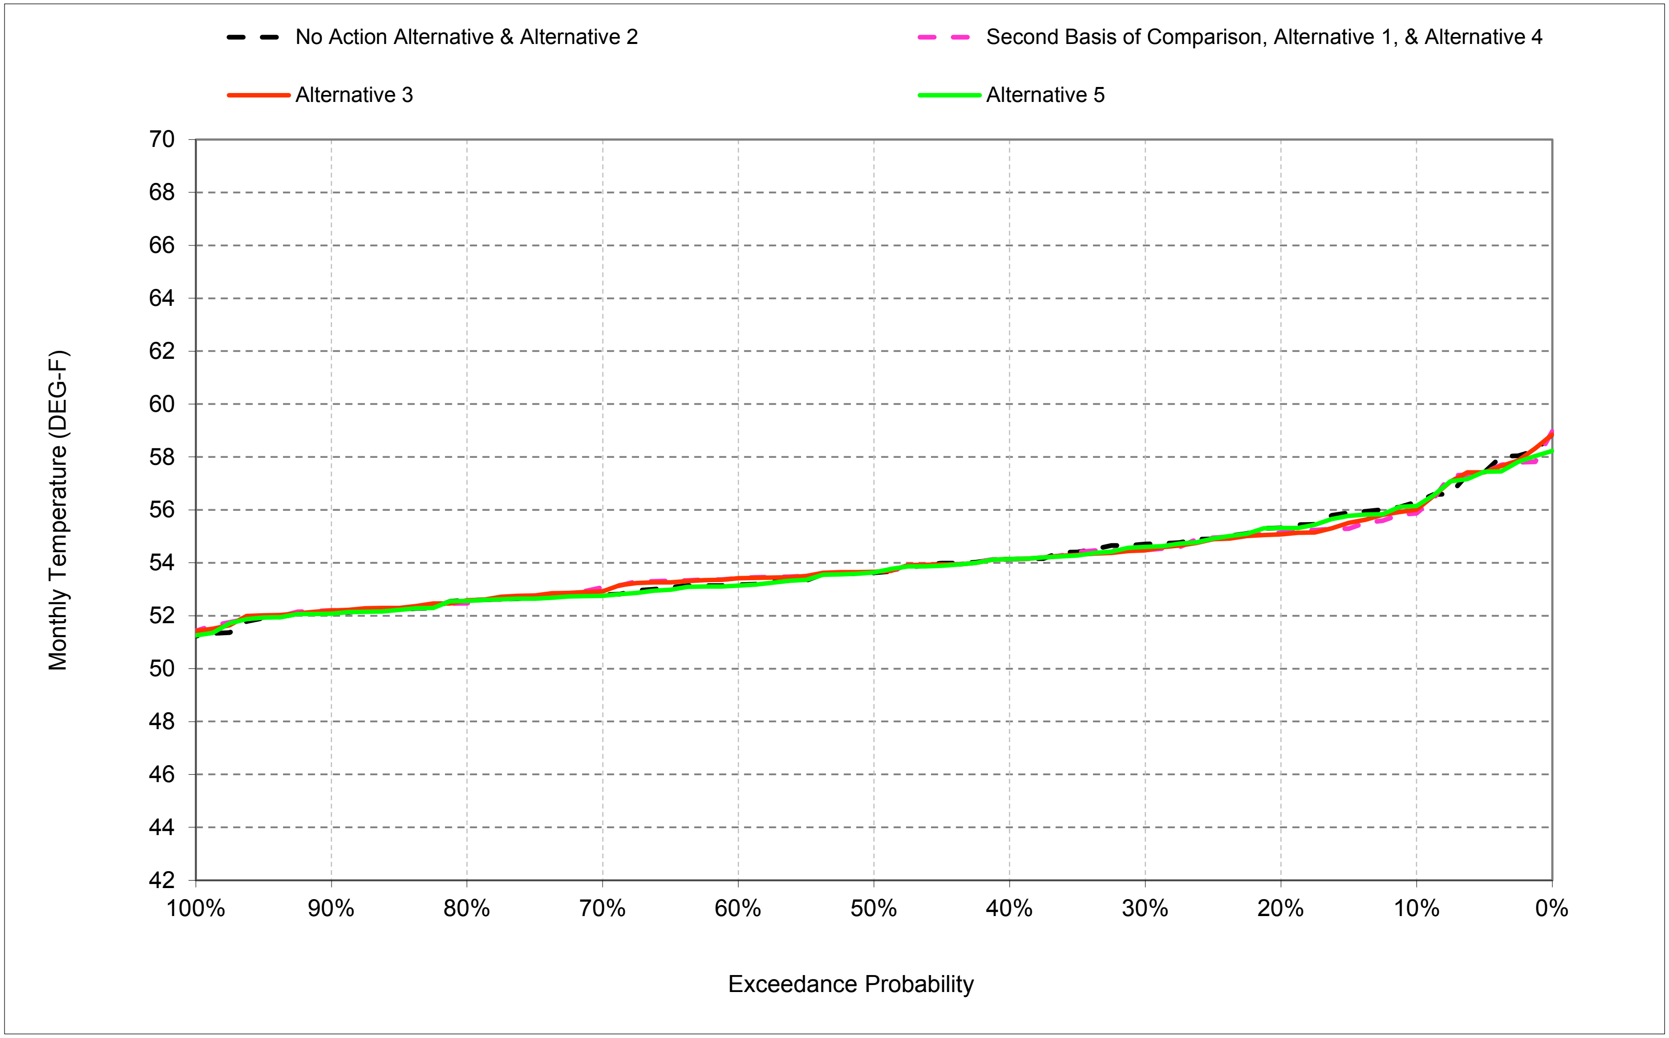
Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-6-9. Sacramento River at Balls Ferry, June



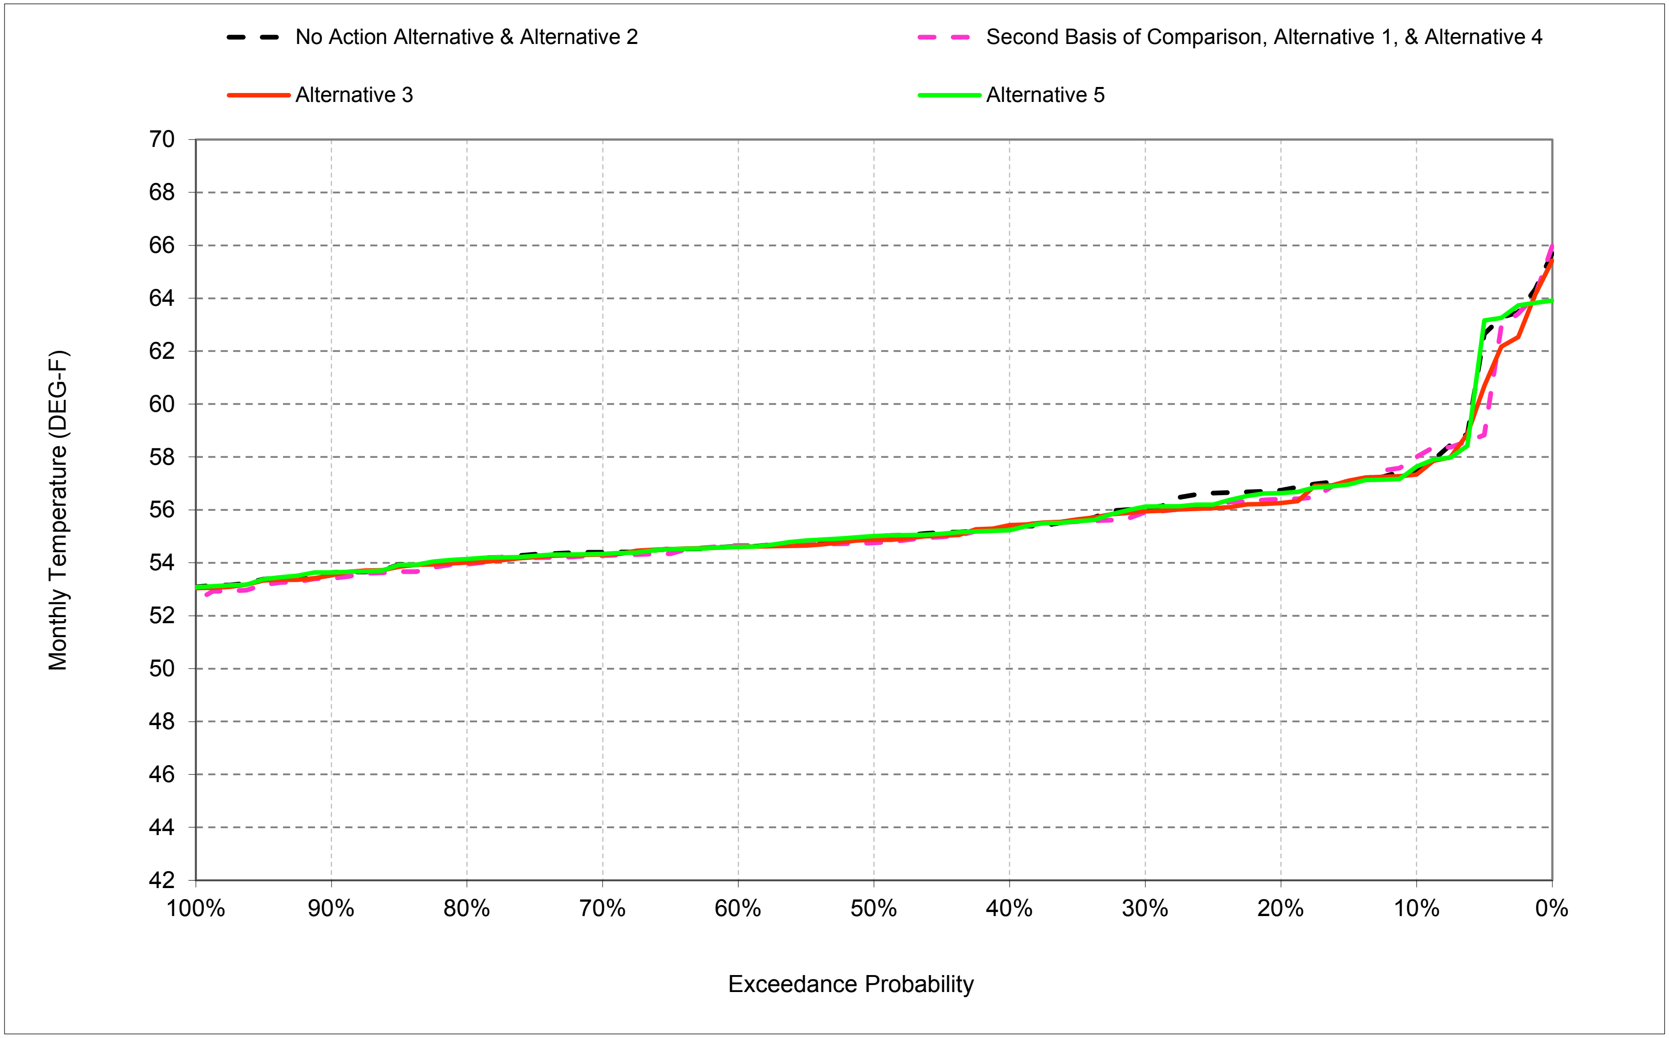
Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-6-10. Sacramento River at Balls Ferry, July



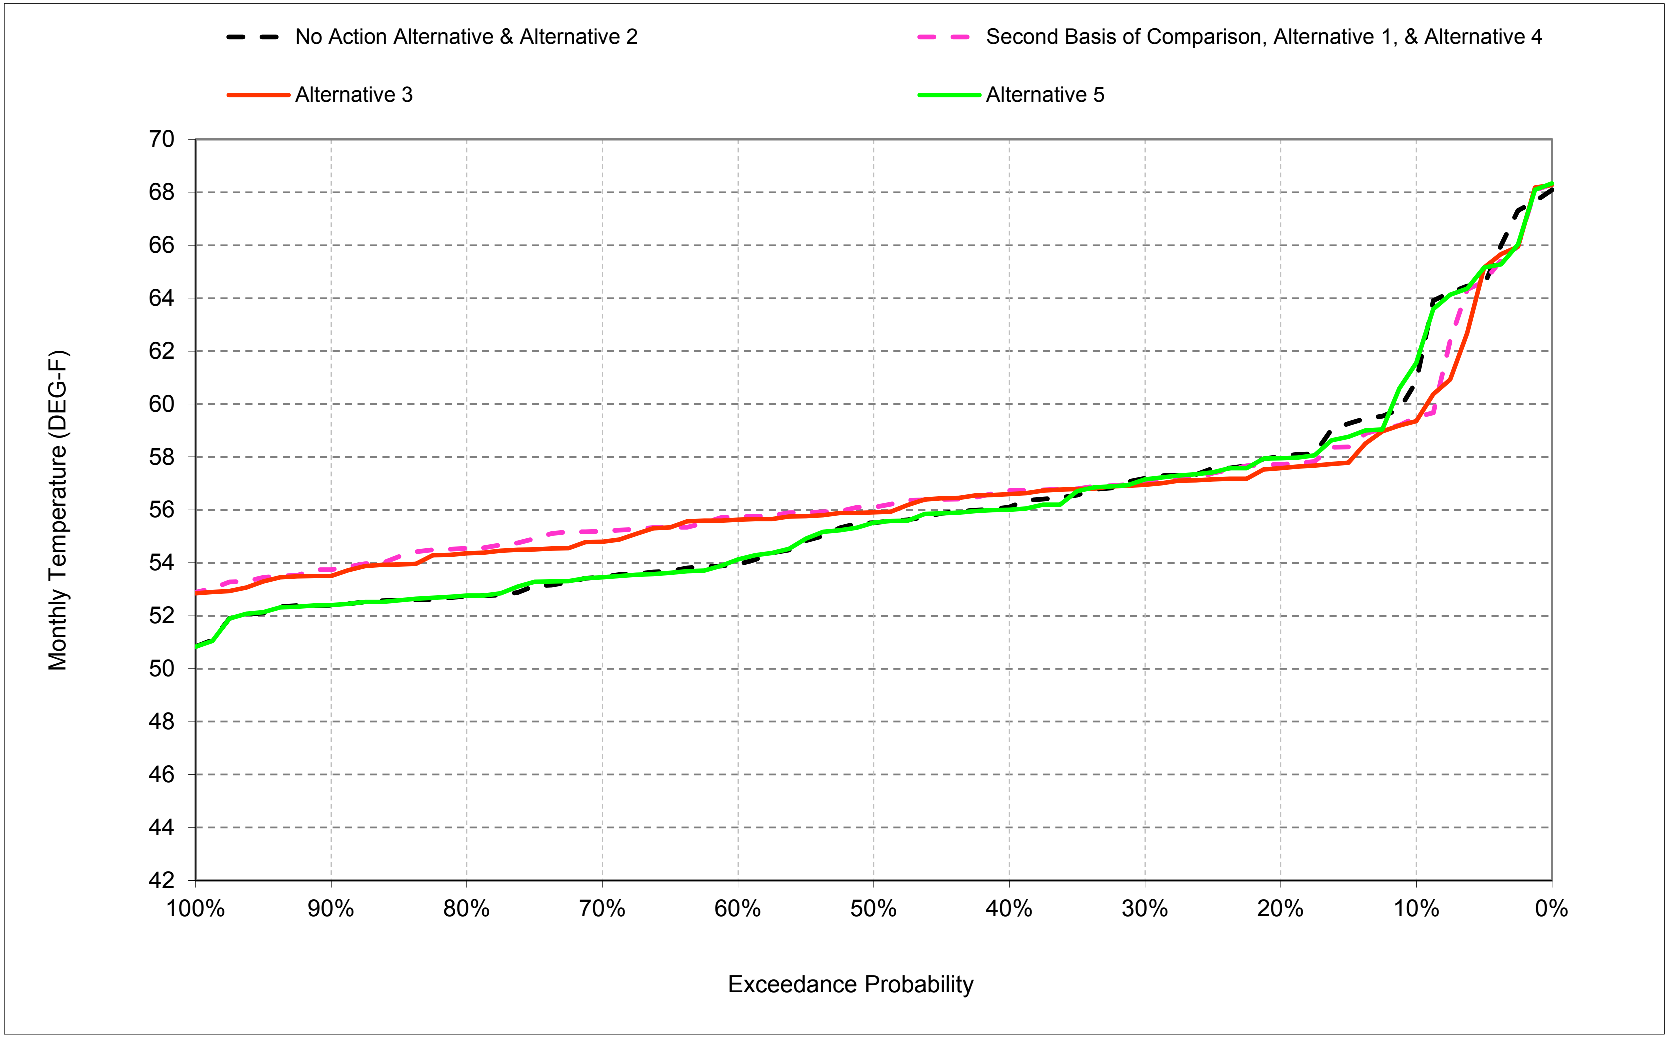
Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-6-11. Sacramento River at Balls Ferry, August



Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-6-12. Sacramento River at Balls Ferry, September



Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Qualitative differences, if applicable, are discussed in the text.

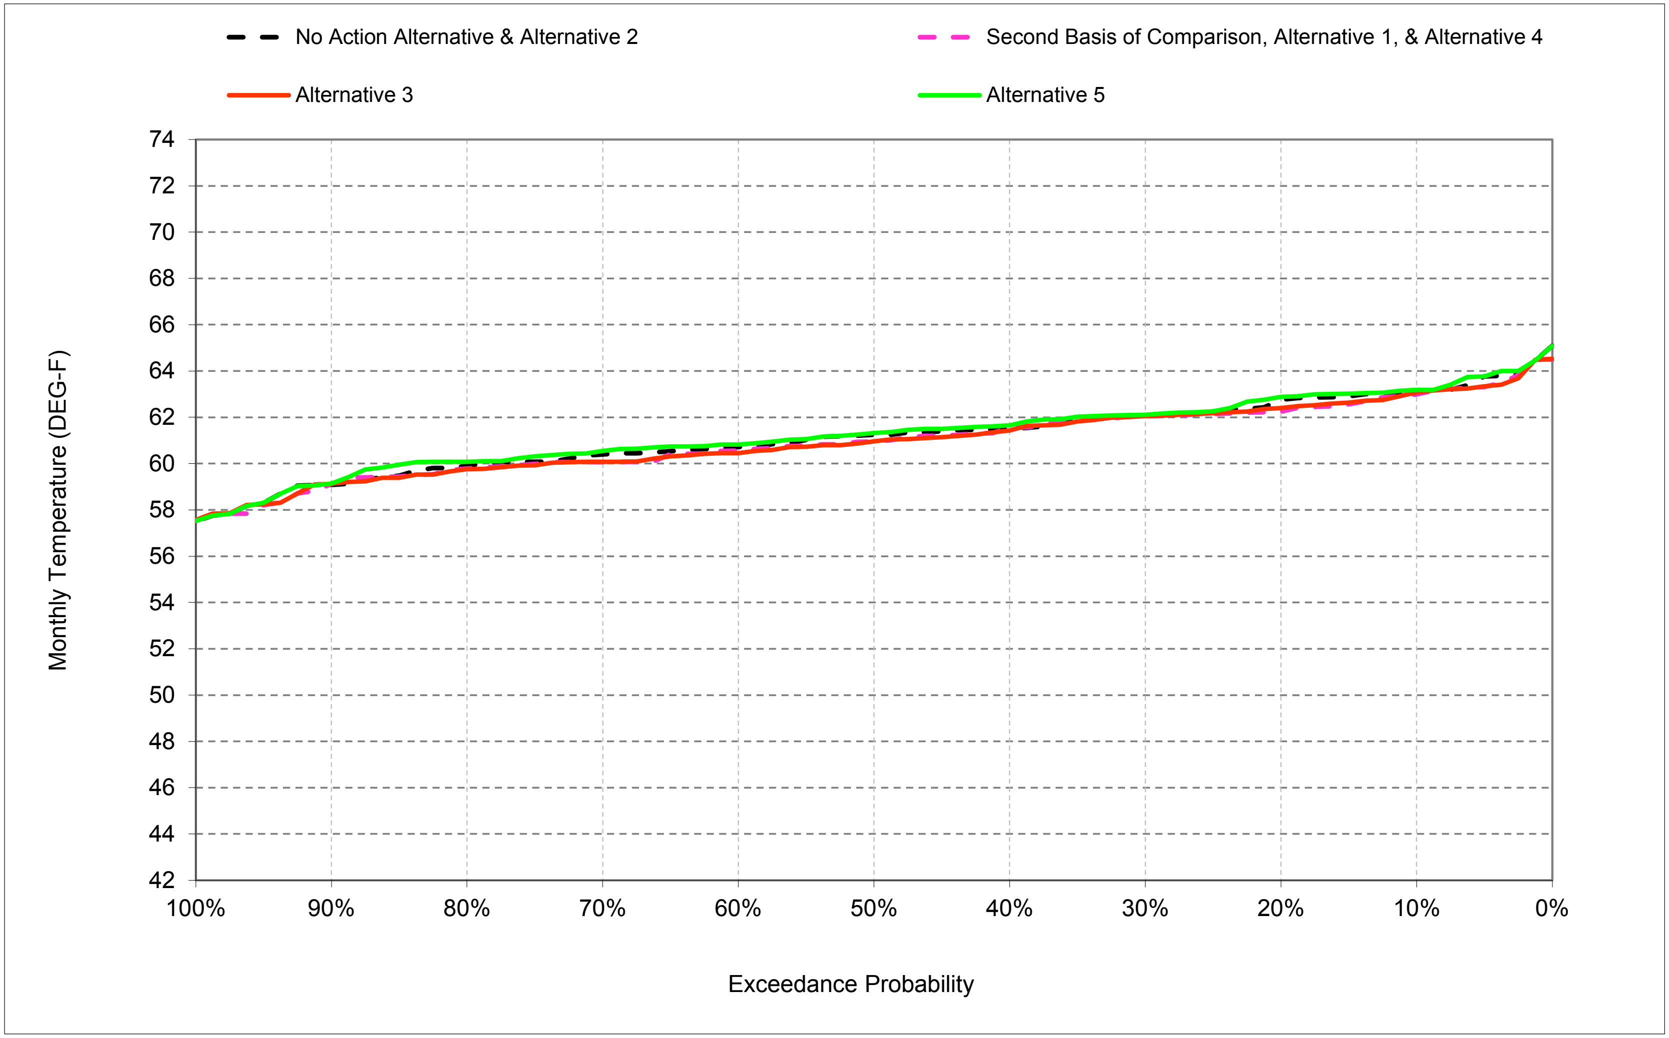
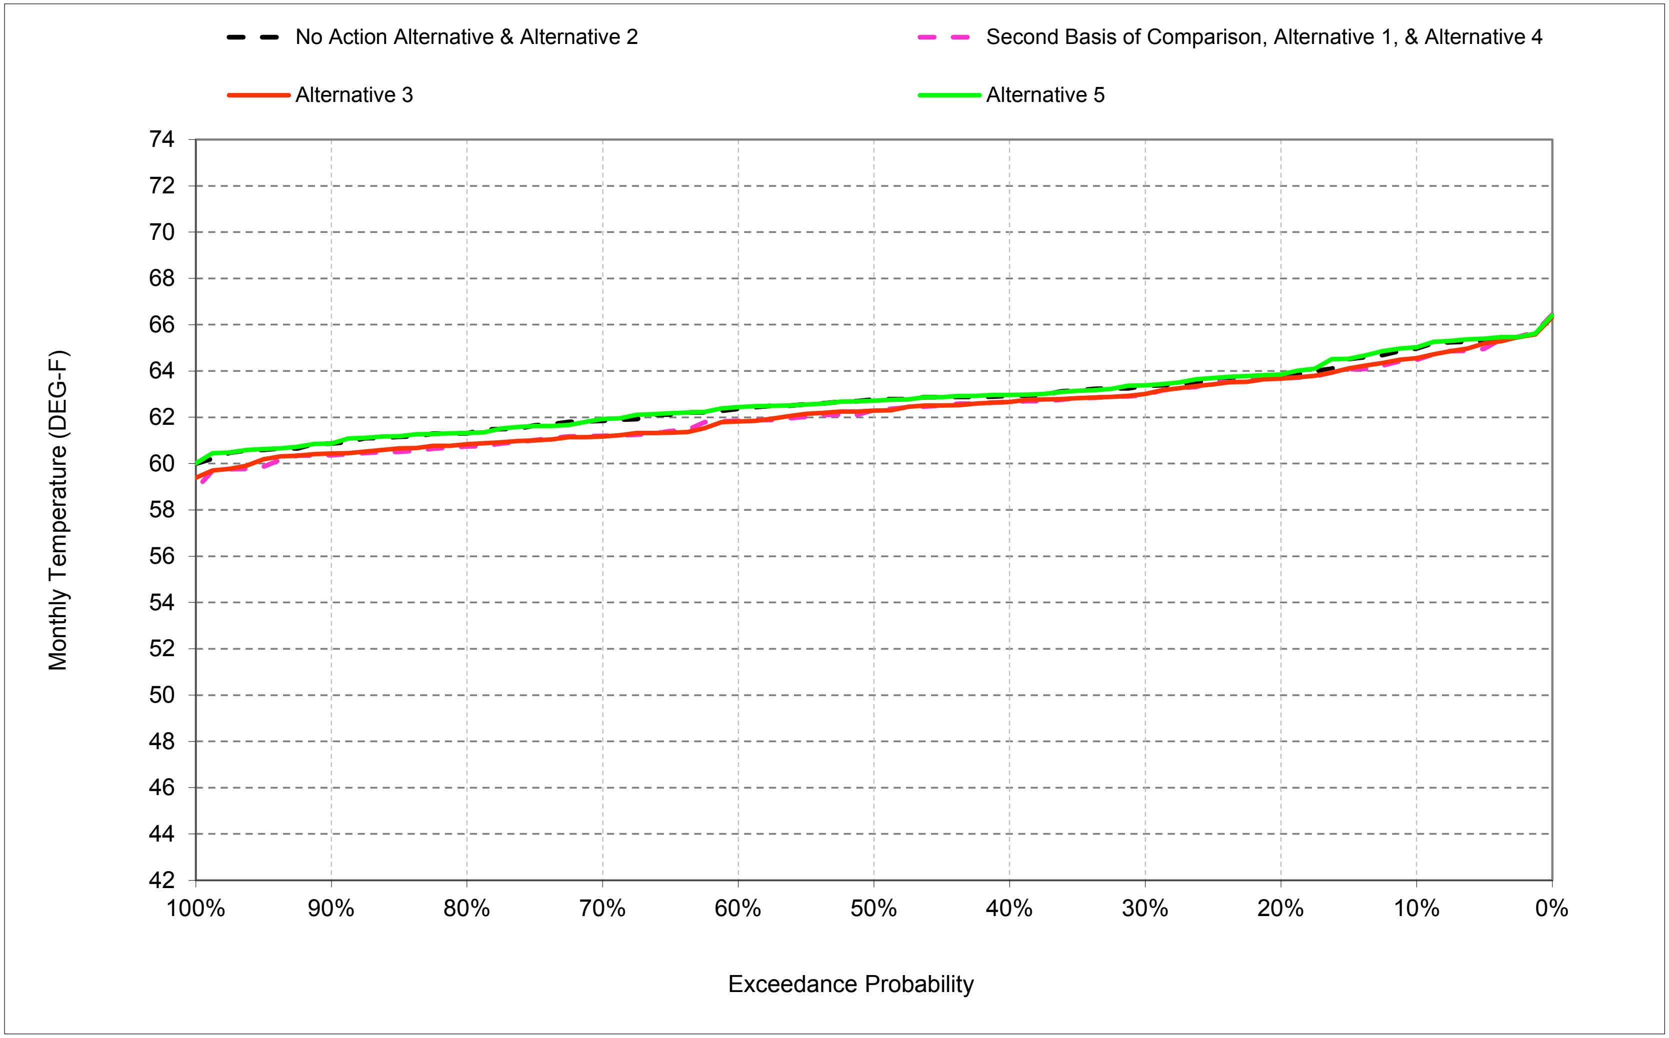
Figure B-10-8. Sacramento River below Hamilton City, May



