ELIGIBILITY AND GENERAL PROJECT INFORMATION TAB	
	Q.1 Applicant Type: Specify which of the following describes the applicant. See section 6003(a)(1)(E) of the regulations: • **Public agency** • **Non-profit organization** • **Public utilities** • **Federally recognized Indian tribe** • **State Indian tribe listed on the Native American Heritage Commission's Tribal Consultation list** • **Mutual water company** • **Joint powers authority**
	Q.2 Project Type: Select the most appropriate project type for the application. See section 6003(a)(1)(E) of the regulations: • **Surface Storage Projects Identified in the CALFED ROD** • **Groundwater Storage** • **Groundwater contamination prevention or remediation with storage benefits** • **Conjunctive Use** • **Reservoir Reoperation** • **Local Surface Storage** • **Regional Surface Storage**
	Q.3 Public Benefits: Identify the public benefit categories for which Program funding is requested. For projects with more than one public benefit, hold down the Ctrl key and select all that apply: • **Ecosystem Improvements (must be included)** • **Water Quality Improvements** • **Flood Control Benefit** • **Emergency Response** • **Recreational Purposes**
	Q.4 Explain why the proposed project does not adversely affect any river afforded protection pursuant to the California or Federal Wild and Scenic Rivers Act. See section 6003(a)(1)(I) of the regulations. **The dams for Sites Reservoir would be constructed on Funks and Stone Corral Creeks. Neither watercourse is protected by the California or Federal Wild and Scenic Rivers Act. No protected rivers would be impacted. See Chapter 6 (Section 6.3) in the Draft EIR/EIS (https://www.sitesproject.org/information/FeasibilityReport)for a detailed analysis of impacts to surface water.**
	Q.5 Is the applicant an agricultural or urban water supplier as defined in section 6001 of the Program regulations? If not, enter "Not Applicable"; if so, has the applicant submitted complete Agricultural or Urban Water Management Plans to DWR? Have those plans been verified as complete by DWR? If not, explain how the applicant is working towards compliance with the requirements of Water Code section 10608.56. See section 6003(a)(1)(J) of the regulations. **The Sites Project Authority is composed of representatives of the potentially affected counties, and water management agencies within the Sacramento River watershed. The Sites Project Reservoir Committee participants include both urban and agricultural water suppliers. All participants that are required to submit plans have submitted plans to DWR. Some of the Urban Water Management Plans have already been approved. The remaining plans are currently under review by DWR. All applicants will work with DWR to resolve any future comments on their plans. The status for the plans of each individual agency participating in Sites Reservoir is provided in the Water Management Plan Summary in Sites_A6A Application Index under the ELIGIBILITY AND GENERAL PROJECT INFORMATION TAB.**

ELIGIBILITY AND GENERAL PROJECT INFORMATION TAB	
	Q.6 Does the proposed project affect groundwater basins, as defined by Water Code section 10722 *et seq.*? If not, enter "Not Applicable"; if so, identify the affected groundwater basins and describe how the project would be integrated with future GSP(s). Explain how the project would reduce, eliminate, or have an effect on undesirable results (as defined in regulations section 6001(a)(85)) within the affected groundwater basin(s). Describe how the applicant would work with GSA(s) or adjudicated participants of the basin. See regulations section 6003(a)(1)(K). **Sites Reservoir would help alleviate undesirable conditions in the Colusa Groundwater Basin. Desert Water Agency and the Coachella Valley Water Agency would use water from Sites for groundwater replenishment to address undesirable results in their basins. See Sites_A6C Groundwater Basins under the ELIGIBILITY AND GENERAL PROJECT INFORMATION TAB.**
	A.1 Attach the executive summary (max 20 pages). See regulations section 6003(a)(1)(A). **Attached filename: Sites_A3 Project Description under the ELIGIBILITY AND GENERAL PROJECT INFORMATION TAB.**
	A.2 Attach the Resolution, as required by regulations section 6003(a)(1)(C). See Program website for an example resolution. **Attached filename: Sites_A2 Resolution under the ELIGIBILITY AND GENERAL PROJECT INFORMATION TAB.**
	A.3 Project Description. Attach a description of the project that meets the requirements of section 3.3 of the TR. If a full project description is included in another attachment, identify the attachment name and beginning page number in this attachment. **Attached filename: Sites_A3 Project Description under the ELIGIBILITY AND GENERAL PROJECT INFORMATION TAB.**
	A.4 Attach maps, schematics and engineering design drawings that support the project description, if not already available in other attached documents. See section 6003(a)(1)(B) of the regulations. **Attached filename: Sites_A4_Drawings under the ELIGIBILITY AND GENERAL PROJECT INFORMATION TAB.** **Also See Federal Feasibility Report (https://www.sitesproject.org/information/FeasibilityReport) – Appendix B**
	A.5 Attach a statement, under penalty of perjury pursuant to the laws of the State of California, attesting that the information provided in the full application is true and correct to the best of the applicant's knowledge. Scanned uploaded documents containing a scanned signature are sufficient. See section 6003(a)(1)(Y) of the regulations. **Refer to filename: Sites_A2 Resolution– contains both A.2 and A.5 under the ELIGIBILITY AND GENERAL PROJECT INFORMATION TAB.**
	A.6 OPTIONAL: Attach any other information that would support the application which does not fit easily in another category: for example, other studies or an index of the submitted application documents. • **Attached filename: Sites_A6A Application Index under the ELIGIBILITY AND GENERAL PROJECT INFORMATION TAB** • **Attached filename: Sites_A6B_WMPs (status of water management plans) under the ELIGIBILITY AND GENERAL PROJECT INFORMATION TAB** • **Attached filename: Sites_A6C_Groundwater Basins under the ELIGIBILITY AND GENERAL PROJECT INFORMATION TAB**

APPLICANT INFORMATION TAB	
APPLICANT INFORMATION	
	<u>Organization Name*</u>: Provide the name of the Agency/Organization responsible for submitting the application. Should the application be successful, this Agency/Organization will be the funding recipient. **Sites Project Authority**
	<u>Tax ID</u>: Provide the federal tax ID number of the Agency/Organization submitting the application. **90-0635251**
	Point of Contact*: • Select "Add New User" to add an unregistered user. Please select Division (address will be auto populated) and type the First Name, Last Name, E-mail, and Phone (Direct) of the new user. Please note that the e-mail address will be the new user's login name. • Select "Existing Register Users" to select the registered user associated with the organization specified above. The rest of the contact information (Division, Address, e-mail, etc.) are auto populated once the above registered user is selected. **Jim Watson, PE**
	<u>Point of Contact Position Title*</u>: Provide the title of the point of contact. **General Manager, Sites Project Authority**
	<u>Proposal Name*</u>: Provide the title of the project. **Sites Project**
	<u>Proposal Objective*</u>: Briefly describe the proposed project's objectives. **This application is submitted by the Sites Project Authority to secure investment funding as authorized under voter approved Proposition 1 in exchange for providing the State of California with eligible public benefits.** **The Sites Project will be an offstream reservoir independently owned, constructed, governed, and operated by the Authority under its own water rights and other regulatory requirements; but in cooperation with the U.S. Bureau of Reclamation and California Department of Water Resources in their operation of the Central Valley Project (CVP) and State Water Project (SWP), respectively. The summary objective of the Sites Project is to make California's water system more efficient, flexible, and reliable, which will provide local, statewide, and national benefits. The project helps to achieve the objectives of the California Water Action Plan by providing a substantial supply of high-quality water to support the economy and enhance the environment, particularly in the face of climate change.** **The public benefits for the Sites Project are to improve the survival of anadromous fish and other aquatic species, provide incremental Level 4 refuge water supply, provide opportunities for recreation, and reduce flood damage reduction. Non-Proposition 1 eligible benefits include water supply and hydropower generation.** **The Authority offers the State of California the first right of refusal for 710,000 AF (40% capacity) for public benefits provided by the project. If the State accepts full responsibility for the public benefits, this would provide a long-term average of 195 TAF of water for public benefits. The submittals in this application assume the State would instead prefer federal participation with shared investment in public benefits at a level that reduces capital costs for the Water Storage Investment Program (WSIP) program. This anticipates future federal funding under the Water Infrastructure for Improvements to the Nation (WIIN) Act.**
BUDGET – all amounts in 2015 dollars	
	<u>Other Contribution</u>: If capital costs are allocated to another State program enter the amount here. If none, enter zero. **$0**
	<u>Local Contribution</u>: Provide the total local funding that will be committed to the project's capital costs exclusive of in-

	kind contributions. **$2,720,000,000**
	Federal Contribution: Enter the portion of total capital costs to be provided from federal funds. If none, enter zero. **$730,000,000**
	In-kind Contribution: Provide the total amount of in-kind services in dollars. In-kind contribution refers to work performed by the funding recipient, the cost of which is considered funding match instead of, or in addition to, actual funds from the funding recipient being used as cost match. If there is no in-kind contribution, enter zero. **$64,000,000**
	Amount Requested*: Provide the amount of total capital costs requested from the Program. **$1,662,000,000**
	Total Proposal Cost*: Total project capital cost is automatically calculated based on the contribution amounts entered above. Total project capital costs must be in 2015 dollars. **$5,176,000,000**
GEOGRAPHIC INFORMATION	
Latitude and longitude in degrees, minutes, and seconds. You may use converters on the Web, such as http://transition.fcc.gov/mb/audio/bickel/DDDMMSS-decimal.html.	
	Latitude*: Enter the latitude that best represents the center of the project or main point of access. **.39.308721 or 39° 18' 31.395"**
	Longitude*: Enter the longitude that best represents the center of the project or main point of access. **-122.338131 or 122° 20' 17.2716"**
	Longitude/Latitude Clarification: Only use if necessary. **The latitude and longitude correspond to the intersection of Sites and Huffmaster Roads, the current point of access to Antelope Valley. Sites Reservoir is a large project with a main reservoir of over 14,000 acres and approx. 13 miles of pipelines.**
	Location: Identify the approximate location. Character Limit: 100 **New reservoir in Colusa and Glenn Counties. New pipeline to the Sacramento River.**
	County*: Provide the county in which the project is located. If the project is located in more than one county, hold down the Ctrl key and select all that apply. **Colusa and Glenn Counties**
	Groundwater Basin: Provide the groundwater basin(s) as listed in the current version of DWR Bulletin 118 (http://www.water.ca.gov/groundwater/bulletin118/gwbasins.cfm), in which your project is located. For projects covering multiple groundwater basins, hold down the Ctrl key and select all that apply. **Sacramento Valley (5-92) and Colusa (5.21-52)**
	Hydrologic Region: Provide the hydrologic region in which your project is located. For projects covering multiple hydrologic regions, hold down the Ctrl key and select all that apply. **Sacramento River**

APPLICANT INFORMATION TAB

	Watershed: Provide the name of the watershed in which the project is located (maximum character limit: 250). A map of California watersheds can be found at the following link: http://www.conservation.ca.gov/dlrp/wp/Documents/CALFED_Watershed_Map[1] .pdf. If your project covers multiple watersheds, you may only provide one "Unique Watershed Number" as listed on the watershed map **Colusa Basin (80)**
LEGISLATIVE INFORMATION	
	Enter the State Assembly*, State Senate*, and U.S. Congressional Districts* in which the project is located (use district numbers only, not the name of the Legislator). For projects that include more than one district, hold the Ctrl key down and select all that apply. **CA Assembly District 03** **CA Senate District 04** **US Congressional District 03**

EARLY FUNDING REQUEST TAB	
	Q.1 Is early funding for completing environmental documentation and/or permits requested? If yes, answer the following question and provide the requested information. See regulations section 6003(a)(1)(X). **Yes**
	Q.2 What is the requested amount? **Requesting 50% of $103,351,000 or $51,675,500.**
	A.1 Attach a schedule, scope of work, and budget. Keep in mind that the applicant must provide a 50 percent cost share and reimbursable costs can only go back to November 4, 2014. Scope of work must include an explanation of why early funding is critical to the project, the viability of the project in the absence of this funding and how the project will proceed once early funding is expended. The scope of work cannot include work performed prior to submittal of the application. The tasks in the schedule, scope of work and budget should match. **See Sites_A1 Scope under the EARLY FUNDING REQUEST TAB**

FEASIBILITY & IMPLEMENTATION RISK TAB	
	A.1 Attach feasibility studies or documentation that demonstrates the proposed project's engineering, environmental, economic, and financial feasibility as described in TR section 3.5. See also regulations section 6003(a)(1)(O). **See Sites_A1 Feasibility under the FEASIBILITY AND IMPLEMENTATION RISK TAB.**
	A.2 Provide a listing and status of all local, state, and federal permits, certifications, and other approval necessary for the construction and operation of the project. See section 6003(a)(1)(W) of the regulations. **See Sites_A2 Permits under the FEASIBILITY AND IMPLEMENTATION RISK TAB.**
	A.3 Attach an estimated schedule for the proposed project until the first year of operation. If the schedule is included in another attachment, identify the location. See section 6003(a)(1)(G) of the regulations. **See Sites_A3 Schedule under the FEASIBILITY AND IMPLEMENTATION RISK TAB.**
	A.4 Attach the most recent publicly available environmental document for the proposed project. If the document is available on a website, provide a link to the document(s). See section 6003(a)(1)(S) of the regulations. **Posted at** http://sitesproject.org/information/DraftEIR-EIS
	A.5 Summarize the project's impacts on environmental or cultural resources and how the project will mitigate or minimize impacts to those resources, or identify where in the CEQA document this information can be found. If any environmental or cultural impacts will not be fully mitigated, explain. See regulations section 6003(a)(1)(T). If applicable, identify whether Tribal consultation has been initiated for the project. If it has, provide supporting documentation, or identify the location in the CEQA document. If consultation has not been initiated, state whether consultation is expected and when consultation is expected to be initiated. See regulations section 6003(a)(1)(U). **See Sites_A5 Tribal Impacts under the FEASIBILITY AND IMPLEMENTATION RISK TAB.**

BENEFIT CALCULATION, MONETIZATION, and RESILIENCY TAB	
	Q.1 Did the applicant use the model products and assumptions described in section 6004(a)(1) of the regulations? See regulations section 6003(a)(1)(CC). If no, provide a description of the models and assumptions used to determine the without- project future conditions for years 2030 and 2070. **The analyses conducted for the Sites Reservoir Project utilized the model products and assumptions described in section 6004(a)(1). This includes the 2030 and 2070 future conditions CalSim II and DSM2 models provided by the California Water Commission on November 2, 2016. The models provided by the commission were modified to include the facilities and operation of the Sites Project as described in the Project Description and Assumptions section.** **For the analysis of the Relative Environmental Values, the with- and without-project current conditions analyses were based on the DWR State Water Project Delivery Capability Report 2015 (DCR 2015) – CalSim II base scenario. The DCR 2015 base scenario, provided by DWR, was modified to include the facilities and operation of the Sites Project. The project description and assumptions for the with-project current condition are the same as for the 2030 and 2070 with-project conditions.** **The analyses also included the use of other analytical tools that were updated for future 2030 and 2070 conditions. These tools include:** • **USRDOM – Upper Sacramento River Daily Operations Model** • **Sacramento River HEC5Q model** • **SALMOD** • **American River CE-QUAL-W2 Model** • **CWEST** • **SWAP** • **LTGEN** • **SWP Power** • **NODOS Power**
	A.1 Attach description and assumptions of with-project conditions for years 2030 and 2070, as defined in section 6004(a)(2) of the regulations, as well as a description of the with- and without-project current conditions. See also regulations section 6003(a)(1)(BB). **Attached filename: Sites_A1 Modeling under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB**
	A.2 Attach the preliminary operations plan for the proposed project. See regulations section 6003(a)(1)(H) for details. If the preliminary operations plan is located in another attachment, identify the attachment and provide the location. **Attached filename: Sites_A2 Operations under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB**
	A.3 Attach the analysis of all public and non-public monetized benefits. Identify at least one Program ecosystem or water quality priority for any ecosystem or water quality public benefit quantified. For each public and non-public benefit, describe the methods used to derive the physical and economic benefits and impacts at a level of detail that allows reviewers to verify your analysis. Description must include: • The physical changes that are being monetized, consistent with information requested in the Physical Public Benefits Tab, and describing linkages between physical benefits and monetized benefits. See regulations sections 6004(a)(3) and 6004(a)(4); and • The monetization method and sources for data used. See regulations section 6004(a)(4). **Attached filename: Sites_A3 Physical Monetized under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB**
	A.4 For each net public benefit claimed, where applicable, identify any existing environmental mitigation or compliance obligations that are accounted for in each net public benefit as of the date of the CalSim-II model product in section 6004(a)(1). • Applicants that use the CalSim-II and DSM2 models to analyze their projects can indicate “within models” for any existing environmental mitigation and compliance obligations contained in those models. • If applicable to their claimed net public benefit such projects shall also list and account for the non-flow related mitigation and compliance obligations of the State Water Project and Central Valley Project.

BENEFIT CALCULATION, MONETIZATION, and RESILIENCY TAB	
	Attached filename: Sites_A4 Mitigation under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB
	A.5 Provide additional information that supports the physical and monetary quantification of the public and non-public benefits and impacts of the project as required by subsection 6004(a)(4) of the regulations. This includes data, assumptions, analytical methods and modeling results, calculations and relevant sources of information. For reference documents or studies relied upon, applicants may provide links to an existing website in lieu of attaching those documents to the application. **Attached filename: Sites_A5 Documentation under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB**
	A.6 Attach a table displaying each future economic benefit in 2015 dollars for each year of the planning horizon as required by section 6004(a)(4)(A) of the regulations. **Attached filename: Sites_A6 Annual Benefits Table under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB**
	A.7 If applicable, provide a summary of public benefits that cannot be monetized. Provide the following information for each non-monetized benefit. • Justification why benefit cannot be monetized, • Qualitative description of importance of benefit (who is affected, how and how often), • Evidence to show how the physical change is beneficial and important to Californians. **Attached Filename: Sites_A7 Non Monetized under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB**
	A.8 Attach an estimate of the total project costs that includes construction cost, interest during construction, land acquisition, monitoring, environmental mitigation or compliance obligations, operations and maintenance, repair, and replacement costs during the planning horizon using methods described in TR section 6. If the project costs are located in another attachment, identify the location. *The project cost estimates must be reviewed, approved and signed by an engineer licensed by the California Board for Professional Engineers, Land Surveyors, and Geologists.* **Attached filename: Sites_A8 Estimate under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB**
	A.9 Attach the benefit and cost analysis for the proposed project. If the analysis is located in another document, identify the location. See regulations section 6004(a)(6). **Attached filename: Sites_A9 BCA Results under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB**
	A.10 Provide a proposed allocation of total project costs to all project beneficiaries, including the Program, and an explanation of how the allocation was calculated, consistent with TR section 8 and section 6004(a)(7) of the regulations. If this information is included in another attachment, identify the location. **Attached filename: Sites_A10 Allocation under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB**
	A.11 Attach the Physical and Economic Benefits Summary tables. These tables can be downloaded from the Commission website and uploaded with the application. See regulations section 6003(a)(1)(N). **Attached filename: Sites_A11 Benefits Table under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB**
	A.12 Attach the uncertainty analysis. See regulations section 6004(a)(8). **Attached filename: Sites_A12 Uncertainty under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB**

PROJECTS TAB This section contains information about the project or projects contained in an application. Budget, Geographic Information and Legislative information can be copied from the Applicant Information Tab.	
PROJECT INFORMATION	
	Project Name*: Provide the same name that was used in the Applicant Information Tab. **Sites Project**
	Implementing Organization: Select the applicant from the drop down list. **Sites Project Authority**
	Secondary Implementing Organization: Leave blank.
	Proposed Start and End Dates: Leave blank.
	Scope of Work, Project Description, and Project Objective: Leave blank.
PROJECT BENEFITS INFORMATION ***Please do not enter any information into GRanTS for the following Project Benefits Questions. The questions are standard GRanTS questions that cannot be removed, and will not be used for the Program benefits analysis.***	
	Benefit Level: Leave blank.
	Benefit Type: Leave blank.
	Benefit: Leave blank.
	Description: Leave blank.
	Measurement: Leave blank.

PHYSICAL PUBLIC BENEFITS TAB

ECOSYSTEM BENEFITS

A.1 Attach completed Ecosystem Priorities worksheets. Be sure to include the general information worksheet as well as worksheets for each priority being claimed for which funds are being requested. Identify at least one Program ecosystem priority for any ecosystem public benefit quantified. See section 6003(a)(1)(Q) of the regulations.

See filename: Sites_A1 Ecosystem General Information under the PHYSICAL PUBLIC BENEFITS TAB.

A.2 Attach supporting documentation requested in Ecosystem Priorities worksheets such as maps or other information not already provided elsewhere in the application.

See filename: Sites_A2 Ecosystem Documentation under the PHYSICAL PUBLIC BENEFITS TAB.

WATER QUALITY BENEFITS

A.1 Attach completed Water Quality Priorities table(s). If the project is claiming water quality benefits that meet the water quality priorities, be sure to include the general application questions table as well as tables for each priority being claimed for which funds are being requested. Identify at least one Program water quality priority for any water quality public benefit quantified See section 6003(a)(1)(Q) of the regulations.

See filename: Sites_A1 Ecosystem Priority under the PHYSICAL PUBLIC BENEFITS TAB.

A.2 Attach supporting documentation requested in Water Quality Priorities tables such as maps or other information not already provided elsewhere in the application.

See filename: Sites_A2_Documentation WQ Priority under the PHYSICAL PUBLIC BENEFITS TAB.

FLOOD CONTROL BENEFITS If the proposed project is not claiming flood control benefits, leave the following questions blank

Q.1 If applicable, how will the project provide flood control benefits? If some project operations will be for flood control purposes, explain. Are the flood control benefits realized locally and/or throughout the larger flood control system? (TR section 4.9.2.1) Describe any negative impacts of providing the flood control benefit. (TR section 4.9.2.4)

The proposed project is located in the Colusa Basin watershed in Colusa and Glenn counties. It consists of constructing two main dams, Golden State Dam on Funks Creek and Sites Dam on Stone Corral Creek, and nine saddle dams on the northern end of the reservoir between the Funks Creek and Hunter Creek watersheds along the Glenn-Colusa county line. The existing Funks Dam is located on Funks Creek would be replaced with a new, larger Holthouse Reservoir.

As an offstream reservoir, Sites Reservoir does not have a large, upstream watershed. Sites Reservoir can, nevertheless, be operated to provide local flood control benefits by capturing and attenuating flood flows associated with Stone Corral and Funks Creeks and the other local ephemeral watersheds. By capturing flows from extreme storm events, the project will reduce flood damages, such as the February 18, 2017 event that flooded the community of Maxwell and temporarily closed Interstate 5.

What methods were used to calculate flood damage reduction? Identify which of the following methods was used to quantify physical flood control benefits:

1. Modeling provided with feasibility study
2. New modeling using historical flood events or historical hydrology
3. New modeling using the climate change hydrology data set provided

If 1 or 2 is used, explain how benefits might be different under the provided future climate and sea levels projections. Provide justification for any methods not identified in section 5.4.3 of the TR. See also regulations section 6004(a)(1)(F).

New modeling using historical flood events or historical hydrology was used to determine physical flood damage reduction benefits. Flooding in the watershed currently occurs between October and April due to rainfall-runoff. If rainfall run-off timing and duration are affected by climate change, it is anticipated that the project will provide additional flood damage reduction benefits. Additional information is provided in Attachment A1 (Sites_A1 Flood Control under the PHYSICAL PUBLIC BENEFITS TAB).

A.1 Attach any relevant flood damage reduction supporting documentation, such as hydraulic and hydrologic modeling studies, and property flood damage analysis (TR section 4.9.4). If information to support this question is located in another attachment, provide the location.

See filename: Sites_A1 Flood Control under the PHYSICAL PUBLIC BENEFITS TAB.

PHYSICAL PUBLIC BENEFITS TAB

EMERGENCY RESPONSE BENEFITS If the proposed project is not claiming emergency response benefits, leave the following questions blank.	
	Q.1 If applicable, how will the project be operated to provide emergency response benefits? Identify the types of emergency benefits the proposed project could provide. (TR section 4.11.1). If additional information to support this question is located in another attachment, provide the location. **The Authority is committed to working with the state and federal water managers and emergency personnel to provide water to support emergency events such as, but not limited to, firefighting, drought relief, and Delta levee failures. Instead of dedicating a volume of water that may not be called upon by the state until at least a one-in-ten year event (or longer) occurs, the Authority proposes that should water from Sites Reservoir be used to aid in responding to or recovery from an emergency, that repayment would occur through a mutually-acceptable exchange or transfer of water. As such, this benefit was not monetized and the Authority is not requesting Proposition 1 funding for this purpose.** **Should the Water Commission be interested in acquiring water to reserve storage for a qualifying Proposition-1 emergency event, the Sites Project Authority will work with the Water Commission to evaluate the concept and, if appropriate, prepare an amendment to this application for the Water Commission's consideration.**
	A.1 Attach a description of the amount or share of stored water to be provided for the emergency benefits and define the conditions under which water would be made available. Describe how the applicant can commit to the conditions under which the emergency benefits would be made available. (TR section 4.11.2) **Not Applicable**
RECREATION BENEFITS If the proposed project is not claiming recreation benefits, leave the following questions blank.	
	Q.1 If applicable, how will the project be operated to provide recreation benefits? If additional information to support this question is located in another attachment, provide the location. **Sites Reservoir will provide new opportunities for surface-water recreation, such as boating, fishing, and swimming. New shoreline facilities at the reservoir will be constructed to support camping, hiking, horseback riding, mountain biking, picnicking, and sightseeing. The project includes two new recreation areas, Stone Corral and Peninsula Hills. Two boat ramps would provide access to the reservoir. Day-use and overnight camping facilities would be constructed on the shore.** **Sites Reservoir operations would also support the maintenance of higher water levels at Shasta and Folsom Lakes. Beneficial effects were noted in some instances where additional storage in existing facilities resulting from the operation of Sites Reservoir would provide more frequent access to boat ramps at these facilities.** **Additional recreational benefits will be provided for fishermen in the Sacramento and American River watersheds as a result of increased populations of Chinook salmon and steelhead. Additional information is provided in Sites_A2 Recreation under the PHYSICAL PUBLIC BENEFITS TAB.**
	Q.2 By providing new recreation benefits, does the proposed project negatively affect any existing recreation activities either at the proposed project site, at another facility, or nearby recreation area? (TR section 4.10.1.1) **Recreational impacts are evaluated in Chapter 21 of the Draft EIR/EIS (Posted at http://sitesproject.org/information/DraftEIR-EIS). No potentially significant impacts were identified. There are no existing recreational activities in the project footprint. Beneficial effects were noted in some instances where additional storage at nearby recreation areas (e.g., Shasta Lake) will result from the operation of Sites Reservoir, providing more frequent access to boat ramps at these facilities.**
	Q.3 Attach an assessment of the proposed recreation physical benefits. Include the size of the facility, recreation activities allowed, recreation facilities associated with these activities, and their capacities and seasonal closures and conditions in which facilities are not usable or activities cannot occur. (TR section 4.10.1.2). **Sites_A2 Recreation under the PHYSICAL PUBLIC BENEFITS TAB contains a description of the proposed recreation facilities.**
	A.1 Attach recreation visitation estimates including documentation of estimation methodology. **See filename: Sites_A1 Recreation Visitation under the PHYSICAL PUBLIC BENEFITS TAB**
	A.2 Attach or provide links to any relevant recreation studies associated with the proposed project. **See filename: Sites_A2 Recreation under the PHYSICAL PUBLIC BENEFITS TAB**

PROGRAM REQUIREMENTS TAB

Q.1 Describe how the project improves the operation of the state water system. See regulations section 6003(a)(1)(M).

Sites Reservoir would improve operational flexibility and reliability of the state water system, especially within the service areas of both the SWP and CVP, in addition to allowing California resource agencies to purposely allocate water for the benefit of environmental uses. CALSIM modeling results indicate that average long-term end of May storage in Lake Oroville would increase by 26 TAF in 2030 and further increase by an additional 31 TAF in 2070 through exchanges with Sites Reservoir. This demonstrates the resiliency of the improvement in the SWP. Likewise, long-term average storage in CVP reservoirs would also increase. End-of-May storage in Shasta Lake would increase by 59 TAF in 2030 and then increase by an additional 80 TAF in 2070. Storage in existing reservoirs that are cooperatively managed with the Sites Project would increase in all year types. This additional storage would provide the state water system greater flexibility in operating the overall system without negative impacts to water supplies and providing California resource agencies with a water supply dedicated to the environment.

Sites Reservoir would be operated collaboratively with the SWP and CVP. The SWP and CVP would make their annual allocations and deliveries as normal. Exchanges with water stored in Sites Reservoir would help to maintain supplies in the existing reservoirs and produce the public benefits described for the project. Sites Reservoir would provide supplemental water that is much needed when allocations are low.

Sites Reservoir Project would provide augment deliveries for both water supply and public benefits, especially during drought years. Sites Reservoir is beneficially located where it can support the operations of existing reservoirs north of the Delta, provide water to the Yolo Bypass for ecosystem restoration, deliver water to be picked up at the North Bay Aqueduct, and export water to the San Joaquin Valley and Southern California. In addition to preserving water in existing SWP and CVP reservoirs through exchange, Sites Reservoir would facilitate water transfers, one of the initiatives in the California Water Action Plan. Water from Sites could be moved south of the Delta to fill Diamond Valley Reservoir or provided for groundwater recharge to Coachella Valley Water District and Desert Water Agency.

This topic is further discussed in the Executive Summary (Sites_A1 ExecSum under the ELIGIBILITY AND GENERAL PROJECT INFORMATION TAB).

Q.2 Describe how the project provides a net improvement in ecosystem and water quality conditions required by Water Code section 79750.

Sites Reservoir would deliver an average of 125 TAF/yr from 2030 to 2070 for improving ecosystem and water quality conditions. This is an unprecedented amount of water that the State resources agencies will be able to directly manage for environmental benefit. Furthermore, cooperatively managing the operation of Sites Reservoir with State and Federal facilities will preserve higher water levels in the existing reservoirs and thereby protect the coldwater pools, improve temperature conditions downstream for existing reservoirs, and provide flows to support the migration of aquatic species in a variety of life stages.

The potential benefits of the project for fish were modeled using SALMOD. Modeling results predict net improvements in fish populations for Chinook salmon (including endangered winter-run) under 2015, 2030, and 2070 conditions. By providing releases to the Yolo Bypass, Sites Reservoir Project can also benefit Delta smelt, however, there are insufficient studies to characterize the magnitude of this benefit at this time.

Sites Reservoir Project would excel in providing opportunities for in lieu use of surface water, thereby reducing the chronic lowering of groundwater levels, an undesirable result under SGMA. Sites Reservoir will also support the delivery of water for basic human needs to disadvantaged communities.

See Sites_A4 Mitigation under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB and Sites_A5 Documentation under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB for further analysis.

Q.3 If applicable, summarize how the applicant is coordinating with the owners and operators of water system facilities not owned or operated by the applicant or project partners that may be affected by the project. See regulations section 6003(a)(1)(P).

The Authority is coordinating the development of operations with the Department of Water Resources and the U.S. Bureau of Reclamation. This coordination includes the future development of Principles of Agreement governing operations. See Sites_A6 Annual Benefits Table under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB. A list of project partners is provided in Sites_A1 Feasibility under the FEASIBILITY AND IMPLEMENTATION RISK TAB.

PROGRAM REQUIREMENTS TAB	
	Q.4 Describe how the project advances the long-term objectives of restoring the ecological health and improving water management for beneficial uses of the Delta. See regulations section 6003(a)(1)(R). **The operations proposed for Sites Reservoir Project were developed with the intent of contributing to the attainment of the co-equal goals for the Delta of ecological health and improving water management for beneficial use. As a result, the annual yield from the Sites Project is divided between environmental and water supply purposes.** **The Sites Project would provide a unique opportunity to allocate reservoir storage and establish the first firm asset Ecosystem Enhancement Account in California. Based on the operations assumptions included in this application, the allocated storage would deliver approximately 125 TAF/yr (in 2030 through 2070 (with deliveries of up to 200 TAF/yr in critically dry years) that would be managed by the State (CDFW, SWRCB, and DWR) and Federal government to perform restoration actions beyond existing regulatory requirements. Conceptually, this account would use Sites Reservoir project assets to support modified operations that facilitate habitat enhancement actions. A Sites Reservoir Ecosystem Enhancement Governance Board would be created to manage the water account. The water account would be managed to adaptively support operational actions and respond to changing future conditions throughout the Sacramento River watershed and Delta.** **Sites Reservoir would also provide water for beneficial uses throughout the State, including water for agriculture and M&I purposes, and State and Federal wildlife refuges. Project participants include agencies in the Sacramento River Valley, Bay Area, San Joaquin Valley, Southern Desert, and South Coast regions of California.**
	Q.5 Describe how the applicant will ensure that the proposed project will comply with and be consistent with all applicable local, state, and federal laws and regulations, including existing environmental mitigation or compliance obligation requirements. See regulations section 6003(a)(1)(V). **The Authority has initiated pre-applications discussions with several of the critical resource management and regulatory agencies in order to expedite compliance with all required laws and regulations. This early and diligent effort to understand the evolving concerns for regulatory compliance will reduce the overall compliance schedule and help ensure compliance with all applicable local, state, and federal laws in the planning, construction, and operation of Sites Reservoir, including mitigation requirements. The EIR/EIS (attached at http://sitesproject.org/information/DraftEIR-EIS) describes the impacts and mitigation measures that when implemented would reduce or avoid impacts and support compliance with all applicable laws, regulations, and statutes. This includes all applicable regulations regarding water operations on the Sacramento River. Regulations are identified in Sites_A2 Permits under the FEASIBILITY AND IMPLEMENTATION RISK TAB. The Authority's commitment to mitigation is further described under Sites_A4 Mitigation under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB.**
	A.1 What measurable improvements to the Delta ecosystem or tributary to the Delta does the project provide? Where is the location of the improvement? If the project is not within the watershed of the Delta, what specific water rights or water contracts would be created or amended to ensure public benefits to the Delta ecosystem? Provide supporting documentation of the willingness of these water right or water contract holders to enter into such contracts or amendments. Explain how these changes would assure measurable improvements to the Delta ecosystem. See regulations section 6003(a)(1)(L). **See Sites_A1 Measurable Benefits under the PROGRAM REQUIREMENTS TAB.**
	A.2 Provide documentation indicating the proposed project is cost-effective. If there is at least one feasible alternative means of providing the same amount or more of the total public and non-public physical benefits as provided by the proposed project, calculate, display and document the least-cost of these alternative means and justify the proposed project by comparison. **See Sites_A2 Cost Effectiveness under the PROGRAM REQUIREMENTS TAB.**

BEFORE THE BOARD OF DIRECTORS OF THE

SITES PROJECT AUTHORITY

Resolution No. 2017-001

In the Matter of:

Authorizing Filing Application to California Water Commission under Water Storage Investment Program for the Sites Project.

WHEREAS, the Water Storage Investment Program ("WSIP") is provided for at Chapter 8 (commencing at Section 79750) of Division 26.7, of the California Water Code, which is part of the November 2014 voter-approved Proposition 1, the process for which is specified in regulations promulgated by the California Water Commission at California Code of Regulations, Title 23, Division 7, Chapter 1 ("WSIP Regulation"); and

WHEREAS, the Sites Project Authority ("Authority") is a joint powers authority formed by and existing among various irrigation districts and other local water districts and local governments within the Sacramento River hydrologic region pursuant to a Joint Exercise of Powers Agreement as last amended February 13, 2017, and through a Reservoir Committee established by the Authority has partners that are not located within said hydrologic region, participating with development of the Sites Project, all as authorized by Water Code Section 79759 of the WSIP authorizing act; and

WHEREAS, the Sites Project, very generally and as described in detail in the application authorize to be filed by this Resolution and its attachments, is a proposed off-stream reservoir to store unregulated water within the Sacramento River watershed when this outflow is not meeting critical environmental, water quality and water supply needs, and to subsequently release such store water from the reservoir for beneficial uses for consumptive and in-stream flow purposes; and

WHEREAS, the Sites Project is among the surface storage projects identified in the CALFED Bay-Delta Program Record of Decision, date August 28, 2000, and is therefore eligible for funding under Water Code Section 79751(a); and

WHEREAS, this Board is familiar with and concurs in the draft of the application authorized to be filed by this Resolution;

NOW, THEREFORE, BE IT RESOLVED by this Board of Directors as follows:

1. The foregoing recitals are true and correct;
2. The General Manager is authorized and directed to timely file an application for the Sites Project with the California Water Commission pursuant to WSIP and its implementing regulations referenced above; and

3. The Authority's officers and General Manager are authorized to do all things necessary and proper to carry out and implement filing the above referenced application with the California Water Commission.

PASSED, APPROVED AND ADOPTED by the Board of Directors of the Sites Project Authority this 31st day of July, 2017, by the following vote:

Ayes:	Colusa County, Reclamation District 108, Westside Water District, Glenn-Colusa Irrigation District, Tehama-Colusa Canal Authority, Maxwell Irrigation District, Colusa County Water District, Orland Artois Water District, Placer County Water Agency/City of Roseville, Proberta Water District/TC 6 Districts and Western Canal Water District.
Nays:	None.
Absent:	Glenn County.
Abstain:	None.

Kim Dolbow Vann, Chair
Sites Project Authority Board

ATTEST: Ann Nordyke
Clerk to the Board of Directors

Ann Nordyke

Ann Nordyke, Clerk

APPROVED AS TO FORM:

Ernest A. Conant, Counsel

Secretary's Certificate

I, Jamie Traynham, Secretary of the Sites Project Authority Board, do hereby certify that the resolution set forth above, is a true and accurate copy of a resolution adopted by the board of directors of the Sites Project Authority at a duly called meeting of the board on July 31, 2017. I further certify that said resolution has not been rescinded, amended, or modified and is in full force and effect as of the date hereof.

In witness whereof, I have executed this certificate this 2nd day of August 2017.

Jamie Traynham

Jamie Traynham, Secretary
Sites Project Authority

General Information

General Info: Ecosystem Priorities and Relative Environmental Value Criteria	
Ecosystem Priorities	
P 1	Provide cold water at times and locations to increase the survival of salmonid eggs and fry.
P 2	Provide flows to improve habitat conditions for in-river rearing and downstream migration of juvenile salmonids.
P 3	Maintain flows and appropriate ramping rates at times and locations that will minimize dewatering of salmonid redds and prevent stranding of juvenile salmonids in side channel habitat
P 4	Improve ecosystem water quality
P 5	Provide flows that increase dissolved oxygen and lower water temperatures to support anadromous fish passage
P 6	Increase attraction flows during upstream migration to reduce straying of anadromous species into non-natal tributaries
P 7	Increase Delta outflow to provide low salinity habitat for Delta smelt, longfin smelt, and other estuarine fishes in the Delta, Suisun Bay, and Suisun Marsh
P 8	Maintain or restore groundwater and surface water interconnection to support instream benefits and groundwater dependent ecosystems.
P 9	Enhance flow regimes or groundwater conditions to improve the quantity and quality of riparian and floodplain habitats for aquatic and terrestrial species.
P 10	Enhance the frequency, magnitude, and duration of floodplain inundation to enhance primary and secondary productivity and the growth and survival of fish
P 11	Enhance the temporal and spatial distribution and diversity of habitats to support all life stages of fish and wildlife species
P 12	Enhance access to fish spawning, rearing, and holding habitat by eliminating barriers to migration
P 13	Remediate unscreened or poorly screened diversions to reduce entrainment of fish
P 14	Provide water to enhance seasonal wetlands, permanent wetlands, and riparian habitat for aquatic and terrestrial species on State and Federal wildlife refuges and on other public and private lands
P 15	Develop and implement invasive species management plans utilizing techniques that are supported by best available science to enhance habitat and increase the survival of native species
P 16	Enhance habitat for native species that have commercial, recreational, scientific, or educational uses
Relative Environmental Value Criteria (REVs)	
REV 1	Number of different ecosystem priorities, for which corresponding public benefits are, provided by the project.
REV 2	Magnitude of ecosystem improvements.
REV 3	Spatial and temporal scale of ecosystem improvements.
REV 4	Inclusion of an adaptive management and monitoring program that includes measurable objectives, performance measures, thresholds, and triggers for managing ecosystem benefits.
REV 5	Immediacy of ecosystem improvement actions and realization of benefits
REV 6	Duration of ecosystem improvements.
REV 7	Consistency with species recovery plans and strategies, initiatives, and conservation plans
REV 8	Location of ecosystem improvements and connectivity to areas already being protected or managed for conservation values
REV 9	Efficient use of water to achieve multiple ecosystem benefits
REV 10	Resilience of ecosystem improvements to the effects of changing environmental conditions, including hydrologic variability and climate change.
Project Information	
Project Name	
Sites Reservoir Project	

General Info: Ecosystem Priorities and Relative Environmental Value Criteria
Project Description (Summary)
The Sites Reservoir Project is composed of a new off-stream reservoir, new diversion, pumping and conveyance facilities and modification to existing facilities and operations to increase the flexibility and reliability of the California water management system. Sites Reservoir, located approximately 10 miles west of the town of Maxwell, would be filled by diversion of water from the Sacramento River from the existing diversions facilities in Red Bluff and Hamilton City, and the new diversion near Delevan when Sacramento River flows that originate from unregulated tributaries to the Sacramento River downstream from Keswick Dam meet specific regulatory and water rights criteria. The operation of Sites Reservoir Project would allow for the development and administration of an ecosystem enhancement storage account (EESA) that could be managed by the State to provide water for ecosystem and water quality purposes of its choosing. As described elsewhere in this application, such an account could provide a pool of dedicated storage to manage in cooperation with existing operations to improve coldwater conservation storage, stabilize river flows during critical fisheries periods, increase flows through certain watercourses and/or facilities (such as, Yolo Bypass), increase availability of wetlands in wildlife refuges, and/or enhance habitat conditions or other ecosystem enhancement actions. Sites Reservoir Project is most beneficial when it is operated in cooperation with CVP and SWP operations to coordinate releases from Shasta Lake, Lake Oroville, and Folsom Lake. Releases from Sites Reservoir would allow the preservation of storage in these other reservoirs while still meeting requirements for minimum instream flow objectives, Sacramento River temperature requirements, and Delta salinity control assigned to the CVP and SWP. Through the use of water stored in Sites Reservoir in substitution for releases from these other reservoirs, storage could be conserved in Shasta Lake, Lake Oroville, and Folsom Lake to significantly increase operational flexibility to improve river water temperatures for fish survival, and Delta ecosystem food-web enhancement. The Sites Reservoir would also provide independent flood control and recreation benefits.
Identify the current conditions date (i.e., year) that will be used within the application.
2015 using CALSIM model furnished by the CWC
Ecosystem improvement application instructions:
To complete the ecosystem improvement section of the Water Storage Investment Program application review the 16 ecosystem priorities listed above, determine which priorities will be addressed by your project's ecosystem improvements, and answer all questions for each priority you will address. In addition to answering the priority-specific questions, answer the general questions listed on this worksheet which apply to all priorities addressed by your project. The final relative environmental value of each project will be based on a technical review of each ecosystem priority using relative environmental criteria (REV) 2-10 and the total number of priorities claimed by a project (REV 1).
For the purpose of this application the Current Conditions date will be based on the existing conditions of an applicant's CEQA document. If specific data requested in this application is not available in the CEQA document, the applicant will use the demarcation date of the existing conditions in the CEQA document. An applicant must use the demarcation date of the existing conditions from their CEQA document consistently within the application when identifying current conditions.
REV 1: Number of ecosystem priorities targeted by the project
Briefly explain which ecosystem priorities will be met by this project.
Ecosystem priorities 1, 2, 3, 4, 5, 10, 11, 14, 15, and 16
REV 4: Inclusion of an adaptive management and monitoring program that includes measurable objectives, performance measures, thresholds, and triggers to achieve ecosystem benefits.
Describe the process through which an adaptive management and monitoring program will be developed for approval by the responsible agency.
The adaptive management program would be developed by the Sites Project Authority in partnership with the National Marine Fisheries Service (NMFS), U.S. Fish and Wildlife Service (USFWS), California Department of Fish and Game (CDFW) as well as concerned and knowledgeable non-governmental organizations. Specific adaptive management investigations will be developed to build on the best available science on the range of issues listed above. Adaptive management would be implemented within a framework that is transparent, collaborative, and responsive to changes in scientific understanding. The Sites Project monitoring plan will be developed in coordination with other similar efforts in the Sacramento River watershed, including studies by the Interagency Ecological Program and ongoing studies by USFW, NMFS and CDFW in the Sacramento River Watershed. Design and implementation of Sites Project monitoring will also be coordinated with ongoing and proposed survey and monitoring efforts along the Sacramento River and within the Delta to share and build on available data.

General Info: Ecosystem Priorities and Relative Environmental Value Criteria
Describe the framework you will use to develop measurable objectives, performance measures, thresholds, and triggers for your adaptive management and monitoring program.
Monitoring efforts would be guided by the specific Sites Project objectives and desired outcomes for ecosystem priorities. The Project's objectives are to meet its primary goal to improve environmental conditions in the Sacramento River and Delta system and improve water supply reliability in the State water supply system. What is measured (indicator), how well it is measured, and how often it is measured are design features that would be defined by the members of the development team who are a part of the Water Operations Committee (refer to Operations Plan). Examples of measurable objectives and performance measures for selected ecosystem priorities are provided under Sites_A2 Operations under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB. Performance measures would be elements of a monitoring framework which would provide data to assess progress towards achieving Sites project objectives and ecosystem priorities, and which would inform adaptive management decision-making for operations. The proposed operations prioritize certain ecosystem priorities listed for the Water Storage Investment Program. Key scientific information for further monitoring and adaptive management activities related to those prioritized operations is: • Quantification of the improvement in temperature for salmonids above that which would have been available absent Sites. • Benefits provided by river flow stabilization using Sites Reservoir Project water • The amount of productivity increase in the Cache Slough area and increases in Delta smelt abundance in this area and Lower Sacramento River • The amount of additional water provided to Level 4 refuges.
How will operational decisions be made if physical parameters and biological responses fall outside the range of anticipated benefits?
The Authority Board of Directors holds the final decision-making authority for all actions pertaining to the Sites Reservoir Project. The Authority Board has, and expects to continue to delegated certain responsibilities to standing committees that do (or will) report to the Board. This Adaptive Management Plan, and its annual updates, will be approved by the Board following public comment. Recognizing the many sources of uncertainty in predicting future environmental conditions, particularly in light of climate change and sea level rise, and knowledge gaps regarding factors controlling fish population dynamics and abundance, an adaptive management approach will be required to make informed decisions about operation management for the Sites Project. The adaptive management concept will be implemented to reduce operational uncertainty, enhance scientific knowledge, comply with the permit requirements of the Sites Project, and improve project performance in a constantly changing natural system. As with other adaptive management plans associated with major water management facilities in California, adaptive management will provide recommended operations intended to test operational hypotheses and provide input to the periodic operational reviews of the Sites Project, and will be developed with the best available science in collaboration with CDFW, NMFS, USFWS, and others. It is expected that all agencies and organizations participating in the Sites Reservoir Project will adopt an adaptive management approach to reduce operational uncertainty associated with the operation of the Sites Project. At this time the participating agencies include the Authority, Reclamation, and the California Resources Agency (as the coordinating agency for the State with regard to WSIP participation). As the Site Project proceeds through WSIP, water right acquisition, and permitting processes, it is anticipated that other agencies (including DWR, CDFW, NMFS and USFWS) will be active participants in the adaptive management process. Together, this adaptive management organization will identify investments in related research, monitoring and other endeavors to support the Sites Project. Additional groups may be added to the adaptive management organization to support the decision-making process.
What funding sources and financial commitments do you intend to utilize for the formation and implementation of an adaptive management and monitoring program over the duration of the claimed benefits?
Funding sources include revenue generated from water delivery contracts to all who contract and receive water from the Sites Project. The formation and implementation of an adaptive management and monitoring program is one of several administrative requirements of the Sites Reservoir Project. The Sites Project is founded on a beneficiary pays basis. Funding sources to support the ESSA deliveries could include funds generated from recaptured water used for environmental benefits when those environmental services are complete. A portion of water released from Shasta to provide Proposition-1 eligible benefits could be recaptured (when Delta outflow is greater than 5,000 cfs and all other operational conditions are met), stored in Sites (or directly delivered downstream to a water user) and later released for non-Proposition-1 eligible benefits (i.e.; water supply) to raise funds to cover O,M&R costs. Other potential funding sources for ESSA deliveries include revenue from hydropower generation associated with releases of water for Proposition-1 eligible environmental purposes (such

General Info: Ecosystem Priorities and Relative Environmental Value Criteria
as releases to the Yolo Bypass).
Explain what environmental uncertainties are relevant to your claimed benefit(s) and will be included in your adaptive management and monitoring program (i.e. climate change, sea level rise, earthquakes, variation in snow pack, forest fires, landslides/erosion etc.).
Uncertainties are described in detail under the Sites_A12 Uncertainty under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB. The WSIP model for project performance included specific climate change and sea level rise assumptions. These assumptions are detailed in Sites_A1 Modeling under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB. Earthquake, forest fire, landslides/erosion are not expected to have significant effects on the project benefits. The benefits described for the Sites Project are generally not subject to other environmental uncertainties (earthquakes, variation in snow pack, forest fires, landslides/erosion, land subsidence).
REV 9: Efficient use of water to achieve multiple ecosystem benefits
Will the same unit of water benefit multiple priorities? If so, explain which priorities will benefit, and the anticipated differences in project water availability between priorities.
Water stored in Shasta Lake or Lake Oroville for coldwater purposes is released over time for flow augmentation to benefit redds and juvenile salmonids. This water addresses multiple ecosystem priorities to provide an interrelated benefit to anadromous fish. Some of the water released from Shasta Lake for environmental benefits can be recaptured downstream and used again to provide further environmental benefits. It is intended that this water (after it has been used to provide at least one Proposition-1 eligible benefit) be recaptured and used to provide funding for the O&M share for public benefits.
How will hydrologic connections among priorities be measured and guaranteed?
The Sites Project operations will be based on operations agreements with Reclamation and DWR for the use and coordinated operations of facilities and on detailed written agreements with project participants for Proposition 1-eligible public benefits and non- Proposition 1-eligible benefits (generally water supply augmentation contracts). These agreements will define the amount of Sites Reservoir storage allocated to the organization seeking the specific benefits, the associated deliveries, and the cost associated with those deliveries. Water delivery contracts will also define the delivery request process, facilities repayment and OM&R charges (pro-rated by acre-foot of delivery). Since the WSIP contributions would cover facilities construction cost, costs associated with Proposition-1 eligible public benefit water delivery contracts would not include facilities repayment costs. Hydrologic connection to the Sacramento River will be maintained by the Tehama Colusa Canal, Glenn-Colusa Canal and the new Delevan pipeline and other new Project facilities (e.g.; turnout to the Colusa Basin Drain). The connection to each of the existing facilities would be part of the operation agreement described above (see Sites_A2 Operations under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB).

Ecosystem Priority 1

Priority 1: Provide cold water at times and locations to increase the survival of salmonid eggs and fry.
Species Information
What salmonid species are you targeting?
Winter-run Chinook Salmon (*Oncorhynchus tshawytscha*; Sacramento River evolutionarily significant unit [ESU]); Spring-run Chinook Salmon (*O. tshawytscha*; Central Valley ESU); Fall-run and late Fall-run Chinook Salmon (*O. tshawytscha*; Central Valley ESU); Steelhead (*O. mykiss*; Central Valley distinct population segment [DPS]); and resident native Rainbow Trout (*O. mykiss*).
Additional locations in the application, supporting documentation or attachments (document name, page number, table number, other) where the temperature needs of each species are described.
Draft EIR/EIS (https://www.sitesproject.org/information/DraftEIR-EIS) Appendix 12A: Aquatic Species Life Histories: • *Sacramento River Winter-run Chinook salmon*: page numbers: 12A-2 to 12A-9 Status, adult migration and holding, spawning and egg incubation, juvenile rearing and migration, and Delta and estuarine rearing; Table 12A-1 Life stage occurrence in the Sacramento River and Table 12A-2 Migration and timing at monitoring stations on the Sacramento River; Figure 12A-1 Current and historical distribution, and critical habitat designation. • *Central Valley Spring-run Chinook salmon*: page numbers: 12A-9 to 12A-14 Status, adult migration and holding, spawning and egg incubation, juvenile rearing and migration, and Delta and estuarine rearing; Table 12A-1 Life stage occurrence in the Sacramento River and Table 12A-2 Migration and timing at monitoring stations on the Sacramento River; Figure 12A-2 Current and historical distribution, and critical habitat designation. • *Central Valley fall-run and Late fall-run Chinook salmon*: page numbers: 12A-15 to 12A-18 Status, adult migration and holding, spawning and egg incubation, juvenile rearing and migration, and Delta and estuarine rearing; Table 12A-1 Life stage occurrence in the Sacramento River and Table 12A-2 Migration and timing at monitoring stations on the Sacramento River; Figure 12A-3 Current and historical distribution. • *Central Valley steelhead*: page numbers: 12A-19 to 12A-24 Status, adult migration and holding, spawning and egg incubation, juvenile rearing and migration, and Delta and estuarine rearing; Table 12A-1 Life stage occurrence in the Sacramento River; Figure 12A-4 Current and historical distribution, and critical habitat designation. The Draft EIR/EIS has a different without Project condition and operation than was used for Water Storage Investment Program (WSIP); however, there is discussion in the Draft EIR/EIS Appendix 12C: Fisheries Impacts Summary concerning thermal and flow-related benefits to fish: Sacramento River Winter-run Chinook salmon, pages 12C-116 to 12C-117; Spring-run Chinook salmon, pages 12C-117 to 12C-118; Fall-run Chinook salmon, pages 12C-118 to 12C-119; Late fall-run Chinook salmon, pages 12C-119 to 12C-120; and Steelhead, pages 12C-120 to 12C-121.
REV 2: Magnitude of ecosystem improvements
What is the expected magnitude of the ecosystem improvement that will address this priority? Magnitude should be expressed as: a) the change from current conditions without the project to current conditions with the project, and b) the change from 2030 conditions without the project to 2030 conditions with the project. How did you estimate this value? If the ecosystem improvement will benefit multiple salmonid species or runs, provide the magnitude of the ecosystem improvement for each species or run separately.
Temperature improvements are the result of the conservation of water (primarily in Shasta Lake) facilitated by cooperative operations with Sites Reservoir. Under current conditions, end-of-September carryover storage in Shasta is increased by 4.7% on average and up to 16.3% in Critical water years. Temperature improvements were estimated using Upper Sacramento River HEC5 model, the American River CE QUAL-W2 Model and SALMOD results (see Sites_A6D Modeling Results Compendium under the ELIGIBILITY AND GENERAL PROJECT INFORMATION TAB). The Project would increase coldwater pool conservation in Shasta Lake, Lake Oroville, and Folsom Lake and improve temperatures in the Sacramento and American Rivers during certain months at specific compliance points, particularly in Below Normal, Dry, and Critical water years. The areas of temperature improvement for these waterways are shown on Figures A2-1 and A2-2 in Sites_A2 Ecosystem Documentation under the PHYSICAL PUBLIC BENEFITS TAB. Approximately 59 river miles of the Sacramento River would be improved with the implementation of the Sites Reservoir Project downstream from Keswick Dam (River Mile [RM] 302.0) to the Red Bluff Pumping Plant (RM 243.0; Figure 1). Sites Project operations emphasize providing Sacramento River cold water releases during the months of July through September

Priority 1: Provide cold water at times and locations to increase the survival of salmonid eggs and fry.
when it's most difficult to achieve temperatures targets. Temperature modeling results for current and 2030 conditions are provided Table A2-1 in Sites_A2 Ecosystem Documentation under the PHYSICAL PUBLIC BENEFITS TAB. The temperature reduction with the Project at Bend Bridge is 0.6°F in July through September for Critical water years in 2030, but improves to 1.4°F in 2070. The reason these results fluctuate is primarily due to an increase in Shasta storage assumed in the 2070 WSIP model than to the effects of climate change (there is no indication that Reclamation will actually operate Shasta differently in 2070). This suggests that the temperature reduction benefits are relatively sustainable in this portion of the Sacramento River. Fall-run, late fall-run, and winter-run Chinook salmon would greatly benefit from more suitable water temperatures in the Sacramento River below Keswick Dam and at Bonnyview Bridge, specifically during the egg incubation period in the month of September in critical water years.
Additional locations in the application, supporting documentation or attachments (document name, page number, table number, other) where the magnitude of the ecosystem improvement is described and quantified.
"Sacramento River Flows for Temperature Control," page 4 of the Performance Scorecard in Sites_A6D Modeling Results Compendium under the ELIGIBILITY AND GENERAL PROJECT INFORMATION TAB
REV 3: Spatial and temporal scale of ecosystem improvements.
What is the geographical extent (e.g., river miles, acres) of the ecosystem improvement that will address this priority?
The spawning distribution of winter-run Chinook Salmon in the mainstem Sacramento River defines the spatial distribution of incubating eggs, alevins, and swim-up fry. Historical spawning data indicate that winter-run spawning occurred from Keswick Dam (RM 302.0) downstream to the site of Red Bluff Diversion Dam (RM 243.0), a distance of 59 river miles. More recent data, however, indicate that the spawning distribution has substantially changed. Aerial redd survey data on winter-run Chinook Salmon in-river spawning from 2003 to 2015 indicate that virtually all spawning occurs from Keswick Dam downstream to Clear Creek (RM 289.3), a short distance of only 12.7 miles (U.S. Bureau of Reclamation 2016, page 7). Over the 12-year monitoring period, 88.7 percent of redds were observed upstream of the State Route 44 Bridge (RM 296.5), only 5.5 miles downstream of Keswick Dam, and 11.3 percent were observed between the State Route 44 Bridge and Clear Creek. No redds were observed downstream of Clear Creek. These data indicate that approximately 12.7 miles (rounded to 13 miles) of the Sacramento River downstream of Keswick Dam are used by winter-run Chinook Salmon for spawning and most spawning is concentrated in the uppermost approximately 5.5 miles (rounded to 6 miles) of the river downstream of Keswick Dam. Therefore, cold water is required for successful egg incubation and alevin rearing in approximately 13 miles of the Sacramento River downstream of Keswick Dam. Water temperatures with and without the Project were modeled and analyzed for this 13-mile river reach. Egg incubation typically occurs between late April and mid-October and alevin rearing in spawning redds occurs between mid-June through November for winter-run Chinook Salmon (Draft EIR/EIS, Appendix 12A, Table 12A-1, page 12A-3; National Marine Fisheries Service 2014, page 15). Incubation of pre-emergent fry (alevins) occurs from mid-June through November. The upper limit of the optimal range for water temperature during egg incubation is 56°F and for pre-emergent fry is 58°F. At higher water temperatures, mortality of eggs and alevins begins to increase (Draft EIR/EIS, Appendix 12D, Table 12D-2, page 12D-5; Vogel 2015, Table 3, page 10). Mean monthly modeled water temperatures in 2030 with and without the Project, using data from an 82-year simulation period, were examined within the mainstem Sacramento River from April through October for different water year types for various locations within the 26-mile reach downstream of Keswick Dam to the Balls Ferry (RM 276), given the optimum water temperature of 56°F for eggs and 58°F for alevins (CH2MHill River Temperature and Modeling Summary Tables and Bar Charts 2030). Note that the water temperature model used was the Upper Sacramento River HEC5 model. The estimated percent reduction in mortality due to thermal benefits of the Project to salmonid eggs and fry are reported and discussed in Sites_A2 Ecosystem Documentation.
Additional locations in the application, supporting documentation or attachments (document name, page number, figure name or number, other) where the geographical extent of the ecosystem improvement is documented or mapped.
"Sacramento River Flows for Temperature Control," page 4 of the Performance Scorecard in Sites_A6D Modeling Results Compendium under the ELIGIBILITY AND GENERAL PROJECT INFORMATION TAB; Ecosystem Priority 1 in Sites_A2 Ecosystem Documentation under the PHYSICAL PUBLIC BENEFITS TAB
When during the year will the project provide cold water for salmonid eggs and fry? How is the amount of cold water provided

Priority 1: Provide cold water at times and locations to increase the survival of salmonid eggs and fry.
to salmonid eggs and fry likely to vary with hydrologic conditions (i.e., among water year types) a) under current conditions with and without the project, and b) in 2030 with and without the project? If the ecosystem improvement will benefit multiple salmonid species or runs, provide the timing of ecosystem improvements for each species or run separately.
For the mainstem Sacramento River from Keswick Dam to Balls Ferry, the Project in 2030 will reduce the percentage of winter-run Chinook salmon egg and fry mortality in September and October of critically dry water years from 7 to 25 percent. The greatest temperature improvements to increase survival of salmonid eggs and fry will occur in dry and critical years, specifically. Temperature conditions are relatively unchanged in wet and above normal precipitation years.
Additional locations in the application, supporting documentation or attachments (document name, page number, table number, other) where the timing of ecosystem improvements that address this priority are described and quantified.

REV 4: Inclusion of an adaptive management and monitoring program that includes measurable objectives, performance measures, thresholds, and triggers to achieve ecosystem benefits.
Provide additional information on how this ecosystem improvement will be incorporated into the adaptive management and monitoring program. If available, provide examples of objectives, performance measures, thresholds, or triggers that could be used to manage benefits associated with this priority.
After completion of Sites Reservoir, winter-run, spring-run, fall-run, and late fall-run Chinook salmon and steelhead are expected to begin rebuilding with the assumption that the environment stays constant. Measurable objectives include temperatures in the upper reaches of the Sacramento River. Temperature data could be

Priority 1: Provide cold water at times and locations to increase the survival of salmonid eggs and fry.
provided through monitoring programs (*e.g.,* Mainstem Sacramento River Mark-recapture Program, Upper Sacramento River Tributary Escapement Monitoring, Sacramento River Tributary Mark-Recapture Monitoring, Hatchery Broodstock and Angler Harvest Sampling) currently proposed by the California Department of Fish and Wildlife in the Sacramento River as well as existing Delta monitoring programs (*e.g.,* Interagency Ecological Program, Delta Juvenile Fish Monitoring Program, Anadromous Fish Restoration Program). The Sites Project adaptive management program will leverage existing data and collaborate with established monitoring programs, where possible, to secure monitoring results to inform operational decisions. Performance measures will include the development of carryover storage targets, flow release schedules, and real-time adjustment of temperature control points.
REV 5: Immediacy of ecosystem improvement actions and realization of benefits
Immediacy of ecosystem improvement: Number of months from grant encumbrance until the proposed ecosystem improvement is completed (i.e., the expected timeframe until the improvement is implemented or construction is completed).
Initial benefits are expected in year 2028 (6 years after investment encumbrance for construction) at a lower level than when the Project is complete. Full benefits are expected in 2030 (8 years after investment encumbrance).
Additional locations in the application, supporting documentation or attachments (document name, page number, table number, other) where the immediacy timeframe is described and quantified.
Sites_A3 Schedule under the FEASIBILITY AND IMPLEMENTATION RISK TAB.
Realization of ecosystem improvement: Number of months from the time the ecosystem improvement is completed (i.e. project is implemented or construction is complete), until the benefit associated with this priority can be observed (i.e. when measurable improvements can be observed and quantified)
Providing cooler water temperatures for steelhead spawning and improvements in all four runs of Chinook salmon in the Sacramento River could potentially be quantified approximately three to four years later (2033 to 2034) when 2030 cohort return to spawn. Improvement should be readily apparent by 2036 to 2038.
Additional locations in the application, supporting documentation or attachments (document name, page number, table number, other) where the realization timeframe is described and quantified.
NA
REV 6: Duration of ecosystem improvements
How long (number of years) after realization (as calculated under REV 5 above) is the ecosystem improvement expected to address this priority? Maximum is 100 years. Explain how this value was determined and whether the magnitude of the ecosystem improvement is anticipated to change over time.
Anticipated duration is 100 years. The magnitude is expected to change over time. The flows that will result in cooler water temperatures were determined using CALSIM modeling and HEC5 temperature model results provided for years 2030 and 2070.
Additional locations in the application, supporting documentation or attachments (document name, page number, table number, other) where the duration of the ecosystem improvement is described and quantified.
Sites_A5 Documentation under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB
REV 7: Consistency with species recovery plans and strategies, initiatives, and conservation plans
Does the ecosystem improvement meet any goals or objectives established in existing species recovery plans, initiatives, or conservation plans including but not limited to the National Oceanic and Atmospheric Administration (NOAA) Fisheries Recovery Plan for Sacramento River winter-run Chinook salmon, Central Valley spring-run Chinook salmon, and Central Valley steelhead; State Wildlife Action Plan; Central Valley Joint Venture Implementation Plan, San Joaquin County Multi-Species Habitat Conservation Plan and Open Space Plan, Draft Solano Multi-Species Habitat Conservation Plan, East Contra Costa County Habitat Conservation Plan/Natural Community Conservation Plan, Draft Recovery Plan for the Giant Garter Snake, and California Water Action Plan? If so which goals, objectives, or actions will be met? Why?
The Project will address the following recovery plan action directly: Action SAR 1.4 Develop and implement a river flow management plan for the Sacramento River downstream of Shasta and Keswick dams that considers the effects of climate change and balances beneficial uses with the flow and water temperature needs of winter-run Chinook salmon, spring-run

Priority 1: Provide cold water at times and locations to increase the survival of salmonid eggs and fry.
Chinook salmon, and steelhead. The ecosystem improvement is also consistent with three of the proposed actions listed in the Sacramento Valley Salmon Resiliency Strategy. These actions are: (1) increase productivity by improving spawning and incubation conditions (habitat and water quality); (2) increase productivity by increasing juvenile salmonid survival; and (3) support the full range of juvenile and adult migration conditions to maintain life history diversity. The Project will meet these actions by providing a more suitable temperature regime as well as increased flows and management of intake diversions to benefit salmonids in the Sacramento River below Keswick Dam. The Project will also enhance and improve the quality of Essential Fish Habitat (EFH) for Pacific Coast Salmon (all four runs of Chinook included; however steelhead is not part of EFH).
Additional locations in the application, supporting documentation or attachments (page number, table number, other) where the consistency with goals, objectives, or actions from recovery plans, initiative, or conservation plans are discussed.
Ecosystem Priority 1 in Sites_A2 Ecosystem Documentation under the PHYSICAL PUBLIC BENEFITS TAB
REV 8: Location of ecosystem improvements and connectivity to areas already being protected or managed for conservation values
Provide a map that shows the extent of the ecosystem improvement that will be address by this priority (e.g., river miles that meet the temperature benefits). Provide additional instructions or clarification to reviewers who will be viewing this map (i.e., describe the color and/or label that identifies the spatial extent of the ecosystem improvement). If available, also submit supporting electronic files such as a .kmz file or ArcGIS layer associated with the maps provided.
Figures A2-1 and A2-2 in Sites_A2 Ecosystem Documentation under the PHYSICAL PUBLIC BENEFITS TAB show the area of temperature improvement for the Sacramento River and the American River, respectively.
Explain why this location was selected. How is the location beneficial to the targeted species in the context of local environmental conditions and the target species' needs?
Locations are downstream from dams that have known salmonid populations downstream (Shasta, Oroville, and Folsom). Water from Sites Reservoir can be exchanged to develop more cold water storage behind these reservoirs. Downstream from each of these dams are salmonid species natal habitat.
Is the ecosystem improvement location adjacent to, or near, other areas already being protected or managed for conservation values? Explain the proximity of the ecosystem improvement to other areas already being protected or managed for conservation values and any hydrologic connectivity that may occur between these locations.
The Project-related ecosystem improvements are adjacent or hydrologically-connected to Turtle Bay Exploration Park East – Bechelli and Anderson River Park.
Additional locations in the application, supporting documentation or attachments (document name, page number, figure name or number, other) that describe and quantify the spatial extent of the ecosystem improvement, the proximity of the ecosystem improvement to other areas already being protected or managed for conservation value, and the degree to which hydrologic connections (if any) occur between the ecosystem improvement and areas already being protected or managed for conservation value.
NA
REV 9: Efficient use of water to achieve multiple ecosystem benefits
How will water provided to address this priority be managed? Explain design efficiencies and operational strategies intended to maximize the efficiency of water allocated to ecosystem improvements that address this priority.
Water released for this priority will be subsequently contributed to Delta outflow requirements or will be recaptured using the Delevan Intake Pumping Plant and re-stored in Sites Ecosystem Enhancement Storage Account (EESA) storage. The re-stored water could also be marketed to provide funds for operation and maintenance associated with the public benefits.
Additional locations in the application, supporting documentation or attachments (document name, page number, figure name or number, other) that describe the design efficiencies and operational strategies used to maximize water efficiency under this priority.
NA

Priority 1: Provide cold water at times and locations to increase the survival of salmonid eggs and fry.
REV 10: Resilience of ecosystem improvements to the effects of changing environmental conditions, including hydrologic variability and climate change.
Which environmental uncertainties associated with this priority were considered in the project siting, design, and operation? How were these uncertainties incorporated into project siting, design, or operation? Examples of environmental uncertainties include, but are not limited to: sea level rise, temperature changes, changes in precipitation, landslides, erosion, earthquakes, wildfires, drought events, and flooding events.
The primary uncertainty is climate change. Results for years 2030 and 2070 were developed using the California Water Commission climate assumptions.
Additional locations in the application, supporting documentation or attachments (document name, page number, figure name or number, other) that describe and quantify the environmental uncertainties considered in the project siting, design, and operation.
Draft EIR/EIS – posted at (https://www.sitesproject.org/information/DraftEIR-EIS) Null, S. E., and J. H. Viers. 2013. In bad waters: Water year classification in nonstationary climates, Water Resources Research, 49, doi:10.1002/wrcr.20097.

Ecosystem Priority 2

Priority 2: Provide flows to improve habitat conditions for in-river rearing and downstream migration of juvenile salmonids.
Species Information
What salmonid species are you targeting?
Winter-run Chinook salmon (*Oncorhynchus tshawytscha*; Sacramento River evolutionarily significant unit [ESU]); Spring-run Chinook salmon (*O. tshawytscha*; Central Valley ESU); Fall-run and Late fall-run Chinook salmon (*O. tshawytscha*; Central Valley ESU); steelhead (*O. mykiss*; Central Valley distinct population segment); and resident native rainbow trout (*O. mykiss*).
Additional locations in the application, supporting documentation or attachments (document name, page number, table number, other) where the flow related habitat needs of each species are described.
Draft EIR/EIS – posted at (https://www.sitesproject.org/information/DraftEIR-EIS) Appendix 12A: Aquatic Species Life Histories: • *Sacramento River Winter-run Chinook salmon*: page numbers: 12A-2 to 12A-9 Status, adult migration and holding, spawning and egg incubation, juvenile rearing and migration, and Delta and estuarine rearing; Table 12A-1 Life stage occurrence in the Sacramento River and Table 12A-2 Migration and timing at monitoring stations on the Sacramento River; Figure 12A-1 Current and historical distribution, and critical habitat designation. • *Central Valley Spring-run Chinook salmon*: page numbers: 12A-9 to 12A-14 Status, adult migration and holding, spawning and egg incubation, juvenile rearing and migration, and Delta and estuarine rearing; Table 12A-1 Life stage occurrence in the Sacramento River and Table 12A-2 Migration and timing at monitoring stations on the Sacramento River; Figure 12A-2 Current and historical distribution, and critical habitat designation. • *Central Valley Fall-run and Late fall-run Chinook salmon*: page numbers: 12A-15 to 12A-18 Status, adult migration and holding, spawning and egg incubation, juvenile rearing and migration, and Delta and estuarine rearing; Table 12A-1 Life stage occurrence in the Sacramento River and Table 12A-2 Migration and timing at monitoring stations on the Sacramento River; Figure 12A-3 Current and historical distribution. • *Central Valley steelhead*: page numbers: 12A-19 to 12A-24 Status, adult migration and holding, spawning and egg incubation, juvenile rearing and migration, and Delta and estuarine rearing; Table 12A-1 Life stage occurrence in the Sacramento River; Figure 12A-4 Current and historical distribution, and critical habitat designation. The Draft EIR/EIS has a different without Project conditions and operation than was used for WSIP; however, there is discussion in the Draft EIR/EIS Appendix 12C: Fisheries Impacts Summary concerning thermal and flow-related benefits to fish: Sacramento River Winter-run Chinook salmon, pages 12C-116 to 12C-117; Spring-run Chinook salmon, pages 12C-117 to 12C-118; Fall-run Chinook salmon, pages 12C-118 to 12C-119; Late fall-run Chinook salmon, pages 12C-119 to 12C-120; and Steelhead, pages 12C-120 to 12C-121.
REV 2: Magnitude of ecosystem improvements
What is the expected magnitude of the ecosystem improvement that will address this priority? Magnitude should be expressed as: a) the change from current conditions without the project to current conditions with the project, and b) the change from 2030 conditions without the project to 2030 conditions with the project. How did you estimate this value? If the ecosystem improvement will benefit multiple salmonid species or runs, provide the magnitude of the ecosystem improvement for each species or run separately.
Water conserved in Shasta Lake would be released to augment flows in the Sacramento River between Keswick Dam and the Red Bluff Pumping Plant. More suitable flow would result in improved conditions for rearing juvenile salmonid species, particularly Fall-run and Late fall-run Chinook salmon. The increase in flows downstream from Keswick Dam (November through February) over the without Project conditions range from an average of 338 cubic feet per second (cfs) under current conditions to 209 cfs in 2030 to 93 cfs in 2070. The greatest benefits occur during dry years (Table A2-4 in Sites_A2 Ecosystem Documentation under the PHYSICAL PUBLIC BENEFITS TAB). This flow augmentation was estimated using the WSIP-provided CALSIM model. SALMOD results show principal benefits to Fall and Late-fall run Chinook salmon (Table A2-5 in Sites_A2 Ecosystem Documentation under the PHYSICAL PUBLIC BENEFITS TAB). Although not included in the SALMOD model runs, juvenile winter-run Chinook salmon also rear in and migrate through the Sacramento River system between July and March (Draft EIR/EIS: Appendix 12A: Aquatic Species Life Histories: Table 12A-1 Life stage occurrence in the Sacramento River) and would therefore benefit from the flow augmentation associated with the Project.
Additional locations in the application, supporting documentation or attachments (document name, page number, table

Priority 2: Provide flows to improve habitat conditions for in-river rearing and downstream migration of juvenile salmonids.
number, other) where the magnitude of the ecosystem improvement is described and quantified.

