The report provides intensity factor of CO₂e

The CO₂ intensity factor is calculated as $705 - 25 * 0.029 - 298 * 0.00617 = 702.44$ to avoid double counting.

The 25 and 298 are GWPs used in CalEEMod2016.3.1

Notes:

1. Based on ratio of trip rates for the same land uses in the ITE Trip Generation Manual.
2. The value for average dwelling unit square footage is rounded based on the average square footage reported in the RASS.
3. Values based on SCAB survey information of employees per square foot of buildings.

Notes:

1. Based on construction survey performed by SCAQMD and included in Appendix E. For acreage beyond the survey size, equipment lists were kept the same.
2. An air compressor for architectural coating phases has been added to reflect the use of such equipment in many architectural coating operations.

1. The default is based on the ratio of wastewater treatment types used in California GHG emission inventories developed by ARB.
2. The value is based on information provided by the District.

Notes:

1. Species class-specific sequestration values are provided in Table 8.2 of "2006 IPCC Guidelines for National Greenhouse Gas Inventories, Volume 4". For species that do not appear in Table 8.2, the species was classified as "miscellaneous" and the average value of all listed data was used.
2. An active growing period of 20 years is assumed for the new trees planted.