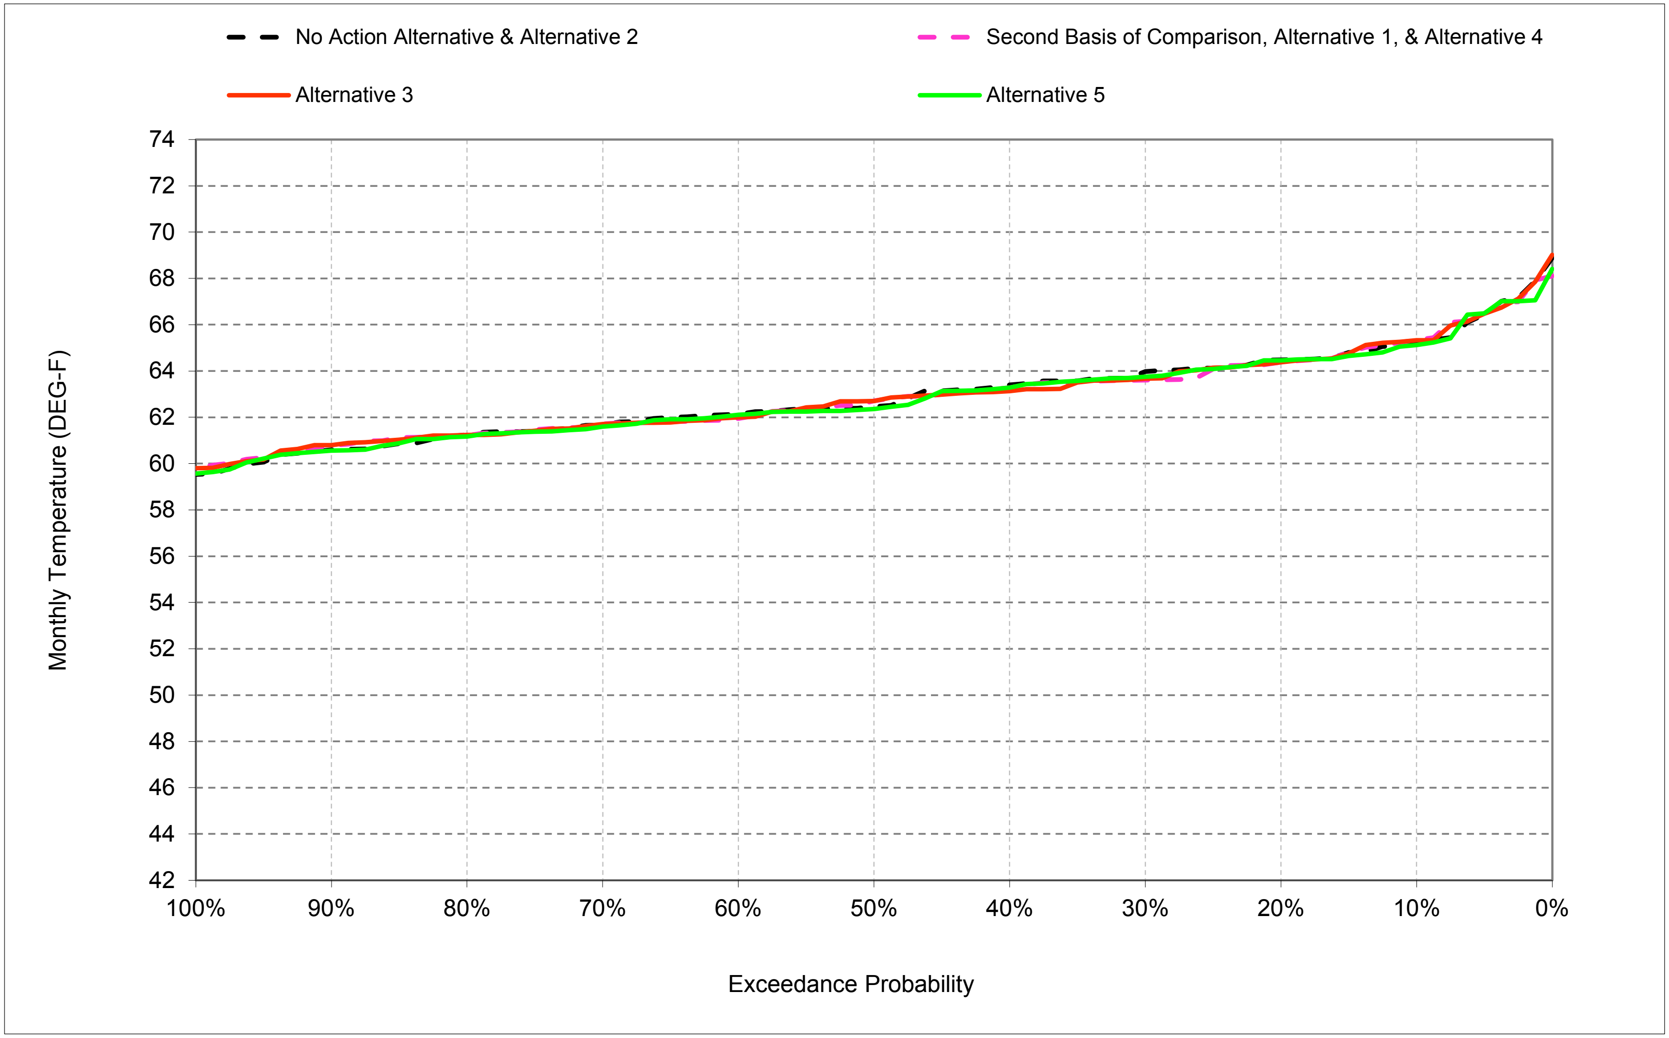
Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-10-9. Sacramento River below Hamilton City, June



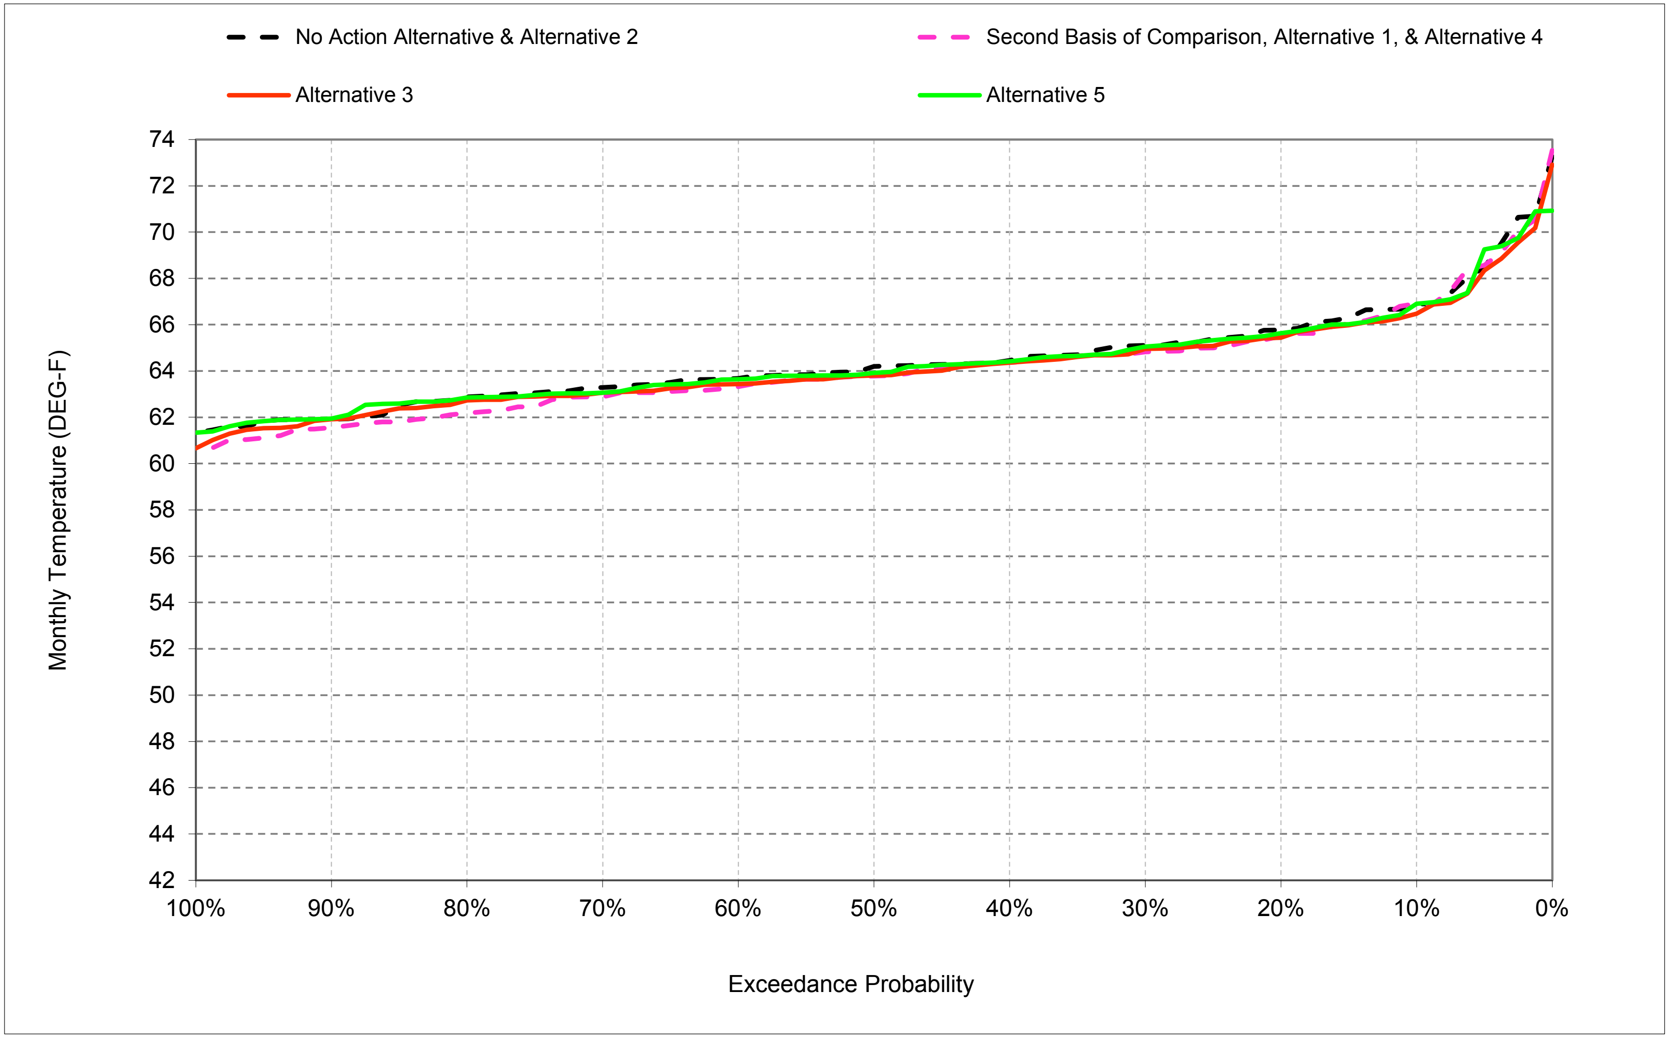
Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-10-10. Sacramento River below Hamilton City, July



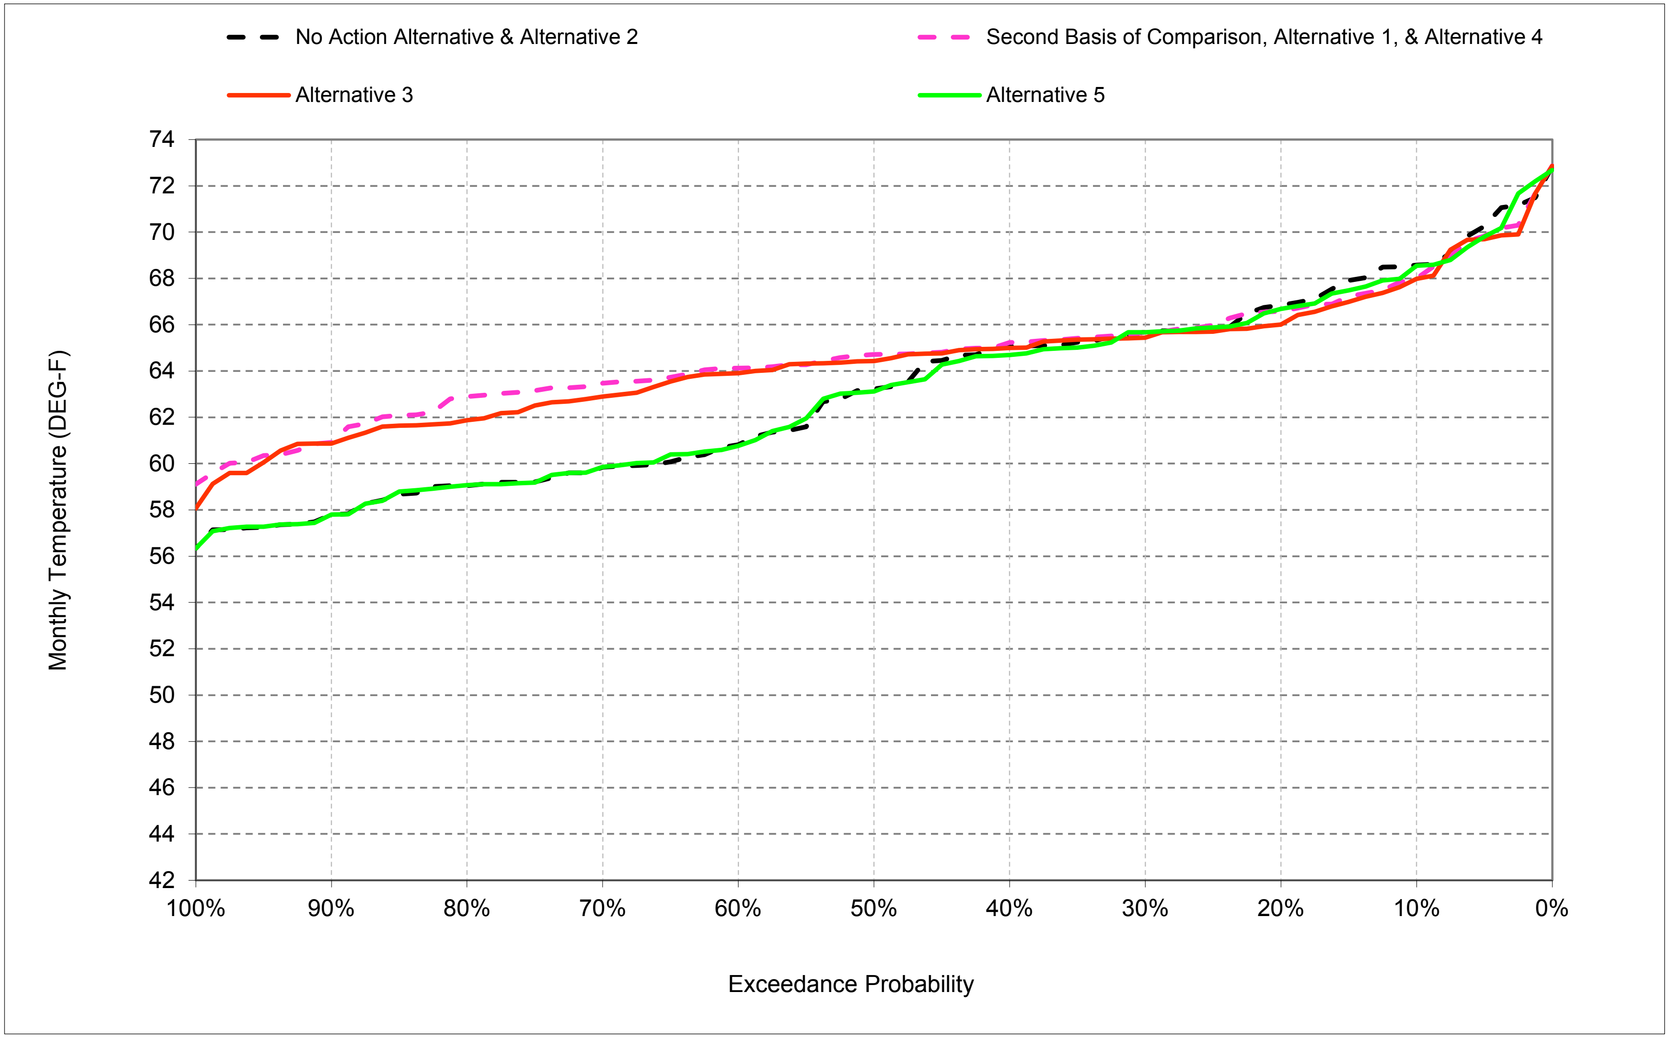
Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-10-11. Sacramento River below Hamilton City, August



Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-10-12. Sacramento River below Hamilton City, September



Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on the 82-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

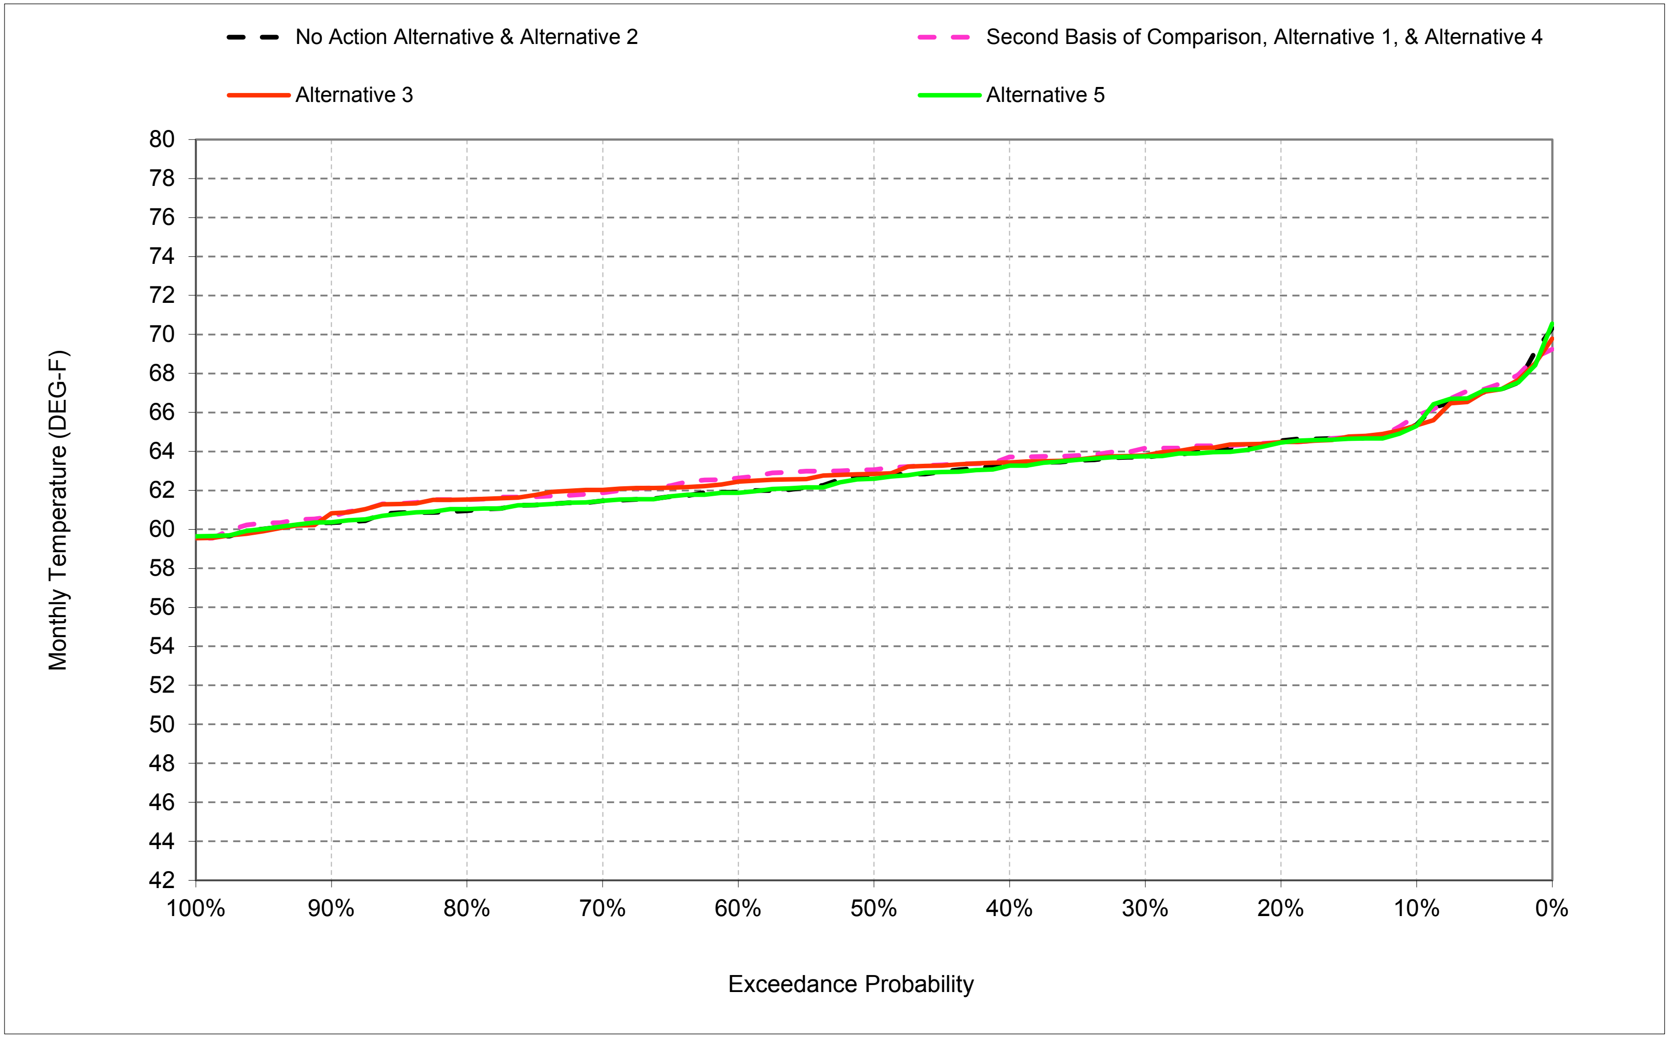
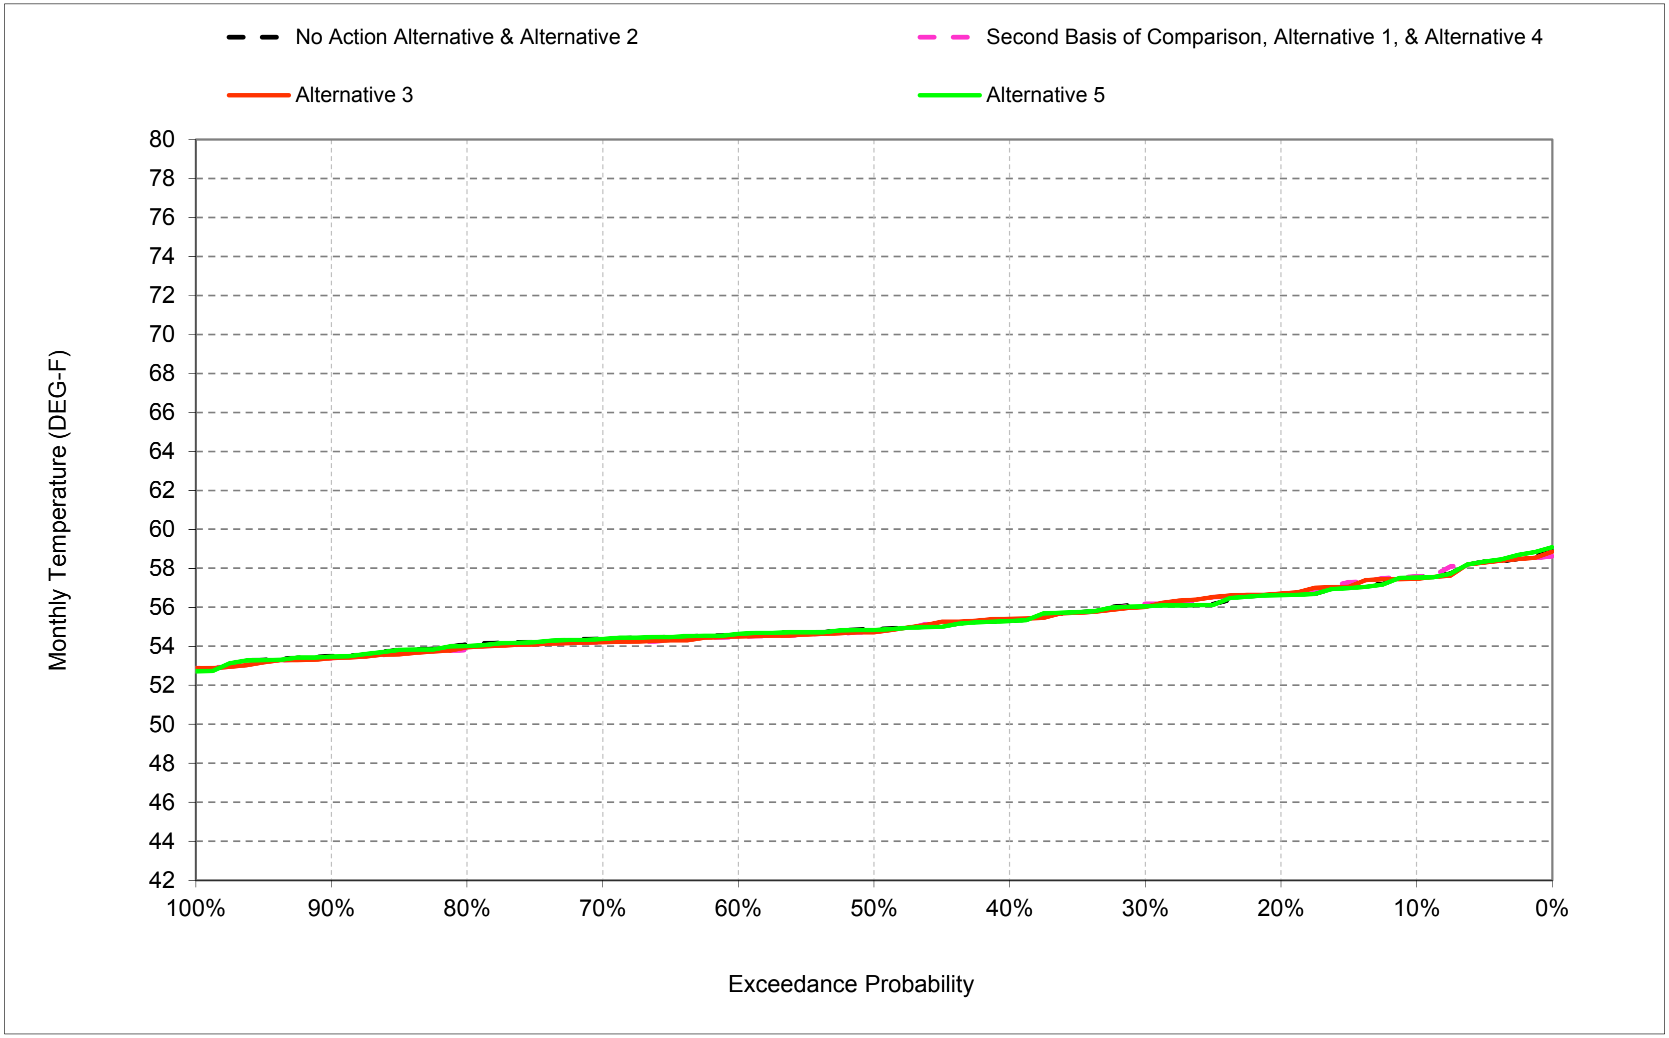
B.11. Sacramento River at Knights Landing Temperature