REV 3: Spatial and temporal scale of ecosystem improvements.
What is the geographical extent (e.g., river miles, acres) of the ecosystem improvement that will address this priority?
Approximately 59 river-miles (RM) of the Sacramento River from Keswick Dam (RM 302.0) down to Red Bluff (RM 243.0) was modeled for current (2015) and 2030 conditions using SALMOD with and without the Project to identify and predict spatial and temporal improvements to habitat that can be quantified for suitability for in-river rearing and downstream migration of salmonids. The benefit to salmonid redds would occur in the uppermost part of mainstem Sacramento River since greater than 90 percent of spawning (specifically winter-run Chinook Salmon) occurs approximately 10.2 river miles between Keswick Dam and Bonnyview Bridge. There could be additional benefits to salmonids that may occur downstream of Red Bluff but this was not modeled; similarly, benefits are also expected in the Feather River downstream from Oroville Dam but this was also not modeled.
Additional locations in the application, supporting documentation or attachments (document name, page number, figure name or number, other) where the geographical extent of the ecosystem improvement is documented or mapped.
Ecosystem Priority 2 in Sites_A2 Ecosystem Documentation under the PHYSICAL PUBLIC BENEFITS TAB; Increased Juvenile Production Compared to Without Project (SALMOD 2030)
When during the year will the project provide flows to improve habitat conditions for in-river rearing and downstream migration of juvenile salmonids? How are flows likely to vary with hydrologic conditions (i.e., among water year types) a) under current conditions with and without the project, and b) in 2030 with and without the project? If the ecosystem improvement will benefit multiple salmonid species or runs, provide the timing of ecosystem improvements for each species or run separately.
Improved flows below Keswick Dam are provided from November through March with the greatest increase in November through February. Improved flows and additional water would improve habitat conditions for in-river rearing of Fall- and Late fall-runs of juvenile Chinook salmon and steelhead. Table A2-4 in Sites_A2 Ecosystem Documentation under the PHYSICAL PUBLIC BENEFITS TAB shows how flows would vary with water year types.
Additional locations in the application, supporting documentation or attachments (document name, page number, table number, other) where the timing of ecosystem improvements that address this priority are described and quantified.
Ecosystem Priority 2 in Sites_A2 Ecosystem Documentation under the PHYSICAL PUBLIC BENEFITS TAB
REV 4: Inclusion of an adaptive management and monitoring program that includes measurable objectives, performance measures, thresholds, and triggers to achieve ecosystem benefits.
Provide additional information on how this ecosystem improvement will be incorporated into the adaptive management and monitoring program. If available, provide examples of objectives, performance measures, thresholds, or triggers that could be used to manage benefits associated with this priority.
Chinook salmon are anadromous species that spend the majority of their adult life in the ocean before returning to their natal streams in 2 to 5 years (typical average of returning adult is 3 years). Monitoring for 12 years is recommended to assess increase in spawning by quantifying increasing trends of the first four consecutive cohorts. Monitoring would begin immediately after completion of Sites Reservoir. Winter-run, Spring-run, Fall-run, and Late fall-run Chinook salmon and steelhead are expected to begin rebuilding with the assumption that the environment stays constant. Measurable objectives include flows delivered and outmigrant numbers. These objectives could be monitored using programs currently proposed by the California Department of Fish and Wildlife (*e.g.,* Mainstem Sacramento River Mark-recapture Program, Upper Sacramento River Tributary Escapement Monitoring, Sacramento River Tributary Mark-Recapture Monitoring, Hatchery Broodstock and Angler Harvest Sampling). Existing Delta monitoring programs (*e.g.,* Interagency Ecological Program, Delta Juvenile Fish Monitoring Program, Anadromous Fish Restoration Program) can also be incorporated in the adaptive management program for the Project. Performance measures include the timing of water releases from Shasta, Oroville, and Folsom to maximize benefits of the Project to salmonid fish species. The Sites Project adaptive management program will leverage existing data and collaborate with established monitoring programs, where possible, to secure monitoring results to

Priority 2: Provide flows to improve habitat conditions for in-river rearing and downstream migration of juvenile salmonids.
inform operational decisions. Performance measures will include the development flow release schedules and real-time adjustment of flow control points.
REV 5: Immediacy of ecosystem improvement actions and realization of benefits
Immediacy of ecosystem improvement: Number of months from grant encumbrance until the proposed ecosystem improvement is completed (i.e., the expected timeframe until the improvement is implemented or construction is completed).
Initial benefits are expected in year 2028 (6 years after grant encumbrance for construction) at a lower level than when the Project is complete. Full benefits are expected in 2030 (8 years after grant encumbrance).
Additional locations in the application, supporting documentation or attachments (document name, page number, table number, other) where the immediacy timeframe is described and quantified.
Sites_A3 Schedule under the FEASIBILITY AND IMPLEMENTATION RISK TAB.
Realization of ecosystem improvement: Number of months from the time the ecosystem improvement is completed (i.e. project is implemented or construction is complete), until the benefit associated with this priority can be observed (i.e. when measurable improvements can be observed and quantified)
Providing cooler water temperatures for steelhead spawning, improvements in Fall- and Late fall-runs of Chinook salmon in the Sacramento River could potentially be quantified approximately three to four years later (2033 to 2034) when 2030 cohort return to spawn. Improvement should be readily apparent by 2036 to 2038.
Additional locations in the application, supporting documentation or attachments (document name, page number, table number, other) where the realization timeframe is described and quantified.
NA
REV 6: Duration of ecosystem improvements
How long (number of years) after realization (as calculated under REV 5 above) is the ecosystem improvement expected to address this priority? Maximum is 100 years. Explain how this value was determined and whether the magnitude of the ecosystem improvement is anticipated to change over time.
Anticipated duration is 100 years. The magnitude of flow augmentation is expected to change over time. The flows were determined using CALSIM modeling. Compared to current conditions, the long-term average flow will increase by 228 thousand acre feet (TAF) by 2030 and by 157 TAF by 2070.
Additional locations in the application, supporting documentation or attachments (document name, page number, table number, other) where the duration of the ecosystem improvement is described and quantified.
Sites_A5 Documentation under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB.
REV 7: Consistency with species recovery plans and strategies, initiatives, and conservation plans
Does the ecosystem improvement meet any goals or objectives established in existing species recovery plans, initiatives, or conservation plans including but not limited to the NOAA Fisheries Recovery Plan for Sacramento River winter-run Chinook salmon, Central Valley spring-run Chinook salmon, and Central Valley steelhead; State Wildlife Action Plan; Central Valley Joint Venture Implementation Plan, San Joaquin County Multi-Species Habitat Conservation Plan and Open Space Plan, Draft Solano Multi-Species Habitat Conservation Plan, East Contra Costa County Habitat Conservation Plan/Natural Community Conservation Plan, Draft Recovery Plan for the Giant Garter Snake, and California Water Action Plan? If so which goals, objectives, or actions will be met? Why?
The Project will address the following recovery plan action directly: Action SAR 1.4 Develop and implement a river flow management plan for the Sacramento River downstream of Shasta and Keswick dams that considers the effects of climate change and balances beneficial uses with the flow and water temperature needs of winter-run Chinook salmon, spring-run Chinook salmon, and steelhead. The ecosystem improvement is also consistent with three of the proposed actions listed in the Sacramento Valley Salmon Resiliency Strategy. These actions are: (1) increase productivity by improving spawning and incubation conditions (habitat and water quality); (2) increase productivity by increasing juvenile salmonid survival; and (3) support the full range of juvenile and adult migration conditions to maintain life history diversity. The Project will meet these actions by providing increased flows

Priority 2: Provide flows to improve habitat conditions for in-river rearing and downstream migration of juvenile salmonids.
and management of intake diversions to benefit salmonids in the Sacramento River below Keswick Dam. The Project will also enhance and improve the quality of Essential Fish Habitat (EFH) for Pacific Coast Salmon (all four runs of Chinook included; however steelhead is not part of EFH).

REV 8: Location of ecosystem improvements and connectivity to areas already being protected or managed for conservation values
Provide a map that shows the extent of the ecosystem improvement that will address this priority (e.g. river miles that meet the temperature benefits). Provide additional instructions or clarification to reviewers who will be viewing this map (i.e. describe the color and/or label that identifies the spatial extent of the ecosystem improvement). If available, also submit supporting electronic files such as a .kmz file or ArcGIS layer associated with the maps provided.
Figures A2-1 and A2-2 in Sites_A2 Ecosystem Documentation under the PHYSICAL PUBLIC BENEFITS TAB show the area of temperature improvement for the Sacramento River and the American River, respectively.
Explain why this location was selected. How is the location beneficial to the targeted species in the context of local environmental conditions and the target species' needs?
Locations are downstream from dams that have known salmonid populations downstream (Shasta, Oroville, and Folsom). Water from Sites Reservoir can be exchanged to develop more storage behind these reservoirs. Downstream from each of these dams are salmonid species natal habitat.
Is the ecosystem improvement location adjacent to, or near, other areas already being protected or managed for conservation values? Explain the proximity of the ecosystem improvement to other areas already being protected or managed for conservation values and any hydrologic connectivity that may occur between these locations.
Rivers below Dams (Keswick, Oroville, Folsom) are managed to maintain habitat for fish populations. Water from the Sites Project can be exchanged with water in the reservoir to enhance the reservoir operators' ability to provide quality habitat. Location of the ecosystem improvement are adjacent to conservation areas or are hydrologically connected to Sacramento River Wildlife Area, Nimbus and American River Hatcheries, American River Parkway, and Colusa-Sacramento River State Recreation Area.
Are the flows provided physically accessible by the targeted species in all year types? If not, explain barriers that may exist between the targeted species and ecosystem improvements.
Flows would be physically accessible in all water year types (greater in above normal, below normal, and dry years). There would be no barriers between the targeted species and ecosystem improvements.
Additional locations in the application, supporting documentation or attachments (document name, page number, figure name or number, other) that describe and quantify the spatial extent of the ecosystem improvement, the proximity of the ecosystem improvement to other areas already being protected or managed for conservation value, and the degree to which hydrologic connections (if any) occur between the ecosystem improvement and areas already being protected or managed for conservation value.
Draft EIR/EIS Appendix 12A; Ecosystem Priority 2 in Sites_A2 Ecosystem Documentation under the PHYSICAL PUBLIC BENEFITS

Priority 2: Provide flows to improve habitat conditions for in-river rearing and downstream migration of juvenile salmonids.
TAB
REV 9: Efficient use of water to achieve multiple ecosystem benefits
How will water provided to address this priority be managed? Explain design efficiencies and operational strategies intended to maximize the efficiency of water allocated to ecosystem improvements that address this priority.
Water released for this purpose will be subsequently released as Delta outflow or be recaptured using the Delevan Intake Pumping Plant and stored in Sites Ecosystem Enhancement Storage Account (EESA) storage. It could also be marketed to cover long-term operations and maintenance costs associated with public benefits.
Additional locations in the application, supporting documentation or attachments (document name, page number, figure name or number, other) that describe the design efficiencies and operational strategies used to maximize water efficiency under this priority.
NA
REV 10: Resilience of ecosystem improvements to the effects of changing environmental conditions, including hydrologic variability and climate change.
Which environmental uncertainties associated with this priority were considered in the project siting, design, and operation? How were these uncertainties incorporated into project siting, design, or operation? Examples of environmental uncertainties include, but are not limited to: sea level rise, temperature changes, changes in precipitation, landslides, erosion, earthquakes, wildfires, drought events, and flooding events.
The primary uncertainty is climate change. Results for years 2030 and 2070 were developed using the California Water Commission climate assumptions.
Additional locations in the application, supporting documentation or attachments (document name, page number, figure name or number, other) that describe and quantify the environmental uncertainties considered in the project siting, design, and operation.
Draft EIR/EIS – posted at (https://www.sitesproject.org/information/DraftEIR-EIS) Null, S. E., and J. H. Viers. 2013. In bad waters: Water year classification in nonstationary climates, Water Resources Research, 49, doi:10.1002/wrcr.20097.

Ecosystem Priority 3

Priority 3: Maintain flows and appropriate ramping rates at times and locations that will minimize dewatering of salmonid redds and prevent stranding of juvenile salmonids in side channel habitat
Species Information
What salmonid species are you targeting?
Winter-run Chinook salmon (*O. tshawytscha*; Sacramento River evolutionarily significant unit [ESU]); Spring-run Chinook salmon (*O. tshawytscha*; Central Valley ESU); Fall-run and Late fall-run Chinook salmon (*O. tshawytscha*; Central Valley ESU); steelhead (*O. mykiss*; Central Valley distinct population segment); and resident native rainbow trout (*O. mykiss*).
Exact location (document name, page number, table number, other) where the flow and ramping rates needed for this species are described.
Draft EIR/EIS (https://www.sitesproject.org/information/DraftEIR-EIS) Appendix 12A: Aquatic Species Life Histories: • *Sacramento River Winter-run Chinook salmon*: page numbers: 12A-2 to 12A-9 Status, adult migration and holding, spawning and egg incubation, juvenile rearing and migration, and Delta and estuarine rearing; Table 12A-1 Life stage occurrence in the Sacramento River and Table 12A-2 Migration and timing at monitoring stations on the Sacramento River; Figure 12A-1 Current and historical distribution, and critical habitat designation. • *Central Valley Spring-run Chinook salmon*: page numbers: 12A-9 to 12A-14 Status, adult migration and holding, spawning and egg incubation, juvenile rearing and migration, and Delta and estuarine rearing; Table 12A-1 Life stage occurrence in the Sacramento River and Table 12A-2 Migration and timing at monitoring stations on the Sacramento River; Figure 12A-2 Current and historical distribution, and critical habitat designation. • *Central Valley Fall-run and Late fall-run Chinook salmon*: page numbers: 12A-15 to 12A-18 Status, adult migration and holding, spawning and egg incubation, juvenile rearing and migration, and Delta and estuarine rearing; Table 12A-1 Life stage occurrence in the Sacramento River and Table 12A-2 Migration and timing at monitoring stations on the Sacramento River; Figure 12A-3 Current and historical distribution. • *Central Valley steelhead*: page numbers: 12A-19 to 12A-24 Status, adult migration and holding, spawning and egg incubation, juvenile rearing and migration, and Delta and estuarine rearing; Table 12A-1 Life stage occurrence in the Sacramento River; Figure 12A-4 Current and historical distribution, and critical habitat designation. The Draft EIR/EIS has a different without Project condition and operation than was used for Water Storage Investment Program (WSIP); however, there is discussion in the Draft EIR/EIS Appendix 12C: Fisheries Impacts Summary concerning thermal and flow-related benefits to fish: Sacramento River Winter-run Chinook salmon, pages 12C-116 to 12C-117; Spring-run Chinook salmon, pages 12C-117 to 12C-118; Fall-run Chinook salmon, pages 12C-118 to 12C-119; Late fall-run Chinook salmon, pages 12C-119 to 12C-120; and Steelhead, pages 12C-120 to 12C-121.
REV 2: Magnitude of ecosystem improvements
What is the expected magnitude of the ecosystem improvement that will address this priority? Magnitude should be expressed as: a) the change from current conditions without the project to current conditions with the project, and b) the change from 2030 conditions without the project to 2030 conditions with the project. How did you estimate this value? If the ecosystem improvement will benefit multiple salmonid species or runs, provide the magnitude of the ecosystem improvement for each species or run separately.
Flow releases of coldwater stored in Shasta Reservoir would provide an overall benefit to Chinook salmon eggs in redds and juveniles rearing in side channel habitats in the Sacramento River between Keswick Dam and Battle Creek. These increased flow releases will be beneficial during egg incubation by preventing dewatering of redds and juvenile stranding while rearing in side channel habitats. Water conserved in Shasta Lake (by exchange for deliveries made from water stored in Sites Reservoir) would be released to augment flows in the Sacramento River between Keswick Dam and the Red Bluff Pumping Plant. More suitable flow would result in improved conditions for rearing juvenile salmonid species, particularly Fall-run and Late fall-run Chinook salmon. The increase in flows downstream from Keswick Dam (November through February) over the without Project conditions range from an average of 338 cubic feet per second (cfs) under current conditions to 209 cfs in 2030 to 93 cfs in 2070. The greatest benefits occur during dry years (Table A2-4 in Sites_A2 Ecosystem Documentation under the PHYSICAL PUBLIC BENEFITS TAB). This flow augmentation was estimated using the WSIP provided CALSIM model. SALMOD results show principal benefits to Fall and Late-fall run Chinook salmon (Table A2-5 in Sites_A2 Ecosystem Documentation under the PHYSICAL PUBLIC BENEFITS TAB).

Priority 3: Maintain flows and appropriate ramping rates at times and locations that will minimize dewatering of salmonid redds and prevent stranding of juvenile salmonids in side channel habitat
Although not included in the SALMOD model runs, juvenile winter-run Chinook salmon also rear in and migrate through the Sacramento River system between July and March (Draft EIR/EIS: Appendix 12A: Aquatic Species Life Histories: Table 12A-1 Life stage occurrence in the Sacramento River) and would therefore benefit from the flow augmentation associated with the Project. Similar to Shasta Reservoir operations, water conserved in Lake Oroville and Folsom Lake by exchange for deliveries from Sites Reservoir will also be released to benefit side channel habitat conditions for juvenile salmon in the Feather and American rivers.
Additional locations in the application, supporting documentation or attachments (document name, page number, table number, other) where the magnitude of the ecosystem improvement is described and quantified.
Ecosystem Priority 2 in Sites_A2 Ecosystem Documentation under the PHYSICAL PUBLIC BENEFITS TAB
REV 3: Spatial and temporal scale of ecosystem improvements.
What is the geographical extent (e.g. river miles, acres) of the ecosystem improvement that will address this priority?
Approximately 59 river-miles (RM) of the Sacramento River from Keswick Dam (RM 302.0) down to Red Bluff (RM 243.0) was modeled for current (2015) and 2030 conditions using SALMOD with and without the Project to identify and predict spatial and temporal improvements to habitat that can be quantified for suitability for in-river rearing and downstream migration of salmonids. The benefit to salmonid redds would occur in the uppermost part of mainstem Sacramento River since greater than 90 percent of spawning (specifically winter-run Chinook Salmon) occurs approximately 10.2 river miles between Keswick Dam and Bonnyview Bridge. There could potentially be additional benefits to salmonids that may occur downstream of Red Bluff but this was not modeled; similarly, benefits are also expected in the Feather River downstream from Oroville Dam but this was also not modeled.
Additional locations in the application, supporting documentation or attachments (document name, page number, figure name or number, other) where the geographical extent of the ecosystem improvement is documented or mapped.
Ecosystem Priority 2 in Sites_A2 Ecosystem Documentation under the PHYSICAL PUBLIC BENEFITS TAB
When during the year will the project maintain flows and appropriate ramping rates to minimize dewatering of salmonid redds and prevent stranding of juvenile salmonids in side channel habitat? How are flows and ramping rates likely to vary with hydrological conditions (i.e., among water year types) a) under current conditions with and without the project, and b) in 2030 with and without the project? If the ecosystem improvement will benefit multiple salmonid species or runs, provide the timing of ecosystem improvements for each species or run separately.
Improved flows below Keswick Dam are provided from November through March with the greatest increase in November through February. The average flows for dry years are higher than the long-term average, with increases of 9% under current conditions and 11.9% in 2030. These improved flows and additional water in 2030 would provide the greatest value by preventing redd dewatering during egg incubation of Fall-run, Late-fall-run, and Spring-run Chinook salmon and steelhead; and prevention of side channel ponding that could potentially strand all four runs of juvenile Chinook salmon and steelhead.
Additional locations in the application, supporting documentation or attachments (document name, page number, table number, other) where the timing of ecosystem improvements that address this priority are described and quantified.
Ecosystem Priority 2 in Sites_A2 Ecosystem Documentation under the PHYSICAL PUBLIC BENEFITS TAB
REV 4: Inclusion of an adaptive management and monitoring program that includes measurable objectives, performance measures, thresholds, and triggers to achieve ecosystem benefits.
Provide additional information on how this ecosystem improvement will be incorporated into the adaptive management and monitoring program. If available, provide examples of objectives, performance measures, thresholds, or triggers that could be used to manage benefits associated with this priority.
Chinook salmon are anadromous species that spend the majority of their adult life in the ocean before returning to their natal streams in 2 to 5 years (typical average of returning adult is 3 years). Monitoring for 12 years is recommended to assess increase in spawning by quantifying increasing trends of the first four consecutive cohorts. Monitoring would begin immediately after completion of Sites Reservoir. Winter-run, Spring-run, Fall-run, and Late fall-run Chinook salmon and

Priority 3: Maintain flows and appropriate ramping rates at times and locations that will minimize dewatering of salmonid redds and prevent stranding of juvenile salmonids in side channel habitat
steelhead are expected to begin rebuilding with the assumption that the environment stays constant. Measurable objectives include flows delivered in the Upper Reaches of the Sacramento River. This objective could be monitored using programs currently proposed by the California Department of Fish and Wildlife (*e.g.,* Mainstem Sacramento River Mark-recapture Program, Upper Sacramento River Tributary Escapement Monitoring, Sacramento River Tributary Mark-Recapture Monitoring, Hatchery Broodstock and Angler Harvest Sampling). Existing Delta monitoring programs (*e.g.,* Interagency Ecological Program, Delta Juvenile Fish Monitoring Program, Anadromous Fish Restoration Program) can also be incorporated in the adaptive management program for the Project. Performance measures include the timing water releases from Shasta, Oroville, and Folsom to maximize benefits of the Project to salmonid fish species.
REV 5: Immediacy of ecosystem improvement actions and realization of benefits
Immediacy of ecosystem improvement: Number of months from grant encumbrance until the proposed ecosystem improvement is completed (i.e. the expected timeframe until the improvement is implemented or construction is completed).
Initial benefits are expected in year 2028 (6 years after grant encumbrance for construction) at a lower level than when the Project is complete. Full benefits are expected in 2030 (8 years after grant encumbrance).
Additional locations in the application, supporting documentation or attachments (document name, page number, table number, other) where the immediacy timeframe is described and quantified.
Sites_A3 Schedule under the FEASIBILITY AND IMPLEMENTATION RISK TAB.
Realization of ecosystem improvement: Number of months from the time the ecosystem improvement is completed (i.e. project is implemented or construction is complete), until the benefit associated with this priority can be observed (i.e. when measurable improvements can be observed and quantified)
Ecosystem improvement would occur after the first full spawning season (2030). The improvement in returning adult population of all four runs of Chinook salmon and steelhead would be seen approximately three to four years later (2033 to 2034) when 2030 cohort return to spawn.
Additional locations in the application, supporting documentation or attachments (document name, page number, table number, other) where the realization timeframe is described and quantified.
NA
REV 6: Duration of ecosystem improvements
How long (number of years) after realization (as calculated under REV 5 above) is the ecosystem improvement expected to address this priority? Maximum is 100 years. Explain how this value was determined and whether the magnitude of the ecosystem improvement is anticipated to change over time.
Anticipated duration is 100 years. The magnitude of flow augmentation is expected to change over time. The flows were determined using CALSIM modeling. Compared to current conditions, the long-term average flow will increase by 228 thousand acre feet (TAF) by 2030 and by 157 TAF by 2070.
Additional locations in the application, supporting documentation or attachments (document name, page number, table number, other) where the duration of the ecosystem improvement is described and quantified.
Sites_A5 Documentation under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB
REV 7: Consistency with species recovery plans and strategies, initiatives, and conservation plans
Does the ecosystem improvement meet any goals or objectives established in existing species recovery plans, initiatives, or conservation plans including but not limited to the NOAA Fisheries Recovery Plan for Sacramento River winter-run Chinook salmon, Central Valley spring-run Chinook salmon, and Central Valley steelhead; State Wildlife Action Plan; Central Valley Joint Venture Implementation Plan, San Joaquin County Multi-Species Habitat Conservation Plan and Open Space Plan, Draft Solano Multi-Species Habitat Conservation Plan, East Contra Costa County Habitat Conservation Plan/Natural Community Conservation Plan, Draft Recovery Plan for the Giant Garter Snake, and California Water Action Plan? If so which goals, objectives, or actions will be met? Why?
The Project will address the following recovery plan action directly: Action SAR 1.4 Develop and implement a river flow

Priority 3: Maintain flows and appropriate ramping rates at times and locations that will minimize dewatering of salmonid redds and prevent stranding of juvenile salmonids in side channel habitat
management plan for the Sacramento River downstream of Shasta and Keswick dams that considers the effects of climate change and balances beneficial uses with the flow and water temperature needs of winter-run Chinook salmon, spring-run Chinook salmon, and steelhead. The ecosystem improvement is also consistent with three of the proposed actions listed in the Sacramento Valley Salmon Resiliency Strategy. These actions are: (1) increase productivity by improving spawning and incubation conditions (habitat and water quality); (2) increase productivity by increasing juvenile salmonid survival; and (3) support the full range of juvenile and adult migration conditions to maintain life history diversity. The Project will meet these actions by providing increased flows and management of intake diversions to benefit salmonids in the Sacramento River below Keswick Dam. The Project will also enhance and improve the quality of Essential Fish Habitat (EFH) for Pacific Coast Salmon (all four runs of Chinook included; however steelhead is not part of EFH).
Additional locations in the application, supporting documentation or attachments (page number, table number, other) where the consistency with goals, objectives, or actions from recovery plans, initiative, or conservation plans are discussed.

REV 8: Location of ecosystem improvements and connectivity to areas already being protected or managed for conservation values
Provide a map that shows the extent of the ecosystem improvement that will address this priority (e.g. river miles that meet the temperature benefits). Provide additional instructions or clarification to reviewers who will be viewing this map (i.e. describe the color and/or label that identifies the spatial extent of the ecosystem improvement). If available, also submit supporting electronic files such as a .kmz file or ArcGIS layer associated with the maps provided.
Figures A2-1 and A2-2 in Sites_A2 Ecosystem Documentation under the PHYSICAL PUBLIC BENEFITS TAB show the area of temperature improvement for the Sacramento River and the American River, respectively.
Explain why this location was selected. How is the location beneficial to the targeted species in the context of local environmental conditions and the target species' needs?
Locations are downstream from dams that have known salmonid populations downstream (Shasta, Oroville, and Folsom). Water from Sites Reservoir can be exchanged to develop more storage behind these reservoirs. Downstream from each of these dams are salmonid species natal habitat.
Is the ecosystem improvement location adjacent to, or near, other areas already being protected or managed for conservation values? Explain the proximity of the ecosystem improvement to other areas already being protected or managed for conservation values and any hydrologic connectivity that may occur between these locations.
Rivers below Dams (Keswick, Oroville, Folsom) are managed to maintain habitat for fish populations. Water from the Sites Project can be exchanged with water in the reservoir to enhance the reservoir operators' ability to provide quality habitat. Locations of the ecosystem improvements are adjacent to conservation areas or are hydrologically connected to Sacramento River Wildlife Area, Nimbus and American River Hatcheries, and Colusa-Sacramento River State Recreation Area.
Are the flows provided physically accessible by the targeted species in all year types? If not, explain barriers that may exist between the targeted species and ecosystem improvements.
The augmented flows provided by the Project would be physically accessible in all water year types (greater in above normal, below normal, and dry years). There would be no barriers between the targeted species and ecosystem improvements.

Priority 3: Maintain flows and appropriate ramping rates at times and locations that will minimize dewatering of salmonid redds and prevent stranding of juvenile salmonids in side channel habitat
Additional locations in the application, supporting documentation or attachments (document name, page number, figure name or number, other) that describe and quantify the spatial extent of the ecosystem improvement, the proximity of the ecosystem improvement to other areas already being protected or managed for conservation value, and the degree to which hydrologic connections (if any) occur between the ecosystem improvement and areas already being protected or managed for conservation value.
Draft EIR/EIS Appendix 12A; Ecosystem Priority 2 in Sites_A2 Ecosystem Documentation under the PHYSICAL PUBLIC BENEFITS TAB
REV 9: Efficient use of water to achieve multiple ecosystem benefits
How will water provided to address this priority be managed? Explain design efficiencies and operational strategies intended to maximize the efficiency of water allocated to ecosystem improvements that address this priority.
Water released for this purpose will be subsequently released as Delta outflow or will be recaptured using the Delevan Intake Pumping and stored in Ecosystem Enhancement Storage Account (EESA) storage in Sites. It could also be marketed to cover long-term operations and maintenance costs associated with public benefits.
Additional locations in the application, supporting documentation or attachments (document name, page number, figure name or number, other) that describe the design efficiencies and operational strategies used to maximize water efficiency under this priority.
NA
REV 10: Resilience of ecosystem improvements to the effects of changing environmental conditions, including hydrologic variability and climate change.
Which environmental uncertainties associated with this priority were considered in the project siting, design, and operation? How were these uncertainties incorporated into project siting, design, or operation? Examples of environmental uncertainties include, but are not limited to: sea level rise, temperature changes, changes in precipitation, landslides, erosion, earthquakes, wildfires, drought events, and flooding events.
The primary uncertainty is climate change. Results for years 2030 and 2070 were developed using the California Water Commission climate assumptions.
Additional locations in the application, supporting documentation or attachments (document name, page number, figure name or number, other) that describe and quantify the environmental uncertainties considered in the project siting, design, and operation.
Draft EIR/EIS – posted at (https://www.sitesproject.org/information/DraftEIR-EIS) Null, S. E., and J. H. Viers. 2013. In bad waters: Water year classification in nonstationary climates, Water Resources Research, 49, doi:10.1002/wrcr.20097.

Ecosystem Priority 4

Priority 4: Improve ecosystem water quality
Constituent Information
What ecosystem water quality constituent(s) are you targeting?
Temperature: A physical water quality parameter important to survival of salmonid species. See Sites_A1 Water Quality Priority 1 under the PHYSICAL PUBLIC BENEFITS TAB for additional information on water quality targets for temperature.
Summarize how the proposed actions will improve the ecosystem water quality in relation to the target constituent.
The proposed action will provide more suitable temperatures during rearing and spawning months for targeted fish species in the mainstem of the Sacramento River below Keswick Dam by increasing storage and preserving the coldwater pool at Shasta Lake. For a summary of the benefits to salmonid eggs and fry due to thermal improvements of this project, see Table A2-3 in Ecosystem Priority 1 in Sites_A2 Ecosystem Documentation under the PHYSICAL PUBLIC BENEFITS TAB.
Does the proposed ecosystem water quality improvement benefit habitats or species life stages? How?
The proposed ecosystem water quality improvement (*i.e.,* temperature) increases the quality of habitat for winter-run Chinook Salmon spawning adults to yield an increased percentage of egg and fry survival below Keswick Dam as described in Ecosystem Priority 1.
Additional locations in the application, supporting documentation or attachments (document name, page number, table number, other) where the chemistry, toxicity, and negative effects constituents are described (i.e. Material Safety Data Sheets).
EIR/EIS Appendix 12C: Fisheries Impact Summary; Figures A2-1 and A2-2 in Ecosystem Priority 1 in Sites_A2 Ecosystem Documentation under the PHYSICAL PUBLIC BENEFITS TAB; Sites_A1 Water Quality Priority 1 under the PHYSICAL PUBLIC BENEFITS TAB; Sites_A6D Modeling Results Compendium under the ELIGIBILITY AND GENERAL PROJECT INFORMATION TAB
REV 2: Magnitude of ecosystem improvements
What is the expected magnitude of the ecosystem improvement that will address this priority? Magnitude should be expressed as: a) the change from current conditions without the project to current conditions with the project, and b) the change from 2030 conditions without the project to 2030 conditions with the project. How did you estimate this value? If the project intends to benefit multiple constituents, the magnitude of the change in each constituent needs to be provided.
Temperature improvements are the result of the conservation of water (primarily in Shasta Lake). Under current conditions, end-of-September carryover storage in Shasta is increased by 4.7% on average and up to 16.3% in critical years. Temperature improvements were estimated using the Upper Sacramento River HEC5Q model and the American River CE QUAL-W2 Model (see Sites_A6D Modeling Results Compendium under the ELIGIBILITY AND GENERAL PROJECT INFORMATION TAB). The project would increase coldwater pool conservation in Shasta Lake, Lake Oroville, and Folsom Lake and improve temperatures in the Sacramento and American Rivers during certain months at specific compliance points, particularly in Below Normal, Dry, and Critical water years. The areas of temperature improvement for these waterways are shown on Figures A2-1 and A2-2 in Sites_A2 Ecosystem Documentation under the PHYSICAL PUBLIC BENEFITS TAB. Approximately 59 river miles of the Sacramento River would be improved with the implementation of the Sites Reservoir Project downstream from Keswick Dam (River Mile 302) to the Red Bluff Pumping Plant (River Mile 243). Figure A2-1 in Sites_A2 Ecosystem Documentation under the PHYSICAL PUBLIC BENEFITS TAB shows the improvement area for the Sacramento River. Sites Project operations emphasize providing Sacramento River cold water releases during the months of July through September when it's most difficult to achieve temperatures targets. Temperature modeling results show improvement for current conditions and 2030 (see Table A2-1 in Sites_A2 Ecosystem Documentation under the PHYSICAL PUBLIC BENEFITS TAB). The temperature reduction with the Project at Bend Bridge is 0.6^{o}F in July through September for critical years) in 2030, but improves to 1.4^{o}F in 2070. The reason these results fluctuate is more due to an increase in Shasta storage assumed in the 2030 WSIP model than to the effects of climate change (there is no indication that Reclamation will actually operate Shasta differently in 2030). This suggests that the temperature reduction benefits are relatively sustainable in this portion of the Sacramento River. Fall-run, late fall-run, and winter-run Chinook salmon would greatly benefit from more suitable water temperatures in the

Priority 4: Improve ecosystem water quality
Sacramento River below Keswick Dam and at Bonnyview Bridge specifically during egg incubation period in the month of September in critical years.
Additional locations in the application, supporting documentation or attachments (document name, page number, table number, other) where the magnitude of the ecosystem improvement is described and quantified.
Sites_A6D Modeling Results Compendium under the ELIGIBILITY AND GENERAL PROJECT INFORMATION TAB
REV 3: Spatial and temporal scale of ecosystem improvements.
What is the geographical extent (e.g. river miles, acres) of the ecosystem improvement that will address this priority?
The spawning distribution of winter-run Chinook Salmon in the mainstem Sacramento River defines the spatial distribution of incubating eggs, alevins, and swim-up fry. Historical spawning data indicate that winter-run spawning occurred from Keswick Dam (River Mile [RM] 302.0) downstream to the site of Red Bluff Diversion Dam (RM 243.0), a distance of 59 miles. More recent data, however, indicate that the spawning distribution has substantially changed. Aerial redd survey data on winter-run Chinook Salmon in-river spawning from 2003 to 2015 indicate that virtually all spawning occurs from Keswick Dam downstream to Clear Creek (RM 289.3), a short distance of only 12.7 miles (U.S. Bureau of Reclamation 2016, page 7). Over the 12-year monitoring period 88.7 percent of redds were observed upstream of the State Route 44 Bridge (RM 296.5), only 5.5 miles downstream of Keswick Dam, and 11.3 percent were observed between the State Route 44 Bridge and Clear Creek. No redds were observed downstream of Clear Creek. These data indicate that approximately 12.7 miles (rounded to 13 miles) of the Sacramento River downstream of Keswick Dam are used by winter-run for spawning and most spawning is concentrated in the uppermost approximately 5.5 miles (rounded to 6 miles) of the river downstream of Keswick Dam. Therefore, cold water is required for successful egg incubation and alevin rearing in approximately 13 miles of the Sacramento River downstream of Keswick Dam. Water temperatures with and without the proposed project can be modeled and analyzed for this 13-mile river reach. Egg incubation typically occurs between late April and mid-October and alevin rearing in spawning redds occurs between mid-June through November for winter run (Draft EIR/EIS, Appendix 12A, Table 12A-1, page 12A-3; National Marine Fisheries Service 2014, page 15). Incubation of pre-emergent fry (alevins) occurs from mid-June through November. The upper limit of the optimal range for water temperature during egg incubation is 56°F and for pre-emergent fry is 58°F. At higher water temperatures mortality of eggs and alevins begins to increase (Draft EIR/EIS, Appendix 12D, Table 12D-2, page 12D-5; Vogel 2015, Table 3, page 10). Mean monthly modeled water temperatures in 2030 with and without the project, using data from an 82-year simulation period, were examined within the mainstem Sacramento River from April through November for different water year types for various locations within the 26-mile reach downstream of Keswick Dam to the Balls Ferry (RM 276), given the optimum water temperature of 56°F for eggs and 58°F for alevins (CH2MHill River Temperature and Modeling Summary Tables and Bar Charts 2030).
Additional locations in the application, supporting documentation or attachments (document name, page number, figure name or number, other) where the geographical extent of the ecosystem improvement is documented or mapped.
Figures A2-1 and A2-2 in Sites_A2 Ecosystem Documentation under the PHYSICAL PUBLIC BENEFITS TAB show the area of temperature improvement for the Sacramento River and the American River, respectively and River Temperature Modeling Summary Tables and Bar Charts
When during the year will ecosystem water quality improvements be provided? How is ecosystem water quality likely to vary with hydrologic conditions (i.e. among water year types) a) under current conditions with and without the project, and b) in 2030 with and without the project? If the project intends to benefit multiple constituents, provide the timing of water quality improvements for each constituent separately.
For the mainstem Sacramento River from Keswick Dam to Clear Creek, the proposed project in 2030 will reduce the percentage of winter-run Chinook salmon egg and fry mortality in September and October of critically dry water years from 7 to 25 percent depending on location.
Additional locations in the application, supporting documentation or attachments (document name, page number, table number, other) where the timing of ecosystem water quality improvements are documented.

REV 4: Inclusion of an adaptive management and monitoring program that includes measurable objectives, performance measures, thresholds, and triggers to achieve ecosystem benefits.
Provide additional information on how this ecosystem improvement will be incorporated into the adaptive management and monitoring program. If available, provide examples of objectives, performance measures, thresholds, or triggers that could be used to manage benefits associated with this priority.
Since water temperatures have direct effects on salmon egg and fry survival; temperature monitoring between Keswick and Red Bluff would begin immediately after completion of Sites Reservoir as a measurable objective and performance measure. After completion of Sites Reservoir, winter-run, spring-run, fall-run, and late fall-run Chinook salmon; and steelhead are expected to begin rebuilding with the assumption that the environment stays constant. Other measurable objectives include temperatures delivered and the use of information developed by the California Department of Fish and Wildlife monitoring programs in the Sacramento River (*e.g.,* Mainstem Sacramento River Mark-recapture Program, Upper Sacramento River Tributary Escapement Monitoring, Sacramento River Tributary Mark-Recapture Monitoring, Hatchery Broodstock and Angler Harvest Sampling). Existing Delta monitoring programs (*e.g.,* Interagency Ecological Program, Delta Juvenile Fish Monitoring Program, Anadromous Fish Restoration Program). The Sites Project adaptive management program will leverage existing data and collaborate with established monitoring programs, where possible, to secure monitoring results to inform operational decisions. Performance measures will include the development of carryover storage targets, flow release schedules, and real-time adjustment of temperature control points.
REV 5: Immediacy of ecosystem improvement actions and realization of benefits
Immediacy of ecosystem improvement: Number of months from grant encumbrance until the proposed ecosystem

Priority 4: Improve ecosystem water quality
improvement is completed (i.e. the expected timeframe until the improvement is implemented or construction is completed).
Initial benefits are expected in year 2028 (6 years after investment encumbrance for construction) at a lower level than when the project is complete. Full benefits are expected in 2030 (8 years after investment encumbrance).
Additional locations in the application, supporting documentation or attachments (document name, page number, table number, other) where the immediacy timeframe is described and quantified.
Sites_A3 Schedule under the FEASIBILITY AND IMPLEMENTATION RISK TAB.
Realization of ecosystem improvement: Number of months from the time the ecosystem improvement is completed (i.e. project is implemented or construction is complete), until the benefit associated with this priority can be observed (i.e. when measurable improvements can be observed and quantified)
NA
Additional locations in the application, supporting documentation or attachments (document name, page number, table number, other) where the realization timeframe is described and quantified.
NA
REV 6: Duration of ecosystem improvements
How long (number of years) after realization (as calculated under REV 5 above) is the ecosystem improvement expected to address this priority? Maximum is 100 years. Explain how this value was determined and whether the magnitude of the ecosystem improvement is anticipated to change over time.
Anticipated duration is 100 years. The magnitude is expected to change over time. The flows were determined using CALSIM modeling and results are provided for years 2030 and 2070.
Additional locations in the application, supporting documentation or attachments (document name, page number, table number, other) where the duration of the ecosystem improvement is described and quantified.
Sites_A5 Documentation under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB
REV 7: Consistency with species recovery plans and strategies, initiatives, and conservation plans
Does the ecosystem improvement meet any goals or objectives established in existing species recovery plans, initiatives, or conservation plans including but not limited to the NOAA Fisheries Recovery Plan for Sacramento River winter-run Chinook salmon, Central Valley spring-run Chinook salmon, and Central Valley steelhead; State Wildlife Action Plan; Central Valley Joint Venture Implementation Plan, San Joaquin County Multi-Species Habitat Conservation Plan and Open Space Plan, Draft Solano Multi-Species Habitat Conservation Plan, East Contra Costa County Habitat Conservation Plan/Natural Community Conservation Plan, Draft Recovery Plan for the Giant Garter Snake, and California Water Action Plan? If so which goals, objectives, or actions will be met? Why?
It addresses the following recovery plan action directly: Action SAR 1.4 Develop and implement a river flow management plan for the Sacramento River downstream of Shasta and Keswick dams that considers the effects of climate change and balances beneficial uses with the flow and water temperature needs of winter-run Chinook salmon, spring-run Chinook salmon, and steelhead. The ecosystem improvement is also consistent with three of the proposed actions listed in the Sacramento Valley Salmon Resiliency Strategy. These actions are: (1) increase productivity by improving spawning and incubation conditions (habitat and water quality); (2) increase productivity by increasing juvenile salmonid survival; and (3) support the full range of juvenile and adult migration conditions to maintain life history diversity. The project will meet these actions by providing increased flows and management of intake diversions to benefit salmonids in the Sacramento River below Keswick Dam. The project will also enhance and improve the quality of Essential Fish Habitat (EFH) for Pacific Coast Salmon (all four runs of Chinook included; however steelhead is not part of EFH).
Additional locations in the application, supporting documentation or attachments (page number, table number, other) where the consistency with goals, objectives, or actions from recovery plans, initiative, or conservation plans are discussed.
Ecosystem Priority 1 in Sites_A2 Ecosystem Documentation under the PHYSICAL PUBLIC BENEFITS TAB

Priority 4: Improve ecosystem water quality
REV 8: Location of ecosystem improvements and connectivity to areas already being protected or managed for conservation values
Provide a map that shows the extent of the ecosystem improvement that will address this priority (e.g. river miles that meet the temperature benefits). Provide additional instructions or clarification to reviewers who will be viewing this map (i.e. describe the color and/or label that identifies the spatial extent of the ecosystem improvement). If available, also submit supporting electronic files such as a .kmz file or ArcGIS layer associated with the maps provided.
Figures A2-1 and A2-2 in Sites_A2 Ecosystem Documentation under the PHYSICAL PUBLIC BENEFITS TAB show the area of temperature improvement for the Sacramento River and the American River, respectively.
Explain why this location was selected in the context of local environmental conditions and the target constituent(s). Why was this location selected over other potential locations?
Locations are downstream from dams that have known salmonid populations downstream (Shasta, Oroville, and Folsom). Water from Sites Reservoir can be exchanged to develop more storage behind these reservoirs. Downstream from each of these dams are salmonid species natal habitat.
Is the ecosystem water quality improvement location adjacent to, or near, other areas already being protected or managed for conservation values? Explain the proximity of the ecosystem water quality improvement to other areas already being protected or managed for conservation values and any hydrologic connectivity that may occur between these locations.
The Project-related ecosystem improvements are adjacent or hydrologically-connected to Turtle Bay Exploration Park East – Bechelli and Anderson River Park. Location of the ecosystem improvement are adjacent to conservation areas or are hydrologically connected to Sacramento River Wildlife Area, Nimbus and American River Hatcheries, American River Parkway Effie Yeaw Nature Center, and Colusa-Sacramento River State Recreation Area.
Additional locations in the application (document name, page number, figure name or number, other) that describe the extent of the ecosystem water quality improvements, the proximity of claimed improvements to other areas already being protected or managed for conservation value, and the degree to which hydrologic connections (if any) occur between claimed improvements and areas already being protected or managed for conservation value.
NA
REV 9: Efficient use of water to achieve multiple ecosystem benefits
If applicable, how will water provided to address this priority be managed? Explain design efficiencies and operational strategies intended to maximize the efficiency of water allocated to ecosystem improvements that address this priority.
Water released for this purpose will be subsequently released out the Delta or will be recaptured using the Delevan Intake Pumping Plant and stored in Sites EESA storage. It could also be marketed to provide funds for operation and maintenance associated with the public benefits.
Additional locations in the application, supporting documentation or attachments (document name, page number, figure name or number, other) that describe the design efficiencies and operational strategies used to maximize water efficiency under this priority.
Ecosystem Priority 1 in Sites_A2_Ecosystem Documentation under the PHYSICAL PUBLIC BENEFITS TAB
REV 10: Resilience of ecosystem improvements to the effects of changing environmental conditions, including hydrologic variability and climate change.
Which environmental uncertainties associated with this priority were considered in the project siting, design, and operation? How were these uncertainties incorporated into project siting, design, or operation? Examples of environmental uncertainties include, but are not limited to: sea level rise, temperature changes, changes in precipitation, landslides, erosion, earthquakes, wildfires, drought events, and flooding events.
The primary uncertainty is climate change. Results for years 2030 and 2070 using the California Water Commission climate assumptions.
Additional locations in the application, supporting documentation or attachments (document name, page number, figure name or number, other) that describe and quantify the environmental uncertainties considered in the project siting, design, and

Priority 4: Improve ecosystem water quality
operation.
Draft EIR/EIS – posted at (https://www.sitesproject.org/information/DraftEIR-EIS) Null, S. E., and J. H. Viers. 2013. In bad waters: Water year classification in nonstationary climates, Water Resources Research, 49, doi:10.1002/wrcr.20097.

Ecosystem Priority 5

Priority 5: Provide flows that increase dissolved oxygen and lower water temperatures to support anadromous fish passage
Species Information
What anadromous fish species are you targeting?
Winter-run Chinook salmon (*O. tshawytscha*; Sacramento River evolutionarily significant unit [ESU]); Spring-run Chinook salmon (*O. tshawytscha*; Central Valley ESU); Fall-run and Late fall-run Chinook salmon (*O. tshawytscha*; Central Valley ESU); steelhead (*O. mykiss*; Central Valley distinct population segment); resident native rainbow trout (*O. mykiss*), and other California native fish species.
Additional locations in the application, supporting documentation or attachments (document name, page number, table number, other) where the flow and dissolved oxygen needs of this species are described.
Draft EIR/EIS (http://www.sitesproject.org/information/DraftEIR-EIS) Appendix 12A: Aquatic Species Life Histories: • *Sacramento River Winter-run Chinook salmon*: page numbers: 12A-2 to 12A-9 Status, adult migration and holding, spawning and egg incubation, juvenile rearing and migration, and Delta and estuarine rearing; Table 12A-1 Life stage occurrence in the Sacramento River and Table 12A-2 Migration and timing at monitoring stations on the Sacramento River; Figure 12A-1 Current and historical distribution, and critical habitat designation. • *Central Valley Spring-run Chinook salmon*: page numbers: 12A-9 to 12A-14 Status, adult migration and holding, spawning and egg incubation, juvenile rearing and migration, and Delta and estuarine rearing; Table 12A-1 Life stage occurrence in the Sacramento River and Table 12A-2 Migration and timing at monitoring stations on the Sacramento River; Figure 12A-2 Current and historical distribution, and critical habitat designation. • *Central Valley Fall-run and Late fall-run Chinook salmon*: page numbers: 12A-15 to 12A-18 Status, adult migration and holding, spawning and egg incubation, juvenile rearing and migration, and Delta and estuarine rearing; Table 12A-1 Life stage occurrence in the Sacramento River and Table 12A-2 Migration and timing at monitoring stations on the Sacramento River; Figure 12A-3 Current and historical distribution. • *Central Valley steelhead*: page numbers: 12A-19 to 12A-24 Status, adult migration and holding, spawning and egg incubation, juvenile rearing and migration, and Delta and estuarine rearing; Table 12A-1 Life stage occurrence in the Sacramento River; Figure 12A-4 Current and historical distribution, and critical habitat designation. The Draft EIR/EIS has a different without Project conditions and operation than was used for WSIP; however, there is discussion in the Draft EIR/EIS Appendix 12C: Fisheries Impacts Summary concerning thermal and flow-related benefits to fish: Sacramento River Winter-run Chinook salmon, pages 12C-116 to 12C-117; Spring-run Chinook salmon, pages 12C-117 to 12C-118; Fall-run Chinook salmon, pages 12C-118 to 12C-119; Late fall-run Chinook salmon, pages 12C-119 to 12C-120; and Steelhead, pages 12C-120 to 12C-121.
REV 2: Magnitude of ecosystem improvements
What is the expected magnitude of the ecosystem improvement that will address this priority? Magnitude should be expressed as: a) the change from current conditions without the project to current conditions with the project, and b) the change from 2030 conditions without the project to 2030 conditions with the project. How did you estimate this value? If the project will benefit multiple anadromous fish species, the magnitude of the ecosystem improvement for each species needs to be provided.
Temperature improvements were estimated using Upper Sacramento River HEC5Q model and the American RiverCE QUAL-W2 Model, Long-term average temperatures generally dropped from 0.1°F to 0.5°F between Keswick Dam and Bend Bridge. The proposed project's improved flow management will promote more suitable water temperatures and provide an increased dissolved oxygen levels for rearing juvenile Winter-run, Fall-run, and Late fall-run Chinook salmon in the mainstem of the Sacramento River below Keswick Dam by increasing the coldwater pool at Shasta Lake.
Additional locations in the application, supporting documentation or attachments (document name, page number, table number, other) where the magnitude of the ecosystem improvement is described and quantified.
Ecosystem Priority 1 in Sites_A2 Ecosystem Documentation under the PHYSICAL PUBLIC BENEFITS TAB

Priority 5: Provide flows that increase dissolved oxygen and lower water temperatures to support anadromous fish passage
REV 3: Spatial and temporal scale of ecosystem improvements.
What is the geographical extent (e.g., river miles, acres) of the ecosystem improvement that will address this priority?
An approximately 59 river-miles (RM) of the Sacramento River from Keswick Dam (RM 302.0) down to Red Bluff (RM 243.0) was modeled for current (2015) and 2030 conditions using SALMOD with and without the project to identify and predict spatial and temporal improvements to habitat that can be quantified for suitability for in-river rearing and downstream migration of salmonids. The benefit to salmonid redds would occur in the uppermost part of mainstem Sacramento River since greater than 90 percent of spawning (specifically winter-run Chinook Salmon) occurs approximately 10.2 river miles between Keswick Dam and Bonnyview Bridge. There could potentially be additional benefits to salmonids that may occur downstream of Red Bluff but this was not modeled; similarly, benefits are also expected in the Feather River downstream from Oroville Dam but this was also not modeled.
Additional locations in the application, supporting documentation or attachments (document name, page number, figure name or number, other) where the geographical extent of the ecosystem improvement is documented or mapped.
Ecosystem Priority 1 and 2 in Sites_A2 Ecosystem Documentation under the PHYSICAL PUBLIC BENEFITS TAB
When during the year will flows that increase dissolved oxygen and lower water temperatures to support anadromous fish passage be provided? How are dissolved oxygen and water temperature likely to vary with hydrologic conditions (i.e. among water year types) a) under current conditions with and without the project, and b) in 2030 with and without the project? If the ecosystem improvement will benefit multiple anadromous species, provide the timing of ecosystem improvements for each species separately.
Chemical composition of water varies greatly depending on season, time of day, location and depth (Dowling and Wiley 1986). Dissolved oxygen in streams is closely correlated with temperature fluctuations and varying flow conditions. Studies of large rivers and small streams show that high temperature and slow flowing water holds less oxygen. Based on results of these studies, the Project's improved flow management will promote more suitable water temperatures and provide increased dissolved oxygen levels for rearing juvenile Winter-run, Fall-run, and Late fall-run Chinook salmon in the mainstem of the Sacramento River below Keswick Dam by releasing the increased coldwater from Shasta Lake in the mainstem Sacramento River used by spawning winter-run Chinook Salmon from Keswick Dam to Clear Creek. By 2030, the Project will increase flows from October through March with the greatest increase in the fall. The average flows for dry years are higher than the long-term average, with increases of 9% under current conditions and 11.9% in 2030. Dowling, D.C. and M.J. Wiley. 1986. The effects of dissolved oxygen, temperature, and low stream flow on fishes: A literature review. Aquatic Biological Section Technical Report. Springfield City Water, Light, and Power Company.
Additional locations in the application (document name, page number, table number, other) where the timing of flow releases associated with this benefit are documented.
Draft EIR/EIS Appendix 12C: Fisheries Impacts Summary
REV 4: Inclusion of an adaptive management and monitoring program that includes measurable objectives, performance measures, thresholds, and triggers to achieve ecosystem benefits.
Provide additional information on how this ecosystem improvement will be incorporated into the adaptive management and monitoring program. If available, provide examples of objectives, performance measures, thresholds, or triggers that could be used to manage benefits associated with this priority.
After completion of Sites Reservoir, Winter-run, Spring-run, Fall-run, and Late fall-run Chinook salmon and steelhead are expected to begin rebuilding with the assumption that the environment stays constant. Measurable objectives include reduced temperatures, increased dissolved oxygen levels, and increased numbers of eggs and rearing juveniles in the Upper Reaches of the Sacramento River. Temperature and dissolved oxygen level data from monitoring programs (*e.g.,* Mainstem Sacramento River Mark-recapture Program, Upper Sacramento River Tributary Escapement Monitoring, Sacramento River Tributary Mark-Recapture Monitoring, Hatchery Broodstock and Angler Harvest Sampling) currently proposed by the California Department of Fish and Wildlife in the Sacramento River as well as existing Delta monitoring programs (*e.g.,* Interagency Ecological Program, Delta Juvenile Fish Monitoring Program, Anadromous Fish Restoration Program) can also be incorporated in the adaptive management program for the Project. Performance measures include the timing water releases from Shasta, Oroville, and Folsom to maximize benefits of the project to salmonid fish species.

Priority 5: Provide flows that increase dissolved oxygen and lower water temperatures to support anadromous fish passage
REV 5: Immediacy of ecosystem improvement actions and realization of benefits
Immediacy of ecosystem improvement: Number of months from grant encumbrance until the proposed ecosystem improvement is completed (i.e. the expected timeframe until the improvement is implemented or construction is completed).
Initial benefits are expected in year 2028 (6 years after grant encumbrance for construction) at a lower level than when the project is complete. Full benefits are expected in 2030 (8 years after grant encumbrance).
Additional locations in the application, supporting documentation or attachments (document name, page number, table number, other) where the immediacy timeframe is described and quantified.
Sites_A3 Schedule under the FEASIBILITY AND IMPLEMENTATION RISK TAB.
Realization of ecosystem improvement: Number of months from the time the ecosystem improvement is completed (i.e. project is implemented or construction is complete), until the benefit associated with this priority can be observed (i.e. when measurable improvements can be observed and quantified)
After the first full spawning season (2030), a quantifiable improvement in the Sacramento River from Keswick to Battle Creek would benefit all four runs of Chinook salmon and steelhead approximately three to four years later (2033 to 2034) when the 2030 cohort returns to spawn.
Additional locations in the application, supporting documentation or attachments (document name, page number, table number, other) where the realization timeframe is described and quantified.
NA
REV 6: Duration of ecosystem improvements
How long (number of years) after realization (as calculated under REV 5 above) is the ecosystem improvement expected to address this priority? Maximum is 100 years. Explain how this value was determined and whether the magnitude of the ecosystem improvement is anticipated to change over time.
Anticipated duration is 100 years. The magnitude of flow augmentation is expected to change over time. The flows were determined using CALSIM modeling and Upper Sacramento River HEC5 temperature model. Compared to current conditions, the long-term average flow will increase by 228 thousand acre feet (TAF) by 2030 and by 157 TAF by 2070.
Additional locations in the application, supporting documentation or attachments (document name, page number, table number, other) where the duration of the ecosystem improvement is described and quantified.
Sites_A5 Documentation under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB
REV 7: Consistency with species recovery plans and strategies, initiatives, and conservation plans
Does the ecosystem improvement meet any goals or objectives established in existing species recovery plans, initiatives, or conservation plans including but not limited to the NOAA Fisheries Recovery Plan for Sacramento River winter-run Chinook salmon, Central Valley spring-run Chinook salmon, and Central Valley steelhead; State Wildlife Action Plan; Central Valley Joint Venture Implementation Plan, San Joaquin County Multi-Species Habitat Conservation Plan and Open Space Plan, Draft Solano Multi-Species Habitat Conservation Plan, East Contra Costa County Habitat Conservation Plan/Natural Community Conservation Plan, Draft Recovery Plan for the Giant Garter Snake, and California Water Action Plan? If so which goals, objectives, or actions will be met? Why?
The Project will address the following recovery plan action directly: Action SAR 1.4 Develop and implement a river flow management plan for the Sacramento River downstream of Shasta and Keswick dams that considers the effects of climate change and balances beneficial uses with the flow and water temperature needs of winter-run Chinook salmon, spring-run Chinook salmon, and steelhead. The ecosystem improvement is also consistent with three of the proposed actions listed in the Sacramento Valley Salmon Resiliency Strategy. These actions are: • increase productivity by improving spawning and incubation conditions (habitat and water quality) • increase productivity by increasing juvenile salmonid survival • support the full range of juvenile and adult migration conditions to maintain life history diversity.

Priority 5: Provide flows that increase dissolved oxygen and lower water temperatures to support anadromous fish passage
The Project will meet these actions by providing increased flows and management of intake diversions to benefit salmonids in the Sacramento River below Keswick Dam. The Project will also enhance and improve the quality of Essential Fish Habitat (EFH) for Pacific Coast Salmon (all four runs of Chinook).
Additional locations in the application, supporting documentation or attachments (page number, table number, other) where the consistency with goals, objectives, or actions from recovery plans, initiative, or conservation plans are discussed.

REV 8: Location of ecosystem improvements and connectivity to areas already being protected or managed for conservation values
Provide a map that shows the extent of the ecosystem improvement that will address this priority (e.g. river miles that meet the temperature benefits). Provide additional instructions or clarification to reviewers who will be viewing this map (i.e. describe the color and/or label that identifies the spatial extent of the ecosystem improvement). If available, also submit supporting electronic files such as a .kmz file or ArcGIS layer associated with the maps provided.
Figures A2-1 and A2-2 in Sites_A2 Ecosystem Documentation under the PHYSICAL PUBLIC BENEFITS TAB show the area of temperature improvement for the Sacramento River and the American River, respectively.
Explain why this location was selected. How is the location beneficial to the targeted species in the context of local environmental conditions and the target species' needs?
Locations are downstream from dams that have known salmonid populations downstream (Shasta, Oroville, and Folsom). Water from Sites Reservoir can be exchanged to develop more storage behind these reservoirs. Downstream from each of these dams are salmonid species natal habitat.
Does the improvement location occur adjacent to or near any other areas already being protected or managed for conservation values? Explain the proximity of improvements to other areas already being protected or managed for conservation values and the distance between them and your claimed improvements. Explain any hydrologic connectivity that may occur between these locations (if any).
Location of the ecosystem improvement are adjacent to conservation areas or are hydrologically connected to Sacramento River Wildlife Area, Nimbus and American River Hatcheries, American River Parkway, Stone Lakes National Wildlife Refuge, Vic Fazio Yolo Wildlife Area, Bidwell-Sacramento River State Park, Colusa-Sacramento River State Recreation Area, Brannan Island State Recreation Area and Delta Meadows.
Will flows provided allow full passage to the targeted species in all year types?
Flows would be physically accessible in all water year types (greater in above normal, below normal, and dry years). There would be no barriers between the targeted species and ecosystem improvements.
Additional locations in the application (document name, page number, figure name or number, other) that describe the extent of the flow benefits, the proximity of claimed improvements to other areas already being protected or managed for conservation value, and the degree to which hydrologic connections (if any) occur between claimed improvements and areas already being protected or managed for conservation value.
Draft EIR/EIS Appendix 12A; Ecosystem Priority 2 in Sites_A2 Ecosystem Documentation under the PHYSICAL PUBLIC BENEFITS TAB

Priority 5: Provide flows that increase dissolved oxygen and lower water temperatures to support anadromous fish passage
REV 9: Efficient use of water to achieve multiple ecosystem benefits
How will water provided to address this priority be managed? Explain design efficiencies and operational strategies intended to maximize the efficiency of water allocated to ecosystem improvements that address this priority.
Water released for this purpose will be subsequently released as Delta outflow or will be recaptured using the Delevan Intake Pumping Plant and stored in Sites Ecosystem Enhancement Storage Account (EESA) storage. It may also be marketed to cover long-term operations and maintenance costs associated with public benefits.
Additional locations in the application, supporting documentation or attachments (document name, page number, figure name or number, other) that describe the design efficiencies and operational strategies used to maximize water efficiency under this priority.
NA
REV 10: Resilience of ecosystem improvements to the effects of changing environmental conditions, including hydrologic variability and climate change.
Which environmental uncertainties associated with this priority were considered in the project siting, design, and operation? How were these uncertainties incorporated into project siting, design, or operation? Examples of environmental uncertainties include, but are not limited to: sea level rise, temperature changes, changes in precipitation, landslides, erosion, earthquakes, wildfires, drought events, and flooding events.
The primary uncertainty is climate change. Results for years 2030 and 2070 were developed using the California Water Commission climate assumptions.
Additional locations in the application, supporting documentation or attachments (document name, page number, figure name or number, other) that describe and quantify the environmental uncertainties considered in the project siting, design, and operation.
Draft EIR/EIS – posted at (https://www.sitesproject.org/information/DraftEIR-EIS) Null, S. E., and J. H. Viers. 2013. In bad waters: Water year classification in nonstationary climates, Water Resources Research, 49, doi:10.1002/wrcr.20097.

Ecosystem Priority 10

Priority 10: Enhance the frequency, magnitude, and duration of floodplain inundation to enhance primary and secondary productivity and the growth and survival of fish
REV 2: Magnitude of ecosystem improvements
What is the expected magnitude of the ecosystem improvement that will address this priority? Magnitude should be expressed as: a) the change from current conditions without the project to current conditions with the project, and b) the change from 2030 conditions without the project to 2030 conditions with the project. How did you estimate this value?
Benefits would be provided in the Yolo Bypass. In 2030, releases from Sites Reservoir through the Colusa Basin Drain and into the Yolo Bypass would increase the flow by a long-term average of 40 thousand acre-feet, a 163% increase in flows from August through October. Additionally, rearing habitat in the Yolo Bypass represents key habitat areas that allows for better growth rates of native fish due to increased food availability. Furthermore, seasonal hydrology of the floodplain provides a more competitive advantage to native fish thus preventing nonnative fish species to dominate. Enhanced frequency, magnitude, and duration in the Yolo Bypass would also increase primary production and therefore food availability (secondary production) for native fish, leading to better survival rates (Sommer et. al 2001).
Additional locations in the application, supporting documentation or attachments (document name, page number, table number, other) where the magnitude of the ecosystem improvement is described and quantified.
Sommer, T., Harrell, B., Nobriga, M.L., Schemel, L. 2001. California's Yolo Bypass: Evidence that flood control can be compatible with fisheries, wetlands, wildlife, and agriculture. Fisheries 26(8):6-16.
REV 3: Spatial and temporal scale of ecosystem improvements.
What is the geographical extent (e.g. river miles, acres) of the ecosystem improvement that will address this priority?
Benefits to food production would occur in the Yolo Bypass Toe Drain, Cache Slough Complex, Liberty island, and into the Lower Sacramento River a little upstream (tidal effects) and below where it enters the Sacramento. Benefits are anticipated at least to the confluence with the San Joaquin River at the tip of Sherman Island.
Additional locations in the application, supporting documentation or attachments (document name, page number, figure name or number, other) where the geographical extent of the ecosystem improvement is documented or mapped.
Draft EIR/EIS (https://www.sitesproject.org/information/DraftEIR-EIS) Appendix 12N: Yolo Bypass Flow and Fremont Weir Spill Analysis and Appendix 12: Aquatic Biological Resources; Ecosystem Priority 10 in Sites_A2 Ecosystem Documentation under the PHYSICAL PUBLIC BENEFITS TAB
When during the year will the frequency, magnitude and duration of floodplain inundation be enhanced for primary and secondary productivity and the growth and survival of fish? How is floodplain inundation likely to vary with hydrologic conditions (i.e. among water year types) a) under current conditions with and without the project, and b) in 2030 with and without the project?
Releases would be provided in August through October.
Additional locations in the application, supporting documentation or attachments (document name, page number, table number, other) where the timing of floodplain enhancements are described and quantified.
NA
REV 4: Inclusion of an adaptive management and monitoring program that includes measurable objectives, performance measures, thresholds, and triggers to achieve ecosystem benefits.
Provide additional information on how this ecosystem improvement will be incorporated into the adaptive management and monitoring program. If available, provide examples of objectives, performance measures, thresholds, or triggers that could be used to manage benefits associated with this priority.
The primary objectives and triggers would be the phytoplankton/zooplankton populations and the Delta smelt population response. Results in August through October time period should be highly reproducible. Monitoring for the amount of water released and phytoplankton/zooplankton. Program would rely on existing Delta smelt monitoring programs to track smelt population including actions consistent with

Priority 10: Enhance the frequency, magnitude, and duration of floodplain inundation to enhance primary and secondary productivity and the growth and survival of fish
Delta Smelt Resiliency Strategy (California Natural Resources Agency, July, 2016) as well as adaptive measures would include changes in the timing of releases, the duration and magnitude of the pulse, and the magnitude of the pulse (in cfs).
REV 5: Immediacy of ecosystem improvement actions and realization of benefits
Immediacy of ecosystem improvement: Number of months from grant encumbrance until the proposed ecosystem improvement is completed (i.e. the expected timeframe until the improvement is implemented or construction is completed).
Improvement is expected to begin in 2026 with initial pulse through the Colusa Basin Drain (48 months after grant encumbrance). Full scale operations expected in 2030.
Additional locations in the application, supporting documentation or attachments (document name, page number, table number, other) where the immediacy timeframe is described and quantified.
Sites_A3 Schedule under the FEASIBILITY AND IMPLEMENTATION RISK TAB.
Realization of ecosystem improvement: Number of months from the time the ecosystem improvement is completed (i.e. project is implemented or construction is complete), until the benefit associated with this priority can be observed (i.e. when measurable improvements can be observed and quantified)
Full realization of phytoplankton and zooplankton population improvements are anticipated in 2030, and then 2031 for improvements of Delta smelt population because of their annual life history strategy.
Additional locations in the application, supporting documentation or attachments (document name, page number, table number, other) where the realization timeframe is described and quantified.
Ecosystem Priority 10 in Sites_A2 Ecosystem Documentation under the PHYSICAL PUBLIC BENEFITS TAB
REV 6: Duration of ecosystem improvements
How long (number of years) after realization (as calculated under REV 5 above) is the ecosystem improvement expected to address this priority? Maximum is 100 years. Explain how this value was determined and whether the magnitude of the ecosystem improvement is anticipated to change over time.
The duration of the improvement is expected to be 90 years (Operations and Maintenance period for the project per the planning horizon used in the application).
Additional locations in the application, supporting documentation or attachments (document name, page number, table number, other) where the duration of the ecosystem improvement is described and quantified.
NA
REV 7: Consistency with species recovery plans and strategies, initiatives, and conservation plans
Does the ecosystem improvement meet any goals or objectives established in existing species recovery plans, initiatives, or conservation plans including but not limited to the NOAA Fisheries Recovery Plan for Sacramento River winter-run Chinook salmon, Central Valley spring-run Chinook salmon, and Central Valley steelhead; State Wildlife Action Plan; Central Valley Joint Venture Implementation Plan, San Joaquin County Multi-Species Habitat Conservation Plan and Open Space Plan, Draft Solano Multi-Species Habitat Conservation Plan, East Contra Costa County Habitat Conservation Plan/Natural Community Conservation Plan, Draft Recovery Plan for the Giant Garter Snake, and California Water Action Plan? If so which goals, objectives, or actions will be met? Why?
Action is consistent with Delta Smelt Resiliency Strategy (California Natural Resources Agency, July, 2016), specifically the north Delta foodweb adaptive management projects juvenile and sub-adult Delta Smelt and their habitats including food availability and quantity.
Additional locations in the application, supporting documentation or attachments (page number, table number, other) where the consistency with goals, objectives, or actions from recovery plans, initiative, or conservation plans are discussed.
California Natural Resources. 2016. Delta Smelt Resiliency Strategy. July 2016.

Priority 10: Enhance the frequency, magnitude, and duration of floodplain inundation to enhance primary and secondary productivity and the growth and survival of fish
REV 8: Location of ecosystem improvements and connectivity to areas already being protected or managed for conservation values
Provide a map that shows the extent of the ecosystem improvement that will address this priority (e.g. river miles that meet the temperature benefits). Provide additional instructions or clarification to reviewers who will be viewing this map (i.e. describe the color and/or label that identifies the spatial extent of the ecosystem improvement). If available, also submit supporting electronic files such as a .kmz file or ArcGIS layer associated with the maps provided.
Ecosystem Priority 10 in Sites_A2 Ecosystem Documentation under the PHYSICAL PUBLIC BENEFITS TAB
Explain why the floodplain inundation location was selected. How is this location beneficial to secondary productivity and the growth and survival of fish in the context of local environmental conditions?
This action was developed to save Delta Smelt, an indicator species of environmental health of the Sacramento-San Joaquin Delta. Floodplain inundation of the Yolo Bypass Wildlife Area would greatly benefit Delta Smelt productivity in the lower Cache Creek and lower Sacramento River, production of desirable food sources within this region in the late-summer and early-fall will be enriched. Stimulating the delta food web and pushing water high in phytoplankton (*e.g.,* chlorophyll, diatoms) and zooplankton (*e.g.,* copepod eggs) directly to Delta Smelt suitable habitats would aid in their growth and condition, thereby potentially increasing abundance over time.
Is the ecosystem improvement location adjacent to, or near, other areas already being protected or managed for conservation values? Explain the proximity of the ecosystem improvement to other areas already being protected or managed for conservation values and any hydrologic connectivity that may occur between these locations.
Liberty Island Ecological Reserve, Miner Slough Wildlife Area, Prospect Island, Brannan Island State Recreation Area.
Additional locations in the application (document name, page number, figure name or number, other) that describe the extent of the floodplain inundation benefits, the proximity of claimed improvements to other areas already being protected or managed for conservation value, and the degree to which hydrologic connections (if any) occur between claimed improvements and areas already being protected or managed for conservation value.
NA
REV 9: Efficient use of water to achieve multiple ecosystem benefits
How will water provided to address this priority be managed? Explain design efficiencies and operational strategies intended to maximize the efficiency of water allocated to ecosystem improvements that address this priority.
Conceptually, two pulses of flow at a minimum of 400 cubic feet per second each over a 2-3 week period into the Yolo Bypass from the Colusa Basin Drain past the Wallace Weir and Ridge Cut into the Tule Drain and flow through the Yolo Bypass Toe Drain and out to the Sacramento River (Pers. comm. Jerry Robbins, 2017). With losses each flow pulse made into the Colusa Basin Drain would total about 24 thousand acre feet (TAF) over each 2-3 week period for a total flow need of about 50 TAF in any one year. This management strategy may not be able to occur annually due to varying water year types, however most years would be desirable.
Additional locations in the application, supporting documentation or attachments (document name, page number, figure name or number, other) that describe the design efficiencies and operational strategies used to maximize water efficiency under this priority.
NA
REV 10: Resilience of ecosystem improvements to the effects of changing environmental conditions, including hydrologic variability and climate change.
Which environmental uncertainties associated with this priority were considered in the project siting, design, and operation? How were these uncertainties incorporated into project siting, design, or operation? Examples of environmental uncertainties include, but are not limited to: sea level rise, temperature changes, changes in precipitation, landslides, erosion, earthquakes, wildfires, drought events, and flooding events.

Priority 10: Enhance the frequency, magnitude, and duration of floodplain inundation to enhance primary and secondary productivity and the growth and survival of fish
The primary uncertainty is climate change. Results for years 2030 and 2070 using the California Water Commission climate assumptions.
Additional locations in the application, supporting documentation or attachments (document name, page number, figure name or number, other) that describe and quantify the environmental uncertainties considered in the project siting, design, and operation.
Draft EIR/EIS (https://www.sitesproject.org/information/DraftEIR-EIS): Appendices 12G Smelt analysis and 12N Yolo Bypass Flow and Fremont Weir Spill Analysis. Null, S. E., and J. H. Viers. 2013. Ecosystem Priority 11

Priority 11: Enhance the temporal and spatial distribution and diversity of habitats to support all life stages of fish and wildlife species
REV 2: Magnitude of ecosystem improvements
What is the expected magnitude of the ecosystem improvement that will address this priority? Magnitude should be expressed as: a) the change from current conditions without the project to current conditions with the project, and b) the change from 2030 conditions without the project to 2030 conditions with the project. How did you estimate this value?
Magnitude of temporal and spatial distribution and diversity of habitats will support native fishes in the Sacramento River and Yolo Bypass as described in sections below and throughout this worksheet: In the Sacramento River, temperature improvements were estimated using Upper Sacramento River HEC5Q model and the American River CE QUAL-W2 Model Sites Reservoir would provide a 4.4% (372 cubic feet per second [cfs]) long term average increase in flows in the Sacramento River at the point of diversion near Colusa that will provide habitat diversity to support fish south of the spawning area. Model results using different water year types show that there is a 7.4% (376 cfs) increase in flows in below normal years and 9% (343 cfs) increase in flows in dry years. In 2030, there is a 2.5% (228 cfs) long term average increase in flows and an 11.9% (474 cfs) increase in dry year flows. These increased flows would provide beneficial results such as a more suitable water temperature for egg incubation and fry (alevin) rearing would lead to higher survival rates of eggs and fry. Typically development of flow management standards include establishment of suitable water temperatures for fish; therefore, flow releases are managed and adjusted to improve conditions for salmon and steelhead by maintaining sufficiently low water temperatures suitable for egg incubation and fry development. Fall-run, late fall-run and winter-run Chinook salmon would greatly benefit from more flows and suitable water temperatures in the Sacramento River below Keswick Dam and at Bonnyview Bridge specifically during egg incubation period in the month of September in critical years. Spatial and temporal distribution of habitats in the Yolo Bypass in 2030 will be enhanced from 163% increase in average flows from August through October totaling 40 thousand acre-feet. Additionally, rearing habitat in the Yolo Bypass represents key habitat areas that allows for better growth rates of native fish due to increased food availability. Furthermore, seasonal hydrology of the floodplain provides a more competitive advantage to native fish thus preventing nonnative fish species to dominate. Enhanced frequency, magnitude, and duration in the Yolo Bypass would also increase primary production and therefore food availability (secondary production) for native fish, leading to better survival rates (Sommer et. al 2001).
Additional locations in the application, supporting documentation or attachments (document name, page number, table number, other) where the magnitude of the ecosystem improvement is described and quantified.
Sommer, T., Harrell, B., Nobriga, M. L., Schemel, L. 2001. California's Yolo Bypass: Evidence that flood control can be compatible with fisheries, wetlands, wildlife, and agriculture. Fisheries 26(8):6-16.
REV 3: Spatial and temporal scale of ecosystem improvements.
What is the geographical extent (e.g., river miles, acres) of the ecosystem improvement that will address this priority?
The spawning distribution of winter-run Chinook Salmon in the mainstem Sacramento River defines the spatial distribution of incubating eggs, alevins, and swim-up fry. Historical spawning data indicate that winter-run spawning occurred from Keswick Dam (River Mile [RM] 302.0) downstream to the site of Red Bluff Diversion Dam (RM 243.0), a distance of 59 miles. More recent data, however, indicate that the spawning distribution has substantially changed. Aerial redd survey data on winter-run Chinook Salmon in-river spawning from 2003 to 2015 indicate that virtually all spawning occurs from Keswick Dam downstream to Clear Creek (RM 289.3), a short distance of only 12.7 miles (U.S. Bureau of Reclamation 2016 , page 7). Over the 12-year monitoring period 88.7 percent of redds were observed upstream of the State Route 44 Bridge (RM 296.5), only 5.5 miles downstream of Keswick Dam, and 11.3 percent were observed between the State Route 44 Bridge and Clear Creek. No redds were observed downstream of Clear Creek. These data indicate that approximately 12.7 miles (rounded to 13 miles) of the Sacramento River downstream of Keswick Dam are used by winter-run for spawning and most spawning is concentrated in the uppermost approximately 5.5 miles (rounded to 6 miles) of the river downstream of Keswick Dam. Therefore, cold water is required for successful egg incubation and alevin rearing in approximately 13 miles of the Sacramento River downstream of Keswick Dam. Water temperatures with and without the proposed project can be modeled and analyzed for this 13-mile river reach. Mean monthly modeled water temperatures in 2030 with and without the project, using data from an 82-year simulation period, were examined within the mainstem Sacramento River from April through November for different water year types for various locations within the 26-mile reach downstream of Keswick Dam to the Balls Ferry Bridge (RM 276.2), given the optimum

Priority 11: Enhance the temporal and spatial distribution and diversity of habitats to support all life stages of fish and wildlife species
water temperature of 56°F for eggs and 58°F for alevins (CH2MHill River Temperature and Modeling Summary Tables and Bar Charts 2030). Note that the water temperature models used were the Upper Sacramento River HEC5 Model. This model has a calculation uncertainty (i.e., precision) of 0.5°F for mean monthly water temperature estimates. In the present analysis, decimals of a degree Fahrenheit are rounded up or down to whole degrees Fahrenheit to match the presentation of results from Richardson and Harrison (1990) presented in Vogel (2015). In the Yolo Bypass Toe Drain, enhancement of frequency, magnitude, and duration of habitat would occur. Benefits to food production would occur in the Cache Slough Complex and into the Lower Sacramento River a little upstream (tidal effects) and below where it enters the Sacramento River. Benefits are anticipated at least to the confluence with the San Joaquin River at the tip of Sherman Island.
Additional locations in the application, supporting documentation or attachments (document name, page number, figure name or number, other) where the geographical extent of the ecosystem improvement is documented or mapped.
Figure A2-1 in Ecosystem Priority 1 in Sites_A2 Ecosystem Documentation under the PHYSICAL PUBLIC BENEFITS TAB; Ecosystem Priority 10 under the PHYSICAL PUBLIC BENEFITS TAB
When during the year will the spatial distribution and diversity of habitats be enhanced to support life stages of fish and wildlife species? How is the temporal and spatial distribution and diversity of habitats likely to vary with hydrologic conditions (i.e. among water year types) a) under current conditions with and without the project, and b) in 2030 with and without the project?
For the mainstem Sacramento River from Keswick Dam to Clear Creek, the proposed project in 2030 will reduce the percentage of winter-run Chinook salmon egg and fry mortality in September and October of critically dry water years from 7 to 25 percent. The greatest temperature improvements to increase survival of salmonid eggs and fry will occur in dry and critical years, specifically. Temperature conditions are relatively unchanged in wet and above normal precipitation years. Over the long term, average flows in the Yolo Bypass from August to October would increase compared to long term conditions without the project, this is due to flow releases from Sites Reservoir.
Additional locations in the application, supporting documentation or attachments (document name, page number, table number, other) where the timing of habitat enhancements are described and quantified.
Ecosystem Priority 1 in Sites_A2 Ecosystem Documentation under the PHYSICAL PUBLIC BENEFITS TAB
REV 4: Inclusion of an adaptive management and monitoring program that includes measurable objectives, performance measures, thresholds, and triggers to achieve ecosystem benefits.
Provide additional information on how this ecosystem improvement will be incorporated into the adaptive management and monitoring program. If available, provide examples of objectives, performance measures, thresholds, or triggers that could be used to manage benefits associated with this priority.
After completion of Sites Reservoir, winter-run, spring-run, fall-run, and late fall-run Chinook salmon; and steelhead are expected to begin rebuilding in the Sacramento River with the assumption that the environment stays constant. Measurable objectives include temperatures produced in the Upper Reaches of the Sacramento River. Temperature data from monitoring programs (*e.g.,* Mainstem Sacramento River Mark-recapture Program, Upper Sacramento River Tributary Escapement Monitoring, Sacramento River Tributary Mark-Recapture Monitoring, Hatchery Broodstock and Angler Harvest Sampling) currently proposed by the California Department of Fish and Wildlife in the Sacramento River as well as existing Delta monitoring programs (*e.g.,* Interagency Ecological Program, Delta Juvenile Fish Monitoring Program, Anadromous Fish Restoration Program) can also be incorporated in the adaptive management program for Sites. Performance measures include the timing of coldwater releases from Shasta, Oroville, and Folsom to maximize benefits of the project to salmonid fish species. In the Yolo Bypass, the primary objectives and triggers would be the phytoplankton/zooplankton populations. Results in August through October time period should be highly reproducible. Monitoring for the amount of water released, nutrients, and phytoplankton/zooplankton as well as Delta smelt population. The Program will rely on existing Delta smelt monitoring programs to track smelt population including actions consistent with Delta Smelt Resiliency Strategy (California Natural Resources Agency, July, 2016) as well as adaptive measures that would include changes in the timing of releases, the duration and magnitude of the pulse (in cfs) to enhance overall habitat.
REV 5: Immediacy of ecosystem improvement actions and realization of benefits
Immediacy of ecosystem improvement: Number of months from grant encumbrance until the proposed ecosystem

Priority 11: Enhance the temporal and spatial distribution and diversity of habitats to support all life stages of fish and wildlife species
improvement is completed (i.e., the expected timeframe until the improvement is implemented or construction is completed).
Initial benefits in the Sacramento River are expected in year 2028 (6 years after investment encumbrance for construction) at a lower level than when the project is complete. Full benefits are expected in 2030 (8 years after investment encumbrance). Improvement in the Yolo Bypass is expected to begin in 2026 with initial pulse through the Colusa Basin Drain (48 months after grant encumbrance). Full scale operations expected in 2030.
Additional locations in the application, supporting documentation or attachments (document name, page number, table number, other) where the immediacy timeframe is described and quantified.
Sites_A3 Schedule under the FEASIBILITY AND IMPLEMENTATION RISK TAB.
Realization of ecosystem improvement: Number of months from the time the ecosystem improvement is completed (i.e. project is implemented or construction is complete), until the benefit associated with this priority can be observed (i.e. when measurable improvements can be observed and quantified)
In the Yolo Bypass, full realization of phytoplankton and zooplankton population improvements are anticipated in 2030, and 2031 for improvements of Delta smelt population because of their annual life history strategy.
Additional locations in the application, supporting documentation or attachments (document name, page number, table number, other) where the realization timeframe is described and quantified.
Ecosystem Priority 1 in Sites_A2 Ecosystem Documentation under the PHYSICAL PUBLIC BENEFITS TAB
REV 6: Duration of ecosystem improvements
How long (number of years) after realization (as calculated under REV 5 above) is the ecosystem improvement expected to address this priority? Maximum is 100 years. Explain how this value was determined and whether the magnitude of the ecosystem improvement is anticipated to change over time.
Anticipated duration is 100 years in the Sacramento River system. The magnitude is expected to change over time. The flows were determined using CALSIM modeling and results are provided for years 2030 and 2070. In the Yolo Bypass, the duration of the improvement is expected to be 90 years (Operations & Maintenance [O&M] period for the project per the planning horizon used in the application).
Additional locations in the application, supporting documentation or attachments (document name, page number, table number, other) where the duration of the ecosystem improvement is described and quantified.
Sites_A5 Documentation under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB
REV 7: Consistency with species recovery plans and strategies, initiatives, and conservation plans
Does the ecosystem improvement meet any goals or objectives established in existing species recovery plans, initiatives, or conservation plans including but not limited to the National Oceanic and Atmospheric Administration (NOAA) Fisheries Recovery Plan for Sacramento River winter-run Chinook salmon, Central Valley spring-run Chinook salmon, and Central Valley steelhead; State Wildlife Action Plan; Central Valley Joint Venture Implementation Plan, San Joaquin County Multi-Species Habitat Conservation Plan and Open Space Plan, Draft Solano Multi-Species Habitat Conservation Plan, East Contra Costa County Habitat Conservation Plan/Natural Community Conservation Plan, Draft Recovery Plan for the Giant Garter Snake, and California Water Action Plan? If so which goals, objectives, or actions will be met? Why?
The ecosystem improvement in the Sacramento River is consistent with two recovery actions of NOAA Fisheries Recovery Plan for Winter-run Chinook salmon, Spring-run Chinook salmon, and Central Valley steelhead in the mainstem Sacramento River (NMFS 2014). The actions in the NOAA Fisheries that will be met are: (1) to develop and apply alternative diversion technologies that reduce entrainment, and (2) evaluate and reduce stranding of juvenile chinook salmon in the channels from Keswick Dam to Colusa, due to flow reductions from Keswick Reservoir, by increasing or stabilizing releases from the reservoir. The ecosystem improvement is also consistent with three of the proposed actions listed in the Sacramento Valley Salmon Resiliency Strategy. These actions are: (1) increase productivity by improving spawning and incubation conditions (habitat and water quality); (2) increase productivity by increasing juvenile salmonid survival; and (3) support the full range of juvenile and adult migration conditions to maintain life history diversity. The project will meet these actions by providing increased flows and management of intake diversions to benefit salmonids in the Sacramento River below Keswick Dam. The project will also enhance and improve the quality of Essential Fish Habitat (EFH) for Pacific Coast Salmon (all four runs of Chinook included;

however steelhead is not part of EFH).