Figure B-11-1. Sacramento River at Knights Landing, October



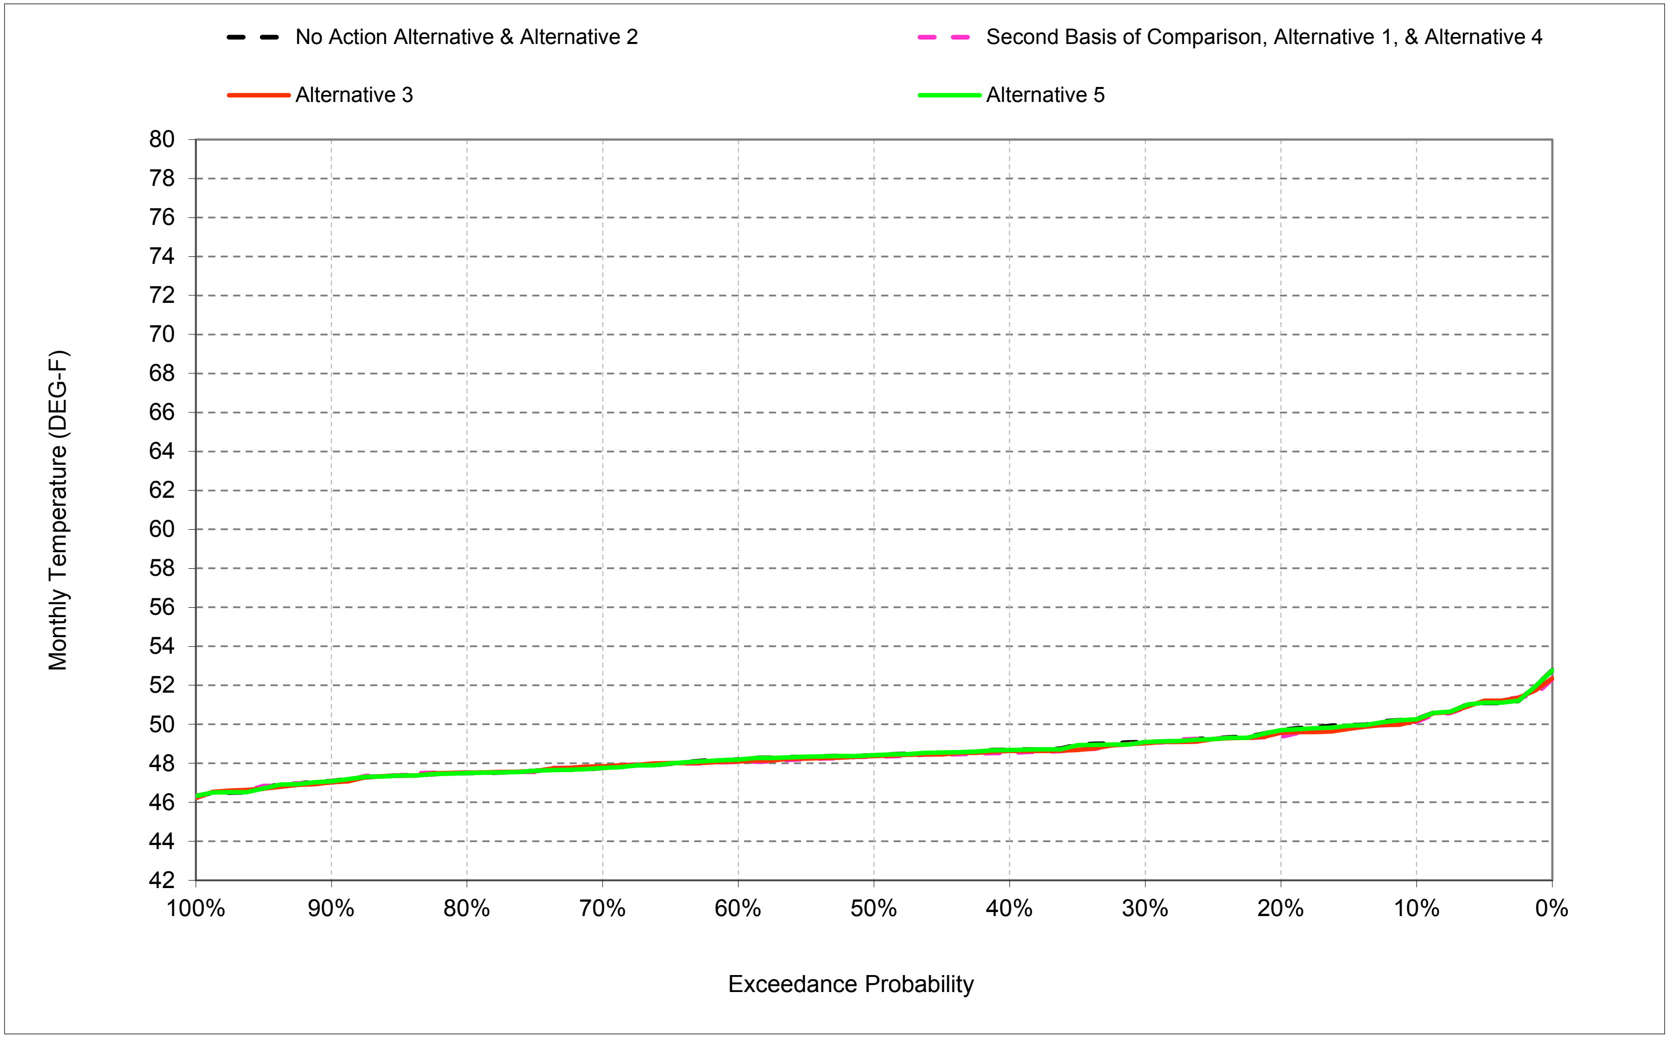
Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-11-2. Sacramento River at Knights Landing, November



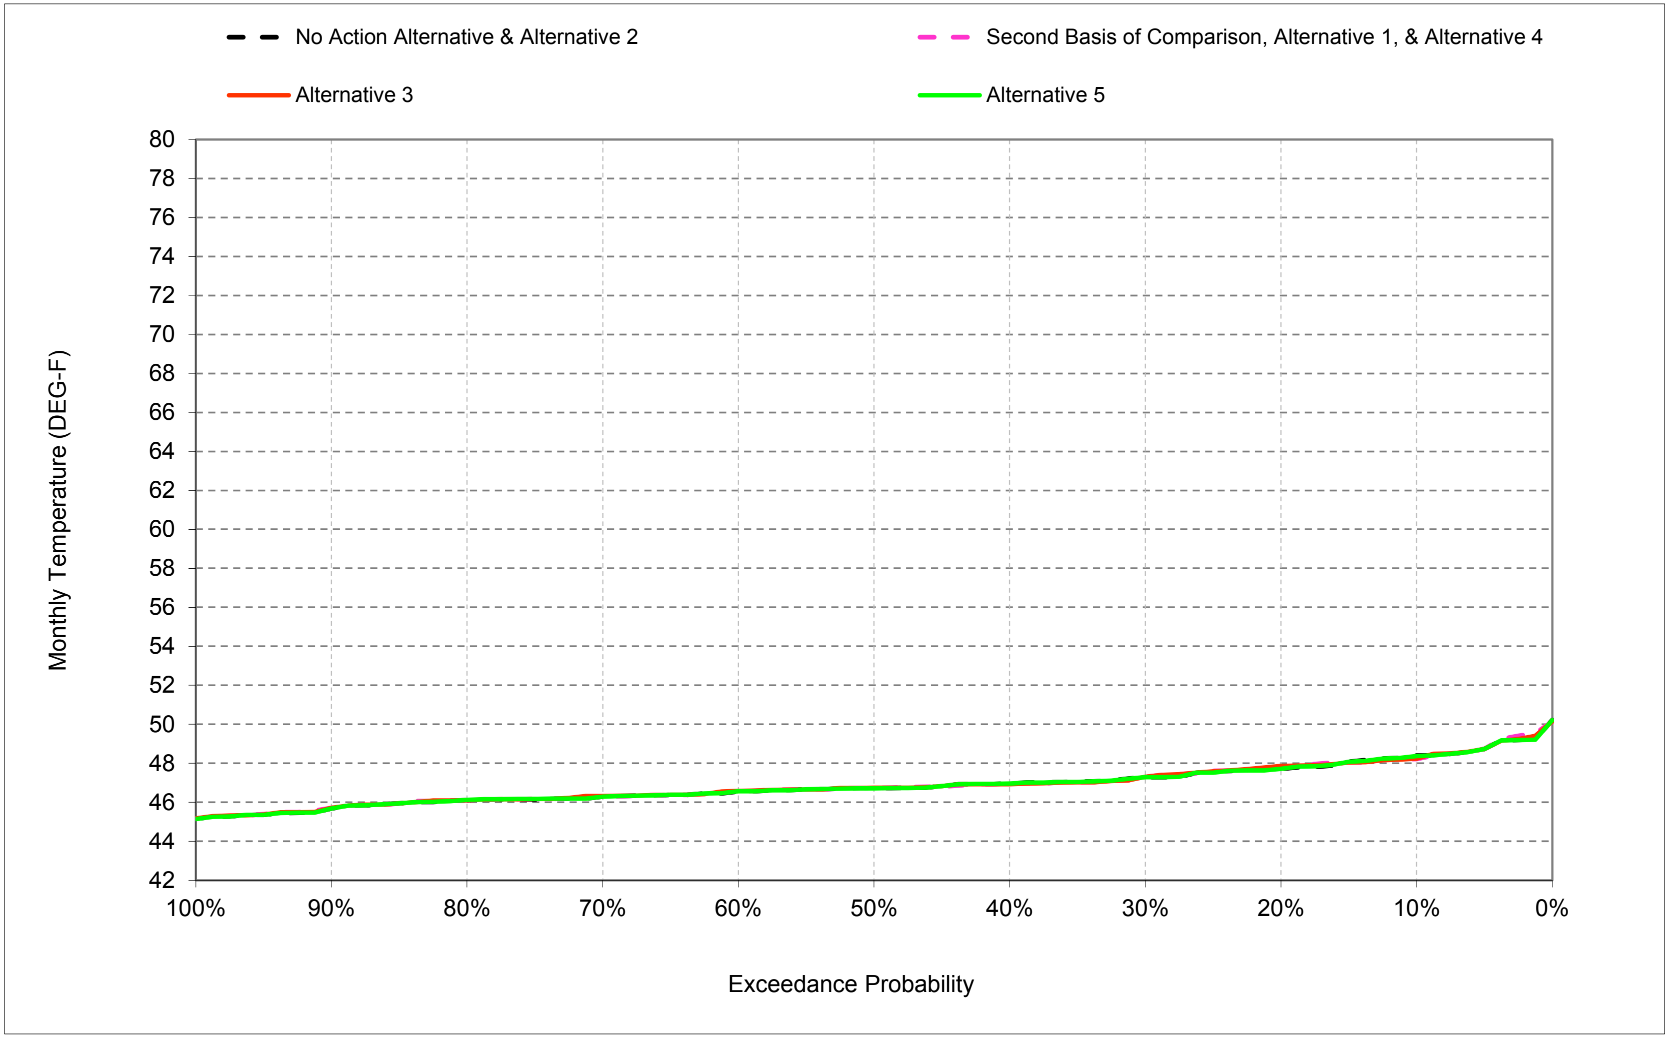
Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-11-3. Sacramento River at Knights Landing, December



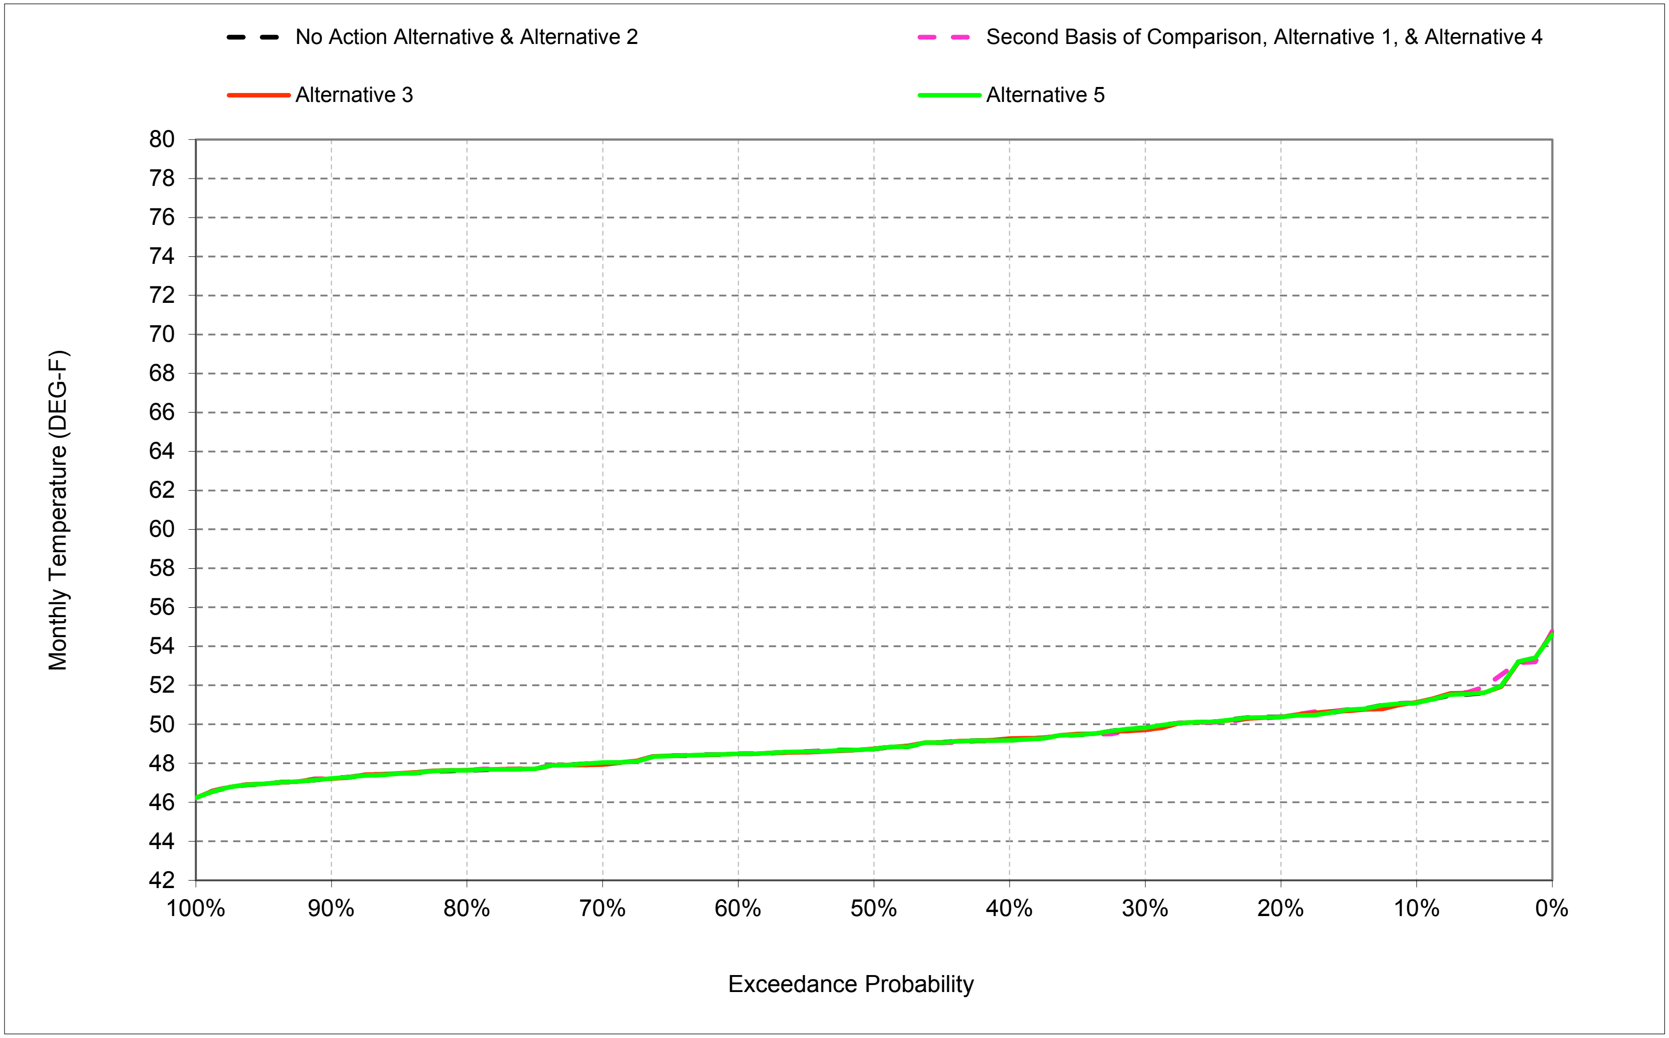
Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-11-4. Sacramento River at Knights Landing, January



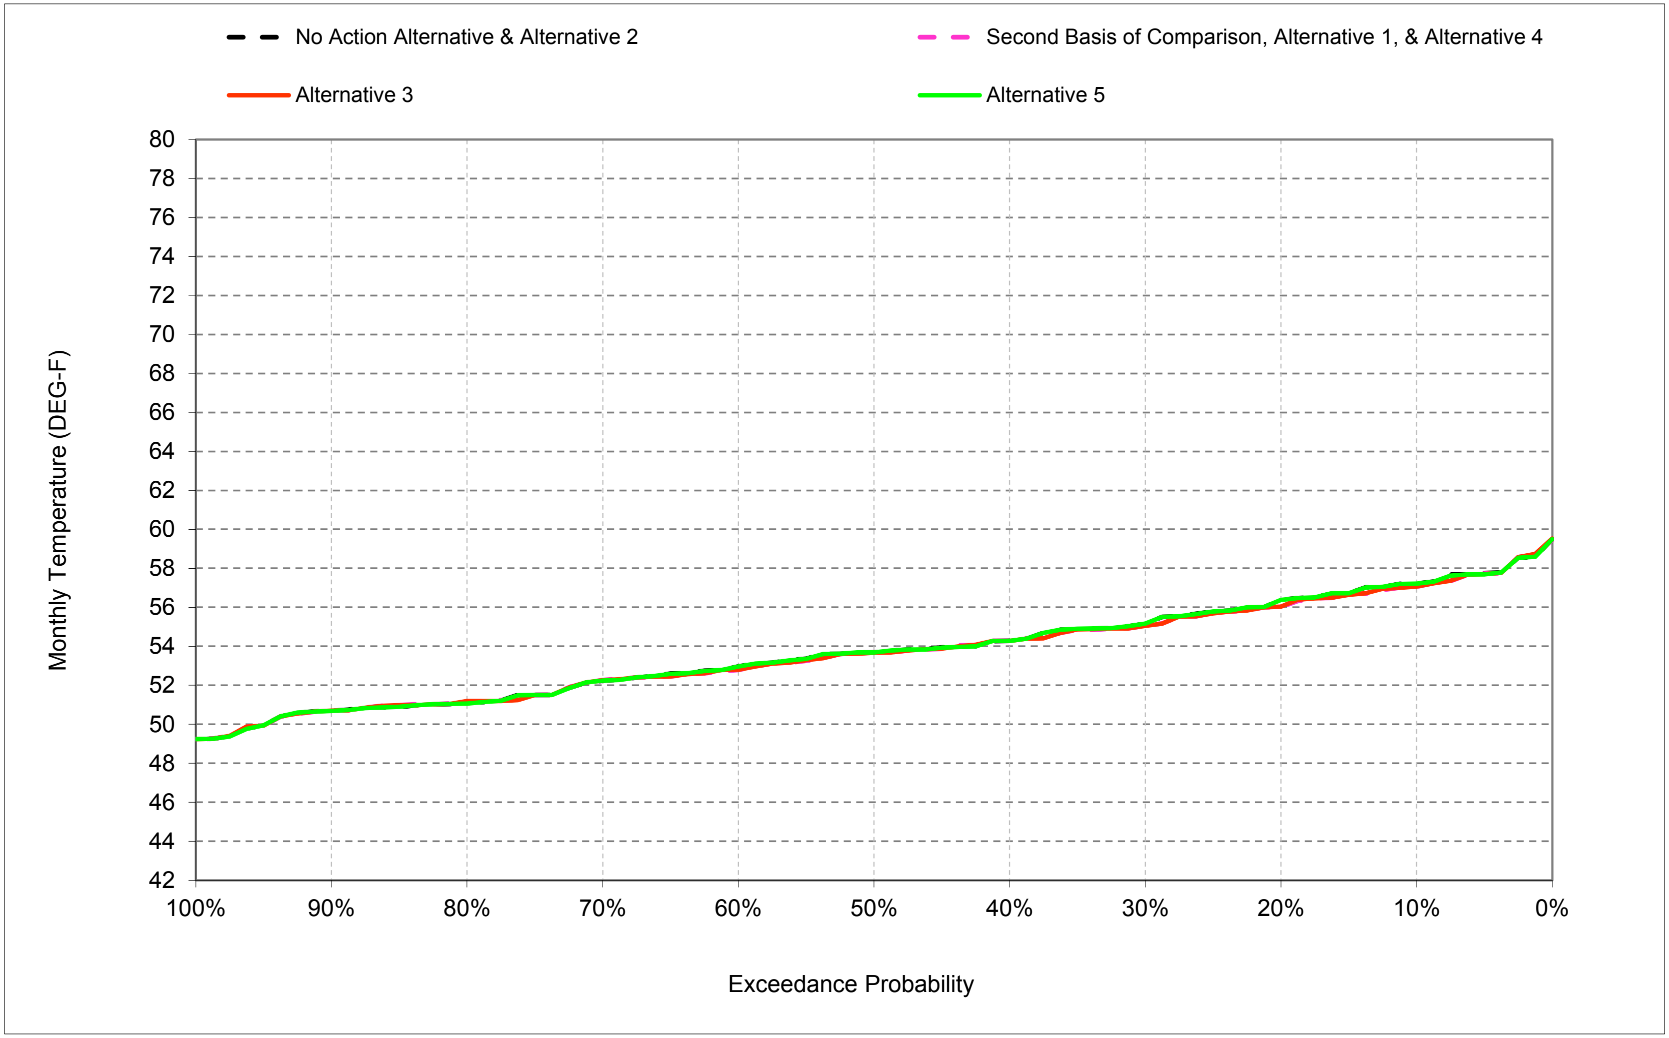
Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-11-5. Sacramento River at Knights Landing, February



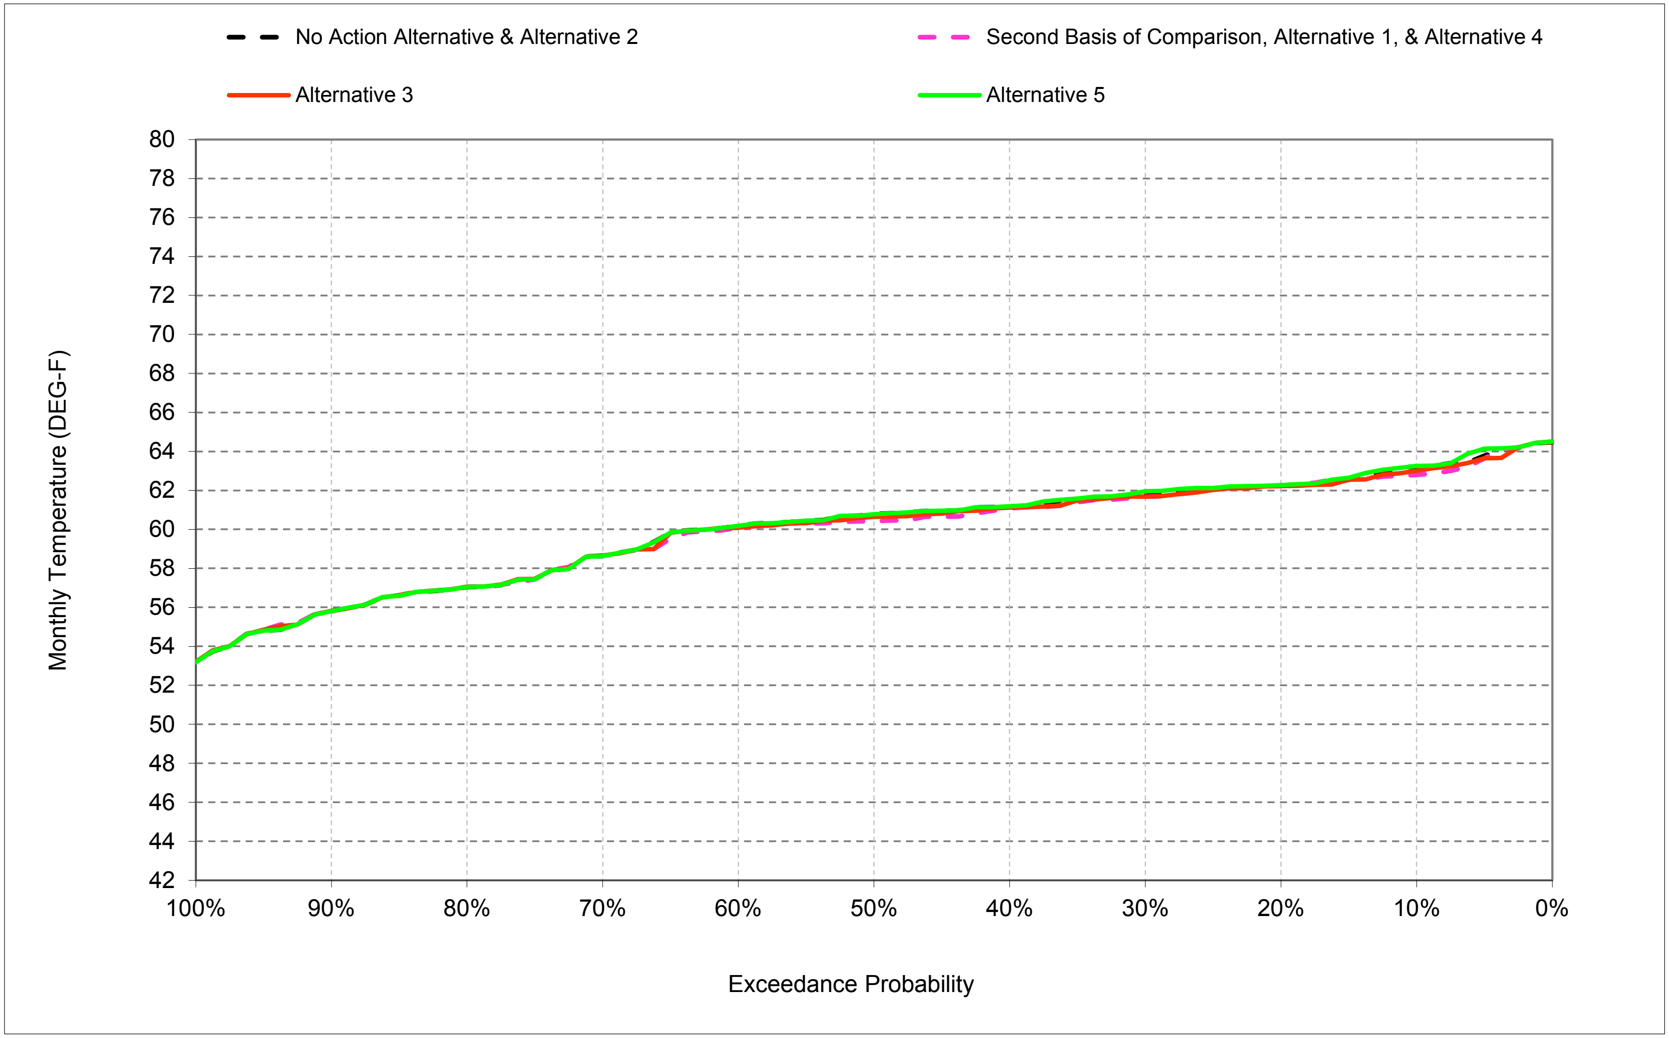
Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-11-6. Sacramento River at Knights Landing, March



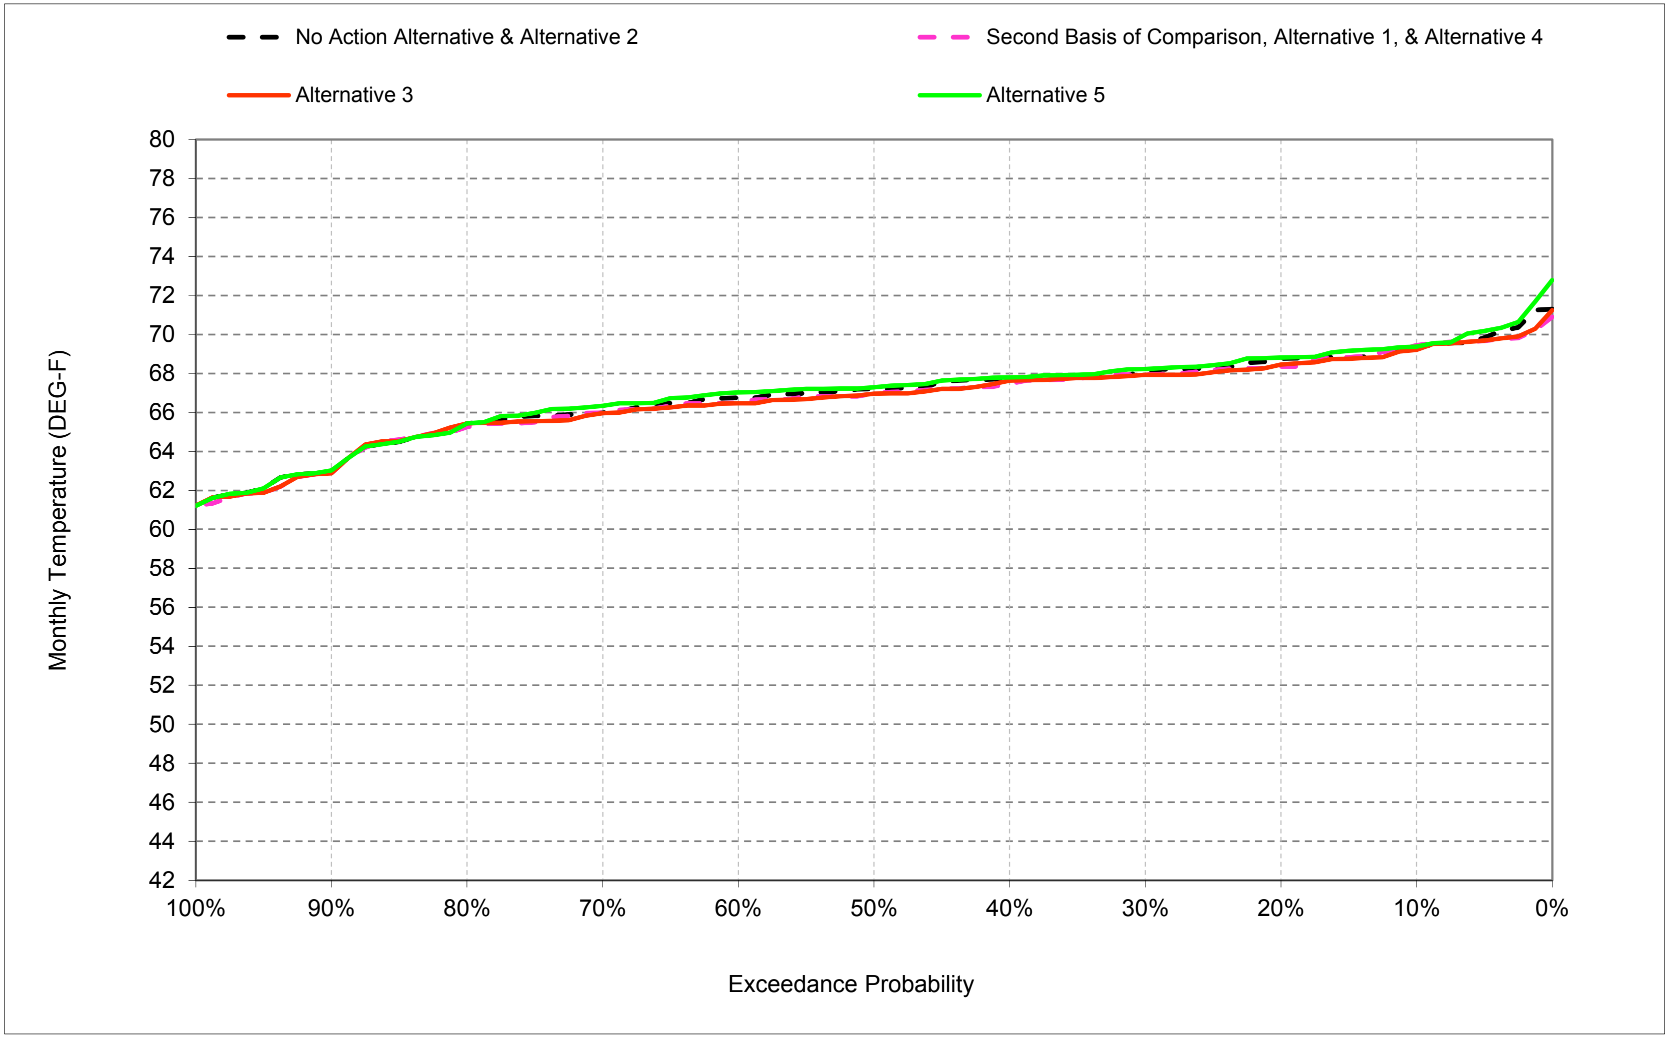
Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-11-7. Sacramento River at Knights Landing, April



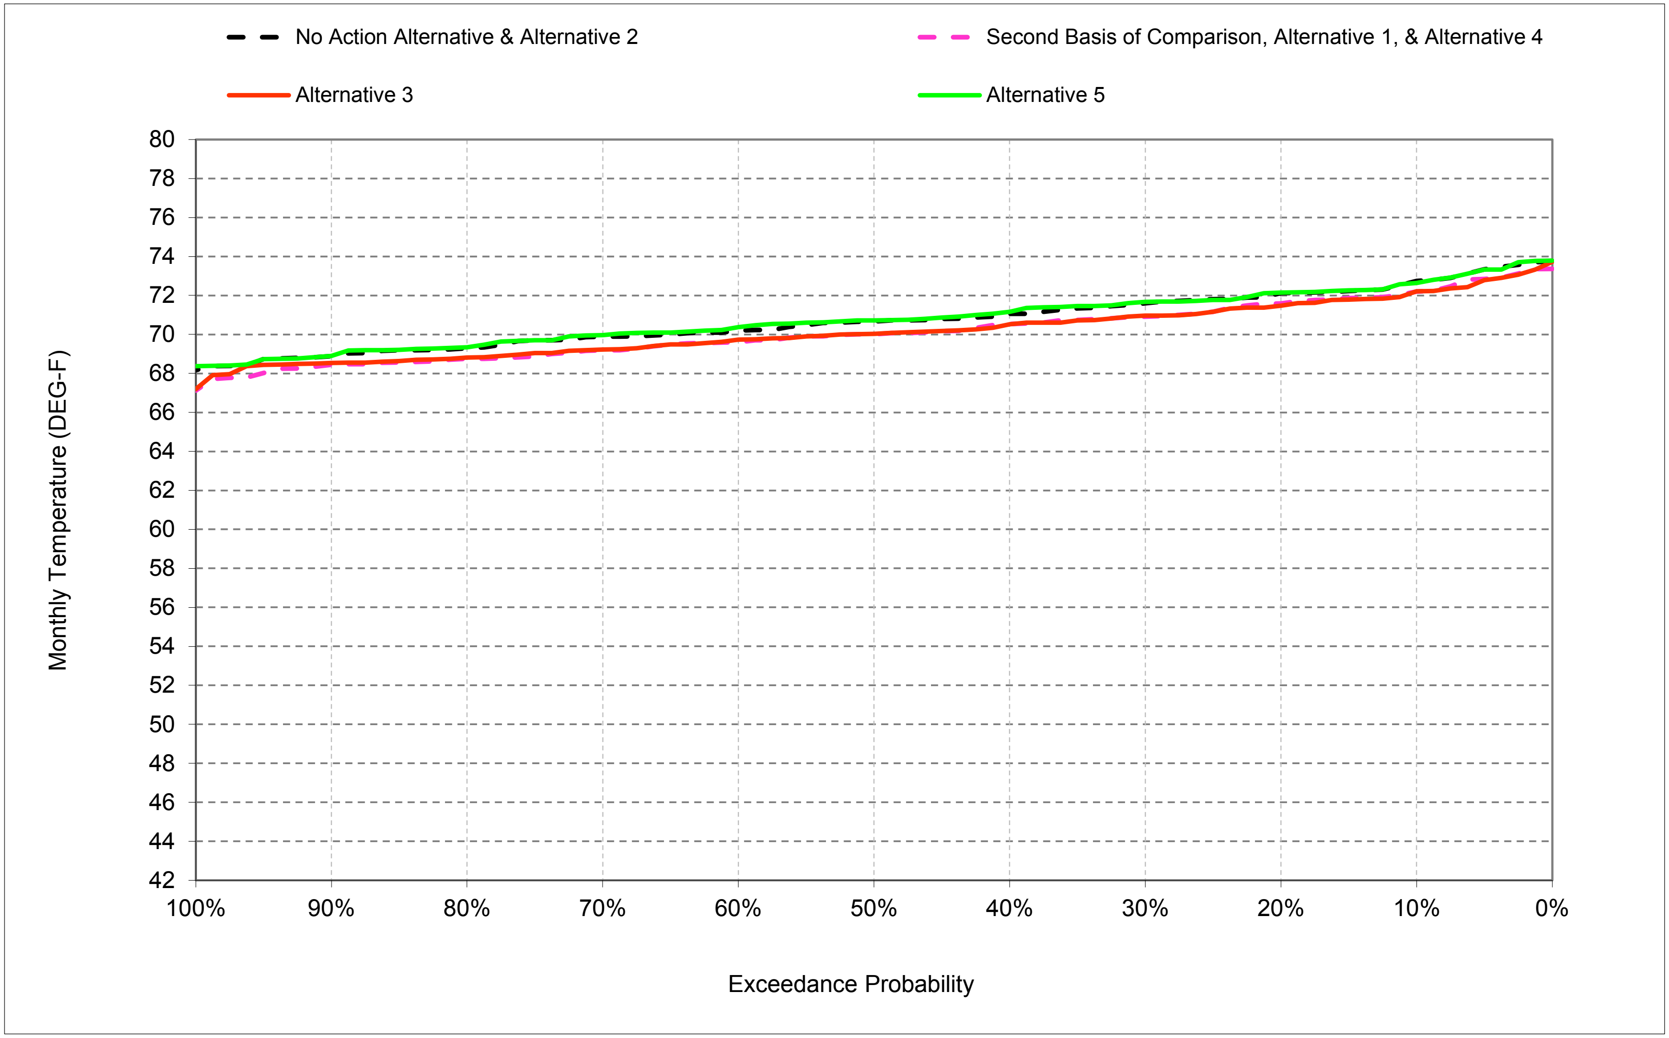
Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-11-8. Sacramento River at Knights Landing, May



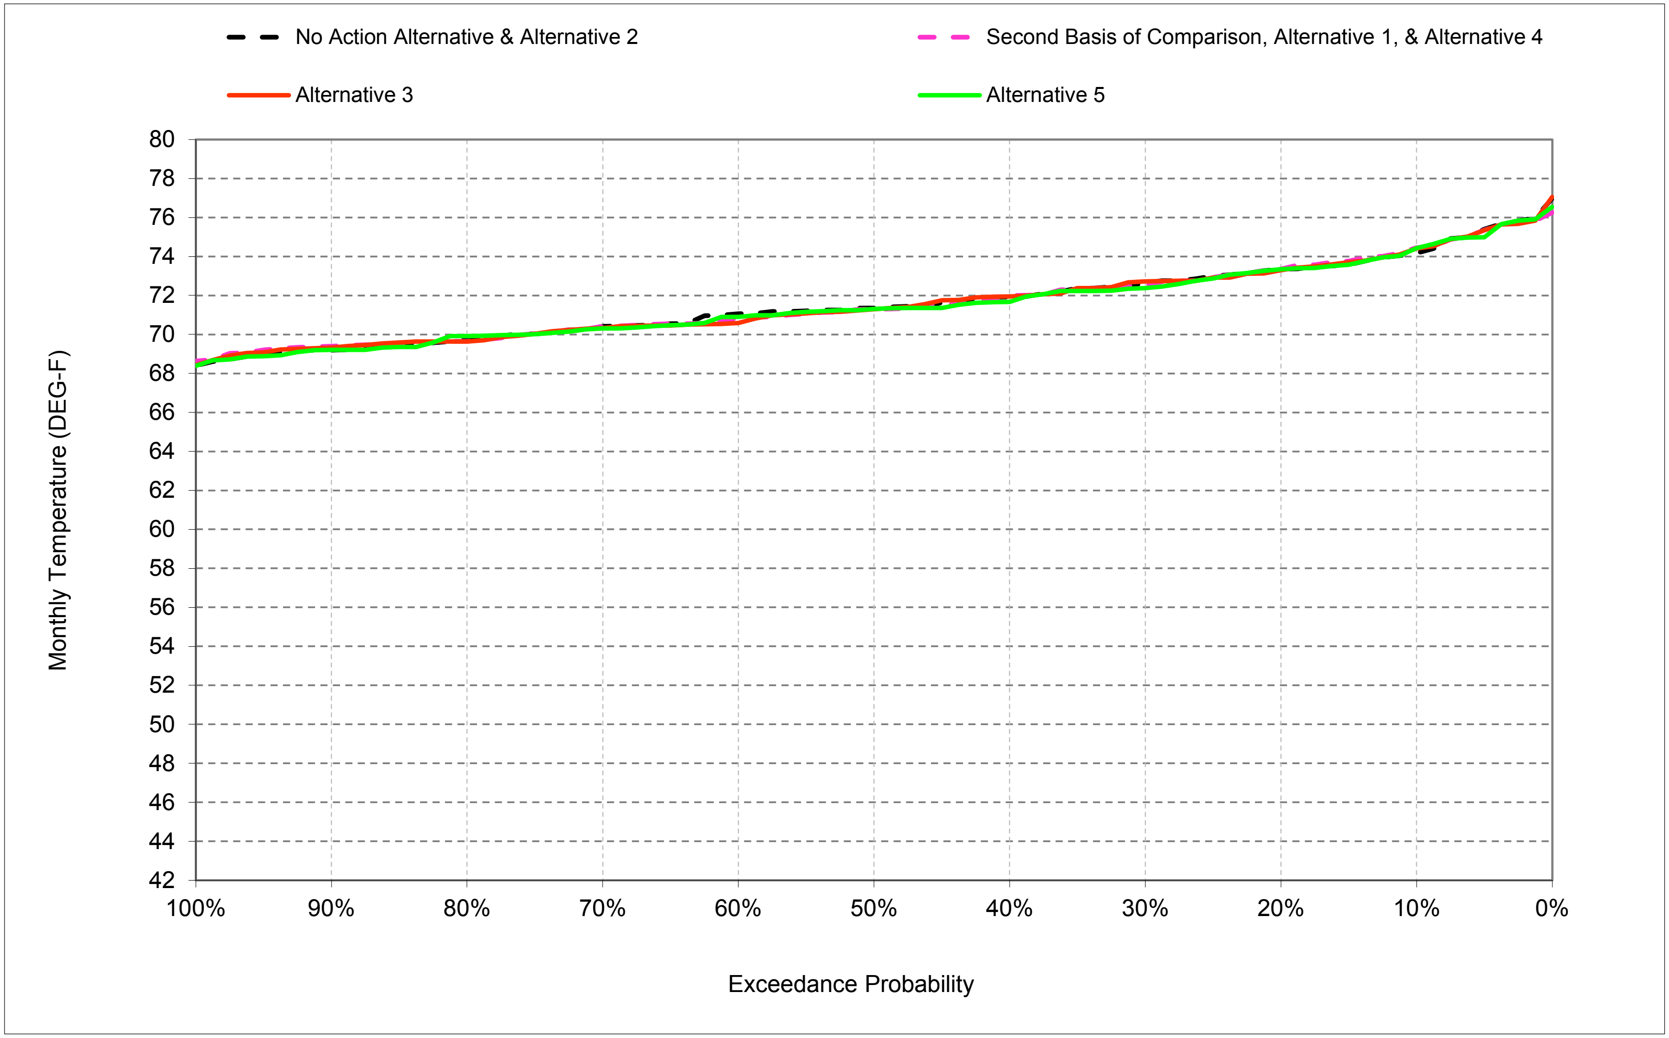
Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-11-9. Sacramento River at Knights Landing, June



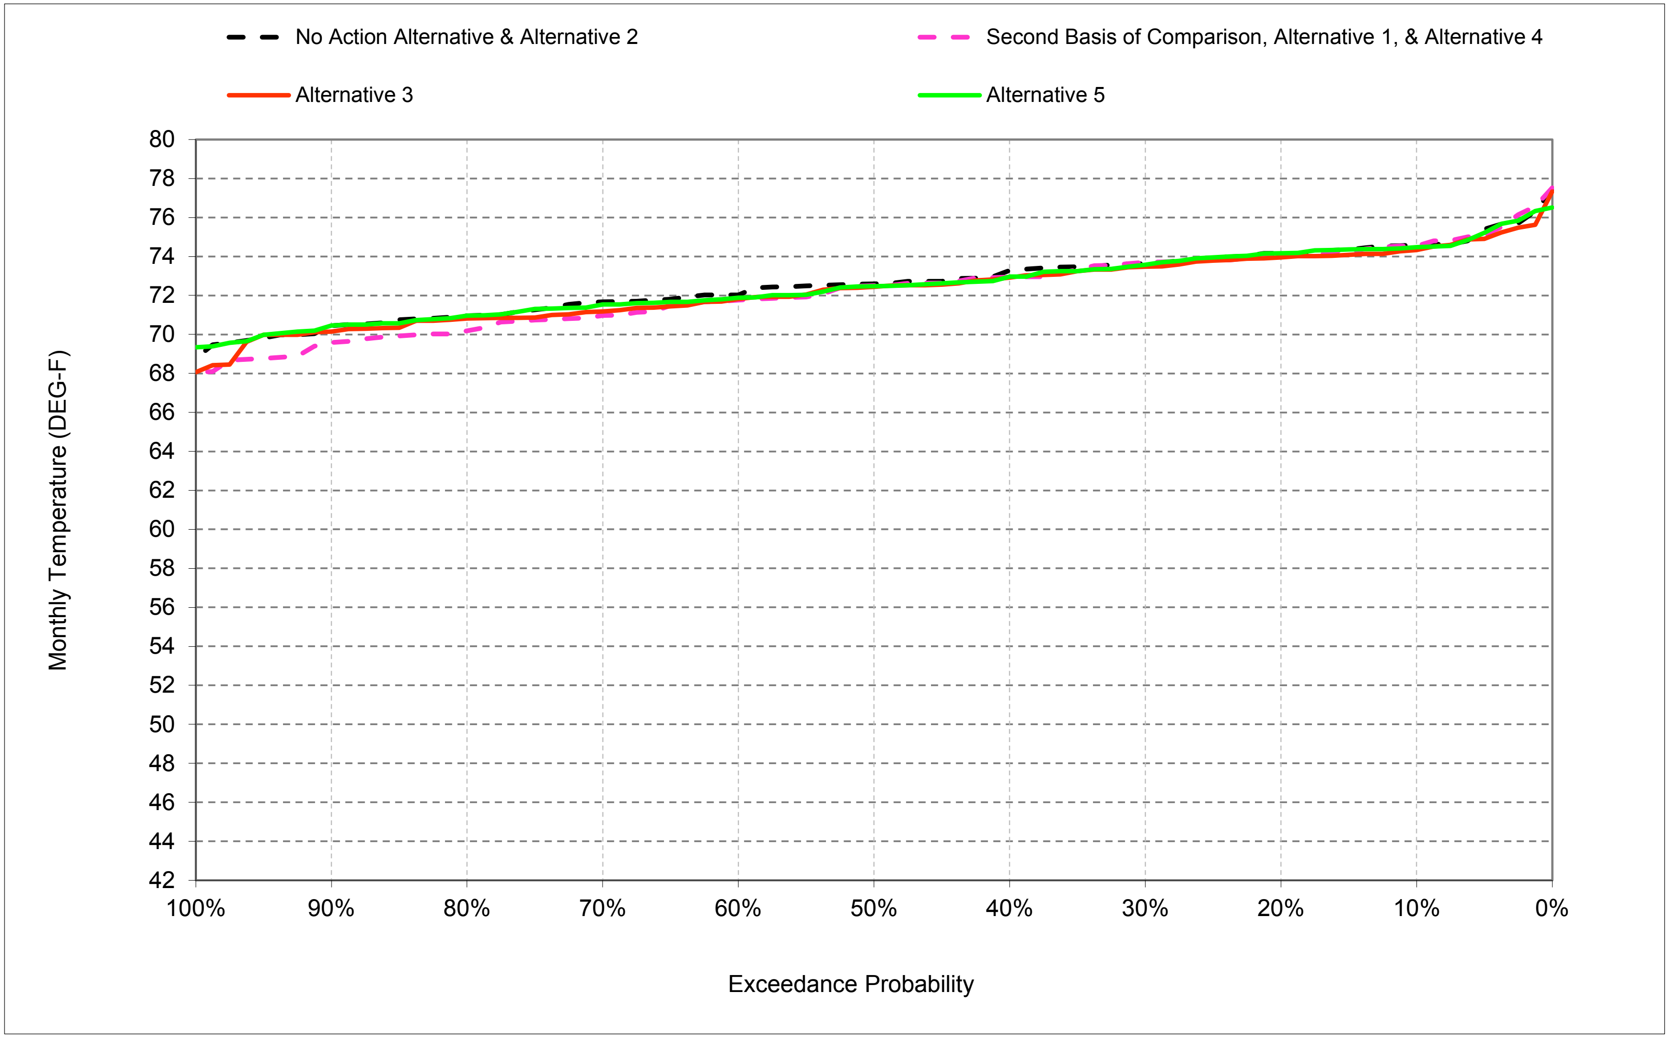
Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-11-10. Sacramento River at Knights Landing, July