In the Yolo Bypass, the action is consistent with Delta Smelt Resiliency Strategy (California Natural Resources Agency, July, 2016), specifically the north Delta foodweb adaptive management projects juvenile and sub-adult Delta Smelt and their habitats including food availability and quantity.

Additional locations in the application, supporting documentation or attachments (page number, table number, other) where the consistency with goals, objectives, or actions from recovery plans, initiative, or conservation plans are discussed.

REV 8: Location of ecosystem improvements and connectivity to areas already being protected or managed for conservation values

Provide a map that shows the extent of the ecosystem improvement that will address this priority (e.g., river miles that meet the temperature benefits). Provide additional instructions or clarification to reviewers who will be viewing this map (i.e., describe the color and/or label that identifies the spatial extent of the ecosystem improvement). If available, also submit supporting electronic files such as a .kmz file or ArcGIS layer associated with the maps provided.

Figures A2-1 and A2-2 in Ecosystem Priority 1 in Sites_A2 Ecosystem Documentation under the PHYSICAL PUBLIC BENEFITS TAB

Explain why this location was selected. How is this location beneficial to life stages of fish and wildlife species in the context of local environmental conditions?

Locations are downstream from dams that have known salmonid populations downstream (Shasta, Oroville, and Folsom). Water from Sites Reservoir can be exchanged to develop more storage behind these reservoirs. Downstream from each of these dams are salmonid species natal habitat.

Yolo Bypass was selected to save Delta Smelt, an indicator species of environmental health of the Sacramento-San Joaquin Delta. Additional pulse flows in the Yolo Bypass Wildlife Area would greatly benefit Delta Smelt productivity in the lower Cache Creek and lower Sacramento River, production of desirable food sources within this region in the late-summer and early-fall will be enriched. Stimulating the delta food web and pushing water high in phytoplankton (*e.g.,* chlorophyll, diatoms) and zooplankton (*e.g.,* copepod eggs) directly to Delta Smelt suitable habitats would aid in their growth and condition, thereby potentially increasing abundance over time.

Is the ecosystem improvement location adjacent to, or near, other areas already being protected or managed for conservation values? Explain the proximity of the ecosystem improvement to other areas already being protected or managed for conservation values and any hydrologic connectivity that may occur between these locations.

Location of the ecosystem improvement are adjacent to conservation areas or are hydrologically connected to Sacramento River Wildlife Area, Nimbus and American River Hatcheries, American River Parkway Effie Yeaw Nature Center, Folsom lake State Recreation Area, Mather Regional Park, Isenberg Crane Service, Cosumnes River Preserve, Stone Lakes National Wildlife Refuge, Laguna Creek Parkway, Vic Fazio Yolo Wildlife Area, Grizzly Island Wildlife Area, Gray Lodge Wildlife Area, Bobelaine Audubon Sanctuary, Bidwell Mansion State Historic Park, Butte City project, Clay Pit State Vehicular Recreation Area, Lake Oroville State Recreation Area, Bidwell-Sacramento River State Park, Colusa-Sacramento River State Recreation Area, Brannan Island State Recreation Area, and Delta Meadows.

Additional locations in the application, supporting documentation or attachments (document name, page number, table number, other) that describe and quantify the extent of habitat benefits, the proximity of claimed improvements to other areas already being protected or managed for conservation value, and the degree to which hydrologic connections (if any) occur between claimed improvements and areas already being protected or managed for conservation value.

REV 9: Efficient use of water to achieve multiple ecosystem benefits

If applicable, how will water provided to address this priority be managed? Explain design efficiencies and operational strategies intended to maximize the efficiency of water allocated to ecosystem improvements that address this priority.

Water released for this purpose will be subsequently released as Delta outflow or will be recaptured using the Delevan Intake Pumping Plant and stored in Sites EESA storage.

Priority 11: Enhance the temporal and spatial distribution and diversity of habitats to support all life stages of fish and wildlife species
Additional locations in the application, supporting documentation or attachments (document name, page number, figure name or number, other) that describe the design efficiencies and operational strategies used to maximize water efficiency under this priority.
NA
REV 10: Resilience of ecosystem improvements to the effects of changing environmental conditions, including hydrologic variability and climate change.
Which environmental uncertainties associated with this priority were considered in the project siting, design, and operation? How were these uncertainties incorporated into project siting, design, or operation? Examples of environmental uncertainties include, but are not limited to: sea level rise, temperature changes, changes in precipitation, landslides, erosion, earthquakes, wildfires, drought events, and flooding events.
The primary uncertainty is climate change. Results for years 2030 and 2070 using the California Water Commission climate assumptions.
Additional locations in the application, supporting documentation or attachments (document name, page number, figure name or number, other) that describe and quantify the environmental uncertainties considered in the project siting, design, and operation.

Ecosystem Priority 14

Priority 14: Provide water to enhance seasonal wetlands, permanent wetlands, and riparian habitat for aquatic and terrestrial species on State and Federal wildlife refuges and on other public and private lands
REV 2: Magnitude of ecosystem improvements
What is the expected magnitude of the ecosystem improvement that will address this priority? Magnitude should be expressed as: a) the change from current conditions without the project to current conditions with the project, and b) the change from 2030 conditions without the project to 2030 conditions with the project. How did you estimate this value?

The Sites Project will provide ecosystem benefits to terrestrial species using State and Federal wildlife refuges and private ricelands of the Central Valley. These benefits are described below.

Refuges

Under current conditions, dry and critically dry years pose significant challenges to managing habitat for terrestrial wildlife dependent on wetlands and riparian habitat in Central Valley refuges within the Central Valley Project Improvement Act (CVPIA) Refuge Water Supply Program (RWSP) The RWSP wetland habitat areas include 12 federal National Wildlife Refuges (NWRs), six State Wildlife Areas, and one privately managed refuge (CDFW 2017). These 19 refuges in the RWSP currently receive approximately 433 thousand acre feet (TAF) Level 2 water supplies, and incremental Level 4 water supplies of an additional 133 TAF (CDFW 2017). From 2005 – 2014 only 43% of Incremental Level 4 allocations were acquired and delivered each year to refuges (CDFW 2017).

Refuges of the Sacramento NWR Complex, including the Sacramento, Colusa, and Delevan NWRs, provide critical managed wetland habitat for many water-dependent wildlife species (USFWS 2009). Drought contingency actions for the Sacramento, Colusa and Delevan NWRs during dry and critically dry years vary depending on the severity of the reduced water allocations, as well as the timing within the water year when the cutback is finalized (USFWS 2011a, 2011b, 2011c). If water allocations are reduced to 25% of normal deliveries at Sacramento, Colusa and Delevan NWRs during dry or critically dry years, the drought contingency plans for all three refuges call for adjustments to wetland management practices, with the substantial impacts on wetland habitat and wetland dependent species (USFWS 2011a, 2011b, 2011c). Attachment A provides details on the impacts of reduced water deliveries on habitat and wildlife at these refuges.

The project would provide additional water in dry and critically dry years to avoid these adverse impacts to seasonal and permanent wetlands and to wetland-dependent wildlife on refuges. The amount of water allocated to the Sacramento, Colusa, and Delevan NWRs and the other refuges in the RWSP is uncertain, but as shown in Sites_A2 Ecosystem Documentation under the PHYSICAL PUBLIC BENEFITS TAB, additional Level 2 and Level 4 water would be available with the highest deliveries in wet, above normal, and below normal years. Attachment 2 summarizes CalSim II Model Runs conducted on June 21, 2017 and shows the net increase in water supply available for all refuges with implementation of the project, and describes how refuges in in the Mendota Pool and the Tulare Basin could also benefit from additional deliveries from the Sites Project.

Deliveries of additional Level 2 and Level 4 water during dry and critically dry years would avoid loss of up to 10,867 acres of wetland habitat on the Sacramento, Colusa, and Delevan NWRs, and the other direct and indirect impacts of reduced water availability described above.

Ricelands

Surface water delivered by the Central Valley Project (CVP) and State Water Project (SWP) provide much of the water for rice and other agricultural uses, and for management of wetlands in the Central Valley; water supply shortages from the CVP and SWP during dry and critically dry years negatively affect waterfowl and waterbird habitats, reduce food resources, and lower the carrying capacity of the Central Valley for wintering waterfowl (Petrie et al. 2016). Attachment A provides additional information about the value of ricelands to waterfowl and waterbirds.

Decisions by rice producers about how many acres to plant in rice are complex and based on a number of variables, but in dry and critical years more water would likely increase acreage of rice planted (Buttner 2017 personal communication). In the drought year of 2014, rice acreage in California was reduced by 133,000 acres, falling 24% from an average of 567,000 acres in 2010–13 to just 434,000 acres in 2014 (PPIC 2015, U.S. Department of Agriculture (USDA), National Agricultural Statistics Service, California Acreage Reports), reducing the acreage of foraging habitat for wintering waterfowl.

The Sites Project would provide additional water in dry and critically dry years to reduce adverse impacts to waterfowl and other waterbirds dependent associated with reduced acreage of ricelands. As shown in Sites_A2 Ecosystem Documentation under the PHYSICAL PUBLIC BENEFITS TAB, additional water would be available to support rice plantings in dry and critically dry years with implementation of the project.

Deliveries of additional agricultural water to rice producers during dry and critically dry years could avoid reductions in acreage of ricelands in the Central Valley. The extent of the increase would depend on many factors, but in dry and critically dry years

Priority 14: Provide water to enhance seasonal wetlands, permanent wetlands, and riparian habitat for aquatic and terrestrial species on State and Federal wildlife refuges and on other public and private lands
could exceed 100,000 acres, based on the decrease in acreage of rice during the drought year of 2014.
Additional locations in the application, supporting documentation or attachments (document name, page number, table number, other) where the magnitude of the ecosystem improvement is described and quantified.

When during the year will water be provided for seasonal wetlands, permanent wetlands, and riparian habitat? How are seasonal wetlands, permanent wetlands, and riparian habitat likely to vary with hydrologic conditions (i.e. among water year types) a) under current conditions with and without the project, and b) in 2030 with and without the project?

Priority 14: Provide water to enhance seasonal wetlands, permanent wetlands, and riparian habitat for aquatic and terrestrial species on State and Federal wildlife refuges and on other public and private lands

Refuges

Water is applied to seasonal and permanent wetlands in all months of the year except February, for a total of 12,850 af, 5,987 af, and 5,000 af for Sacramento, Delevan, and Colusa, respectively. Peak seasonal water use for wetlands on the refuges peaks in late fall in dry and critically dry years. Refuge managers and biologists strategize constantly for the optimal use of water to continue to meet the refuges' conservation goals. Typically staff is flexible with water usage so water conserved early in the season can be used later in the season to support migratory bird populations and meet management objectives to the extent possible.

Ricelands

In dry and critically dry years additional water supply from the project would typically be provided in April and May to flood up rice fields.

Additional locations in the application, supporting documentation or attachments (document name, page number, table number, other) where the timing of water releases for seasonal wetlands, permanent wetlands, or riparian habitat improvements are described and quantified.

CalSim II Model Runs for WSIP 2030 Sites Reservoir Regional_Deliveries_WSIP_2030_With_Project_vs_Without_Project. Updated June 21, 2017

REV 4: Inclusion of an adaptive management and monitoring program that includes measurable objectives, performance measures, thresholds, and triggers to achieve ecosystem benefits.

Provide additional information on how this ecosystem improvement will be incorporated into the adaptive management and monitoring program. If available, provide examples of objectives, performance measures, thresholds, or triggers that could be used to manage benefits associated with this priority.

Refuges

Measurable objectives include an annual assessment of the acreage of seasonal and permanent wetlands and waterfowl numbers at the refuges. The NWR System has a legal mandate to monitor the status and trends of fish, wildlife, and plant populations on refuges. Every year Refuge Managers at the Sacramento NWR Complex review the outcome of the previous year's habitat management plan and compile data on the extent of wetlands and other habitat types on each refuge. This process also involves a planning team visiting each habitat unit on each refuge to document the previous year's accomplishments, establish needs and develop plans for the upcoming year. In addition, waterfowl surveys are usually conducted monthly by refuge biologists from October through February, including counts of birds that may be affected by disease. These findings are compiled to produce the current year's habitat management plan for each refuge.

Ricelands

Measurable objectives include an annual assessment of the acreage of rice planted in the Central Valley in dry and critically dry years.

REV 5: Immediacy of ecosystem improvement actions and realization of benefits

Immediacy of ecosystem improvement: Number of months from grant encumbrance until the proposed ecosystem improvement is completed (i.e., the expected timeframe until the improvement is implemented or construction is completed).

Initial benefits are expected during dry and critically dry years starting in year 2028 (6 years after grant encumbrance for construction). Full benefits are expected in 2030 (8 years after grant encumbrance).

Additional locations in the application, supporting documentation or attachments (document name, page number, table number, other) where the immediacy timeframe is described and quantified.

Sites_A3 Schedule under the FEASIBILITY AND IMPLEMENTATION RISK TAB

Realization of ecosystem improvement: Number of months from the time the ecosystem improvement is completed (i.e. project is implemented or construction is complete), until the benefit associated with this priority can be observed (i.e. when measurable improvements can be observed and quantified)

Benefits of additional water supply will be observed and quantified during dry and critically dry years.

Additional locations in the application, supporting documentation or attachments (document name, page number, table number, other) where the realization timeframe is described and quantified.

- USFWS 2011b. Colusa National Wildlife Refuge Water Management Plan
- USFWS 2011c. Delevan National Wildlife Refuge Water Management Plan

REV 6: Duration of ecosystem improvements

How long (number of years) after realization (as calculated under REV 5 above) is the ecosystem improvement expected to address this priority? Maximum is 100 years. Explain how this value was determined and whether the magnitude of the ecosystem improvement is anticipated to change over time.

Refuges

Benefits of additional water supply for wetlands and wildlife dependent on wetlands will be observed for the duration of the Sacramento, Colusa, and Delevan NWRs's existence in dry and critically dry years.

Ricelands

Benefits of additional water supply for ricelands, and the waterbirds and waterfowl dependent on them, would be observed for the duration of the project as long as rice production occurs in the Central Valley.

Additional locations in the application, supporting documentation or attachments (document name, page number, table number, other) where the duration of the ecosystem improvement is described and quantified.

REV 7: Consistency with species recovery plans and strategies, initiatives, and conservation plans

Priority 14: Provide water to enhance seasonal wetlands, permanent wetlands, and riparian habitat for aquatic and terrestrial species on State and Federal wildlife refuges and on other public and private lands
Does the ecosystem improvement meet any goals or objectives established in existing species recovery plans, initiatives, or conservation plans including but not limited to the National Oceanic and Atmospheric Administration (NOAA) Fisheries Recovery Plan for Sacramento River winter-run Chinook salmon, Central Valley spring-run Chinook salmon, and Central Valley steelhead; State Wildlife Action Plan; Central Valley Joint Venture Implementation Plan, San Joaquin County Multi-Species Habitat Conservation Plan and Open Space Plan, Draft Solano Multi-Species Habitat Conservation Plan, East Contra Costa County Habitat Conservation Plan/Natural Community Conservation Plan, Draft Recovery Plan for the Giant Garter Snake, and California Water Action Plan? If so which goals, objectives, or actions will be met? Why?
Improving water supply to refuges during dry years to enhance habitat and support waterfowl, shorebirds, and other wildlife dependent on seasonal and permanent wetlands is consistent with goals and objectives described in the following conservation plans • Migratory Habitat Enhancement Plan - 2014 • North American Waterfowl Management Plan - 2012 • U.S. Shorebird Conservation Plan – 2001 • Central Valley Joint Venture Implementation Plan – Conserving Bird Habitat • California Wildlife Action Plan Improving water supply to refuges during dry years is also consistent with recovery goals described in • Draft Recovery Plan for the Giant Garter Snake • Conservation Plan for the Tricolored Blackbird
Additional locations in the application, supporting documentation or attachments (page number, table number, other) where the consistency with goals, objectives, or actions from recovery plans, initiative, or conservation plans are discussed.
Refuges Improving water supply to refuges during dry years is also consistent with conservation and recovery goals described in • North American Waterfowl Management Plan - 2012 (page 2) • U.S. Shorebird Conservation Plan – 2001 (page 30) • Central Valley Joint Venture Implementation Plan – Conserving Bird Habitat (Chapter 10) • California Wildlife Action Plan (Executive Summary page 2) • Draft Recovery Plan for the Giant Garter Snake (page 9) • Conservation Plan for the Tricolored Blackbird (page 11) **Ricelands** Improving water supply to ricelands during dry years is also consistent with conservation and recovery goals described in • Migratory Habitat Enhancement Plan 2014 – (Figure 2, page 6) • North American Waterfowl Management Plan – 2012 (page 2) • U.S. Shorebird Conservation Plan – 2001 (page 30) • Central Valley Joint Venture Implementation Plan – Conserving Bird Habitat (Chapter 10) • California Wildlife Action Plan (Executive Summary page 2) • Draft Recovery Plan for the Giant Garter Snake (page 40) • Conservation Plan for the Tricolored Blackbird (page 27)
REV 8: Location of ecosystem improvements and connectivity to areas already being protected or managed for conservation values
Provide a map that shows the extent of the ecosystem improvement that will address this priority (e.g., river miles that meet the temperature benefits). Provide additional instructions or clarification to reviewers who will be viewing this map (i.e., describe the color and/or label that identifies the spatial extent of the ecosystem improvement). If available, also submit supporting electronic files such as a .kmz file or ArcGIS layer associated with the maps provided.

Priority 14: Provide water to enhance seasonal wetlands, permanent wetlands, and riparian habitat for aquatic and terrestrial species on State and Federal wildlife refuges and on other public and private lands
Refuges USFWS 2009 • Overview map of refuges, page 1 • Table 4. Acreage and habitats of Sacramento National Refuge Complex, page 51 • Figure 6. Sacramento Refuge Habitat Management, page 52 • Figure 7. Delevan Refuge Habitat Management, page 53 • Figure 8. Colusa Refuge Habitat Management, page 54 **Ricelands** • Migratory Habitat Enhancement Plan 2014 – (Figure 2, page 6)
Explain why this location was selected. How does this location enhance seasonal wetlands, permanent wetlands, and riparian habitat for aquatic and terrestrial species in the context of local environmental conditions?
Refuges Seasonal and permanent wetlands in the Sacramento NW are managed specifically for enhancement of seasonal and permanent wetland habitat for the benefit of waterfowl, shorebirds, and special-status wildlife species. **Ricelands** The ricelands of California were selected as a target for ecosystem priority because they provide crucial wintering habitat for waterfowl and waterbirds on the Pacific Flyway, supporting the majority of Flyway population in some years (Migratory Bird Partnership 2014). Ricelands are indispensable components of waterbird habitat; residual rice, weed seeds, and invertebrates provide food for many avian species during fall and winter (Eadie et al. 2008). Ricelands also provide breeding habitat for a variety of birds, and rice fields that are flooded after harvest (i.e., winter flooded) to decompose rice straw provide many of the same habitat values for waterfowl as the wetlands that they replaced.
Is the ecosystem improvement location adjacent to, within, or near, other areas already being protected or managed for conservation values? Explain the proximity of the ecosystem improvement to other areas already being protected or managed for conservation values and any hydrologic connectivity that may occur between these locations.
Refuges The refuges in the Sacramento NWR complex are all protected and managed by the USFWS for conservation values. **Ricelands** The Sacramento, Delevan, Colusa, and Sutter National Wildlife Refuges (collectively, the Sacramento NWFs) are generally surrounded by irrigated rice lands (USFWS 2009) and originally the refuges were established to manage land and provide lure crops for ducks that depredated neighboring rice fields. Migratory birds and a number of other wildlife commonly spend time both on refuges and nearby privately owned rice fields, often on a daily basis. The Sacramento NWR and adjacent ricelands are often hydrologically connected by the networks of canals that supply water to both.
Additional locations in the application, supporting documentation or attachments (document name, page number, figure name or number, other) that describe and quantify the spatial extent of the ecosystem improvement, the proximity of the ecosystem improvement to other areas already being protected or managed for conservation value, and the degree to which hydrologic connections (if any) occur between the ecosystem improvement and areas already being protected or managed for conservation value.
Refuges • USFWS 2009. Sacramento, Delevan, Colusa, and Sutter National Wildlife Refuges. Final Comprehensive Conservation Plan and Environmental Assessment. REV 9: Efficient use of water to achieve multiple ecosystem benefits

How will water provided to address this priority be managed? Explain design efficiencies and operational strategies intended to maximize the efficiency of water allocated to ecosystem improvements that address this priority.

Refuges

Refuge managers and biologists strategize constantly for the optimal use of water to continue to meet the refuges' conservation goals. Typically staff is flexible with water usage so water conserved early in the season can be used later in the season to support migratory bird populations and meet management objectives to the extent possible.

Ricelands

Funding and agreements to foster ecosystem and wildlife benefits of ricelands is currently available through the US Department of Agriculture's Natural Resources Conservation Service (NRCS) Waterbird Habitat Enhancement Program (WHEP). The goal of WHEP is to enhance habitat on 100,000 acres of California ricelands, and has been supported by $10 million of federal funds (Migratory Bird Conservation Partnership 2014). The WHEP has successfully enrolled nearly 20 percent of California's 550,000 acres of rice in bird-friendly farming practices. WHEP relies on short-term funding sources, and to secure a more sustainable funding source, the California Rice Commission, Audubon California, Point Blue Conservation Science and The Nature Conservancy are working with NRCS and other parties to develop sustainable conservation programs to continue to incentive the kind of bird-friendly farming practices such as those supported by WHEP.

Additional locations in the application, supporting documentation or attachments (document name, page number, figure name or number, other) that describe the design efficiencies and operational strategies used to maximize water efficiency under this priority.

REV 10: Resilience of ecosystem improvements to the effects of changing environmental conditions, including hydrologic variability and climate change.

Which environmental uncertainties associated with this priority were considered in the project siting, design, and operation? How were these uncertainties incorporated into project siting, design, or operation? Examples of environmental uncertainties include, but are not limited to: sea level rise, temperature changes, changes in precipitation, landslides, erosion, earthquakes, wildfires, drought events, and flooding events.

Climate change and associated increased frequency of dry and critically dry years is the primary source of uncertainty. Long term modeling of climate change suggests that 34–38% of years may be classified as dry and critically dry years in the Sacramento Valley, and 66–69% may be classified as dry and critically dry years in the San Joaquin Valley by the end of the 21st century (Null and Viers 2013).

Additional locations in the application, supporting documentation or attachments (document name, page number, figure name or number, other) that describe and quantify the environmental uncertainties considered in the project siting, design, and operation.

Priority 14: Provide water to enhance seasonal wetlands, permanent wetlands, and riparian habitat for aquatic and terrestrial species on State and Federal wildlife refuges and on other public and private lands
Research, 49, doi:10.1002/wrcr.20097.

Ecosystem Priority 15

Priority 15: Develop and implement invasive species management plans utilizing techniques that are supported by best available science to enhance habitat and increase the survival of native species
Species Information
What invasive species are you targeting?
Yellow star thistle (*Centaurea solstitialis*)
Additional locations in the application, supporting documentation or attachments (document name, page number, table number, other) where the biology of the invasive species and their impacts on native fish and wildlife are described and quantified.
Ecosystem Priority 15 in Sites_A2 Ecosystem Documentation under the PHYSICAL PUBLIC BENEFITS TAB
REV 2: Magnitude of ecosystem improvements
When implemented what is the expected magnitude of habitat enhancement and increased survival of native species? Magnitude should be expressed as: a) the change from current conditions without the project to current conditions with the project, and b) the change from 2030 conditions without the project to 2030 conditions with the project. How did you estimate this value? If the project intends to target multiple invasive species, the magnitude of the ecosystem improvement for each species needs to be provided.
The approximate acreage of the valley extending from Golden Gate Dam to Funks Reservoir was determined. Except for vegetation on the shore of Funks Creek, this area is covered in star thistle. Habitat enhancement would be accomplished between 2028 and 2030. Once the habitat is established it will be maintained for the 100 year planning horizon. The restoration of native prairie would increase the value to native species, including providing forage habitat for golden eagles.
Additional locations in the application, supporting documentation or attachments (document name, page number, table number, other) where the magnitude of the ecosystem improvement is described and quantified.
Ecosystem Priority 15 in Sites_A2 Ecosystem Documentation under the PHYSICAL PUBLIC BENEFITS TAB
REV 3: Spatial and temporal scale of ecosystem improvements.
What is the geographical extent (e.g., river miles, acres) of the ecosystem improvement that will address this priority?
90 Acres
Additional locations in the application, supporting documentation or attachments (document name, page number, figure name or number, other) where the geographical extent of the ecosystem improvement is documented or mapped.
Ecosystem Priority 15 in Sites_A2 Ecosystem Documentation under the PHYSICAL PUBLIC BENEFITS TAB
When during the year will the project manage invasive species for the benefit of native species? How is the distribution of invasive species likely to vary with hydrologic conditions (i.e., among water year types) a) under current conditions with and without the project, and b) in 2030 with and without the project? If the project intends to target multiple invasive species, provide the timing of management actions for each invasive species separately.
Year round improvement regardless of hydrologic conditions.
Additional locations in the application, supporting documentation or attachments (document name, page number, table number, other) where the timing of ecosystem improvements that address this priority are described and quantified.
Ecosystem Priority 15 in Sites_A2 Ecosystem Documentation under the PHYSICAL PUBLIC BENEFITS TAB
REV 4: Inclusion of an adaptive management and monitoring program that includes measurable objectives, performance measures, thresholds, and triggers to achieve ecosystem benefits.
Provide additional information on how this ecosystem improvement will be incorporated into the adaptive management and monitoring program. If available, provide examples of objectives, performance measures, thresholds, or triggers that could be

Priority 15: Develop and implement invasive species management plans utilizing techniques that are supported by best available science to enhance habitat and increase the survival of native species
used to manage benefits associated with this priority.
The restored area will be surveyed monthly during the initial establishment of native prairie and then surveyed annually. Adaptive management will consist of removing any invasive plants and reseeding with native species.
REV 5: Immediacy of ecosystem improvement actions and realization of benefits
Immediacy of ecosystem improvement: Number of months from grant encumbrance until the proposed ecosystem improvement is completed (i.e., the expected timeframe until the improvement is implemented or construction is completed).
Approximately 108 months.
Additional locations in the application, supporting documentation or attachments (document name, page number, table number, other) where the immediacy timeframe is described and quantified.
Ecosystem Priority 15 in Sites_A2 Ecosystem Documentation under the PHYSICAL PUBLIC BENEFITS TAB
Realization of ecosystem improvement: Number of months from the time the ecosystem improvement is completed (i.e. project is implemented or construction is complete), until the benefit associated with this priority can be observed (i.e. when measurable improvements can be observed and quantified)
Once the area is reseeded the benefit is immediate.
Additional locations in the application, supporting documentation or attachments (document name, page number, table number, other) where the realization timeframe is described and quantified.
Ecosystem Priority 15 in Sites_A2 Ecosystem Documentation under the PHYSICAL PUBLIC BENEFITS TAB
REV 6: Duration of ecosystem improvements
How long (number of years) after realization (as calculated under REV 5 above) is the ecosystem improvement expected to address this priority? Maximum is 100 years. Explain how this value was determined and whether the magnitude of the ecosystem improvement is anticipated to change over time.
100 years. The Authority has budgeted mitigation funds that can be used for this purpose. Future funding may also be obtained through grants.
Additional locations in the application, supporting documentation or attachments (document name, page number, table number, other) where the duration of the ecosystem improvement is described and quantified.
Ecosystem Priority 15 in Sites_A2 Ecosystem Documentation under the PHYSICAL PUBLIC BENEFITS TAB
REV 7: Consistency with species recovery plans and strategies, initiatives, and conservation plans
Does the ecosystem improvement meet any goals or objectives established in existing species recovery plans, initiatives, or conservation plans including but not limited to the National Oceanic and Atmospheric Administration (NOAA) Fisheries Recovery Plan for Sacramento River winter-run Chinook salmon, Central Valley spring-run Chinook salmon, and Central Valley steelhead; State Wildlife Action Plan; Central Valley Joint Venture Implementation Plan, San Joaquin County Multi-Species Habitat Conservation Plan and Open Space Plan, Draft Solano Multi-Species Habitat Conservation Plan, East Contra Costa County Habitat Conservation Plan/Natural Community Conservation Plan, Draft Recovery Plan for the Giant Garter Snake, and California Water Action Plan? If so which goals, objectives, or actions will be met? Why?
No
Additional locations in the application, supporting documentation or attachments (page number, table number, other) where the consistency with goals, objectives, or actions from recovery plans, initiative, or conservation plans are discussed.
NA
REV 8: Location of ecosystem improvements and connectivity to areas already being protected or managed for conservation values
Provide a map that shows the extent of the ecosystem improvement that will address this priority (e.g., river miles that meet the temperature benefits). Provide additional instructions or clarification to reviewers who will be viewing this map (i.e., describe the

Priority 15: Develop and implement invasive species management plans utilizing techniques that are supported by best available science to enhance habitat and increase the survival of native species
color and/or label that identifies the spatial extent of the ecosystem improvement). If available, also submit supporting electronic files such as a .kmz file or ArcGIS layer associated with the maps provided.
The map is provided in Ecosystem Priority 15 in Sites_A2 Ecosystem Documentation under the PHYSICAL PUBLIC BENEFITS TAB
Explain why the location of invasive species management was selected. How is the location beneficial to the survival of native species in the context of local environmental conditions and species' needs?
The location is on property that will be acquired for construction of project facilities and will remain in the control of the Authority. The property is currently overrun with yellow star thistle.
Is the ecosystem improvement location adjacent to, or near, other areas already being protected or managed for conservation values? Explain the proximity of the ecosystem improvement to other areas already being protected or managed for conservation values and any hydrologic connectivity that may occur between these locations.
This area is near the proposed Stone Corral recreation area that will be managed for conservation values; however, the area to be restored as prairie will not be accessible to the general public.
Additional locations in the application, supporting documentation or attachments (document name, page number, table number, other) where the timing of ecosystem improvements that address this priority are described and quantified.
Ecosystem Priority 15 in Sites_A2 Ecosystem Documentation under the PHYSICAL PUBLIC BENEFITS TAB
REV 9: Efficient use of water to achieve multiple ecosystem benefits
If applicable, how will water be efficiently managed to implement invasive species management?
Water for establishing native vegetation will most likely be taken from Holthouse Reservoir, a project facility.
Additional locations in the application, supporting documentation or attachments (document name, page number, figure name or number, other) that describe the design efficiencies and operational strategies used to maximize water efficiency under this priority.
NA
REV 10: Resilience of ecosystem improvements to the effects of changing environmental conditions, including hydrologic variability and climate change.
Which environmental uncertainties associated with this priority were considered in the project siting, design, and operation? How were these uncertainties incorporated into project siting, design, or operation? Examples of environmental uncertainties include, but are not limited to: sea level rise, temperature changes, changes in precipitation, landslides, erosion, earthquakes, wildfires, drought events, and flooding events.
Affects choice of native species for re-seeding.
Additional locations in the application, supporting documentation or attachments (document name, page number, figure name or number, other) that describe and quantify the environmental uncertainties considered in the project siting, design, and operation.
Ecosystem Priority 15 in Sites_A2 Ecosystem Documentation under the PHYSICAL PUBLIC BENEFITS TAB

Ecosystem Priority 16

Priority 16: Enhance habitat for native species that have commercial, recreational, scientific, or educational uses
REV 2: Magnitude of ecosystem improvements
What is the expected magnitude of the ecosystem improvement that will address this priority? Magnitude should be expressed as: a) the change from current conditions without the project to current conditions with the project, and b) the change from 2030 conditions without the project to 2030 conditions with the project. How did you estimate this value?

Under current conditions, dry and critically dry years pose significant challenges to managing habitat for terrestrial wildlife dependent on wetlands and riparian habitat in Central Valley refuges within the Central Valley Project Improvement Act (CVPIA) Refuge Water Supply Program (RWSP) The RWSP wetland habitat areas include 12 federal National Wildlife Refuges (NWRs), six State Wildlife Areas, and one privately managed refuge (CDFW 2017). These 19 refuges in the RWSP currently receive approximately 433 thousand acre feet (TAF) Level 2 water supplies, and incremental Level 4 water supplies of an additional 133 TAF (CDFW 2017). From 2005 – 2014 only 43% of Incremental Level 4 allocations were acquired and delivered each year to refuges (CDFW 2017).

Refuges of the Sacramento NWR Complex , including the Sacramento, Colusa, and Delevan NWRs, provide critical managed wetland habitat for many water-dependent wildlife species, including snow geese, northern pintail, white-faced ibis, sandhill crane, and giant-garter snake (USFWS 2009). Drought contingency actions for the Sacramento, Colusa and Delevan NWRs during dry and critically dry years vary depending on the severity of the reduced water allocations, as well as the timing within the water year when the cutback is finalized (USFWS 2011a, 2011b, 2011c). If water allocations are reduced to 25% of normal deliveries at Sacramento, Colusa and Delevan NWRs during dry or critically dry years, the drought contingency plans for all three refuges call for adjustments to wetland management practices, with the following impacts on wetland habitat and wetland dependent species (USFWS 2011a, 2011b, 2011c):

For 50% of normal deliveries, wetland acreage at the three refuges would be reduced by 30–50%. Composite acreages of seasonal and permanent wetlands at all three refuges totals 15,525 acres (based on 2010 data), which includes 13,722 acres of seasonal wetlands (timothy grass and water grass) and 1,803 acres of permanent and semi-permanent wetland/brood ponds. A 30–50% reduction for permanent and seasonal wetlands would amount to a loss of 4,658 to7,762 acres. For 25% of normal deliveries, total wetland acreage at the three refuges would be reduced by 60–70%, amounting to loss of 9,315 to 10,867 acres. In addition to the direct loss of wetlands, longer term impacts would also occur to future wetland habitat quality throughout the refuges. Loss of permanent pond acreage would be 80% for both the 50% and 25% reductions of normal deliveries. Other impacts on habitat and wildlife of reductions to 50 to 25% of normal deliveries include:

- Very early spring draw-downs of wetlands which severely limits shorebird habitat and results in poor germination for important wildlife and waterfowl plants.
- Loss of permanent pond acreage adversely affects habitat for special-status species such as giant garter snakes, tricolored blackbirds, western pond turtles, and for duck broods.
- Complete elimination of irrigation for annual food plants and control of invasive species such as cocklebur, resulting in increased mowing/diesel fuel consumption to mitigate.
- Flood-ups delayed on remaining acreage, resulting in widespread crop depredation in nearby agricultural lands.
- Extreme waterfowl crowding and disease risk (avian botulism (Type C) and avian cholera).
- Reduced public use on all refuge habitats reduced (or eliminated for 25% of water delivery scenario) other than having the Sacramento NWR visitor center open, and visitor use would decrease to a fraction of normal.

The project would provide additional water, with the highest deliveries in wet, above normal, and below normal years to reduce adverse impacts to seasonal and permanent wetlands and to wetland-dependent wildlife on refuges. The amount of water allocated to the Sacramento, Colusa, and Delevan NWRs and the other refuges in the RWSP is uncertain, but as shown in Sites_A2 Ecosystem Documentation under the PHYSICAL PUBLIC BENEFITS TAB, additional Level 2 and Level 4 water would be available in dry and critically dry years. Sites_A2 Ecosystem Documentation under the PHYSICAL PUBLIC BENEFITS TAB summarizes CalSim II Model Runs conducted on June 21, 2017 and shows the net increase in water supply available for all refuges with implementation of the project.

Deliveries of additional Level 2 and Level 4 water during dry and critically dry years would avoid loss of up to 10,867 acres of wetland habitat on the Sacramento, Colusa, and Delevan NWRs, and the other direct and indirect impacts of reduced water availability described above.

Sites_A2 Ecosystem Documentation under the PHYSICAL PUBLIC BENEFITS TAB lists the native species that occur on the Sacramento NWR Complex refuges and which have commercial, recreational, scientific, or educational uses and values, and

Priority 16: Enhance habitat for native species that have commercial, recreational, scientific, or educational uses
would benefit from implementation of the project.
Additional locations in the application, supporting documentation or attachments (document name, page number, table number, other) where the magnitude of the ecosystem improvement is described and quantified.
CalSim II Model Runs for WSIP 2030 Sites Reservoir Regional_Deliveries_WSIP_2030_With_Project_vs_Without_Project. Updated June 21, 2017 CDFW 2017. Refuge Water Supply Program Overview. REV 3: Spatial and temporal scale of ecosystem improvements.
What is the geographical extent (e.g., river miles, acres) of the ecosystem improvement that will address this priority?
• Sacramento National Wildlife Refuge - 10,819 acres • Colusa National Wildlife Refuge - 4,686 acres • Delevan National Wildlife Refuge - 5,877 acres.
Additional locations in the application, supporting documentation or attachments (document name, page number, figure name or number, other) where the geographical extent of the ecosystem improvement is documented or mapped.
USFWS 2009 • Overview map of refuges, page 1 • Table 4. Acreage and habitats of Sacramento National Refuge Complex, page 51 • Figure 6. Sacramento Refuge Habitat Management, page 52 • Figure 7. Delevan Refuge Habitat Management, page 53 • Figure 8. Colusa Refuge Habitat Management, page 54
When during the year will the project enhance habitat for native species that have commercial, recreational, scientific or educational uses? How is habitat for native species likely to vary with hydrologic conditions (i.e., among water year types) a) under current conditions with and without the project, and b) in 2030 with and without the project?
In dry years, with 25% of water allocations, water is applied to seasonal and permanent wetlands in all months of the year except February, for a total of 12,850 acre feet (af), 5,987 af, and 5,000 af for Sacramento, Delevan, and Colusa, respectively. Peak seasonal water use for wetlands on the refuges peaks in late fall in dry and critically dry years. Refuge managers and biologists strategize constantly for the optimal use of water to continue to meet the refuges' conservation goals. Typically staff is flexible with water usage so water conserved early in the season can be used later in the season to support migratory bird populations and meet management objectives to the extent possible.

Priority 16: Enhance habitat for native species that have commercial, recreational, scientific, or educational uses
USFWS 2011c. Delevan National Wildlife Refuge Water Management Plan: Drought Contingency Plan • Table 3. 50% Anticipated Water Use Schedule • Table 4. 25% Anticipated Water Use Schedule
REV 4: Inclusion of an adaptive management and monitoring program that includes measurable objectives, performance measures, thresholds, and triggers to achieve ecosystem benefits.
Provide additional information on how this ecosystem improvement will be incorporated into the adaptive management and monitoring program. If available, provide examples of objectives, performance measures, thresholds, or triggers that could be used to manage benefits associated with this priority.
Every year Refuge Managers at the Sacramento NWR Complex review the outcome of the previous year's habitat management plan, a process that involves a planning team visiting each habitat unit on each refuge to document the previous year's accomplishments, establish needs and develop plans for the upcoming year. These findings are compiled to produce the current year's habitat management plan for each refuge. Waterfowl surveys are usually conducted monthly by refuge biologists from October through February.
REV 5: Immediacy of ecosystem improvement actions and realization of benefits
Immediacy of ecosystem improvement: Number of months from grant encumbrance until the proposed ecosystem improvement is completed (i.e., the expected timeframe until the improvement is implemented or construction is completed).
Initial benefits are expected during dry and critically dry years starting in year 2028 (6 years after grant encumbrance for construction). Full benefits are expected in 2030 (8 years after grant encumbrance).
Additional locations in the application, supporting documentation or attachments (document name, page number, table number, other) where the immediacy timeframe is described and quantified.
Sites_A3 Schedule under the FEASIBILITY AND IMPLEMENTATION RISK TAB
Realization of ecosystem improvement: Number of months from the time the ecosystem improvement is completed (i.e., project is implemented or construction is complete), until the benefit associated with this priority can be observed (i.e., when measurable improvements can be observed and quantified)
Benefits of additional water supply will be observed and quantified during dry and critically dry years.
Additional locations in the application, supporting documentation or attachments (document name, page number, table number, other) where the realization timeframe is described and quantified.
CalSim II Model Runs for WSIP 2030 Sites Reservoir Regional_Deliveries_WSIP_2030_With_Project_vs_Without_Project. Updated June 21, 2017 CDFW 2017. Refuge Water Supply Program Overview. Available at: https://www.wildlife.ca.gov/Conservation/Watersheds/Refuge-Water/Overview. Accessed June 29, 2017 USFWS 2009. Sacramento, Delevan, Colusa, and Sutter National Wildlife Refuges. Final Comprehensive Conservation Plan and Environmental Assessment. Vol. 1 USFWS 2011a. Sacramento National Wildlife Refuge Water Management Plan USFWS 2011b. Colusa National Wildlife Refuge Water Management Plan USFWS 2011c. Delevan National Wildlife Refuge Water Management Plan
REV 6: Duration of ecosystem improvements
How long (number of years) after realization (as calculated under REV 5 above) is the ecosystem improvement expected to address this priority? Maximum is 100 years. Explain how this value was determined and whether the magnitude of the ecosystem improvement is anticipated to change over time.
Benefits of additional water supply for wetlands and wildlife dependent on wetlands will be observed for the duration of the refuge's existence in dry and critically dry years.
Additional locations in the application, supporting documentation or attachments (document name, page number, table number, other) where the duration of the ecosystem improvement is described and quantified.

Priority 16: Enhance habitat for native species that have commercial, recreational, scientific, or educational uses
CalSim II Model Runs for WSIP 2030 Sites Reservoir Regional_Deliveries_WSIP_2030_With_Project_vs_Without_Project. Updated June 21, 2017 CDFW 2017. Refuge Water Supply Program Overview. Available at: https://www.wildlife.ca.gov/Conservation/Watersheds/Refuge-Water/Overview. Accessed June 29, 2017 USFWS 2009. Sacramento, Delevan, Colusa, and Sutter National Wildlife Refuges. Final Comprehensive Conservation Plan and Environmental Assessment. Vol. 1 USFWS 2011a. Sacramento National Wildlife Refuge Water Management Plan USFWS 2011b. Colusa National Wildlife Refuge Water Management Plan USFWS 2011c. Delevan National Wildlife Refuge Water Management Plan
REV 7: Consistency with species recovery plans and strategies, initiatives, and conservation plans
Does the ecosystem improvement meet any goals or objectives established in existing species recovery plans, initiatives, or conservation plans including but not limited to the National Oceanic and Atmospheric Administration (NOAA) Fisheries Recovery Plan for Sacramento River winter-run Chinook salmon, Central Valley spring-run Chinook salmon, and Central Valley steelhead; State Wildlife Action Plan; Central Valley Joint Venture Implementation Plan, San Joaquin County Multi-Species Habitat Conservation Plan and Open Space Plan, Draft Solano Multi-Species Habitat Conservation Plan, East Contra Costa County Habitat Conservation Plan/Natural Community Conservation Plan, Draft Recovery Plan for the Giant Garter Snake, and California Water Action Plan? If so which goals, objectives, or actions will be met? Why?
Improving water supply to refuges during dry years to support waterfowl, shorebirds, and other wildlife dependent on seasonal and permanent wetlands is consistent with goals and objectives described in the following conservation plans • North American Waterfowl Management Plan • U.S. Shorebird Conservation Plan • North American Waterbird Conservation Plan • Central Valley Joint Venture Implementation Plan – Conserving Bird Habitat Improving water supply to refuges during dry years is also consistent with recovery goals described in • Draft Recovery Plan for the Giant Garter Snake • Conservation Plan for the Tricolored Blackbird
Additional locations in the application, supporting documentation or attachments (page number, table number, other) where the consistency with goals, objectives, or actions from recovery plans, initiative, or conservation plans are discussed.
• North American Waterfowl Management Plan - 2012 (page 2) • U.S. Shorebird Conservation Plan – 2001 (page 30) • Central Valley Joint Venture Implementation Plan – Conserving Bird Habitat (Chapter 10) • California Wildlife Action Plan (Executive Summary page 2) • Draft Recovery Plan for the Giant Garter Snake (page 9) • Conservation Plan for the Tricolored Blackbird (page 11)
REV 8: Location of ecosystem improvements and connectivity to areas already being protected or managed for conservation values
Provide a map that shows the extent of the ecosystem improvement that will address this priority (e.g., river miles that meet the temperature benefits). Provide additional instructions or clarification to reviewers who will be viewing this map (i.e., describe the color and/or label that identifies the spatial extent of the ecosystem improvement). If available, also submit supporting electronic files such as a .kmz file or ArcGIS layer associated with the maps provided.
USFWS 2009 • Overview map of refuges, page 1 • Table 4. Acreage and habitats of Sacramento National Refuge Complex, page 51 • Figure 6. Sacramento Refuge Habitat Management, page 52

Priority 16: Enhance habitat for native species that have commercial, recreational, scientific, or educational uses
• Figure 7. Delevan Refuge Habitat Management, page 53 • Figure 8. Colusa Refuge Habitat Management, page 54
Explain why this location was selected. How is the location of enhanced habitat beneficial in the context of local environmental conditions?
Seasonal and permanent wetlands in the Sacramento NW are managed specifically for enhancement of seasonal and permanent wetland habitat for the benefit of native species that have commercial, recreational, scientific, or educational uses, including waterfowl, shorebirds, and special-status wildlife species.
Is the ecosystem improvement location adjacent to, or near, other areas already being protected or managed for conservation values? Explain the proximity of the ecosystem improvement to other areas already being protected or managed for conservation values and any hydrologic connectivity that may occur between these locations.
Seasonal and permanent wetlands in the Sacramento NWR are managed specifically for the benefit of native species that have commercial, recreational, scientific, or educational uses enhancement of seasonal and permanent wetland habitat for the benefit of waterfowl, shorebirds, and special-status wildlife species.
Additional locations in the application, supporting documentation or attachments (document name, page number, figure name or number, other) that describe and quantify the spatial extent of the ecosystem improvement, the proximity of the ecosystem improvement to other areas already being protected or managed for conservation value, and the degree to which hydrologic connections (if any) occur between the ecosystem improvement and areas already being protected or managed for conservation value.
• USFWS 2009. Sacramento, Delevan, Colusa, and Sutter National Wildlife Refuges. Final Comprehensive Conservation Plan and Environmental Assessment. Vol. 1
REV 9: Efficient use of water to achieve multiple ecosystem benefits
If applicable, how will water provided to address this priority be managed? Explain design efficiencies and operational strategies intended to maximize the efficiency of water allocated to ecosystem improvements that address this priority.
Refuge managers and biologists strategize constantly for the optimal use of water to continue to meet the refuges' conservation goals. Typically staff is flexible with water usage so water conserved early in the season can be used later in the season to support migratory bird populations and meet management objectives to the extent possible.
Additional locations in the application, supporting documentation or attachments (document name, page number, figure name or number, other) that describe the design efficiencies and operational strategies used to maximize water efficiency under this priority.
USFWS 2009. Sacramento, Delevan, Colusa, and Sutter National Wildlife Refuges. Final Comprehensive Conservation Plan and Environmental Assessment. Vol. 1 USFWS 2011a. Sacramento National Wildlife Refuge Water Management Plan USFWS 2011b. Colusa National Wildlife Refuge Water Management Plan USFWS 2011c. Delevan National Wildlife Refuge Water Management Plan
REV 10: Resilience of ecosystem improvements to the effects of changing environmental conditions, including hydrologic variability and climate change.
Which environmental uncertainties associated with this priority were considered in the project siting, design, and operation? How were these uncertainties incorporated into project siting, design, or operation? Examples of environmental uncertainties include, but are not limited to: sea level rise, temperature changes, changes in precipitation, landslides, erosion, earthquakes, wildfires, drought events, and flooding events.
Climate change and associated increased frequency of dry and critically dry years is the primary source of uncertainty. Long term modeling of climate change suggests that 34–38% of years may be classified as dry and critically dry years in the Sacramento Valley, and 66–69% may be classified as dry and critically dry years in the San Joaquin Valley by the end of the 21st century (Null and Viers 2013).
Additional locations in the application, supporting documentation or attachments (document name, page number, figure name

Priority 16: Enhance habitat for native species that have commercial, recreational, scientific, or educational uses
or number, other) that describe and quantify the environmental uncertainties considered in the project siting, design, and operation.
Null, S. E., and J. H. Viers (2013), In bad waters: Water year classification in nonstationary climates, Water Resources Research, 49, doi:10.1002/wrcr.20097.

Sites Project Executive Summary

FOR CALIFORNIA'S WATER STORAGE INVESTMENT PROGRAM

Providing high-quality water to enhance the environment, the economy and quality of life for Californians

Sites

SITESPROJECT.ORG

Sites is an innovative, environmentally sound solution to California's toughest water challenges.

With broad statewide support, the Sites Project fulfills the clear Proposition 1 mandate from the People of California, who overwhelmingly said the state needs public benefits from new water storage.

Sites Project Executive Summary

This document summarizes how the Sites Project Authority (Authority) has addressed the California Water Commission's requirements of the Water Storage Investment Program (WSIP), to provide water supply and eligible public benefits.

The Sites Project will make California's water system more efficient, flexible and reliable, which will provide local, statewide and national benefits.

The project:

- Helps achieve the objectives of the California Water Action Plan
- Reflects the innovative approach mandated by the people of California under Proposition 1
- Provides a substantial supply of high-quality water to support the economy and enhance the environment, particularly in the face of climate change
- Better captures, stores and provides water for the environment, the economy and quality of life for families, farms and businesses
- Is being developed in accordance with the beneficiary-pays-principle

The Sites Project offers the State of California a significant supply of water to improve conditions for salmon and smelt and to comply with the will of California voters.

The Sites Reservoir

Delivers about **441,000** acre-feet of water per year to California's water system for...

- Drinking Water
- Irrigation
- Climate Change Resiliency
- Enhanced Water Quality
- New Recreational Opportunities
- Flood Management
- Ecosystem Improvements
- Renewable Energy

Stabilize Sacramento River fall flows for salmon

Conserve coldwater pools in existing reservoirs later into the summer months to improve conditions for salmon spawning and rearing

Provide nutrient rich water to the Yolo Bypass to benefit smelt

Increase water supplies for refuges and managed wetlands north and south of the Delta

The time is NOW to implement bold and strategic water storage options, in order to capture and deliver water for use where and when it's needed most for the environment, families, farms and businesses.

By investing in Sites, the California Water Commission has a unique opportunity to invest in the ecological health of the Sacramento River and Sacramento-San Joaquin Delta (Delta) and fulfill the will of California Voters.

Sites Works for California and Goes Above and Beyond California Water Commission Scoring Criteria in Four Essential Ways

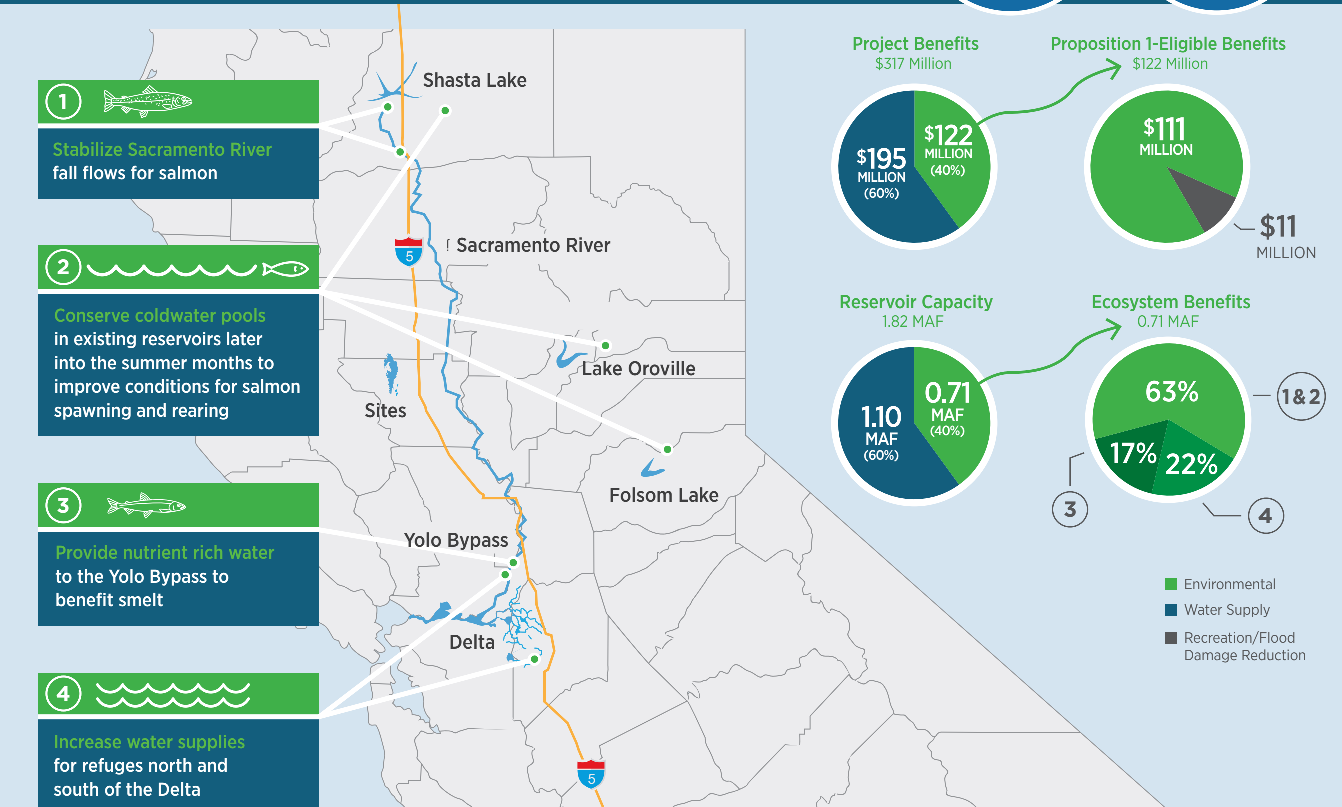
Public Benefit to Cost Ratio and Ecosystem Improvement Benefits

Sites is Cost Effective

Learn more about the project's public benefit to cost ratio on page 14.

$122 MILLION in annual public benefits

2.1 Public **Benefit to Cost** Ratio



Learn more about the project's ecosystem benefits on page 12.

Relative Environmental Values

Sites provides substantial ecosystem benefits.

The project includes several **critical environmental enhancements**

Learn more about the project's Relative Environmental Values on page 15.

Resiliency

Sites is resilient.

Sites provides **dedicated water storage** that can be adaptively managed to meet the **changing needs of the Sacramento watershed and Delta,** constituting significant benefits under anticipated future climate conditions

Learn more about the project's resiliency on page 17.

Implementation Risk

Sites Project is feasible. The real risk lies in not implementing the Sites Project.

The project meets the California Water Commission criteria for **technical, economic, financial,** and **environmental feasibility.**

The Bureau of Reclamation's Feasibility Report independently validates the feasibility of implementing the Sites Project.

Learn more about the project's implementation risk on page 16.

Why Sites?

Sites is a critical surface storage project that combines the public benefits of water storage with the ecosystem benefits of increased environmental flows in the Sacramento River.

California has grappled with serious water supply reliability and ecosystem challenges for decades. Voters overwhelmingly approved Proposition 1 in anticipation of more frequent drought conditions, a smaller snowpack, heavier rain and flashier storms, aging water infrastructure and declining ecosystem conditions. The Sites Project offers the best opportunity for meeting the will of the voters by providing a reliable source of high-quality water to benefit the ecosystem and provide needed water storage.

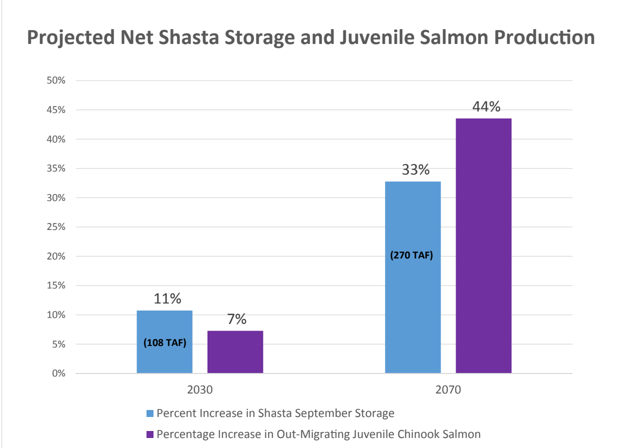
The Sites Project Authority (Authority) proposes to provide the state with 710,000 acre-feet (40%) of the usable capacity in Sites Reservoir for ecosystem benefits. When this water is managed according to California Water Commission requirements, the resulting long-term annualized water deliveries would provide:

Proposed 2030-2070 Average Ecosystem Benefits (Acre-Feet)

Species Benefiting	Drier Years	Average Years
Chinook Salmon	190,000	125,000
Delta Smelt	29,000	39,000
Level 4 Refuge Supplies	19,000	33,000

The proposed operations intentionally provide substantial carry-over storage. This produces larger ecosystem benefits in dry and critical years. Additional benefits for the Water Commission's consideration include:

- **Flexibility:** Should future hydrologic and/or environmental conditions result in a need to provide different benefits than have been assumed in today's Relative Environmental Values (REVs), state's resource managers could reallocate the water to align with new priorities.
- **Partnership:** Through an effective partnership between the Authority and the state resource agencies managing the state's investment, even greater benefits can be achieved.
- **Management:** The Sites Project is being developed in accordance with the beneficiary-pays principle, which enables the state to retain management control over its investment for the life of the Sites Reservoir.
- **Federal Participation:** The Bureau of Reclamation (Reclamation) has been preparing studies to advance the Sites Reservoir. Their congressionally-mandated Draft Feasibility Report demonstrates a strong interest to invest in the Sites Project, which would strengthen and enhance the state's investment. The federal level of participation will only be determined after the Authority has received a decision on the Water Commission's level of investment.



Sites Project Authority

Sites is being developed by several Northern California public agencies who are motivated to sustainably build a local water management project that helps the state meet its overall water system needs. The Authority was formed on August 26, 2010 and is governed by a 12-member Board of Directors representing Sacramento Valley leadership in government and water management.

The Authority's Board of Directors is the lead agency working with regional stakeholders and water agencies statewide to advance the construction of the Sites Project. In January 2017, the Authority assumed lead agency responsibilities for ensuring compliance with the California Environmental Quality Act (CEQA) and is working with Reclamation, the federal lead agency, to ensure compliance with the National Environmental Policy Act (NEPA).

Together, the Authority, Reclamation and the California Department of Water Resources (DWR) are working in partnership to improve the operation of the state's interdependent water system.

Should the state or federal government elect to invest in the project's construction, in exchange for acquiring water which they would manage for environmental benefits, the Authority intends that the appropriate state and/or federal resource agency would become a partner. This agency would then have the same or equivalent status as the water agencies who participate and fund their share of the project's costs to improve their water supplies.

Sites Eligibility for Proposition 1 Funding

The Sites Project complies with all eligibility requirements for WSIP funding and achieves California's co-equal goals of water supply reliability and ecosystem improvement.

WSIP Funding Requirement	Sites Project Compliance
Eligible Applicant Type (CCR 6006(c)(1)(A)1a)	A Joint Powers Authority will own, govern, manage and operate the Sites Project (CWC 79759)
Eligible Project Type (CCR 6006(c)(1)(A)1b))	The Sites Project is one of the surface storage projects identified in the 2000 CALFED Record of Decision (CWC 79751(a))
Not affect a designated Wild and Scenic River (CCR 6006(c)(2)(A))	The Sites Project will not impact designated wild or scenic rivers
Consistent with Agricultural and Urban Water Management Plans (CCR 6013(a)(1)(C))	Sites has submitted plans for all participating water suppliers that meet the size compliance threshold
WSIP Program Cost Share < 50% (CCR 6006(c)(1)(A)2)	The proposed WSIP funding share for Sites is 32% of the total project capital cost
The project's inclusion in an integrated regional water management plan (CWC 6003(a)(1)(A)2)	Sites is identified as a long-term regional priority in the Sacramento Valley Integrated Water Management Plan
Monetized Ecosystem Benefits > 50% (CCR 6006(c)(1)(A)(3)	The value of ecosystem benefits of Sites are > 90% of the total Proposition 1-eligible public benefits
Provides measurable improvements to the Delta ecosystem or to the tributaries to the Delta (CCR 6006(c)(2)(B))	Sites provides measurable temperature and flow benefits for fish in the Sacramento River (the largest tributary to the Delta), many of which migrate through the Delta
State Water System Improvement (CCR 6006(c)(2)(C))	In year 2030, the operation of Sites to release water adds an average 83,000 AF of water in Lake Shasta and 59,000 AF of September storage in Oroville
Cost Effective (benefit cost ratio > 1) (CCR 6006(c)(2)(D))	Depending upon how the state values the public benefits, the Public Benefits Ratio ranges from 2.1 to 4.5 when using WSIP guidelines
Provides net improvement in ecosystem and water quality conditions (CCR (6006(c)(2)(E))	Sites increases Chinook salmon populations, especially when compared to the no project alternative
Advances the long-term objectives of restoring ecological health and improving water management for beneficial uses of the Delta (CCR 6006(c)(2)(F))	Sites benefits anadromous fish populations in Delta tributaries, provides pulse flows into the Yolo Bypass to increase food sources to improve Delta smelt growth and condition as they mature into adults and provides Delta outflows from June through September to support beneficial uses

"Sites Reservoir offers a remarkable opportunity to reoperate California's longest and largest river, the Sacramento, to provide multiple benefits for fish, farms and cities in an innovative manner. By partnering with the Sites Project Authority in the development of the Reservoir, the state would acquire water storage capacity and have management control over the resulting releases to ensure environmental benefits are achieved."

— Senator Dianne Feinstein

"North and South, rural and urban, Republican and Democrat, California's leaders agree on one thing: our state needs to invest in Sites Reservoir to meet the water supply challenges of today and the future. Sites provides more water per dollar invested than any other proposed project in the state, enough to supply millions of Californians for an entire year, while also creating environmental benefits and allowing smart recapture and reuse of water released from other reservoirs. Investing in Sites will fulfill the will of the 67% of Californians who supported Proposition 1 funding for water storage infrastructure, and I hope the California Water Commission recognizes the project's diverse benefits."

— Congressman LaMalfa

"Sites Reservoir is one of the most useful, cost-effective water infrastructure projects California could build. It is an ideal project that can provide water for agriculture, urban uses and the environment. The support for the Sites Project from a majority of the California Congressional delegation speaks to the statewide benefits of the project."

— Congressman Garamendi

"As water and environmental managers have been forced to operate under a constant regulatory threat, Sites Reservoir will provide a critical tool for them to solve California's toughest water problems collaboratively and productively."

— Senator Nielsen

"Sites is an incredibly important project for the State of California that meets many of the public benefits required by the Water Bond."

— Assemblymember Gallagher

"Building Sites Reservoir is an imperative part of the solution to help California meet our water supply challenges of today and the future. The operational flexibility provided by the unique project offers reliable long-term assistance to California's complex water system."

— Assemblymember Dahle

Project Location

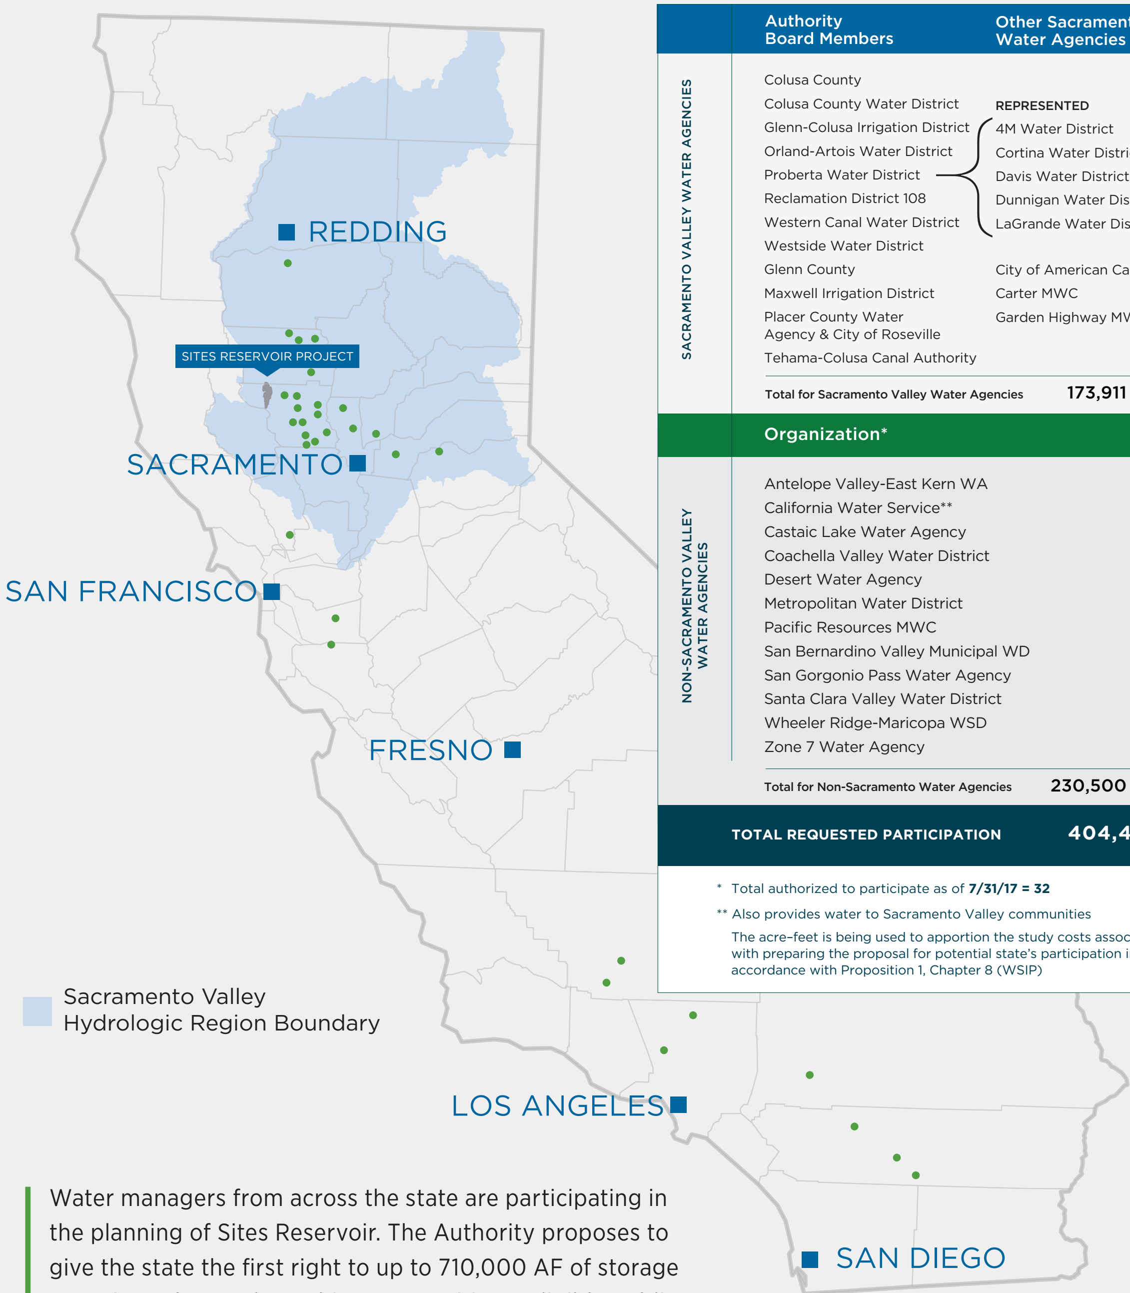
Ideally located in California's largest watershed, Sites includes a new 1.8 million acre-foot (MAF) reservoir offstream of the Sacramento River. The Sites Project will be situated on the west side of the Sacramento Valley, approximately 10 miles west of the rural town of Maxwell, in historic Colusa County. The Sacramento Valley is a unique region, known for it's farming community, rich agricultural benefits, and natural beauty. The region has been considered ideal for offstream water storage since the 1950's. Today, with climate change creating a new normal of changing future conditions (less snow-pack and flashier rainfall), **Sites is ideally located to maximize the diversion and storage of excess storm event flows in the Sacramento River.**

Sites is widely supported by local community leaders, residents, as well as state water managers and agencies from the Bay Area to Southern California. There is bipartisan support for the Sites Project, including the 43 members of California's Congressional Delegation, 12 State Senators and 18 State Assemblymembers who have signed letters of support.

Participants in the Sites Project represent 39 of California's 51 congressional districts. A full list of supporters of the Sites Project can be found in Attachment 6E to the Eligibility Tab of the WSIP application.

Sites Statewide Project Participation

Sites is locally-led in partnership with the state and federal government, and is widely supported by water agencies and stakeholders from across the state.



Organization and Amount of Sites Water Requested

	Authority Board Members	Other Sacramento Water Agencies
SACRAMENTO VALLEY WATER AGENCIES	Colusa County	
	Colusa County Water District	REPRESENTED
	Glenn-Colusa Irrigation District	4M Water District
	Orland-Artois Water District	Cortina Water District
	Proberta Water District	Davis Water District
	Reclamation District 108	Dunnigan Water District
	Western Canal Water District	LaGrande Water District
	Westside Water District	
	Glenn County	City of American Canyon
	Maxwell Irrigation District	Carter MWC
	Placer County Water Agency & City of Roseville	Garden Highway MWC
	Tehama-Colusa Canal Authority	
	Total for Sacramento Valley Water Agencies	173,911 AF
	Organization*	
NON-SACRAMENTO VALLEY WATER AGENCIES	Antelope Valley-East Kern WA	
	California Water Service**	
	Castaic Lake Water Agency	
	Coachella Valley Water District	
	Desert Water Agency	
	Metropolitan Water District	
	Pacific Resources MWC	
	San Bernardino Valley Municipal WD	
	San Gorgonio Pass Water Agency	
	Santa Clara Valley Water District	
	Wheeler Ridge-Maricopa WSD	
	Zone 7 Water Agency	
	Total for Non-Sacramento Water Agencies	230,500 AF
	TOTAL REQUESTED PARTICIPATION	**404,411**

* Total authorized to participate as of **7/31/17 = 32**

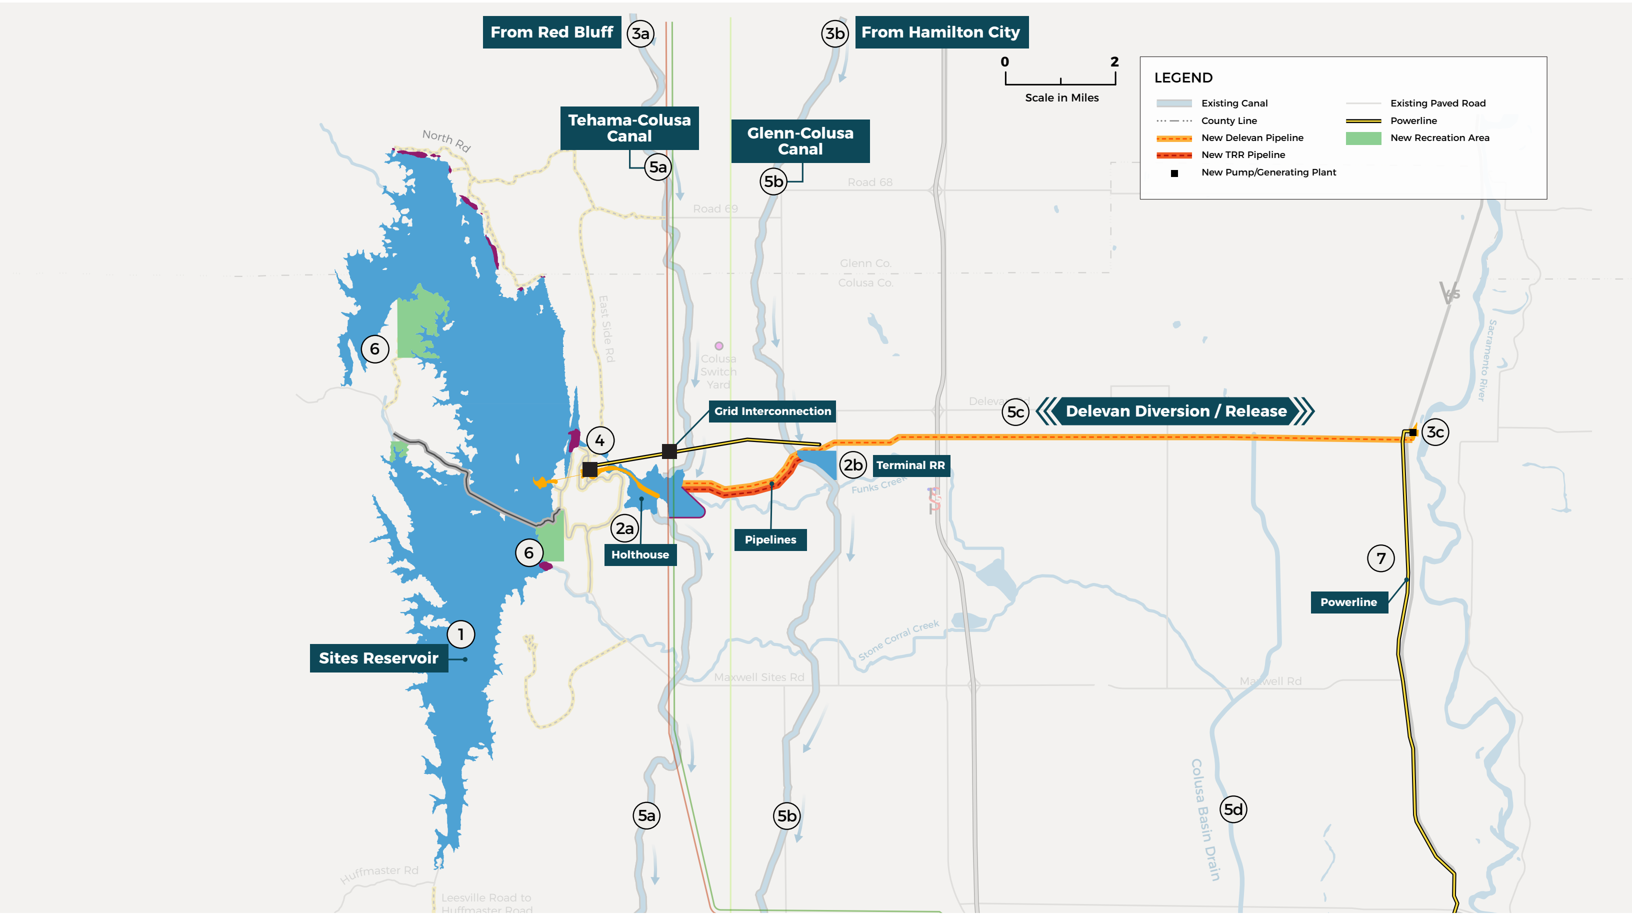
** Also provides water to Sacramento Valley communities

The acre-feet is being used to apportion the study costs associated with preparing the proposal for potential state's participation in accordance with Proposition 1, Chapter 8 (WSIP)

Water managers from across the state are participating in the planning of Sites Reservoir. The Authority proposes to give the state the first right to up to 710,000 AF of storage capacity to be used to achieve Proposition 1-eligible public benefits. The Authority has established a waiting list from its participants which would be used to finance the project should the state and federal investment level be lower than the 40% proposed.

Sites Project Facilities

Sites is the modern infrastructure upgrade California needs to meet 21st century water challenges



Sites Creates Jobs and will Enhance Region-Wide Economic Growth and Stability

Annual Employment	Approximate # of Jobs Added
Short Term Employment	
Direct Jobs: Construction	115
Indirect and Induced Jobs: Construction	390
Total Direct, Indirect, and Induced Employment	**505**
Long-Term Employment: Direct Jobs	
Operations and Maintenance	30
Recreation	15
Total Direct Jobs	45
Long-Term Employment: Indirect and Induced Jobs	
Operations and Maintenance	10
Recreation	2
Total Long-Term Indirect and Induced Jobs	12
Long-Term Total Direct, Indirect and Induced Employment	57

As an offstream reservoir, Sites avoids environmental impacts to aquatic species common with in-stream dam construction. Sites combines the public benefits of water storage with the ecosystem benefits of increased environmental flows in the Sacramento River during droughts, when water for the environment has the highest value. It ensures cold water is available during the late summer months to benefit fish. **With the construction of Sites Reservoir, the combined storage capacity of large reservoirs in the Sacramento Valley increases by about 15%.**

Sites Project Facilities

Water managers have long acknowledged that by creating a new source of water and adding more flexibility in the system, Sites can help California succeed in implementing 21st century water solutions—to meet human AND environmental needs. To achieve this, the project includes the following facilities:

1 Sites Reservoir

The **1.8 MAF** offstream reservoir will require two main dams (Sites and Golden Gate) and nine saddle dams. The resulting reservoir covers **14,200 acres**. This reservoir will also improve local flood protection as witnessed by the February 18, 2017 storm event that flooded part of Maxwell and temporarily closed Interstate 5.

2 Regulating Reservoirs

2a. Holthouse is an expansion of the existing Funks Reservoir, which provides flow equalization for the Tehama-Colusa Canal. Holthouse Reservoir is sized to allow pump-storage operations to generate renewable energy. Water entering Holthouse Reservoir will be pumped into Sites.

2b. The Terminal Regulating Reservoir will be constructed at the Glenn-Colusa Irrigation District Canal for flow equalization with flows pumped into Holthouse.

3 Diversions

Water from the Sacramento River will be diverted for conveyance to Sites Reservoir from three locations:

3a. The existing Red Bluff Pumping Plant will divert water and convey it through the Tehama-Colusa Canal.

3b. The existing Glenn-Colusa Irrigation District Pumping Plant will divert water and convey it through the Glenn-Colusa Canal.

3c. A new Delevan Intake Pumping/Generating Plant will divert water into a new pipeline that will convey water into Holthouse Reservoir.

Both the Glenn-Colusa and Tehama-Colusa diversions currently utilize state-of-the-art fish screens and the Delevan Intake will include state-of-the-art fish screens to ensure fish friendly diversions.

4 Sites Pumping/Generating Plant

This facility will have a capacity of **5,900 cubic-feet per second** to fill Sites Reservoir. Water released from the reservoir will flow in the reverse direction through the plant and generate seasonal **hydropower** and daily pumped-storage to contribute to the state's renewable energy goals.

5 Conveyance

Water from Sites can be delivered throughout much of California. Releases from Sites include the following:

5a. The existing Tehama-Colusa Canal conveys water from the Red Bluff Diversion to Holthouse and deliver releases from Sites to local users south of the reservoir.

5b. The existing Glenn-Colusa Canal conveys water from the Hamilton City Diversion to the Terminal Regulating Reservoir and deliver releases from Sites to local users south of the reservoir.

5c. The new 13.5 mile Delevan Pipeline connects the new Sacramento River intake with Holthouse to convey water in either direction.

5d. To the Colusa Basin Drain and either to the Sacramento River or into the Yolo Bypass through Knights Landing Ridge Cut.

Integrating local infrastructure reduces costs and ensures the project complements the Sacramento Valley water system.

6 Recreation Areas

The project will include the construction of two new recreation areas on the shore of Sites Reservoir for camping, picnicking, hiking, horseback riding, boating and fishing, among other activities. A separate boat ramp will also be included.

7 Powerlines

Overhead powerlines will connect the three pumping/generating plants located at: Holthouse (Sites), the Terminal Regulating Reservoir, and Delevan to the state's electrical grid.

Sites Project Operations

Sites Reservoir will be filled by diverting excess Sacramento River flows originating from unregulated upstream tributaries. Diversions can potentially occur in any month or water year type, but would be greatest in the winter months with an emphasis on capturing flows from storm events. If Sites existed during 2017's rainy spring, and had been completely empty, 1.8 million acre-feet (AF) of water could have been stored as of May 3, 2017 (DWR).

The Sites Project will operate in cooperation with Central Valley Project (CVP) and State Water Project (SWP) system facilities to produce a wide range of public and ecosystem benefits that can be flexibly managed to adapt to future changes, depending on need and priority. Up to 710,000 AF of capacity supports the storage and then release of critical water supplies dedicated to environmental needs.

Sites Reservoir will provide water benefits through two primary mechanisms: (1) water stored in Sites Reservoir can be released directly to the Colusa Basin Drain and Sacramento River, and (2) water stored in Sites Reservoir could be exchanged for water stored in Shasta Lake, Folsom Lake, or Lake Oroville and Clair Engle Lake (Trinity).

> **Had Sites been operational during the 2017 rainy spring season, an additional 1.8 million acre-feet of water could have been stored as of May 3, 2017.**

Sites Reservoir can be used to reduce releases and increase storage in other reservoirs with downstream habitat critical to fish, while still meeting requirements for minimum instream flow objectives, Sacramento River temperature requirements, and Delta salinity control assigned to the SWP and CVP. Through this reduction in releases, storage can be conserved in Trinity Lake, Shasta Lake, Lake Oroville and Folsom Lake to significantly increase regional and system-wide operational flexibility.

> **Sites provides significant environmental benefits during dry and critical water year types, and especially during extended drought periods, to benefit coldwater releases for salmon. This benefit also applies to Folsom and Oroville coldwater pools.**

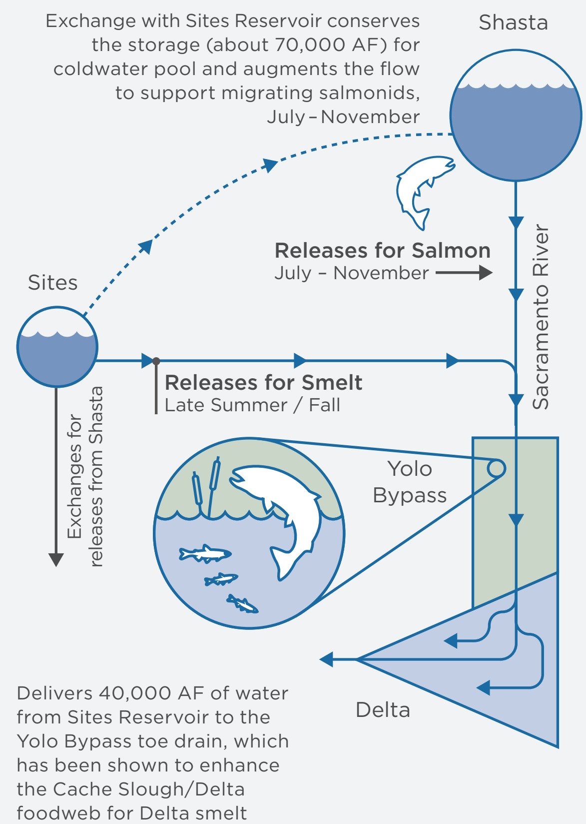
Diversion of excess Sacramento River flows to Sites Reservoir will only take place when flow monitoring indicates that sufficient bypass flows are present in the Sacramento River due to storm event flows.

> **Sites will capture high, excess runoff in a future with less snowpack and higher temperatures. Approximately 210,000 AF of Sites water will be available annually for environmental use as a long-term average supply.**

Sites Benefits to Salmon and Smelt

Sites Ensures Climate Change Resiliency

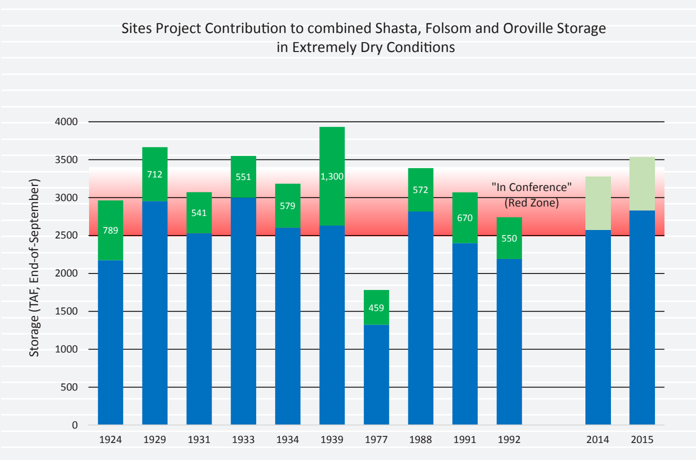
Sites promotes salmon outmigration, enhances habitat, and improves summer/fall water temperatures, as well as water volumes and food for Delta smelt.



Sites will be operated to provide a variety of environmental benefits that will be managed by the state to provide water for ecosystem and water quality purposes. This pool of dedicated water will be managed to improve coldwater conservation storage, augment river flows during critical periods for fish migration, increase flows through certain watercourses and/or facilities (such as the Yolo Bypass), improve water quality and/or enhance habitat restoration. Collectively, the state and the Authority will manage a sizable supply of water to address real-time needs and achieve both intermediate and long-term goals.

Sites Reservoir water will also be used to supplement existing municipal and agricultural supplies for use in the Sacramento Valley and south of the Delta. These operations will be conducted in cooperation with CVP and SWP operations.

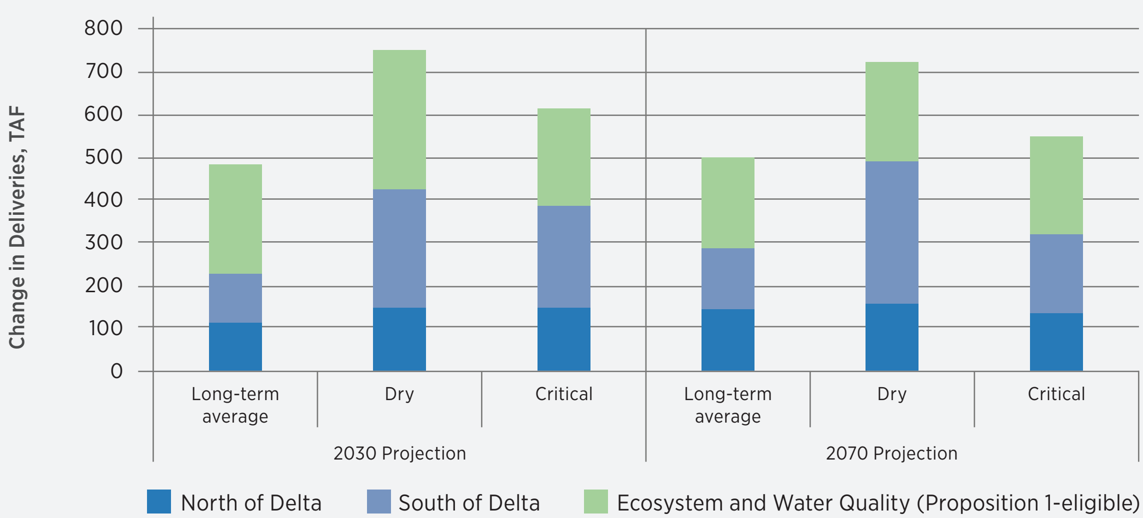
> **Sites is particularly beneficial during dry and critical years and extended drought periods, increasing overall water supplies despite climate change impacts.**



During droughts, Sacramento Valley reservoir operations become severely constrained when combined storage levels of Shasta, Folsom and Oroville are reduced to approximately 3 MAF. The addition of Sites Reservoir adds approximately 15% additional storage for the Sacramento Valley. Using the 2030 WSIP hydrology, when drought conditions occur, Sites Reservoir would provide relief during that year for both listed native fish species and for water agencies. Approximately 700,000 acre-feet of the Sites water would carry over into the next year should drought conditions continue.

Sites Reservoir Provides Water for Public and Non-Proposition 1-Eligible Public Benefits in All Water Year Types

Sites Reservoir Increase in Water Supply



Proposition 1-Eligible Public Benefits

Proposition 1 allows taxpayer resources to be used for specific public benefits the state can invest in. The state's investment in the Sites Reservoir can be used to achieve the following Proposition 1-eligible benefits.

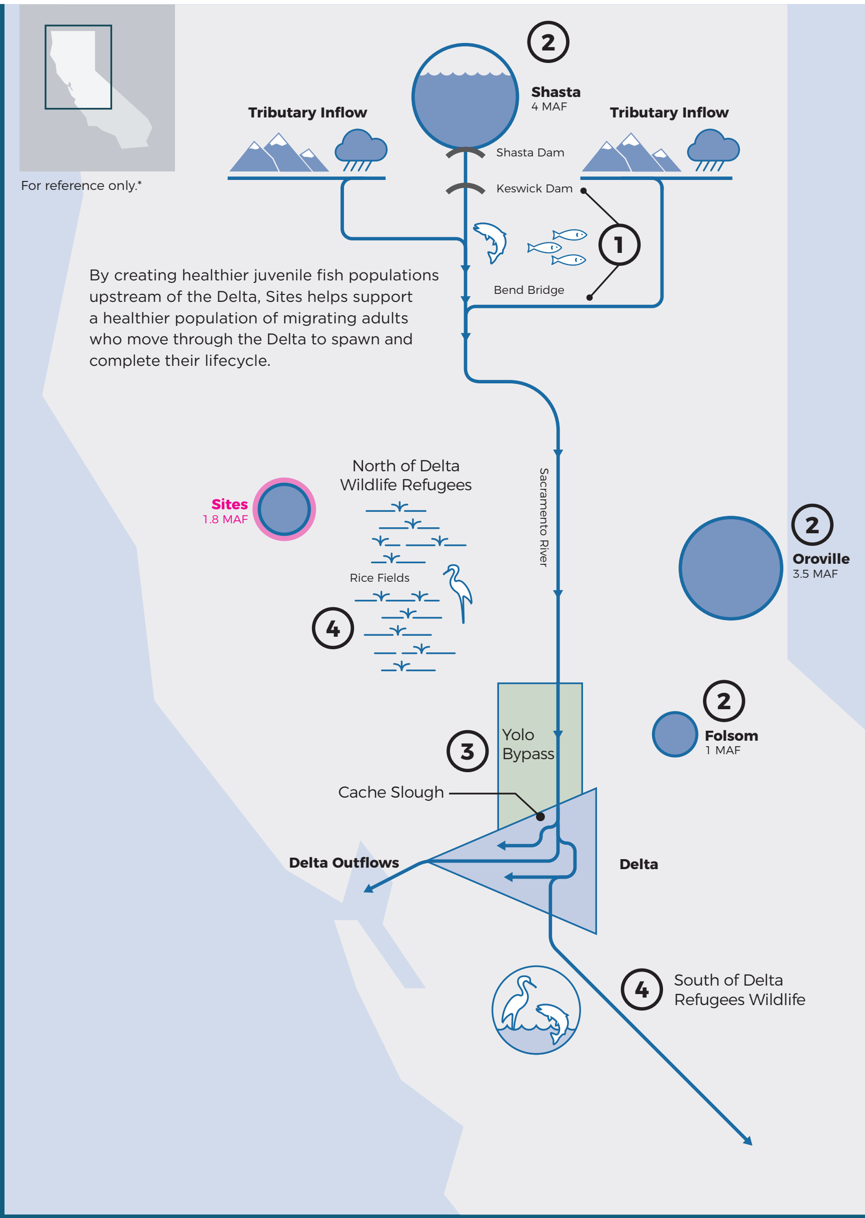
Ecosystem Improvements

The Authority will partner with the California Department of Fish and Wildlife (CDFW) and State Water Resources Control Board (SWRCB) to deliver an annual supply of water that would be directed to meet the highest priority water needs in the state.

1. The greatest ecosystem benefit will be improved temperatures and flows in the Sacramento River between Keswick Dam and Bend Bridge. This portion of the Sacramento River is critical habitat for Chinook salmon (including the endangered Winter Run) and Steelhead. Water released from Sites Reservoir will meet existing SWP and CVP obligations to enable additional coldwater Storage at Shasta and Oroville above critical fish habitat. This storage will provide better temperature control and supplemental flows to support fish migration and reduce egg mortality (i.e. redds).

2. Sites will allow for increased coldwater pool storage levels and more reliable coldwater pool storage in existing reservoirs later into the summer months, improving conditions for native fish in several ways:
   - Increased Shasta Lake storage levels provide additional coldwater pool storage in below normal, dry, and critical water-year types.
   - Improved water temperature suitability in Lake Oroville for juvenile steelhead and spring-run Chinook salmon over-summer rearing and fall-run Chinook salmon spawning in the lower Feather River and augmented flows in the lower Feather River to minimize redd dewatering, juvenile stranding and isolation of anadromous salmonids.
   - Additional coldwater pool storage in Folsom Lake benefits juvenile steelhead summer rearing and fall-run Chinook salmon spawning in the lower American River.

3. In a distinctly unique ecosystem action, Sites Reservoir will provide two pulse flows of at least 400 cubic feet per second over a two to three week period into the Yolo Bypass. These pulses will be adaptively managed by the state's designated resource agencies to push water high in phytoplankton and zooplankton directly into the Cache Slough area, the only place in the Delta where the endangered Delta smelt population is increasing. The resulting increase in desirable food sources should improve Delta smelt growth and populations as they mature into adults.



4. Sites water will enhance ecosystems for bird populations utilizing the Pacific Flyway during annual migration periods. Additionally, up to 50,000 AF of water will be provided to assist in meeting incremental Level 4 wildlife refuge water needs north and south of the Delta. This water will improve habitat conditions for a number of species, including giant garter snake, tricolored blackbird, and migrating waterfowl.

Additional Ecosystem Improvements (not monetized)

The Sites Project will provide additional benefits that have not been monetized due to lack of sufficient, tangible data and generally-accepted models that could reasonably estimate benefits to specific species. The benefits for Chinook Salmon in the Sacramento River watershed between Keswick Dam and Red Bluff (the area captured in SALMOD models) were monetized, but benefits to salmonids in the Feather River and American River were not monetized. Coldwater and additional flows made possible by Sites will also benefit other species of fish in the Sacramento River watershed, including steelhead and sturgeon. **Therefore, the net environmental benefits Sites can provide are even greater than those provided in the WSIP application criteria.**

Additional Proposition 1-Eligible Public Benefits

Water Quality (Not Monetized). The Sites Project meets SWRCB water quality priorities by providing improved temperature and groundwater conditions. The project will also provide additional water supply to agencies serving disadvantaged communities. These benefits have not been monetized as water quality benefits. However, the temperature improvements benefit anadromous fish and are included in our analysis of coldwater pool benefits. Further, participants in Sites Reservoir are expected to use their water to address the undesirable effects by complying with the Sustainable Groundwater Management Act (SGMA), but the magnitude of these improvements is still being defined.

Flood. The local area downstream from the project is prone to floods, including portions of Maxwell, Williams and Colusa. Even though these are seasonal streams, the Funks Creek and Stone Corral Creek watersheds are a key source of flooding during major storms. Construction of the Sites and Golden Gate Dams will reduce the frequency of flooding, reduce river levels to avoid flood events and relieve pressure on local levees. Had Sites been operational during the 2017 spring rainy season, runoff from local creeks and streams could have been captured and stored, reducing high flows, preventing overtopping and avoiding flood waters that caused significant economic damage in Colusa County and temporarily closed Interstate 5, which is a critical artery for commerce.

> **The Sites Project advances California's objectives of restoring ecological health in the Delta and improving water management for beneficial uses.**

Emergency Response (not monetized). The Authority is committed to working with state and federal water managers and emergency personnel to provide water to support emergency events such as, but not limited to, firefighting, drought relief and Delta levee failures. Instead of dedicating a volume of water that may not be called upon by the state until at least a one in ten-year event (or longer) occurs, the Authority proposes that should water from Sites Reservoir be used to aid in responding to or recovery from an emergency, that repayment would occur through a mutually-acceptable exchange or transfer of water. As such, this benefit was not monetized and the Authority is not requesting Proposition 1 funding for this purpose.

Recreation. Two new recreation areas and a boat ramp will be created on the shore of Sites Reservoir. These areas will provide opportunities for boating, camping, hiking and equestrian use and have been monetized. Sites Reservoir will also improve water levels in existing reservoirs (e.g. Shasta, Oroville and Folsom) to support water-based recreational activities, but these benefits have not been monetized.

Additional Considerations

Operational Flexibility (not monetized). Sites Reservoir can be operated to achieve a wide variety of environmental and water quality objectives by operating to different strategies or priorities. This application proposes an operational strategy that aligns with the Water Commission's regulations by focusing on specific ecologic improvements in the Delta by providing benefits to native anadromous fish and in-Delta fish species. In the future, this operational strategy may be changed to reflect new or higher priorities.

Further, Sites reservoir will increase today's storage capacity in the largest reservoirs in the Sacramento Valley by 15%. Once the reservoir is operable, the state's water managers have the ability to operate differently – for both environmental and human uses – knowing there is additional capacity in the system. The ability to adaptively manage the reservoir releases to achieve different benefits and the benefits associated with the increase in system-wide storage capacity have not been monetized.

State's Operational Control (not monetized). The Authority proposes that the agencies with delegated authority to manage the state's investment would also have management control. This would be in the planning and also in the day-to-day releases needed to adapt to current and forecast conditions.

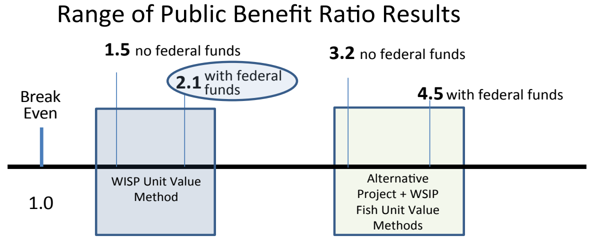
Net Benefits. The resulting ecosystem benefits were developed using the CalSim-II model as provided by the Water Commission for use in preparing this application. This model incorporates environmental, water quality, and water rights compliance obligations. Further, the Authority has added a simulated pulse flow criterion to be more protective of migrating juvenile salmonids and a criterion to ensure in-Delta water quality compliance requirements are achieved. The benefits presented in this application represent the difference between the "with project" from the "without project" to reflect the project's net benefits.

Sites Economic Benefits

Benefit-Cost Ratio: The Sites Project has been evaluated using two different and independent perspectives in conformity with the Water Commission's WSIP regulations and in accordance with Reclamation's federal procedures required for congressional authorizations. Their resulting Benefit-Cost Ratios are 1.52 and 1.72, respectively, which are both well above the minimum 1.0 threshold used as the conventional investment decision-making criterion. The difference is attributable to their different future climate change scenarios and use of different unit benefit values reflecting different value propositions.

Public Benefit Ratio (PBR): The state's investment in the Sites Project has been evaluated using two different WISP regulation approved monetization approaches – the alternative cost method and adjusted WISP provided unit benefit values. Each approach was applied to only the project's readily monetizable benefits under both "with" and "without" federal participation scenarios. Their corresponding resulting PBRs results are provided in the following figure:

Range of Public Benefit Ratio Results



Public Benefit Ratio Using Two Different Benefit Monetization Methods

The higher range PBRs reflects the high cost and scarcity of feasible major infrastructure development projects to obtain new water supplies. The alternative cost method also does not fully account for potential economies of scale benefits that large-scale and multi-purpose storage projects such as Sites can achieve. Using more conservative adjusted WSIP unit benefit values (based on the water transfer market) the resulting PBRs are correspondingly lower. Neither of these methods included the non-monetized benefits, some of which are significant.

Proposition 1 Eligible Benefit (in $M)	Annual Benefits ($M)
Ecosystem Improvement	$111
Water Quality	N/A
Recreation	$7
Flood Damage Reduction	$4
Emergency Response	N/A
Proposition 1 Non-Eligible Benefits (in $M)	
Water Supply	$175
Hydropower	$19
Total Monetized Benefit Annually	**$317**
PUBLIC BENEFIT RATIO: 2.1 to 4.5	

Beneficiary-Pays-Principle: Each participant pays their proportionate cost-share based on their assigned share of the reservoir's capacity over the project's life using their storage. Each participant decides how to use their storage – hold it, release it and/or exchange it – within the parameters established by Agreements. To accomplish this:

> **The benefits of the Sites Project far outweigh the costs. Sites is projected to cost $4.7 billion (2015 dollars), with an estimated $317 million in benefits as an annual return on investment.**

Continues on page 16 »

Relative Environmental Values

Benefits delivered by the Sites Project address the Ecosystem and Water Quality Priorities identified by CDFW and the SWRCB. Summary of Priorities:

Ecosystem	#	Priority	Benefit
	1	**Cold water for salmonid eggs and fry**	**Improved temperature downstream of Shasta, Oroville and Folsom**
	2	**Provide flow for rearing and juvenile migration**	**Additional water from Shasta and Oroville to be released for migrating juveniles**
	3	**Avoid dewatering redds and stranding juveniles**	**Release flows from additional storage in Shasta, Oroville and Folsom to stabilize flows and preserve redds**
	4	**Improve ecosystem water quality**	**Provide colder water temperatures in the Sacramento, Feather and American Rivers**
	5	**Improve dissolved oxygen and colder water**	**Provides colder water in the Sacramento, Feather and American Rivers**
	6	Increase attraction flows during migration	Not included, but operations could be reprioritized for this purpose
	7	Increase Delta outflow	Not monetized. June to October Delta outflow increased by 4% under 2030 conditions.
	8	Maintain or restore groundwater and surface water interconnection	The current groundwater to surface water interconnection will not change with operation of Sites Reservoir
	9	**Enhance flow regimes for riparian and floodplain habitat**	**Release of water to the Yolo Bypass will improve riparian habitat. Augmented flows to preserve redds will lead to seasonal improvement in floodplain habitat.**
	10	**Improve floodplain Inundation**	**Benefits additional flow to Yolo Bypass**
	11	**Enhance diversity of habitat for fish and wildlife**	**Enhanced habitat in the Sacramento River, Delta, and wildlife refuges**
	12	Eliminate barriers to migration	As an offstream reservoir, Sites does not create or remove a barrier to fish migration
	13	Remediate inadequately screened diversions	State-of-the-art fish screens were previously installed on the Sacramento River at the Tehama-Colusa Canal and Glenn-Colusa Canal
	14	**Provide water to State and Federal Wildlife Refuges**	**Up to 50 TAF/yr to refuges and privately managed wetlands**
	15	**Implement invasive species management**	**Not monetized. Mitigation areas will manage/control invasive species.**
	16	**Habitat for commercial, educational, etc. species**	**Enhanced habitat for waterfowl and gamefish (salmon, steelhead, sturgeon)**
	Water Quality Priorities		
F C	1	**Temperature**	**Operation of Sites Reservoir with the CVP/SWP in the Sacramento, Feather, and American Rivers will increase the volume of coldwater that can be released to benefit fish**
	2	Dissolved Oxygen	Operation of Sites Reservoir does not improve dissolved oxygen in water bodies deemed to be impaired by the State Water Resources Control Board
	3	Nutrients	Operation of Sites Reservoir does not change the amounts of nitrogen introduced into the waterways
	4	Mercury	Construction and operation of Sites Reservoir does not change the amount of mercury in the Sacramento, Feather or American Rivers
	5	**Salinity**	**Not monetized. If Sites were operable in 2015, benefits could be provided. However, based on the WSIP requirements, any benefits will erode by 2070 due to effects of climate change.**
	6	**Groundwater**	**Sites Reservoir will reduce undesirable results in groundwater**
	7	**Delta Tributary Flows**	**Operation of Sites Reservoir will not provide flows that resemble natural hydrograph patterns. However, it will provide increased flows, especially in dry and critical water year types, as well as provide pulse flows for benefits in Yolo Bypass.**
	8	Improve required water self-reliance	Sites Reservoir incrementally improves regional water self-reliance by helping reduce demand on the Delta watershed by developing local supplies in the west side of the Sacramento Valley.
	9	**Basic Human Needs**	**Water from Sites will be provided to disadvantaged communities**

Bold type = Public benefits offered by the Sites Project

Beneficiary-Pays-Principle (con't)

- Capital costs: The participating water agencies will finance their proportionate shares of capacity and Proposition 1 funds will cover the state's share of the initial capital.
- Annual Costs (Operations, Maintenance and Replacement): The participating water agencies will pay their proportionate share based on releases either at Holthouse or Delevan as appropriate. The state's share of these costs can be provided from revenues generated from at least two sources: (1) after water has been released from a reservoir to provide at least one Proposition 1-eligible benefit, a small portion of this water could be recaptured and then sold under a long-term contract and/or (2) the state's share of water stored in the reservoir could be used to generate electricity for third annual party sales through the pumped-storage operations. Should the state's revenue exceed the applicable annual costs, the surplus could be used to provide additional public benefits within the Sacramento Valley and/or Delta.

Implementation Risk

The implementation risk of the Sites Project has been characterized in accordance with the WSIP methodology in this application. Further, an independent analysis of the Project's feasibility using federal guidelines is available in the Draft NODOS Feasibility Report. Although the federal methodology differs from the WSIP methodology (e.g., different climate change assumptions), the results of the two studies are generally consistent. This independent analysis of the project by Reclamation found the project to be feasible based on available information.

> **Sites offers essential benefits under future conditions.**

Technical Feasibility: Reclamation, DWR and the Authority have independently reviewed the engineering for the Sites Project facilities and considered them all feasible for construction. The development of cooperative operations that cause "no harm" to SWP or CVP operations or senior water rights is currently underway in a collaborative process. The operations modeled in this application are restricted to the diversion of excess Sacramento River flows. Additional protection for migrating salmonids that restricts diversions during pulse flow periods are also included in the modeling to ensure that the public benefits result in net ecosystem improvement.

Economic Feasibility: The annualized benefits provided by the project significantly exceed the annualized total project costs – even when only those benefits that could be monetized are included and even when conservative estimates of unit values are applied (refer to economics section).

Financial Feasibility: There are currently 32 water agencies throughout the state that are participating in the development of the Sites Project. Of this, 28 agencies have requested to participate at a level that would allow them to receive water supply benefits. For planning purposes, the Authority has been using 500,000 acre-feet as the average long-term annualized volume the Sites Reservoir could produce. To date, these participants have requested 404,411 acre-feet (80%). Should the state elect to participate in the 710,000 acre-feet of reservoir capacity (40%), the participant's requests will be reduced proportionately (i.e. currently, there is a waiting list to receive water supply benefits).

Congress has authorized federal participation in up to 50% of a locally-sponsored water storage project in exchange for acquiring water benefits for the environment and water quality. Reclamation's Draft Feasibility Report, determines there is a federal interest in participation for up to 14% of the project's cost. A water storage project, having local, state, and federal participation demonstrates a strong level of financial backing and solid financial feasibility.

> **Operational flexibility and adaptive management are key components of the Sites Project, contributing to environmental benefits and ecosystem protection.**

Environmental Feasibility: When filled, Sites Reservoir will convert what has predominately been lands used for livestock grazing to create a new aquatic ecosystem. Sites will provide a significant new source of water to support existing and struggling aquatic and riparian ecosystems, conserve coldwater pools in upstream reservoirs for salmon and increase plankton for native estuarine fish. The Sites Project will minimally impact existing rivers and channels and where environmental impacts do exist a scientifically-based adaptive management program and mitigation and monitoring strategy will be implemented to protect the ecosystem.

As the CEQA and NEPA lead agencies, respectively, the Authority and Reclamation released a Draft Environmental Impact Report/Environmental Impact Statement (EIR/EIS) that describes the impacts to environmental and cultural resources that would be reasonably expected to occur with the development of the Sites Project. Impacts that are significant and unavoidable are described within the EIR/EIS. While the project creates substantial ecosystem benefits, some significant and unavoidable impacts will remain after mitigation. These impacts include impacts to the community of Sites, existing golden eagle habitat, historical and cultural resources, disturbance of a dedicated cemetery, and conversion of prime farmland and native rangeland. The Authority is working with landowners, communities, Tribes, and government agencies to develop relocation and mitigation plans to mitigate these impacts.

> **Sites creates and protects aquatic and riparian habitat, improves ecosystem conditions, provides additional flows during critical periods for fish, and secures water for consumptive use.**

Sustainable Groundwater Management

In the DWR SGMA Program's Water Available for Replenishment Report (2017), it is estimated that 48% of the water that could be used to replenish California's groundwater will need to come out of the Sacramento River. Both the storage and the conveyance systems associated with Sites Reservoir are well suited to staging and conveying water to areas where groundwater depletion is producing undesirable effects. Providing surface water at a controlled rate and in seasons where the opportunity for in lieu of use and infiltration can be maximized is essential to SGMA compliance. In addition, Sites participants include agencies that are deeply invested in groundwater management in the Sacramento Valley, Bay Area, Central Valley, and Southern California. For example, Colusa County is investing in 10 TAF/year specifically to support SGMA compliance.

Resiliency

Because of climate change, some public benefits decline slightly and others increase between 2030 and 2070 for the operations modeled under current WSIP application requirements. One of the most beneficial features of Sites is that it provides dedicated storage of water for environmental purposes that can be repurposed for the highest priority public benefit as future conditions change.

The benefits to anadromous fish from the Sites Project become even more valuable over time. Without Sites, the population of Chinook salmon would decline drastically due to climate change. Modeling results for Sites Reservoir demonstrate the ability of the project to offset some of the decline in population due to rising temperatures, improving the resiliency of salmon populations in the face of climate change.

Integration with the State's Water System

The Authority is working with Reclamation and DWR to develop cooperative operations between Sites Reservoir, the SWP and the CVP that will improve water supply reliability throughout the state's integrated water system.

The operational scenarios are designed to concurrently:

- maximize water supply reliability
- improve Delta water quality
- provide seasonal flexible hydropower storage and daily pumped-storage
- increase survival of anadromous fish that migrate through the Delta. Provide seasonal nutrient-rich food for Delta smelt.

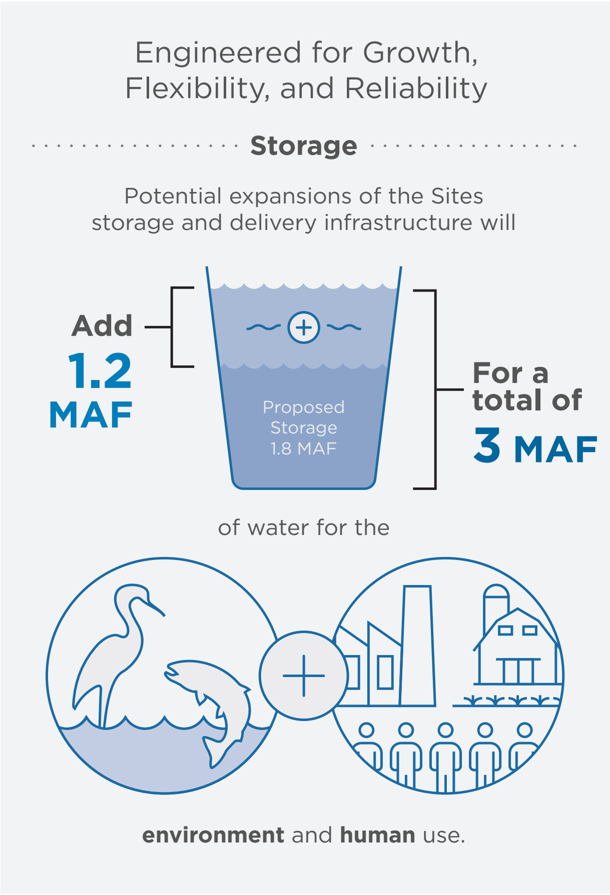
Sites Reservoir is also an important regional initiative and was identified as a long-term regional priority in the Sacramento Valley Integrated Water Management Plan due to its water supply reliability and flood protection benefits.

Finally, the Sites Project will also increase the value of projects that may be implemented in the future. One example is the River Arc Project on the American River under consideration by Authority members Placer County Water Agency and the City of Roseville, in coordination with the Sacramento County Water Agency and City of Sacramento. The River Arc Project will improve water supply reliability and groundwater quality in the lower American River watershed. Constructing Sites Reservoir can considerably enhance the potential benefits of this project and other future groundwater storage projects that improve groundwater sustainability in the Sacramento Valley.

Potential for Expansion

The Sites Project can be expanded to provide additional public and non-Proposition 1 eligible benefits. The most likely near-term expansion includes the ability to divert floodwaters into storage from the Colusa Basin Drain. This will provide water managers with the ability to divert an additional 40 TAF annually of excess river flows.

The Draft NODOS Feasibility Report, which evaluated the development of the "Colusa Basin Complex" could include raising the Sites Reservoir dams and constructing dams with Sites Reservoir to increase storage in existing SWP and CVP reservoirs and also improve the conditions downstream from these reservoirs for fish.



> Sites is a smart water storage investment for California's future. The California Water Commission has an opportunity to improve the Delta ecosystem, enhance the flexible operation of our state's water system and fulfill the will of California voters.

Sites Works for California by providing a solid return on the investment of public dollars for both the state to produce environmental benefits beyond what is achievable today and for public water agencies seeking to improve their water supply reliability.

Sites Reservoir will give California its first major reservoir that dedicates a significant capacity (710,000 acre-feet or 40%) to ensure the Proposition 1-eligible benefits that were approved by the voters are achieved. This innovative new partnership will ensure that water for environmental purposes is directed to the most critical needs and highest priorities – both today and into an uncertain future.

Sites:

- Is a feasible and cost-effective project that will advance the long-term objectives of restoring ecological health and improving water management for beneficial uses of the Delta.
- Is resilient by providing long-term operational flexibility for both environmental and water supply reliability purposes, that will also improve the overall operation of the state's water system.
- Will be operated to provide additional water during droughts by diverting storm-generated runoff in the Sacramento River, when there is minimal impact to the environment, to then provide reservoir releases into the Sacramento, Feather and Lower American Rivers at times that are critical to the survival of native fish species.

Project Benefits

Enhanced water management flexibility

Improved environmental flows

Increased water supply reliability

Ecosystem improvements

Potential new renewable energy resources

New recreation opportunities

Climate change resiliency

Flood management

Enhanced water quality

Introduction

This WSIP Feasibility Study responds to the specific requirements of WSIP. Extensive studies have been prepared by the U.S. Bureau of Reclamation (Reclamation) and the California Department of Water Resources (DWR). Key publications by these agencies include the following:

- *Draft North-of-the-Delta Offstream Storage (NODOS) Investigation Feasibility Report*, Reclamation, 2017.

  https://www.sitesproject.org/information/FeasibilityReport

- *North-of-the-Delta Offstream Storage Investigation Highlights*, DWR, 2014.

  http://www.water.ca.gov/storage/docs/Highlights/NODOS%20Highlights%20Booklet%2028May14.pdf

This WSIP Feasibility Study addresses all requirements of Section 3.5 of the TR (California Water Commission [CWC], 2017); however, there are some fundamental differences between this attachment and the U.S. Bureau of Reclamation (Reclamation) Feasibility Report. The most significant is a different climate change assumption for the evaluation of economic feasibility. The Reclamation Feasibility Report uses current conditions while this application evaluates 2030 and 2070 under changed climate conditions.

WSIP Feasibility Requirements

The WSIP application for Sites Reservoir includes the following information, consistent with Section 3.5 of the *Technical Reference* (CWC, 2017).

Project Objectives

The project objectives, including all public and non-public benefits the proposed project is designed to provide, are as follows:

- Improve water supply and water supply reliability
- Provide Incremental Level 4 water supply
- Improve the survival of anadromous fish and other aquatic species
- Improve Delta environmental and export water quality

The secondary objectives are:

- Provide sustainable hydropower generation
- Provide opportunities for recreation
- Provide flood-damage reduction

Project Description

A description of the proposed project, including facilities, operations, and relationships with existing facilities and operations is provided in Sites_A3 Project Description under the ELIGIBILITY AND GENERAL PROJECT INFORMATION TAB. A detailed operations plan is provided in Sites_A2 Operations under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB.

Project Costs

The Basis of Estimate Report is in Sites_A8 Estimate under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB. It documents all project costs, including construction costs, interest during construction, replacement costs, operations and maintenance costs consistent with the operations plan, and costs of mitigation for adverse environmental consequences identified in the draft environmental documentation.

Project Benefits

Sites_A5 Documentation under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB describes and quantifies all project benefits, consistent with the operations plan. Public benefits and non-public benefits are quantified using physical metrics and, where possible, monetized. Proposed project benefits are displayed as expected average annual values for each year of the planning horizon is in Sites_A6 Annual Benefits Table under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB. The benefits analysis addresses specific water year types (such as dry and critical).

Cost Allocation

A benefits-based cost allocation is provided in Sites_A10 Allocation under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB.

Technical Feasibility

The Modeling Summary and Operations Plan (Sites_A1 Modeling under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB and Sites_A2 Operations under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB) demonstrates that the project is technically feasible consistent with the operations plan, including a description of data and analytical methods, the hydrologic period, development conditions, and hydrologic time step. A water balance analysis showing, for the with- and without-project condition, all flows and water supplies relevant to the benefits analysis is provided in Appendix 1 at the end of this attachment.

The ability of the project to achieve the level of benefits identified in this application depends on collaborative operation of Sites Reservoir with the Central Valley Project (CVP) and State Water Project (SWP). The Authority is coordinating an Operations Working Group with participation from Reclamation and DWR to develop Principles of Agreement to coordinate the operations in a way that will deliver the expected benefits. The Authority has coordinated with the California State Water Resources Control Board (SWRCB) staff with regard to water rights and is developing a strategy to secure the water rights required for project implementation.

The engineering design for most facilities has been developed to support a Class 3 (a higher level than is required in the WSIP Technical Reference) estimate (Association for the Advancement of Cost Engineering [AACE] International) of the construction costs; however, some facilities are currently developed to a Class 4 (less rigorous) level. Design, estimate, and constructability (DEC) reviews were performed by Reclamation in July 2007 and May 2014. A special assessment was performed in March 2017.

Sites Reservoir is constructible and can be operated and maintained. The construction would be similar to that of existing CVP and SWP facilities. Construction would result in changes in operations for the CVP and SWP systems. Considerable effort would be needed to cooperatively operate Sites Reservoir with the existing CVP and SWP facilities in a manner that would fully realize the benefits.

Environmental Feasibility

The environmental effects of the project are evaluated in Reclamation and Authority, Sites Project Draft Environmental Impact Report (EIR)/Environmental Impact Statement (EIS) (2017). Constructing Sites Project would affect environmental resources in the Primary, Secondary, and Extended Study Areas. Beneficial effects correspond to the following resource areas: water management, agricultural resources, fisheries and aquatic resources, socioeconomics, power and energy, and recreation. Some adverse effects would be temporary, construction-related effects that would be reduced to less-than-significant levels through mitigation. Other adverse effects would be significant, including the effects on aquatic, botanical, terrestrial, wetlands, cultural/tribal, paleontological, land use, and air quality in Alternative D (the Authority's proposed project). The proposed mitigation is identified in the Mitigation Monitoring Plan (Appendix A1 in the Draft EIR/EIS). The URL for the Draft EIR/EIS is https://www.sitesproject.org/information/DraftEIR-EIS.

Economic Feasibility

The expected benefits of the project exceed the expected costs, considering all benefits and costs related to or caused by the project. This analysis is presented in the Physical Monetized Benefits attachment, Sites_A3 Physical Monetized under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB.

Financial Feasibility

Pursuant to WSIP Regulation 6003(a)(1)(O) and the Water Storage Investment Program (WSIP) Technical Reference Document (Technical Reference) (California Water Commission, November 2016), the purpose of the Funding Strategy is to demonstrate that the Sites Reservoir project will be able to obtain sufficient funding from public (including the requested WSIP funds) and private sources to cover the construction and operation and maintenance costs of the project over the planning horizon. This section outlines a funding strategy based on the assumption that long-term, tax-exempt bond financing will be utilized to fund the Municipal and Industrial (M&I) and Agricultural Water Supply portions of the project costs.

As described in other sections of this application, the requested WSIP funding in conjunction with separately requested Federal funding will support the provision of significant public benefits that would not otherwise be financeable through conventional means. In addition, the WSIP and Federal funding will help to offset interest carrying costs during the project's construction phase, thus significantly lowering overall development costs and delivering multiple public and water supply benefits to the citizens of California.

Project Costs

As detailed in Section A10 (Allocation of Total Costs) and shown below in Table A1-1, the total development costs for the project are estimated at $5,176 million, including both construction costs and interest during construction (IDC). Assuming Federal funding of $730 million in combination with the requested $1,662 million in funding from WSIP for the public benefits portions of the project, the remaining portion of the project's costs would be approximately $2,784 million, including $509 million for hydropower. The total amount of project's cost attributed to M&I and Agricultural water supply would be $2,276 million. This is the portion of the project for which the Sites Joint Power Authority (JPA) would need to seek financing, either from conventional sources such as tax-exempt revenue bonds, or through alternative project delivery approaches.

Table A1-1. Sites Reservoir Capital Development Sources and Uses (2015$; $Millions)

Sources	Uses (Costs)		*Sources of Funding*					
			Federal Non-Reimbursable		**WSIP**		**Other Public & Private**

Current Investors and Committed Funding Sources

Current investors for the project include the JPA investors listed below in Table A1-2. In addition to directly funding the preparation of early feasibility analysis, preparation of funding applications and other activities during the first phase of project development, these investors are providing the necessary commitments for purchasing water resources from the project to ensure a stable long-term revenue stream to support the repayment of debt for the construction of the project as well as the long-term payment of water conveyance and operations and maintenance costs.

Although the below listed agencies have invested in the development of the WSIP application, they are not currently under a formal agreement to fund design, construction, or ongoing operations and maintenance (O&M). The initial distribution of investors displayed in Table A1-2 is not final, and water could be allocated differently between these investors or new investors could be added prior to construction. Even if these agencies became the investors responsible for M&I and agricultural water supply, it is unlikely that they would be the sole water users.

Table A1-2. Current JPA Investors by Type and Class

Agency	Class 1 (TAF/yr)	Class 2 (Waiting List) (TAF/yr)	Grand Total

Funding Strategy

Traditional capital financing strategies for major water infrastructure projects like the Sites Reservoir typically include both short- and long-term debt, such as revenue bonds, general obligation bonds, and state revolving loan funds. After an extensive review of the available options, and given the relatively large size of the proposed project, the funding strategy that appears most viable would rely on:

1. a combination of public grant funding (Federal and WSIP) for the project's public benefit purposes;
2. short-term debt during the design and construction phase; and
3. long-term tax exempt revenue bond debt, to be repaid over the course of 40 years from M&I and agricultural water supply revenues.

The funding structure for each project component is discussed below.

Public Benefits

As described in detail in Sites_A10 Allocation under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB, federal funding in combination with WSIP would fund the project's public benefit purposes (e.g., ecosystem improvements). This funding would also result in significant overall capital cost saving for the project as a result of reduced interest costs during the construction phase of the project. Federal non-reimbursable construction funding of up to $730 million would be provided as funding for Anadromous Fish ($488 million), Incremental Level 4 Refuge ($201 million) and Flood Reduction ($41 million) purposes. The federal government would also provide $1.3 million per year as its 50 percent cost share of the Incremental Level 4 Refuge's allocated $2.6 million annual O&M cost (see Table A10-1).

If granted, the $1,662 million in WSIP funding would provide sufficient matching funds to fully cover the capital cost for all the project's public benefit categories. WSIP would provide 100 percent funding for the capital cost assignments for Oroville Coldwater Pool, Yolo Bypass and recreation. The WSIP funding would also provide the necessary 56 percent remaining capital needed by the other public benefit purposes receiving federal funding (i.e., Incremental Level 4 Refuge, Anadromous Fish and Flood Reduction).

WSIP funding is not available to pay for the future O&M costs assigned to the public benefit purposes. Although these annual O&M costs are relatively minor compared to the public benefits' capital costs, future funding will needed to cover their respective assigned O&M costs. Except for Incremental Level 4 Refuge which could receive a 50% O&M cost-share contribution, it is expected that non-federal partners (e.g. California Fish and Game) and/or the JPA would be responsible for repaying the majority of the public benefits' estimated future O&M costs of $12.2 million per year.

It is expected that some O&M funding may be obtained for recreation from user fees. Preliminary analysis suggests that $1.1 million in fee revenues could potentially be obtained from reservoir visitors. In addition, flood protection beneficiaries could perhaps be willing to contribute some minor share towards the public benefit purpose's future annual O&M expenses.

In addition to its planned water supply deliveries for agricultural and M&I users, Sites Reservoir will collect limited quantities of "recaptured" water that will be assigned for JPA use. The quantity of future recaptured water is expected to average approximately 11 TAF per year. The JPA plans to sell the recaptured water predominantly to south-of-the-Delta water contractors and use the sale revenues to pay the public benefits' cost share of the project's annual O&M expenses. At a $700 to $800 per acre foot water price, the JPA would be able to contribute $7.7 million to $8.8 million annually.

The JPA also proposes to use its hydropower operation's net revenues as another supplemental funding source for the public benefit purpose's O&M costs. In accordance with the JPA's general "beneficiary pays' approach, to the extent possible revenue sharing would be made between purposes based on their corresponding water allocation. As a result, water supply beneficiaries would also receive a commensurate share of the hydropower operation's net benefits as that for the public benefit purposes.

However, in absence of securing any other public agency funding support for the project's ecosystem benefit purposes, future O&M funding shortfall could occur. In which case, any such shortfall would mostly likely be re-assigned to the project's water supply users. Based on an average total water supply deliveries of 275 TAF, a potential $1 million shortfall would correspond to approximately an additional $3.65 per acre foot cost surcharge to the JPA water contractors.

Hydropower Benefits

As discussed in the Cost Allocation analysis (Sites_A10 Allocation under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB), the capital costs for the project's Hydropower facilities would be $509 million. This portion of the project would be financed during phases 1 through 3 through short-term debt in the form of loans from commercial banks or other financial institutions.

As with the project's water supply purpose described below, the primary long-term financing for hydropower would be obtained from revenue bonds to be repaid from energy purchasing agreement and sales to utilities. The hydropower revenues would be expected to include compensation for the facility's ancillary and system-wide capacity benefits. Preliminary analysis suggests there is both ample demand for this type of energy resource, and strong financial capacity among relevant California energy utilities to ensure long-term demand for the project's hydropower energy resources.

Sites Reservoir water contractors would also be a potential funding source for the project's hydropower operations. The water contractors provide an additional guarantee of potential O&M funding in the unlikely event of a funding shortfall in any given year since if necessary, the required revenues could be obtained through increased operating cost surcharges. Depending on their future O&M funding sources, there may or may not also be some opportunities for cost recapture from increased operating cost surcharges to some of the project's public benefit purposes.

Water Supply Benefits

A total of $2,276 million in development costs are attributed to water supply. These costs would be funded through short-term debt from commercial banks or other financial institutions during Phase 1 through 3 of the project. After which long-term, tax-exempt revenue bonds would be used for the project's expected 40 year repayment phase. Under this structure, payment of principal and interest on the bonds would be secured by a pledge of gross revenues derived from payment obligations under water supply contracts with JPA participating contractors.

Water Supply for State Water Contractors

As currently planned approximately 44 percent of the water supply quantities from the Sites Reservoir will likely be delivered to California SWP contractors. Based on preliminary discussions with DWR staff, there may be future partnership or cooperative agreements opportunities with DWR to assist the JPA with both future administration and management of the water supply payments but also participate with underwriting and financing assistance for a major portion of the project's water supply capital cost.

DWR could most readily provide this assistance through its SWP program. The SWP has existing legal authority, regulatory mechanisms, contractual agreements and administrative capacity to partner with the JPA's future water supply program. Furthermore DWR's technical expertise and longstanding working relationships with the state water contractors would be major assets for both funding and managing the project's future water supply program.

The JPA and DWR could coordinate future billing, payment and operations through a series of operational and trust agreements. SWP contractors and DWR have several options for reaching agreement that ensure: (1) JPA participating contractors receive their Sites Reservoir entitled deliveries independently from other SWP deliveries; and (2) DWR collects the contractors' payments.

Currently, it is envisioned that new I(h)4(a) agreements would likely be the preferred regulatory approach for establishing the necessary new SWP-contractors agreements. This authorizing regulation allows separate new "side agreements" mutually agreed upon between the SWP and individual water contractors in support of the development of new capital facilities.

Alternatively, amendments or Yuba Accord approaches could be used to develop the necessary agreements and arrangements. However, these approaches will likely involve more extensive and time-consuming negotiation and approvals.

There are numerous potential major benefits for future partnership arrangements between the JPA, DWR and participating SWP contractors. By partnering with the SWP, the JPA and its participating SWP contractors would be able to take advantage of highly favorable administrative and financing mechanisms that allow for the SWP to collect contractor payments, qualify and secure bond financing, and subsequently manage the debt administration and repayment through State Water Project backed bond financing.

Capital funds raised on behalf of the SWP contractors through SWP bond financing would likely be obtained at lower overall interest rates and have more favorable financing terms than capital funding raised by non-SWP contractors.

Water Supply for Other Water Agencies (Non-SWP Contractors)

It is currently expected that other JPA water contractors would be ineligible to participate under the SWP partnership program. As currently planned, these contactors would account for approximately 56 percent of total water supply deliveries and would have to obtain revenue bond financing through other means, including but not limited to traditional municipal bond markets and private placements.

The feasibility of financing all or part of the Sites Reservoir project with revenue bonds was evaluated by Citigroup Municipal Securities in March, 2014 at the request of the Glenn-Colusa irrigation district. The Citigroup analysis found that financing up to $4.2B in total development costs would be feasible through a series of revenue bonds issued with a coupon rate of 5 percent. This analysis has not been subsequently updated, but for the purposes of this application it provides important and external verification that both SWP and non-SWP contractors would be able to access adequate sources of debt financing to underwrite the capital costs to develop Sites Reservoir's future water storage and supply facilities.

For the purposes of the debt repayment capacity analysis which follows below, it is assumed that the interest rate, debt service reserve and other terms reflect a generalized and blended bond financing approach taking into account both SWP and non-SWP financing. Note that this analysis also includes the annual O&M costs that would also have to be paid by the water contractors.

Capacity for Repayment of Debt Plus Operations and Maintenance

Table A1-3 below provides a simplified presentation of one bond repayment scenario. This funding scenario is based on the revenue bond assumptions listed below, and incorporates water supply revenues estimated from other sections of this application.

As shown below in Table A1-3, the anticipated annual water supply revenues would be more than sufficient to cover both the repayment of a 40-year bond of $2,276 million and the future ongoing O&M costs. A full operating pro forma for the water supply portion of the project is included as an attachment to this section.

Project financing, bond amortization and interest cost assumptions are as follows:

1. Coupon interest rate assumed to be 3%, as adjusted to reflect 2015 terms.
2. No interest is paid on bonds during the construction phase.
3. Each bond series is assumed to be issued with a 5 percent debt service reserve fund (“DSRF“).
4. The project bonds are scheduled to amortize over the course of 40 years.
5. Bonds would be issued either by municipal utilities, or under a partnership agreement with a State of California agency.

Table A1-3 shows a “static” or average year pro-forma for the Sites Reservoir’s water supply operations. Under this simplified pro-forma, the JPA’s annual revenue requirements are met by an estimated average water supply price of $422 per acre foot over a 40 year repayment period. The analysis assumes a real (i.e., without inflation) interest repayment rate of 3 percent and is also based on averaged total water supply quantities of 274 TAF per year.

Table A1-3. Annual Bond Repayment and O&M, 40-year Term (2015$; $Millions)

	2030-2069		2070-2122		2030-2122	
Annual Water Supply Expenses	Total Cost $M	$/AF	Total Cost $M	$/AF	Total Cost $M	$/AF

Net Operating Revenue	$0		$0		$0	

Table A1-4 shows the public benefits cash flow on an annual basis over the full study period. This analysis assumes $750 per acre foot for recaptured water supply sales and $1.1 million in recreation fee revenues. These revenues would not fully cover the total WSIP public benefits O&M ($12.2 million per year) and would be expected to result in a $2.8 million per year revenue shortfall. However, it is possible the State government may assist with the public benefits’ O&M costs. Alternatively, the State could potentially reduce its water deliveries (particularly in wetter years) to sell some of its water allocation to generate revenues to cover any remaining or accumulated O&M funding shortfalls.

Table A1-4. Sites Reservoir Public Benefits Cash Flow (2015$; $Millions, TAF)

Factor	Total Period 2030-2122 (93 Yrs)						
	2030	2031	...	...	2122	Total	Average
Recaptured Water Supply	11	11	...	...	11	***1,023***	***11***
Recaptured Water Supply Sales	$8	$8	...	...	$8	*$767*	*$8*

WSIP Public Benefits O&M	($12)	($12)	...	...	($12)	*($1,127)*	*($12)*
Subtotal Authority Admin Operations	**($2.8)**	**($2.8)**	...	...	**($2.8)**	***($257)***	***($2.8)***

Assumptions:

Water Supply Prices	2030-2122
Recaptured Sales Price $/Acre Foot	**$750**

Table A1-5 shows the pro forma on an annual basis over the full study period. This more detailed pro forma includes the projected future annual water supply quantities (which are expected to increase between 2030 and 2070). The base water supply cost has also been adjusted to factor in both: (1) an additional 5 percent cost surcharge for a debt service reserve fund; and (2) a 3 percent net operating income surcharge to provide the additional JPA revenues to ensure that project is net revenue positive (when the debt service reserve fund is included) during its early operating years.

As shown in Table A1-5, at a water supply cost of $456 per acre foot, the project's water supply program would be expected to operate in 2030 with a net operating income deficit of $4.0 million. However, if the $5.7 million debt service reserve contribution is included, the overall net operating income for the JPA's water supply program would be positive at $1.6 million. As future water supply quantities increase, the JPA's water supply program's net operating income would improve to near break-even by 2040 (and would also make its full $5.7 million debt service reserve contribution).

In subsequent years, the JPA water supply program would operate with an increasing net operating income (NOI) surplus. By 2069 its NOI surplus would total $10.3 million per year. Over the 40 year repayment period, the JPA water supply program would be expected to result in a of $125 million cumulative NOI surplus. Although perhaps unlikely, in the absence of any required reserve draw downs, the JPA water supply program would also accumulate debt service reserve funds of $240 million. If unused, both these cumulative funds could be used to pre-pay the remaining principal prior the end of the 40 year repayment period. The size of these cumulative reserves indicates the extent of the financial buffer that the debt reserve fund would provide during the project's repayment period.

Table A1-5 also shows that from 2070 onwards, the annual water supply cost would decrease to only $44 per acre foot in order to cover the JPA water supply program's assigned O&M costs.

Table A1-5. Sites Reservoir Water Supply Financial Pro Forma (2015$; $Millions; TAF)

Alternative Delivery Financing

Give the large size of the Sites Reservoir Project and the strong existing appetite in the financial markets for stable, long-term investments in major infrastructure assets, there are several “alternative delivery” financing approaches that would also likely prove feasible for this project. These include primarily various forms of public-private partnerships (“P3s“). As defined by the Water Research Foundation, these typically “involve a contractual arrangement whereby the resources, risks and rewards of both the public agency and private entity are combined to provide greater efficiency, better access to capital, and improved compliance with government regulations”.[1] Under Assembly Bill (AB) 2551 adopted in August 2016, California has relatively broad authorizing legislation allowing alternative delivery methods for water storage projects. Additional details on alternative delivery are provided below as Appendix 1 to this Section.

Conclusion

In accordance with the WSIP Technical Guidance, the analysis period for the Site Reservoir project was 93 years from its start of operations in 2030 through to the end of the study period in 2122. Over the course of this period the project will deliver significant new public benefits, clean hydroelectric energy and major new water deliveries for California’s M&I and agricultural water users. The above analysis provides a conservative approach to financing the construction costs for the project over the course of 40-years, assuming relatively low-risk financing approaches that are commonly utilized by water contractors and authorities across the United States, and for which there is currently considered to be ample demand from investors.

Although this low-risk approach would be feasible, there are also other potential approaches that could be leveraged over the long-run to deliver water supply resources at rates lower than those assumed for the purposes of this financing strategy. The full range of options has not been explored here, but will be analyzed in greater detail in the future as public funding commitments for the project, including WSIP, are confirmed.

Constructability

At the current feasibility level of design for the Sites Reservoir Project, detailed construction plans and specifications are not yet available. However, the concepts for all of the major facilities comprising the project are at a level that supports developing a Class 4 cost estimate and a preliminary implementation schedule for construction. The constructability review for the current level of design is a high level review that focuses on identifying design concept and construction schedule issues that could introduce significant cost estimating and planning risk.

The constructability review findings include the following:

1. The conceptual designs represent proven technology. Rapidly evolving, new concepts have not been adopted, although these concepts may allow for improved designs and cost savings based on further evaluation in future design phases for the project.

2. Construction easements (permanent and temporary) have been evaluated in sufficient detail to determine that real estate costs are reasonable.
3. Environmental mitigation costs have been evaluated based on current understanding of project permitting needs (based on site environmental assessments) and in preliminary consultation with the various state and federal agencies.
4. A preliminary assessment of the potential for encountering hazardous material was performed; including the presence of abandoned gas well, septic systems, underground tanks, and the like.
5. For major facilities, cost estimates were based on preliminary quantity estimates, equipment and manpower estimates to complete tasks, manufacturer's quotes, and AECOM experience on recent similar projects.
6. The construction schedule is based on manpower and equipment needed to complete construction, and reflects the interdependency of construction tasks between facilities that control the start or finish of construction activities.
7. An adequate labor pool exists in the region to complete the project.
8. Appropriate allowances have been included for mobilization and demobilization, construction contingency, and non-contract (owner) costs.
9. Packaging of contracts can facilitate competition and avoid potential for equipment and material shortages.
10. Traffic handling and detours during construction has been considered.
11. Temporary diversion of water during the winter has been considered.

Appendix 1: Financial Feasibility - Research Foundation Definitions of Water Infrastructure Financing Types [2]

Traditional Financing

Revenue Bonds

Revenue bonds are fixed income, debt obligations issued by local governments or other public agencies where the principal and interest on the bonds are secured by the specific revenues named in the bond documents. Revenue bonds typically include a rate covenant by which the user agrees to set rates sufficient to meet all operating costs and some multiple of debt service, and may include a flow of funds requirement and a cash reserve fund requirement, among others.

General Obligation Bond. General Obligation bonds are debt obligations issued by a government entity that are secured by the entities full faith and credit and pledge of tax revenues. This is the strongest pledge the government can provide and is usually regarded by investors and rating agencies as the strongest form of bond security. General Obligation bond issuances often require a bond referendum and public vote.

State Revolving Fund Loan

The State Revolving Loan Fund (SRF) program provides low-interest loans for water and sanitation infrastructure to municipalities, water/sewer authorities, and utility districts. Each state's SRF programs

[2] From *New and Emerging Capital Providers for Infrastructure Funding,* Water Research Foundation, 2016.

receive its initial capital from federal grants and state contributions, and then "revolves" through the repayment of principal and the payment of interest on outstanding loans. There are two SRF programs, the Clean Water State Revolving Fund created under the Clean Water Act, and the Drinking Water State Revolving Fund created under the Safe Drinking Water Act. Each state administers their own SRF programs and program eligibility, requirements, and benefits differ from state to state.

Alternative Delivery: Public Private Partnerships

"Public-private partnerships ("P3s") are a contractual arrangement whereby the resources, risks and rewards of both the public agency and private company are combined to provide greater efficiency, better access to capital, and improved compliance with government regulations. The public's interests are generally assured through provisions in the contracts that provide on-going monitoring and oversight of the operation of a service or development of a facility. The key distinctions of P3s from other forms of alternative project delivery are (1) the extended duration of the partnership, and (2) the nature of the financing and the sources of revenues. In a P3, the duration of the partnership is a long-term one, lasting 10 to 20 years or more. While private financing is not a pre-requisite for an alternative delivery project, it is commonly accepted that private financing is a key distinguishing feature of a P3 arrangement.

In general, there are at least two types of P3 models; (1) demand risk model, and (2) availability payment model. The demand risk model represents the case where P3 financing is secured with the future revenue streams from user charges, and where the private concessionaire takes on the overall financial risks associated with potential fluctuations in future user demand. This model is typically used where there are sufficient revenue streams from user charges to fund the capital investment. Under the availability payment model, the private concessionaire provides the P3 financing, but it is secured with annual payment commitments from the public sector over the concession term. Table A1-6 shows the major investors in North American water infrastructure with their global ranking.

Table A1-6. Top 10 Global Investors in Water Infrastructure, North America

2016 Global Rank	Company	Country	Funding ($M)
2	Brookfield Asset Management	Canada	$31,985
3	Global Infrastructure Partners	United States	$20,780
4	Borealis Infrastructure	Canada	$19,246
7	ArcLight Capital Partners	United States	$10,675
11	Kohlberg Kravis Roberts	United States	$5,913
12	Energy Capital Partners	United States	$5,882
13	Stonepeak Infrastructure Partners	United States	$5,275
14	JP Morgan Investment Management	United States	$5,171
17	EnerVest	United States	$4,400
20	First Reserve	United States	$3,769

Appendix 2: Water Balance of CalSim II Simulation Results for Current Conditions, WSIP 2030, and WSIP 2070

The following section contains tables that portray the water balance results for the following CalSim II simulations:

1. Current Conditions With Project vs. Current Conditions Without Project
2. WSIP 2030 With Project vs. WSIP 2030 Without Project
3. WSIP 2070 With Project vs WSIP 2070 Without Project

As defined in Section 4.3.1 of the WSIP Technical Reference Document, a water balance is an accounting of all the flows of water into and out of an account for a defined period. An account can represent a location or geographic boundary, such as a reservoir, watershed, or region. The following accounts are included in this report:

1. Sites Reservoir
2. Colusa Basin
3. Sacramento Valley
4. Sacramento-San Joaquin Delta

The Sacramento-San Joaquin Delta account consists of the region upstream of Delta outflow and downstream of inflows at Freeport and Vernalis. The Sacramento Valley account includes the region upstream of Freeport and downstream of inflows at Shasta Lake and Trinity Lake, not including the Colusa Basin. The Colusa Basin account consists of the entire Colusa Basin region, not including Sites Reservoir. The Sites Reservoir account provides a water balance for the reservoir itself.

The following tables include inputs, outputs, and changes in reservoir storage for each account. The parameters are presented as water-year (October through September) annual averages based on the full simulation period (82 years; 1922–2003). The mass balance is computed as the total volume of inputs subtracted by the total volume of outputs and the total volume of change in storage. A mass balance value of zero indicates that all water entering the account is equal to all water leaving the account and accumulating in storage. Moreover, a mass balance of zero confirms that there are no net gains or losses within the account that are unaccounted for. As shown in this report, all the CalSim II models achieve mass balance values of zero for each of the four accounts defined above.

Sites Reservoir Mass Balance *(All values are in TAF)*	Annual Average for Full Simulation Period		
	Current Conditions With Project	Current Conditions Without Project	Difference
Sites Reservoir Mass Balance **Inputs**			
Diversion to Sites Reservoir at Red Bluff (TCC)	277	0	277
Diversion to Sites Reservoir at Hamilton City (GCC)	105	0	105
Diversion to Sites Reservoir at Delevan Pipeline	133	0	133
Total Inputs to Sites Reservoir	**514**	**0**	**514**
Outputs			
Release from Sites Reservoir to TCC, GCC, and Colusa Basin Drain	233	0	233
Release from Sites Reservoir to Delevan Pipeline	234	0	234
Sites Reservoir Evaporation & Losses	44	0	44
Total Outputs from Sites Reservoir	**510**	**0**	**510**
Change in Storage			
Sites Reservoir	4	0	4
Mass Balance	0	0	0

*Change in Storage is End of Period Volume minus Beginning of Period Volume divided by number of years in the period.

*Annual Averages for October through September.

Colusa Basin Mass Balance *(All values are in TAF)*	Annual Average for Full Simulation Period Current Conditions With Project	 Current Conditions Without Project	 Difference
Colusa Basin Mass Balance **Inputs**			
Diversion at Red Bluff (TCC & Corning Canal)	428	188	240
Diversion at Hamilton City (GCC)	890	861	29
Release from Sites Reservoir to TCC, GCC, and Coluse Basin Drain	233	0	233
Other Diversions from Sacramento River	507	505	1
Stony Creek and other tributary Inflows	928	928	0
Return Flows	332	332	0
Total Inputs to Colusa Basin	**3,318**	**2,814**	**503**
 Outputs			
Diversion to Corning Canal	23	20	3
Diversion to Orland Unit Agriculture	102	103	0
Diversion to TCCA Agriculture	246	173	73
Diversion from TCC to Sites Reservoir	277	0	277
Diversion to GCID Agriculture	763	759	4
Diversion from GCC to Sites Reservoir	105	0	105
Diversion to Refuges	100	97	3
Diversion to Other Colusa Basin Agriculture (Right Bank)	507	505	1
Stony Creek Outflow to Sacramento River	235	237	-2
Colusa Basin Drain Outflow to Sacramento River	447	427	20
Knights Landing Ridge Cut Outflow	342	320	22
Losses from Canals (TCC, CC, GCC, CBD)	147	149	-2
Stony Creek Reservoirs Evaporation & Losses	24	24	0
Total Outputs from Colusa Basin	**3,317**	**2,814**	**503**
 Change in Storage			
Stony Creek Reservoirs	1	1	0
Mass Balance	**0**	**0**	**0**

*The Colusa Basin mass balance includes parameters within the Colusa Basin, not including Sites Reservoir, Funks Reservoir, and the Sacramento Valley outside of the Colusa Basin. The Delevan Pipeline is not included in this table because it serves as an input and output for the Sites Reservoir Mass Balance and Sacramento Valley Mass Balance reports.
*Other Diversion from Sacramento River include diversions to Colusa Basin, West Bank, and WBA8S
*Stony Creek and other tributary inflows include inflows to East Park Reservoir, Stony Gorge Reservoir, Black Butte Lake and DSA 12 Accretion
*Return flows include those from WBA8NN, WBA7N, WBA7S, WBA8S, WBA8NS, Delevan and Colusa Refuges
*Diversion to TCCA Agriculture includes diversions to WBA4, WBA7N, and WBA7S.
*Diversion to GCID Agriculture includes diversions to WBA8NN and WBA8NS.
*Diversion to Refuges includes diversions from the Sacramento Valley and the Colusa Basin Drain.
*Stony Creek Reservoirs includes East Park Reservoir, Stony Gorge Reservoir, and Black Butte Lake.
*Change in Storage is End of Period Volume minus Beginning of Period Volume divided by number of years in the period
*Annual Averages for October through September.

Sacramento Valley Mass Balance	Annual Average for Full Simulation Period		
(All values are in TAF)	Current Conditions With Project	Current Conditions Without Project	Difference
Sacramento Valley Mass Balance			
Inputs			
Inflow to Shasta Lake and Whiskeytown Reservoir	5,998	5,998	0
Flow through Clear Creek Tunnel	550	542	7

Accretions in Feather River	460	460	0
American River Inflow to Folsom Lake	2,734	2,734	0
Other American River Inflows	674	674	0
Accretions in Lower Sacramento River	595	595	0
Inflow from Knights Landing Ridge Cut	342	320	22
Groundwater Pumping	1,204	1,204	-1
Return Flows	1,502	1,494	8
Total Inputs to Sacramento Valley	**25,256**	**24,968**	**289**
Outputs			
Diversion to Sutter Refuge	13	11	2
Diversion at Red Bluff (TCC & CC)	428	188	240
Diversion at Hamilton City (GCC)	890	861	29
Diversion to Sites Reservoir through Delevan Pipeline	133	0	133
Diversion to Other Colusa Basin Agriculture (Right Bank)	507	505	1
Diversion to Other Sacramento River Agriculture and M&I	2,875	2,875	0
Diversion to Feather River Agriculture and M&I	2,245	2,226	19
Diversion to Yuba River Agriculture and M&I	63	65	-1
Reservoir Evaporation & Losses	231	227	4
Stream-Groundwater Interaction	139	145	-6
Yolo Bypass	2,129	2,158	-29
Sacramento River below Freeport	15,605	15,709	-104
Total Outputs from Sacramento Valley	**25,257**	**24,970**	**288**
Change in Storage			
Shasta Lake	5	4	1
Lake Oroville	-8	-7	-1
Folsom Lake	1	0	0
Other Reservoirs	1	1	0
Total Change in Reservoir Storage in Sacramento Valley	**-1**	**-2**	**1**
Mass Balance	**0**	**0**	**0**

*The Sacramento Valley Mass Balance includes parameters upstream of Freeport to Shasta Lake and Trinity Lake inflow, not including the Colusa Basin. See "Colusa Basin Mass Balance" for additional detail.
*Other Inflows upstream of Red Bluff include Cow Creek, Cottonwood Creek, Battle Creek, and Payne Creek.
*Inflows between Red Bluff and Hamilton City include Elder Creek, Thomes Creek, Antelope Creek, Mills Creek, Deer Creek, and Red Bank Creek.
*Other American River Inflows include inflows to the Sacramento River and from Lake Natoma.
*Diversion to Other Sacramento River Agriculture and M&I include diversions to West Sacramento Diversion for Davis Municipal Project, EBMUD & CCWD Freeport Regional Water Project, North Fork Dam, DSA12, DSA15, DSA59, DSA70, WBA4, and WBA5.
*Diversion to Feather River Agriculture and M&I includes diversions to Gray Lodge Refuge, Butte Sink Duck Clubs, Western Canal & Joint WD Rice Straw Decomp, DSA69, and diversion to Sites Reservoir at Joint Canal near Thermalito.
*Diversion to Yuba River Agriculture and M&I include transfers for Lower Yuba River Accord and SCWA excess flows.
*Change in Storage is End of Period Volume minus Beginning of Period Volume divided by number of years in the period.
*Other Reservoirs include Whiskeytown Lake, Kesiwck Reservoir, Thermalito Complex, and Lake Natoma.
*Annual Averages for October through September.

Sacramento - San Joaquin Delta Mass Balance *(All values are in TAF)*	Annual Average for Full Simulation Period		
	Current Conditions With Project	Current Conditions Without Project	Difference
Sacramento - San Joaquin Delta Mass Balance **Inputs**			
Sacramento River below Freeport	15,605	15,709	-104

Introduction

The proposed project is located in the Colusa Basin watershed in Colusa and Glenn. Due to the relatively low elevation, flooding in the watershed typically takes place between October and April due to rainfall-runoff. Flood flows from the foothill streams are prone to sudden surges that flow swiftly into the Colusa Basin Drain. The Colusa Basin Drain is a designated floodway according to the Central Valley Flood Protection Board. The primary cause of flooding is inadequate conveyance capacities in the many ephemeral streams throughout the watershed. In addition, high intensity rainfall will cause localized flooding due to poor drainage facilities.

Funks Creek flows into the existing Funks Reservoir at the Tehama-Colusa (T-C) Canal, with flow contributed from a drainage area of 43 square miles. Stone Corral Creek flows from a drainage area of approximately 38 square miles. The headwaters of Grapevine Creek are on the west side of the proposed Sites Reservoir inundation area and flow into the reservoir inundation area north of Sites-Lodoga Road. Grapevine Creek flows into Funks Creek approximately seven miles upstream of the existing Funks Reservoir. The headwaters of Antelope Creek are also on the west side of the proposed Sites Reservoir inundation area, just south of the headwaters of Grapevine Creek. Antelope Creek flows through the southern portion of the proposed Sites Reservoir inundation area and joins Stone Corral Creek near the town of Sites. To the north of the proposed reservoir inundation area, Hunters Creek flows to the east. Southeast of the proposed inundation area is Lurline Creek, which flows to the east. Both Hunters and Lurline Creeks flow into the Colusa Basin Drain. Figure 1 depicts the proximity of the proposed project features to these ephemeral streams.