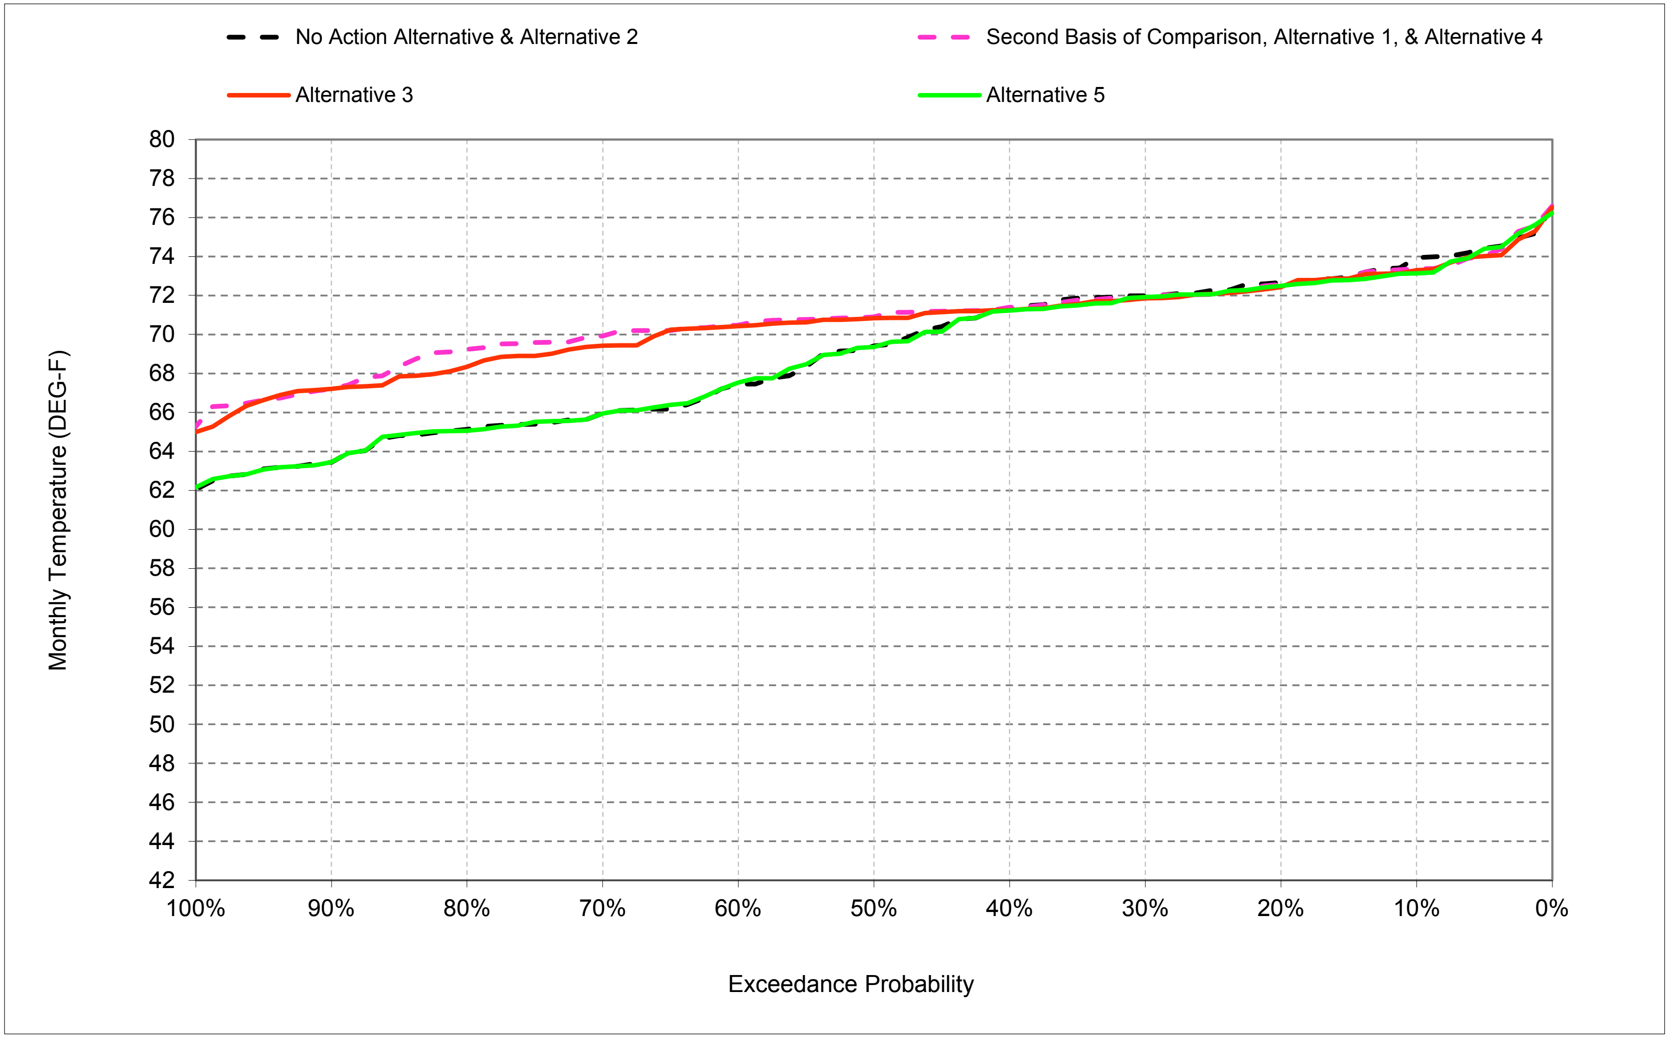
Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-11-11. Sacramento River at Knights Landing, August



Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-11-12. Sacramento River at Knights Landing, September



Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on an 81-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Second Basis of Comparison and Alternative 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on an 81-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on an 81-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

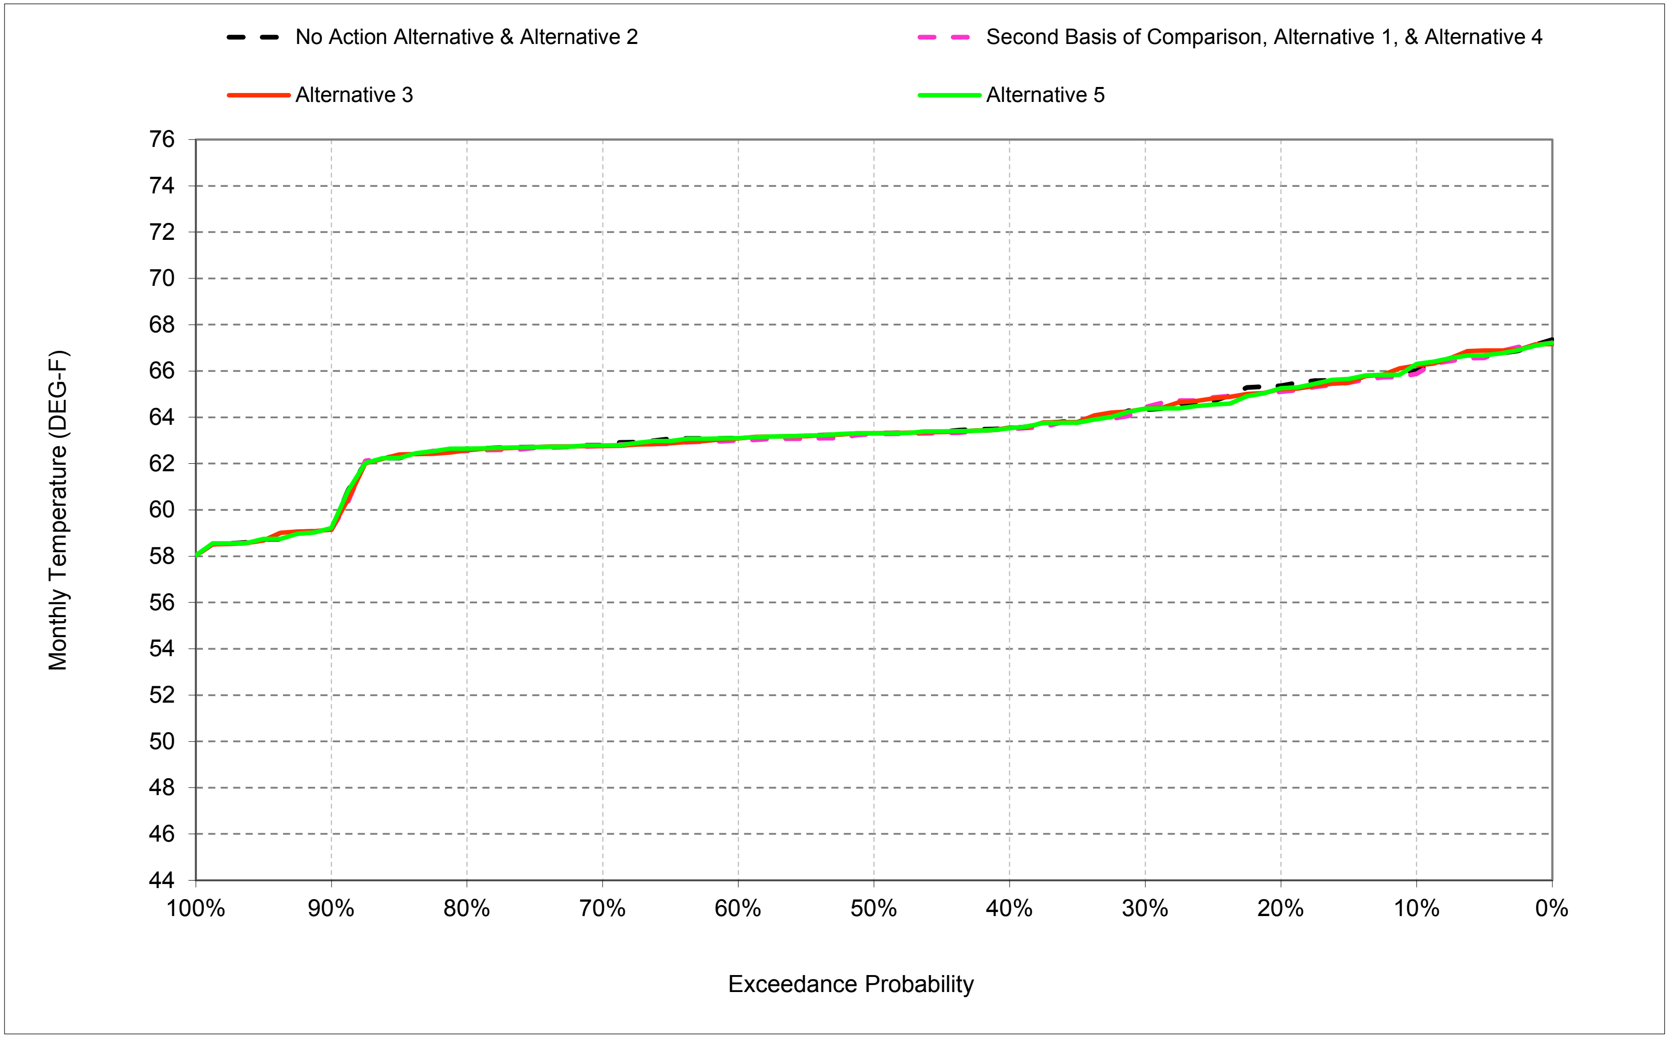
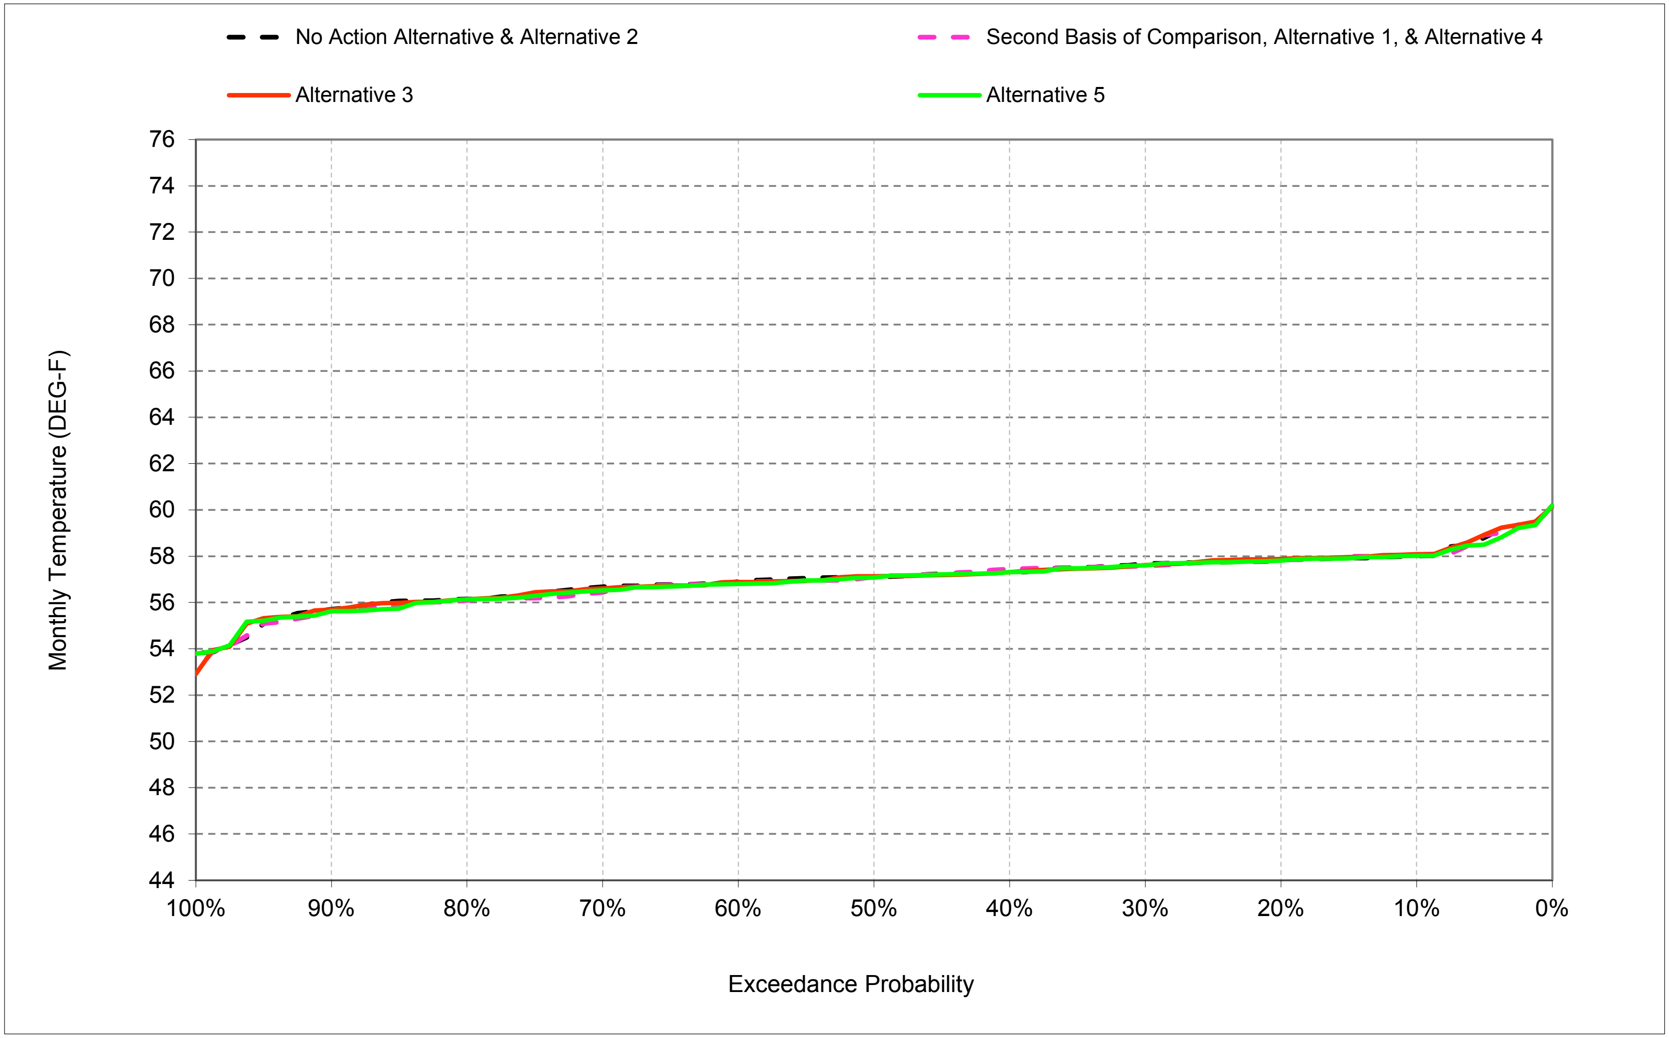
B.12. American River below Nimbus Temperature

Figure B-12-1. American River below Nimbus Dam, October



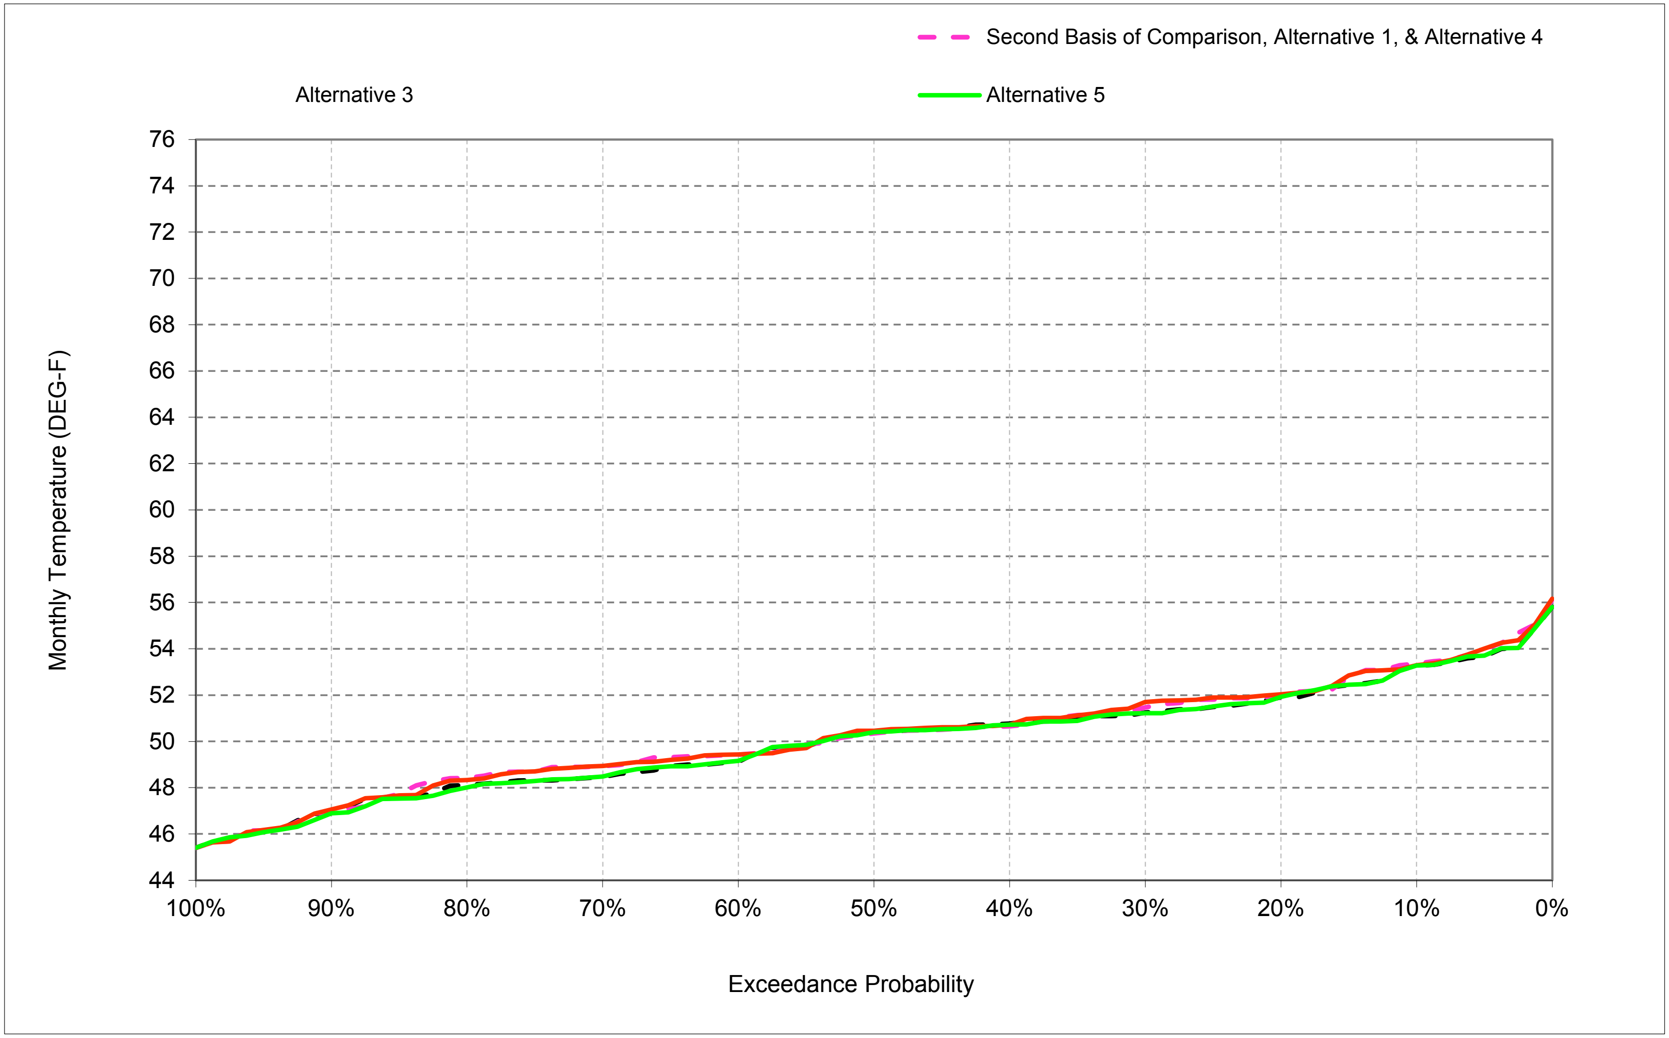
Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-12-2. American River below Nimbus Dam, November



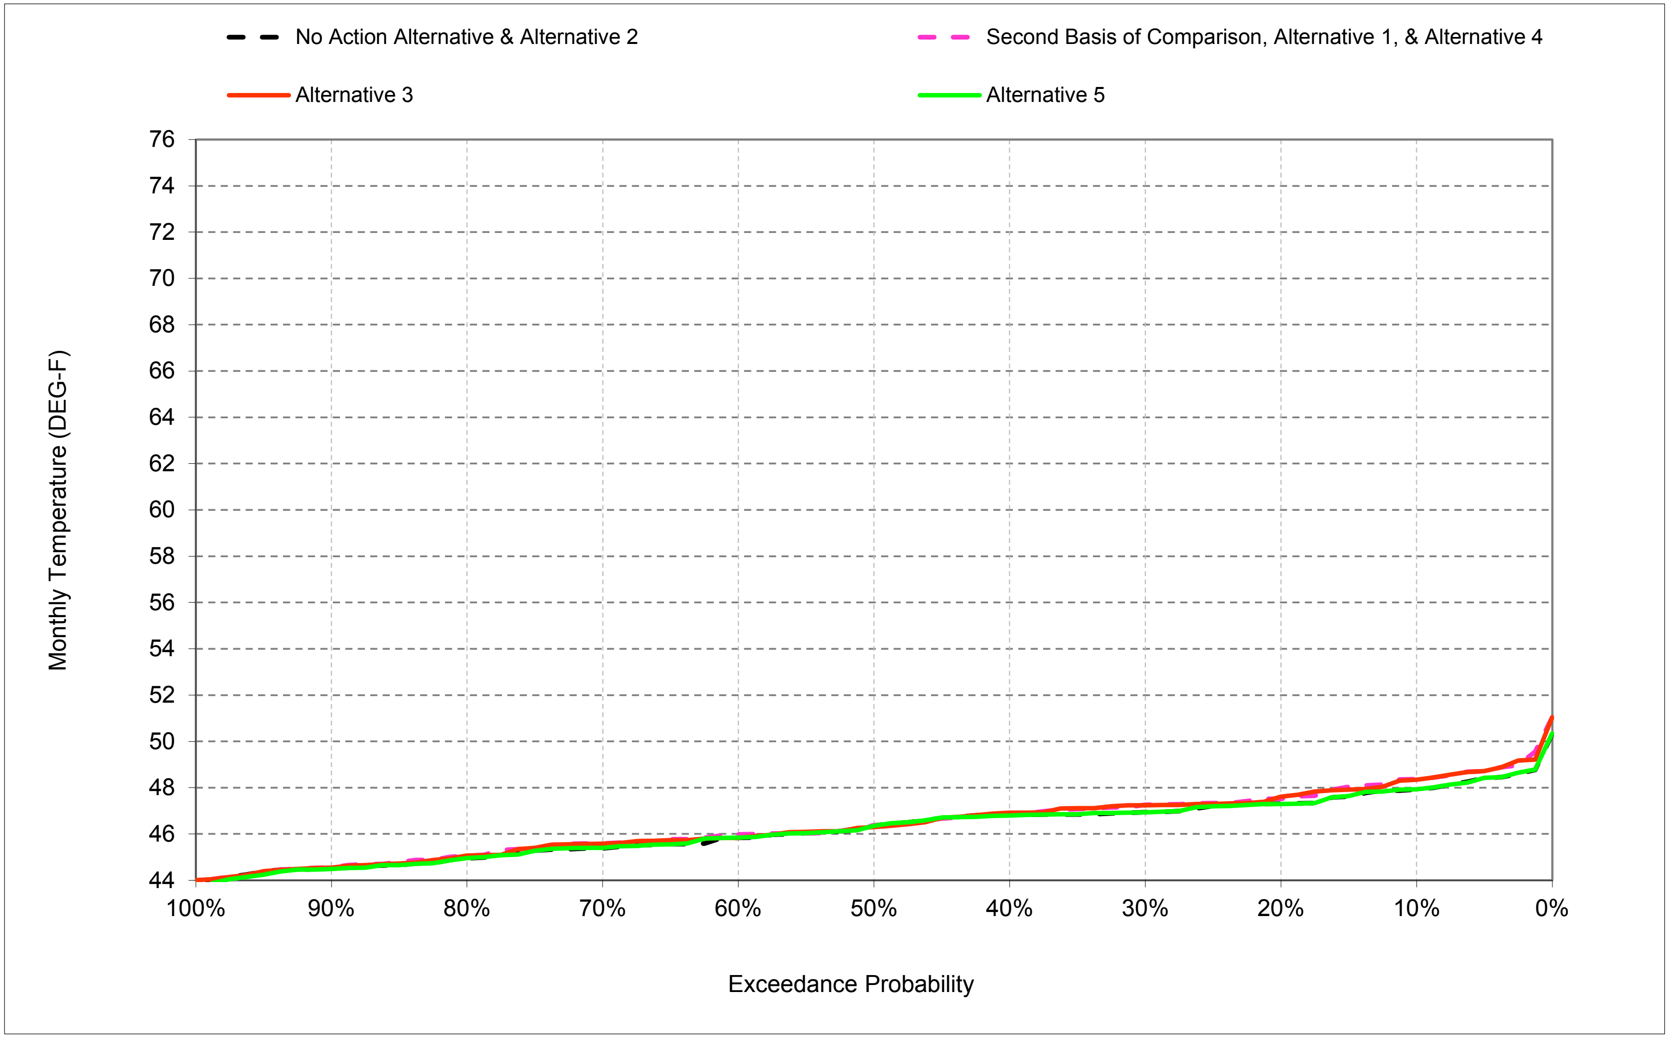
Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-12-3. American River below Nimbus Dam, December



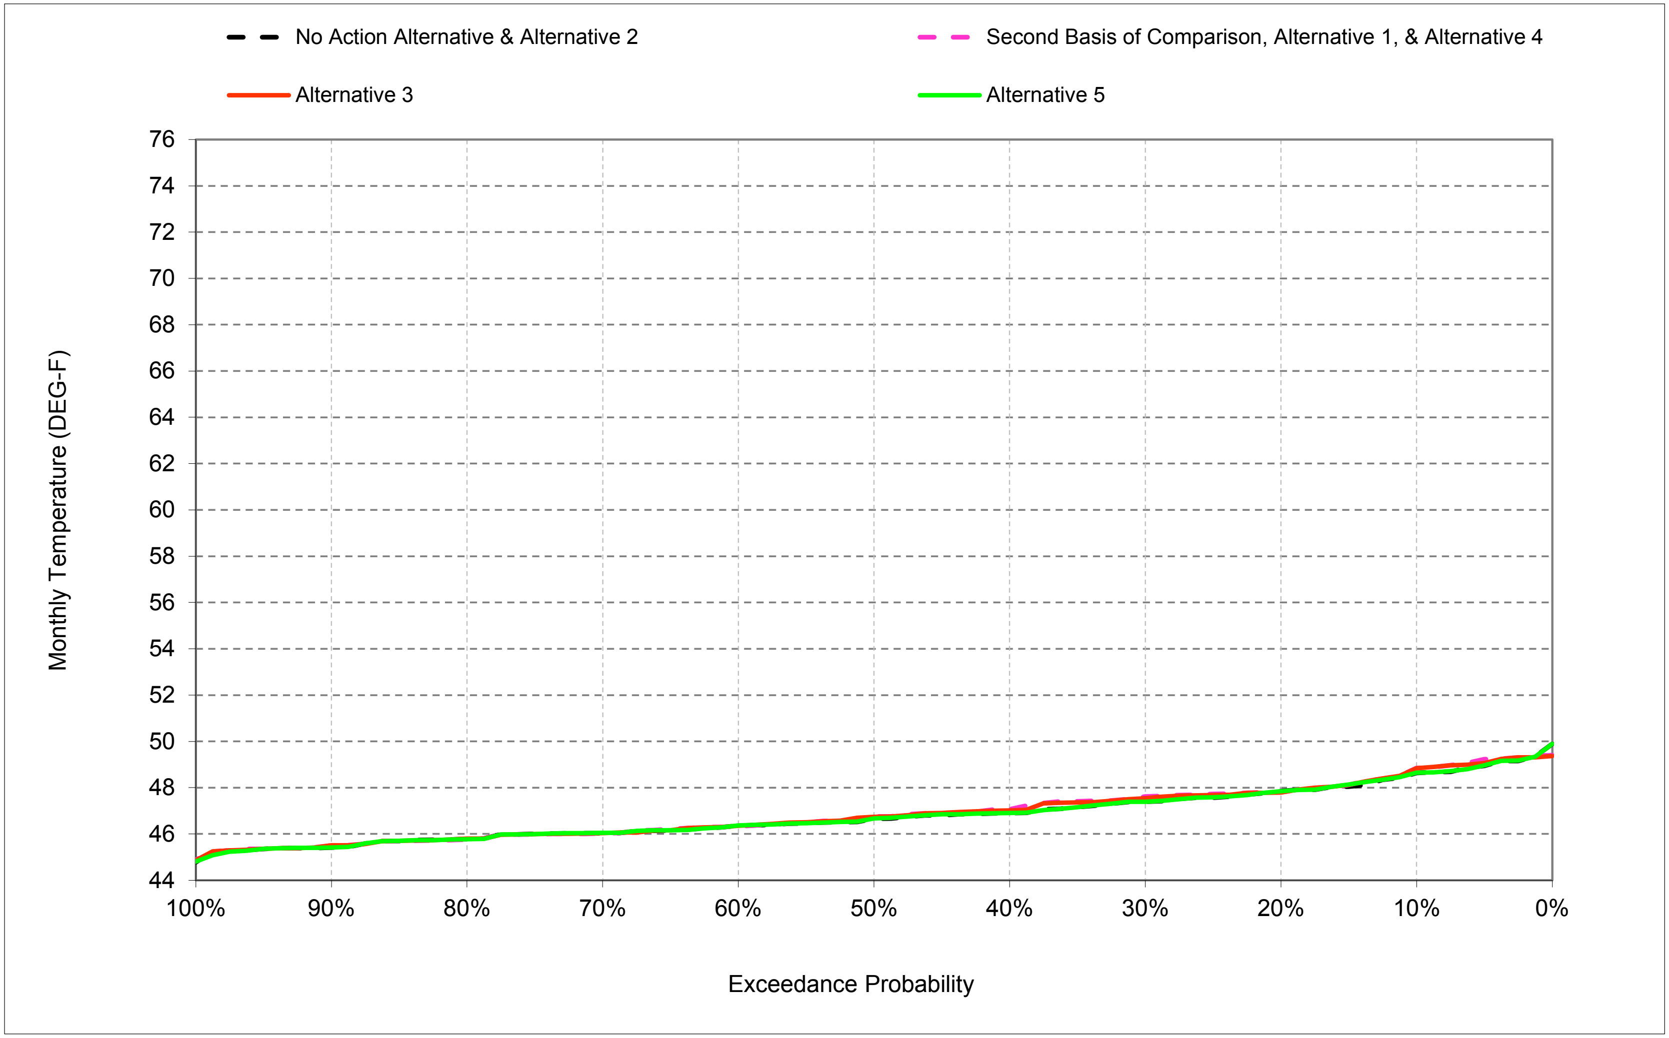
Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-12-4. American River below Nimbus Dam, January



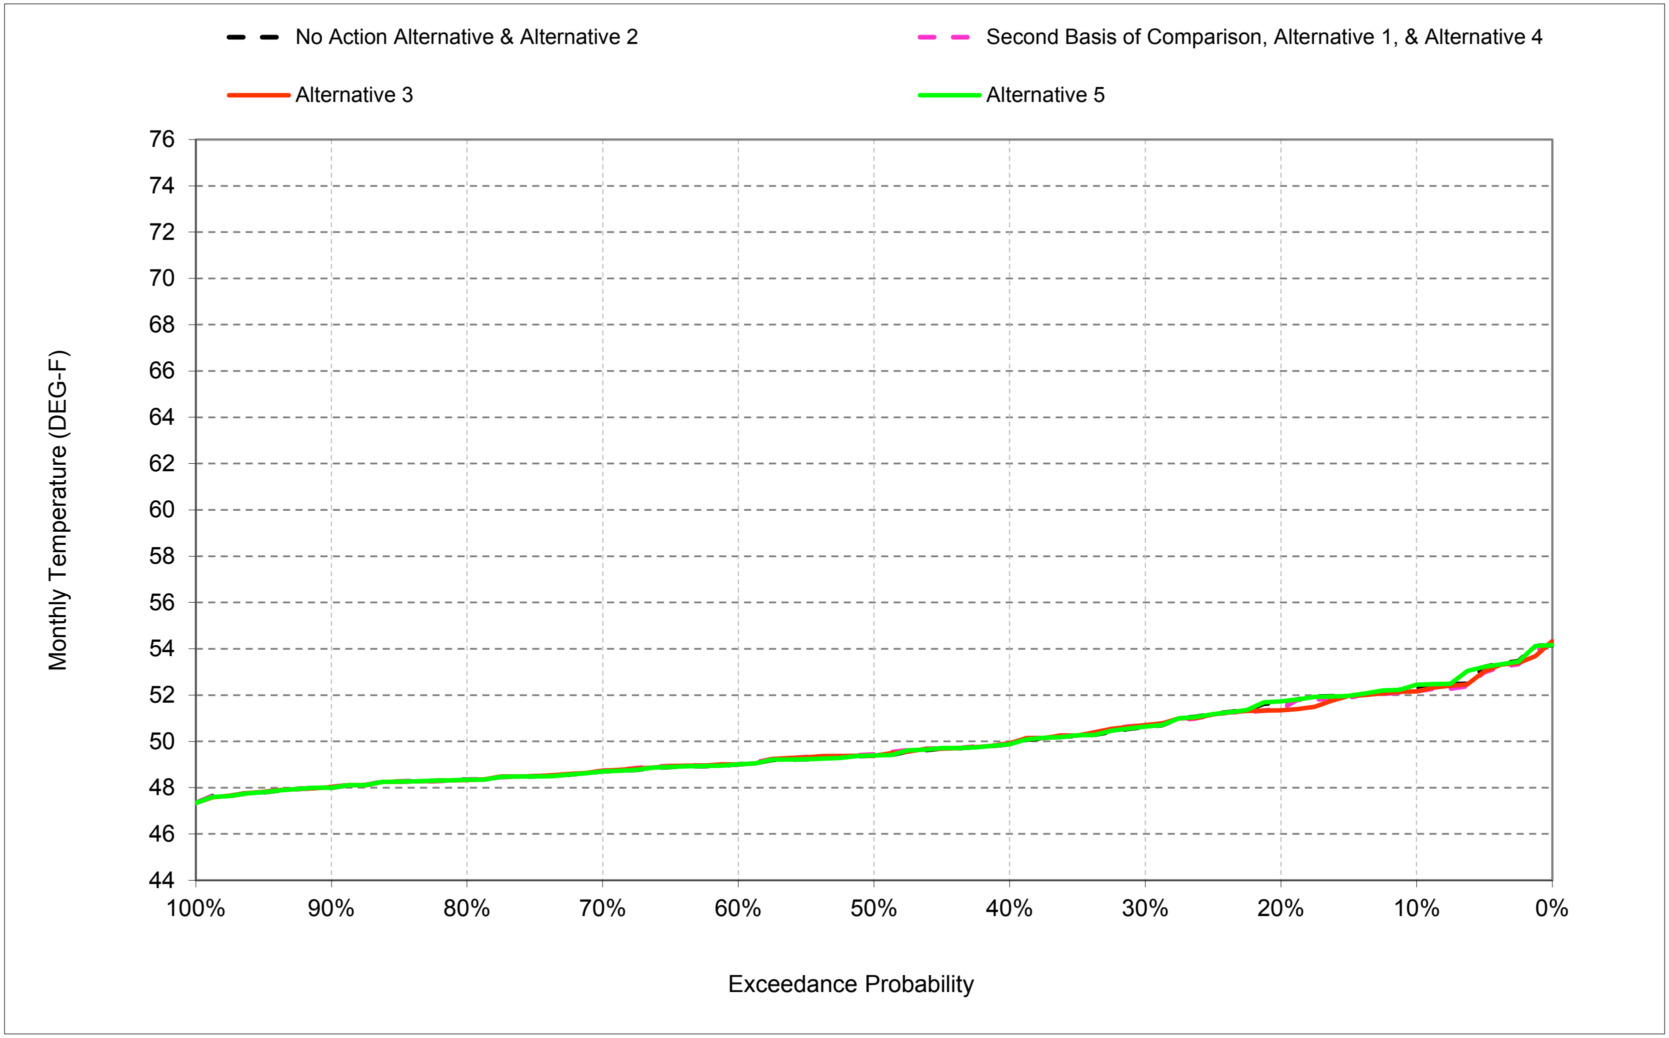
Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-12-5. American River below Nimbus Dam, February



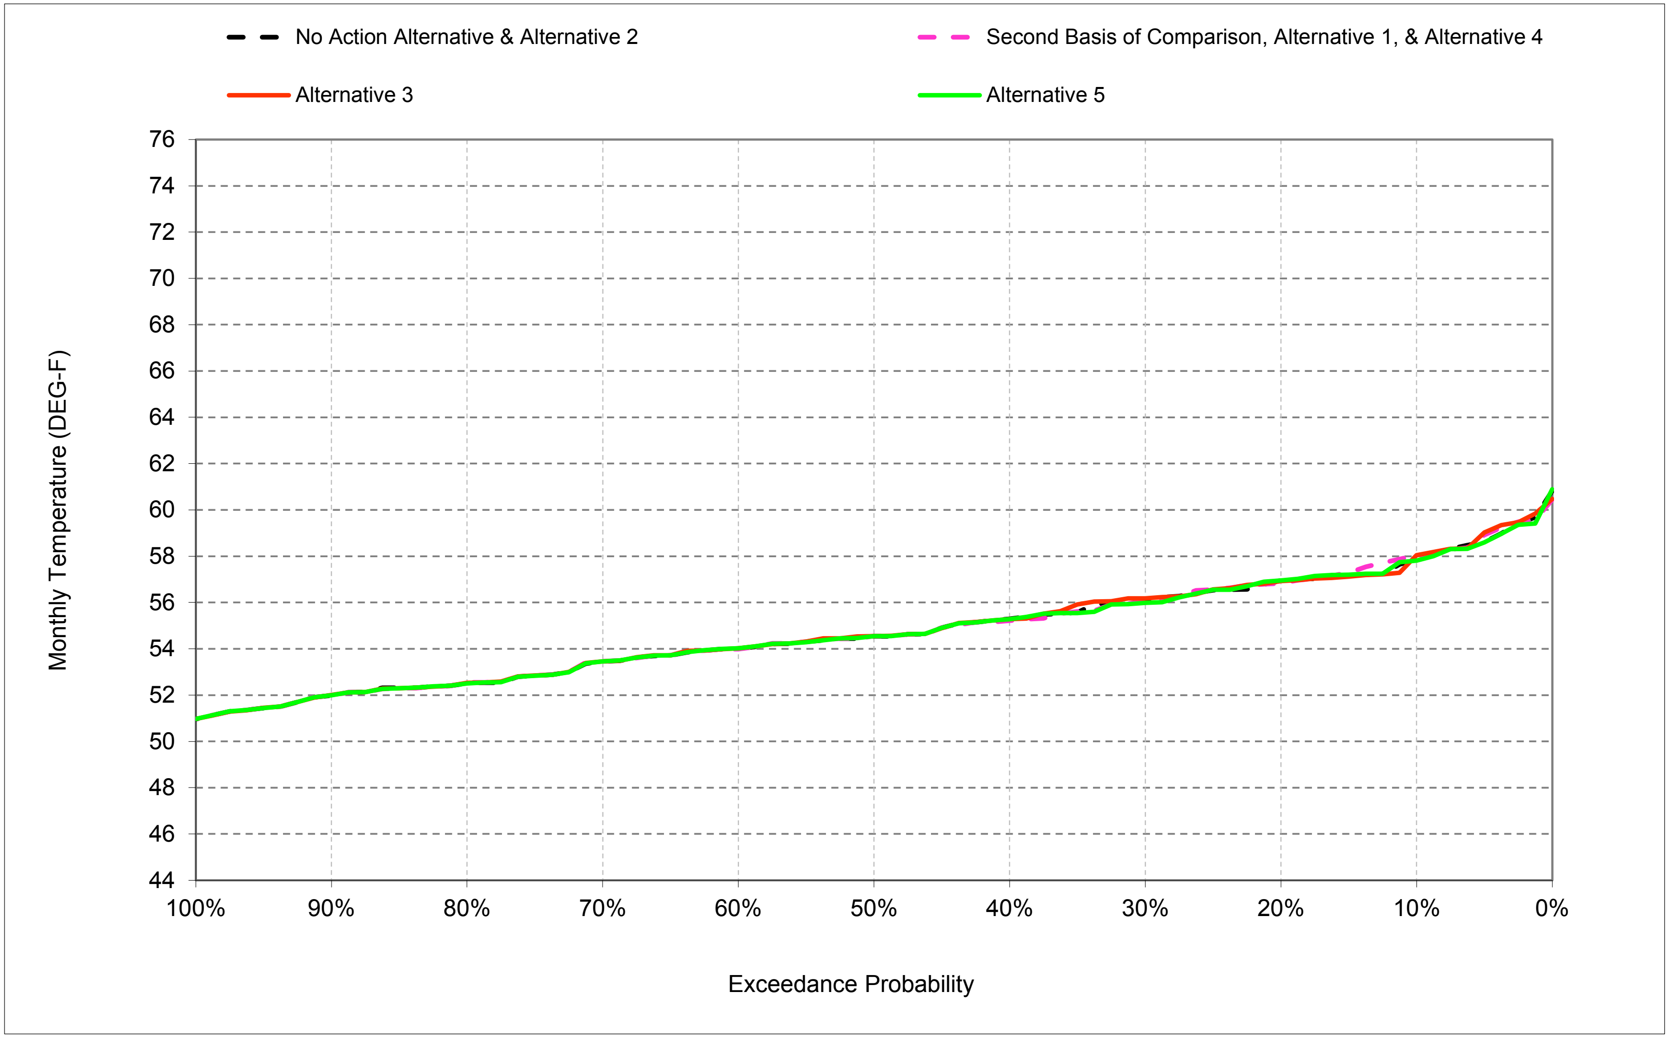
Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-12-6. American River below Nimbus Dam, March



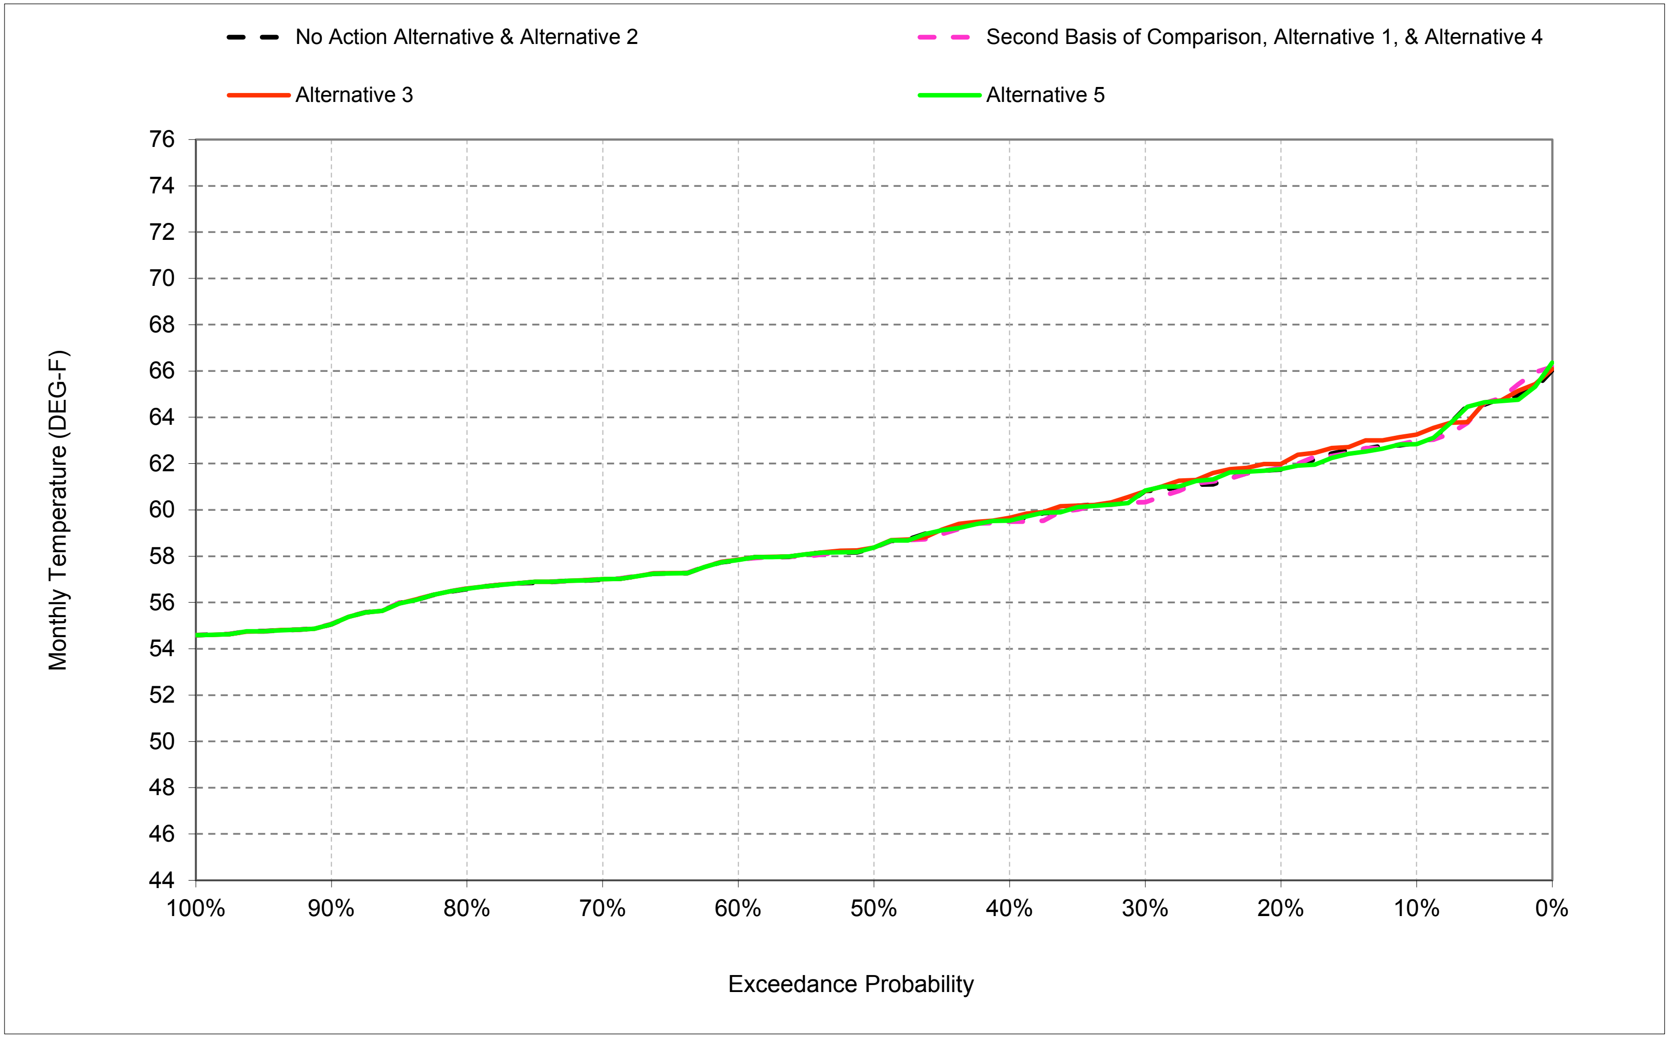
Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-12-7. American River below Nimbus Dam, April