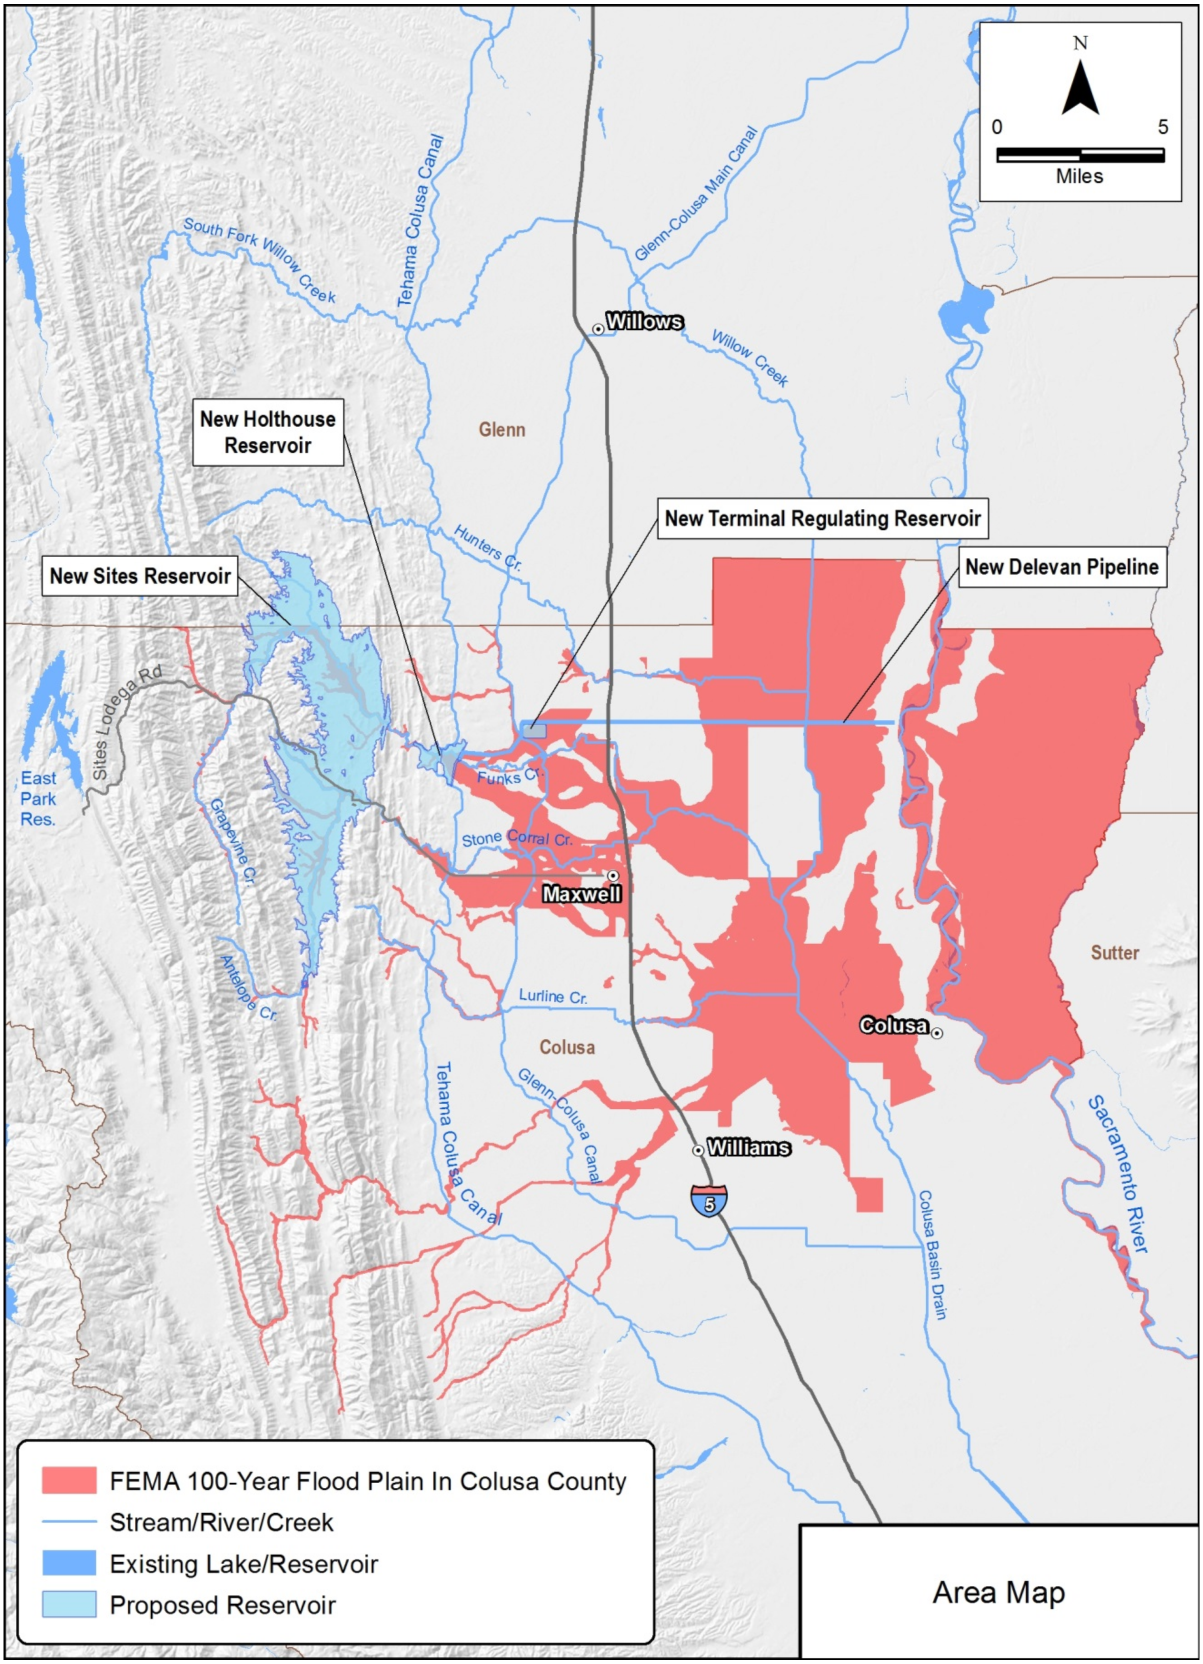

Figure 1. Area Map

Without-Project Future Conditions

The without-project future conditions and existing conditions are assumed to be similar given the rural nature of the area and limited potential for growth and development in Glenn and Colusa counties. Commercial and residential land use is generally limited to the town of Maxwell and areas adjacent to Interstate Highway 5, State Highway 20, and the local roads which traverse this part of Colusa County.

Figure 2 depicts the existing Federal Emergency Management Agency (FEMA 100-year floodplain in western Colusa County. A portion of the area along Funks Creek, downstream of the existing Funks Reservoir, and Stone Corral Creek are in the existing 100-year floodplain. Funks Reservoir is not a flood control reservoir and therefore can be overwhelmed with runoff allowing peak flows to continue downstream in Funks Creek. Of the 76,269 acres located within the existing 100-year floodplain, 75,716 acres are currently agricultural, 64 acres residential, and 489 acres non-residential.

A large portion of the town of Maxwell is located within the existing 100-year floodplain. Maxwell is a farm community with a population of about 1,100 people located west of Interstate Highway 5. The most recent census information (2015 American Community Survey) reports that the town of Maxwell has 370 housing units. No census information is provided on the number of businesses in town, although the Colusa County Assessor’s parcel records indicate 14 commercial properties with structures present in Maxwell. In addition, the town of Maxwell has one governmental parcel as well as six institutional parcels with an even split of churches and schools.

In February 2017, the Sacramento Valley experienced heavy rainfall. In Colusa County, the rainfall run-off caused flooding along Stone Corral Creek inundating the town of Maxwell and the surrounding areas including a portion of Interstate Highway 5 and the Sites Project Authority office. Photos of the flooding are included as Figure 3.

Figure 3. February 2017 Flooding: Town of Maxwell and Vicinity

With-Project Future Conditions - Potential Flood Control Physical Benefits

Direct flood control benefits would be provided by the proposed project within the Stone Corral Creek and Funks Creek watersheds including the town of Maxwell by reducing the size of the floodplain within the region. It is estimated that the proposed project would reduce the 100-year floodplain by about 10,000 acres, a 9% reduction. In addition to increasing the level of protection in the Funks Creek and Stone Corral Creek watersheds, 100-year level of protection would also be achieved for approximately 4,025 acres in the Colusa Basin located east of Interstate Highway 5. Table 1 provides a summary of the change in 100-year floodplain area by land use type. Figure 3 depicts the With-Project Future Conditions 100-year floodplain.

Table 1. Sites Reservoir Changes in Flooding Footprint and Damages for the 100-Year Event

	100-Year Existing (Acres)	100-Year With Project (Acres)	Net Change (Acres)
Agriculture	75,716	65,874	9,842
Residential	64	44	20
Non-Residential	489	349	140
Total	**76,269**	**66,267**	**10,002**

Flood Inundation Study

A flood inundation study was conducted to better understand the extent of existing flooding along Funks Creek and Stone Corral Creek downstream of the proposed project area and to analyze changes in the floodplain with the proposed Sites Reservoir project in place.

Existing information from FEMA's Flood Insurance Study for Colusa County (May 2003) and Letter of Map Revision for town of Maxwell (effective July 2015) were reviewed. FEMA's model was not readily available; therefore, a new numerical model was developed to analyze the future with-project conditions for the 5-, 10-, 25-, 50-, 100-, and 500-year flood events. Table 2 summarizes the elements of the new hydraulic model developed for this analysis. The modeling results compared to FEMA's results are similar especially near the town of Maxwell.

Table 2. Hydraulic Model Data Sources

Item	FEMA Studies	Sites Reservoir Flood Inundation Study
Hydraulic model software	U.S. Army Corps of Engineers (USACE) Model HEC-2 and HEC-RAS version 4.1 (1-D) and FLO-2D (2-D) (https://www.flo-2d.com/)	USACE Model HEC-RAS version 5.0.3 (1-D/2-D) (http://www.hec.usace.army.mil/software/hec-ras/)
Topography / Digital Terrain Model	USGS quadrangles and LiDAR from Central Valley Floodplain Evaluation and Delineation (CVFED) program	USGS National Elevation Dataset (NED) (https://nationalmap.gov/elevation.html)
Hydrology	HEC-1 and HEC-HMS (from Preliminary Hydrologic Analysis for Colusa County; Maxwell, Williams, and Arbuckle Study areas (supported Colusa County Letter of Map revision); May 2013)	Preliminary Hydrologic Analysis for Colusa County; Maxwell, Williams, and Arbuckle Study areas (May 2013) and USGS Regression Equations

Program Requirements Tab

Attachment A.1: Measurable Benefits

A.1 What measurable improvements to the Delta ecosystem or tributary to the Delta does the project provide? Where is the location of the improvement? If the project is not within the watershed of the Delta, what specific water rights or water contracts would be created or amended to ensure public benefits to the Delta ecosystem? Provide supporting documentation of the willingness of these water right or water contract holders to enter into such contracts or amendments. Explain how these changes would assure measurable improvements to the Delta ecosystem. See regulations section 6003(a)(1)(L).

WSIP Application Instructions, March, 2017

Response

Table A.1-1 provides some of the key benefits (public and non-public) from the modeling results for Sites Reservoir. Public benefits are highlighted in yellow.

The most significant measurable improvement to a tributary to the Delta is the improvement in Sacramento River water temperatures that result from Sites Reservoir. The modeled temperature improvements are shown at multiple locations in the river in Table A.1-1 (see under EEA-2).

Measurable improvements to the Delta ecosystem would be provided through releases to the Yolo Bypass for ecosystem enhancement (see EEA-5 on Table A.1-1). Benefits in the Sacramento, Feather, and American River watersheds (tributaries to the Delta) are also provided (see EEA-1 through EEA-4 and EEA-6 through EEA-8). The locations of the improvements are specified in the table.

The project is within the watershed contributing to the Delta and can make releases to the Delta for public benefits.

Introduction

This document provides descriptions and assumptions of the with-project conditions for the Sites Reservoir Project for years 2030 and 2070 as proposed by the Sites Project Authority (Authority). In addition, this document includes a description of the with- and without-project current conditions.

The with-project conditions include a 1.81-million-acre-foot (MAF) reservoir, which would be located in the Sacramento Valley west of the town of Maxwell, and associated conveyance facilities including use of existing Tehama-Colusa Canal (T-C Canal) and Glenn-Colusa Irrigation District (GCID) Main Canal diversion and conveyance facilities, plus a proposed new diversion and discharge pipeline. The proposed reservoir would be filled by diversion of excess Sacramento River water that originates from unregulated tributaries to the Sacramento River downstream from Keswick Dam. These flows are "excess" to those needed to meet current regulatory requirements or other water demands. Operation of the proposed reservoir would be in cooperation with the operations of existing Central Valley Project (CVP) and State Water Project (SWP) system facilities to facilitate and maximize the potential for a wide range of benefits. Detailed operating agreements would need to be developed that define a framework and procedures for cooperative operations among the Sites Project Authority (Authority), Central Valley Project (CVP), and State Water Project (SWP).

Approach

The with-project assumptions were developed through a series of meetings and coordination with Authority representatives including participating water district managers and county representatives, California Department of Water Resources (DWR), and Bureau of Reclamation (Reclamation). The with-project condition builds on previous work conducted under the CALFED Bay-Delta Program (CALFED) by DWR and Reclamation. Subsequent to CALFED, DWR has been the lead on technical studies in coordination with the Authority as part of the North-of-Delta Offstream Storage (NODOS) Project and associated investigations.

The analyses conducted for the Sites Reservoir Project utilized the model products and assumptions described in section 6004(a)(1) of the code of regulations. This includes the 2030 and 2070 future conditions CALSIM II and DSM2 models provided by the California Water Commission on November 2, 2016. The models provided by the commission were modified to include the facilities and operation of the Sites Project as described below in the Project Description and Assumptions section. There were no modifications to existing CVP and SWP operating criteria.

The with- and without-project Current Conditions analyses were based on the DWR State Water Project Final Delivery Capability Report 2015 (DWR 2015) – base scenario. Similar to above, the DCR 2015 base scenario, provided by DWR, was modified to include the facilities and operation of the Sites Project. The project description and assumptions for the with-project current condition is the same as described for the 2030 and 2070 with-project conditions.

The CALSIM II model is based on a monthly time step and, therefore, does not incorporate all the detailed decision processes that occur in actual daily operations of the CVP and SWP systems. To evaluate naturally occurring storm event flows, supplemental modeling was conducted on a daily time step to assess availability of excess Sacramento River flows.

Table 1 (located at the end of this document) shows the range of potential beneficiary operations under drought and other hydrologic conditions, and priorities assumed for various seasonal operations. It is intended that storage and associated releases could be adaptively managed to support operational actions found to produce the greatest benefits over time.

The analyses included the use of other analytical tools that were updated for future 2030 and 2070 conditions. These tools include:

- USRDOM – Upper Sacramento River Daily Operations Model
- Sacramento River HEC5Q model
- SALMOD
- American River CE-QUAL Model
- CWEST
- SWAP
- LTGEN
- SWP Power
- NODOS Power

The analytical framework, tools, and analyses were formulated for evaluating the benefits and impacts of the Project. The framework provides for iteratively refining operations criteria to minimize both the systemwide and localized impacts on various resources while maximizing the benefits.

The primary model in the framework is CALSIM II with inputs describing the hydrology, facilities, water management, regulatory standards, and operational criteria assumptions. CALSIM II outputs regarding system operation decisions including deliveries, flows and storages are then used by every other model in the analytical framework. CALSIM II operations were informed based on the reporting metrics from various models that simulate river temperatures, anadromous fish survival, Delta water quality, hydropower generation and economics.

Upper Sacramento River Daily Operations Model (USRDOM) uses the CALSIM II outputs regarding the operational controls and reservoir releases to simulate daily reservoir operations and daily river flows for the upper Sacramento River from Shasta Dam to Knights Landing. For evaluating Project operations, CALSIM II and USRDOM were simulated iteratively to determine potential Reservoir diversions based on flow conditions in Sacramento River.

Delta Simulation Model (DSM2) was used to simulate hydrodynamics (flow, velocity and water levels) and water quality (salinity) in the Sacramento-San Joaquin Delta. The Upper Sacramento River HEC5Q model was used to simulate reservoir and river temperatures in the upper Sacramento River, from Shasta Lake to Knights Landing. The Folsom CE-QUAL-W2 model was used to simulate reservoir and river temperatures on the American River. The SALMOD model was used to simulate benefits to anadromous fish in the Sacramento River. The LTGEN, SWP Power, and NODOS Power were used to study the power production and use. The SWAP and CWEST economic modeling tools were used to study the benefits to agricultural water supply and urban water supply. The interrelationships between the models are shown in the analytical framework in Figure 1.

Descriptions of the models used in the analytical framework are included in the following attachments.

- CALSIM II and DSM2 Modeling Assumptions
- HEC5Q Modeling for the Sites Project
- SALMOD Salmon Modeling of the Sacramento River
- Upper Sacramento River Daily Flow and Operations Modeling
- Power Modeling of the Sites Reservoir Project
- Economic Modeling of the Sites Reservoir Project
- Folsom Reservoir CE-QUAL-W2 Temperature Modeling

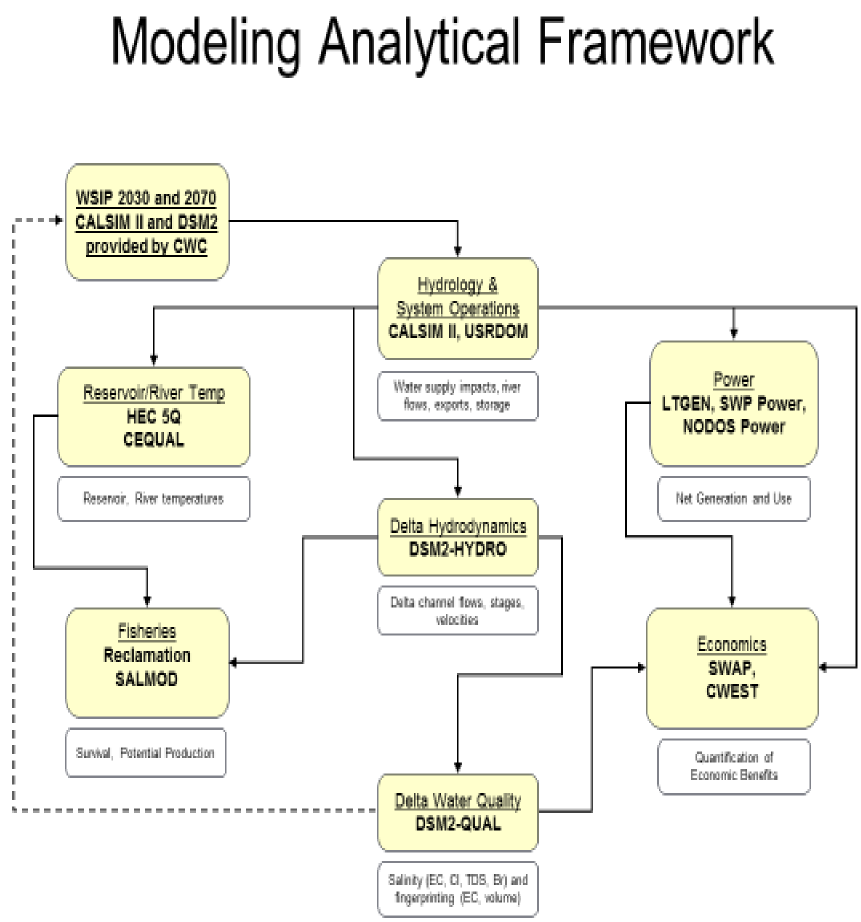

Figure 1. Modeling Analytical Framework

Project Description and Assumptions

Sites Reservoir would be filled by diversion of excess Sacramento River flows that originate from unregulated tributaries to the Sacramento River downstream from Keswick Dam. As described below, diversions are assumed to potentially occur in any month or water year type, but would likely be greatest in the winter months with wetter conditions (depending on storage conditions and annual flows and events). The Sites Reservoir Project could operate in cooperation with CVP and SWP system facilities to facilitate a wide range of benefits. Sites Reservoir would provide water through four primary mechanisms:

- Water stored in Sites Reservoir could be released directly to Colusa Basin users,
- Water could be released to the Sacramento River
- Water could be released through the Colusa-Basin Drain and Knights Landing Ridge Cut
- Water stored in Sites Reservoir could be exchanged for water stored in Shasta Lake or other CVP and SWP system reservoirs.

This last mechanism could be used to significantly increase upstream north-of-Delta storage and operational flexibility to support multiple water supply and ecosystem benefits.

The project employs a strategy to maximize the potential benefits of Sites Reservoir while not adversely affecting the CVP and SWP’s ability to meet existing system regulatory requirements including the following:

- Water rights
- Instream flow requirements
- Biological opinions
- Delta water quality requirements
- CVP and SWP requirements
- Central Valley Project Improvement Act (CVPIA)

The following sections describe the proposed Sites Reservoir Project infrastructure, Sacramento River diversion criteria and assumptions, public benefits, and water supply benefits.

Project Infrastructure

The primary facilities include a 1.81-MAF Sites Reservoir that would rely on the existing T-C Canal and GCID Main Canal for diversion and conveyance purposes, as well as a new proposed Delevan Pipeline and intake to divert and convey water to and from the reservoir. Figure 1 shows the location of the proposed reservoir and associated conveyance facilities. A description of existing and proposed new conveyance facilities and their proposed operation follows.

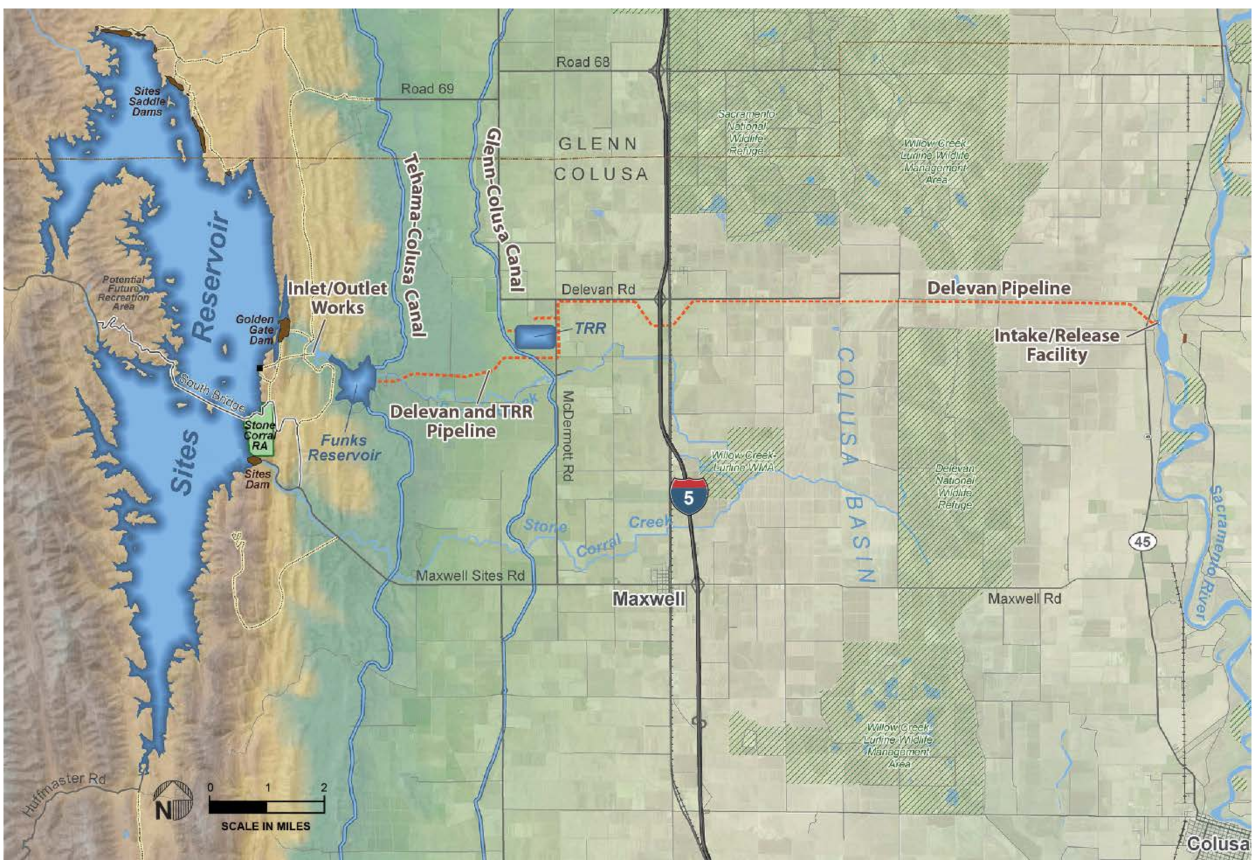

Figure 2. Sites Reservoir and Proposed Facilities

Tehama-Colusa Canal and Red Bluff Pumping Plant Facilities and Capacity

The existing Tehama-Colusa Canal Authority's (TCCA) T-C Canal through the TCCA service area and Red Bluff Pumping Plant located on the Sacramento River near Red Bluff would be used to divert and convey water to the proposed Sites Reservoir. Operating agreements among the Authority, TCCA, and Reclamation would need to be developed to define Sites Reservoir Project operations and cooperation among the parties.

Red Bluff Pumping Plant has an existing pumping capacity of 2,000 cubic feet per second (cfs), which is used to meet current agricultural water demand. The project would include installation of one additional pump (250 cfs) to the existing pump grouping, which would increase the overall pumping capacity to 2,250 cfs to fully use the 2,100-cfs capacity for diversion of water through T-C Canal to Sites Reservoir. The total conveyance capacity of T-C Canal is assumed to be 2,250 cfs at the upstream end of the canal and 2,100 cfs at Holthouse Reservoir. Any unused capacity remaining after meeting existing agricultural demands could be used as necessary to convey water to fill Sites Reservoir. Approximately 50 to 60 cfs of the T-C Canal capacity is assumed to be used for existing winter operations, based on communication with TCCA representatives.

No dedicated period for maintenance was assumed for T-C Canal on the basis of current canal capacity and projected Sites Reservoir diversion amounts. Discussions with TCCA representatives revealed operations and maintenance could be scheduled around proposed Sites Reservoir Project operations.

Glenn-Colusa Irrigation District Main Canal and Hamilton City Pumping Facilities and Capacity

Similar to T-C Canal, GCID Main Canal would be used to convey water pumped from the existing Hamilton City pumping facility to divert and convey Sacramento River water to the proposed Sites Reservoir. Operating agreements between the Authority and GCID would need to be developed to define Sites Reservoir Project operations and cooperation between the parties. The Hamilton City pumping facility has a 3,000 cfs diversion capacity at the Sacramento River intake, and the capacity of GCID Main Canal is 1,800 cfs at TRR. Any unused capacity remaining after existing agricultural operations could be used to convey water to the proposed Sites Reservoir. The following flows are assumed to occupy capacity in the canal during existing winter operations of GCID Main Canal (values in cfs).

October	November	December	January	February	March
513	534	389	235	56	48

A dedicated annual maintenance shutdown period was assumed from January 7 through February 21.

Proposed Delevan Pipeline and Intake Diversion and Release Capacities

The proposed Delevan Pipeline would extend east/west across the GCID service area located west of the existing Maxwell Irrigation District intake facility. The proposed intake and discharge facility would include a fish screen and pump station intake to divert up to 2,000 cfs from the Sacramento River to Sites Reservoir when excess Sacramento River water is available for diversion. The pipeline would also have the ability to convey up to 2,500 cfs by gravity from the Sites Reservoir back to the Sacramento River for downstream uses.

A dedicated annual maintenance shutdown period sometime between April 1 and May 31 is assumed for the pipeline, intake, and fish screen facility in wet, above-normal, and below-normal water year types in accordance with the Sacramento Valley 40-30-30 index. During the maintenance, both diversion and release operations at Delevan would be shut down. No maintenance would be scheduled in dry and critical water year types.

Existing Tehama-Colusa Canal and Glenn-Colusa Irrigation District Main Canal Intertie

The existing T-C Canal and GCID Main Canal intertie provides flexibility in routing flows of up to 285 cfs from the T-C Canal to the GCID Main Canal.

Williams Outlet

The Williams Outlet provides flexibility in routing water of up to 65 cfs from the T-C Canal to the GCID Main Canal.

Holthouse (Funks) Reservoir

The existing Funks Reservoir includes a storage capacity of 2,250 acre-feet and serves as a re-regulating reservoir to stabilize flows in T-C Canal as diverters come on line and off line. The existing Funks Reservoir would be expanded to form Holthouse Reservoir by constructing a new dam (Holthouse Dam) and reservoir to the east of Funks Reservoir, with an enlarged active storage capacity of approximately 6,500 acre-feet and a surface area of approximately 450 acres.

Terminal Regulating Reservoir and Pipeline

TRR would be a 1,200-acre-foot regulating reservoir constructed adjacent to GCID Main Canal, approximately 3 miles northeast of Holthouse Reservoir. TRR would be composed of an earthen embankment dam, concrete emergency overflow weir, outfall standpipe, and an approximate 4,000-foot-long underground 60-inch-diameter overflow outlet pipe to Funks Creek.

Water conveyed down GCID Main Canal would be directed into the proposed TRR. A new pump station (the proposed TRR pumping and generating plant) would then convey the water from TRR via the proposed TRR pipeline to the proposed Holthouse Reservoir. TRR would be required to provide operational storage for the TRR pumping and generating plant to balance normal and emergency flow variations between the upstream GCID Main Canal pump station, the 40 miles of connecting canal, and the TRR pumping and generating plant.

The proposed TRR pipeline would be bidirectional, allowing water to be pumped from TRR to Holthouse (Funks) Reservoir for storage, and allowing water to flow by gravity from Holthouse Reservoir for release to TRR and GCID Main Canal. The pipeline would have a capacity of 1,800 cfs to convey water pumped from TRR to Holthouse Reservoir. The capacity of the pipeline to convey water by gravity flow from Holthouse Reservoir to TRR would be 900 cfs.

Diversions to Sites Reservoir

The proposed Sites Reservoir would be filled through the diversion of excess Sacramento River water that originates from unregulated tributaries to the Sacramento River downstream from Keswick Dam. Less than 1 percent of diversions to Sites Reservoir are assumed to be provided by flood releases or spills that flow through Lake Shasta. Sacramento River water would be diverted at the three locations on the river as described above. Excess flows are defined as river flows in addition to those required to meet the following:

- Senior downstream water rights, existing CVP and SWP and other water rights diversions including SWP Article 21 (interruptible supply), and other more senior excess flow priorities (diversions associated with Freeport Regional Water Project and existing Los Vaqueros Reservoir)
- Existing regulatory requirements including State Water Resources Control Board (SWRCB) D-1641, CVPIA 3406(b)(2), the 2008 U.S. Fish and Wildlife Service biological opinion, and the 2009 National Marine Fisheries Service biological opinion and other instream flow requirements
- Bypass flow conditions needed to maintain and protect anadromous fish survival and Delta water quality

The Authority would need to obtain a water right permit to allow the intended operations. Operations would be consistent with the terms and conditions contained in the water right permit approved by SWRCB. The permit would describe the points and methods of diversion, diversion season, purposes of use, and places of use.

A description of proposed minimum bypass flow requirements and pulse flow criteria to protect existing and future water uses are provided below.

Sites Reservoir Diversion Bypass Flow Protection

Excess Sacramento River flow diversions to Sites Reservoir would only take place when flow monitoring indicates that bypass flows are present in the river due to storm event flows. Several existing and additional proposed bypass flow criteria were assumed at specified locations. These flow criteria are designed to make certain only excess water would be diverted into Sites Reservoir to maintain and protect existing downstream water uses, as follows.

- A bypass flow of 3,250 cfs downstream from Red Bluff Diversion Dam must be present to maintain flows in the upper Sacramento River that are required in SWRCB WR 90-5 to prevent dewatering salmonid redds and maintain water temperatures. Diversions at Red Bluff Pumping Plant for filling Sites Reservoir would only be allowed when flows in the river were above the 3,250-cfs bypass flow criteria.
- Diversions at the Hamilton City intake for GCID Main Canal currently require a bypass flow of 4,000 cfs to prevent fish entrainment. Diversions at Red Bluff Pumping Plant and GCID Main Canal intake for filling Sites Reservoir would only be allowed when flows in the river were above the 4,000-cfs bypass flow requirement downstream from Hamilton City.
- Diversions for filling Sites Reservoir would only be allowed when flows below Wilkins Slough were above 5,000 cfs given the current minimum flow requirements. Wilkins Slough Navigation Control Point minimum flows currently range from 3,250 to 5,000 cfs depending on hydrologic conditions.
- Diversions for filling Sites Reservoir would only be allowed when a Sacramento River flow of 15,000 cfs is present at Freeport in January, 13,000 cfs in December and February through June, and 11,000 cfs in all other months. This flow threshold was designed to protect and maintain existing downstream water uses and water quality in the Delta.

Pulse Flow Protection Diversion Assumptions

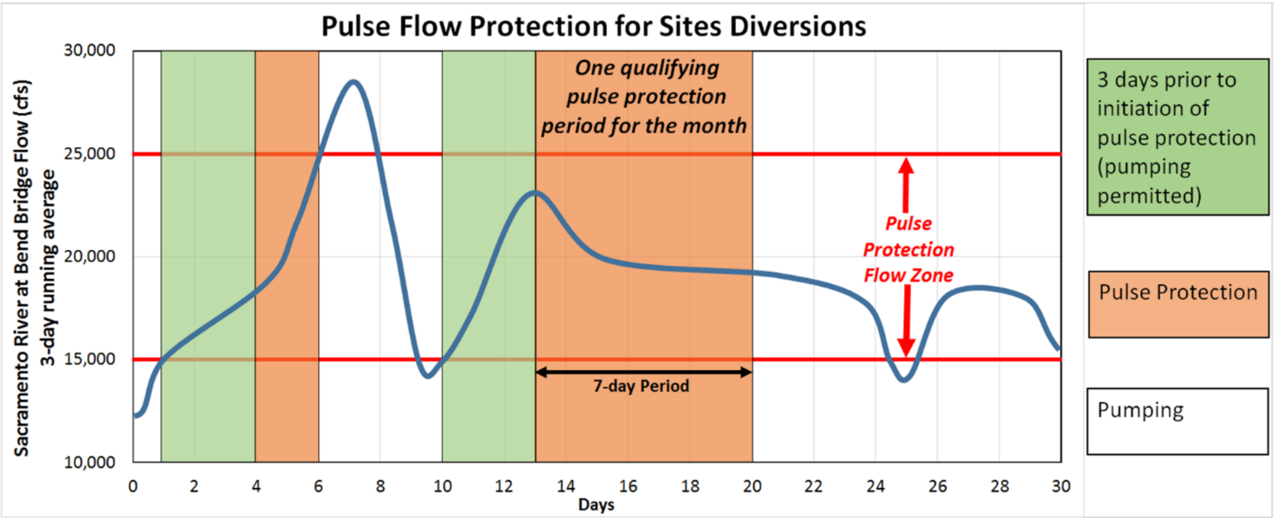
Operations modeling of the proposed Project included restrictions on diversions to limit impacts on out-migrating juvenile fish as a “surrogate” for likely permit conditions. Based on recent literature and the proposed permit conditions for other diversion projects, operations modeling for the proposed Project diversions were assumed to be restricted to minimize impacts to fish passage associated with pulse flow events that stimulate the observed spike in juvenile salmon outmigration. Actual operations are anticipated to be informed by real-time monitoring of fish movement.

The assumed limits on diversions during naturally occurring, storm-induced pulse flow events in the Sacramento River were based on a recent study by del Rosario et al. (2013), which found an abrupt and substantial spike in winter-run Chinook salmon arrivals at Knights Landing in association with the first storm event producing a flow of 400 cubic meters per second (14,126 cfs) at Wilkins Slough. This spike was followed shortly by passage of up to the 50th percentile of cumulative migration. This relationship was apparent for a wide range of water year types based on catch data collected between 1999 and 2007.

Accordingly, an assumed pulse protection period was developed that would extend from October through May to address out-migration of juvenile winter-, spring-, fall- and late-fall-run Chinook salmon, as well as steelhead. Pulse flows during this period would provide flow continuity between the upper and lower Sacramento River to support fish migration. It is recognized that research regarding the benefits of pulse flows is ongoing, and further research and adaptive management would be required to develop and refine a pulse flow protection strategy for fish migration and, as such, this assumption was used for modeling and informational purposes only.

For proposed Sites Reservoir operations, pulse flows are defined by extended peak river flows at Bend Bridge that originate primarily from storm event tributary inflows downstream from Keswick Dam. For the purposes of operations modeling, a naturally occurring pulse event was considered initiated when the 3-day running average flow below Bend Bridge exceeded 15,000 cfs. Such an event would need to continue for at least a 7-day duration to be considered a qualified storm event for the simulation process. Diversions to Sites Reservoir would not be allowed during the 7-day period that flow was greater than 15,000 cfs. The duration of a pulse flow event would be considered terminated under the following conditions: 1) the 3-day running average discharge flow remained greater than 15,000 cfs for 7 days after initiation, 2) the 3-day running average discharge flow dropped below 15,000 cfs before reaching the 7-day duration, or 3) the 3-day running average discharge flow exceeded 25,000 cfs before reaching the 7-day duration.

Given that del Rosario et al. (2013) indicate that the first storm event was associated with a spike in salmon arrivals at Knights Landing, diversions to Sites Reservoir would not be allowed during the first 7-day qualified pulse period, when flows reach 15,000 cfs during the out-migration season. For evaluation of Sites Project Reservoir operations, it was assumed that up to one qualified 7-day pulse event would occur each month during the pulse protection period from October through May, to encourage and support salmonid out-migration and minimize potential diversion impacts. Therefore, for operations modeling, diversions to Sites Reservoir storage would be restricted under the following conditions: 1) if pulse conditions exist at Bend Bridge, and a qualified pulse event has not already occurred within the given month, and 2) if Bend Bridge flows are less than 25,000 cfs during the pulse event. Diversions are allowed when flows exceed 25,000 cfs because flows of this magnitude are considered to provide lesser benefits to fish migration, as shown in Figure 2.



Pulse flow protection period is October through May

Figure 3. Pulse Flow Protection for Sites Diversions

Diversions to Fill Sites Reservoir Storage

Diversions of excess Sacramento River water to Sites Reservoir using existing T-C Canal and GCID Main Canal conveyance facilities could occur at any time during the year, given the flow conditions described above are present in the river. Deliveries for TCCA and GCID service areas have first priority at the existing T-C Canal and GCID intakes, with diversions to Sites Reservoir using the unused capacities of the two canals.

Diversions through the proposed Delevan Pipeline could also occur at any time of the year assuming Sacramento River flow conditions are above the bypass and pulse flow criteria described above. In summer months, preference would generally be given to Sites Reservoir releases to the river, resulting in limited diversions to storage because the pipeline could only convey flows in one direction at a time.

Sites Reservoir Evaporation

In the absence of available evaporation data, Sites Reservoir "net-evaporation" rates were estimated using evaporation and precipitation data from existing nearby reservoirs. Net-evaporation is the difference between evaporation and precipitation. Positive values indicate higher rates of evaporation than precipitation while negative values indicate lower rates of evaporation than precipitation. Evaporation and precipitation data have been collected for three nearby reservoirs along Stony Creek including: (1) East Park Reservoir, (2) Stony Gorge Reservoir, and (3) Black Butte Lake.

The evaporation data was taken from Reclamation's Stony Creek model (Yaworsky, 2006), which makes monthly estimates based on historical data from DWR, Reclamation, and U.S. Army Corps of Engineers (USACE). These evaporation rates are consistent with the data used as inputs in the DCR 2015, WSIP 2030, and WSIP 2070 CALSIM II models.

The data consists of six historical time series ranging from October 1922 to September 2003 at a monthly time-step. The average annual evaporation rates at East Park Reservoir, Stony Gorge Reservoir, and Black Butte Lake are 6.5 TAF, 4.7 TAF, and 12.2 TAF, respectively. The precipitation data has been provided by the Variable Infiltration Capacity (VIC) model (Liang et al., 1994), a large-scale, semi-distributed hydrologic model originally developed by Xu Liang at the University of Washington.

The net-evaporation rates for East Park Reservoir, Stony Gorge Reservoir, and Black Butte Reservoir were computed by subtracting each reservoir's precipitation rates from its evaporation rates. The monthly net-evaporation of the three reservoirs was averaged and used as the input for Sites Reservoir net-evaporation. Using this method, the average annual net-evaporation for Sites Reservoir equates to 33.3 TAF.

Consistent with all other evaporation inputs in CALSIM II, the Sites Reservoir net-evaporation rates are unchanged under 2030 and 2070 future climate conditions.

Reservoir Operations Assumptions

The primary operational criteria include the following:

- A defined ecosystem enhancement storage account would be established in Sites Reservoir to be managed by the State to provide water for ecosystem and water quality purposes.
- Each of the participating Authority members would be allocated a defined storage account in the Sites Reservoir Project to manage their water, as well as store water from other potential sources of supply.
- It is assumed that a water market of some form would be facilitated by the Authority to promote efficient use and exchange of water in Sites Reservoir storage.
- All storage accounts would receive an equal proportional share of new water diversions into Sites Reservoir storage.
- Any water in storage beyond designated member account volumes would be "at risk" and would be "spilled" if the reservoir fills to capacity.
- A set of operating guidelines and rules would be developed to promote efficient water management for operations of Sites Reservoir and associated facilities.
- All water stored in Sites Reservoir storage accounts are subject to evaporation and other losses.

Public Benefits

The operation of Sites Reservoir Project would allow for the development and administration of an ecosystem enhancement storage account that could be managed by the State to provide water for ecosystem and water quality purposes. Such an account would provide a pool of dedicated storage to manage in cooperation with existing operations to improve coldwater conservation storage, stabilize river flows during critical fisheries periods, increase flows through certain watercourses and/or facilities (such as, Yolo Bypass), improve water quality, and/or enhance habitat restoration.

Sites Reservoir Project would be operated in cooperation with CVP and SWP operations to coordinate releases from Trinity Lake, Shasta Lake, Lake Oroville, and Folsom Lake. Releases from Sites Reservoir would allow reduced releases from other reservoirs while still meeting requirements for minimum instream flow objectives, Sacramento River temperature requirements, and Delta salinity control assigned to CVP and SWP. Through this reduction in releases, storage could be conserved in Trinity Lake, Shasta Lake, Lake Oroville, and Folsom Lake to significantly increase operational flexibility to improve river water temperatures for fish survival, Delta water quality, flood control, and recreation.

The following summarizes the anticipated primary benefits that could be realized through the provision of Sites Reservoir Project water beyond that required to meet Authority member needs. The priorities and amount of water potentially allocated to achieving the benefits listed below will be subject to the participation of the California Water Commission Water Storage Investment Program. Sites Reservoir Project operations would achieve multiple benefits over a wide range of hydrologic conditions.

In drought conditions, Sites Reservoir Project could:

- Increase coldwater pool conservation in Trinity Lake, Shasta Lake, Lake Oroville, and Folsom Lake
- Help regulate Sacramento River summer flows for best use of cold water for control of temperature conditions adverse to anadromous fish

In non-drought hydrologic conditions, Sites Reservoir Project water could:

- Stabilize Sacramento River fall flows for improving spawning and rearing success of anadromous fish
- Provide water to the Yolo Bypass to support salmon migration and summer food production for delta smelt
- Provide water for Incremental Level 4 refuge deliveries per CVPIA
- Provide (via upstream actions) incidental Delta water quality improvements in the summer and fall

More detailed descriptions of potential actions that could be implemented in cooperation with the CVP and SWP operations are provided below.

Shasta Lake Coldwater Pool and Sacramento River Temperature Control

Maximum benefits could be realized assuming Sites Reservoir and Shasta Lake were operated in cooperation to increase Shasta Lake storage and preserve a greater volume of coldwater pool storage. This additional cold water would improve operational flexibility to provide releases to maintain appropriate water temperatures in the Sacramento River during summer months and in drought years.

Through releases from Sites Reservoir to meet TCCA and GCID irrigation diversions and equivalent reductions in CVP Shasta Lake releases, demands on Shasta Lake storage could be reduced and the coldwater pool maintained for a longer time at higher levels than are currently achievable. Shasta Lake release patterns could be shifted in season and between adjacent years to improve coldwater storage and flow management for salmon and other species using the portion of the Sacramento River between Keswick Dam and the Red Bluff Diversion Dam as habitat.

Stabilize Upper Sacramento River Fall Flows

Additional storage in Shasta Lake could be used to stabilize fall flows between Keswick Dam and Red Bluff to avoid abrupt flow reductions due to changes in local tributary inflows as a results of storm events. This would reduce adverse conditions for spawning fall-run Chinook salmon (such as, dewatering of redds and scour damage).

Sacramento River Diversion Reductions at Red Bluff and Hamilton City

The Sites Reservoir Project could allow Shasta Lake to provide increased Sacramento River flows in spring through fall by reducing Sacramento River diversions into T-C Canal and GCID Main Canal during the irrigation season. This would be achieved through exchange with releases from Sites Reservoir to meet CVP T-C Canal and GCID Main Canal contract demands, and could provide multiple benefits to anadromous fish and estuarine-dependent species by providing or augmenting transport flows, increasing habitat availability, increasing productivity, and improving nutrient transport and food availability.

Folsom Lake Coldwater Pool Improvement and Supply Reliability

Sites Reservoir Project operations in cooperation with Folsom Lake could improve the reliability of coldwater carryover storage at Folsom Lake, stabilize flows in the American River, and help maintain suitable water temperatures in the lower American River. Additional summer releases from Sites Reservoir could reduce the need for releases from Folsom Lake, resulting in increased carryover storage. Sites Reservoir releases could also provide additional Delta outflow and reduce short-term emergency flow reliance on Folsom Lake releases to maintain Delta water quality.

Yolo Bypass and Delta Outflow Improvement

Sites Reservoir releases through the Colusa Basin Drain and Knights Landing Ridge Cut into the Yolo Bypass would help increase productivity in in the lower Cache Slough and lower Sacramento River areas to increase desirable food sources for Delta smelt and other key fish species in the late summer and early fall.

Lake Oroville Coldwater Pool Improvement

Sites Reservoir releases could increase the reliability of coldwater pool storage in Lake Oroville to reduce lower Feather River water temperatures for juvenile steelhead and spring-run Chinook salmon over-summer rearing, and fall-run Chinook salmon. Higher and more stables flows in the lower Feather River at critical times could also minimize redd dewatering, juvenile stranding, and isolation of anadromous salmonids.

Water Supply

The Sites Reservoir Project could provide a substantial amount of water to potential Sites Reservoir Project participants including agricultural and municipal and industrial (M&I) users. Sites Reservoir water would be released to meet demands and supplement existing allocations to CVP contractors in the Colusa Basin and released for other water users in the Sacramento Valley.

The South-of-Delta CVP and SWP contractors that receive water from the Sites Reservoir Project have contract provisions for the conveyance of extra water through SWP of CVP facilities above their SWP or CVP allocations. These water users may opt to have their Sites Reservoir Project water conveyed as either “project” water or “non-project” depending on the conveyance agreements they develop with DWR or Reclamation. If the water is conveyed as project water, then it has a more flexible timeframe for its conveyance and the releases of their water from Sites via the Delevan Pipeline. If the water is conveyed as non-project water, then the water would likely be released from Sites Reservoir and conveyed south or west of the Delta during the “water transfer window” in the biological opinions for the operation on the CVP/SWP in the Delta, provided there is capacity to convey this non-project water.

CALSIM II and DSM2 Modeling Assumptions

CALSIM II and DSM2 Modeling Assumptions

Introduction

This attachment provides a description of the assumptions for the CALSIM II and DSM2 modeling of the Current Conditions, WSIP 2030, and WSIP 2070 without project scenarios.

The with- and without-project Current Conditions analyses were based on the DWR State Water Project Delivery Capability Report 2015 (DCR 2015) – base scenario. The DCR 2015 base scenario was modified to include the facilities and operation of the Sites Project.

The 2030 and 2070 future conditions CALSIM II and DSM2 models provided by the California Water Commission on November 2, 2016 were modified to include the facilities and operation of the Sites Project.

Assumptions for DCR 2015, WSIP 2030, and WSIP 2070 Model Without Project Simulations

This section documents the assumptions used in the CALSIM II and DSM2 model simulations for the baseline model (Without Project) simulations used in the Sites Reservoir Project evaluation. The DCR 2015, WSIP 2030 Without Project, and WSIP 2070 Without Project models are identical except for hydrologic inflows and sea level rise due to climate change.

The Without Project assumptions include implementation of water operations components of the Reasonable and Prudent Alternatives (RPA) specified in the 2008 Fish and Wildlife Service (FWS) and 2009 National Marine Fisheries Service (NMFS) Biological Opinions (BiOps). The specific assumptions and implementation in the CALSIM II and DSM2 models were developed by a multiagency team comprised of fisheries and modeling experts from the DWR, Department of Fish and Game (DFG), Reclamation, USFWS, and NMFS.

The description of CALSIM II assumptions refers to the DCR 2015 scenario. However, these assumptions are applicable to the WSIP 2030 Without Project and WSIP 2070 Without Project scenarios also. A summary of the CALSIM II model assumptions in the DWR State Water Project Delivery Capability Report 2015 – base scenario is provided in Table 1.

CALSIM II Assumptions for Current Conditions (DCR 2015)

<u>Hydrology</u>

Inflows/Supplies

CALSIM II model includes the historical hydrology with projected 2030 modifications for the operations upstream of the rim reservoirs. Reservoir inflows, stream gains, diversion requirements, irrigation efficiencies, return flows and groundwater operation are all components of the hydrology for CALSIM II.

Level of Development

CALSIM II input hydrology is based on an analysis of agricultural and urban land use and population estimates. The assumptions used for Sacramento Valley land use result from aggregation of historical survey and projected data developed for the California Water Plan Update (Bulletin 160-98). Generally, land use projections are based on Year 2020 estimates (hydrology serial number 2020D09E). However, the San Joaquin Valley hydrology reflects draft 2030 land use assumptions developed by Reclamation. Where appropriate Year 2030 projections of demands associated with water rights and SWP and CVP water service contracts have been included. Specifically, projections of full build out are used to describe the American River region demands for water rights and CVP contract supplies and California Aqueduct and the Delta Mendota Canal SWP/CVP contractor demands are set to full contract amounts.

Demands, Water Rights, CVP/SWP Contracts

CALSIM II demand inputs are preprocessed monthly time series for a specified level of development (e.g. 2030) and per hydrologic conditions. Demands are classified as CVP project, SWP project, local project or non-project (e.g. pre-1914 water rights, in-Delta consumptive use etc.). CVP and SWP demands are separated into different classes based on the contract type. A description of various demands and classifications included in CALSIM II is provided in the 2008 OCAP Biological Assessment Appendix D (Reclamation 2008a). Non-project demands within each Depletion Study Area (DSA) are based on the proportion of the acreage served by the projects versus the total acreage, for each land-use type. Non-project demands are satisfied from sources other than project storage and project conveyance facilities and are reduced as a function of water availability in the absence of project operations.

DCR 2015 assumes demands north of the Delta at the future level of development assuming full build-out of facilities and increases associated with water rights and CVP and SWP service contracts. This is primarily an increase in CVP M&I service contracts (253 TAF/Yr) and water rights (184 TAF/Yr) related to urban municipal and industrial (M&I) use, especially in the communities in El Dorado, Placer, and Sacramento counties.

DCR 2015 also assumes full contract amounts for demands associated with SWP contracts, south of the Delta at the future level of development, in all hydrologic conditions.

Facilities

CALSIM II includes representation of all the existing CVP and SWP storage and conveyance facilities. Key storage facilities including Shasta Lake, Trinity Lake, Whiskeytown Lake, Lake Oroville, Folsom Lake, Los Vaqueros Reservoir, San Luis Reservoir and Millerton Lake are represented in CALSIM II. Regulating reservoirs such as Lewiston, Keswick, Thermalito and Nimbus are also included in CALSIM II.

CALSIM II also represents existing conveyance facilities in the Colusa Basin region. Red Bluff Diversion Dam, Tehama-Colusa Canal (TCC) and its intake on the Sacramento River, Corning Canal, Glenn Colusa Canal (GCC) and its intake on the Sacramento River, Stony Creek – TCC intertie, TCC – GCC intertie, and Colusa Basin Drain are some of the key facilities included in the model.

CALSIM II also represents the flood control weirs along the Sacramento River such as Ord Ferry, Moulton Weir, Colusa Weir and Tisdale Weir, which bypass flood flows into Sutter Bypass. USRDOM was used to model the weir spills into the Sutter Bypass for the simulations. In addition, CALSIM II also represents the flood control weirs such as Fremont Weir and Sacramento Weir, which spill flood flows from the Sacramento River into Yolo Bypass.

Freeport Regional Water Project, located along the Sacramento River near Freeport, is assumed to be operational under the DCR 2015. Similarly, 30 mgd capacity, City of Stockton Delta Water Supply Project is assumed to be operational under the DCR 2015. Delta-Mendota Canal–California Aqueduct Intertie is assumed to be operational under the DCR 2015. Contra Costa Water District Alternative Intake Project and Los Vaqueros expanded storage capacity of 160 TAF, are included in the DCR 2015 along with the South Bay Aqueduct rehabilitation, to 430 cfs capacity, from junction with California Aqueduct to Alameda County FC&WSD Zone 7.

Red Bluff Pumping Plant

The permanent TCC Pumping Plant and intake facilities are in place and the Red Bluff Diversion Dam is operated with gates out of the water all year as required in the NMFS BO Action I.3.1 providing unimpeded upstream and downstream fish passage.

Tehama Colusa Canal Capacity

Fish Passage Improvements at Red Bluff Pumping Plant and Fish Screen are included in the DCR 2015 allowing for a pumping capacity of 2,000 cfs into TCC.

Glenn Colusa Canal Capacity

3,000 cfs of total diversion capacity is assumed at the Sacramento River intake near Hamilton City into GCC.

Existing TCC-GCC Intertie

The existing TCC-GCC intertie provides flexibility in routing flows of up to 285 cfs, between TCC and GCC.

Williams Outlet

The Williams Outlet provides flexibility in routing flows of up to 65 cfs, between TCC and GCC.

Funks Reservoir

The existing Funks Reservoir includes a storage capacity of 2,250 acre-foot and is part of the TCC system. Funks Reservoir serves as a re-regulating reservoir to stabilize flows in the TCC downstream of Funks Reservoir as diverters come on line and off line. Funks Reservoir is not modeled explicitly in CALSIM II.

The Delta serves as a natural system of channels to transport river flows and reservoir storage to the CVP and SWP facilities in the south Delta, which export water to the projects' contractors through two pumping plants: SWP's Harvey O. Banks Pumping Plant and CVP's C.W. Jones Pumping Plant. Banks and Jones Pumping Plants supply water to agricultural and urban users throughout parts of the San Joaquin Valley, South Lahontan, Southern California, Central Coast, and South San Francisco Bay Area regions.

The Contra Costa Canal and the North Bay Aqueduct supply water to users in the northeastern San Francisco Bay and Napa Valley areas.

SWP Banks Pumping Plant Capacity

SWP Banks pumping plant has an installed capacity of about 10,668 cfs (two units of 375 cfs, five units of 1,130 cfs, and four units of 1,067 cfs). The SWP water rights for diversions specify a maximum of 10,350 cfs, but the U. S. Army Corps' of Engineers (ACOE) permit for SWP Banks Pumping Plant allows a maximum pumping of 6680 cfs. With additional diversions depending on Vernalis flows the total diversion can go up to 8,500 cfs during December 15th – March 15th. Additional capacity of 500 cfs (pumping limit up to 7,180 cfs) is allowed to reduce impact of NMFS BO Action 4.2.1 on SWP.

CVP C.W. Bill Jones Pumping Plant (Tracy PP) Capacity

The Jones Pumping Plant consists of six pumps including one rated at 800 cfs, two at 850 cfs, and three at 950 cfs. DMC-California Aqueduct Intertie that allows 400 cfs additional DMC capacity is assumed to be in place; therefore, pumping capacity is 4,600 cfs in all months.

CCWD Intakes

The Contra Costa Canal originates at Rock Slough, about four miles southeast of Oakley, and terminates after 47.7 miles at Martinez Reservoir. The canal and associated facilities are part of the CVP, but are operated and maintained by the Contra Costa Water District (CCWD). CCWD also operates a diversion on Old River. CCWD can divert water to the Los Vaqueros Reservoir to store good quality water when available and supply to its customers. In addition to the Rock Slough and Old River diversions, CCWD's Middle River Intake and Pump Station (previously known as the Alternative Intake Project) is included in the DCR 2015. The Alternative Intake Project is a new drinking water intake at Victoria Canal, about 2.5 miles east of Contra Costa Water District's (CCWD) existing intake on the Old River.

Regulatory Standards

Major regulatory standards that govern the operations of the CVP and SWP facilities are briefly described below. Specific assumptions related to key regulatory standards are also outlined below.

D-1641 Operations

The SWRCB Water Quality Control Plan (WQCP) and other applicable water rights decisions, as well as other agreements are important factors in determining the operations of both the Central Valley Project (CVP) and the State Water Project (SWP).

The December 1994 Accord committed the CVP and SWP to a set of Delta habitat protective objectives that were incorporated into the 1995 WQCP and later, were implemented by D-1641. Significant elements in the D-1641 standards include X2 standards, export/inflow (E/I) ratios, Delta water quality standards, real-time Delta Cross Channel operation, and San Joaquin flow standards.

Coordinated Operations Agreement (COA)

The CVP and SWP use a common water supply in the Central Valley of California. The DWR and Reclamation have built water conservation and water delivery facilities in the Central Valley in order to deliver water supplies to project contractors. The water rights of the projects are conditioned by the SWRCB to protect the beneficial uses of water within each respective project and jointly for the protection of beneficial uses in the Sacramento Valley and the Sacramento-San Joaquin Delta Estuary. The agencies coordinate and operate the CVP and SWP to meet the joint water right requirements in the Delta.

The Coordinated Operations Agreement (COA), signed in 1986, defines the project facilities and their water supplies, sets forth procedures for coordination of operations, identifies formulas for sharing joint responsibilities for meeting Delta standards, as the standards existed in SWRCB Decision 1485 (D-1485), and other legal uses of water, identifies how unstored flow will be shared, sets up a framework for exchange of water and services between the Projects, and provides for periodic review of the agreement.

CVPIA (b)(2) Assumptions

The previous 2008 Operations Criteria and Plan (OCAP) Biological Assessment (BA) modeling included a dynamic representation of Central Valley Project Improvement Act (CVPIA) 3406(b)(2) water allocation, management and related actions (B2). The selection of discretionary actions for use of B2 water in each year was based on a May 2003 Department of the Interior policy decision. The use of B2 water is assumed to continue in conjunction with the USFWS and NMFS BO RPA actions. The CALSIM II implementation does not explicitly account for the use of (b)(2) water, but rather assumes pre-determined USFWS BO upstream fish objectives for Clear Creek and Sacramento River below Keswick Dam in addition to USFWS and NMFS BO RPA actions for the American River, Stanislaus River, and Delta export restrictions.

USFWS Delta Smelt BO Actions

The USFWS Delta Smelt BO was released on December 15, 2008, in response to Reclamation's request for formal consultation with the USFWS on the coordinated operations of the Central Valley Project (CVP) and State Water Project (SWP) in California. To develop CALSIM II modeling assumptions for the RPA documented in this BO, the Department led a series of meetings that involved members of fisheries and project agencies. This group has prepared the assumptions and CALSIM II implementations to represent the RPA in DCR 2015 CALSIM II simulation. The following actions of the USFWS BO RPA have been included in the DCR 2015 CALSIM II simulations:

- Action 1: Adult Delta smelt migration and entrainment (RPA Component 1, Action 1 – First Flush)
- Action 2: Adult Delta smelt migration and entrainment (RPA Component 1, Action 2)
- Action 3: Entrainment protection of larval and juvenile Delta smelt (RPA Component 2)
- Action 4: Estuarine habitat during Fall (RPA Component 3)
- Action 5: Temporary spring head of Old River barrier and the Temporary Barrier Project (RPA Component 2)

NMFS BO Salmon Actions

The NMFS Salmon BO on long-term actions of the CVP and SWP was released on June 4, 2009. To develop CALSIM II modeling assumptions for the RPA documented in this BO, the Department led a series of meetings that involved members of fisheries and project agencies. The following NMFS BO RPA have been included in the DCR 2015 CALSIM II simulations:

- Action I.1.1: Clear Creek spring attraction flows
- Action I.3.1: Operations after May 14, 2012: Operate RBDD with Gates Out
- Action I.4: Wilkins Slough operations
- Action II.1: Lower American River flow management
- Action III.1.3: Stanislaus River flows below Goodwin Dam
- Action IV.1.2: Delta Cross Channel gate operations
- Action IV.2.1: San Joaquin River flow requirements at Vernalis and Delta export restrictions
- Action IV.2.3: Old and Middle River flow management

For Action I.2.1, which calls for a percentage of years that meet certain specified end-of-September and end-of-April storage and temperature criteria resulting from the operation of Lake Shasta, no specific CALSIM II modeling code is implemented to simulate the performance measures identified.

Water Transfers

Lower Yuba River Accord (LYRA)

Lower Yuba River Accord (LYRA) Component 1 water is assumed to be transferred to South of Delta (SOD) State Water Project (SWP) contractors to help mitigate the impact of the NMFS BO on SWP exports during April and May. An additional 500 cfs of capacity is permitted at Banks Pumping Plant from July through September to export this water.

Phase 8 transfers

Phase 8 transfers are not included.

Short-term or Temporary Water Transfers

Short term or temporary transfers such as Sacramento Valley acquisitions conveyed through Banks PP are not included.

Specific Regulatory Assumptions

Upstream Reservoir Operations

Minimum flow below Lewiston Dam

The volume of the Trinity River instream flow requirement below Lewiston Dam ranges from 369 – 815 TAF/year, based on the Trinity EIS Preferred Alternative. The minimum flow volume is determined based on the Trinity River water year classification. The flow schedules from the Trinity Sites Reservoir Project were assumed for each water year type.

Trinity Lake End-of-September Minimum Storage

Based on the Trinity EIS Preferred Alternative, a minimum end-of-September carryover storage objective of 600 TAF at Trinity Reservoir was assumed to help provide coldwater resource protection. This objective may not be fully accomplished in extended drought periods.

Minimum flow below Whiskeytown Dam

Whiskeytown Dam is operated to meet the downstream water rights in the Clear Creek and 1963 Reclamation Proposal to USFWS and National Park Service (NPS). It is also operated to meet the predetermined CVPIA 3406(b)(2) flows, and the flow requirements identified under NMFS BO Action I.1.1.

Shasta Lake End-of-September Minimum Storage

Shasta Lake is operated such that the end-of-September carryover storage is 1900 TAF in non-critically dry years per the NMFS 2004 Winter-run Biological Opinion.

2009 NMFS BO Action 1.2.1 requires certain storage to be met at certain percentile of all years. A post-process of operations is used to determine whether or not these requirements are met.

Minimum flow below Keswick Dam

Keswick Dam is operated to meet the release schedule under SWRCB WR 90-5, which maintains 3,250 cfs in the Sacramento River. It is also operated to meet predetermined CVPIA 3406(b)(2) flows. NMFS BO Action I.2.2 includes actions that call for minimum flows to protect temperatures.

Flow Objective for Navigation at Wilkins Slough

NMFS BO Action 1.4 requires that to conserve cold water pool in Shasta Lake, Wilkins Slough is operated at a flow ranging from 3,500 cfs to 5,000 cfs based on the CVP water supply condition.

Minimum flow below Thermalito Diversion Dam

Thermalito diversion dam is operated to meet a minimum flow requirement of 700 cfs or 800 cfs in the Feather River low flow channel based on the 2006 Oroville Relicensing Settlement Agreement.

Minimum flow below Thermalito Afterbay Outlet

1983 DWR – DFG Agreement requires a minimum flow in the Feather River below Thermalito Afterbay Outlet to be between 750 cfs and 1,700 cfs, depending on the Oroville storage condition and the forecasted Feather River runoff condition.

Flow at Mouth of the Feather River

During the Feather River Service Area (FRSA) diversion season from April through September, a minimum flow of 2,800 cfs is maintained at the mouth of the Feather River depending on Lake Oroville inflow and FRSA allocation.

Minimum flow below Nimbus Dam

Nimbus Dam is operated to meet a minimum flow requirement based on the American River Flow Management under the NMFS BO Action II.1. Minimum release requirements range from 800 to 2,000 cfs based on a sequence of seasonal indices and adjustments.

American River Minimum flow at H Street Bridge

The minimum allowable flows in the Lower American River are defined by SWRCB Decision 893 (D-893) which states that, in the interest of fish conservation, releases should not ordinarily fall below 250 cfs between January 1 and September 15 or below 500 cfs at other times.

Minimum flow near Rio Vista

The minimum flow required on the Sacramento River at Rio Vista under the WQCP, SWRCB D-1641 is included. During September through December months, the flow requirement ranges from 3,000 cfs to 4,500 cfs, depending on the month and D-1641 40-30-30 index water year type.

Delta Outflow Index (Flow and Salinity)

SWRCB D-1641:

All flow based Delta outflow requirements per SWRCB D-1641 are included in the DCR 2015 simulation. Similarly, for the February through June period X2 standard is included.

USFWS BO (December, 2008) Action 4:

USFWS BO Action 4 requires additional Delta outflow to manage X2 in the fall months following the wet and above normal years to maintain average X2 for September and October no greater (more eastward) than 74 kilometers in the fall following wet years and 81 kilometers in the fall following above normal years.

Combined Old and Middle River Flows

USFWS BO restricts south Delta pumping to preserve certain OMR flows in three of its Actions: Action 1 to protect pre-spawning adult Delta smelt from entrainment during the first flush, Action 2 to protect pre-spawning adults from entrainment and from adverse hydrodynamic conditions, and Action 3 to protect larval Delta smelt from entrainment. CALSIM II simulates these actions to a limited extent.

Brief description of USFWS BO Actions 1-3 implementations in CALSIM is as follows: Action 1 is onset based on a turbidity trigger that takes place during or after December. This action requires limit on exports so that the average daily OMR flow is no more negative than -2,000 cfs for a total duration of 14 days, with a 5-day running average no more negative than 2,500 cfs (within 25 percent of the monthly criteria). Action 1 ends after 14 days of duration or when Action 3 is triggered based on a temperature criterion. Action 2 starts immediately after Action 1 and requires range of net daily OMR flows to be no more negative than -1,250 to -5,000 cfs (with a 5-day running average within 25 percent of the monthly criteria). The Action continues until Action 3 is triggered. Action 3 also requires net daily OMR flow to be no more negative than -1,250 to -5,000 cfs based on a 14 day running average (with a simultaneous 5-day running average within 25 percent). Although the range is similar to Action 2, the Action implementation is different. Action 3 continues until June 30 or when water temperature reaches a certain threshold.

NMFS BO Action 4.2.3 requires OMR flow management to protect emigrating juvenile winter-run, yearling spring-run, and Central Valley steelhead within the lower Sacramento and San Joaquin rivers from entrainment into south Delta channels and at the export facilities in the south Delta. This action requires reducing exports from January 1 through June 15 to limit negative OMR flows to -2,500 to -5,000 cfs. CALSIM II assumes OMR flows required in NMFS BO are covered by OMR flow requirements developed for actions 1 through 3 of the USFWS BO.

South Delta Export-San Joaquin River Inflow Ratio

NMFS BO Action 4.2.1 requires exports to be capped at a certain fraction of San Joaquin River flow at Vernalis during April and May while maintaining a health and safety pumping of 1,500 cfs. This export constraint is included.

Exports at the South Delta Intakes

Exports at Jones and Banks Pumping Plant are restricted to their permitted capacities per SWRCB D-1641 requirements. In addition, the south Delta exports are subjected Vernalis flow based export limits during April and May as required Action 4.2.1. Additional 500 cfs pumping is allowed to reduce impact of NMFS BO Action 4.2.1 on SWP during July through September period.

D-1641 1:1 CVP/SWP export limit based on the Vernalis flow from April 15 – May 15, is also included.

Under D-1641 the combined export of the CVP Tracy Pumping Plant and SWP Banks Pumping Plant is limited to a percentage of Delta inflow. The percentages range from 35% to 45% during February depending on the January eight river index and 35% during March through June months. For rest of the months 65% of the Delta inflow is allowed to be exported.

Delta Water Quality

The DCR 2015 simulation includes compliance with the SWRCB D-1641 salinity requirements. However, not all salinity requirements are included as CALSIM II is not capable of predicting salinities in the Delta. Instead, empirically based equations and models are used to relate interior salinity conditions with the flow conditions. DWR's Artificial Neural Network (ANN) trained for salinity is used to predict and interpret salinity conditions at Emmaton, Jersey Point, Rock Slough and Collinsville stations. Emmaton and Jersey Point standards are for protecting water quality conditions for agricultural use in the western Delta and they are in effect from April 1st to August 15th. The EC requirement at Emmaton varies from 0.45 mmhos/cm to 2.78 mmhos/cm, depending on the water year type. The EC requirement at Jersey Point varies from 0.45 mmhos/cm to 2.20 mmhos/cm, depending on the water year type. Rock Slough standard of 250 mg/L chloride is for protecting water quality conditions for M&I use for water through the Contra Costa Canal. It is a year-round standard. D-1641 also requires a certain number of days in a year with chloride concentration less than 150 mg/L. The number of days required is dependent upon the water year type. A pre-processed fixed number of days is used as input to CALSIM II to comply with 150 mg/L chloride standard at Rock Slough. Collinsville standard is applied during October through May months to protect the water quality conditions for the migrating fish species, and it varies between 12.5 mmhos/cm in May and 19.0 mmhos/cm in October.

Operations Criteria

Delta Cross Channel Gate Operations

SWRCB D-1641 DCC standards provide for closure of the DCC gates for fisheries protection at certain times of the year. From November through January, the DCC may be closed for up to 45 days for fishery protection purposes. From February 1 through May 20, the gates are closed for fishery protection purposes. The gates may also be closed for 14 days for fishery protection purposes during the May 21 through June 15 time period. Reclamation determines the timing and duration of the closures after discussion with USFWS, DFG, and NMFS.

NMFS BO Action 4.1.2 requires gates to be operated as described in the BO based on presence of salmonids and water quality from October 1 through December 14; and gates to be closed from

December 15 to January 31, except short-term operations to maintain water quality. CALSIM II includes NMFS BO DCC gate operations in addition to the D-1641 gate operations. When the daily flows in the Sacramento River at Wilkins Slough exceeds 7,500 cfs (flow assumed to flush salmon into the Delta), DCC is closed for a certain number of days per month.

Allocation Decisions

CALSIM II includes allocation logic for determining deliveries to north-of-Delta and south-of-Delta CVP and SWP contractors. The delivery logic uses runoff forecast information, which incorporates uncertainty in the hydrology and standardized rule curves (i.e. Water Supply Index versus Demand Index Curve). The rule curves relate forecasted water supplies to deliverable “demand,” and then use deliverable “demand” to assign subsequent delivery levels to estimate the water available for delivery and carryover storage. Updates of delivery levels occur monthly from January 1 through May 1 for the SWP and March 1 through May 1 for the CVP as runoff forecasts become more certain. The south-of-Delta SWP delivery is determined based on water supply parameters and operational constraints. The CVP system wide delivery and south-of-Delta delivery are determined similarly upon water supply parameters and operational constraints with specific consideration for export constraints.

San Luis Operations

CALSIM II sets targets for San Luis storage each month that are dependent on the current South-of-Delta allocation and upstream reservoir storage. When upstream reservoir storage is high, allocations and San Luis fill targets are increased. During a prolonged drought when upstream storage is low, allocations and fill targets are correspondingly low. The San Luis rule curve is managed to minimize situations in which shortages may occur due to lack of storage or exports.

CALSIM II Assumptions for WSIP 2030

The WSIP 2030 without project CALSIM II model was provided by the CWC. The assumptions and operating criteria are identical to DCR 2015 assumptions except for hydrologic inflows and sea level rise due to climate change.

CALSIM II Assumptions for WSIP 2070

The WSIP 2070 without project CALSIM II model was provided by the CWC. The assumptions and operating criteria are identical to DCR 2015 except for hydrologic inflows and sea level rise due to climate change.

DSM2 Assumptions for Current Conditions

The Current Conditions DSM2 model was developed from the baseline WSIP 2030 study. The boundary conditions and dispersion factors in the CWC model representing 2030 conditions were removed to create the current conditions DSM2 study. Model input data from DWR’s Bay Delta Office Modeling Support Branch Delta Modeling Section was incorporated to represent Current Conditions. All other data used in the Current Conditions study is consistent with the CWC 2030 DSM2 model.

River Flows

For the Current Conditions (DCR 2015) DSM2 simulation, the river flows at the DSM2 boundaries are based on the monthly flow time series from DWR CALSIM II DCR 2015 model results.

Tidal Boundary

The tidal boundary condition at Martinez is provided by an adjusted astronomical tide normalized for sea level rise (Ateljevich and Yu, 2007).

Water Quality

Martinez EC

Martinez EC boundary condition is estimated using the G-model based on the net Delta outflow simulated in CALSIM II and the pure astronomical tide (Ateljevich, 2001).

Vernalis EC

For the Current Condition DSM2 simulation, the Vernalis EC boundary condition is based on the monthly San Joaquin EC time series estimated in the DWR DCR 2015 CALSIM II model results.

Morphological Changes

No additional morphological changes were assumed as part of the Current Condition simulation. DSM2 model and grid developed as part of the 2009 recalibration effort (CH2M HILL, 2009) was used as part of the modeling.

DSM2 Assumptions for WSIP 2030 and WSIP 2070

The WSIP Baseline DSM2 without project models for 2030 and 2070 conditions were provided by the CWC.