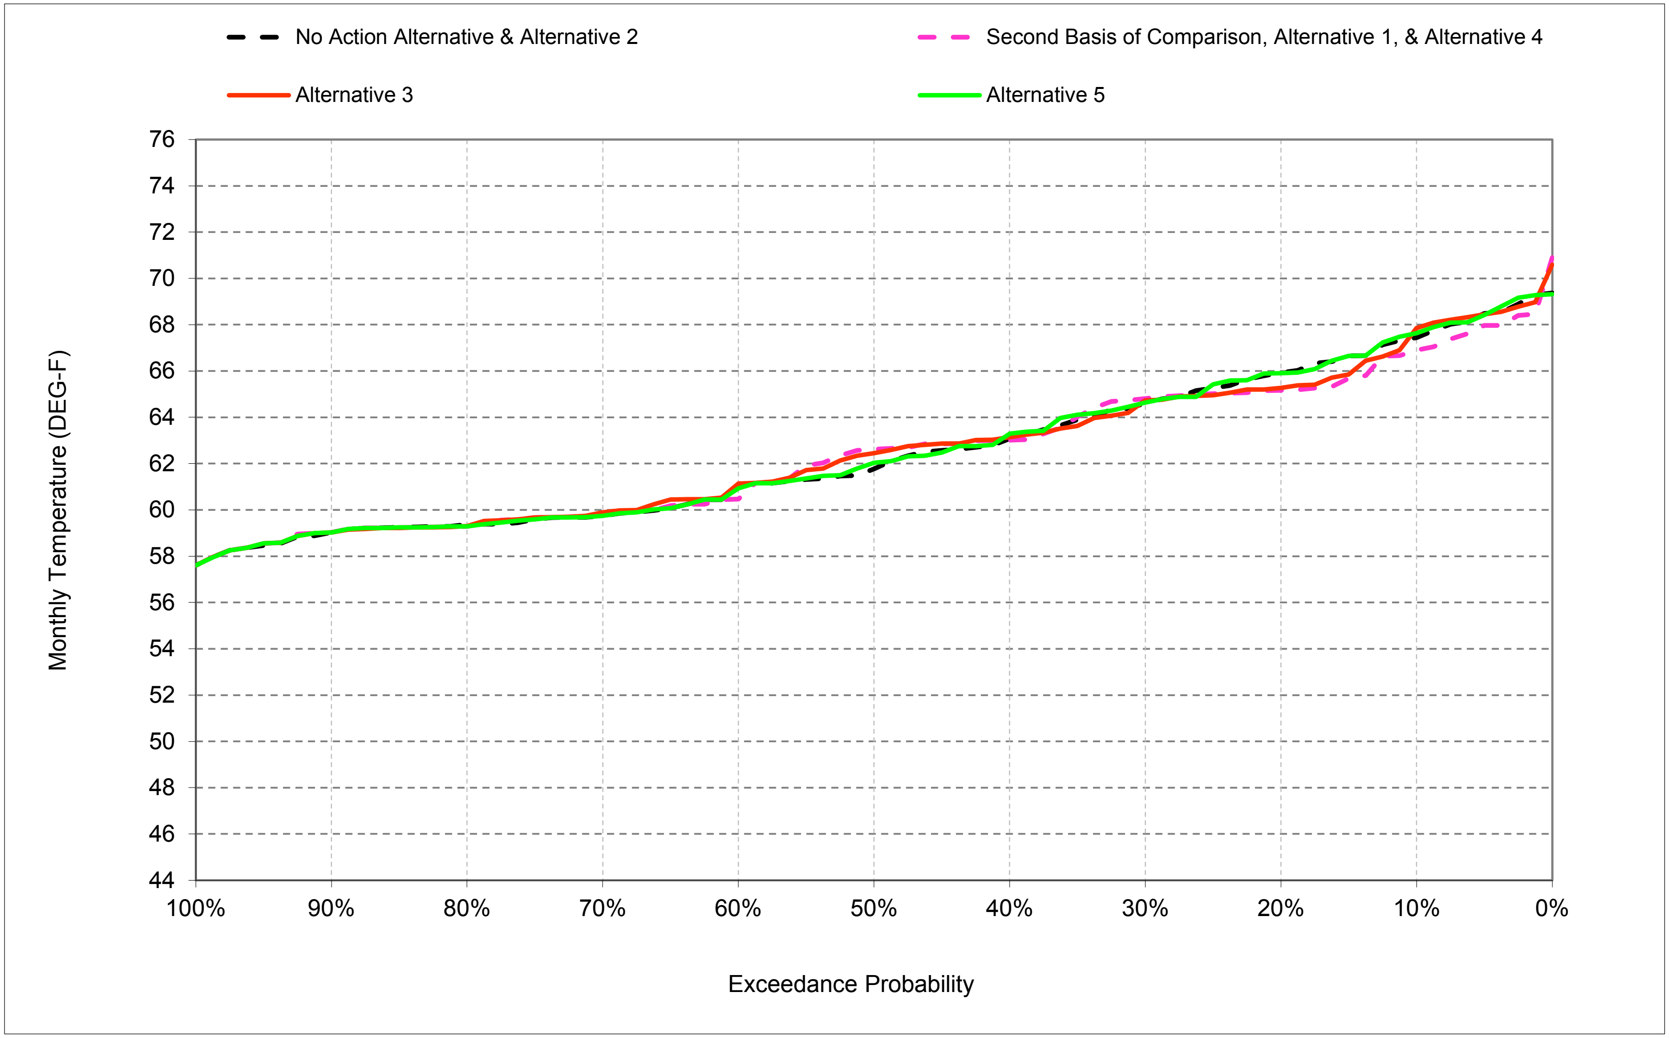
Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-12-8. American River below Nimbus Dam, May



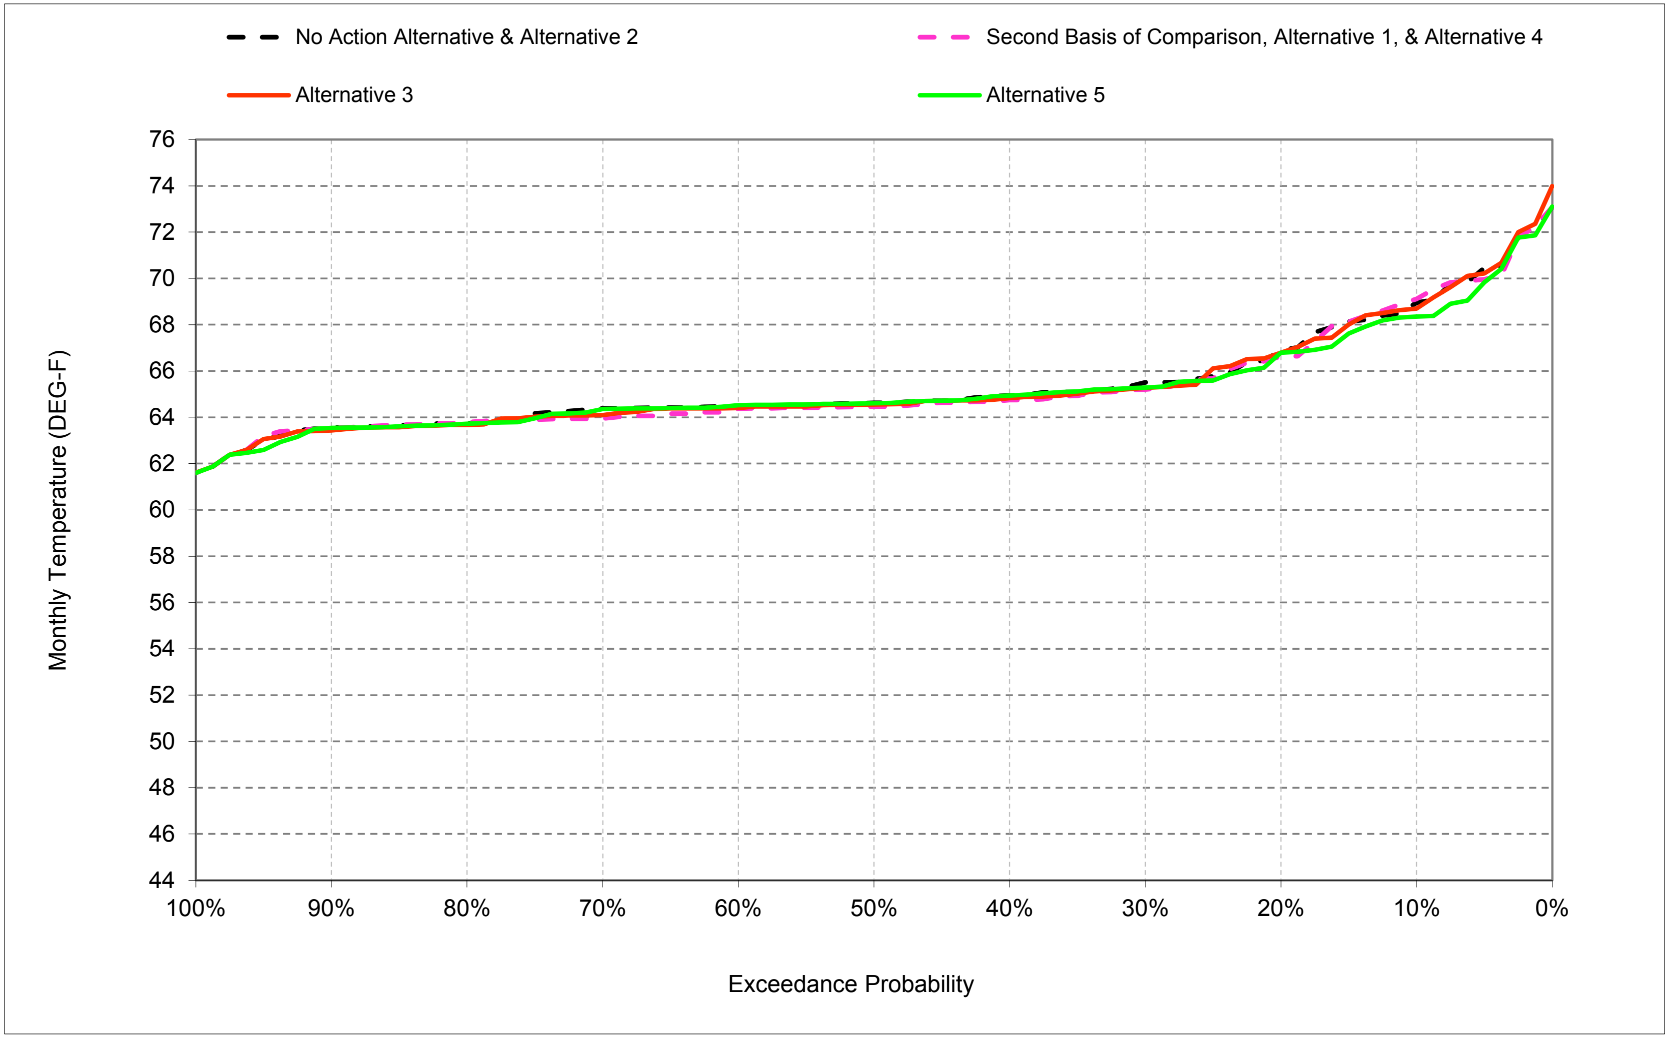
Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-12-9. American River below Nimbus Dam, June



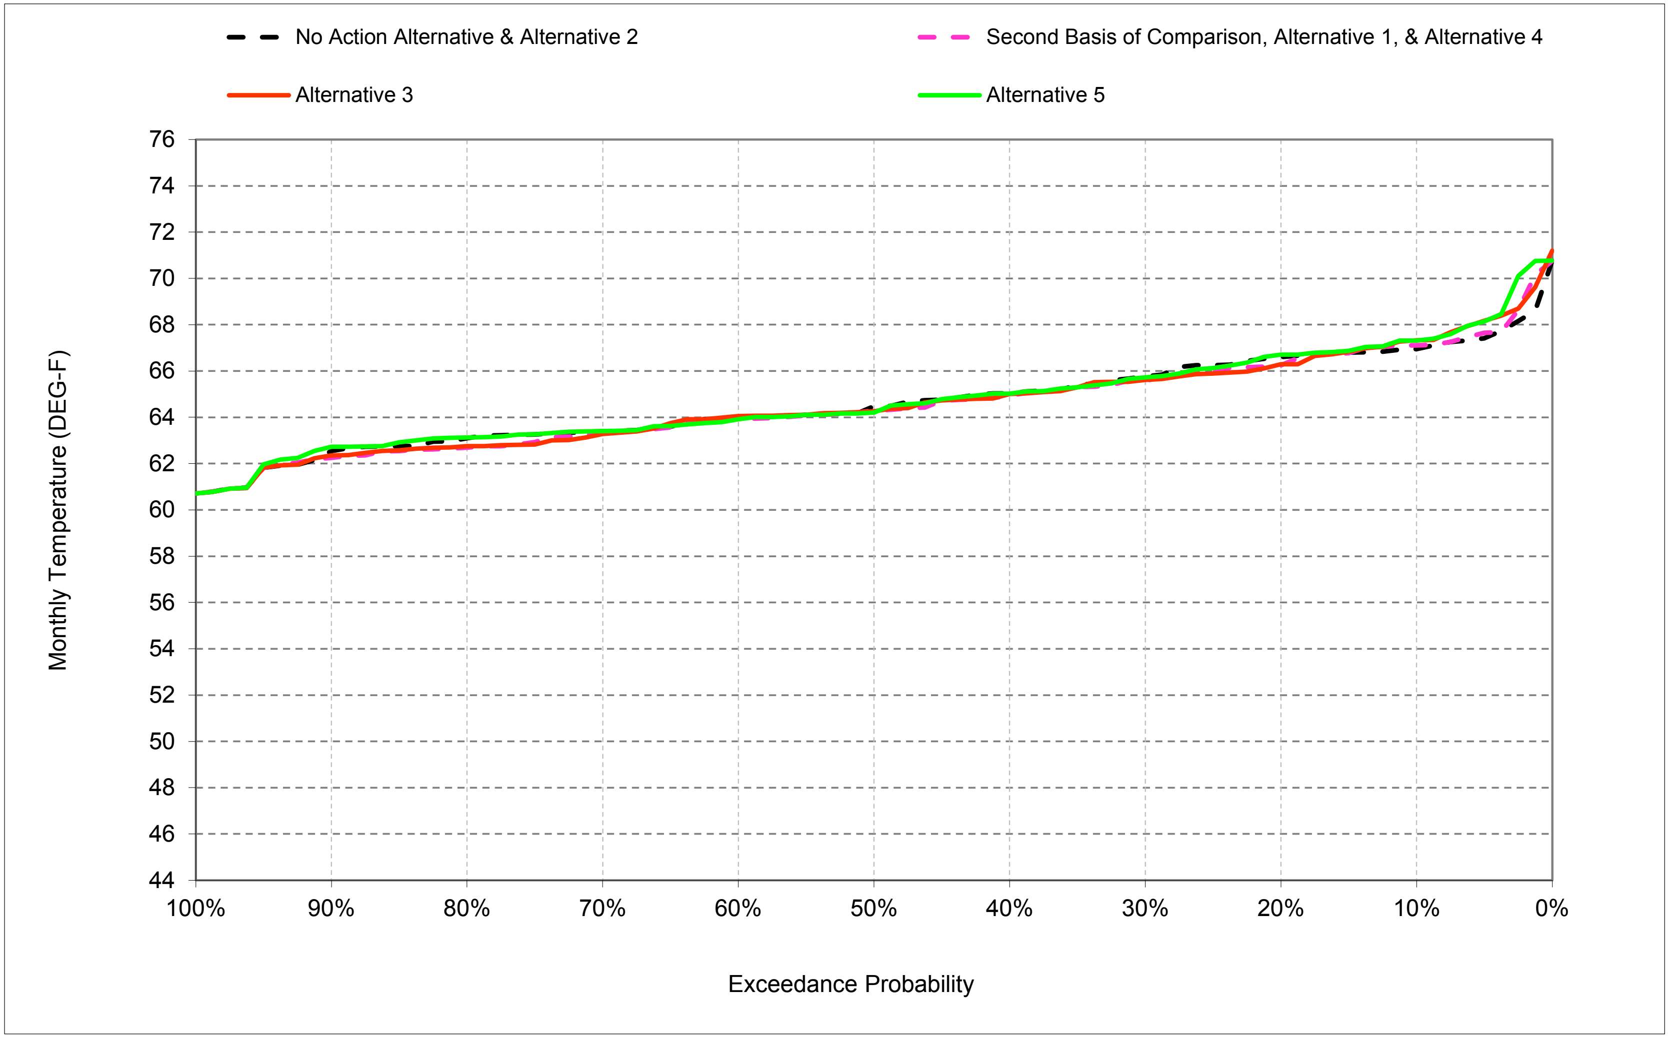
Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-12-10. American River below Nimbus Dam, July



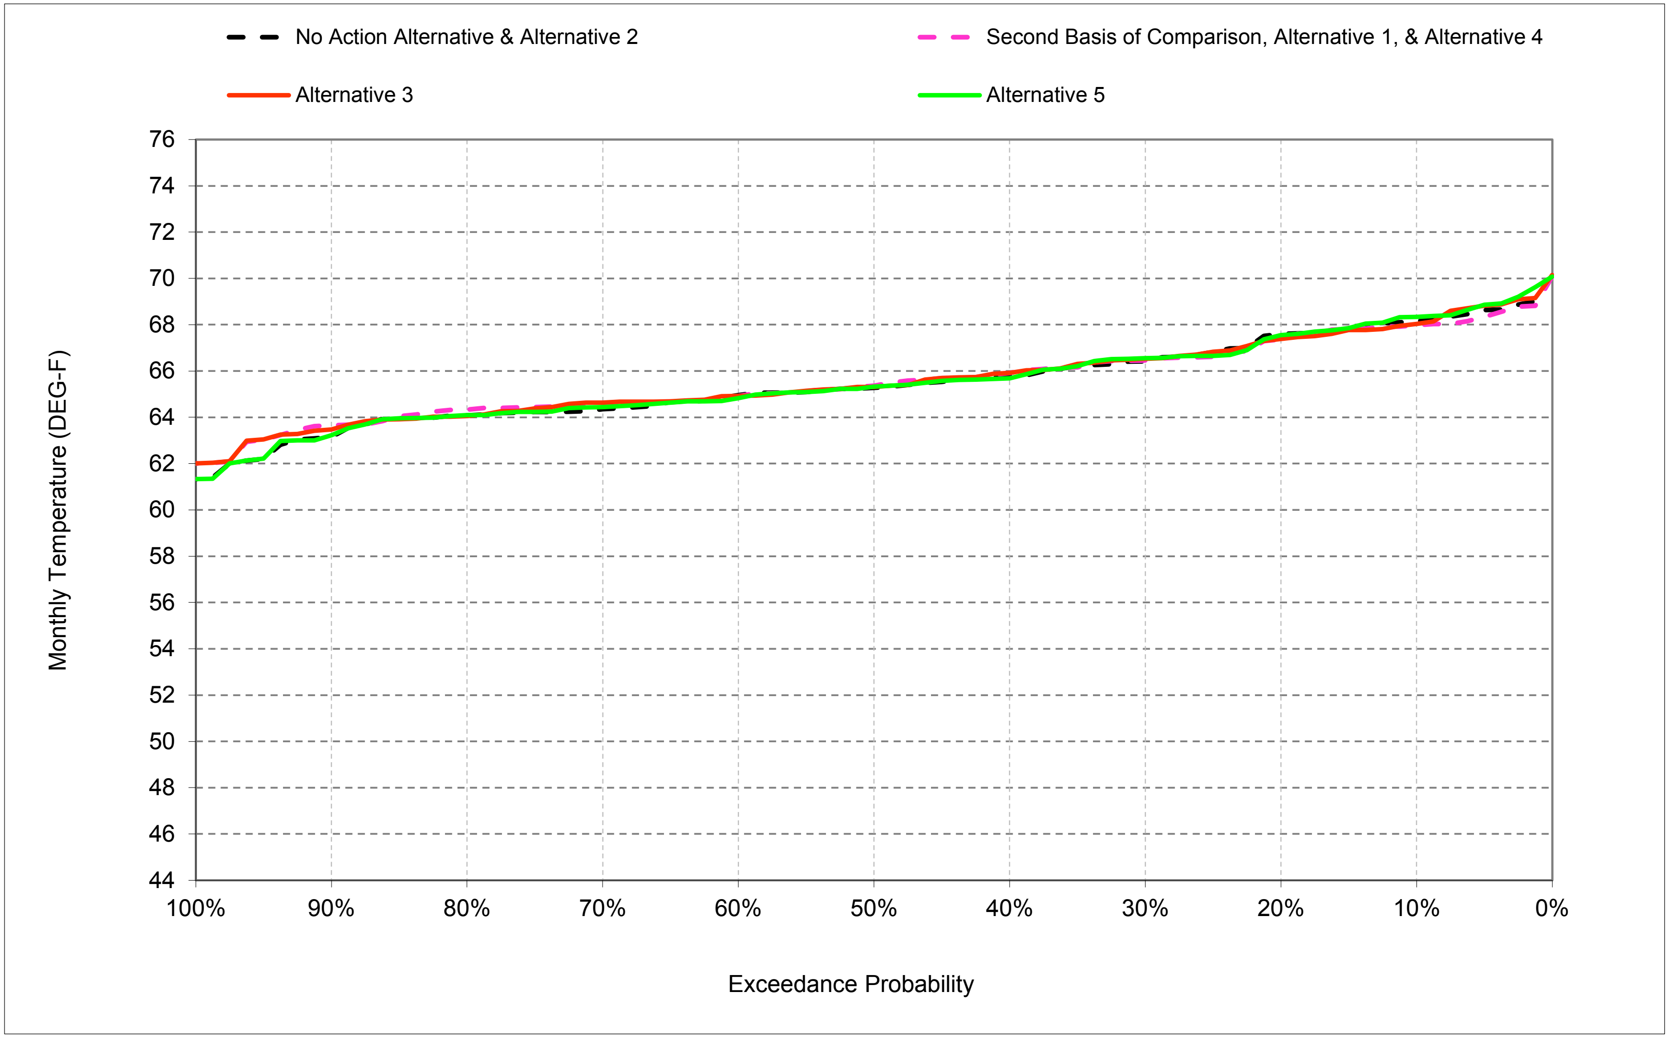
Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-12-11. American River below Nimbus Dam, August



Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-12-12. American River below Nimbus Dam, September



Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on an 81-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on an 81-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

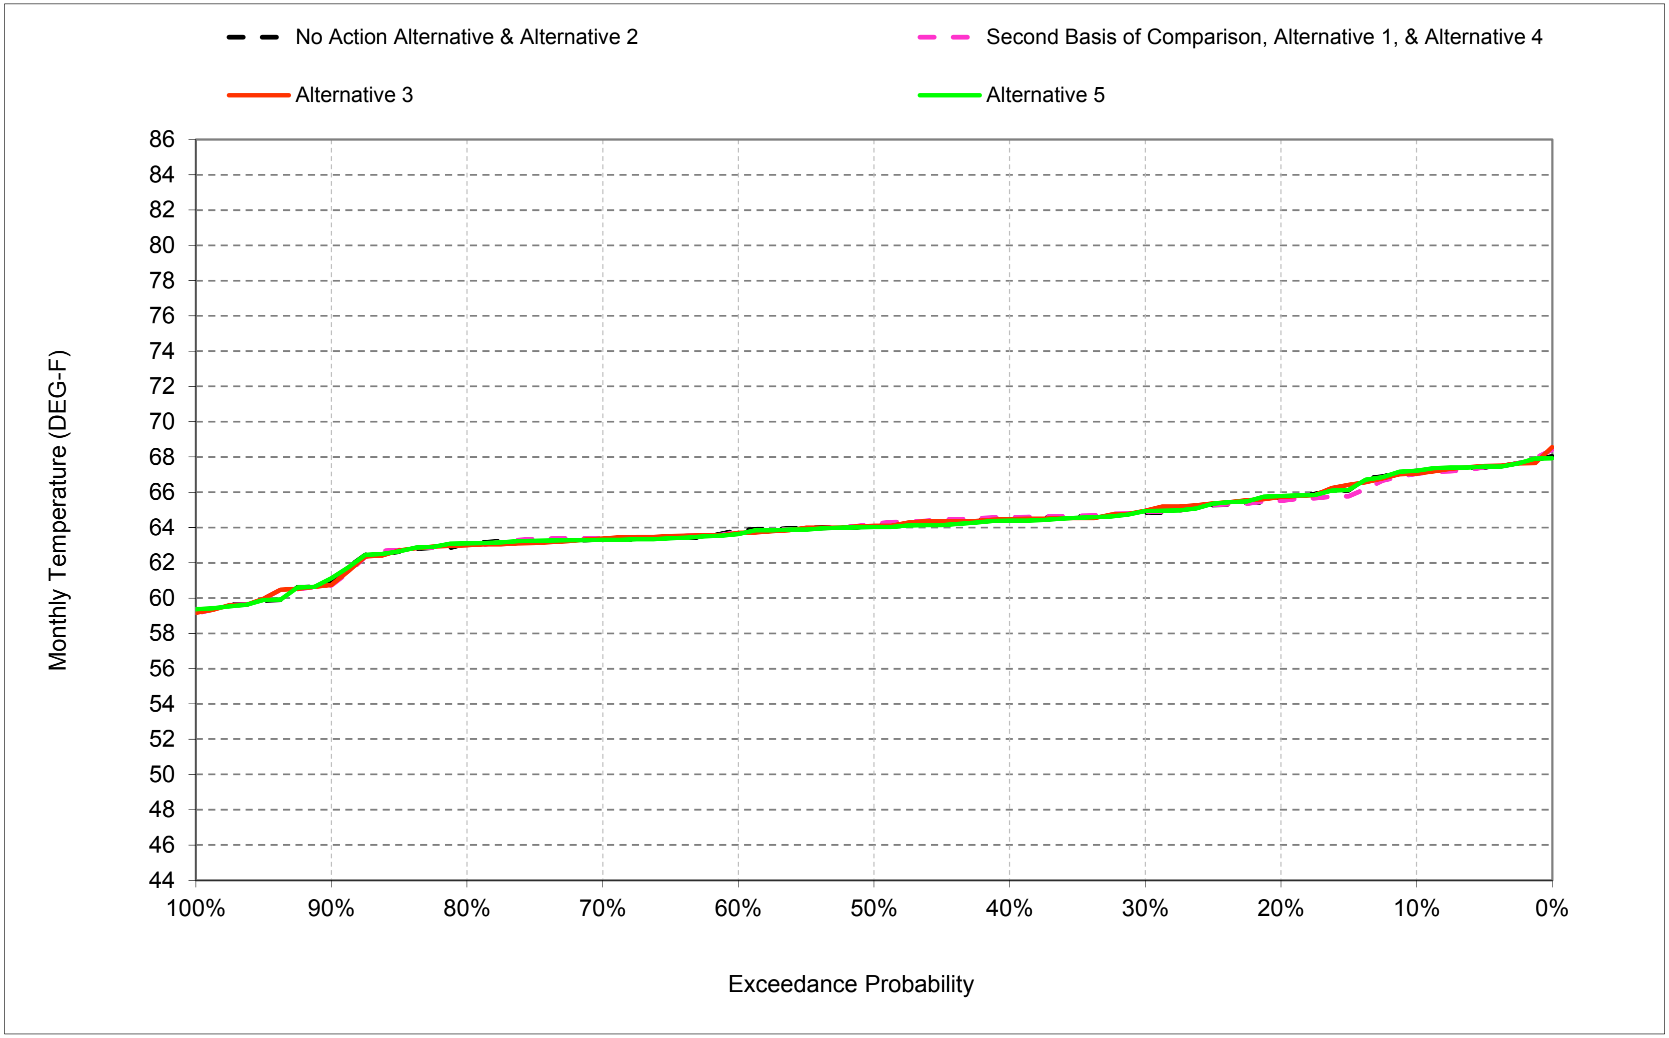
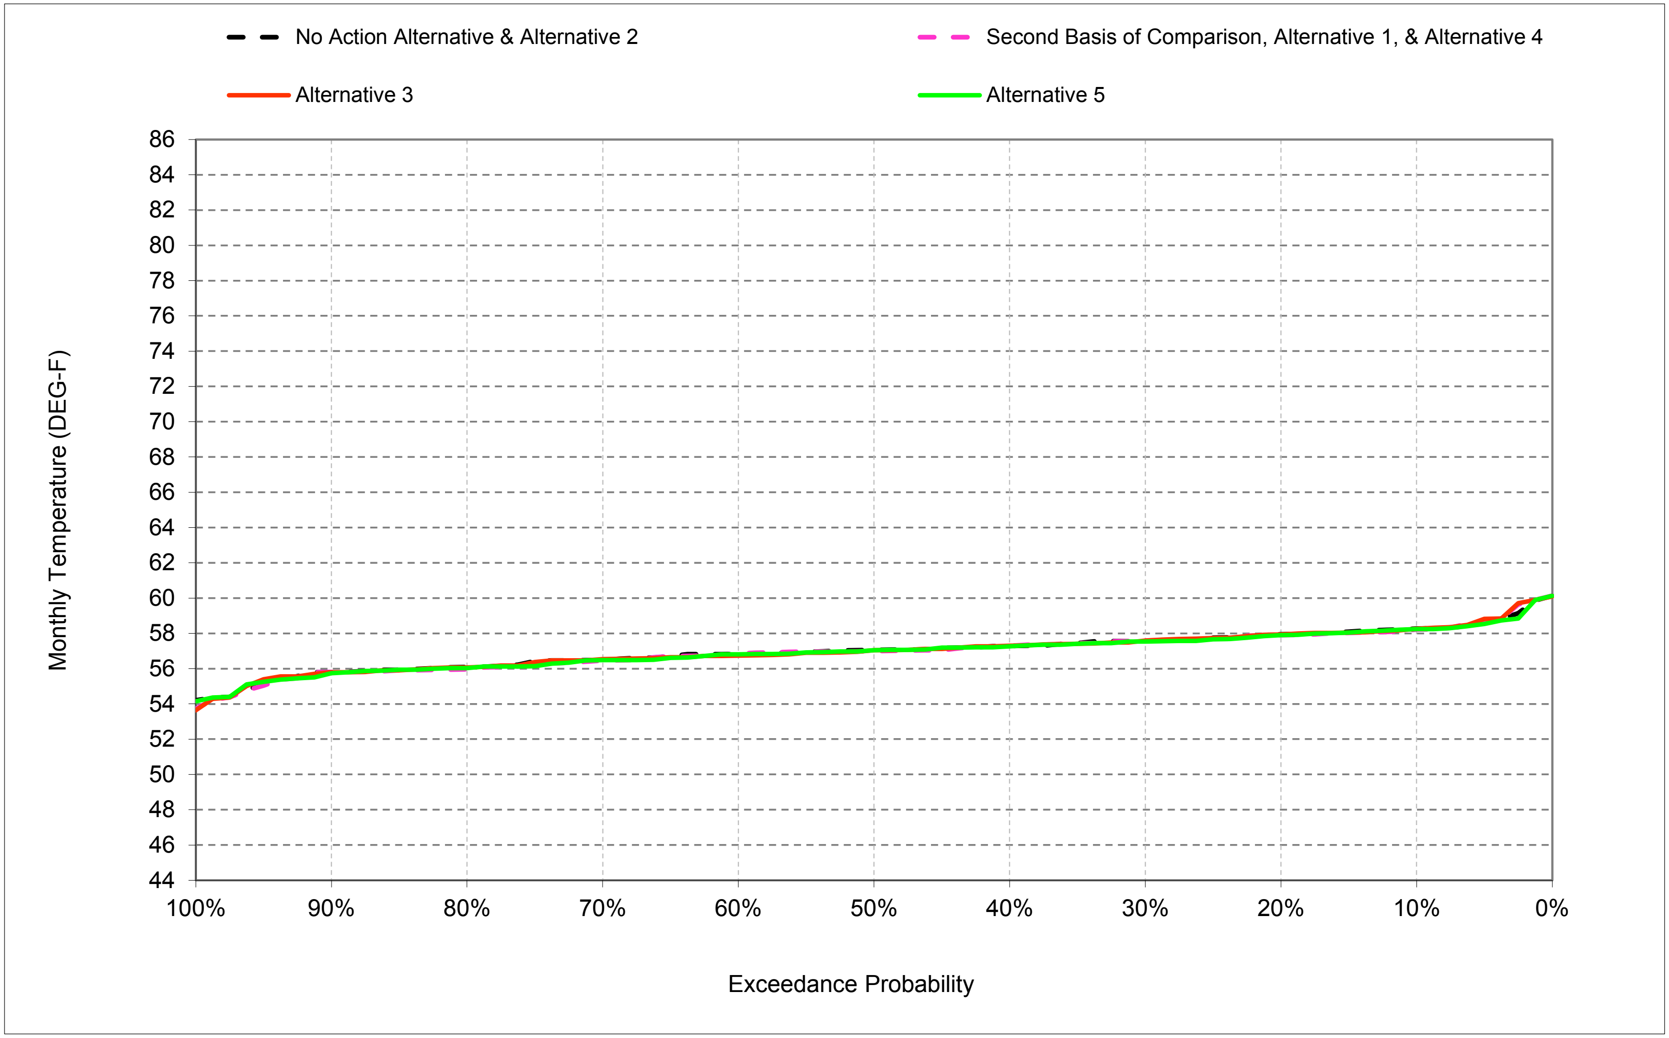
B.13. American River at Watt Avenue Temperature

Figure B-13-1. American River at Watt Avenue, October



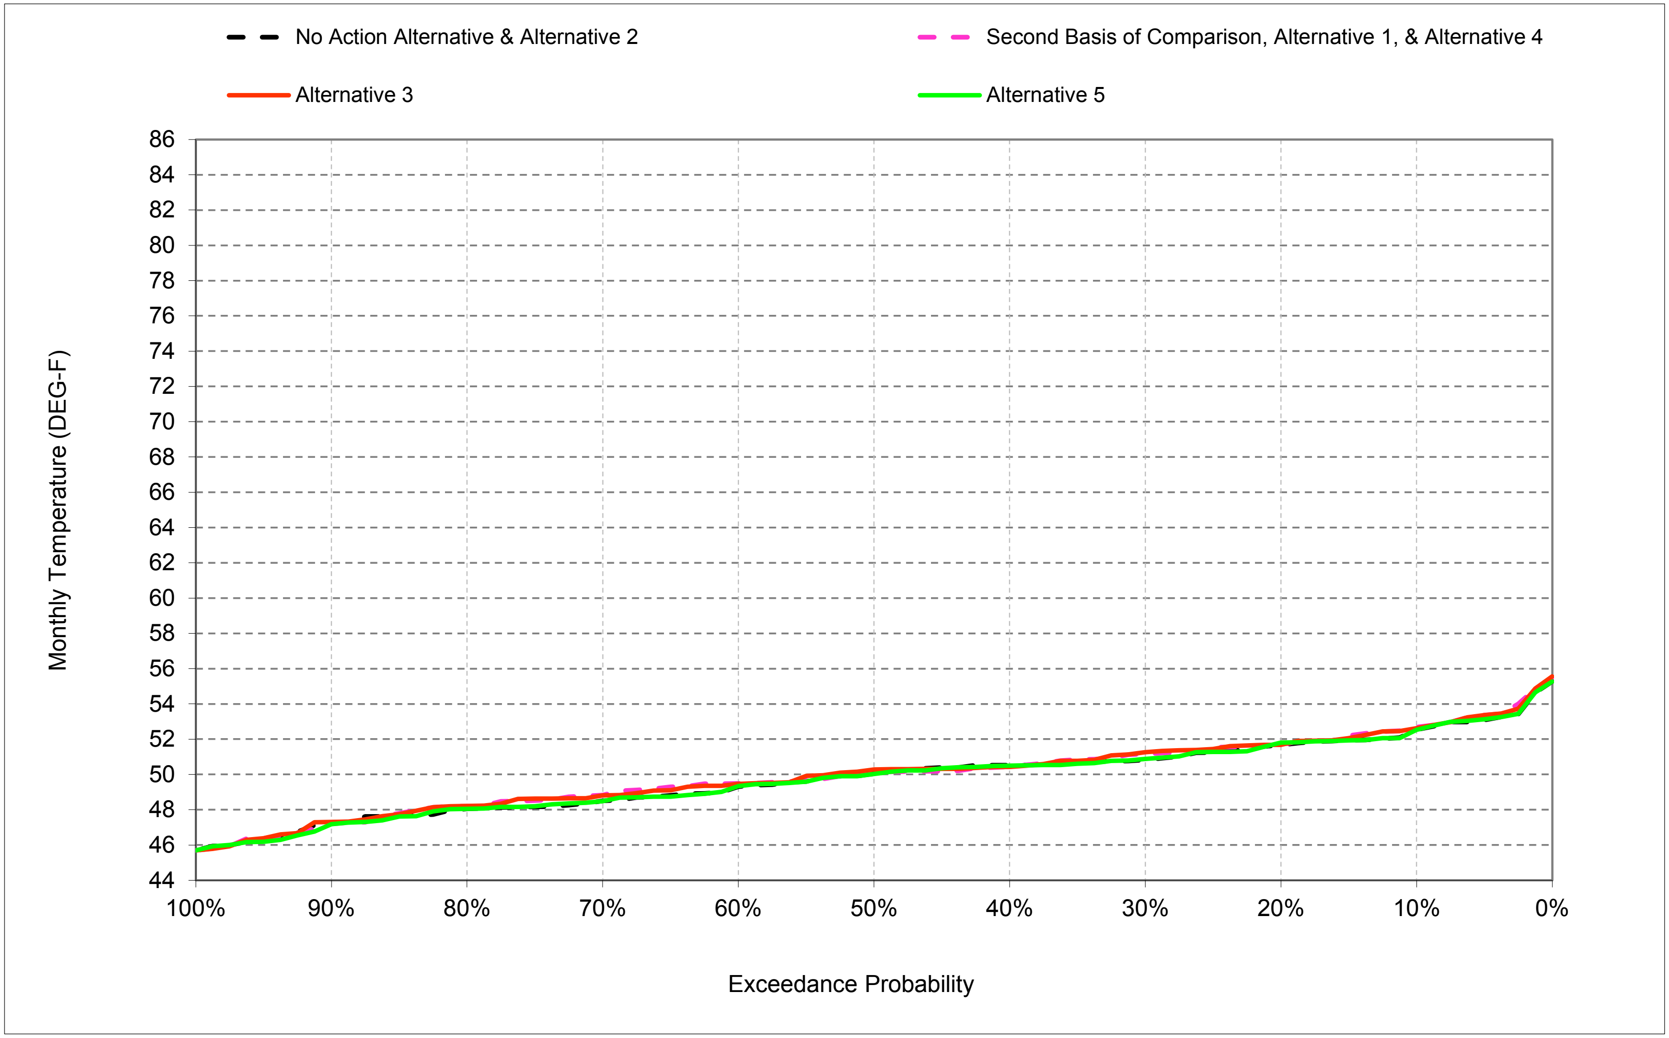
Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-13-2. American River at Watt Avenue, November



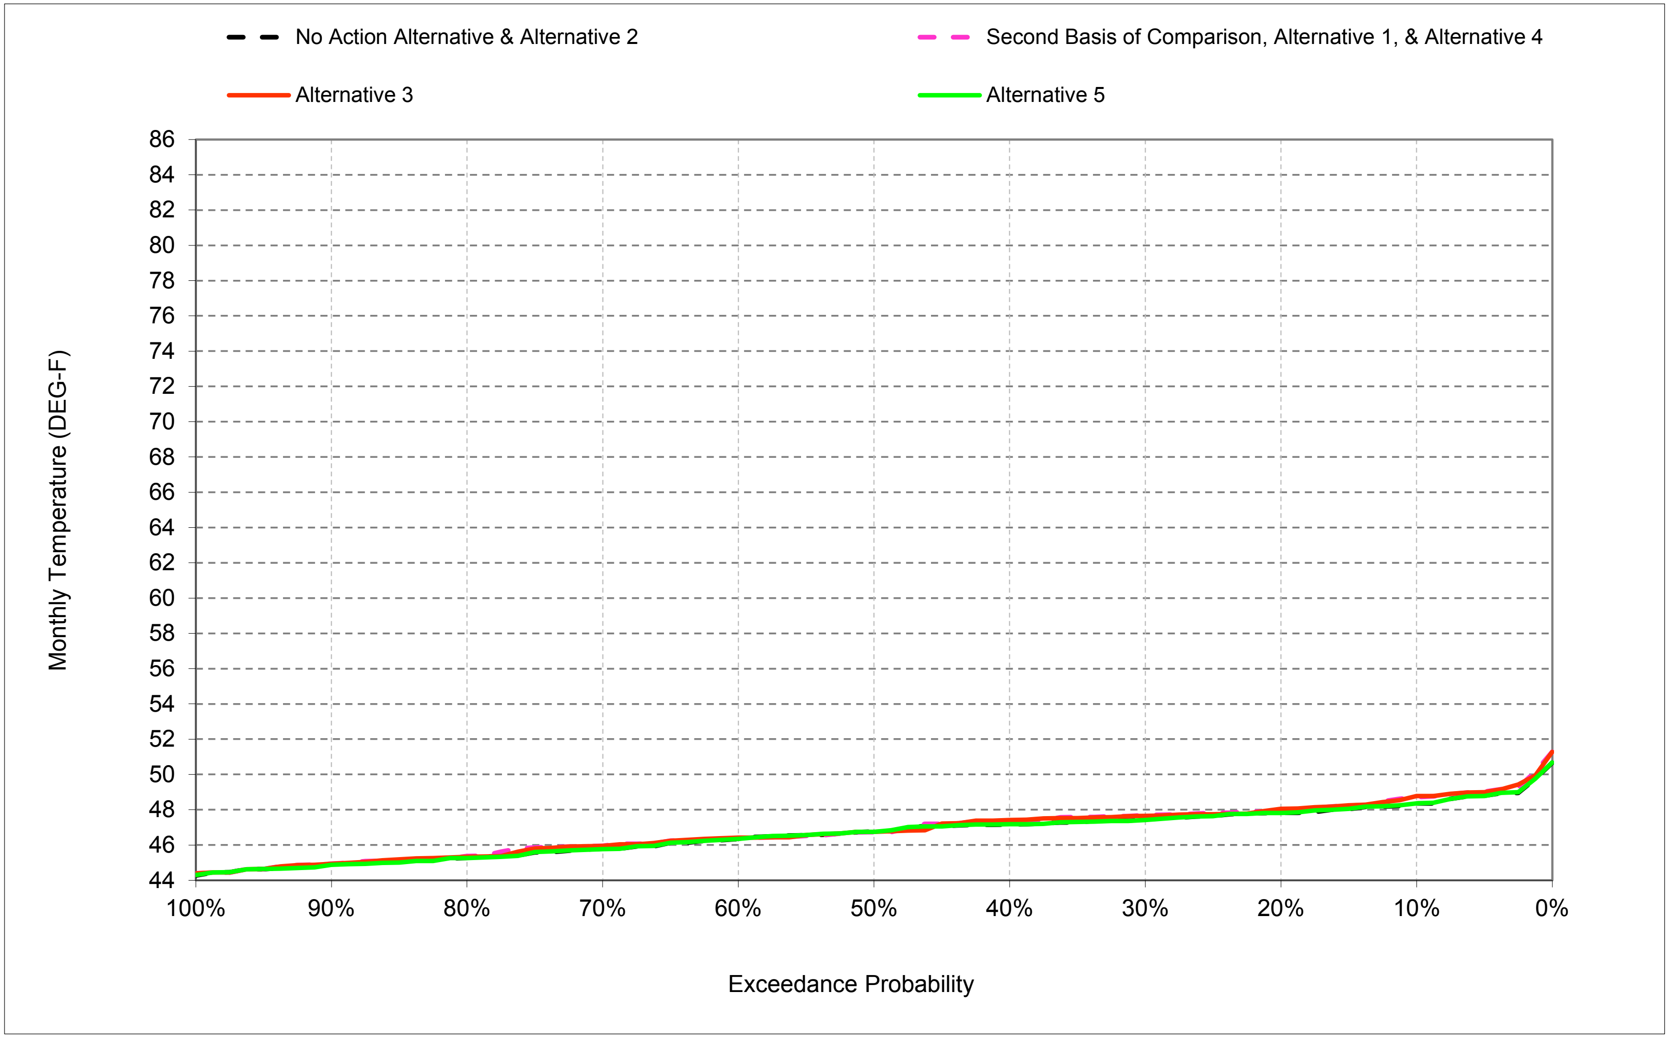
Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-13-3. American River at Watt Avenue, December



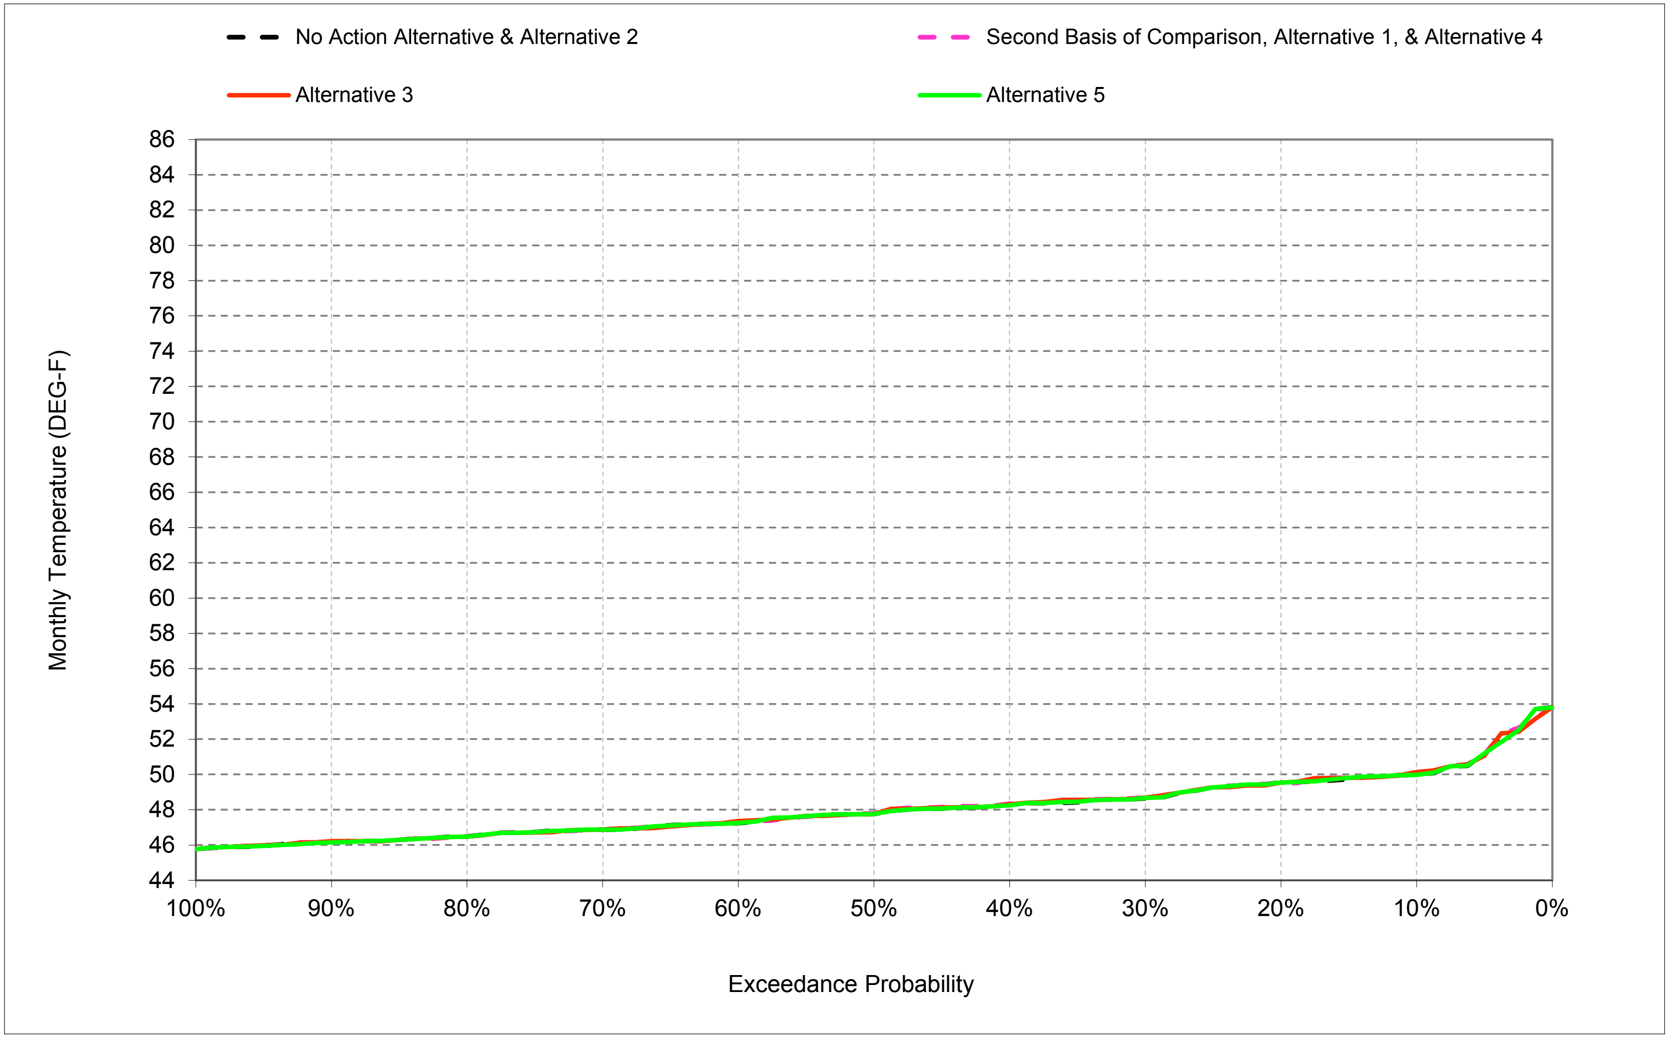
Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-13-4. American River at Watt Avenue, January



Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.

Figure B-13-5. American River at Watt Avenue, February



Notes: 1) Exceedance probability is defined as the probability a given value will be exceeded in any one year. 2) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 3) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternatives 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 4) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. a Exceedance probability is defined as the probability a given value will be exceeded in any one year.

b Based on an 81-year simulation period.

c As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999); projected to Year 2030.

Notes: 1) All alternatives are simulated with projected hydrology and sea level at Year 2030 conditions. 2) Model results for Alternatives 1, 4, and Second Basis of Comparison are the same, therefore Alternative 1 and 4 results are not presented. Qualitative differences, if applicable, are discussed in the text. 3) Model results for Alternative 2 and No Action Alternative are the same, therefore Alternative 2 results are not presented. Qualitative differences, if applicable, are discussed in the text.