Table 1
CALSIM II Model Assumptions

CALSIM II Modeling Assumptions from DWR State Water Project Delivery Capability Report 2015

	Existing Condition[1]
Planning Horizon	2015
Period of Simulation	82 years (1922-2003)
HYDROLOGY	
Level of Development (land use)	2030 Level[2]
DEMANDS	
North of Delta (excluding the American River)	
CVP	Land-use based, full build-out of contract amounts[3]
SWP (FRSA)	Land-use based, limited by contract amounts[4, 7]
Non-project	Land-use based, limited by water rights and SWRCB Decisions for Existing Facilities
Antioch Water Works	Pre-1914 water right
Federal refuges	Firm Level 2 water needs[5]
American River Basin	
Water rights	Year 2025, full water rights[6]
CVP	Year 2025, full contracts, including Freeport Regional Water Project[6]
San Joaquin River Basin[8]	
Friant Unit	Limited by contract amounts, based on current allocation policy
Lower basin	Land-use based, based on district level operations and constraints
Stanislaus River basin[9, 17]	Land-use based, based on New Melones Interim Operations Plan, up to full CVP Contractor deliveries (155 TAF/yr) depending on New Melones Index
South of Delta	
CVP	Demand based on contract amounts[3]
Federal refuges	Firm Level 2 water needs[5]
CCWD	195 TAF/yr CVP contract supply and water rights[10]
SWP [4, 11]	Demand based on full Table A amounts (4.13 MAF/yr)
Article 56	Based on 2001-2008 contractor requests
Article 21	MWD demand up to 200 TAF/month (December-March) subject to conveyance capacity, KCWA demand up to 180 TAF/month, and other contractor demands up to 34 TAF/month, subject to conveyance capacity
North Bay Aqueduct	77 TAF/yr demand under SWP contracts, up to 43.7 cfs of excess flow under Fairfield, Vacaville and Benicia Settlement Agreement NOD Allocation Settlement Agreement terms for Napa and Solano [15]

	Existing Condition[1]
FACILITIES	
System-wide	Existing facilities
Sacramento Valley	
Shasta Lake	Existing, 4,552 TAF capacity
Red Bluff Diversion Dam	Diversion dam operated with gates out all year, NMFS BO (Jun 2009) Action I.3.1[17];assume permanent facilities in place
Colusa Basin	Existing conveyance and storage facilities
Lower American River	Hodge criteria for diversion at Fairbairn
Upper American River	PCWA American River pump station
Lower Sacramento River	Freeport Regional Water Project
Fremont Weir	Existing Weir
Delta Export Conveyance	
SWP Banks Pumping Plant (South Delta)	Physical capacity is 10,300 cfs, permitted capacity is 6,680 cfs in all months and up to 8,500 cfs during Dec 15th - Mar 15th depending on Vernalis flow conditions[18]; additional capacity of 500 cfs (up to 7,180 cfs) allowed Jul–Sep for reducing impact of NMFS BO (Jun 2009) Action IV.2.1[17] on SWP[19]
CVP C.W. "Bill" Jones Pumping Plant (formerly Tracy PP)	Permit capacity is 4,600 cfs in all months (allowed for by the Delta-Mendota Canal- California Aqueduct Intertie)
Upper Delta-Mendota Canal Capacity	Exports limited to 4,200 cfs plus diversion upstream from DMC constriction plus 400 cfs Delta-Mendota Canal-California Aqueduct Intertie
Los Vaqueros Reservoir	Enlarged storage capacity (160 TAF), existing pump location, Alternate Intake Project included[13]
San Joaquin River	
Millerton Lake (Friant Dam)	Existing, 520 TAF capacity
Lower San Joaquin River	City of Stockton Delta Water Supply Project, 30 mgd capacity
South of Delta (CVP/SWP project facilities)	
South Bay Aqueduct	SBA rehabilitation, 430 cfs capacity from junction with California Aqueduct to Alameda County FC&WSD Zone 7 point
California Aqueduct East Branch	Existing capacity
REGULATORY STANDARDS	
Trinity River	
Minimum Flow below Lewiston Dam	Trinity EIS Preferred Alternative (369-815 TAF/yr)
Trinity Reservoir end-of-September minimum storage	Trinity EIS Preferred Alternative (600 TAF/yr as able)

	Existing Condition[1]
Clear Creek	
Minimum flow below Whiskeytown Dam	Downstream water rights, 1963 Reclamation proposal to USFWS and NPS, predetermined Central Valley Protection Improvement Act 3406(b)(2) flows[20], and NMFS BO (Jun 2009) Action I.1.1[17]
Upper Sacramento River	
Shasta Lake end-of-September minimum storage	NMFS 2004 Winter-run Biological Opinion (1,900 TAF in non-critical dry years), and NMFS BO (Jun 2009) Action I.2.1[17]
Minimum flow below Keswick Dam	Flows for the SWRCB Water Rights Order 90-5, predetermined Central Valley Protection Improvement Act 3406(b)(2) flows, and NMFS BO (Jun 2009) Action I.2.2[17]
Feather River	
Minimum flow below Thermalito Diversion Dam	2006 Settlement Agreement (700 / 800 cfs)
Minimum flow below Thermalito Afterbay outlet	1983 DWR, DFG agreement (750 – 1,700 cfs)
Yuba River	
Minimum flow below Daguerre Point Dam	D-1644 Operations (Lower Yuba River Accord)[14]
American River	
Minimum flow below Nimbus Dam	American River Flow Management as required by NMFS BO (Jun 2009) Action II.1[17]
Minimum flow at H Street Bridge	SWRCB D-893
Lower Sacramento River	
Minimum flow near Rio Vista	SWRCB D-1641
Mokelumne River	
Minimum flow below Camanche Dam	Federal Energy Regulatory Commission 2916-029[12], 1996 (Joint Settlement Agreement) (100 – 325 cfs)
Minimum flow below Woodbridge Diversion Dam	Federal Energy Regulatory Commission 2916-029, 1996 (Joint Settlement Agreement) (25 – 300 cfs)
Stanislaus River	
Minimum flow below Goodwin Dam	1987 Reclamation, DFG agreement, and flows required for NMFS BO (Jun 2009) Action III.1.2 and III.1.3[17]
Minimum dissolved oxygen	SWRCB D-1422

	Existing Condition1
Merced River	
Minimum flow below Crocker- Huffman Diversion Dam	Davis-Grunsky (180 – 220 cfs, Nov – Mar), and Cowell Agreement
Minimum flow at Shaffer Bridge	Federal Energy Regulatory Commission 2179 (25 – 100 cfs)
Tuolumne River	
Minimum flow at Lagrange Bridge	Federal Energy Regulatory Commission 2299-024, 1995 (Settlement Agreement) (94 – 301 TAF/yr)
Updated Tuolumne River	New Don Pedro operations
San Joaquin River	
San Joaquin River below Friant Dam/Mendota Pool	Full San Joaquin River Restoration flows
Maximum salinity near Vernalis	SWRCB D-1641
Minimum flow near Vernalis	SWRCB D1641. VAMP is turned off since the San Joaquin River Agreement has expired.[16] NMFS BO (Jun 2009) Action IV.2.1 Phase II flows not provided due to lack of agreement for purchasing water
Sacramento-San Joaquin Delta	
Delta Outflow Index (flow and salinity)	SWRCB D-1641 and FWS BO (Dec 2008) Action 4[17]
Delta Cross Channel gate operation	SWRCB D-1641 with additional days closed from Oct 1-Jan 31 based on NMFS BO (Jun 2009) Action IV.1.2[17] (closed during flushing flows from Oct 1-Dec 14 unless adverse water quality conditions)
South Delta exports (Jones PP and Banks PP)	SWRCB D-1641 export limits as required by NMFS BO (June 2009) Action IV.2.1 Phase II[17] (additional 500 cfs allowed for Jul-Sep for reducing impact on SWP)[19]
Combined Flow in Old and Middle River (OMR)	FWS BO (Dec 2008) Actions 1-3 and NMFS BO (Jun 2009) Action IV.2.3[17]
OPERATIONS CRITERIA: RIVER-SPECIFIC	
Upper Sacramento River	
Flow objective for navigation (Wilkins Slough)	NMFS BO (Jun 2009) Action I.4[17]; 3,250 – 5,000 cfs based on CVP water supply condition
American River	
Folsom Dam flood control	Variable 400/670 flood control diagram (without outlet modifications)
Feather River	
Flow at mouth of Feather River (above Verona)	Maintain the DFG/DWR flow target of 2,800 cfs for Apr - Sep dependent on Oroville inflow and FRSA allocation
Stanislaus River	
Flow below Goodwin Dam	Revised Operations Plan and NMFS BO (Jun 2009) Action III.1.2 and III.1.3[17]

	Existing Condition[1]
San Joaquin River	
Salinity at Vernalis	Grasslands Bypass Project (full implementation)
OPERATIONS CRITERIA: SYSTEMWIDE	
CVP Water Allocation	
CVP settlement and exchange	100% (75% in Shasta critical years)
CVP refuges	100% (75% in Shasta critical years)
CVP agriculture	100% - 0% based on supply. South-of-Delta allocations are additionally limited due to D-1641, FWS BO (Dec 2008), and NMFS BO (Jun 2009) export restrictions[17]
CVP municipal & industrial	100% - 50% based on supply. South-of-Delta allocations are additionally limited due to D-1641, FWS BO (Dec 2008), and NMFS BO (Jun 2009) export restrictions[17]
SWP Water Allocation	
North of Delta (FRSA)	Contract-specific NOD Allocation Settlement Agreement terms for Butte and Yuba [15]
South of Delta (including North Bay Aqueduct)	Based on supply; equal prioritization between Ag and M&I based on Monterey Agreement; allocations are limited due to D-1641, FWS BO (Dec 2008), and NMFS BO (Jun 2009) export restrictions[17] NOD Allocation Settlement Agreement terms for Napa and Solano [15]
CVP/SWP Coordinated Operations	
Sharing of responsibility for in-basin use	1986 Coordinated Operations Agreement (FRWP and EBMUD 2/3 of the North Bay Aqueduct diversions are considered as Delta export, 1/3 of the North Bay Aqueduct diversion is considered as in-basin use)
Sharing of surplus flows	1986 Coordinated Operations Agreement
Sharing of restricted export capacity for project-specific priority pumping	Equal sharing of export capacity under SWRCB D-1641, FWS BO (Dec 2008), and NMFS BO (Jun 2009) export restrictions[17]
Water transfers	Acquisitions by SWP contractors are wheeled at priority in Banks Pumping Plant over non-SWP users; LYRA included for SWP contractors[19]
Sharing of export capacity for lesser priority and wheeling-related pumping	Cross Valley Canal wheeling (max of 128 TAF/yr), CALFED ROD defined Joint Point of Diversion (JPOD)
San Luis Reservoir	San Luis Reservoir is allowed to operate to a minimum storage of 100 TAF
CVPIA 3406(b)(2)	
Policy decision	Per May 2003 Department of Interior decision
Allocation	800 TAF/yr, 700 TAF/yr in 40-30-30 dry years, and 600 TAF/yr in 40-30-30 critical years
Actions	Pre-determined non-discretionary FWS BO (Dec 2008) upstream fish flow objectives (Oct-Jan) for Clear Creek and Keswick Dam, non-discretionary NMFS BO

	Existing Condition[1]
	(Jun 2009) actions for the American and Stanislaus Rivers, and NMFS BO (Jun 2009) actions leading to export restrictions[17]
Accounting adjustments	No discretion assumed under FWS BO (Dec 2008) and NMFS BO (Jun 2009)[17], no accounting
WATER MANAGEMENT ACTIONS	
Water Transfer Supplies (long term programs)	
Lower Yuba River Accord[19]	Yuba River acquisitions for reducing impact of NMFS BO export restrictions[17] on SWP
Phase 8	None
Water Transfers (short term or temporary programs)	
Sacramento Valley acquisitions conveyed through Banks PP[21]	Post analysis of available capacity

Notes:

[1] These assumptions have been developed under the direction of the Department of Water Resources and Bureau of Reclamation management team for the BDCP HCP and EIR/EIS. Additional modifications were made by Reclamation for its October 2014 NEPA NAA baselines and by DWR for the 2015 DCR.

[2] The Sacramento Valley hydrology used in the Existing Condition CALSIM II model reflects 2020 land-use assumptions associated with Bulletin 160-98. The San Joaquin Valley hydrology reflects draft 2030 land-use assumptions developed by Reclamation to support Reclamation studies.

[3] CVP contract amounts have been reviewed and updated according to existing and amended contracts, as appropriate. Assumptions regarding CVP agricultural and M&I service contracts and Settlement Contract amounts are documented in the Delivery Specifications attachments to the BDCP CALSIM assumptions document.

[4] SWP contract amounts have been updated as appropriate based on recent Table A transfers/agreements. Assumptions regarding SWP agricultural and M&I contract amounts are documented in the Delivery Specifications attachments to the BDCP CALSIM assumptions document.

[5] Water needs for Federal refuges have been reviewed and updated, as appropriate. Assumptions regarding firm Level 2 refuge water needs are documented in the Delivery Specifications attachments to the BDCP CALSIM assumptions document. Refuge Level 4 (and incremental Level 4) water is not included.

[6] Assumptions regarding American River water rights and CVP contracts are documented in the Delivery Specifications attachments to the BDCP CALSIM assumptions document. The Sacramento Area Water Forum agreement, its dry year diversion reductions, Middle Fork Project operations and “mitigation” water is not included.

[7] Demand for rice straw decomposition water from Thermalito Afterbay was added to the model and updated to reflect historical diversion from Thermalito in the October through January period.

[8] The new CALSIM II representation of the San Joaquin River has been included in this model package (CALSIM II San Joaquin River Model, Reclamation, 2005). Updates to the San Joaquin River have been included since the preliminary model release in August 2005. The model reflects the difficulties of on-going groundwater overdraft problems. The 2030 level of development representation of the San Joaquin River Basin does not make any attempt to offer solutions to groundwater overdraft problems. In addition, a dynamic groundwater simulation is not yet developed for the San

Joaquin River Valley. Groundwater extraction/ recharge and stream-groundwater interaction are static assumptions and may not accurately reflect a response to simulated actions. These limitations should be considered in the analysis of result

[9] The CALSIM II model representation for the Stanislaus River does not necessarily represent Reclamation's current or future operational policies. A suitable plan for supporting flows has not been developed for NMFS BO (Jun 2009) Action III.1.3.

[10] The actual amount diverted is reduced because of supplies from the Los Vaqueros project. The existing Los Vaqueros storage capacity is 100 TAF, and future storage capacity is 160 TAF. Associated water rights for Delta excess flows are included.

[11] Under DCR 2015 and the Future No Action baseline, it is assumed that SWP Contractors can take delivery of all Table A allocations and Article 21 supplies. Article 56 provisions are assumed and allow for SWP Contractors to manage storage and delivery conditions such that full Table A allocations can be delivered. Article 21 deliveries are limited in wet years under the assumption that demand is decreased in these conditions. Article 21 deliveries for the NBA are dependent on excess conditions only, all other Article 21 deliveries also require that San Luis Reservoir be at capacity and that Banks PP and the California Aqueduct have available capacity to divert from the Delta for direct delivery.

[12] Mokelumne River flows reflect EBMUD supplies associated with the Freeport Regional Water Project.

[13] The CCWD Alternate Intake Project, an intake at Victoria Canal, which operates as an alternate Delta diversion for Los Vaqueros Reservoir.

[14] D-1644 and the Lower Yuba River Accord are assumed to be implemented for Existing baselines. The Yuba River is not dynamically modeled in CALSIM II. Yuba River hydrology and availability of water acquisitions under the Lower Yuba River Accord are based on modeling performed and provided by the Lower Yuba River Accord EIS/EIR study team.

[15] This includes draft logic for the updated Allocation Settlement Agreement for four NOD contractors: Butte, Yuba, Napa and Solano.

[16] It is assumed that D-1641 requirements will be in place in 2030, and VAMP is turned off.

[17] In cooperation with Reclamation, National Marine Fisheries Service, Fish and Wildlife Service, and CA Department of Fish and Game, the CA Department of Water Resources has developed assumptions for implementation of the FWS BO (Dec 15th 2008) and NMFS BO (June 4th 2009) in CALSIM II.

[18] Current ACOE permit for Banks PP allows for an average diversion rate of 6,680 cfs in all months. Diversion rate can increase up to 1/3 of the rate of San Joaquin River flow at Vernalis during Dec 15th – Mar 15th up to a maximum diversion of 8,500 cfs, if Vernalis flow exceeds 1,000 cfs.

[19] Acquisitions of Component 1 water under the Lower Yuba River Accord, and use of 500 cfs dedicated capacity at Banks PP during Jul-Sep, are assumed to be used to reduce as much of the impact of the Apr-May Delta export actions on SWP contractors as possible.

[20] Delta actions, under USFWS discretionary use of CVPIA 3406(b)(2) allocations, are no longer dynamically operated and accounted for in the CALSIM II model. The Combined Old and Middle River Flow and Delta Export restrictions under the FWS BO (Dec 15th 2008) and the NMFS BO (June 4th 2009) severely limit any discretion that would have been otherwise assumed in selecting Delta actions under the CVPIA 3406(b)(2) accounting criteria. Therefore, it is anticipated that CVPIA 3406(b)(2) account availability for upstream river flows below Whiskeytown, Keswick and Nimbus Dams would be very limited. It appears the integration of BO RPA actions will likely exceed the 3406(b)(2) allocation in all water year types. For these baseline simulations, upstream flows on the Clear Creek and Sacramento River are pre-determined

based on CVPIA 3406(b)(2) based operations from the Aug 2008 BA Study 7.0 and Study 8.0 for Existing and Future No Action baselines respectively. The procedures for dynamic operation and accounting of CVPIA 3406(b)(2) are not included in the CALSIM II model.

[21] Only acquisitions of Lower Yuba River Accord Component 1 water are included.

HEC5Q Modeling for the Sites Reservoir Project

Development of WSIP Climate Scenarios for Use in HEC5Q

The section describes the updates to HEC5Q that were necessary for performing temperature benefits analysis to support the Water Storage Investment Program (WSIP) application.

Background

HEC5Q Model Background and Limitations

Over the last 15 years, the US Bureau of Reclamation (Reclamation) has developed applications of the US Army Corps of Engineers HEC5Q model for evaluation of water temperatures on the Sacramento River, American River, and Stanislaus Rivers. Reclamation made substantial revisions to these models for use in their NEPA EIS analysis of the Coordinate Long-Term Operations of the Central Valley Project and State Water Project (LTO EIS) (Reclamation, 2015). The HEC5Q model was designed to work with the model results of the CALSIM II model and was calibrated for historical meteorological conditions. For the LTO EIS analysis, procedures were established to incorporate operational assumptions related to selective withdrawal features at Shasta Lake (temperature control device). HEC5Q is listed in Table 4-14 of the WSIP Technical Reference document as one of the applicable water quality models that can be used to quantify physical changes in water temperatures.

The regulations for the WSIP require that the models used in the evaluation of the Project incorporate changes associated with the WSIP 2030 and 2070 climate conditions. This required establishing Without Project versions of the HEC5Q models that reflected the change in temperatures associated with the WSIP 2030 and 2070 climate conditions. The LTO EIS HEC5Q model for the Sacramento River was modified to adjust for increases in temperature associated with each climate condition. Further, the operational assumptions related to selective withdrawal features at Shasta Lake were adjusted to consider the effects of each climate condition on the management of reservoir release temperatures and the extent to which water temperature objectives could be achieved within the critical reaches downstream of these reservoirs.

The HEC5Q models calculate the change over time in water temperatures in reservoirs and rivers based on estimates of equilibrium water temperature and the rate at which heat exchange in the water will change as it approaches equilibrium. These estimates are based on meteorological and environmental information associate with the geographic location being studied. Based on temperature information included in the WSIP statewide gridded monthly data products (CWC, 2016) model inputs for equilibrium temperatures were adjusted for the WSIP climate scenarios.

In applying the HEC5Q models, water temperature objectives downstream of Shasta Lake are required for the model to select what elevation to withdrawal releases from. The temperature of water varies with depth in a reservoir depending on the degree to which the profile is stratified (due to temperature and density variation). Warmer water is less dense than cooler water and will move to the top of the reservoir. Much of the warming of a reservoir over the spring and early summer months comes from solar radiation through the surface of the lake. To meet temperature objectives downstream of the reservoir, water is selectively withdrawn at an elevation that provides water cool enough to meet the downstream objective. The Shasta Lake schedule is varied each year of simulation based on reservoir storage and inflow conditions and expected changes in water temperature that occur between the reservoirs and the objective locations in the rivers. Based on reiterative analysis, schedules of temperature objectives are modified to reflect the effects of the WSIP climate conditions.

The HEC5Q model provides a projection of how the water temperature trends with changes in storage and flows in the water resources system. The model does not provide a prediction of what future water temperatures will be. This model is intended for use in comparative analysis and demonstration of potential effects in the setting of hydrologic information considering historical variability and the effects of climate change. It should be recognized that the HEC5Q model is a simplified and generalized representation of complex hydrodynamic and thermodynamic processes in the riverine environment. While the HEC5Q model can provide 6-hour to daily timestep information at any location within the model domain, evaluation of the model results should consider the limitations of the information used to calibrate the model and the inputs to the model for the specific conditions being evaluated. Because the CALSIM II model results used are subject to specific location and monthly timestep limitations, care must be used in drawing any conclusion from the HEC5Q model results that is finer in spatial and temporal resolution than the CALSIM II model used. Nevertheless, HEC5Q is the best available tool for this evaluation of system effects related to the Project.

Approach

HEC5Q Changes

Updates were made to the Trinity-Sacramento River Reclamation HEC5Q models used for the Coordinated Long-Term Operations of the Central Valley Project and State Water Project Environmental Impact Study (LTO EIS) to support temperature modeling for the WSIP Application process. The following changes were made to better simulate water temperatures at Current Conditions, and in the 2030 and 2070 climate scenarios developed by the California Water Commission (CWC) for the WSIP Application process: 1) increasing the equilibrium temperatures based on the calculated increase in air temperature for the WSIP 2030 and 2070 climate scenarios, and 2) adjusting the Shasta release temperature schedule assumptions in the Trinity-Sacramento HEC5Q model.

Equilibrium Temperature Adjustment

Changes in climate can have a myriad of potential and unpredictable effects on water temperatures. However, several studies indicate that increasing air temperatures result in increased water temperatures, regardless of climate scenario (Webb and Walsh 2004, Cushing 1997, Isaak et al. 2012). Since air temperatures are predicted to increase under the WSIP 2030 and 2070 climate scenarios, an increase in water temperature is assumed.

With the limited data provided, equilibrium temperatures were increased based on the increased air temperature in the WSIP 2030 and 2070 climate scenarios. This approach was supported with an analysis between observed air temperature data from the Gerber and Nicolaus CIMIS stations and the calculated equilibrium temperatures at those two stations. The equilibrium temperatures were developed as part of the Sacramento River Water Quality Extension effort conducted by Reclamation (Smith et al. 2013). The period of record of the observed air temperature data was 01Jan2001 to 31Dec2011. The observed air temperature was averaged by month and then plotted against the calculated current climate equilibrium temperature as shown in Figures 1 and 2. Two linear regressions were performed on the data, one regression for the fall and winter months (October-March) and one regression for the spring and summer months (April-September). Regressions at Gerber indicate a 1:1 ratio of air temperature to equilibrium temperature during fall and winter months and 1:0.8 ratio of air temperature to equilibrium temperature in spring and summer months. Regressions at Nicolaus indicate a 1:1 ratio, year-round. The calculation of the climate adjusted equilibrium temperature, based on these regressions, is described in the next section.

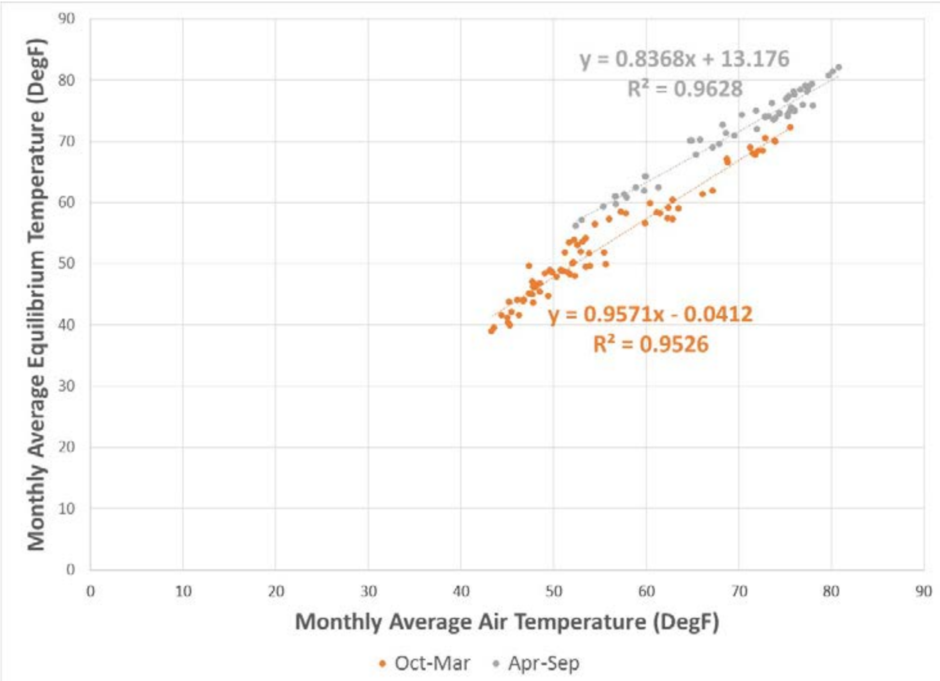

Figure 1: Gerber CIMIS Station Monthly Average Observed Air Temperature vs. Monthly Average Calculated Equilibrium Temperature

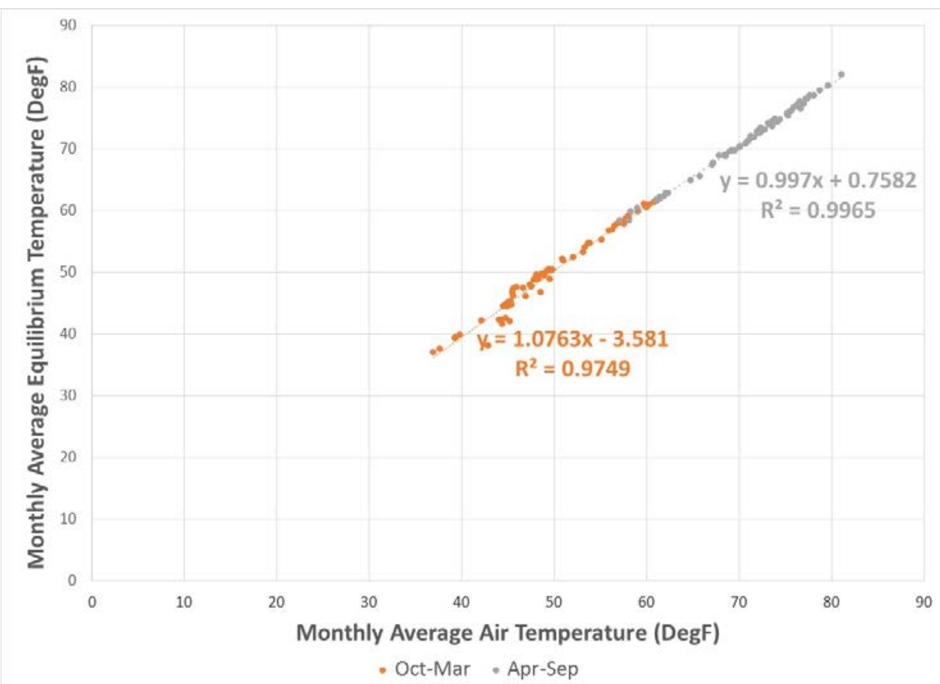

Figure 2: Nicolaus CIMIS Station Monthly Average Observed Air Temperature vs. Monthly Average Calculated Equilibrium Temperature

After performing the regressions to determine the seasonal adjustment factor, the following process was used to calculate the climate scenario adjusted equilibrium temperatures. The WSIP climate scenario data was obtained from the CWC website (Water Commission 2016). The data comes in files that correspond to grid cells with different latitude and longitudes. In order to perform the equilibrium temperature adjustments, the latitude and longitude coordinates of the Gerber and Nicolaus California Irrigation Management Information System (CIMIS) stations the meteorology data is based from were obtained and then matched with the closest WSIP climate scenario grid cell (Table 1). The climate scenario data that corresponded to that grid cell was then retrieved for the two CIMIS stations.

Table 1: CIMIS Station Latitude and Longitude coordinates and the corresponding WSIP grid cell coordinates

Station	**CIMIS**		**WSIP**	
	Latitude	*Longitude*	*Latitude*	*Longitude*
Gerber	40.05	122.16	40.03125	122.15625
Nicolaus	38.87	121.55	38.84375	121.53125

After retrieving the data, the maximum and minimum monthly air temperatures (Tmax & Tmin) in the WSIP climate scenario data were converted to Fahrenheit from Celsius to match the units of the HEC5Q model. For each WSIP climate scenario, the average monthly air temperature (Tavg) was calculated by averaging the maximum and minimum monthly air temperatures (Tmax + Tmin)/2. Then, the monthly average temperature shifts from Current Climate to WSIP 2030 and 2070 were calculated by subtracting the WSIP Current Climate Tavg from the 2030 Tavg and the 2070 Tavg, respectively. Gerber temperature shifts for April to September were multiplied by 0.8 to reflect the equilibrium temperature ratio described earlier. This difference was added to the existing HEC5Q Current Climate Equilibrium Temperature time series (described earlier) to calculate the climate adjusted equilibrium temperature for 2030 and 2070. Figures A1 to A6 in Appendix A show the 2030 and 2070 temperature shifts for each of the Gerber and Nicolaus CIMIS stations.

It should be noted that the WSIP Current Climate and the LTO EIS HEC5Q Current Climate are based on different climate analyses that do not reflect the same set of assumptions. However, for the WSIP climate updates, it was assumed that both represent the same current climate. In addition, the California Department of Water Resources 2015 Delivery Capability Report (DCR 2015) CALSIM II model was used to analyze the benefits of Sites reservoir under current climate conditions. The WaterFix HEC5Q Current Climate inputs are used for DCR 2015. See Figure 3 for a schematic of the climate adjustment process and climate scenarios used. With project and without project refer to without or with Sites Reservoir.

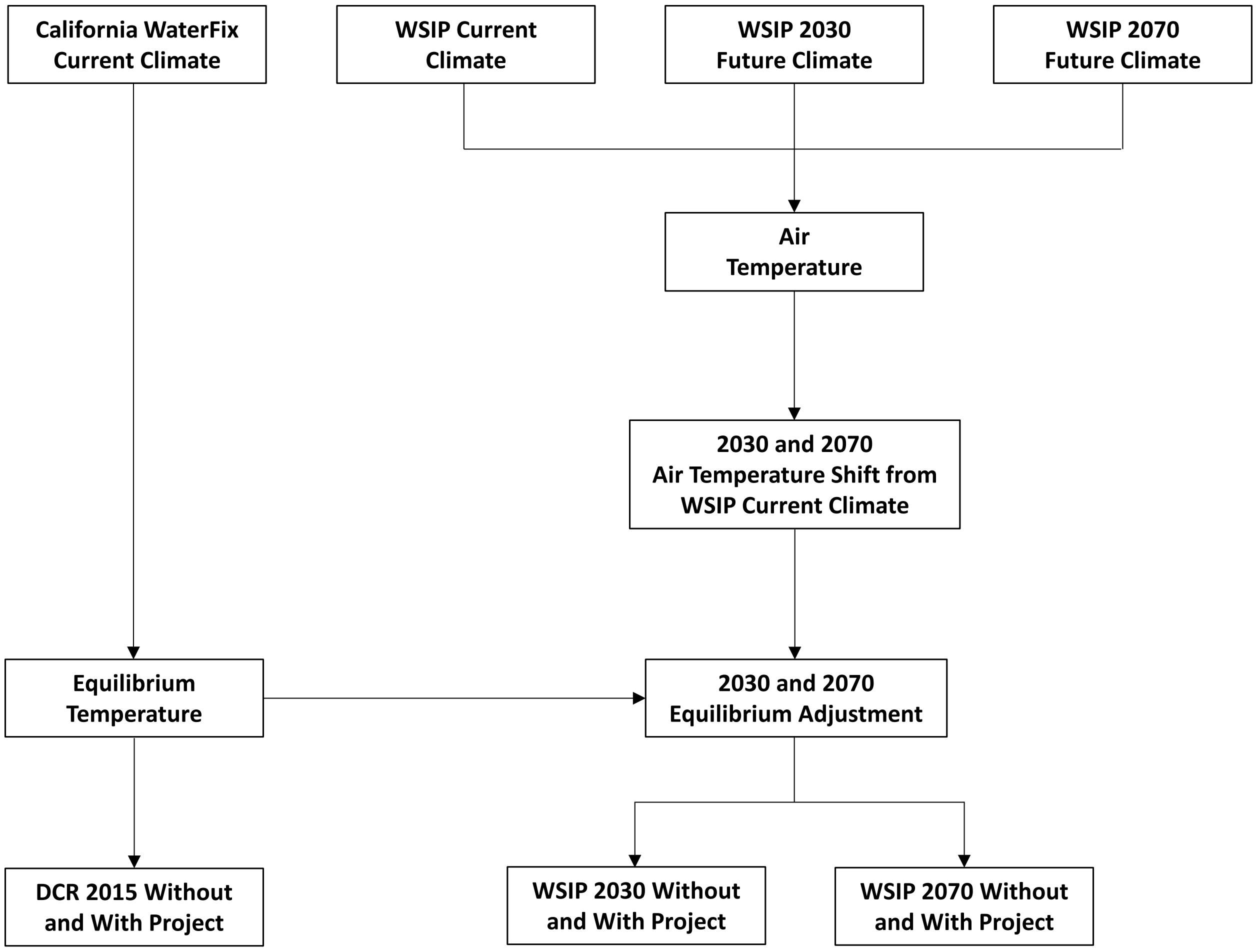

Figure 3: Climate scenarios and climate update process used to update equilibrium temperature for the Sites Reservoir WSIP Application.

Shasta Release Temperature Targeting Adjustments

The HEC5Q model simulates the Shasta Temperature Control Device (Shasta TCD) to manage temperature downstream at the following four temperature compliance locations: Clear Creek at Bonnyview Bridge, Balls Ferry, Jelly's Ferry, and Bend Bridge. The Shasta TCD modeling code requires a temperature release target for Shasta to operate to. These temperature target schedules are developed as a series of annual temperature target schedules in a pre-processing spreadsheet tool for each temperature compliance location. For the Sites WSIP Application, two adjustments were made to the assumptions of the temperature target spreadsheet tool to demonstrate the Sacramento River temperature benefits of the changed operations at Shasta due to the operational flexibility provided by Sites Reservoir. These adjustments are described below.

Storage Tier Adjustments

For the Sites WSIP Application, the maximum of April and May end-of-month storage was used to specify that year's compliance location. This adjustment was made because End-of-May is greater than End-of-April storage in some years. Allowing flexibility between End-of-April and End-of-May storage gives a more complete picture of how much cold water pool is available for the temperature management season than if just End-of-April storage was used as the indicator of available cold water pool.

Second, the storage tiers were adjusted due to the change in inflows and air temperatures in the WSIP 2030 and 2070 climate scenarios. The changes in climate variables requires a greater volume of water to meet temperature compliance at the targeted compliance location (e.g. it will take more storage volume to meet temperature compliance at Balls Ferry throughout the year).

An iterative approach was used to adjust the storage levels for both the WSIP 2030 and 2070 climate scenarios. An initial HEC5Q run was completed that utilizes the Maximum End-of-April or May Shasta Storage levels (see Table 2). After the run was completed, temperature outputs for the four compliance locations were loaded into the spreadsheet along with Shasta storage data from CALSIM II. The average of July and August temperature for each year of the 81 year period of record was calculated for each compliance location. The average between July and August was used because it represents the two months with the highest expected temperatures. The furthest downstream location that had a July-August temperature below 56 degrees was the compliance location that was met for that year. For example, if the July-August temperature is 54.5, 55, 55.8, and 56.2 for Bonnyview, Balls Ferry, Jellys Ferry, and Bend Bridge respectively, then the compliance location that was met was Jellys Ferry, since it is the most downstream location that is below 56 degrees. The compliance location based on the Maximum End-of-April or May Shasta storage was also calculated. The number of years where the compliance location was different between the July-August average temperature and the Maximum End-of-April or May Shasta storage was tabulated. The Maximum End-of-April or May Shasta storage levels were then adjusted until the smallest difference was achieved.

The Shasta temperature target schedules were then recomputed for each year and the HEC5Q model was then rerun. The new temperature results at the compliance locations were loaded into the spreadsheet and the same process of changing the Maximum End-of-April or May Shasta storage levels was performed. The final Maximum End-of-April or May Shasta storage levels were settled upon after the third iteration for the WSIP 2030 and WSIP 2070 climate scenarios, as shown in Table 2 below. The values in the table show the maximum storage necessary for each compliance location.

Table 2: Adjusted End-of-April Shasta Storage Levels

Compliance Location	**Maximum End-of-April or May Shasta Storage**		
	Current Conditions	*2030*	*2070*
Bend Bridge	9999	9999	9999
Jelly's Ferry	4425	4500	4500
Balls Ferry	4000	4300	4400
Below Clear Creek	3600	3600	4000
None	2000	2000	2000

Temperature Target Adjustments

A temperature schedule was developed for each temperature compliance location. These temperature schedules are Shasta release temperatures that are calculated based on the amount of warming that will occur between Shasta and the four compliance locations. The amount of warming that occurs was calculated using an exceedance based approach. With the change in operations to Shasta with Sites Reservoir in place, these exceedance percentages were adjusted in order to demonstrate the potential amount of temperature benefit Sites Reservoir can provide. The June to October exceedance percentages were lowered, which calculates a higher warming that occurs between Shasta and the compliance locations for which Shasta has to adjust to by lowering its release temperature target. Lowering the release temperature targets means Shasta uses more of the cold water pool that is available. The exceedance percentages were adjusted to save cold water in the cold water pool for August and September. See Table 3 for the June to September exceedance percentages used for the without project scenarios and the adjusted exceedance percentages used to characterize warming in the river for the with-project scenarios in the Sites WSIP Application.

Table 3: June to October exceedance percentages used to characterize warming between Shasta and the temperature compliance locations on the Sacramento River

Compliance Location	Exceedance Percentages							
	June		*July*		*August*		*September*	
	W/O Sites	W Sites	W/O Sites	W Sites	W/O Sites	W Sites	W/O Sites	W Sites
Clear Creek	75%	5%	50%	5%	15%	5%	5%	5%
Balls Ferry	75%	10%	50%	10%	15%	5%	5%	5%
Jellys Ferry	75%	15%	50%	15%	15%	5%	5%	5%
Bend Bridge	75%	25%	50%	25%	15%	5%	5%	5%

After setting the exceedance percentages, the HEC5Q model was run three times in order to settle in on the Shasta release temperatures based on these new exceedances. This process was done for the three climate scenarios. See Attachment B for the final Shasta Release temperature schedules for the three climate scenarios.

Results

After making the necessary adjustments to the climate updates described above, the Without-Project CALSIM II models for each of the three climate scenarios provided by the California Water Commission were run through the updated Trinity-Sacramento River HEC5Q models to quantify the river temperatures on the Sacramento River under the Without Project condition. This established the river temperature baselines for the three climate scenarios that river temperature benefits of the With-Project conditions would be quantified from. Attachment D shows river temperature results on the Sacramento River at Jellys Ferry. The results for both the Sacramento River show that river temperatures increase between the Current Conditions climate, the WSIP 2030 climate scenario, and the WSIP 2070 climate scenario. There are two major factors for this change, the shift in equilibrium temperature based on the increased air temperature and the change in operations based on the change in hydrologic conditions between the climate scenarios.

SALMOD Salmon Modeling of the Sacramento River

SALMOD Salmon Modeling of the Sacramento River for the Sites Reservoir Project

This attachment provides a summary of the SALMOD model used to simulate the annual production potential for each run of Chinook salmon in the Sacramento River for the Sites Reservoir Water Storage Investment Program Application. It includes a description of the SALMOD model and assumptions.

SALMOD Overview

SALMOD simulates the population dynamics of the freshwater life stages of anadromous Chinook salmon. Model processes include spawning (egg deposition), egg and alevin development and growth, mortality, and movement (due to habitat limitation, freshets, and seasonal stimuli). Pre-smolts do not graduate to the smolt stage within the model. Instead, they exit the study area and the population is reinitialized with survey estimates of spawning adults each biological year. SALMOD is a spatially explicit model in which habitat quality and carrying capacity are characterized by the hydraulic and thermal properties of individual mesohabitats, which serve as spatial computational units in the model. SALMOD is organized around events occurring during a biological year beginning with spawning and typically concluding with fish that are physiologically "ready" (e.g., pre-smolts), swimming downstream toward the ocean. It operates on a weekly timestep for one or more biological years. Input variables (e.g., streamflow, water temperature, number and distribution of adult spawners) are represented by their weekly average values. SALMOD tracks a population of spatially distinct cohorts that originate as eggs and grow from one life stage to another as a function of local water temperature. The biological characteristics of fish within a cohort are the same. Fish cohorts are tracked by life stage and size class within the spatial computational units. SALMOD uses the weekly averages of the daily flow outputs from the CALSIM II model and the daily temperature outputs from the Trinity-Sacramento HEC5Q model.

The 2008 Central Valley Project and State Water Project Operations Criteria and Plan Biological Assessment (OCAP BA) Technical Appendix P (Reclamation, 2008) describes the SALMOD model in detail including the development history, model formulation, input assumptions, use of outputs, and limitations of the model.

SALMOD Assumptions for Returning Chinook Salmon Spawners

This section presents the assumptions used for returning Chinook salmon spawners used in SALMOD modeling for evaluation of the alternatives. The Chinook salmon runs considered in SALMOD include winter, spring, fall, and late fall.

Based on spatial distribution of surveyed redds on various segments of the Sacramento River, a distribution of spawners is assumed for the reach segments in the SALMOD model. Assumptions of the spawning distributions were based on average 2003–2014 redd survey data, provided by David Swank at NMFS in April 2015.

The total number of returning adults assumed for each of the four runs is shown in Table 1. The numbers of returning adults assumed for each run summarized in Table 1 are approximate maximums of values assumed in recent applications of the SALMOD model. The ratios of spawning females to total number of returning adults are also included in Table 1. References are unavailable for these ratios. The fractional distribution of returning adults, for each reach segment, for each salmon run, are summarized in Table 2. Each segment is identified by locations along the Sacramento River. Using the fractional distribution of spawners shown in Table 2, the number of returning adults was apportioned to the reach segments in the model.

SALMOD modeled production potential is assumed to vary across alternatives and within each alternative across each biological year according to variations in water temperatures, flows, and the resultant habitat available for Chinook salmon. The assumed number and distribution of returning female spawners is not varied by biological year. The high value was assumed for the number of returning female spawners so as to describe the potential available habitat under a wide range of flow and temperature conditions (value based on maximums of values assumed in recent applications of the SALMOD model). Therefore, the SALMOD results are not intended to estimate a specific number of Chinook salmon produced, but rather to provide an index of available habitat assuming that the number of returning female spawners is not limited.

Table 1: Number of Returning Chinook Salmon Adults, and Ratio of Spawning Females to All Returning Adults, on the Sacramento River

Chinook Salmon Run	Returning Adults (High Curve)	Ratio of Spawning Adults to Non-spawning Adults
Winter	8,500	0.48
Spring	999	0.48
Fall	65,000	0.48
Late Fall	14,000	0.48

Table 2: Distribution of Returning Chinook Salmon Adults in Eight Spawning Segments of the Sacramento River

Cumulative Distance from Keswick Dam (meters)	Location of Sacramento River Segment	Fraction of Returning Chinook Salmon Adults (percentage)			
		Winter-Run	Spring-Run	Fall-Run	Late Fall-Run
5791	Keswick Dam to Anderson-Cottonwood Irrigation District (ACID) Dam	45.10	12.83	19.50	71.30
9025	ACID Dam to Highway 44 Bridge	42.10	33.97	6.60	5.20
28810	Highway 44 Bridge to Airport Road Bridge	12.20	29.76	14.70	3.90
41411	Airport Road Bridge to Balls Ferry Bridge	0.30	11.12	19.40	8.90

Upper Sacramento River Daily River Flow and Operations Modeling

Upper Sacramento River Daily River Flow and Operations Modeling

This attachment provides the summary of modeling performed to simulate daily flow and operations in the reservoirs, rivers and other conveyance features that are part of the Central Valley Project (CVP) and the Sites Reservoir Project (Project). It includes a description of the Upper Sacramento River Daily Operations Model (USRDOM) and results used in the detailed evaluation of alternatives.

USRDOM Overview

USRDOM simulates daily flow and storage conditions in the upper Sacramento River including Trinity basin, Sacramento River from Shasta Lake to Knights Landing and Colusa Basin including the Project conveyance and storage features. USRDOM utilizes results from CALSIM II to evaluate the impacts of changing diversion, in-basin use and Delta operations under projected conditions within current or future regulatory and operational regimes. It couples the downstream monthly operational decisions in CALSIM II to a simulation of the associated sub-monthly operational response at Lake Shasta depending on the inflows. It is particularly useful in verifying the CALSIM II simulated river conditions and the availability of excess flows to fill the Sites Reservoir under the capacity and operational constraints of the three intakes at the Red Bluff, Hamilton City and Delevan locations.

Development of the USRDOM, calibration and verification, its use in planning simulations and its application to the Sites Reservoir Project is documented in detail in the final USRDOM Development, Calibration, and Application report prepared by CH2M HILL for Reclamation (CH2M HILL, 2011).

Objective

USRDOM is used in several ways as part of modeling of the operations of the Sites Reservoir Project. It was used to test and finalize the CALSIM II operations for the Project alternatives. The main objective of using USRDOM was to simulate daily flows to inform CALSIM II (monthly) about the potential restrictions on the diversions due to pulse flow conditions. It was also used to evaluate storage conditions in Lake Shasta and Sites Reservoir, flow conditions on a daily-weekly time scale along the Sacramento River from Keswick Dam to Knights Landing and in the Colusa Basin conveyance. The results from USRDOM are used for input into temperature, biological and flow regime models to evaluate the Project.

Project Intake Operations Assumptions

This section briefly describes the key operational assumptions used in the USRDOM model for evaluating the Project.

The operational assumptions governing the diversions at the three Project intakes, namely existing Tehama Colusa Canal (TCC) Intake, Glenn Colusa Canal (GCC) Intake and the Delevan Pipeline Intake include:

- Restrictions based on the available channel conveyance capacities at various locations along the TCC and GCC. Further, restrictions based on the dedicated annual maintenance periods for TCC, GCC, and Delevan pipeline.
- Restrictions based on meeting the specified bypass flow requirements downstream of each of the three intakes. In addition, diversions are restricted based on the seasonal bypass flow requirements specified for Sacramento River near Hood.

- Restrictions based on the occurrence of pulse flows in the Sacramento River, which provide key biological cues for the outmigrating juvenile winter-, spring-, fall, and late fall-run Chinook salmon, as well as a portion of the steelhead juvenile fish. Therefore, diversions are restricted for up to one pulse event recognized in each month of the October through May period. Bend Bridge flow was used to identify pulse signals as part of the modeling.

Overview of the Planning Analysis

CALSIM II simulates CVP and State Water Project (SWP) operations on a monthly timestep from WY 1922 through WY 2003. Therefore, for the USRDOM projected conditions simulation, the inputs are taken from CALSIM II for a consistent analysis. Because USRDOM requires inputs on a daily timestep, the monthly inputs and outputs of the CALSIM II model are downscaled to a daily timestep using the CAL2DOM utility. CAL2DOM utility translates monthly CALSIM II operations data to a daily time step. It uses the inputs and outputs from CALSIM II, USRDOM hydrology inputs, and other datasets to compute inflows, diversions, and evaporation rates for using as inputs in the USRDOM.

Analysis of the Project

CALSIM II was the core model used to simulate Project operations. However, the assumptions related to the intake operations require daily flow data in determining the diversions allowed at the intakes, in turn affecting the system-wide operations. Since CALSIM II is a monthly timestep model, USRDOM results were used to enforce the intake operations on a sub-monthly scale. Due to the complexity in the intake operational rules, a spreadsheet tool was developed to implement the operational constraints using the daily results from the USRDOM. Further, the models were iterated to ensure all the intake operations assumptions were simulated accurately. Figure 1 shows the schematic of the modeling process used to simulate Project operations.

In the first iteration, CALSIM II and USRDOM models are simulated for the Project to determine the days requiring the pulse protection. A draft CALSIM II simulation was run with all the physical, regulatory and operational assumptions for the Project alternative. The results from this “draft” CALSIM II simulation were used to run the USRDOM model. The USRDOM setup included Project assumptions consistent with the draft CALSIM II. Since this USRDOM run is used to estimate daily flows in the river to determine the days requiring pulse protection, the diversions at the TCC, GCC, and Delevan intakes are restricted to meet the agricultural demands and other local uses in Colusa Basin region. The CAL2DOM logic was altered to estimate the diversions at the three intake locations without including the diversions for filling Sites Reservoir in this USRDOM run (called as, draft USRDOM No Fills Run). The results from the draft USRDOM No Fills run are used in a spreadsheet tool to determine the number of days under pulse protection in each month, over the 82-year period.

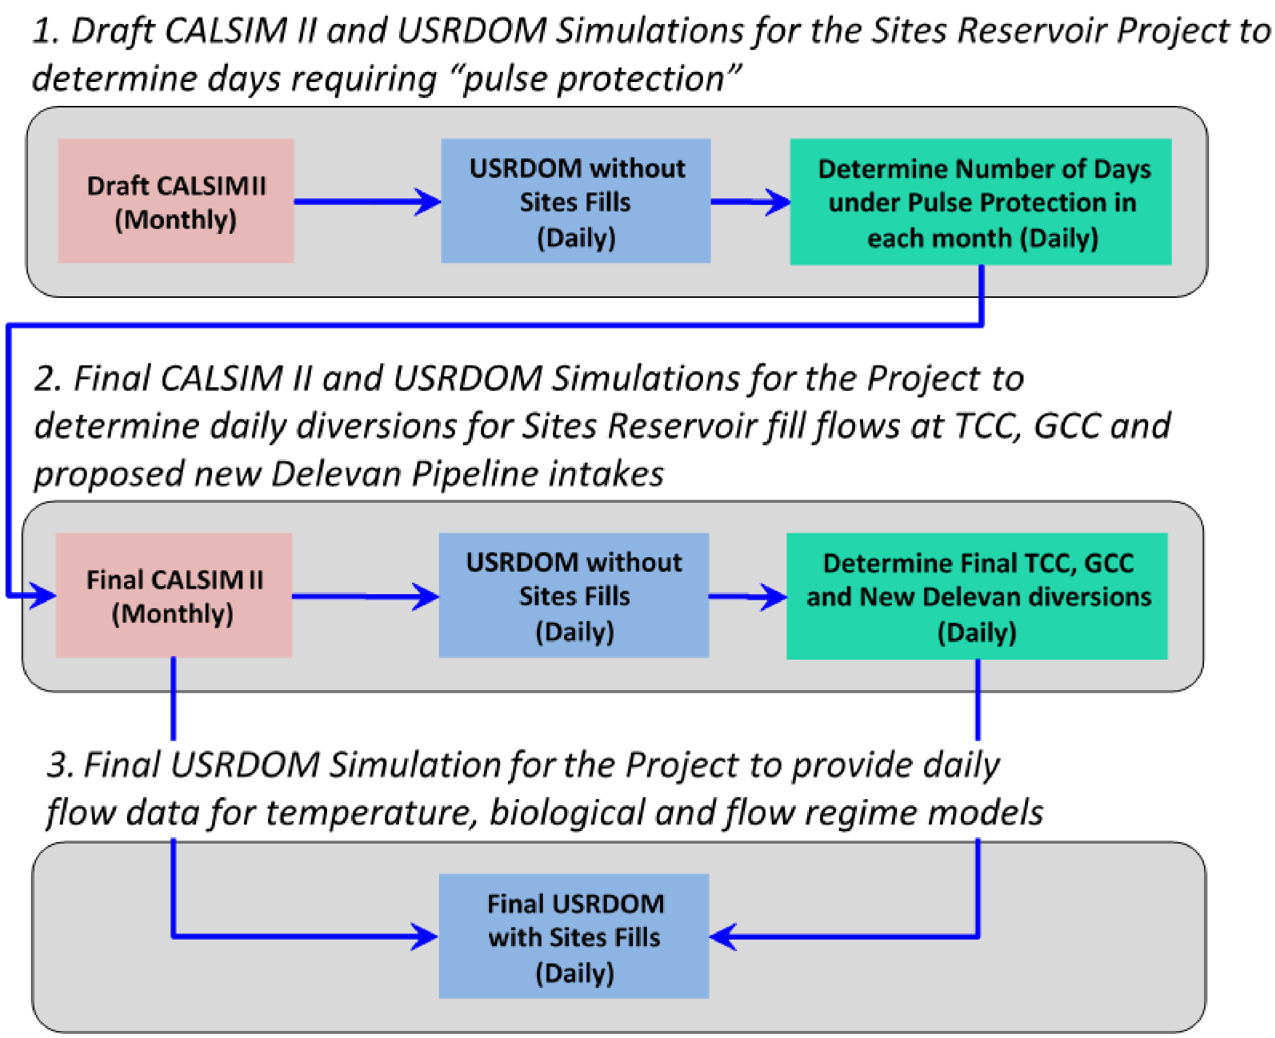

Figure 1 - Operations Modeling Process used for the Project Alternatives Evaluation

In the second iteration, the draft CALSIM II from the first iteration is re-run with the pulse protection data, to simulate the final monthly operations for the Project. The goal of this iteration is to determine the daily diversion amounts at the TCC, GCC, and Delevan pipeline intakes. Since the complexity involved in simulating capacity and maintenance constraints, bypass flow requirements and pulse protection restrictions simultaneously, the existing CAL2DOM logic to determine the daily diversions at the three intakes is insufficient. Therefore, the results from the final CALSIM II simulation are used to run another USRDOM simulation without including the diversions needed to fill the Sites Reservoir at the three intake locations (called as, final USRDOM No Fills Run). The purpose of this final USRDOM No Fills run is to determine the daily flows in the Sacramento River at key control points. This data is used in a spreadsheet tool to determine the daily diversions required to fill Sites Reservoir at the three intakes while complying with all the operational rules.

The daily diversions for the Sites fills at the three intakes are determined in three steps in the spreadsheet tool. In the first step the available diversion capacity is determined based on the capacity and maintenance constraints described above. In addition, based on the daily USRDOM flow the available flow to meet the monthly average diversion for fill (from CALSIM II) is determined at each intake, while meeting the bypass flow requirements. If there are no pulse flow restrictions for a given day, then the diversion at each intake is estimated as the minimum of available capacity and the available flow for diversion.

If the total diversion volumes at each intake from the first step for each month are less than the amount determined in CALSIM II, additional diversions needed to make up the difference are estimated in the second step. In this step, the additional diversions are made up at any of the three intakes depending on the available diversion capacity and the available flow for the diversion. First TCC intake is checked, then the GCC intake and finally the Delevan pipeline intake for any available diversion capacity for each month.

Based on the diversions from the second step, the months with volumes continue to be short of the CALSIM II values are flagged in the third and final step. These shortages are carried forward to the next months in which the diversion capacity and the flow for the diversion are available. This carrying forward of the shortages is only allowed in November through May months, which generally is the Sites Reservoir filling period. The availability of the flow for the diversion is estimated as the Wilkins Slough flow in excess of the minimum flow requirement at Knights Landing (estimated in CAL2DOM).

In this process, a few reasonable simplifying assumptions were made for modeling purposes, mainly because CALSIM II determines the diversions at the three intakes on a monthly timestep without knowing the daily constraints due to the intake operations assumptions and the daily variability in the unregulated flows. It is assumed that based on the available real-time monitoring, there is enough flexibility in TCC, GCC, and Delevan pipeline operations and in the interoperability among the three conveyance systems such that the diversions to fill Sites Reservoir can be made up through the following:

- Diversions at any of the three intake locations while meeting all the intake operations assumptions at each intake
- Diversions in any of the months during the fill season of November through May if usable diversion capacity and divertible flow is available

In the third iteration a final USRDOM run is simulated using the final CALSIM II results and the daily diversions for fills from the final step of the spreadsheet tool. CAL2DOM is modified to combine the diversions for the fills and the diversions for meeting local Colusa Basin demands to determine the total daily diversions at each of the three intakes.

Limitations

In using the USRDOM results for the Sites Reservoir Project evaluation following limitations should be noted:

The USRDOM calibration for Clear Creek flows below Whiskeytown Dam is significantly weaker than for other flows in the Trinity and Sacramento River systems. It is recommended that the CALSIM II model alone be used as the basis for impact assessment on Clear Creek flows.

In the downscaling of CALSIM II boundary condition flows for use in the USRDOM simulations, diversions at Red Bluff, Hamilton City and the Delevan Pipeline (Project alternatives) are smoothed from monthly to daily timestep. In this smoothing operation, in order to conserve volume and have a gradual change in diversion flows (as opposed to sharp changes at monthly or other time scale boundaries), there are some days in which diversions are represented in the model at flow rates that may exceed the sustainable rate of the physical capacity of these facilities. It is recommended that any assessment of flows or other parameters linked to the peak flow rate of these diversions use monthly average values rather than daily or other sub-monthly average values.

The CALSIM II model is used to establish system operational conditions and USRDOM is used to interpret these on a daily time-step; all residuals and inconsistencies between the CALSIM II and USRDOM models accumulate in storage facilities modeled, including Sites Reservoir; the Sites Reservoir storage in the USRDOM sometimes exceeds physical capacity slightly due to this inconsistency between the models.

Power Modeling of the Sites Reservoir Project

Sites Reservoir Power Analysis – Planning Level Assumptions and Modeling Approach

This section describes the planning level modeling approach to estimate power impacts of proposed Sites Reservoir facilities.

Sites Reservoir Power Model Overview

The Sites Reservoir power analysis tool is a spreadsheet post-processor that evaluates power impacts of flow scenarios from CALSIM II operations studies. The tool estimates average annual energy generation and use at proposed Sites Reservoir generation and pumping facilities, including existing facilities that would be operated differently if Sites Reservoir is built. For generation facilities, the tool estimates average annual energy generation and average annual peaking power capacity. For pumping facilities, the tool estimates average annual power requirements. The tool also checks to determine whether off-peak energy use targets are being met. Transmission losses are estimated for both pumping and generation facilities.

In addition, the tool estimates the economic benefits and costs of power generation and use at the proposed Sites Reservoir generation and pumping facilities.

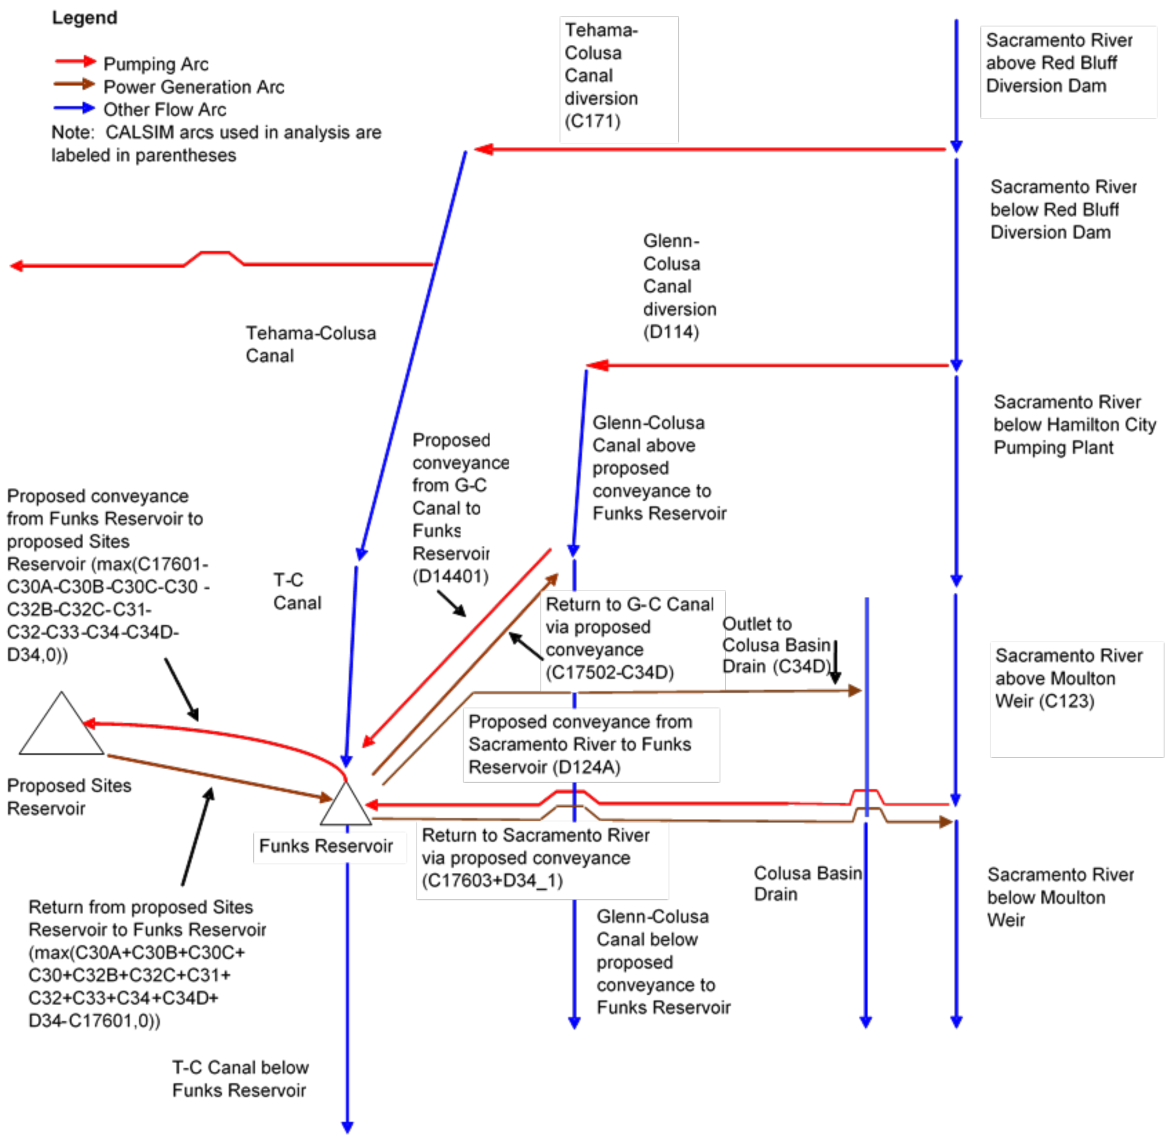
Flow and storage levels used in the power analysis tool are taken from CALSIM II studies. The analysis period is for 82 years, based on the projected level hydrologic and land use assumptions associated with the CALSIM II analysis used.

Figure 1 shows pumping and power generation facilities that are included in the power analysis tool (CALSIM II output parameter names are included in the figure).

A total of five pumping facilities and three generation facilities are included in the analysis.

- Pumping facilities:
    - Sacramento River diversion to Tehama-Colusa Canal (existing pumping facility)
    - Sacramento River diversion to Glenn-Colusa Canal (existing pumping facility)
    - Conveyance from Glenn-Colusa Canal Terminal Regulating Reservoir to Funks Reservoir (proposed conveyance with pumping facilities)
    - Conveyance from Sacramento River to Funks Reservoir (proposed conveyance with pumping facilities)
    - Conveyance from Funks Reservoir to Sites Reservoir (proposed conveyance with pumping facilities)

FIGURE 1
Facilities Included in the Sites Reservoir Power Analysis



Generation facilities:

- Conveyance from Sites Reservoir to Funks Reservoir (proposed conveyance with power generation facilities)
- Conveyance from Funks Reservoir to the Sacramento River (proposed conveyance with power generation facilities)
- Conveyance from Funks Reservoir to Glenn-Colusa Canal Terminal Regulating Reservoir (proposed conveyance with power generation facilities)

Approach

This section documents the approach that is used to estimate energy use, generation, peaking power capacity, and transmission losses.

Energy Use at Pumping Facilities

The approach used to estimate energy use at pumping facilities assumes that pumping plant energy use is a function of flow and total head. Energy use is estimated using the following equation:

Energy Use (MWh) =

$$0.7457\frac{kW}{hp}*62.4\frac{lbs}{ft\text{^}3}*\frac{1MW}{1000kW}*\frac{1hp}{550\frac{lb*ft}{s}}*t\frac{hrs}{month}*\frac{1}{\eta}*\text{head}(ft)*\text{Q}\frac{ft\text{^}3}{s}$$

The tool also estimates whether user-defined off-peak energy use targets can be met. For example, if it is desired that 90% of required pumping energy use during a particular month occur during off-peak hours, the tool determines whether this is feasible given power and flow capacity limits.

Energy Generation

The approach used to estimate energy generation at power facilities assumes that power plant generation is a function of flow and total head. Energy generation is estimated using the following equation:

Energy Generation (MWh) =

$$0.7457\frac{kW}{hp}*62.4\frac{lbs}{ft\text{^}3}*\frac{1MW}{1000kW}*\frac{1hp}{550\frac{lb*ft}{s}}*t\frac{hrs}{month}*\eta*\text{head}(ft)*\text{Q}\frac{ft\text{^}3}{s}$$

Power Capacity

The approach used to estimate power capacity assumes that peak capacity is a function of total head and average power plant flow. Power capacity is estimated using the following equation:

Power Capacity (MW) =

$$0.7457\frac{kW}{hp}*62.4\frac{lbs}{ft\text{^}3}*\frac{1MW}{1000kW}*\frac{1hp}{550\frac{lb*ft}{s}}*\eta*\text{head}(ft)*$$

$$\text{Avg. power plant flow rate}(\frac{ft\text{^}3}{s})$$

The above approach may underestimate peak power capacity. The approach uses average monthly power plant flows, while generation facilities may release at levels considerable higher than average monthly flows during peak demand periods. This approach should be revised if the use of average monthly flows is determined to be too conservative.

Transmission Losses

Transmission losses are estimated to estimate energy use and generation at load center. Transmission losses are estimated as a percentage of energy use or generation.

Economic Benefits and Costs

The economic benefits and costs of power generation and use at each facility is estimated using year 2025 forecasted monthly on-peak and off-peak power prices for Northern California.

Assumptions

Tables 1-A through 1-E list assumptions that are used to estimate energy use and transmission losses at proposed Sites Reservoir pumping facilities.

Tables 2-A through 2-C list assumptions that are used to estimate energy generation, power capacity, and transmission losses at proposed Sites Reservoir generation facilities.

Table 3 shows the 2025 forecasted on-peak and off-peak power prices that are used to estimate economic costs and benefits.

Economic Modeling

Economic Modeling of the Sites Reservoir Project

This attachment includes the assumptions and approaches used to estimate hydropower benefits from the Sites Reservoir Project. The California Water Commission (CWC) requirements and recommendations for water supply and Hydropower benefits estimation provided in the Technical Reference document are incorporated and detailed in this document. Section 1 covers two approaches that provide M&I water supply benefits at 2030 and 2070 conditions in average annual value (2015 dollars):

1. Unit Value Approach using California Water Commission (CWC) provided $/Acre-Foot benefit of water supply cited in the Technical Reference Document
2. Economic Model Approach:
    a. M&I Water Supply: California Water Economics Spreadsheet Tool (CWEST)
    b. Agricultural Water Supply: Statewide Agricultural Production Model (SWAP)

Section 2 covers the estimation of hydropower benefits and conveyance costs using Long Term Generation (LTGen), State Water Project (SWP) Power, and North of Delta Off-Stream Storage (NODOS) Power.

Section 3 provides additional comments on the CWC Water Storage Investment Program (WSIP) Technical Reference document (CWC, 2016).

Section 1. Water Supply Benefits Estimation

Quantifying Private Water Availability and Uses

Sites Project Participants are both agricultural (Ag) and municipal and industrial (M&I) agencies. Table X1 provides a list of Sites Project Participants and beneficial use of Sites water supply. Figure X1 maps the location of the Sites Project Participants.

Table X1. Sites Project Participants (Ag/M&I)

Sacramento Valley Sites Project Participants (Ag)	
Colusa County	Glenn-Colusa Irrigation District
Colusa County Water District	Orland-Artois Water District
Cortina Water District	Proberta Water District
Davis Water District	Reclamation District 108

Wheeler Ridge-Maricopa Water Storage District	

Figure X1 Sites Project Participants

The WSIP 2030 and 2070 without Project CALSIM II model runs were compared to the WSIP 2030 and 2070 with Project CALSIM II model runs to quantify the annual deliveries to Sites Project Participants. Table X2 provides the annual delivery by water year type and long-term average that were used in the water supply and hydropower benefit estimation. Delivery is the calculated quantity at the location of each Sites Project Participant after accounting for conveyance losses, consistent with section 4.12.3 Location at Which Supply is Measured of the CWC Technical Reference document (CWC, 2016).

Table X2. Delivery[1] by Water Year Types[2] (TAF/year)

	Year of Analysis - 2030	Year of Analysis -2070

Approach 1 Unit Values Estimation

Approach 1 applies a dollar value per acre-foot ($/AF) values for water by region, water year type, and future condition. Table D-6 "Unit Values of Water for WSIP, by Year Type, Future Condition, and Region" of the WSIP Technical Reference (CWC, 2016) unit values were applied to deliveries by region and water year type for 2030 and 2070 conditions. Conveyance costs were included in the benefit calculation. For more information on estimated conveyance costs, see Section 2 Hydropower and Conveyance Cost Estimation.

Approach 2 Economics Models

M&I Water Supply Benefit: CWEST

CWEST was developed for the US Bureau of Reclamation's Coordinated Long Term Operation of the Central Valley Project and State Water Project Environmental Impact Statement (LTO EIS) Environmental Consequences analysis. Appendix 19A of the LTO EIS details the history, methodology, and assumptions (Reclamation, 2015). CWEST was selected to estimate M&I water supply benefits in the WSIP application through the list of criteria in Technical Reference document Section 4.12 Water Supply Analysis (CWC, 2016). CWEST was updated for the Sites WSIP analysis to evaluate nine M&I Sites Project Participants. The updates to CWEST include 2030 and 2070 analysis using 2015 UWMP data, inclusion of only Sites Project Participants, and all relevant assumptions outlined in the CWC Technical Reference document.

Methodology

CWEST quantifies M&I water supply benefit by simulating the decisions made at the district or agency level. The model's objective is to select each Sites Project Participant's set of management actions that meet the annual water demand at the lowest cost. The difference in cost between the water supply conditions with and without Sites delivery provides the M&I water supply benefit.

Data Update for Prop 1 WSIP Application

The major update to CWEST was removing non- Sites Project Participants from the model and including any Sites Project Participants that were not including in the existing version on the model. CWEST updates for the WSIP application allows for analysis at 2030 and 2070 and is in 2015 dollars. The main data source for the update was individual Sites Project Participants Urban Water Management Plans (UWMPs). Table X3 lists the major model updates relevant Technical Reference document requirements and data sources.

Table X3. CWEST Key Assumptions, Updates, and Sources

Variables	Notes	Sources
Retail Water Price	Retail water prices are in 2015 dollars and were provided by the Raftelis 2015 California-Nevada Water and Wastewater Rate Survey. For Sites Project Participants not included in this study, retail water rates were gathered from individual Site Project Participant documents. Retail water prices were escalated to 2030 based on a retail water price escalation within CWEST (USBR, 2015).	(American Canyon, 2017), (AVEK, 2015), (City of Banning, 2010), (Desert Water Agency, 2017), (Raftelis, 2015), (USBR, 2015)
Conveyance Costs	Conveyance Costs calculations are described in Section 2	
Groundwater Pumping Costs	The existing CWEST Groundwater pumping cost estimates (USBR, 2015) are applicable to only Sites Project Participants with groundwater as a supply in their 2015 UWMP. The cost ($/AF) is the sum of a representative cost by region plus a groundwater replenishment charge assumed to be the same as the conveyance cost. Inclusion of the groundwater replenishment charge is consistent with Section 5.4.1.1 of the Technical reference document.	(USBR, 2015), UWMPs for each Sites Project Participant (See reference list)
Shortage Cost	The default M&I demand elasticity in CWEST is -0.1 as published in the LTO EIS (USBR, 2015) and is determined applicable for the WSIP application. In CWEST, long-term conservation is a decision variable for M&I Sites Project Participants. With adoption of additional long-term conservation by Sites Project Participants in our analysis, a shortage caused welfare loss needs to be measured under this heightened level of conservation. The CWEST update for the WSIP application relies on 2030	(USBR, 2015), (MCubed and RMann, 2016)

Table X3. CWEST Key Assumptions, Updates, and Sources		
Variables	**Notes**	**Sources**
	conservation and demand levels for the nine M&I Sites Project Participants provided in their 2015 UWMPs. Calculating welfare loss at a level of conservation greater than the UWMP stated conservation and demand levels supports the use of a more inelastic response. The default M&I demand elasticity in CWEST results in a welfare loss per AF similar in magnitude to the values provided in previous studies. Across the nine M&I Sites Project Participants, 2030 welfare loss per AF is in a range of $300 to $2,300 with an average value of $1,100 per AF. MCubed and RMann Economics, 2016 study calculated welfare loss per AF across California in a range of $500 to $2,600 with an average value of $1,500 per AF. Therefore, the use of the default M&I demand elasticity in CWEST is reasonable.	
Transfer Quantities and Costs	Annual transfers were available for the Sites Project Participants with transfers as a 2030 supply in their UWMP. The stated quantity is the annual limit for below normal or above or dry/critical water year types if that information was available. The $/AF cost of transfer water is based on the Technical Reference document provided unit values by region and water year type plus the conveyance charge.	(CWC, 2016), UWMPs for each Sites Project Participant (See reference list)
2030, 2070 Water Demands	2030 water demands were gathered from 2015 UWMPs. 2070 followed Technical reference document provided methods in section 2.7.1 Future Population Levels and Section 2.7.3 Future M&I Water Demand Levels using Department of Finance population projections and gallons per capita per day estimates from 2015 UWMPs	Technical Reference document (CWC, 2016) section 2.7.1 Future Population Levels method using Department of Finance population projects and UWMPs for each Sites Project Participant (See reference list)
2030, 2070 Water Supplies	2030 water supply data for preliminary Sites M&I participants was gathered from 2015 UWMPs. 2030 water supplies were held consistent through 2070, with no modifications based on future climate, environmental, or physical conditions due to data availability.	UWMPs for each Sites Project Participant (See reference list)
Alternative Supply Costs	Alternative Supply costs and available quantities were extrapolated from LCPSIM v97 input values. The four categories of alternative supply costs are: Indoor Conservation, Outdoor Conservation, Recycling, and Desalination. Costs were converted to 2015 dollars and escalated to 2024 based on the Technical Reference document section 5.2.7 Real	(DWR, 2010)

Table X3. CWEST Key Assumptions, Updates, and Sources		
Variables	**Notes**	**Sources**
	Energy Price Escalation.	
Accounting for Potential Reuse	Section 4.12.7 Accounting for Potential Reuse discusses reuse of new supply. This analysis does not include additional benefit from the reuse of Sites deliveries	

Other Relevant Information

M&I groundwater pumping is modeled in CWEST for Sites Project Participants if their 2015 UWMP includes groundwater as a water supply in 2030. M&I groundwater pumping is used to meet annual demand under variable surface water deliveries. When available, annual put and take limits, storage capacity, losses, and pumping costs are modeled in CWEST as managed storage facilities. Otherwise, the UWMP stated 2030 groundwater pumping quantity constrains the maximum annual pumping quantity. For more information on groundwater in CWEST see Reclamation, 2015. Potential SGMA pumping limits were not incorporated into 2030 or 2070 conditions due to data availability. M&I groundwater basins are generally adjudicated or not identified as medium to high priority. Therefore, groundwater use stated in UWMPs is likely to be consistent with future Groundwater Sustainability Plans. Nevertheless, CWEST does not allow annual groundwater pumping to exceed UWMP stated 2030 quantities, annual take limits, or cumulative take greater than the UWMP stated groundwater storage capacity.

The distinction between wholesale and retail electricity prices is relevant to private water supply and hydropower benefits estimation. The Technical Reference document did not make this distinction in section 5.2.7 Real Energy Prices for Future Project Costs. For the Hydropower benefits estimation, proprietary wholesale electricity prices were used. In the M&I water supply benefits estimation, the Technical Reference document provided escalation rates to 2024 were used where applicable. This included the escalation of alternative supply costs and groundwater pumping costs. Retail water price escalation used a retail water price escalation to 2030. Following the Technical Reference document section 5.2.7, 2024 or 2030 were held constant thereafter for the 2070 analysis.

Agricultural Water Supply Benefit: SWAP

The CWC provided a SWAP model to estimate the benefit to ag Sites Project Participants. This CWC version of SWAP was applied to ensure consistency between the Sites agricultural benefit analysis and the CWC unit value analysis (CWC, 2016).

Methodology

See *Statewide Agricultural Production (SWAP) Model Update and Application to Federal Feasibility Analysis* (Reclamation, 2012) for a comprehensive report on the SWAP model.

Data Update for Prop 1 WSIP Application

The Sites SWAP analysis used the CWC provided SWAP model without any modifications to the model code or baseline data.

Section 2. Hydropower and Conveyance Cost Estimation

Methodology

Hydropower benefits estimation follows the requirements of section 4.13 Hydropower Analysis in the Technical Reference document (CWC, 2016). Pumping costs and generation revenue for all major SWP, CVP, and Sites facilities is calculated based on three hydropower models: SWP Power, LTgen, and NODOS Power, respectively. SWP Power and LTgen are publicly available models and are referenced in Section 4.13.3.1 Energy Generation of the CWC Technical Reference document (CWC, 2016).

Data Update for Prop 1 WSIP Application

Electricity prices provided by CA DWR in an email correspondence were used to updated all three of the hydropower models. The DWR provided data is proprietary and will not be published in this documentation. The 2030 NP-15 wholesale electricity prices were used in both 2030 and 2070 conditions. Forecasts are not available for 2070 and per the direction of the CWC Technical Reference document, 2030 prices were applied to the 2070 analysis. No changes were made to SWP Power and LTgen from the Sites EIR/EIS or feasibility study. NODOS power was updated to be consistent with the project proposal.

Conveyance Cost Estimation

Technical Reference document Section 6.5.1 requires all water "be assigned a water delivery cost per acre-foot be based on variable costs" (CWC, 2016). Conveyance costs for each Sites Project Participant were twofold – A north of delta operations power cost plus the conveyance charge to respective location and delivery quantity after conveyance losses.

1. North of Delta Operations Hydropower Cost: A $/AF north of delta operations hydropower cost was calculated by dividing the total long-term average annual net costs north of delta by the total long-term average annual AF through Holthouse. Annual net cost is the total hydropower generation revenue minus the total pumping costs over one year. The water balance accounting at Holthouse can be used to allocate the north of delta operations hydropower cost across the private and public accounts. The net north of delta operations hydropower cost includes Sites net pumping/generation costs and any other with-project effects measured in other north of delta facilities. The SWP/CVP facilities included in the calculation had net effects measured between the No Action and With-Project CALSIM runs. The effects on these facilities were generally reductions in pumping costs or increases in generation revenue. The net north of delta operations hydropower cost was calculated at $16/AF.

2. A unique $/AF conveyance cost for each Sites Project Participant is added to the $16/AF cost from #1. The unique $/AF conveyance cost is the sum of representative unit costs of facilities (pumping and generation) used to get the delivered water to each Site Project Participant location. The unit cost for each facility was calculated from LTgen and SWP power model analyzed with the WSIP 2030 and 2070 with Project CALSIM II runs. This $/AF was applied to the delivered water to estimate the total hydropower cost. The calculated conveyance costs are similar to the SWP conveyance charges provided in Bulletin 132-10 (DWR, 2013).

Section 3. Additional Comments on Private Water Supply Benefit and Hydropower Costs Estimation

Comments	
2030 and 2070 With and Without-project Future Conditions for M&I, Ag, and Hydropower benefits estimation	2030 and 2070 With and without-project future conditions are identical in these benefit estimation categories. With and without-project hydrology is the only difference in future conditions. Future hydrology used in these analyses were the CWC provided WSIP 2030 without Project CALSIM II modelling runs were compared to the Sites WSIP 2030 with Project modelling runs.
Consistency with existing Sites Feasibility study and EIR/EIS for M&I benefits estimation	The M&I benefits estimation in the Feasibility Study and EIR/EIS use LCPSIM and OMWEM. Due to the difference in participant beneficiaries in the WSIP application, CWEST was determined to be a more suitable model. The evaluation methods of M&I benefits in CWEST is generally consistent with LCPSIM and OMWEM
Consistency with existing Sites Feasibility study and EIR/EIS for Ag benefits estimation	The Ag benefits estimation in the Feasibility Study and EIR/EIS use SWAP, albeit a previous version. Due to the availability of a newer version through the CWC for the WSIP application, the CWC model was selected to evaluate ag benefits in the WSIP application. In addition, use of the CWC SWAP model in the Sites WSIP application provides consistent analysis with the CWC unit values estimation in the Technical Reference document.
Consistency with existing Sites Feasibility study and EIR/EIS for Hyrdopower benefits estimation	The Hydropower benefits estimation in the Feasibility Study and EIR/EIS use LTgen, SWP power, and NODOS power models, albeit with different future wholesale electricity prices. Due to the availability of a newer forecasted future wholesale electricity prices, these models were updated for the WSIP application.

Folsom Reservoir
CE-QUAL-W2 Temperature Model

Folsom Reservoir CE-QUAL-W2 Temperature Modeling

This attachment discusses the CE-QUAL-W2 water temperature modeling tool (PCWA 2015), which was applied to evaluate temperature benefits on the American River. The model was developed for Placer County Water Agency's (PCWA) American River Water Rights Extension (ARWRE) Project (PCWA 2015).

CE-QUAL-W2 Overview

The CE-QUAL-W2 model was developed to test the ability of alternative hydrology and reservoir operations scenarios to meet regulatory water temperature requirements (or targets if the requirement cannot be met) in the lower American River at Watt Avenue. The water temperature targets are based on the Automated Temperature Selection Procedure (ATSP) schedules developed as part of the Water Forum Flow Management Standard (FMS). The primary water temperature management objective for the lower American River is to meet the best possible temperature schedule each year for Central Valley steelhead (summer rearing) and fall-run Chinook salmon spawning (fall months) given Folsom Reservoir inflows, available reservoir volume, and Folsom Reservoir outflows. The model simulates temperatures in Folsom Lake and temperatures on the American River downstream of Folsom to the confluence with the Sacramento River. The model has the capability of simulating the City of Folsom Temperature Control Device and the Folsom Dam Shutters For planning analyses, the CE-QUAL-W2 temperature model represents the best available planning model for the American River.

Similar to the Sacramento River HEC5Q model, the input climate data to the CE-QUAL-W2 model was updated to incorporate the WSIP 2030 and 2070 climate scenarios. The process for updating climate in the CE-QUAL-W2 model was different than the climate updates that were performed for HEC5Q.

The CE-QUAL-W2 model uses climate data based on the Folsom/Fair Oaks CIMIS station. As described in the HEC5Q climate updates section, the WSIP climate change data is based on grid cells and the closest grid cell to the Folsom/Fair Oaks CIMIS station was 38.65625 degrees latitude and -121.15625 degrees longitude. Climate data for 1995, 2030, and 2070 were downloaded from the data file corresponding to that grid cell. The monthly average air temperature was then calculated by summing the min and max air temperature and dividing by two. The difference between the 1995 average air temperature and the 2030 and 2070 air temperatures was then calculated. The air temperature difference calculated was then added to the original hourly climate data of the model. The difference was added at the midpoint of each month and then difference to each subsequent hour was added based on linear interpolation between the midpoints of each month. For instance, if the difference for June was 2 degrees and for July was 3 degrees, the difference for 6/25 was interpolated between 6/15 and 7/15. In addition to updating the air temperature, the relative humidity was also adjusted using a formula that links air temperature, dew point, and relative humidity based on the adjusted 2030 and 2070 air temperatures.

Table 1. Estimated Annual Recreation Visitation at Sites by Primary Activity.. 4

Acronyms and Abbreviations

NODOS	North-of-the-Delta Offstream Storage
USBR	U.S. Bureau of Reclamation

Introduction

Recreation benefits are informed in part with visitor use projections for the recreational areas planned for the Sites Project (i.e., Stone Corral, Peninsula Hills). Annual visitation was estimated using a comparable demand and/or facilities-based estimation approach that accounts for Sites planned facilities, carrying capacity, the regional population of potential users, surface acreage of the reservoir and fluctuations in storage throughout the year, as well as the amenities and visitation levels of substitute reservoirs in the region. Additional information and recreation analysis is available in Appendix C of the North-of-the-Delta Offstream Storage (NODOS) Draft Feasibility Study (USBR 2017). These variables for consideration are consistent with those outlined in the WSIP Technical Reference (TR Section 5.4.5). Annual visitation was calculated as a measure of total visitor days, which represents one person visiting for any part or all of a calendar day. This metric is commonly used to inform recreational benefits, and should not be confused with a recreational visit, which could last for more than one calendar day (e.g., camping).

Visitation projections for Sites, including proportion of visitor use by primary activity type were informed with previous planning estimates (CALFED 2000) and subsequent collaboration with the U.S. Bureau of Reclamation (USBR 2006 & 2017). The visitation estimates draw upon recreational assessments of regional reservoirs using a comparable demand and/or facilities-based estimation approach; these techniques are founded on the assumption that use at a new reservoir would be similar to use at an existing reservoir that is nearby and hosts similar types and levels of amenities.

Black Butte Reservoir is considered the most similar nearby reservoir to the planned Sites project to form a comparable attendance estimate. To estimate the number of visitors by type of primary activity at Sites, historical visitation estimates tallied from traffic counters and assumptions on the number of persons per vehicle were applied to data from a visitor characteristic survey at Black Butte. Initial estimates of approximately 400,000 annual recreation user days for Sites were conservatively scaled down to a *maximum* of 200,000 annual visitor days. This downward adjustment was made in response to ongoing conversations with the Bureau of Reclamation and other project partners as well as additional refinements to Sites planned recreational facilities. In addition, the 200,000 annual visitor days were further adjusted to account for operations that would reduce the reservoir’s surface area available to visitors during the peak recreation months, resulting in an annual estimate of approximately 187,000 visitor days.

The table below illustrates the estimated annual attendance at Sites by primary activity type. As discussed, the breakdowns by activity type follow typical patterns of recreational activity in the region and have been matched with planned recreational facilities to ensure that the projected recreational use could be supported at Sites. Appendix E of the NODOS Draft Feasibility Study (USBR 2017) provides a more detailed discussion of the recreation facilities currently planned and budgeted for development at Sites.

Table 1. Estimated Annual Recreation Visitation at Sites by Primary Activity

Activities	Annual Visitor Days	Percent of Total
Shore fishing	16,254	8.7%
Boat fishing	8,407	4.5%
Picnicking	17,188	9.2%
Camping	27,514	14.7%
Sightseeing	36,992	19.8%
Swimming / beach use	40,492	21.7%
Walking	5,418	2.9%
Bicycling/Motorcycling	2,429	1.3%
Off-road vehicle	187	0.1%
Horseback riding	747	0.4%
Boating / water-skiing	29,145	15.6%
Hunting	560	0.3%
Other	1,495	0.8%
Total	**186,829**	**100%**

Early Funding Tab

Attachment A1: Scope of Work

Attach a schedule, scope of work, and budget.

Keep in mind that the applicant must provide a 50 percent cost share and reimbursable costs can only go back to November 4, 2014.

Scope of work must include an explanation of why early funding is critical to the project, the viability of the project in the absence of this funding and how the project will proceed once early funding is expended.

The scope of work cannot include work performed prior to submittal of the application.

The tasks in the schedule, scope of work and budget should match.

CEQA	California Environmental Quality Act
EIR	Environmental Impact Report
EIS	Environmental Impact Statement
NEPA	National Environmental Policy Act

Introduction

The primary activities requiring early funding to support implementation of the Sites Reservoir Project (Project) are associated with federal, state, and local environmental compliance and approvals. The Authority and Reclamation will be releasing the joint public draft Environmental Impact Report/ Environmental Impact Statement (EIR/EIS) in August 2017. In addition to needing to complete the final EIR/EIS and related decision documents per the California Environmental Quality Act (CEQA) and National Environmental Policy Act (NEPA), several permits and authorizations will be required prior to Project construction. Many of these permit applications require a sufficient level of engineering design, field surveys (some multiple year), public review, and agency input and review to obtain which can in many cases require multiple years to complete. As such, multiple activities need to be initiated to maintain project schedules including continued engineering design to finalize all facility locations, permit application development and required surveys, and review of anticipated impacts and proposed/required impacts minimization and mitigation measures.

Early and consistent coordination with federal, state, and local permitting entities throughout the permitting process will be critical to successful project implementation. Anticipated permits and authorizations are identified below, as well as anticipated level of effort to obtain each approval. Given the scale of the proposed project, the effort anticipated to obtain all permits will be substantial and is proposed to continue to be in part funded by Project participants, as well as the State given the projected benefits to the State that will be provided by the Project. Early funding from the State to support the approval acquisition effort is critical to ensure all approvals are obtained in a timely manner to meet the required project implementation schedule.

Acquisition of Required Permits and Authorizations

A variety of federal, state, and local agencies permits and approvals will be required to allow for Project implementation, including approvals under the federal and California Endangered Species Acts, issuance of permits under the Clean Water Act, and agency approvals under other federal, state, and local laws and regulations. Table A1-1 identifies the approvals/jurisdiction and authorizations that are anticipated for the Project.

Table A1-1. Primary Anticipated Permits, Approvals, and Authorizations for the Sites Reservoir Project

Jurisdiction	Responsibility
Federal Agency Permits, Approvals, and Authorizations	
United States Department of the Interior, Bureau of Reclamation	• Complete Final EIS) and issue the Record of Decision (ROD) as the representative NEPA lead agency for the Department of the Interior. • Prepare and submit biological assessment to U.S. Fish and Wildlife Service (USFWS) and National Marine Fisheries Service (NMFS) for consideration of issuance of biological opinions • National Historic Preservation Act of 1966, Sections 106 and 110 • American Indian Religious Freedom Act • Native American Graves Protection and Repatriation Act
United States Department of the Interior, USFWS	• Issue biological opinion to Reclamation in accordance with ESA Section 7 consultation and incidental take authorization • Determine compliance with the following legislation: – Fish and Wildlife Coordination Act – Bald and Golden Eagle Protection Act – Migratory Bird Treaty Act – Wild and Scenic Rivers Act
National Oceanic and Atmospheric Administration, NMFS	• Issue a biological opinion to Reclamation in accordance with Endangered Species Act (ESA) Section 7 consultation and incidental take authorization • Determine compliance with the following legislation: – Fish and Wildlife Coordination Act – Magnuson-Stevens Fishery Conservation and Management Act
United States Army Corps of Engineers (USACE)	• Issue permits and approvals related to the following legislation and Executive Order: – Rivers and Harbors Act Section 9 (construction of dikes), Section 10 (alteration of navigable waters), and Section 408 (levee modification) – Clean Water Act Section 404 (discharge of dredge/fill) permitting and Section 401 water quality certification – Emergency Flood Control Fund Act of 1955 – Executive Order 11988 (floodplain management) – Executive Order 11990 (protection of wetlands)
United States Environmental Protection Agency (USEPA)	• Provide compliance with the following legislation (and through agreements with the State of California to implement requirements through CalEPA associated with air quality): – Clean Water Act in coordination with USACE (including evaluation of Least Environmentally Damaging Practicable Alternative [LEDPA]) – Spill Prevention Control and Countermeasures Plan (SPCCP) developed in accordance with 40 Code of Federal Regulations (CFR) 112 – Clean Air Act and State Implementation Plan, including the National Ambient Air Quality Standards (NAAQS), as well as Section 309 evaluation of draft EIS – Safe Drinking Water Act
Federal Energy Regulating Commission (FERC)	• Potentially provide a license for the Project hydropower component
State Agency Permits, Approvals, and Authorizations	
California Air Resources Board	• Administer the air quality policy to achieve the California Ambient Air Quality Standards (including the NAAQS for USEPA) and State Air Quality Designations

Jurisdiction	Responsibility
California Department of Boating and Waterways	• California Harbors and Navigation Code compliance
California Department of Fish and Wildlife	• Lake and Streambed Alteration Agreement permitting (pursuant to Section 1602 of the California Fish and Game Code) • Compliance with Fish and Game Code related to fully protected species, birds of prey, native plant protection, invasive species, sufficient fisheries flows below dams, and fish screening • California Endangered Species Act consultation and incidental take authorization (Section 2081) • California Native Plant Protection Act • Salmon, Steelhead Trout, and Anadromous Fisheries Program Act • Marine Invasive Species Act
California Department of Toxic Substances Control	• Compliance with generation, transportation, treatment, storage, and disposal of hazardous waste regulations
California Department of Transportation	• Issuance of encroachment/transportation in coordination with the Federal Highway Administration for federal highways • Approval of transportation management plans
California Office of Historic Preservation	• Coordinate with implementation of the California Register of Historical Resources under CEQA • Coordinate with federal agencies implementation of National Historic Preservation Act Section 106 consultation
California State Lands Commission (CSLC)	• Issue leases for work in areas under CSLC jurisdiction (e.g., along Sacramento River)
California State Water Resources Control Board	• Issue water rights • Administer Clean Water Act for USEPA in coordination with Central Valley Regional Water Quality Board (CVRWQCB)
California Department of Water Resources, Division of Safety of Dams	• Approval of plans and specifications for the construction or enlargement of a dam or reservoir
Central Valley Regional Water Quality Control Board	• Clean Water Act Section 401 certification Clean Water Act Section 402 National Pollutant Discharge Elimination System (NPDES) permitting (including requirements for construction Stormwater Pollution Prevention Plan [SWPPP])
Central Valley Flood Protection Board	• Responsible for controlling flooding along the Sacramento and San Joaquin rivers and their tributaries in cooperation with USACE • Maintain integrity of existing flood control system/designated floodways through permits for encroachments
Native American Heritage Commission	• Identify sacred sites and Most Likely Descendants for Native American burials and provision of Native American contact information
Regional and Local Agency Permits, Approvals, and Authorizations	
Colusa, Glenn, and Tehama Counties	
Planning Departments	• Issuance of Conditional Use Permit • Rezoning of parcels in both counties • Conformance with State Surface Mining and Reclamation Act (SMARA) permitting or exemption if borrow is required from borrow site(s) not previously permitted • Conformance with CEQA environmental review requirements

Jurisdiction	Responsibility
Engineering and Surveying Services Departments	• Plan approval for county road or bridge crossings at creeks or grading for structures drainage plan; and grading permit • Erosion control plan development and permitting • Building and electrical permitting • Development of blasting plan for foundation/roadway installation
Environmental Health Services Departments	• Septic and water system permitting, including well installations
Roads Departments	• Encroachment permitting • Construction traffic control plan development for county roads • Assessment of fees for increases in peak-hour trips, if required • Heavy haul permitting • Roadway damage and repair bonds
Fire Departments	• Permitting for the use and storage of hazardous and flammable materials/wastes • Hazardous materials business plan development • Fire protection plan development
Colusa County APCD and Glenn County APCD	• Administer local air quality plans and coordinate with the California Air Resources Board

Notes:
APCD = Air Pollution Control District
CalEPA = California Environmental Protection Agency
CFR = Code of Federal Regulations
CSLC = California State Lands Commission
CVRWQCB = Central Valley Regional Water Quality Control Board
FERC = Federal Energy Regulating Commission
EIS = Environmental Impact Statement
ESA = Endangered Species Act
LEDPA = Least Environmentally Damaging Practicable Alternative
NAAQS = National Ambient Air Quality Standard
NMFS = National Marine Fisheries Service
NPDES = National Pollutant Discharge Elimination System
ROD = Record of Decision
SMARA = Surface Mining and Reclamation Act
SPCCP = spill prevention control and countermeasure plan
SWPPP = stormwater pollution prevention plan
USACE = United States Army Corps of Engineers
USEPA = U.S. Environmental Protection Agency
USFWS = U.S. Fish and Wildlife Service

The final EIR/EIS (FEIR/EIS), when finalized, will be used by the Authority and Reclamation when considering approval of the Project. All cooperating agencies and other federal, State, and local agencies with permitting or approval authority over any aspect of the proposed Project are expected to use the information contained in the FEIR/EIS to meet most, if not all, of their information needs to make decisions and/or issue permits.

Acquisition of the permits and approvals identified above in Table A1-1 above and by permits/anticipated level of effort/cost in Table A1-2 will require a variety of activities (depending on permit/approval) including:

- Initial project meetings and application review and input
- Interagency and lead permitting agency coordination and negotiation
- Field reviews (including resource delineations), evaluations, data collection and evaluation

- Biological resource surveys
- Application preparation and refinement
- GIS-based mapping
- Project facility pre-design and design
- Mitigation refinement and identification
- Hydraulic evaluation

Table A1-2 identifies the primary federal, state, and local permits and approvals and key activities anticipated associated with each. Anticipated level of effort/cost varies depending on the application requirements, necessary surveys and/or design evaluations/studies, and coordination. Level of effort and time required can vary substantially depending on agency jurisdiction, concerns, and policy. Costs for permit acquisition could in turn vary based on these factors and related agency information and survey/engineering information requests. As shown on Table A1-2, the anticipated required actions, documentation, and surveys (as appropriate) for each permit/approval are identified as separate tasks. Tasks include:

Permit Application and Fee

This task will include all activities required to develop the actual permit applications including specific information required by a given agency according to their jurisdiction. This task will also include the required filing and processing fees.

Project Description, Design Drawings, Maps and Figures

Activities under this task will include development of the overall project description specific to a given permit application and agency jurisdiction, as well as specifically required design drawings, maps, and figures. It is the Authority's intent to develop a generalized detailed project description (which will be in part taken from the EIR/EIS) as a "template" that will be used for all applications and amended/revised as necessary to eliminate redundant effort and make the most efficient use of Project funds. Specific information and/or drawings will be included as required by a given agency.

Surveys and Resources Reports

Required field reviews, surveys per specific agency protocols (e.g., wetland delineations per USACE requirements), and associated resource reports will be prepared as part of this task. Such surveys will be conducted in close coordination with the appropriate agency(s) and will be structured to address as many separate agency protocols and/or specific concerns as possible to minimize the need for additional field review and surveys. Similarly, resource reports indicating likely/observed species presence will be prepared, and will include all species and habitat observed, and acreage of impact anticipated to be impacted (temporary and permanent). Proposed minimization and mitigation measures including construction timing (both seasonal and time of day) as appropriate based on specific agency requirements and mitigation ratios will be identified.

Pre-application Meeting Coordination, Preparation, and Participation; Follow-up Requests and On-going Communication

This task will include all required coordination effort from the initial pre-application meeting to all meetings (including phone/on-line sessions) required during the review of the specific permit applications to support obtaining final approvals. This task will also include anticipated additional information development and clarification of project activities, operations, and potential impacts within the context of a given agency's jurisdiction.

Anticipated Field Evaluations Requiring Substantial Level of Effort

Among the primary activities required to gain a required approval is the necessary field excavation and evaluation to support the implementation of the anticipated activities likely to be specified by the Programmatic Agreement required per Section 106 of the National Historic Preservation Act. Table A1-2 identifies the level of effort/cost anticipated to conduct anticipated excavations/evaluations that will likely be required prior to initiation of construction within the entire project area. In addition, completing the necessary activities to support the federal and state ESA consultation process will require extensive coordination, review, studies, and mitigation plan development as indicated in Table A1-2. The potential for discovery of significant resources or sites during construction is addressed separately as part of the mitigation costs assumed as part of overall project implementation.

Anticipated Permit Application Preparation/Acquisition Schedule

Preparation of permit applications will occur concurrently with Project design. Those applications requiring sufficient project details, such as the California Department of Water Resources, Division of Safety of Dams approval of plans and specifications for the construction or enlargement of a dam or reservoir and the Central Valley Flood Protection Board encroachment permit for the proposed Delevan diversion/discharge facility. Permit application development and negotiation/acquisition is anticipated to range from a few months to over two years depending on the need for design detail as well as required information development (including surveys for some approvals) for a given permit/approval. Permit application development is anticipated to range from one month to up to one year for more complex applications. Those processes which are anticipated to potentially require multiple years of surveys (e.g., Section 106 and Section 7/Bald Eagle Preservation Act approvals) would involve longer timeframes. Permits with longer lead times due to required design detail or anticipated negotiation complexity are anticipated to take up to 2 years+ and include:

- SWRCB Water Rights
- USACE Section 404/10 Permit (and involvement in LEDPA evaluation and Section 408 approval)
- DWR Division of Safety of Dams Approval
- USFWS/NMFS/Reclamation Section 7 Endangered Species Act (ESA) Consultation (including Bald Eagle Preservation Act approval)
- CDFW California Endangered Species Act (CESA) Consultation
- Federal Energy Regulatory Commission License
- Advisory Council on Historic Preservation/State Office of Historic Preservation/Reclamation Section 106 Compliance

Permits/approvals with shorter lead times are anticipated to be those required by local counties, as well as approvals required from Caltrans and the Air Resources Board (including county approvals). Table A1-3 shows the anticipated key milestones associated with the required permitting effort.

Completion of Final EIR/EIS

Completion of the EIR/EIS will require the review of and response to federal, state, local agency and public comments on the document, the development of final draft, and the development of the state Notice of Determination and federal Record of Decision. It is anticipated given the scale of the proposed project, a wide range of comments from a variety of stakeholders will likely be received, some of which will likely require additional evaluation (within the bounds of the analyses included within the public draft EIR/EIS including potentially further evaluation of the proposed WSIP project operational approach).

Key tasks will include:

- Continued project team meetings and coordination with project participants
- Comment review and categorization
- Development of thematic and master responses
- Evaluation and refinement of analysis as required by comments (including operations associated with the proposed project)
- Figure and graphics revisions
- Development of administrative, pre-release, and final EIR/EIS
- Development of Notice of Determination and Findings and assistance in preparation of Record of Decision

All written and oral comments received during the public draft EIR/EIS review period will be identified, compiled, and responded to as appropriate. Comments will be categorized by similar issue area and comments requiring individual responses identified, including where thematic responses are necessary to respond to over-arching comments (if determined necessary). Responses to each comment category will be prepared with public and agency comments and responses assembled into a package clearly defining each comment and the corresponding response. All commenters and comments will be indexed according to the categorization process and tracked accordingly. An administrative final EIR/EIS will be developed that will include findings and conclusions, revisions, and clarification to the public draft EIR/EIS, the public and agency's comments and corresponding responses, and other information that may be required to adequately present technical information and data. A pre-release final EIR/EIS will be prepared in response to Authority team and participant review which will be subsequently revised as necessary to allow for issuance of the final EIR/EIS. It is assumed that the final EIR/EIS will be prepared in an errata format to the Public Draft EIR/EIS. The document will be used to support (and will be appropriately referenced) in the development of the CEQA Notice of Determination, and Findings, as well as the NEPA Record of Decision. The anticipated level of effort is estimated to be approximately $3 million. Actual costs depend on comments, and will be less if comments are less extensive and complex than expected (or greater if a larger number of complex comments are received than expected).

Table A1-2. Applicable Federal, State, and Local Permits and Approvals and Estimated Costs

Agency	Type of Permit or Approval	Regulated Activity	Authority	Required Actions, Documentation, and Surveys	Total Level of Effort
Federal Agency Permits and Approvals					
U.S. Army Corps of Engineers	Department of the Army Permit (Section 404 and 10)	Discharge of dredged or fill material into waters of the U.S. (including wetlands) - Section 404; Construction of any structure in or over navigable waters of the U.S., the excavation/ dredging or deposition of material in these waters, or any obstruction or alteration in navigable water - Section 10	Section 404 Clean Water Act (33 U.S.C. 1344); Section 10 of the Rivers and Harbor Act (33 U.S.C. 403)	Section 404/10 Pre-Construction Notification application package	**$3,000,000**
				Project description; engineering design drawings; maps and figures	
				Aquatic resources (wetlands and waters of the U.S.) delineation, CRAM evaluation, and aquatic resources delineation report	
				Section 401 Water Quality Certification application package	
				Pre-application meeting coordination, preparation, and participation; follow-up and ongoing communication	
U.S. Army Corps of Engineers	Department of the Army Permit (Section 408)	Any proposed project that may affect any existing USACE (and/or State Plan of Flood Control levee in the Central Valley and Delta)	Section 408 of the Rivers and Harbors Act (33 U.S.C. 408)	Section 408 Permit application package	**$2,500,000**
				Project description; design drawings; maps and figures	
				Hydrologic and Hydraulics System Performance Analysis	
				Geotechnical Analysis	
				Pre-application meeting coordination, preparation, and participation; follow-up and ongoing communication	
				Sediment Transport Modeling & Bathymetric Surveys	
U.S. Army Corps of Engineers/U.S. Environmental Protection Agency	LEDPA review	Review of LEDPA for issuance of an Individual Permit (Section 404) if required. Project could be relieved of LEDPA analysis if water-dependent determination is upheld.	Section 404(b)(1)	Section 404(b)(1) application package	**$1,100,000**
				Project description; design drawings; maps and figures	
				Alternatives Analysis	
				Pre-application meeting coordination, preparation, and participation; follow-up and ongoing communication	
Advisory Council on Historic Preservation/ State Office of Historic Preservation	Section 106 Review and Compliance	Federal undertaking and as part of consideration of a Section 404 permit by USACE	NHPA (36 CFR 800)	Consultation meeting coordination, preparation, and participation; follow-up and ongoing communication (includes review of USBR-prepared programmatic agreement and research design)	**$40,000,000**
		Complete cultural resources inventory for archaeological and built environment resources	in support of Section 106 compliance (and state regs)	record search; complete field survey; DPRs; technical reports	
		Tribal member involvement (compensation)		Tribal review and input	

Agency	Type of Permit or Approval	Regulated Activity	Authority	Required Actions, Documentation, and Surveys	Total Level of Effort
		Tribal remains repatriation			
		Other human remains/cemetery treatment, fees, etc.			
		Evaluation of archeological and tribal cultural resources that must be addressed prior to construction (potentially NHRP-eligible resources); ethnographic studies		Evaluation excavations and ethnographic study for entire project area and proposed features	
Reclamation/ U.S. Fish and Wildlife Service/National Marine Fisheries Service	Section 7 Consultation	Required for all approvals and funding provided by Reclamation Federal undertaking and as part of consideration of a Section 404 permit by USACE Essential Fish Habitat under Magnuson-Stevens Fisheries Conservation and Management Act Fish and Wildlife Coordination Act, 16 USC 661-667e	16 U.S.C. 1531 et seq.: 50 CFR 17, Sections 17.94-17.96 ESA	Section 404 Permit application package Consultation meeting coordination, preparation, and participation; follow-up requests and ongoing communication; necessary surveys (in addition to those required by USACE 404/10 and CDFW 2081 approval processes) Aquatic studies to support consultation. BA development assistance	**$7,300,000**
U.S. Fish and Wildlife Service	Bald Eagle Protection Act (typically addressed through Section 7 consultation)	Federal undertaking potentially impacting bald or golden eagle	16 U.S.C. 668-668d, 54 Stat. 250	Consultation meeting coordination, preparation, and participation; follow-up requests and ongoing communication; necessary surveys Golden eagle satellite telemetry studies	**$1,000,000**
U.S. Coast Guard	Navigability determination	Determination if proposed activities potentially affect river navigation	33 CFR 2.40	Consultation meeting coordination, preparation, and participation; follow-up requests and ongoing communication	**$50,000**
Bureau of Reclamation	Warren Act Contract	Storage and transportation of non-CVP water supplies through CVP water facilities	42 CFR 523	Consultation meeting coordination, modeling, preparation, and participation; follow-up requests and ongoing communication	**$400,000**
Federal Energy Regulatory Commission	Hydropower License	Authorizes the construction and operation of a hydroelectric project for a term of up to 50 years	Federal Power Act – 16 U.S.C. 791(a)-825r	FERC Pre-Application Document FERC Hydropower License (ILP) application package Project description; design drawings; maps and figures Pre-application meeting coordination, preparation, and participation; follow-up requests and ongoing communication	**$8,000,000**

Agency	Type of Permit or Approval	Regulated Activity	Authority	Required Actions, Documentation, and Surveys	Total Level of Effort
State Agency Permits and Approvals					
California Department of Transportation	Encroachment Permits	Use of California rights-of-way for installation of pipelines along State freeways and roads	21 CCR 14.11.1–14.11.6	CalTrans Encroachment Permit application package and fee	**$400,000**
				Project description; design drawings; maps and figures	
				Biological resources reconnaissance survey and biological assessment	
				Aquatic resources (wetlands and waters of the U.S.) delineation and aquatic resources delineation report	
				Cultural resources literature search, pedestrian survey, and archaeological reconnaissance report	
				Pre-application meeting coordination, preparation, and participation; follow-up requests and ongoing communication	
California Department of Transportation	Transportation Permit	Transport of heavy or oversized loads on State roads during construction	California Vehicle Code Section 35780; California Streets and Highway Code 117, 660–711	CalTrans Annual Transportation Permit application package (9 required throughout duration of construction) and fee	**$250,000**
				Project description; design drawings; maps and figures	
				Pre-application meeting coordination, preparation, and participation; follow-up requests and ongoing communication	
California State Lands Commission	Land Use Lease	Placement of fill or structures in navigable waterways or Section 16 or 36 lands (Water intake structures are typically exempt from this process but outfall may require approval)	California Public Resources Code Section 6000 et. seq.	State Lands Commission Lease application package (including survey information) and fee	**$300,000**
				Project description; design drawings; maps and figures	
				Pre-application meeting coordination, preparation, and participation; follow-up requests and ongoing communication	
				Following acquisition of lease: as-built drawings; surveys; internal and external inspection program, including structural evaluation and integrity assessment.	
Central Valley Flood Protection Board	Encroachment Permit	Encroachment onto/through state flood control facilities.	23 CCR encroachment permit	CVFPB Encroachment Permit 3615 and 3615a application package (including required mapping and deeds) and fee	**$900,000**
				Project description; design drawings; maps and figures	
				Hydrologic and Hydraulics System Performance Analysis	
				Section 408 Permit application package	
				Local Maintaining Agency endorsement and concurrence with USACE	
				Pre-application meeting coordination, preparation, and participation; follow-up requests and ongoing communication	

Agency	Type of Permit or Approval	Regulated Activity	Authority	Required Actions, Documentation, and Surveys	Total Level of Effort
State Water Resources Control Board	Water Rights Permit	Diversion of water from existing streamflow	California Water Code § 5101	Water Rights Permit application package (including fee)	**$6,000,000**
				Water Availability Analysis	
				Project description; design drawings; maps and figures; operations modeling; cooperative operations coordination	
				Pre-application meeting coordination, preparation, and participation; follow-up requests and ongoing communication	
				Water Rights Hearings	
State Water Resources Control Board and Regional Water Quality Control Boards	General Construction Stormwater National Pollution Discharge Elimination System Permit	All stormwater discharges when clearing, grading, and excavation result in a land disturbance of 5 or more acres	CWA	Construction General Permit application package and fee	**$800,000**
				Project description; design drawings; maps and figures	
				Stormwater Pollution Prevention Plan	
				Pre-application meeting coordination, preparation, and participation; follow-up requests and ongoing communication	
State Water Resources Control Board and Regional Water Quality Control Boards	Waste Discharge Requirements	Discharge of reclaimed water on land and to groundwater	Porter-Cologne Water Quality Act	Waste Discharge application package and fee	**$250,000**
				Project description; design drawings; maps and figures	
				Pre-application meeting coordination, preparation, and participation; follow-up requests and ongoing communication	
State Water Resources Control Board and Regional Water Quality Control Boards	Section 401 Water Quality Certification	Discharge of fill materials to waters of the U.S.	CWA	Section 401 Water Quality Certification application package and fee	**$1,000,000**
				Project description; design drawings; maps and figures	
				Biological resources reconnaissance survey and biological assessment	
				Aquatic resources (wetlands and waters of the U.S.) delineation and aquatic resources delineation report	
				Section 404 Pre-Construction Notification application package	
				Pre-application meeting coordination, preparation, and participation; follow-up requests and ongoing communication	
California Department of Water Resources, Division of Safety	Approval of Plans and Specifications for the Construction or Enlargement of a	Dam or reservoir construction or enlargement	California Water Code Division 3, Dams and Reservoirs Parts 1 and 2	Approval of Plans and Specifications for the Construction or Enlargement of a Dam or Reservoir application package and fee ($5 million fee) - total of 14 structures subject to DSOD requirements	**$6,600,000**
				Project description; design drawings; maps and figures	

Agency	Type of Permit or Approval	Regulated Activity	Authority	Required Actions, Documentation, and Surveys	Total Level of Effort
of Dams	Dam or Reservoir			Pre-application meeting coordination, preparation, and participation; follow-up requests and ongoing communication	
California Occupational Safety and Health Administration	Permit for Buildings/ Structures, Scaffolding/ Falsework, Demolition, Trenches/ Excavations	Construction of trenches or excavations 5 feet or deeper and into which a person is required to descend. Construction or demolition of any building, structure, scaffolding, or falsework more than 3 stories high. The underground use of diesel engines in working mines and tunnels.	California Labor Code Section 6500	Buildings/Structures, Scaffolding/Falsework, Demolition, Trenches/Excavations Permit application package and fee	**$250,000**
				Project description; design drawings; maps and figures	
				Pre-application meeting coordination, preparation, and participation; follow-up requests and ongoing communication	
California Department of Fish and Wildlife	Streambed Alteration Agreement	Crossing of streams, rivers, or lakes (also for reservoirs, which interrupt streams)	Sections 1601–1603 of the California Fish and Game Code	Lake and Streambed Alteration Agreement Notification Package and fee	**$800,000**
				Project description; design drawings; maps and figures	
				Biological resources reconnaissance survey and biological assessment	
				Aquatic resources (wetlands and waters of the U.S.) delineation and aquatic resources delineation report	
				Hydrologic and Hydraulics System Performance Analysis	
				Pre-application meeting coordination, preparation, and participation; follow-up requests and ongoing communication	
California Department of Fish and Wildlife	Section 2081 Incidental Take Permit	Potential adverse effects on State-listed endangered or threatened species or species proposed for State listing. Incidental take of State-protected species by a non-state entity.	Section 2081 California Fish and Game Code	Sections 2081 (b) and (c) Incidental Take Permit application package and fee	**$2,700,000**
				Project description; design drawings; maps and figures (Separate GIS maps assumed	
				Biological resources reconnaissance survey (assume CDFW protocol)	
				Mitigation Monitoring and Reporting Plan	
				Pre-application meeting coordination, preparation, and participation; follow-up requests and ongoing communication	
NAHC/Local Tribes	AB 52 Consultations	Effects on tribal cultural resources	PRC 21080.3.1	Consultation meetings; coordination; development of mitigation measures	**$500,000**

Agency	Type of Permit or Approval	Regulated Activity	Authority	Required Actions, Documentation, and Surveys	Total Level of Effort
State Office of Historic Preservation	See Advisory Council on Historic Preservation under USACE	Potential adverse effects on State unique archaeological sites and historical resources	PRC 21083.2 & PRC 21084.1	Consultation meeting coordination, preparation, and participation; follow-up and ongoing communication	**$300,000**
Local Agency Permits and Approvals					
Colusa and Glenn County Air Pollution Control Districts	Authority to Construct, Permit to Operate, and Notification of Operation	Construction or operation of any non-exempt source of air contaminants; typically limited to stationary sources.	New Source Review regulations; Clean Air Act; New Source Review regulations; Clean Air Act; Glenn County Air Pollution Control District Article III, Sections 50 to 57; Colusa County Air Pollution Control District Regulation III, Rules 3.1 to 3.18.	Authority to Construct, Permit to Operate, and Notification of Operation application packages and fees (for each county)	**$200,000**
				Project description; design drawings; maps and figures	
				Pre-application meeting coordination, preparation, and participation; follow-up requests and ongoing communication, including annual inspection approach follow-up requests and communication	
Colusa and Glenn County Public Works Departments	Encroachment Permit	Use of local jurisdictions right-of-way to install pipeline across roadways	County ordinances	Encroachment Permit application packages and fees (for each county)	**$125,000**
				Project description; design drawings; maps and figures	
				Pre-application meeting coordination, preparation, and participation; follow-up requests and ongoing communication	
Colusa and Glenn County Public Works Departments	Transportation Permit	Transport of heavy or oversized loads on county roads	County ordinances	Transportation Permit application packages and fees (for each county)	**$150,000**
				Project description; design drawings; maps and figures	
				Pre-application meeting coordination, preparation, and participation; follow-up requests and ongoing communication	
Colusa and Glenn County Public Works Departments	Building Permit, Street Improvement Permit, and Grading Permit	Construction activities within the county	Uniform Building Codes, as adopted	Building Permit, Street Improvement Permit, and Grading Permit application packages and fees (for each county)	**$200,000**
				Project description; design drawings; maps and figures	
				Pre-application meeting coordination, preparation, and participation; follow-up requests and ongoing communication	
Colusa County Planning Department	General Plan Amendments, and/or Zoning Amendments	Changes to zoning or General Plan designations	County Zoning Code and General Plan	Major Use Permits, Tentative Parcel Maps, Tentative Subdivision Maps, General Plan Amendments, and/or Zoning Amendments application package and fee	**$100,000**
				Project description; design drawings; maps and figures	

Agency	Type of Permit or Approval	Regulated Activity	Authority	Required Actions, Documentation, and Surveys	Total Level of Effort
				Pre-application meeting coordination, preparation, and participation; follow-up requests and ongoing communication	
Estimated Cost for Permits and Approvals (includes associated required engineering drawings/information)					**$85,175,000**
Project Management/Oversight/Review (assume 15%)					**$12,776,000**
SUBTOTAL					**$97,951,000**
Sites Project Authority/U.S. Bureau of Reclamation	*Completion of Final EIR/EIS*	*Potential impacts to the environment associated with a state, local, or federal action/project*	*PRC Section 21000 et seq./Public Law 91-190, 42 U.S.C. 4321-4347 as amended*	*Review and respond to comments*	**$3,000,000**
				Conduct quantitative analysis (e.g., modeling)	
				Prepare final EIS/EIR, meeting coordination, preparation, and participation; follow-up requests and ongoing communication	
Sunk Costs (Draft EIR/S – excludes all WSIP application support)					**$2,400,000**
TOTAL					**$103,351,000**

Table A1-3. Applicable Federal, State, and Local Permits and Approvals Acquisition Timeframes/Schedule (June 2018 Start Date Assumed)

Agency	Type of Permit or Approval	Required Actions, Documentation, and Surveys	Duration (Months)	Total Task Duration (Months/ Anticipated Completion Date)
Federal Agency Permits and Approvals				
U.S. Army Corps of Engineers	Department of the Army Permit (Section 404 and 10)	Section 404/10 Pre-Construction Notification application package	3	24 (June 2020)
		Project description; engineering design drawings; maps and figures	6	
		Aquatic resources (wetlands and waters of the U.S.) delineation, CRAM evaluation, and aquatic resources delineation report	9	
		Section 401 Water Quality Certification application package	0	
		Pre-application meeting coordination, preparation, and participation; follow-up and ongoing communication	24	
U.S. Army Corps of Engineers	Department of the Army Permit (Section 408)	Section 408 Permit application package	9	24 (June 2020)
		Project description; design drawings; maps and figures	8	
		Hydrologic and Hydraulics System Performance Analysis	9	
		Geotechnical Analysis	9	
		Pre-application meeting coordination, preparation, and participation; follow-up and ongoing communication	24	
		Sediment Transport Modeling & Bathymetric Surveys	9	
U.S. Army Corps of Engineers/U.S. Environmental Protection Agency	LEDPA review	Section 404(b)(1) application package	6	18 (January 2020)
		Project description; design drawings; maps and figures	6	
		Alternatives Analysis	6	
		Pre-application meeting coordination, preparation, and participation; follow-up and ongoing communication	18	
Advisory Council on Historic Preservation/ State Office of Historic Preservation	Section 106 Review and Compliance	Consultation meeting coordination, preparation, and participation; follow-up and ongoing communication (includes review of USBR-prepared Programmatic Agreement [PA] and research design)	36	36 (June 2021 receive final PA; necessary excavations continue based on approved research design in PA)
		Record search; complete initial field survey; DPRs; technical reports	24	
		Tribal review and input	36	
		Evaluation excavations and ethnographic study for entire project area and proposed features	36	
Reclamation/U.S. Fish and Wildlife Service/National Marine Fisheries Service	Section 7 Consultation	Section 404 Permit application package	0	24 (June 2020)
		Consultation meeting coordination, preparation, and participation; follow-up requests and ongoing communication; necessary surveys (in addition to those required by USACE 404/10 and CDFW 2081 approval processes)	24	
		BA development assistance	12	
U.S. Fish and Wildlife Service	Bald Eagle Protection Act (typically addressed through Section 7 consultation)	Consultation meeting coordination, preparation, and participation; follow-up requests and ongoing communication; necessary surveys	24	24 (June 2020)
		Golden eagle satellite telemetry studies	24	
U.S. Coast Guard	Navigability	Consultation meeting coordination, preparation, and participation; follow-up requests	9	9 (March 2019)

Agency	Type of Permit or Approval	Required Actions, Documentation, and Surveys	Duration (Months)	Total Task Duration (Months/ Anticipated Completion Date)
	determination	and ongoing communication		
Bureau of Reclamation	Warren Act Contract	Consultation meeting coordination, preparation, and participation; follow-up requests and ongoing communication	18	18 (January 2020)
Federal Energy Regulatory Commission	Hydropower License	FERC Pre-Application Document	4	120 (June 2028)
		FERC Hydropower License (ILP) application package	12	
		Project description; design drawings; maps and figures	12	
		Pre-application meeting coordination, preparation, and participation; follow-up requests and ongoing communication	12	
State Agency Permits and Approvals				
California Department of Transportation	Encroachment Permits	CalTrans Encroachment Permit application package and fee	0	18 (January 2020)
		Project description; design drawings; maps and figures	6	
		Biological resources reconnaissance survey and biological assessment	0	
		Aquatic resources (wetlands and waters of the U.S.) delineation and aquatic resources delineation report	0	
		Cultural resources literature search, pedestrian survey, and archaeological reconnaissance report	0	
		Pre-application meeting coordination, preparation, and participation; follow-up requests and ongoing communication	18	
California Department of Transportation	Transportation Permit	CalTrans Annual Transportation Permit application package (9 required throughout duration of construction) and fee	9	18 (January 2020)
		Project description; design drawings; maps and figures	9	
		Pre-application meeting coordination, preparation, and participation; follow-up requests and ongoing communication	18	
California State Lands Commission	Land Use Lease	State Lands Commission Lease application package (including survey information) and fee	9	18 (January 2020)
		Project description; design drawings; maps and figures	9	
		Pre-application meeting coordination, preparation, and participation; follow-up requests and ongoing communication	12	
		Following acquisition of lease: as-built drawings; surveys; internal and external inspection program, including structural evaluation and integrity assessment.	18	
Central Valley Flood Protection Board	Encroachment Permit	CVFPB Encroachment Permit 3615 and 3615a application package (including required mapping and deeds) and fee	9	24 (June 2020)
		Project description; design drawings; maps and figures	9	
		Hydrologic and Hydraulics System Performance Analysis	12	
		Section 408 Permit application package	12	
		Local Maintaining Agency endorsement and concurrence with USACE	12	
		Pre-application meeting coordination, preparation, and participation; follow-up requests and ongoing communication	24	

Agency	Type of Permit or Approval	Required Actions, Documentation, and Surveys	Duration (Months)	Total Task Duration (Months/ Anticipated Completion Date)
State Water Resources Control Board	Water Rights Permit	Water Rights Permit application package (including fee)	12	36 (June 2021)
		Water Availability Analysis	12	
		Project description; design drawings; maps and figures; operations modeling; cooperative operations coordination	12	
		Pre-application meeting coordination, preparation, and participation; follow-up requests and ongoing communication	24	
		Water Rights Hearings	12	
State Water Resources Control Board and Regional Water Quality Control Boards	General Construction Stormwater National Pollution Discharge Elimination System Permit	Construction General Permit application package and fee	9	18 (January 2020)
		Project description; design drawings; maps and figures	9	
		Stormwater Pollution Prevention Plan	12	
		Pre-application meeting coordination, preparation, and participation; follow-up requests and ongoing communication	18	
State Water Resources Control Board and Regional Water Quality Control Boards	Waste Discharge Requirements	Waste Discharge application package and fee	9	18 (January 2020)
		Project description; design drawings; maps and figures	9	
		Pre-application meeting coordination, preparation, and participation; follow-up requests and ongoing communication	18	
State Water Resources Control Board and Regional Water Quality Control Boards	Section 401 Water Quality Certification	Section 401 Water Quality Certification application package and fee	9	18 (January 2020)
		Project description; design drawings; maps and figures	9	
		Biological resources reconnaissance survey and biological assessment	0	
		Aquatic resources (wetlands and waters of the U.S.) delineation and aquatic resources delineation report	0	
		Section 404 Pre-Construction Notification application package	0	
		Pre-application meeting coordination, preparation, and participation; follow-up requests and ongoing communication	18	
California Department of Water Resources, Division of Safety of Dams	Approval of Plans and Specifications for the Construction or Enlargement of a Dam or Reservoir	Approval of Plans and Specifications for the Construction or Enlargement of a Dam or Reservoir application package and fee ($5 million fee)	48	48 (August 2021)
		Project description; design drawings; maps and figures	18	
		Pre-application meeting coordination, preparation, and participation; follow-up requests and ongoing communication	36	
California Occupational Safety and Health Administration	Permit for Buildings/ Structures, Scaffolding/ Falsework, Demolition, Trenches/ Excavations	Buildings/Structures, Scaffolding/Falsework, Demolition, Trenches/Excavations Permit application package and fee	9	18 (January 2020)
		Project description; design drawings; maps and figures	9	
		Pre-application meeting coordination, preparation, and participation; follow-up requests and ongoing communication	18	
California Department of Fish and Wildlife	Streambed Alteration Agreement	Lake and Streambed Alteration Agreement Notification Package and fee	9	24 (June 2020)
		Project description; design drawings; maps and figures	9	
		Biological resources reconnaissance survey and biological assessment	18	
		Aquatic resources (wetlands and waters of the U.S.) delineation and aquatic resources	18	

Agency	Type of Permit or Approval	Required Actions, Documentation, and Surveys	Duration (Months)	Total Task Duration (Months/ Anticipated Completion Date)
		delineation report		
		Hydrologic and Hydraulics System Performance Analysis	0	
		Pre-application meeting coordination, preparation, and participation; follow-up requests and ongoing communication	24	
California Department of Fish and Wildlife	Section 2081 Incidental Take Permit	Sections 2081 (b) and (c) Incidental Take Permit application package and fee	12	24 (June 2020)
		Project description; design drawings; maps and figures (Separate GIS maps assumed	12	
		Biological resources reconnaissance survey (assume CDFW protocol)	18	
		Mitigation Monitoring and Reporting Plan	18	
		Pre-application meeting coordination, preparation, and participation; follow-up requests and ongoing communication	24	
NAHC/Local Tribes	AB 52 Consultations	Consultation meetings; coordination; development of mitigation measures	24	24 (June 2020)
State Office of Historic Preservation	See Advisory Council on Historic Preservation under USACE	Consultation meeting coordination, preparation, and participation; follow-up and ongoing communication	24	24 (June 2020)
Local Agency Permits and Approvals				
Colusa and Glenn County Air Pollution Control Districts	Authority to Construct, Permit to Operate, and Notification of Operation	Authority to Construct, Permit to Operate, and Notification of Operation application packages and fees (for each county)	12	18 (January 2020)
		Project description; design drawings; maps and figures	12	
		Pre-application meeting coordination, preparation, and participation; follow-up requests and ongoing communication, including annual inspection approach follow-up requests and communication	18	
Colusa and Glenn County Public Works Departments	Encroachment Permit	Encroachment Permit application packages and fees (for each county)	6	12 (June 2019)
		Project description; design drawings; maps and figures	6	
		Pre-application meeting coordination, preparation, and participation; follow-up requests and ongoing communication	12	
Colusa and Glenn County Public Works Departments	Transportation Permit	Transpiration Permit application packages and fees (for each county)	12	18 (January 2020)
		Project description; design drawings; maps and figures	12	
		Pre-application meeting coordination, preparation, and participation; follow-up requests and ongoing communication	18	
Colusa and Glenn County Public Works Departments	Building Permit, Street Improvement Permit, and Grading Permit	Building Permit, Street Improvement Permit, and Grading Permit application packages and fees (for each county)	12	18 (January 2020)
		Project description; design drawings; maps and figures	12	
		Pre-application meeting coordination, preparation, and participation; follow-up requests and ongoing communication	18	
Colusa County Planning Department	General Plan Amendments, and/or Zoning Amendments	Major Use Permits, Tentative Parcel Maps, Tentative Subdivision Maps, General Plan Amendments, and/or Zoning Amendments application package and fee	12	18 (January 2020)
		Project description; design drawings; maps and figures	12	
		Pre-application meeting coordination, preparation, and participation; follow-up	18	

Agency	Type of Permit or Approval	Required Actions, Documentation, and Surveys	Duration (Months)	Total Task Duration (Months/ Anticipated Completion Date)
		requests and ongoing communication		
Sites Project Authority/U.S. Bureau of Reclamation	Completion of Final EIR/EIS	Review and respond to comments	5	10 months (from receipt of public comments)
		Conduct quantitative analysis (e.g., modeling - concurrent with response to comments))	5	
		Prepare final EIS/EIR, meeting coordination, preparation, and participation; follow-up requests and ongoing communication	5	

Notes:
AB = Assembly Bill
BA = Biological Assessment
CCR = California Code of Regulations
CDFW = California Department of Fish and Wildlife
CFR = Code of Federal Regulations
CRAM = California Rapid Assessment Method
CVFPB = Central Valley Flood Protection Board
CWA = Clean Water Act
DPR = Department of Parks and Recreation
DSOD = Divisions of Safety of Dam
EIR = Environmental Impact Report
EIS = Environmental Impact Statement
FERC = Federal Energy Regulating Commission
GIS = Geographic Information System
ILP = Integrated Licensing Process
LEDPA = Least Environmentally Damaging Practicable Alternative
NAHC = Native American Heritage Commission
NHPA = National Historic Preservation Act
NHRP = National Register of Historic Places
PRC = Public Resources Code
U.S.C. = United States Code
USACE = United States Army Corps of Engineers
USBR = U.S. Bureau of Reclamation
WSIP = Water Storage Investment Program

<table>
<tr><th colspan="9">WSIP Data and Information Summary Table: General Application Questions for Water Quality Priorities</th></tr>
<tr><td colspan="9">Instructions: This table must be used (only once) for each project. Please provide responses below, regardless of priorities claimed, for the overall project. If the information varies based on the claimed priority(ies), explain the variations. Attach up to three (3) additional pages if more space is needed.</td></tr>
<tr><td colspan="9">Check (x) all priorities that the project would address and realize (i.e., check all claimed priorities):</td></tr>
<tr><td>Priority 1: Temperature</td><td>Priority 2: Dissolved Oxygen</td><td>Priority 3: Nutrients</td><td>Priority 4: Mercury</td><td>Priority 5: Salinity</td><td>Priority 6: Groundwater</td><td>Priority 7: Delta Tributary Flows</td><td>Priority 8: Demand on Delta</td><td>Priority 9: Basic Human Needs</td></tr>
<tr><td>X</td><td></td><td></td><td></td><td></td><td>X</td><td>X</td><td></td><td>X</td></tr>
<tr><td colspan="9">1. Identify the current conditions date (i.e., year) that is used within the application. Current conditions must be based on the date (year) of the CEQA Notice of Preparation for the project or subsequently revised information used to describe existing conditions. The current condition date must be used consistently throughout the water quality priorities application section.</td></tr>
<tr><td colspan="9">An updated CEQA Notice of Preparation for the Sites Reservoir Project was released in February 2017. The current conditions date used in the analyses for the application was based on the DWR Delivery Capability Report and base scenario model released in July 2015. The year 2015 was used for current conditions because the Delivery Capability Report and base scenario model the most recent and best data available for the analysis.</td></tr>
<tr><td colspan="9">2. Briefly describe where the project would occur. Attach a map that shows the project area.</td></tr>
<tr><td colspan="9">The Sites Reservoir would be constructed in Antelope Valley, approximately 10 miles west of the town of Maxwell. Figure 2-1 in in Sites_A3 Project Description uploaded under the ELIGIBILITY AND GENERAL PROJECT INFORMATION TAB shows the Sites Reservoir footprint. Operation of the proposed reservoir would be in cooperation with the operations of the existing water management system in California, especially the existing Central Valley Project (CVP) and State Water Project (SWP) system facilities, to facilitate delivery and maximize the potential for a wide range of benefits. Water provided by the project would be used and managed within Sites Participant’s service areas. Figures A.6-1 through A.6-3 provided in Sites_ A6C Groundwater Basins depict the general service areas for Sites Participants under the ELIGIBILITY AND GENERAL PROJECT INFORMATION TAB.</td></tr>
<tr><td colspan="6">Additional locations in the application where data and relevant supporting information, including attachments, are documented (document name, page number, table number, map number, etc.).</td><td colspan="3">Application Reference:
See Figure 2-1 in Sites_A3 Project Description uploaded as an attachment under the ELIGIBILITY AND GENERAL PROJECT INFORMATION TAB.

See Figures 6-1A, 6-1B and 6-1C on pages 6-2 through 6-4 in Chapter 6, “Surface Water Resources” of the EIR/EIS located online here: [http://sitesproject.org/information/DraftEIR-EIS]

Figures A.6-1 through A.6-3 provided in Sites_A6C Groundwater Basins under the ELIGIBILITY AND GENERAL PROJECT INFORMATION TAB.</td></tr>
<tr><td colspan="9">3. Briefly describe the area that the project would improve. Attach a map that shows the improvement area.</td></tr>
<tr><td colspan="9">The improvement areas for the project vary depending on the type of water quality benefit provided. A description of the improvement area by the priorities the project would address is further discussed below:

• Priority 1: Temperature. With cooperative operations with Reclamation and DWR, the project would increase coldwater pool storage in Shasta Lake, Lake Oroville, and Folsom Lake and improve temperatures in the Sacramento and American Rivers during certain months at specific compliance points, particularly in Below Normal, Dry, and Critical water years. The areas of temperature improvement for these waterways are shown on Figures Water Quality P – 1a and P – 1b.

• Priority 6: Groundwater. The project would assist with improving chronic lowering of water levels and reduction of groundwater storage within the groundwater basins associated with Sites Participants. Incidental water quality and subsidence improvements may also result with increases in storage and water levels. Figure Water Quality P – 6a show areas that would receive surface water deliveries as a result of the project and the potential groundwater improvement area. Benefits could be identified in areas where surface water would be replacing, or substantially supplementing, groundwater as a source of water supply in areas with groundwater basins in overdraft. It is anticipated that the groundwater basins located within the Sacramento Valley Hydrologic Region would receive the greatest benefits from the project as a result of the volume of water that would be delivered as part of the project.

• Priority 7: Delta Tributary Flows. Loss of connection to floodplain habitat on the Sacramento River has affected the food web in the Delta. By making late summer releases to the toe drain for the Yolo Bypass, Sites Reservoir can support phytoplankton/zooplankton populations in the Lower Sacramento River. This would provide additional food for Delta smelt and other Delta species.</td></tr>
</table>

WSIP Data and Information Summary Table: General Application Questions for Water Quality Priorities	
• **Priority 9: Basic Human Needs.** The project would provide supplemental surface water supplies to Municipal and Industrial (M&I) water providers with disadvantaged communities located within their service areas. Incidental water quality and subsidence improvements may also result with increases in storage and water levels. Figure Water Quality P – 6a show the potential groundwater improvement area. It is anticipated that the groundwater basins located within the Sacramento Valley Hydrologic Region would receive the greatest benefits from the project.	
Additional locations in the application where data and relevant supporting information, including attachments, are documented (document name, page number, table number, map number, etc.).	Application Reference: Figures Water Quality P – 1a and P – 1b. (Sites_A2 WQ Maps) Figure Water Quality P – 6a (Sites_A2 WQ Maps) Figures Water Quality P – 9a, through P– 9c, (Sites_A2 WQ Maps)
4. Briefly describe the existing and potential beneficial uses for the waters affected by the project (cite the appropriate water quality control plan(s) adopted by the California State and Regional Water Boards, or other applicable and reliable sources).	
Water quality objectives for waters affected by the project are specified in the basin plans for the North Coast, Central Valley, Tulare Lake, and the San Francisco Bay regions. Water quality objectives for water temperature are also specified in the SWRCB Water Quality Control Plan for Control of Temperature in the Coastal and Interstate Waters and Enclosed Bays and Estuaries of California. SWRCB Water Rights Orders 90-05 and 91 and the 2009 NMFS biological opinion also include requirements related to storage and conveyance facility operations in order to achieve temperature compliance objectives. The water quality objectives and beneficial uses are further described in Table 7.1 on pages 7-1 to 7-3 in Chapter 7, “Surface Water Quality” of the EIR/EIS.	
Additional locations in the application where data and relevant supporting information, including attachments, are documented (document name, page number, table number, etc.).	Application Reference: Table 7.1 pages 7-1 to 7-3 in Chapter 7, “Surface Water Quality” of the EIR/EIS located online here: [http://sitesproject.org/information/DraftEIR-EIS]
5. Briefly describe any significant adverse water quality impacts and mitigation measures associated with the project.	
In general, the water quality impacts associated with the Sites Reservoir Project would be similar to those analyses for Alternative D in Chapter 7, “Surface Water Quality” of the EIR/EIS. Sites Reservoir operations would involve the diversion of Sacramento River water only when flow monitoring indicates that excess bypass flows are present in the river due to storm event flows. Sites Reservoir Project operations would also be coordinated with SWP and CVP operations. Consequently, all water quality compliance obligations would be met as part of operations associated with the CVP and SWP facilities. In general, the Sites Reservoir operational strategy is to maximize the potential benefits of Sites Reservoir while not adversely affecting the CVP and SWP’s ability to meet existing system regulatory requirements including established water quality objectives, biological opinions, water right orders, and instream flow requirements. Several existing and additional proposed Sacramento River bypass flow criteria were assumed at specified locations. These flow criteria are designed to make certain only excess water would be diverted into Sites Reservoir to maintain and protect existing water quality compliance and downstream water uses. As a mitigation measure to more fully avoid and minimize entrainment and impingement of juvenile salmonids and other poor-swimming aquatic species, Sacramento River diversions to Sites Reservoir would also be restricted to protect fish migration during naturally occurring, storm-induced, pulse flow events in the Sacramento River. The proposed pulse protection period would extend from October through May to address outmigration of juvenile winter-, spring-, fall- and late-fall-run Chinook salmon, as well as steelhead. Pulse flows during this period would provide flow continuity between the upper and lower Sacramento River to support fish migration. It is recognized that research regarding the benefits of pulse flows is ongoing, and further research and adaptive management will be required to develop and refine a pulse flow protection strategy for fish migration. No other significant adverse water quality impacts were identified associated with Sites Reservoir operations. Under the proposed WSIP application operations plan, enhanced flows to Yolo Bypass would be released through the Colusa Basin Drain and Knights Landing Ridge Cut during summer and fall months to help increase productivity in the Yolo Bypass in the lower Cache Slough and Sacramento River. Adaptive management and monitoring strategies to minimize adversely affect water quality impacts associated with enhanced flows within the Yolo Bypass and its receiving waters in the Sacramento-San Joaquin Delta would also be implemented.	
Additional locations in the application where data and relevant supporting information, including attachments, are documented (document name, page number, table number, etc.).	Application Reference: Chapter 7, “Surface Water Quality” of the EIR/EIS. [http://sitesproject.org/information/DraftEIR-EIS]

WSIP Data and Information Summary Table: General Application Questions for Water Quality Priorities	
6. Identify any impediments or circumstances that may reduce the project's claimed improvements. Include a description of how those impediments or circumstances may reduce the improvement as evaluated by the applicable REVs. Impediments may include: waste or wastewater discharges, water rights/overdiversion, or other potential factors.	
Initial water quality improvements are expected in year 2028 and full benefits are expected by 2030 depending on hydrologic condition. Achieving full benefits would require water supplies from one or more of the following: • State of California Water Rights for "Sites Reservoir" • Riparian Water Rights in the Inundation Area Further coordination between the Authority, the State Water Resources Control Board and other cooperating agencies will be required to determine the applicability and feasibility of using any of these water rights approaches. Water rights issues could potentially delay the immediacy of the realization of full benefits (REV 7) of the project by 2030. Projected groundwater basin benefits are currently an approximation based on interested JPA investors (also referred to as Sites Participants). The actual distribution of water supplies would vary based on the final investors for the project. In addition, each investor may manage supplemental water supplies differently, which may result in greater than expected magnitude and spatial scale of benefits (REV 2 and REV 3, respectively) in one region over another region. Projected benefits provided by Sites Reservoir are largely dependent on the capability to divert excess Sacramento River water into the reservoir, which is influenced by changing climate conditions. The operational flexibility of Sites Reservoir allows for the delivery of water for public benefits where and when it is needed most, dependent on changing climate conditions and adaptation to future conditions to provide sustained public benefits. For further information refer to the Sites_A12 Uncertainty under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB.	
Additional locations in the application where data and relevant supporting information, including attachments, are documented (document name, page number, table number, etc.).	Application Reference: Chapter 6 of the Federal Feasibility Report [https://www.sitesproject.org/information/FeasibilityReport] Sites_A1 Feasibility under the FEASIBILITY AND IMPLEMENTATION RISK TAB Sites_A12 Uncertainty under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB
7. Does the project improve conditions in a groundwater basin where undesirable results (as defined in Water Code 10721(x)(1-6)) caused by extraction have occurred? If yes, describe in applicable priority tables.	
The project would improve groundwater levels and storage in adjudicated basins as well as designated medium and high priority basins under SGMA, including those in critical overdraft. Supplemental water supplies delivered during certain times of the year could result in reduction in decreased use of groundwater through conjunctive use operations by its participants. These operations would increase surface water deliveries and change the timing of available surface and groundwater supplies by providing Sites participants with surface water for storage, use or replenishment (typically in above normal and wet year conditions) and then recovering a portion of the water during periods of water supply shortages (in dry and critical year conditions). These improvements are further discussed under Sites_A1 WQ Priority 6 under the PHYSICAL PUBLIC BENEFITS TAB.	
Additional locations in the application where data and relevant supporting information, including attachments, are documented (document name, page number, table number, etc.).	Application Reference:
8a. Is there an adaptive management and monitoring plan for the project? □ None X Draft □ Final	
8b. Briefly describe the adaptive management and monitoring program framework for the project.	
The Adaptive Management and Monitoring Framework for the project has been developed to identify measurable objectives, performance measures, thresholds, and triggers to meet operational objectives and desired ecosystem benefits. Because uncertainties remain about natural hydrologic variations, project operations, and ecological responses, the Sites Project is being designed with a range of operational scenarios to evaluate the effectiveness of different management actions and evaluate strategies for resilience to climate change. These are further described in the Operations Plan. A monitoring program would also be implemented to collect data necessary to operate and evaluate the Project's success. Key data monitoring elements would include the following: • Physical Habitat – diversion (inflow) and release flow rates, reservoir depth, snags, submerged vegetation, and other habitat elements; • Water Quality – salinity, temperature, dissolved oxygen, nutrients; • Aquatic Biota – algae, plankton, invertebrates, fish community (species, distribution, abundance);	

WSIP Data and Information Summary Table: General Application Questions for Water Quality Priorities	
• Birds – species, abundance and distribution, use of habitat features, breeding and nesting, sick or dead birds; and • Contaminants – contaminants of concern concentrations in water, sediment, terrestrial or avian biota. Monitoring efforts would be guided by the specific Sites Project objectives and desired outcomes and would focus on the most informative, efficient, and cost-effective indicators and methods. Types of potential indicators include: • Triggers for real-time diversion and release operations – flow rates, anticipated water year type, storage in Sites and other reservoirs, storm events, fish migration data. • Performance measures – attributes of target species and their habitat, such as physical habitat conditions, water quality in Sites and elsewhere in the Sacramento River/Delta system, and distribution, abundance and composition of aquatic invertebrates, fish and birds; and • Threat indicators – potential for floods or droughts, contaminants of concern, mosquitoes and other vectors, disease outbreaks on Sites Reservoir or elsewhere. A preliminary Adaptive Management Framework is included as part of Sites_A2 Operations under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB. A more detailed plan and decision-making process will be developed in future phases of the Sites Project.	
Additional locations in the application where data and relevant supporting information, including attachments, are documented (document name, page number, table number, etc.).	Application Reference: Sites_A2 Operations under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB Sites_A2 Operations under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB. Emphasis on the Adaptive Management Framework section.

9. Check (x) the climate change risk factor(s) below that were considered in the project siting and design, and identify any that are not applicable (N/A).

Sea level rise and storm surge	Temperature changes	Changing precipitation and runoff	Ocean acidification	Low oxygen waters	Wildfires	Hydrologic variability and extreme events	
						Drought	Flooding
N/A	X	X	N/A	N/A	N/A	X	X

Additional locations in the application where data and relevant supporting information, including attachments, are documented (document name, page number, table number, etc.).	Application Reference: Sites_A12 Uncertainty under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB.

WSIP Data and Information Summary Table: Water Quality Priorities 1-5 (Water Bodies Not Meeting Standards)

Priorities 1-5 (summarized): Improve conditions in surface water bodies that are not meeting water quality standards for: (1) temperature; (2) dissolved oxygen; (3) nutrients; (4) mercury; and/or (5) salinity conditions (as described in Priority 5).

Instructions: This table must be used for projects claiming water quality priorities 1-5 (identified below). Please check the claimed priority and provide REV responses (data and information) below, as appropriate. Descriptions and clarifying information should provide the rationale for the claimed improvements (e.g., how the values were determined, etc.).

If the project claims more than one of the priorities below, please complete this table separately for each claimed priority.

Check (x) the claimed priority being addressed by this table (check only one per table):

Priority 1: Temperature	Priority 2: Dissolved Oxygen	Priority 3: Nutrients	Priority 4: Mercury	Priority 5: Salinity
X				

For the priority checked above, please respond to the following requests for data and information by filling in the fields below. Attach up to three (3) additional pages if more space is needed.

Describe how the project would improve conditions in surface water bodies or surface water body segments that are not meeting water quality standards for the parameter or constituent selected above.

The project would increase coldwater pool storage in Shasta Lake, Lake Oroville, and Folsom Lake and improve temperatures in the Sacramento and American Rivers during certain months at specific compliance points, particularly in Below Normal, Dry, and Critical water years. Temperature benefits provided with the project would assist to achieve compliance with 56°F water quality standard in September during critical water years for the Sacramento River below Keswick and Sacramento River at Red Bluff, in August during critical water years in the Sacramento River at Bonny view, and in August during dry water years at Balls Ferry.

Refer to Sites_A2 Documentation WQ Priority 1 “WSIP Data and Information Summary Table: Water Quality Priorities 1 – Temperature” for a summary of temperatures modeling results, uploaded under the PHYSICAL PUBLIC BENEFITS TAB.

Additional locations in the application where data and relevant supporting information, including attachments, are documented (document name, page number, table number, etc.).	Application Reference: Sites_A2 Documentation WQ Priority 1, “WSIP Data and Information Summary Table: Water Quality Priorities 1 – Temperature” uploaded under the PHYSICAL PUBLIC BENEFITS TAB.

Applicable water quality standards* for surface water bodies that would be improved by the project:

Surface Water Body Name (by segment as applicable)	Time Period (days/months in year when standard applies)	Water Quality Standard Value and Unit	Source Citation
Sacramento River – Shasta Dam	Daily	56°F	SWRCB Orders 90-5 and 91-1
Keswick Dam to Hamilton City	Daily	56°F	Central Valley Regional Water Quality Control Board Basin Plan
Hamilton City to the I Street Bridge	Daily	68°F	Central Valley Regional Water Quality Control Board Basin Plan
Sacramento River at Clear Creek		57°F	2015 Final Sacramento River Temperature Management Plan
Sacramento River - Balls Ferry Bridge to Bend Bridge	May 15 – October 31	56°F	2009 NMFS BO
Sacramento River – Red Bluff Diversion Dam	-	56°F	SWRCB Orders 90-5 and 91-1
Trinity River – Lewiston Dam to Douglas City Bridge	July 1 – September 14	60°F	North Coast Regional Water Quality Control Board Basin Plan
Trinity River – Lewiston Dam to Douglas City Bridge	September 15 – October 1	56°F	North Coast Regional Water Quality Control Board Basin Plan
Trinity River – Lewiston Dam to Douglas City Bridge	October 1 – December 31	56°F	North Coast Regional Water Quality Control Board Basin Plan
American River – Watt Ave	Daily	68°F	2009 NMFS BO

*For the purpose of this table, water quality standards means numeric or narrative water quality objectives in water quality control plans adopted by the California State and Regional Water Boards, and water quality criteria promulgated by the USEPA for California under Clean Water Act section 303(c) (e.g., California Toxics Rule).

WSIP Data and Information Summary Table: Water Quality Priorities 1-5 (Water Bodies Not Meeting Standards)			
REV 2: Magnitude			
Provide the parameter or constituent values (including units) for each surface water body or surface water body segment that would be improved by the project in the following table. Indicate any time periods associated with applicable water quality standards.			
Surface Water Body Name (by segment as applicable)	Current Condition**	Expected Without-Project Condition 2030	Expected With-Project Condition 2030
Trinity River below Lewiston (July-Sept Avg.) - Critical	53.7°F	53.8°F	53.5°F
Sacramento River – Below Keswick (July-Sept Avg.) - Dry	52.0°F	53.3°F	53.2°F
Sacramento River – Below Keswick (July-Sept Avg.) - Critical	54.1°F	55.6°F	54.9°F
Sacramento River – Bonnyview (July-Sept Avg.)***	52.5°F	53.6°F	53.6°F
Sacramento River – Bonnyview (July-Sept Avg.) - Dry	52.9°F	54.3°F	54.1°F
Sacramento River – Bonnyview (July-Sept Avg.) - Critical	55.1°F	56.5°F	55.9°F
Sacramento River – Balls Ferry (July-Sept Avg.)***	54.1°F	55.2°F	55.2°F
Sacramento River – Balls Ferry (July-Sept Avg.) - Dry	54.5°F	56.0°F	55.7°F
Sacramento River – Balls Ferry (July-Sept Avg.) - Critical	56.6°F	58.1°F	57.5°F
Sacramento River – Jelly's Ferry (July-Sept Avg.)***	55.4°F	56.6°F	56.5°F
Sacramento River – Jelly's Ferry (July-Sept Avg.) - Dry	55.8°F	57.3°F	57.0°F
Sacramento River – Jelly's Ferry (July-Sept Avg.) - Critical	57.9°F	59.4°F	58.8°F
Sacramento River – Bend Bridge (July-Sept Avg.)***	56.5°F	57.6°F	57.6°F
Sacramento River – Bend Bridge (July-Sept Avg.) - Dry	56.9°F	58.5°F	58.1°F
Sacramento River – Bend Bridge (July-Sept Avg.) - Critical	58.9°F	60.3°F	59.7°F
Sacramento River – Red Bluff (July-Sept Avg.)***	58.1°F	59.3°F	59.1°F
Sacramento River – Red Bluff (July-Sept Avg.) - Dry	58.5°F	59.3°F	59.1°F
Sacramento River – Red Bluff (July-Sept Avg.) - Critical	60.5°F	60.2°F	59.8°F
American River at Nimbus (July-Sept Avg.)***	62.4°F	67.1°F	66.3°F
American River at Nimbus (July-Sept Avg.) - Dry	63.6°F	67.0°F	66.6°F
American River at Nimbus (July-Sept Avg.) - Critical	65.8°F	68.9°F	68.5°F
American River at Watt Ave (July-Sept Avg.)***	68.0°F	70.6°F	69.9°F
American River at Watt Ave (July-Sept Avg.) - Dry	68.1°F	70.7°F	69.9°F
American River at Watt Ave (July-Sept Avg.) - Critical	70.7°F	73.6°F	73.1°F
American River at Mouth (July-Sept Avg.)***	68.4°F	73.1°F	72.6°F
American River at Mouth (July-Sept Avg.) - Dry	70.0°F	73.5°F	73.4°F
American River at Mouth (July-Sept Avg.) - Critical	73.3°F	77.0°F	76.5°F
**For the purpose of this table, "current condition" means conditions measured or estimated at the year of the CEQA Notice of Preparation (NOP) for the project or subsequently revised information used to describe existing conditions. ***Results presented are a long-term average over the full 82-year simulation period for all water year types.			
Provide additional clarifying information below, as needed.			
See Sites_A1 WQ Priority 1, "WSIP Data and Information Summary Table: Water Quality Priorities 1 –Temperature" for a summary of temperatures modeling results.

Sites_A6.D Modeling Results Compendium, "Temperature Results WSIP 2030 with Project vs without Project" uploaded under the ELIGIBILITY AND GENERAL PROJECT INFORMATION TAB. Sites_A6.D Modeling Results Compendium, "Performance Measures Scorecard for Sites Reservoir Potential Beneficiaries" uploaded under the ELIGIBILITY AND GENERAL PROJECT INFORMATION TAB. Sites_A6.D Modeling Results Compendium, "Temperature Results DCR 2015 with Project vs DCR 2015 without Project" uploaded under ELIGIBILITY AND GENERAL PROJECT INFORMATION TAB.		

WSIP Data and Information Summary Table: Water Quality Priorities 1-5 (Water Bodies Not Meeting Standards)	
REV 3: Spatial Scale	
Provide the geographical extent of the improvement for each surface water body or water body segment that would be improved by the project. Attach a map of the improvement area.	
Surface Water Body Name (by segment as applicable)	Geographical Extent Improved in 2030 (e.g., number of river miles improved)
Sacramento River	Approximately 59 river miles of the Sacramento River would be improved with the implementation of the Sites Reservoir Project downstream from Keswick Dam (River Mile 302) to the Red Bluff Diversion Dam (River Mile 243). Figure Water Quality P-1a shows the improvement area for the Sacramento River.
American River	Approximately 30 river miles of the American River would be improved with the implementation of the Sites Reservoir Project downstream from Folsom Dam to the mouth of the American River. Figure Water Quality P-1c shows the improvement area for the American River.
Provide additional clarifying information below, as needed.	
See Sites_A2 WQ Maps, Figures P-1a and P-1b for temperature maps depicting the potential area of improvement.	
Additional locations in the application where data and relevant supporting information, including attachments, are documented (document name, page number, table number, map number, etc.).	Application Reference: See Sites_A1 WQ Priority 1, "WSIP Data and Information Summary Table: Water Quality Priorities 1 –Temperature" uploaded under the PHYSICAL PUBLIC BENEFITS TAB.
REV 4: Temporal Scale	
Provide the time period(s) during the year (days or months) when the water quality improvement would occur for each surface water body or water body segment that would be improved by the project:	
Surface Water Body Name (by segment as applicable)	Expected Time Period Provided by Project in 2030
Sacramento River – Below Keswick	July through September
Sacramento River – Bonnyview	July through November
Sacramento River – Balls Ferry	July through November
Sacramento River – Jelly's Ferry	July through November
Sacramento River – Bend Bridge	July through November
Sacramento River – Red Bluff	August through November
Trinity River below Lewiston	July through September
American River at Nimbus	April through September
American River at Watt Ave	April through September
American River at Mouth	April through September
The expected time period provided by Project in 2030 is dependent upon water year type. See Sites_A1 WQ Priority 1, "WSIP Data and Information Summary Table: Water Quality Priorities 1 –Temperature" for a summary of temperatures modeling results.	
Additional locations in the application where data and relevant supporting information, including attachments, are documented (document name, page number, table number, etc.).	Application Reference: See Sites_A1 WQ Priority 1, "WSIP Data and Information Summary Table: Water Quality Priorities 1 –Temperature" uploaded under the PHYSICAL PUBLIC BENEFITS TAB.
REV 5: Adaptive Management	
Describe the adaptive management and monitoring strategies for the claimed priority (e.g., potential management or corrective actions that could be taken if monitoring results fall outside of the range of expected values or if claimed improvements are not being achieved by the project). Include the potential measurable objectives, performance measures, thresholds, and triggers to monitor project performance and achievement of improvements.	
The Adaptive Management and Monitoring Framework for the project has been developed to identify measurable objectives, performance measures, thresholds, and triggers to meet operational objectives and desired ecosystem benefits. A monitoring program would also be implemented to collect data necessary to operate and evaluate the Project's success. As part of proposed monitoring, temperature data would be collected. Monitoring efforts would be guided by the specific Sites Project objectives and desired outcomes and would focus on the most informative, efficient, and cost-effective indicators and methods. Temperature operational triggers would be developed to assist with real-time diversion and release operations. A preliminary Adaptive Management Framework is included as part of Sites_A6.D Modeling Results Compendium uploaded under the ELEGIBILITY AND GENERAL PROJECT INFORMATION TAB. A more detailed plan and decision-making process, including the establishment of temperature specific operational triggers, and performance standards will be developed in future phases of the Sites Project.	
Additional locations in the application where data and relevant supporting	Application Reference:

WSIP Data and Information Summary Table: Water Quality Priorities 1-5 (Water Bodies Not Meeting Standards)	
information, including attachments, are documented (document name, page number, table number, etc.).	Operations Plan provided in Sites_A2 Operations, uploaded under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB. Adaptive Management Framework provided in Sites_A2 Operations uploaded under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB.
REV 6: Immediacy of Improvement Action	
Describe when the project would begin implementing actions toward achieving the improvement(s) associated with the claimed priority. Include the number of months expected to elapse between grant encumbrance and project implementation (i.e., completed projected construction and start-up of project element(s) that are expected to achieve the claimed priority). Include specifics by surface water body or water body segment, as appropriate.	
Initial benefits are expected in year 2028 (6 years after grant encumbrance for construction) at a lower level than when the project is complete. Full benefits are expected in 2030 (8 years after grant encumbrance). See Sites_A6.D Modeling Results Compendium, “Temperature Results WSIP 2030 With Project vs Without Project” uploaded under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB for temperature modeling results.	
Additional locations in the application where data and relevant supporting information, including attachments, are documented (document name, page number, table number, etc.).	Application Reference: See Sites_A6.D Modeling Results Compendium, “Temperature Results WSIP 2030 With Project vs Without Project” uploaded under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB.
REV 7: Immediacy of the Realization of Benefits	
Describe when the improvement(s) associated with the claimed priority would be realized by the project. Include the number of months expected to elapse from grant encumbrance to full realization of the improvement (i.e., improvement achieves the claimed magnitude at 2030). Include specifics by surface water body or water body segment, as appropriate.	
Initial benefits are expected in year 2028 (6 years after grant encumbrance for construction) at a lower level than when the project is complete. Full benefits are expected in 2030 (8 years after grant encumbrance). See Sites_A6.D Modeling Results Compendium, “Temperature Results WSIP 2030 With Project vs Without Project” uploaded under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB for temperature modeling results.	
Additional locations in the application where data and relevant supporting information, including attachments, are documented (document name, page number, table number, etc.).	Application Reference: See Sites_A6.D Modeling Results Compendium, “Temperature Results WSIP 2030 With Project vs Without Project” uploaded under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB.
REV 8: Duration	
Describe the duration of the improvement(s) associated with the claimed priority. Include the number of years that the project would deliver the full realization of the improvement (i.e., the claimed magnitude at 2030). Include specifics by surface water body or water body segment, as appropriate.	
The anticipated duration of the improvements is 100 years. Full benefits are expected in 2030. To determine the duration of potential benefits, additional temperatures modeling with and without the project for 2070 was performed. In most instances, the same magnitude and duration of benefits would be provided by the project in 2070; however, without the project temperatures would continue to warm thereby creating a need for increased coldwater releases to meet temperature water quality objectives The temporal scale of benefits in the Sacramento River shifts to June through October in critical water years. In some instances, the temperature benefits provided by coldwater pool conservation increase by 2070. For example, there are additional temperature benefits provided in 2070 for the reach of the Sacramento River above Keswick during August and September in below normal years and in the American River reach from Nimbus to the mouth in November. Additional incidental temperature benefits on the Trinity River below Lewiston would also be realized by 2070. See Sites_A6.D Modeling Results Compendium, “Temperature Results WSIP 2070 With Project vs Without Project” uploaded under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB for temperature modeling results.	
Additional locations in the application where data and relevant supporting information, including attachments, are documented (document name, page number, table number, etc.).	Application Reference: See Sites_A6.D Modeling Results Compendium, “Temperature Results WSIP 2070 With Project vs Without Project” uploaded under the BENEFIT CALCULATION,

WSIP Data and Information Summary Table: Water Quality Priorities 1-5 (Water Bodies Not Meeting Standards)	
	MONETIZATION, AND RESILIENCY TAB.
REV 9: Consistency	
Describe how the improvement(s) associated with the claimed priority would be consistent with water quality control plans and water quality control policies. Include specifics by surface water body or water body segment, as appropriate.	
Sites Project reservoir operations providing temperature benefits would be consistent with applicable water quality control plans and policies. In certain months and water year types, Sites operations would also assist in achieving with water quality temperature standards in reaches of the Sacramento River that currently exceed standards in summer months during dry and critically dry water years. As discussed in the Operations Plan, the Sites JPA will work with Reclamation and DWR to account for its water within the CVP and SWP conveyance systems and coordinate its releases from reservoirs to meet Sites water user allocations while providing claimed benefits. Reclamation in cooperation with the Sites JPA will also work with the NMFS, USFWS and CDFW to allow Sites project water to be conveyed in the later summer and fall to Sites project customers, potentially across the Delta, under the current Biological Opinions as has been done for early summer water held for cold water pool purposes in the past. The effects of the conveyance of Sites water across the Delta would also be included in the project description in any SWP/CVP re-consultation process under the Federal Endangered Species Act.	
Additional locations in the application where data and relevant supporting information, including attachments, are documented (document name, page number, table number, etc.).	Application Reference: Operations Plan provided in See Sites_A2 Operations, uploaded under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB
REV 10: Connectivity	
Describe, if applicable, how the project would restore or create a hydrologic connection, as a result of water quality improvement(s), to areas that support beneficial uses of water or are being managed for water quality. If multiple connections are restored or created, include specifics by location.	
N/A	
Additional locations in the application where data and relevant supporting information, including attachments, are documented (document name, page number, table number, etc.).	Application Reference:
REV 11: Resilience to Climate Change at 2030	
Describe how the climate risk factors, identified in the General Application Questions for water quality priorities, were considered as part of the project siting and design for the claimed priority. Explain why any identified risk factors are not applicable.	
Various modeling scenarios were run to allow evaluation of how the benefits of the project can be sustained under potential future climate risk factors, including temperature changes. Results demonstrate that Sites Reservoir will provide operational flexibility to sustain both public and private temperature benefits under a range of climate change scenarios, including severe extended droughts. See Sites_A1 WQ Priority 1, “WSIP Data and Information Summary Table: Water Quality Priorities 1 – Temperature” and “Sites Reservoir Project Sources of Uncertainty Analysis,” Sites_A12 Uncertainty, uploaded under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB.	
Additional locations in the application where data and relevant supporting information, including attachments, are documented (document name, page number, table number, etc.).	Application Reference: See Sites_A1 WQ Priority 1, “WSIP Data and Information Summary for Water Quality Priorities 1 –Temperature” uploaded under the PHYSICAL PUBLIC BENEFITS TAB.
REV 12: Undesirable Groundwater Results Corrected	
Not applicable because Priorities 1-5 only apply to surface water bodies.	

WSIP Data and Information Summary Table: Water Quality Priority 6 (Groundwater)

Priority 6: Protect, clean up, or restore groundwater resources in high- and medium-priority basins designated by the Department.

Instructions: This table must be used for projects claiming water quality priority 6. This priority can only be claimed by projects that are expected to achieve improvements in high- or medium-priority basins designated by the Department. There are three sections to this table. Provide information below in those sections that apply to the project. Descriptions and clarifying information should provide the rationale for the claimed improvements (e.g., how the values were determined, etc.). Attach up to three (3) additional pages if more space is needed.

For the purpose of this table, the following definitions apply:

- "Protect" means to maintain the current groundwater quality condition or prevent further degradation.
- "Clean up" means to improve upon the current groundwater quality condition through remediation (contaminant removal) or other methods.
- "Restore" means a return to, or closely achieve, a prior, improved groundwater level (elevation) condition (when compared to the current condition) that improves water quality.
- "Basin" means a groundwater basin or subbasin identified and defined in "California's Groundwater: Bulletin 118" (updated in 2003) or modified pursuant to Chapter 3 (commencing at section 10722) of the Water Code.

Describe how the project would protect, clean up, or restore groundwater resources.

The Sites Reservoir project would improve groundwater sustainability by supplying surface water to facilitate increased conjunctive use practices and for replenishment to enhance aquifer storage recovery.

Refer to Sites_A2 Documentation WQ Priority 6 "WSIP Data and Information Summary for Water Quality Priorities 6 – Groundwater" uploaded under the PHYSICAL PUBLIC BENEFITS TAB for further information.

Additional locations in the application where data and relevant supporting information, including attachments, are documented (document name, page number, table number, etc.).	Application Reference:

List the basin(s) and subbasin(s) to be improved by the project. Include the name and basin/subbasin number, and indicate the basin/subbasin priority level designated by the Department (high or medium). Cite the source.

NA

Select the benefit(s) (protect, clean up, or restore) that the project would achieve. For the selected benefit(s), respond to the following requests for data and information by filling in the sections below.

The project would □ Protect □ Clean up **X** Restore (groundwater resources)

Section 1: Protect

Provide the applicable water quality standards* for parameters/constituents that would be protected by the project:

Parameter/Constituent	Water Quality Standard Value and Unit	Source Citation
NA		

*For the purpose of this table, water quality standards means numeric or narrative water quality objectives in water quality control plans adopted by the California State and Regional Water Boards.

REV 2: Magnitude (Protect)

Provide the parameter/constituent values (including units) in the table below:

Groundwater Basin/ Subbasin Name & Number	Parameter/ Constituent	Current Condition**	Without-Project Condition in 2030	With-Project Condition in 2030
NA				

**For the purpose of this table, "current condition" means conditions measured or estimated at the year of the CEQA Notice of Preparation (NOP) for the project or subsequently revised information used to describe existing conditions.

Provide additional clarifying information below, as needed.

WSIP Data and Information Summary Table: Water Quality Priority 6 (Groundwater)	
Describe the duration of the improvement(s) associated with the claimed priority. Include the number of years that the project would deliver the full realization of the improvement (i.e., the claimed magnitude at 2030). Include specifics by groundwater basin or subbasin, as appropriate.	
NA	
Additional locations in the application where data and relevant supporting information, including attachments, are documented (document name, page number, table number, etc.).	Application Reference:
REV 9: Consistency (Protect)	
Describe how the improvement(s) associated with the claimed priority would be consistent with water quality control plans, water quality control policies, and/or the Sustainable Groundwater Management Act. Include specifics by groundwater basin or subbasin, as appropriate.	
NA	
Additional locations in the application where data and relevant supporting information, including attachments, are documented (document name, page number, table number, etc.).	Application Reference:
REV 10: Connectivity (Protect)	
Describe, if applicable, how the project would restore or create a hydrologic connection, as a result of water quality improvement(s), to areas that support beneficial uses of water or are being managed for water quality. If multiple connections are restored or created, include specifics by location.	
NA	
Additional locations in the application where data and relevant supporting information, including attachments, are documented (document name, page number, table number, etc.).	Application Reference:
REV 11: Resilience to Climate Change at 2030 (Protect)	
Describe how the climate risk factors, identified in the General Application Questions for water quality priorities, were considered as part of the project siting and design for the claimed priority. Explain why any identified risk factors are not applicable.	
NA	
Additional locations in the application where data and relevant supporting information, including attachments, are documented (document name, page number, table number, etc.).	Application Reference:
REV 12: Undesirable Groundwater Results Corrected (Protect)	
Describe the current groundwater conditions within the claimed project improvement area(s), including, but not limited to: the estimated number of wells present, total pumping values for the basin, current land use, potential and existing beneficial uses, existing water quality values, soil information, geology of the area, and any applicable undesirable results listed at Water Code section 10721(x)(1-6).	
NA	
Describe the expected without-project groundwater conditions in 2030 within the claimed project improvement area, including the factors addressed for current conditions (above).	
NA	
Describe the expected with-project groundwater conditions (after project implementation) in 2030 within the claimed project improvement area, including: the factors addressed for current conditions (above); how the project would coordinate with the appropriate GSA; how the project complies with SGMA if a GSA has not yet been assigned; and how the project would improve conditions in a groundwater basin/subbasin where undesirable results (as defined in Water Code 10721(x)(1-6)) caused by extraction have occurred.	
NA	
Additional locations in the application where data and relevant supporting information, including attachments, are documented (document name, page number, table number, etc.).	Application Reference:
Section 2: Clean Up	

WSIP Data and Information Summary Table: Water Quality Priority 6 (Groundwater)
Provide the applicable water quality standards* for parameters/constituents that would be cleaned up by the project:

Parameter/Constituent	Water Quality Standard Value and Unit	Source Citation
NA		

*For the purpose of this table, water quality standards means numeric or narrative water quality objectives found in water quality control plans adopted by the California State and Regional Water Boards.
REV 2: Magnitude (Clean Up)
Provide the parameter/constituent values (including units) in the table below:

Groundwater Basin/ Subbasin Name & Number	Parameter/ Constituent	Current Condition**	Without-Project Condition in 2030	With-Project Condition in 2030
NA				

**For the purpose of this table, "current condition" means conditions measured or estimated at the year of the CEQA Notice of Preparation (NOP) for the project or subsequently revised information used to describe existing conditions.
Provide additional clarifying information below, as needed.

WSIP Data and Information Summary Table: Water Quality Priority 6 (Groundwater)

REV 12: Undesirable Groundwater Results Corrected (Clean Up)

Describe the current groundwater conditions within the claimed project improvement area(s), including, but not limited to: the estimated number of wells present, total pumping values for the basin, current land use, potential and existing beneficial uses, existing water quality values, soil information, geology of the area, and any applicable undesirable results listed at Water Code section 10721(x)(1-6).

NA

Describe the expected without-project groundwater conditions in 2030 within the claimed project improvement area, including the factors addressed for current conditions (above).

NA

Describe the expected with-project groundwater conditions (after project implementation) in 2030 within the claimed project improvement area, including: the factors addressed for current conditions (above); how the project would coordinate with the appropriate GSA; how the project complies with SGMA if a GSA has not yet been assigned; and how the project would improve conditions in a groundwater basin/subbasin where undesirable results (as defined in Water Code 10721(x)(1-6)) caused by extraction have occurred.

NA

Additional locations in the application where data and relevant supporting information, including attachments, are documented (document name, page number, table number, etc.).	Application Reference:

Section 3: Restore

REV 2: Magnitude (Restore)

Provide the groundwater elevation and volume (include units) for each groundwater basin/subbasin that would be restored by the project.

Groundwater Basin/Subbasin Name & Number	Current Condition**	Without-Project Condition in 2030	With-Project Condition in 2030
Sacramento Valley Hydrologic Region	Refer to Sites_A2 Documentation WQ Priority 6 “WSIP Data and Information Summary for Water Quality Priorities 6 –Groundwater” uploaded under the PHYSICAL PUBLIC BENEFITS TAB for further information.		
San Joaquin Valley Hydrologic Region			
San Francisco Bay Hydrologic Region			
Central Coast Hydrologic Region			
Tulare Lake Hydrologic Region			
South Lahontan Hydrologic Region			
South Coast Hydrologic Region			

**For the purpose of this table, “current condition” means conditions measured or estimated at the year of the CEQA Notice of Preparation (NOP) for the project or subsequently revised information used to describe existing conditions.

Provide additional clarifying information below, as needed.

Describe the expected quality of water used to restore groundwater levels.

The quality of the water used for replenishment of groundwater would come from surface water deliveries, and direct or in-lieu recharge. The quality of the source water would depend on the location of the Sites Participant and the conveyance system used to deliver the water. A detailed description of the water quality associated with the major waterways and conveyance systems is provided in Chapter 7, Surface Water Quality” of the EIR/EIS. In-lieu recharge activities would not alter the natural composition of the underlying aquifer water quality. In the Sacramento Valley Hydrologic Basin, conjunctive use and direct recharge water that would be used to restore groundwater levels would be similar to Sacramento River water quality. Sacramento River water is generally considered to be of good quality with low concentrations of salts when compared to underlying groundwater. Utilization of supplemental surface water supplies from the Sacramento River in areas of agricultural production in-lieu of groundwater would support salt management practices and assist to reduce groundwater quality degradation.

Additional locations in the application where data and relevant supporting information, including attachments, are documented (document name, page number, table number, etc.).	Application Reference: Chapter 7, Surface Water Quality” of the EIR/EIS [http://sitesproject.org/information/DraftEIR-EIS].

REV 3: Spatial Scale (Restore)

Provide the geographical extent (e.g., dimensions in acres, depth in feet, acre-feet) of the improvement in 2030 claimed by the

WSIP Data and Information Summary Table: Water Quality Priority 6 (Groundwater)	
project for each groundwater basin/subbasin that would be restored. Attach a map of the improvement area.	
Groundwater Basin/Subbasin Name & Number	Unit Value (e.g., acres, acre-feet, feet)
Sacramento Valley Hydrologic Basin (Long-term Average)	111,000 acre-ft
Sacramento Valley Hydrologic Basin (Dry and Critical Water Years)	155,000 acre-ft
San Joaquin Valley Hydrologic Basin (Long-term Average)	28,000 acre-ft
San Joaquin Valley Hydrologic Basin (Dry and Critical Water Years)	10,000 acre-ft
San Francisco Bay Hydrologic Basin (Long-term Average)	38,000 acre-ft
San Francisco Bay Hydrologic Basin (Dry and Critical Water Years)	72,000 acre-ft
Tulare Lake Hydrologic Basin (Long-term Average)	33,000 acre-ft
Tulare Lake Hydrologic Basin (Dry and Critical Water Years)	57,000 acre-ft
South Lahontan Hydrologic Basin (Long-term Average)	3,000 acre-ft
South Lahontan Hydrologic Basin (Dry and Critical Water Years)	3,000 acre-ft
South Coast Hydrologic Basin (Long-term Average)	67,000 acre-ft
South Coast Hydrologic Basin (Dry and Critical Water Years)	126,000 acre-ft
Provide additional clarifying information below, as needed.

</table>

WSIP Data and Information Summary Table: Water Quality Priority 6 (Groundwater)	
REV 9: Consistency (Restore)	
Describe how the improvement(s) associated with the claimed priority would be consistent with water quality control plans, water quality control policies, and/or the Sustainable Groundwater Management Act. Include specifics by groundwater basin or subbasin, as appropriate.	
The Site project could potentially assist Participants achieve compliance under SGMA, requirements for adjudicated basins and/or applicable groundwater management ordinances. Consistency determinations and compliance would be the responsibility of individual Site Participants.	
Additional locations in the application where data and relevant supporting information, including attachments, are documented (document name, page number, table number, etc.).	Application Reference:
REV 10: Connectivity (Restore)	
Describe, if applicable, how the project would restore or create a hydrologic connection, as a result of water quality improvement(s), to areas that support beneficial uses of water or are being managed for water quality. If multiple connections are restored or created, include specifics by location.	
The Sites Reservoir project would allow for greater operational flexibility to support maintaining hydrologic connection between surface and groundwater. Conjunctive use practices by Sites participants could reduce surface water diversions and improve surface water flows by using stored groundwater during dry and critical periods. In addition, supplemental water supplies from the Sites Reservoir project would assist with improving aquifer storage and groundwater levels. Refer to Sites_A2 Documentation WQ Priority 6 "WSIP Data and Information Summary for Water Quality Priorities 6 – Groundwater" uploaded under the PHYSICAL PUBLIC BENEFITS TAB.	
Additional locations in the application where data and relevant supporting information, including attachments, are documented (document name, page number, table number, etc.).	Application Reference: Sites_A2 Documentation WQ Priority 6 "WSIP Data and Information Summary for Water Quality Priorities 6 – Groundwater" uploaded under the PHYSICAL PUBLIC BENEFITS TAB.
REV 11: Resilience to Climate Change at 2030 (Restore)	
Describe how the climate risk factors, identified in the General Application Questions for water quality priorities, were considered as part of the project siting and design for the claimed priority. Explain why any identified risk factors are not applicable.	
Various modeling scenarios were run to allow evaluation of how the benefits of the project can be sustained under potential future climate risk factors, including water quality changes, changing participation and runoff and extreme hydrologic variability. Sea-level rise, ocean acidification and wildfire risk factors are not applicable to the Sites Reservoir project. Operations modeling results demonstrate that Sites Reservoir will provide operational flexibility to sustain both public and private benefits under a range of climate change scenarios, including severe extended droughts. Refer to Sites_A2 Documentation WQ Priority 6 "WSIP Data and Information Summary for Water Quality Priorities 6 – Groundwater" uploaded under the PHYSICAL PUBLIC BENEFITS TAB and Attachment A.12, "Sites Reservoir Project Sources of Sites_A12 Uncertainty under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB.	
Additional locations in the application where data and relevant supporting information, including attachments, are documented (document name, page number, table number, etc.).	Application Reference: Sites_A2 Documentation WQ Priority 6 "WSIP Data and Information Summary for Water Quality Priorities 6 – Groundwater" uploaded under the PHYSICAL PUBLIC BENEFITS TAB Sites_A12 Uncertainty under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB.
REV 12: Undesirable Groundwater Results Corrected (Restore)	
Describe the current groundwater conditions within the claimed project improvement area(s), including, but not limited to: the estimated number of wells present, total pumping values for the basin, current land use, potential and existing beneficial uses, existing water quality values, soil information, geology of the area, and any applicable undesirable results listed at Water Code section 10721(x)(1-6).	
Refer to Sites_A2 Documentation WQ Priority 6 "WSIP Data and Information Summary for Water Quality Priorities 6 – Groundwater" uploaded under the PHYSICAL PUBLIC BENEFITS TAB	
Describe the expected without-project groundwater conditions in 2030 within the claimed project improvement area, including	

WSIP Data and Information Summary Table: Water Quality Priority 6 (Groundwater)	
the factors addressed for current conditions (above).	
Refer to Sites_A2 Documentation WQ Priority 6 "WSIP Data and Information Summary for Water Quality Priorities 6 – Groundwater" uploaded under the PHYSICAL PUBLIC BENEFITS TAB	
Describe the expected with-project groundwater conditions (after project implementation) in 2030 within the claimed project improvement area, including: the factors addressed for current conditions (above); how the project would coordinate with the appropriate GSA; how the project complies with SGMA if a GSA has not yet been assigned; and how the project would improve conditions in a groundwater basin/subbasin where undesirable results (as defined in Water Code 10721(x)(1-6)) caused by extraction have occurred.	
The Site project could potentially assist Participants achieve compliance under SGMA. Some of the participants are designated as a Groundwater Sustainability Agency (GSA) for affected groundwater basins, including but not limited to Colusa County, Colusa County Water District, Santa Clara Valley Water District, and Zone 7. Many other agencies participating in the Sites Project also participate in GSAs. These member agencies will be involved in the future integration of the Sites Project into their respective Ground Water Sustainability Plans (GSPs). In addition, Sites participants: Desert Water Agency, California Water Service, San Bernardino Valley Municipal Water District, Metropolitan Water District and San Gorgonio Pass Water Agency are affiliated with adjudicated groundwater basins. Antelope Valley - East Kern Water Agency is affiliated with a groundwater basin that is pending adjudication. The associated operations by participating agencies with adjudicated basins would be included in annual monitoring and reporting activities. Coachella Valley Water District, Desert Water Agency, Santa Clara Valley Water Agency, and Zone 7 Water Agency have submitted requests for an Alternative strategy to the GSP. The Alternative strategy could consist of a groundwater management plan or law authorizing ground water management within a specific basin. The Sites project could also be incorporated into the overall groundwater management strategy for the groundwater basins associated with these Participants.	
Additional locations in the application where data and relevant supporting information, including attachments, are documented (document name, page number, table number, etc.).	Application Reference: Sites_A2 Documentation WQ Priority 6 "WSIP Data and Information Summary for Water Quality Priorities 6 – Groundwater" uploaded under the PHYSICAL PUBLIC BENEFITS TAB

WSIP Data and Information Summary Table: Water Quality Priority 7 (Delta Tributary Flows)

Priority 7: Achieve Delta tributary stream flows that resemble natural hydrograph patterns or other flow regimes that have been demonstrated to improve conditions for aquatic life.

Instructions: This table must be used for projects claiming water quality priority 7. Descriptions and clarifying information should provide the rationale for the claimed improvements (e.g., how the values were determined, etc.). Attach up to three (3) additional pages if more space is needed.

Describe how the project would be designed and operated in a manner that resembles natural (unimpaired) hydrograph~~s~~ patterns or other flow regimes that have been demonstrated to improve conditions for aquatic life (e.g., native species and their habitats).

The Cache Slough area receives water from the Yolo Bypass. It is the only place in the Delta estuary where the Delta smelt population has recently increased. The goal for this operation of the Sites Reservoir Project is to benefit Delta smelt in the lower Cache Slough and lower Sacramento River areas by delivering water through the Yolo Bypass in the late summer and early fall. This flow regime is intended to increase the desirable food sources which should help improve Delta smelt growth and condition as they mature into adults, thereby increasing Delta smelt abundance over time. The key is to push water with a high population of phytoplankton and zooplankton directly into an area of good Delta smelt habitat, where additional production may occur.

Additional locations in the application where data and relevant supporting information, including attachments, are documented (document name, page number, table number, etc.).	Application Reference: Sites_A2 Operations under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB

Applicable water quality standards* for Delta tributary flows that would be improved by the project:

Tributary to the Delta (by segment as appropriate)	Time Period (days/months in year when standard applies)	Water Quality Standard Value and Unit	Source Citation
Rio Vista	September – December (minimum monthly average)	3,000 – 4,500 cfs	

*For the purpose of this table, water quality standards means the water quality objectives for river flows and Delta outflow in the California State Water Board's Water Quality Control Plan for the San Francisco Bay/Sacramento-San Joaquin Delta Estuary (2006).

REV 2: Magnitude

Provide flow values (cfs) for each tributary to the Delta that would be improved by the project:

Tributary to the Delta (by segment as appropriate)	Current Condition**	Without-Project Flow Condition in 2030	With-Project Flow Condition in 2030
Yolo Bypass (August – October)	15 TAF	24 TAF	64 TAF

**For the purpose of this table, "current condition" means conditions measured or estimated at the year of the CEQA Notice of Preparation (NOP) for the project or subsequently revised information used to describe existing conditions.

Provide additional clarifying information below, as needed.

The concept is that 2 pulses of flow of at least 400 cfs each over a 2–3 week period would be made into the Yolo Bypass via the Colusa basin drain past the Wallace Weir and Ridge Cut into the Tule Drain and flow through the Toe drain and out to the Sacramento River. With losses, each flow pulse made into the Colusa basin Drain would total about 24 TAF over each 2–3 week period. The flow pulses would be adaptively managed, but it is initially projected as a late summer and early fall release, perhaps in August and September. The release would not occur every year, but in most years a release would be desirable.

Additional locations in the application where data and relevant supporting information, including attachments, are documented (document name, page number, table number, etc.).	Application Reference: Sites_A2 Operations under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB

REV 3: Spatial Scale

Provide the geographical extent of the improvement for each tributary to the Delta that would be improved by the project. Attach a map of the improvement area.

Tributary to the Delta	Geographical Extent Improved in 2030

WSIP Data and Information Summary Table: Water Quality Priority 7 (Delta Tributary Flows)	
(by segment as appropriate)	(e.g., number of river miles improved)
Lower Sacramento River	
Provide additional clarifying information below, as needed.	
Benefits to food production would occur in the Cache Slough Complex and into the Lower Sacramento River a little upstream (tidal effects) and below where it enters the Sacramento. Benefits are anticipated at least to the confluence with the San Joaquin River at the tip of Sherman Island.	
Additional locations in the application where data and relevant supporting information, including attachments, are documented (document name, page number, table number, map number, etc.).	Application Reference:
REV 4: Temporal Scale	
Provide the time period(s) during the year (days or months) when the improvement would occur for each tributary to the Delta improved by the project:	
Tributary to the Delta (by segment as appropriate)	Expected Time Period Provided by Project in 2030
Lower Sacramento River Lower Sacramento River	August through October
Provide additional clarifying information below, as needed.	
Additional locations in the application where data and relevant supporting information, including attachments, are documented (document name, page number, table number, etc.).	Application Reference:
REV 5: Adaptive Management	
Describe the adaptive management and monitoring strategies for the claimed priority (e.g., potential management or corrective actions that could be taken if monitoring results fall outside of the range of expected values or if claimed improvements are not being achieved by the project). Include the potential measurable objectives, performance measures, thresholds, and triggers to monitor project performance and achievement of improvements.	
Would monitor the amount of water released, nutrients, and phytoplankton/zooplankton. Would rely on existing Delta smelt monitoring programs to track smelt benefits. The primary objectives and triggers would be the phytoplankton/zooplankton populations and the Delta smelt population response. Results in August through October time period should be highly reproducible. Adaptive measures would include changes in the timing of releases, the duration and magnitude of the pulse, and the magnitude of the pulse (in cfs).	
Additional locations in the application where data and relevant supporting information, including attachments, are documented (document name, page number, table number, etc.).	Application Reference: Sites_A2 Operations under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB. Emphasis on the Adaptive Management Framework section.
REV 6: Immediacy of Improvement Action	
Describe when the project would begin implementing actions toward achieving the improvement(s) associated with the claimed priority. Include the number of months expected to elapse between grant encumbrance and project implementation (i.e., completed projected construction and start-up of project element(s) that are expected to achieve the claimed priority). Include specifics by Delta tributary, as appropriate.	
Improvement is expected to begin in 2026 with initial pulse through the Colusa Basin Drain (48 months after grant encumbrance). Full scale operations expected in 2030.	
Additional locations in the application where data and relevant supporting information, including attachments, are documented (document name, page number, table number, etc.).	Application Reference:

WSIP Data and Information Summary Table: Water Quality Priority 7 (Delta Tributary Flows)	
REV 7: Immediacy of the Realization of Benefits	
Describe when the improvement(s) associated with the claimed priority would be realized by the project. Include the number of months expected to elapse from grant encumbrance to full realization of the improvement (i.e., improvement achieves the claimed magnitude at 2030). Include specifics by Delta tributary, as appropriate.	
Baseline monitoring should begin in 2025. Full realization of improvement (as measured by phytoplankton/zooplankton populations) anticipated in 2030. Benefit occurring in Lower Sacramento River.	
Additional locations in the application where data and relevant supporting information, including attachments, are documented (document name, page number, table number, etc.).	Application Reference:
REV 8: Duration	
Describe the duration of the improvement(s) associated with the claimed priority. Include the number of years that the project would deliver the full realization of the improvement (i.e., the claimed magnitude at 2030). Include specifics by Delta tributary, as appropriate.	
The duration of the improvement is expected to be 90 years (O&M period for the project per the planning horizon used in the application).	
Additional locations in the application where data and relevant supporting information, including attachments, are documented (document name, page number, table number, etc.).	Application Reference:
REV 9: Consistency	
Describe how the improvement(s) associated with the claimed priority would be consistent with water quality control plans, water quality control policies, and the Sustainable Groundwater Management Act. Include specifics by Delta tributary, as appropriate.	
Action is consistent with *Delta Smelt Resiliency Strategy* (California Natural Resources Agency, July, 2016)	
Additional locations in the application where data and relevant supporting information, including attachments, are documented (document name, page number, table number, etc.).	Application Reference:
REV 10: Connectivity	
Describe, if applicable, how the project would restore or create a hydrologic connection, as a result of water quality improvement(s), to areas that support beneficial uses of water or are being managed for water quality. If multiple connections are restored or created, include specifics by location.	
Not applicable	
Additional locations in the application where data and relevant supporting information, including attachments, are documented (document name, page number, table number, etc.).	Application Reference:
REV 11: Resilience to Climate Change at 2030	
Describe how the climate risk factors, identified in the General Application Questions for water quality priorities, were considered as part of the project siting and design for the claimed priority. Explain why any identified risk factors are not applicable.	
The CalSim II model considered temperature change, sea level rise, and changing precipitation. The long-term average increase in flow is estimated at 42 TAF under current conditions, 40 TAF under 2030 conditions, and 38 TAF under 2070 conditions. Flows provided into the Yolo Bypass toe drain would be greatly reduced in critical years with flows of 9 TAF under current conditions, 5 TAF under 2030 conditions, and 13 TAF under 2070 conditions. Deliveries into the toe drain are proposed for above normal, below normal, and dry years.	
Additional locations in the application where data and relevant supporting information, including attachments, are documented (document name, page number, table number, etc.).	Application Reference: Sites_A12 Uncertainty under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB
REV 12: Undesirable Groundwater Results Corrected	
Describe, if applicable, the current groundwater conditions within the claimed project improvement area(s), including, but not limited to: the number of wells present, total pumping values for the basin, current land use, potential and existing beneficial uses, existing water quality values, soil information, geology of the area, and any applicable undesirable results listed at Water	

WSIP Data and Information Summary Table: Water Quality Priority 7 (Delta Tributary Flows)	
Code section 10721(x)(1-6).	
Not applicable	
Describe, if applicable, the expected without-project groundwater conditions in 2030 within the claimed project improvement area, including the factors addressed for current conditions (above).	
Describe, if applicable, the expected with-project groundwater conditions (after project implementation) in 2030 within the claimed project improvement area, including: the factors addressed for current conditions (above); how the project would coordinate with the appropriate GSA; how the project complies with SGMA if a GSA has not yet been assigned; and how the project would improve conditions in a groundwater basin/subbasin where undesirable results (as defined in Water Code 10721(x)(1-6)) caused by extraction have occurred.	
Additional locations in the application where data and relevant supporting information, including attachments, are documented (document name, page number, table number, etc.).	Application Reference:

WSIP Data and Information Summary Table: Water Quality Priority 9 (Basic Human Needs)

Priority 9: Provide water for basic human needs, such as drinking, cooking, and bathing, in disadvantaged communities, where those needs are not being met.

Instructions: This table must be used for projects claiming water quality priority 9 that improve conditions in a non-public water system that serves a disadvantaged community (DAC). Descriptions and clarifying information should provide the rationale for the claimed improvements (e.g., how the values were determined, etc.). Attach up to three (3) additional pages if more space is needed. (Projects that provide water for public water systems, serve DACs, and that are not meeting their existing obligations to provide safe drinking water are not eligible for this priority due to those existing compliance obligations. However, projects that would, as an incidental benefit, provide higher quality water, while not specifically creating new drinking water projects, may be eligible and should describe this scenario where appropriate, below).

Describe how the project would provide water for basic human needs, such as drinking, cooking, and bathing, in DACs, where those needs are not being met. Include the additional expected volume (acre-feet per year) of suitable water that would be made available for a non-public water system(s) that serves DACs and the additional DAC population that would be served by the improved water supply. If incidental improvements to regional water quality are achieved, highlight the public water system(s) and non-public water system(s) that would benefit from that incidental improvement.

The project would provide supplemental surface water supplies to Sites Participants Municipal and Industrial (M&I) water providers located within disadvantaged communities (DACs) that have drinking water supplies that exceed California maximum contaminant levels for various naturally occurring and human-caused contaminants including arsenic, nitrates, hexavalent chromium, bacteria, radionuclides, and disinfection by-products. The primary source for drinking water in the majority of the DACs is groundwater. Supplemental high quality surface water supplies generated from the project could be made available to DACs with unsafe drinking water supplies. In some DACs, chronic lowering of groundwater has resulted in wells reportedly going dry during periods of drought. Groundwater level benefits from increased conjunctive use by Sites participants could also Refer to Sites_A2 WQ Priority 9, "Documentation for Water Quality Priority 9 –Basic Human Needs" uploaded under the PHYSICAL PUBLIC BENEFITS TAB for further information.

Additional locations in the application where data and relevant supporting information, including attachments, are documented (document name, page number, table number, etc.).	Application Reference: Refer to Sites_A2 WQ Priority 9, "Documentation for Water Quality Priority 9 –Basic Human Needs" uploaded under the PHYSICAL PUBLIC BENEFITS TAB.

Identify the DAC(s) addressed by the project using the Department of Water Resources Disadvantaged Communities Mapping Tool or other DAC identifier. Cite the source.

Refer to Sites_A2 WQ Priority 9, "Documentation for Water Quality Priority 9 –Basic Human Needs" uploaded under the PHYSICAL PUBLIC BENEFITS TAB.

Provide the population levels for the DACs benefited by the project:

DAC Location	Current DAC Population with Unmet Needs	2030 DAC Population Benefited by the Project
See Sites_A2 WQ Priority 9, "Documentation for Water Quality Priority 9 –Basic Human Needs" uploaded under the PHYSICAL PUBLIC BENEFITS TAB.		

Applicable water quality standards* for parameters/constituents that would be improved by the project:

Parameter/ Constituent	**Water Quality Standard Value and Unit**	**Source Citation**
Arsenic	0.01 mg/L	California MCL (22 CCR §64431)
Nitrate	10 mg/L as N	California MCL (22 CCR §64431)
Nitrate-Nitrite	10 mg/L as N	California MCL (22 CCR §64431)
Hexavalent Chromium	0.01 mg/L	California MCL (22 CCR §64431)
Coliform	<40 samples/month - More than 1 Total Coliform-positive sample in a month >40 samples/month - More than 5.0% Total Coliform -positive samples in a month	Acute Total Coliform MCL (22 CCR § 64426.1)
E. Coli	E.coli-positive repeat sample following Total Coliform -positive routine sample; or Total Coliform -positive repeat sample following an E.coli positive routine sample	E.coli MCL (Federal Revised Total Coliform Rule)
Radionuclides/Gross Alpha Particle Activity	Gross Alpha Particle Activity - 15 pCi/L Radium-226 + Radium-228 - 5 pCi/L	California MCLs (22 CCR §64441 and §64443—Radioactivity)

*For the purpose of this table, water quality standards means numeric or narrative water quality objectives, including maximum contaminant levels (MCLs), in water quality control plans adopted by the California State and Regional Water Boards.
mg/L = milligrams per liter

WSIP Data and Information Summary Table: Water Quality Priority 9 (Basic Human Needs)				
MCL = maximum contaminant level pCi/L = picocuries per liter				
REV 2: Magnitude				
Provide the parameter/constituent values (including units) for each surface water body or groundwater basin/subbasin that would be improved by the project and be available to a non-public water system that serves a DAC, or be available to DAC(s) that might receive incidental benefits.				
Water Body Name (including stream segment or groundwater basin/subbasin number, as applicable)	Parameter/ Constituent	Current Condition**	Without-Project Condition in 2030	With-Project Condition in 2030
Water quality improvements to surface water bodies or groundwater basins that would serve DAC would vary depending on where supplemental surface supplies would be delivered. Refer to Sites_A2 WQ Priority 9, “Documentation for Water Quality Priority 9 –Basic Human Needs” uploaded under the PHYSICAL PUBLIC BENEFITS TAB for further information.				
**For the purpose of this table, “current condition” means conditions measured or estimated at the year of the CEQA Notice of Preparation (NOP) for the project or subsequently revised information used to describe existing conditions.				
Provide additional clarifying information below, as needed.				
Additional locations in the application where data and relevant supporting information, including attachments, are documented (document name, page number, table number, etc.).			Application Reference: Refer to Sites_A2 WQ Priority 9, “Documentation for Water Quality Priority 9 –Basic Human Needs” uploaded under the PHYSICAL PUBLIC BENEFITS TAB for further information.	

REV 3: Spatial Scale	
Provide the geographical extent of the improvement claimed by the project for each location. Attach a map of the improvement area.	
Water Body Name (including stream segment or groundwater basin/subbasin number, as applicable)	Geographical Extent Improved in 2030 (e.g., river miles or acre-feet improved)
The geographical extent of water quality improvements to surface water bodies or groundwater basins that would serve DAC would vary depending on where supplemental surface supplies would be delivered. Refer to Sites_A2 WQ Priority 9, “Documentation for Water Quality Priority 9 –Basic Human Needs” uploaded under the PHYSICAL PUBLIC BENEFITS TAB for further information.	
Provide additional clarifying information below, as needed.	
Additional locations in the application where data and relevant supporting information, including attachments, are documented (document name, page number, table number, map number, etc.).	Application Reference: Refer to Sites_A2 WQ Priority 9, “Documentation for Water Quality Priority 9 –Basic Human Needs” uploaded under the PHYSICAL PUBLIC BENEFITS TAB for further information.

REV 4: Temporal Scale	
Provide the time period(s) during the year (days or months) when the improvement would occur for each location improved by the project:	
Water Body Name (including stream segment or groundwater basin/subbasin number, as applicable)	Expected Time Period Provided by Project in 2030
Water quality improvements to surface water bodies or groundwater basins that would serve DAC would vary depending on where supplemental surface supplies would be delivered. Refer to Sites_A2 WQ Priority 9, “Documentation for Water Quality Priority 9 –Basic Human Needs” uploaded under the PHYSICAL PUBLIC BENEFITS TAB for further information.	
Provide additional clarifying information below, as needed.	
Additional locations in the application where data and relevant supporting information, including attachments, are documented (document name, page number, table number, etc.).	Application Reference: Refer to Sites_A2 WQ Priority 9, “Documentation for Water Quality Priority 9 –Basic Human Needs” uploaded under the PHYSICAL PUBLIC BENEFITS TAB for further information.

</table>

WSIP Data and Information Summary Table: Water Quality Priority 9 (Basic Human Needs)	
REV 9: Consistency	
Describe how the improvement(s) associated with the claimed priority would be consistent with water quality control plans, water quality control policies, and the Sustainable Groundwater Management Act. Include specifics by location, as appropriate.	
Water quality objectives for waters affected by the project are specified in the basin plans for the North Coast, Central Valley, Tulare Lake, and the San Francisco Bay regions. The water quality objectives and beneficial uses are further described in Table 7.1 on pages 7-1 to 7-3 in Chapter 7, "Surface Water Quality" of the EIR/EIS.	
Additional locations in the application where data and relevant supporting information, including attachments, are documented (document name, page number, table number, etc.).	Application Reference: Table 7.1 pages 7-1 to 7-3 in Chapter 7, "Surface Water Quality" of the EIR/EIS located online here: [http://sitesproject.org/information/DraftEIR-EIS]
REV 10: Connectivity	
Describe, if applicable, how the project would restore or create a hydrologic connection, as a result of water quality improvement(s), to areas that support beneficial uses of water or are being managed for water quality. If multiple connections are restored or created, include specifics by location.	
The Sites Reservoir project would allow for greater operational flexibility to support maintaining hydrologic connection between surface and groundwater. Conjunctive use practices by Sites participants could reduce surface water diversions and improve surface water flows by using stored groundwater during dry and critical periods. In addition, supplemental water supplies from the Sites Reservoir project would assist with improving aquifer storage and groundwater levels. Refer to Sites_A2 Documentation WQ Priority 6 "WSIP Data and Information Summary for Water Quality Priorities 6 – Groundwater" uploaded under the PHYSICAL PUBLIC BENEFITS TAB	
Additional locations in the application where data and relevant supporting information, including attachments, are documented (document name, page number, table number, etc.).	Application Reference: Refer to Sites_A2 Documentation WQ Priority 6 "WSIP Data and Information Summary for Water Quality Priorities 6 – Groundwater" uploaded under the PHYSICAL PUBLIC BENEFITS TAB.
REV 11: Resilience to Climate Change at 2030	
Describe how the climate risk factors, identified in the General Application Questions for water quality priorities, were considered as part of the project siting and design for the claimed priority. Explain why any identified risk factors are not applicable.	
Various modeling scenarios were run to allow evaluation of how the benefits of the project can be sustained under potential future climate risk factors, including water quality changes, changing participation and runoff and extreme hydrologic variability. Sea-level rise, ocean acidification and wildfire risk factors are not applicable to the Sites Reservoir project. Operations modeling results demonstrate that Sites Reservoir will provide operational flexibility to sustain both public and private benefits under a range of climate change scenarios, including severe extended droughts. See Sites_A12 Uncertainty, "Uncertainty Analysis" uploaded under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB.	
Additional locations in the application where data and relevant supporting information, including attachments, are documented (document name, page number, table number, etc.).	Application Reference: See Sites_A12 Uncertainty, "Uncertainty Analysis" uploaded under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB.
REV 12: Undesirable Groundwater Results Corrected	
Describe, if applicable, the current groundwater conditions within the claimed project improvement area(s), including, but not limited to: the estimated number of wells present, total pumping values for the basin, current land use, potential and existing beneficial uses, existing water quality values, soil information, geology of the area, and any applicable undesirable results listed at Water Code section 10721(x)(1-6).	
The Sites Reservoir project would improve groundwater sustainability by supplying surface water to facilitate increased conjunctive use practices and for replenishment to enhance aquifer storage recovery. The Sites Reservoir project would improve groundwater in adjudicated groundwater basins, and medium and high priority basins defined under SGMA, including those in critical overdraft. Sites_A6C, "Groundwater Basins Affected by the Sites Reservoir Project:" uploaded under the ELIGIBILITY AND GENERAL PROJECT INFORMATION TAB provided a listing of potential groundwater basins that could be improved by the project. Improvements would occur by supplying supplemental surface water that could be used to facilitate increased conjunctive use practices and replenishment to enhance aquifer storage recovery. Sites operations would change the timing of available surface and groundwater supplies by providing Sites participants with supplemental surface water for storage, use or replenishment (typically in above normal and wet year conditions) and then recovering a portion of the water during periods of water supply shortages (in dry and critical year conditions) by groundwater pumping. Increased conjunctive use and replenishment operations	

WSIP Data and Information Summary Table: Water Quality Priority 9 (Basic Human Needs)	
would assist with improving chronic lowering of water levels and reduction of groundwater storage within the groundwater basins associated with Sites Participants. Incidental water quality, salt water intrusion and subsidence improvements may also result with increases in storage and water levels.	
Describe, if applicable, the expected without-project groundwater conditions in 2030 within the claimed project improvement area, including the factors addressed for current conditions (above).	
Generally speaking, in areas that rely wholly or predominantly on groundwater, only a portion of the water pumped percolates back to the groundwater system, resulting in net extraction of groundwater where groundwater pumping (in part due to recent dry conditions) has exceeded recharge. Sustainability of groundwater supplies depends largely on the amount of surface water available for use and groundwater replenish. The project would provide supplemental surface water supplies that would help to balance groundwater supplies. Without the project, it is anticipated that groundwater pumping would continue to exceed recharge during dry period that would result in increased groundwater storage deficits.	
Describe, if applicable, the expected with-project groundwater conditions (after project implementation) in 2030 within the claimed project improvement area, including: the factors addressed for current conditions (above); how the project would coordinate with the appropriate GSA; how the project complies with SGMA if a GSA has not yet been assigned; and how the project would improve conditions in a groundwater basin/subbasin where undesirable results (as defined in Water Code 10721(x)(1-6)) caused by extraction have occurred.	
The Site project could potentially assist Participants achieve compliance under SGMA. Some of the participants are designated as a Groundwater Sustainability Agency (GSA) for affected groundwater basins, including but not limited to Colusa County, Colusa County Water District, Santa Clara Valley Water District, and Zone 7. Many other agencies participating in the Sites Project also participate in GSAs. These member agencies will be involved in the future integration of the Sites Project into their respective Ground Water Sustainability Plans (GSPs). In addition, Sites participants: Desert Water Agency, California Water Service, San Bernardino Valley Municipal Water District, Metropolitan Water District and San Gorgonio Pass Water Agency are affiliated with adjudicated groundwater basins. Antelope Valley - East Kern Water Agency is affiliated with a groundwater basin that is pending adjudication. The associated operations by participating agencies with adjudicated basins would be included in annual monitoring and reporting activities. Coachella Valley Water District, Desert Water Agency, Santa Clara Valley Water Agency, and Zone 7 Water Agency have submitted requests for an Alternative strategy to the GSP. The Alternative strategy could consist of a groundwater management plan or law authorizing ground water management within a specific basin. The Sites project could also be incorporated into the overall groundwater management strategy for the groundwater basins associated with these Participants.	
Additional locations in the application where data and relevant supporting information, including attachments, are documented (document name, page number, table number, etc.).	Application Reference: Sites_A1 WQ Priority 6, “WSIP Data and Information Summary Table: Water Quality Priority 6 –Groundwater” uploaded under the PHYSICAL PUBLIC BENEFITS TAB. Sites_A6C, “Groundwater Basins Affected by the Sites Reservoir Project” uploaded under the ELIGIBILITY AND GENERAL PROJECT INFORMATION TAB

Program Requirements Tab

Attachment A.2: Cost Effectiveness

Provide documentation indicating the proposed project is cost-effective. If there is at least one feasible alternative means of providing the same amount or more of the total public and non-public physical benefits as provided by the proposed project, calculate, display and document the least-cost of these alternative means and justify the proposed project by comparison.

WSIP Application Instructions, March, 2017

Response

The proposed project has a benefit cost ratio of 1.5 as discussed in Sites_A9 BCA Results under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB. The Federal Feasibility Report (see https://www.sitesproject.org/information/FeasibilityReport) independently analyzed the project using somewhat different economic methodologies and also concluded that the project was cost effective with a benefit to cost ratio of 1.45 (see Chapter 7 of the Federal Feasibility Report).

Feasible alternatives were evaluated. The NODOS Investigation by DWR and Reclamation identified three primary alternative locations for surface storage as potential alternatives to Sites Reservoir (Colusa Complex, Newville Reservoir, and Red Bank Reservoir). These alternatives are discussed in Chapter 4 of the Federal Feasibility Report (see) and in Chapter 2 of the Draft EIR/EIS (see https://www.sitesproject.org/information/DraftEIR-EIS). Red Bank Reservoir was screened out due to less suitable diversion locations and environmental impacts.

To provide a preliminary economic assessment for the three surface storage measures, costs for the construction of the reservoirs and the associated conveyance were compared with yield and unit costs. These costs are presented in Table 1. The estimated average annual cost per yield is similar in magnitude for Sites and Newville Reservoirs. The construction cost of Colusa Reservoir Complex would be approximately 4.4 times that of Sites Reservoir, and six times that of Newville Reservoir, while the increase in yield over what would be produced by the Sites and Newville Reservoirs is approximately 10 to 25 percent.

Table 1. Comparison of Total Construction and Yield Cost in 2015 Dollars

Attribute	Measure		
	Colusa Reservoir Complex	Sites Reservoir	Newville Reservoir
Gross Storage (acre-feet)	3,000,000	1,810,000	1,900,000
Dead Storage (acre-feet)	100,000	40,000	50,000
Construction Cost	$20.1B	$4.5B	$4.8B
Average Annual Cost [a]	$708M	$159M	$169M
Estimated Average Annual Yield (acre-feet)	328,000	274,000	275,000
Average Annual Cost/Yield (acre-feet)	$2,160/acre-foot	$579/acre-foot	$615/acre-foot

Note: [a] Per WSIP guidance, annual costs were based on a 93-year operating period and a 3.5 percent discount rate. Annual cost shown does not include any allowance for interest during construction or future O&M costs

Auburn Dam was also considered as a potential alternative to Sites Reservoir. Reclamation estimated the cost for Auburn Dam at $9.9 billion (compared to $4.7 billion for Sites Reservoir) with an average annual yield of 229 TAF (compared to 450 TAF for Sites Reservoir) (*Folsom Auburn South Unit: Special Report: Benefits and Costs Update*, Reclamation, 2006).

As a result, the Newville Reservoir was determined to be the least cost alternative project that would result in comparable total overall benefits. Sites_A5 Documentation under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB includes a Least Cost Alternative that provides the same total physical benefits. No project specific estimates for Newville Reservoir non-construction costs were available. Therefore, a rough approximation of Newville Reservoir future full cost (i.e., including interest during construction, mitigation and future O&M costs) was estimated based on the corresponding Sites Reservoir costs and proportionally adjusted based on Newville's higher construction cost.

Consequently, assuming an eight year construction period and similar scheduling, the IDC cost for Newville Reservoir was estimated to be $820 million based on the WSIP required 3.5 percent discount rate. Environmental mitigation costs of $388 million were also assumed for the project. The present value of Newville Reservoir's total O&M expenses was estimated to be $838 million. Altogether, Newville Reservoir's estimated total project cost was estimated be $6,926 million in present value terms.

Throughout the analysis of benefits, the alternative project cost approach was used in monetization of several benefit categories (see Sites_A5 Documentation under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB). However, as discussed in the section, Shasta Lake Dam raise was determined to be a more appropriate alternative project for the benefit valuation of the Sites Reservoir's future ecosystem improvements.

Attachment 1 - WSIP Data and Information Summary for Water Quality Priorities 1 – Temperature

Methods

The 2015 current conditions data used in the analyses for the application was based on the DWR Delivery Capability Report and base scenario model released in July 2015 with project operations. The year 2015 was used for current conditions because the Delivery Capability Report and base scenario model the most recent and best data available for the analysis. Current conditions temperature modeling data for the WSIP application is presented in Sites_A6D Modeling Results Compendium under the ELIGIBILITY AND GENERAL PROJECT INFORMATION TAB.

The 2030 expected with- and without-project conditions analyses for the Sites Reservoir Project WSIP Application utilized the model products and assumptions described in section 6004(a)(1) of the code of regulations, including the 2030 and 2070 future conditions CalSim-II models provided by the California Water Commission on November 2, 2016. Temperature models for the primary river systems used the CalSim II reservoir storage, reservoir releases, river flows, and meteorological conditions to estimate reservoir and river temperatures. Water temperature models used were the Upper Sacramento River Water Quality Model (USRWQM) and U.S. Bureau of Reclamation Temperature Model (RECTEMP). A further description of the modeling used for the analysis is provided in Sites_A1 Modeling under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB. Temperature modeling data "Performance Measures Scorecard for Sites Reservoir Potential Beneficiaries", "Temperature Results DCR 2015 with Project vs DCR 2015 without Project", and "Temperature Results WSIP 2030 with Project vs without Project" are presented in Sites_A6D Modeling Results Compendium under the ELIGIBILITY AND GENERAL PROJECT INFORMATION TAB.

Water Quality Objectives and Beneficial Uses

Water quality objectives for waters affected by the project are specified in the basin plans for the North Coast, Central Valley, Tulare Lake, and the San Francisco Bay regions. Water quality objectives for water temperature are also specified in the SWRCB Water Quality Control Plan for Control of Temperature in the Coastal and Interstate Waters and Enclosed Bays and Estuaries of California. SWRCB Water Rights Orders 90-05 and 91 and the 2009 National Marine Fisheries Service (NMFS) biological opinion (BO) also include requirements related to storage and conveyance facility operations in order to achieve temperature compliance objectives.

The water bodies within the Project area support warm and cold fresh water habitat and other aquatic beneficial uses. Water bodies in these areas must maintain water temperatures supportive of resident and seasonal fish species habitats, particularly for endangered species. State Water Resources Control Board Order 90-5 compliance. Order 90-5 establishes water right requirements on the U.S. Bureau of Reclamation operations of Keswick Dam, Shasta Dam, the Spring Creek Power Plant and the Trinity River Division related to temperature control in the Upper Sacramento River for the protection of fishery resources and requires monitoring and reporting to evaluate compliance with those requirements.

As part of the requirements of the 2009 NMFS BO, the preparation of an annual temperature management plans by Reclamation are required to determine NMFS approved management strategies to protect the cold water pool of Trinity, Shasta, Folsom Reservoirs and acceptable temperatures at select compliance points within the river systems downstream of the reservoirs. State Water Project operations at Lake Oroville are also factored into the temperature management plans. The water quality objectives and beneficial uses are further described in Table 7.1 on pages 7-1 to 7-3 in Chapter 7, "Surface Water Quality" of the EIR/EIS. Water quality objectives specific to temperature for the Trinity River system and the Sacramento River are presented on Tables 7-2, 7-3 and 7-4.

Areas of Temperature Improvements

The project would increase coldwater pool conservation in Shasta Lake, Lake Oroville, and Folsom Lake and improve temperatures in the Sacramento and American Rivers during certain months at specific compliance points, particularly in Below Normal, Dry, and Critical water years. The areas of temperature improvement for these waterways are shown on Figures Water Quality P – 1a and P – 1b.

As discussed in the Operations Plan, Sites_A2 Operations under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB, it is thought that maximum temperature benefits in the Sacramento and American Rivers could be realized by emphasizing cold water releases during the months of highest potential water temperature related impacts (i.e., July through November). Adaptive management and monitoring would also be implemented to ensure that these benefits are achieved to the maximum extent possible. The areas of greatest temperature improvement are summarized in the "Performance Measures Scorecard for Sites Reservoir Potential Beneficiaries" are presented in Sites_A1 Modeling under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB. Temperature modeling data. All temperature modeling data is presented in "Temperature Results WSIP 2030 with Project vs without Project" are presented in" are presented in Sites_A1 Modeling under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB

Sacramento River

Approximately 59 river miles of the Sacramento River would be improved with the implementation of the Sites Reservoir Project downstream from Keswick Dam (River Mile 302) to the Red Bluff Diversion Dam (River Mile 243). Figure Water Quality P-1a shows the improvement area for the Sacramento River. Site project operations emphasize providing Sacramento River cold water releases during the months of July through November when it's most difficult to achieve temperatures water quality standards; therefore, the main focus of discussion regarding temperatures benefits is limited to this time of the year. Incidental benefits during other times of the year can also be seen, including January through February in most water year types in the Sacramento from below Keswick to Bend Bridge.

Sacramento River – Below Keswick

Long-term and water year type monthly temperature averages with and without the project in 2030 for the Sacramento River below Keswick Dam are presented in Table SQ2-1a. With the operation of Sites Reservoir project, temperatures would improve in August and September of dry water years and July through November in critical water years. Temperature benefits provided with the project in September during critical water years would assist to achieve compliance with 56◦F water quality standard; without the project temperatures would exceed 56◦F.

Sacramento River – Bonny view

Temperatures in the Sacramento River at Bonnyview would improve in August for all water year types, in September during dry water years, and July through November in critical water years. Temperature benefits provided with the project in August during critical water years would assist to achieve compliance with 56◦F water quality standard; without the project temperatures would exceed 56◦F. Long-term and water year type monthly temperature averages with and without the project in 2030 for the Sacramento River at Bonnyview are presented in Table SQ3-1a.

Sacramento River – Balls Ferry

In the Sacramento River at Balls Ferry, the project would improve temperatures in August for all water year types, in September during below normal and dry water years, and July through November in critical water years. Temperature benefits provided with the project in August during dry water years would assist to achieve compliance with 56◦F water quality standard; without the project temperatures would exceed 56◦F. Long-term and water year type monthly temperature averages with and without the project in 2030 for the Sacramento River at Balls Ferry are presented in Table SQ4-1a.

Sacramento River – Jelly's Ferry

Temperatures in the Sacramento River at Jelly's Ferry would improve in August for all water year types, in September during below normal and dry water years, and July through November in critical water years. Long-term and water year type monthly temperature averages with and without the project in 2030 for the Sacramento River at Jelly's Ferry are presented in Table SQ5-1a.

Sacramento River – Bend Bridge

Temperatures in the Sacramento River at Bed Bridge would improve in August for all water year types, in September during below normal and dry water years, and July through November in critical water years. Long-term and water year type monthly temperature averages with and without the project in 2030 for the Sacramento River at Bend Bridge are presented in Table SQ6-1a.

Sacramento River – Red Bluff

Long-term and water year type monthly temperature averages with and without the project in 2030 for the Sacramento River below Red Bluff are presented in Table SQ8-1a. With the operation of Sites Reservoir project, temperatures would improve in August and September of during below normal and dry years and August through November in critical water years. Temperature benefits provided with the project in September during critical water years would assist to achieve compliance with 56◦F water quality standard; without the project temperatures would exceed 56˚F.

American River

Cold water releases from Folsom Reservoir to the American River as part of site project operations are targeted during the months of July through November. During these months, it's most difficult to achieve temperatures water quality standards. The greatest benefits are seen between April and October during all water year types. Approximately 30 river miles of the American River would be improved with the implementation of the Sites Reservoir Project downstream from Folsom Dam to the mouth of the American River. Figure Water Quality P-1c shows the improvement area for the American River.

American River at Nimbus

Long-term and water year type monthly temperature averages with and without the project in 2030 for the American River at Nimbus Dam are presented in Table SQ9-1a. Modeling results indicate that temperatures in the American River at Nimbus would improve April through September during most water year types. The greatest benefits can be seen during the month of September.

American River at Watt Ave

Temperatures in the American River at Watt would improve during April through September in most water year types. The greatest benefits can be seen during the month of September. Long-term and water year type monthly temperature averages with and without the project in 2030 for the American River at Watt are presented in Table SQ10-1a.

American River at Mouth

At the mouth of the American River, temperatures would improve April during most water year types. The greatest temperature benefits provided with the project are July through September during critical water years. Long-term and water year type monthly temperature averages with and without the project in 2030 for the American River at the mouth are presented in Table SQ11-1a.

Attachment 1 - WSIP Data and Information Summary for Water Quality Priorities 6 –Groundwater

Methods

The 2015 current conditions data used in the analyses for the application was based on the DWR Delivery Capability Report and base scenario model released in July 2015 with project operations. The year 2015 was used for current conditions because the Delivery Capability Report and base scenario model the most recent and best data available for the analysis. Regional deliveries modeling data for the WSIP application is presented in Sites_A6D Modeling Results Compendium under the ELIGIBILITY AND GENERAL PROJECT INFORMATION TAB.

The 2030 expected with- and without-project estimated deliveries for the Sites Reservoir Project WSIP Application utilized the model products and assumptions described in section 6004(a)(1) of the code of regulations, including the 2030 and 2070 future conditions CalSim-II models provided by the California Water Commission on November 2, 2016. A further description of the modeling used for the analysis is provided in Sites_A1 Modeling under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB. Regional deliveries modeling data for the WSIP application “Regional Deliveries DCR 2015 with Project vs without Project” “Regional Deliveries WSIP 2030 with Project vs without Project” and “Regional Deliveries WSIP 2070 with Project vs without Project” are presented in Sites_A6D Modeling Results Compendium under the ELIGIBILITY AND GENERAL PROJECT INFORMATION TAB.

Regional Groundwater Improvements

The Sites Reservoir project would improve groundwater in adjudicated groundwater basins, and medium and high priority basins defined under SGMA, including those in critical overdraft. Sites_A6C Groundwater Basins under the ELIGIBILITY AND GENERAL PROJECT INFORMATION TAB provided a listing of potential groundwater basins that could be affected by the project. Improvements would occur by supplying supplemental surface water that could be used to facilitate increased conjunctive use practices and replenishment to enhance aquifer storage recovery. Sites operations would change the timing of available surface and groundwater supplies by providing Sites participants with supplemental surface water for storage, use or replenishment (typically in above normal and wet year conditions) and then recovering a portion of the water during periods of water supply shortages (in dry and critical year conditions) by groundwater pumping. Increased conjunctive use and replenishment operations would assist with improving chronic lowering of water levels and reduction of groundwater storage within the groundwater basins associated with Sites Participants. Incidental water quality, salt water intrusion and subsidence improvements may also result with increases in storage and water levels.

Conjunctive Use Management by Sites Participants

Several Sites Participants have already implemented or are in the process of implemented groundwater replenishment and conjunctive use programs in order to improve groundwater conditions. For example, Santa Clara Water District manages approximately 300 acres of groundwater recharge ponds and more than 90 miles of creeks that recharge approximately 156,000 acre-feet of groundwater each year (2013 California Water Plan Update). There are also several projects considered in the North Sacramento Valley and Sacramento Valley Integrated Regional Water Management Plans (IRWMP) that could potentially use water from Sites Reservoir to support sustainable groundwater management. These projects include:

- Stony Creek Fan Partnership Conjunctive Management Program
- Foothill stream restoration and recharge enhancement project;
- In-lieu recharge project in north-eastern Glenn County; and

- Glenn County surface and groundwater quality improvement project.
- Cooperative Program for Groundwater Studies between the County of Glenn and the Colusa Basin Drainage District

Increases in Regional Surface Water Deliveries

Table 1 shows the total annual increase in deliveries with the implementation of the project for averages over the long-term and for Dry and Critical water years. An annual breakdown for all water year types is presented in 'Regional Deliveries WSIP 2030 with Project vs without Project" are presented in Sites_A6D Modeling Results Compendium under the ELIGIBILITY AND GENERAL PROJECT INFORMATION TAB.

Hydrologic Region and Groundwater Basin Information

The Sites project has the potential to provide improvements to groundwater basins located within the Participant's service area, within Colusa County and near refuges when increases in Incremental Level 4 Refuge Water Supply would be delivered (Table 1). A description of the hydrologic regions is presented in Chapter 6, "Surface Water Resources" of the EIR/EIS. Detailed information regarding groundwater elevation and water wells data for these hydrologic regions can be found on DWR's Groundwater Level Monitoring Website (http://www.water.ca.gov/groundwater/data_and_monitoring/levels.cfm).

The greatest benefits from the Sites Project to groundwater are expected in the Sacramento Valley Hydrologic Region. Sites Reservoir would alter the regional water balance in the Sacramento Valley, thereby protecting the region from the long-term overdraft conditions that have come to characterize the San Joaquin Valley.

Sites Reservoir is an important component of regional water planning for Colusa and Glenn Counties. In 2014 and 2015, the Tehama Colusa Canal received no allocation of water from the Bureau of Reclamation due to the severity of the drought. At the same time, the Colusa subbasin was in an overdraft condition and NASA reported subsidence in the vicinity of Arbuckle, CA (approximately 30 miles south of the proposed location for Sites Reservoir). A recent study concluded that drought, not cropping patterns, is having the dominant effect on declining groundwater levels in this area (Davids Engineering, Inc., *Analysis of Land and Water Use in Relation to Groundwater Conditions in Colusa County*, 2016). The Sacramento Valley consists of fresh water aquifer systems underlain by larger saline water aquifer systems. Groundwater management must prevent mixing of the fresh and saline aquifer systems. Overpumping of groundwater without adequate recharge could result mixing of these system and degradation of water quality. Recharge throughout the area depends strongly on the availability of supplemental surface water. The reservoir would provide a much more stable water supply of surface water throughout the service areas of Sites participants in the Sacramento Valley (i.e., TCCA, RD 108, County of Colusa and Western Canal WD).

Climate Change Risks

Climate change projections indicate that California will experience more extreme weather, such as floods and droughts. At the same time, warming temperatures are expected to raise the snowfall elevation, causing more winter precipitation in the Sierra Nevada to occur as rainfall. This will lead to larger and earlier runoff events. As a result of these changes, several million acre-feet of natural snowpack storage could be lost annually, reducing available water supply. In addition, the increasing severity of storms and increased runoff could overwhelm existing reservoir flood protection capacity and increase flood risks downstream.

By expanding surface storage capacity, water supply systems would have greater flexibility to capture the increased winter runoff and help control larger anticipated flood flows. Additional reserve storage would also allow water to be held over for all uses in dry years and droughts.

Expansion of surface storage capacity can be an effective climate change adaptation strategy because increasing local and regional surface storage can provide greater flexibility for capturing runoff and managing supplies to meet increasingly variable future conditions. The ability to store water from wet years for use in dry years is critical to addressing increasing climate variability. Additional surface storage allows water to be held over from year to year as a hedge against dry years and droughts.

Surface storage provides ability to capture flood flows to protect downstream assets and quickly release large quantities of water when demands increase, or to meet instream temperature requirements.

Reservoirs also allow storage of water that can be released slowly at rates that match groundwater basin percolation rates and facilitate recharge of downstream groundwater basins.

The operational flexibility of Sites Reservoir allows for the delivery of water for public benefits where and when it is needed most while adapting to future conditions to provide sustained public benefits. For further information refer to the Sites_A12 Uncertainty under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB.

Attachment A2 – Documentation for Water Quality Priority 9 –Basic Human Needs

The Sites Project would provide supplemental surface water supplies to Municipal and Industrial (M&I) water providers whose service areas include disadvantaged communities (DACs) that have drinking water supplies that exceed California maximum contaminant levels for various naturally occurring and human-caused contaminants including arsenic, nitrates, hexavalent chromium, bacteria, radionuclides, and disinfection by-products. The primary source for drinking water in the majority of the DACs is groundwater. Supplemental high quality surface water supplies generated from the project could be made available to DACs with unsafe drinking water supplies.

In addition, the Sites Reservoir Project water deliveries could augment groundwater storage and water level benefited that could also provide water quality improvements. In some DACs, chronic lowering of groundwater has resulted in wells reportedly going dry during periods of drought. Groundwater level benefits from increased conjunctive use by Sites participants could also improve access to drinking water supplies in DACs with wells going dry, particularly in the Sacramento River Colusa Subbasins.

Methods

An evaluation of water supplies and public water systems within the hydrologic regions that will receive Sites Reservoir M&I water supplies and DACs was performed to identify potential disadvantaged communities where those basic human water needs, such as drinking, cooking, and bathing, are not currently being met. The State Water Resources Control Board (SWRCB) Human Right to Water Portal was used to identify water systems that currently do not meet drinking water standards. Water system details were obtained using the SWRCB's Safe Drinking Water Information System. DACs were identified using DWR's web-based Disadvantaged Communities Mapping Tool (DWR, 2015b). An overlay of the Sites Participant's service areas and DAC in areas with drinking water systems not currently meeting standards was performed.

Results

Table 1 presents the drinking water systems that are currently not meeting drinking water Standards in Participant Service Areas. These areas are also shown on Figures Water Quality P – 9a through Figures Water Quality P – 9c. The allocation of deliveries within each service area will be defined by each M&I participant and could vary from year-to-year depending on the needs of water users in that service area and specific timing and amount of deliveries from the Sites project.

Ecosystem Priority 1: Provide cold water at times and locations to increase the survival of salmonid eggs and fry

Improved Temperatures

Cold water benefits will be realized by operating Sites Reservoir and Shasta Lake in cooperation to preserve a greater volume of coldwater pool storage in Shasta Lake. This will be accomplished by substituting water from Sites Reservoir to meet a portion of the CVP water demand from Shasta (especially in the lower GCID and TCCA service areas) thus allowing cold water to be conserved in storage in Shasta Reservoir to benefit anadromous fish. This water will be released to maintain appropriate water temperatures in the Sacramento River, with particular emphasis on the months of highest potential water temperature related impacts. The area of temperature improvement for the Sacramento River resulting from the Project is shown in Figure A2-1 below and temperature improvements in Critical water years are shown in Table A2-1. Shasta Lake average end-of-month storage in May under simulated current, 2030, and 2070 dry water year conditions increases by 90 thousand acre feet (TAF) to 100 TAF above the respective without-project conditions.

Table A2-1. Temperature (°F) Improvements in Critical Water Years (July through September Period)

Sacramento River Location	Current Condition without Project (°F)	Current Condition with Project (°F)	Difference (°F)	WSIP 2030 without Project (°F)	WSIP 2030 with Project (°F)	Difference (°F)
Bonnyview	56.5	55.1	-1.4	56.5	55.9	-0.6
Balls Ferry	58.0	56.6	-1.4	58.1	57.5	-0.6
Jellys Ferry	59.2	57.9	-1.3	59.4	58.8	-0.6
Bend Bridge	60.1	58.9	-1.2	60.3	59.7	-0.6

Through releases from Sites Reservoir to meet TCCA and GCID irrigation diversions and equivalent reductions in CVP Shasta Lake releases, demands on Shasta Lake storage could be reduced and the coldwater pool maintained for a longer time at higher levels than are currently achievable. Shasta Lake release patterns could be shifted in season and between adjacent years to improve coldwater storage and flow management for salmon and other species using the portion of the Sacramento River between Keswick Dam and the Red Bluff Pumping Plant as habitat. Similar increases in storage can be achieved in Lake Oroville (average end-of-May increases of 25 to 35 TAF).

The operation of Sites Reservoir also provides opportunity for improved temperature conditions in the American River. Results for the American River at Watt Avenue are provided in Table A2-2 and the area of temperature improvement for the American River is shown in Figure A2-2.

Reduction in Sacramento River Winter-run Chinook Salmon Mortality

The estimated percent reduction in mortality to Winter-run Chinook salmon eggs and fry due to thermal benefits of the project are summarized in Table A2-3, separated by location and water year type.

Table A2-3. Estimated Percent Reduction in Mortality Due to Thermal Benefits of Project to Salmonid Eggs and Fry

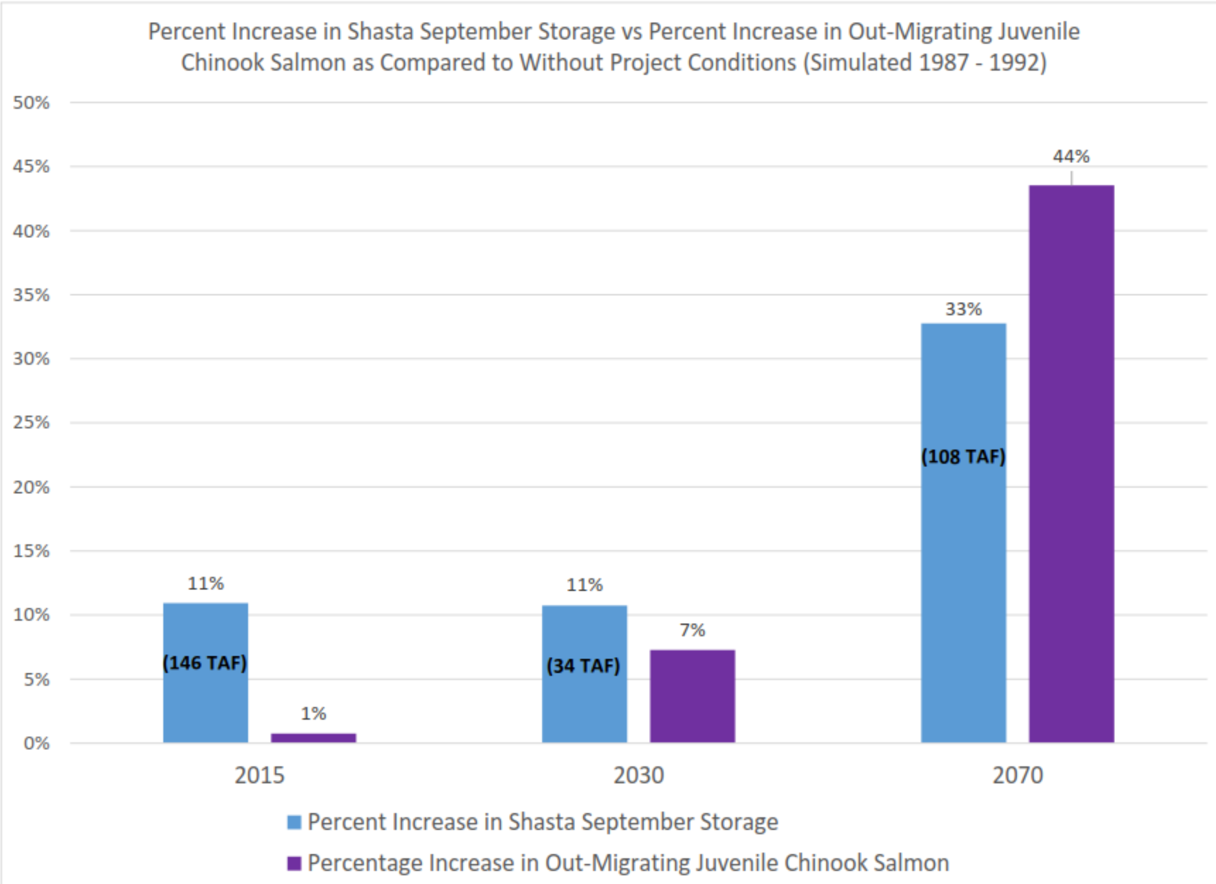
Beginning at Keswick Dam and continuing in a downstream direction the results were:

Sacramento River Below Keswick Dam (RM 302.0) (Table SQ2-1a)

Critical water years only (15% of total water years): During September 2030 without the project the mean monthly water temperature is projected to be 57°F, thus exceeding the upper water temperature optimum of 56°F for egg incubation, but less than the upper water temperature of 58°F for pre-emergent alevins. At this temperature it is expected that egg mortality will increase by 8 percent after 24 days of exposure. No increase in mortality for pre-emergent alevins will occur (Vogel 2015, Table 3, page 10). With the project in place 56°F will not be exceeded in September, and egg and alevin mortality will not increase over natural levels. Therefore, the project would reduce egg mortality during September by approximately 8 percent for those eggs remaining in redds. In October 2030 both with and without the project the mean monthly water temperature will rise to 58°F, thereby increasing egg mortality by 15 percent over 22 days of exposure for any remaining incubating eggs. The number of incubating eggs in October is expected to be small. There would be no increase in alevin mortality with or without the project (Vogel 2015, Table 3, page 10). Both operating scenarios would have similar results by increasing egg mortality during October. During November only pre-emergent fry remain in the spawning gravels and water temperatures with and without the project remain less than 58°F, indicating no increase in mortality with or without the project over natural levels.



*Values presented in TAF represent increases in Shasta September Storage as Compared to Without Project Conditions

Sacramento River at Bonnyview Bridge, Redding (RM 291.8) (Table SQ3-1a)

Note that most Winter-run spawning occurs (greater than 90 percent) upstream of this location which is 10.2 miles downstream of Keswick Dam.

Critical water years only (15% of total water years): During September 2030 the mean monthly water temperature without the project is projected to be 58°F, thus exceeding the upper water temperature optimum of 56°F for egg incubation, but not exceeding the thermal optimum of 58°F for pre-emergent alevins. The 58°F water temperature would result in an estimated 15 percent increase in egg mortality over a 22 day period for those eggs still incubating. With the project in place, egg mortality would decline to 8 percent over a 24-day exposure period (Vogel 2015, Table 3, page 10). Thus, the project would reduce egg mortality during September by approximately 7 percent. Pre-emergent alevins would not be exposed to greater mortality than natural levels with or without the project during September. During October 2030 egg mortality without the project is projected to be 59°F, thus exceeding the upper water temperature optimum of 56°F for egg incubation. This temperature would result in an estimated 25 percent increase in mortality over natural levels if exposed for 20 days for those eggs remaining. The number of incubating eggs in October is expected to be small. During October 2030 with the project the mean monthly water temperature is projected to be 58°F which would result in a 15 percent increase in egg mortality over natural levels if exposed for 22 days for those eggs remaining. Therefore, the project would reduce egg mortality by 10 percent at this location during October. Without the project pre-emergent alevins would be exposed to a 10 percent higher mortality rate if exposed for 14 days. With the project, no increase in mortality would occur. Therefore, the project would reduce pre-emergent alevin mortality by 10 percent over the without project scenario. During November only pre-emergent fry remain in the spawning gravels and water temperatures with and without the project remain less than 58°F, indicating no increase in mortality with or without the project.

Sacramento River at Balls Ferry (RM 276.0) (Table SQ4-1a)

Note that all Winter-run spawning occurs 13 miles or further upstream of this location. Balls Ferry is 26 miles downstream of Keswick Dam. No redds with incubation eggs and pre-emergent alevins would be located at Balls Ferry. Balls Ferry is a water temperature compliance point with a target water mean daily water temperature of 56°F (State Water Resources Control Board WR 90-5 [1990]).

Dry water years only (22% of total water years): During September of 2030 mean monthly water temperature is projected to reach 57°F, thus exceeding the upper water temperature optimum of 56°F for egg incubation, but not exceeding the thermal optimum of 58°F for pre-emergent alevins. At this temperature it is expected that egg mortality would increase by 8 percent after 24 days of exposure, if eggs were actually present at this location. No increase in mortality for pre-emergent alevins would occur if alevins were actually present (Vogel 2015, Table 3, page 10). With the project in place 56°F would not be exceeded in September, and egg and alevin mortality would not increase over natural levels were eggs and alevins actually present at this location. Therefore, the project would reduce egg mortality during September by approximately 8 percent for those eggs remaining in redds if eggs were actually present at Balls Ferry. In October 2030 the opposite is true, with the project resulting in a mean monthly water temperature of 57°F and without the project a projected 56°F. Therefore, the theoretical increase in egg mortality would be 8 percent with the project and no increase without the project. No impact to pre-emergent alevins would occur with and without the project if alevins were actually present at this location.

Critical water years only (15% of total water years): The mean monthly water temperature index of 56°F for egg incubation is exceeded from July through October 2030 both with and without the project. In July the mean monthly water temperature with and without the project is 57°F which would result in an 8 percent increase in mortality over natural levels if exposed for 24 days (Vogel 2015, Table 3, page 10). In August this value would increase to 58°F without the project, but remain at 57°F with the project. Therefore, in August, the project would reduce egg mortality by 15 percent if exposed for 22 days. During September the mean monthly water temperature would increase to 60°F without the project and 59°F with the project. Thus, egg mortality would increase by 50 percent without the project over a 12-day exposure and 25 percent with the project over a 20 day exposure. Therefore the project would reduce egg mortality by 25% in September. During October the mean monthly water temperature both with and without the project is 59°F, resulting in an increase in egg mortality of 25 percent for a 20 day exposure for those few eggs still incubating. Pre-emergent alevins would not be exposed to increased mortality until September 2030. During September the mean monthly water temperature is projected to reach 60°F without the project and 59°F with the project. The respective increases in alevin mortality greater than natural levels are 25 percent over a 14-day exposure period and 10 percent over the same period (Vogel 2015, Table 3, page 10). Therefore the project would reduce alevin mortality by 15% in September. During October 2030, the mean monthly water temperature is 59°F with and without the project resulting in a 10 percent increase in mortality over a 14-day period for remaining alevins had they actually been present at Balls Ferry. Alevin mortality would not increase above natural levels during November 2030 for any fish remaining in redds.

In summary, in the reach of the Sacramento River used by spawning Winter-run Chinook salmon from Keswick Dam to Clear Creek, the proposed project in 2030 will reduce the percentage of egg mortality in September and October of critically dry water years from 7 to 10 percent depending on location. In the spawning reach pre-emergent fry (alevins) would not be impacted adversely by water temperature with or without the project.

Species Conservation Plans

The ecosystem improvement is consistent with two recovery actions of National Oceanic and Atmospheric Administration (NOAA) Fisheries Recovery Plan for Winter-run Chinook salmon, Spring-run Chinook salmon, and Central Valley steelhead in the mainstem Sacramento River (National Marine Fisheries Service [NMFS] 2014). The actions in the NOAA Fisheries that will be met are: (1) to develop and apply alternative diversion technologies that reduce entrainment, and (2) evaluate and reduce stranding of juvenile chinook salmon in the channels from Keswick Dam to Colusa, due to flow reductions from Keswick Reservoir, by increasing or stabilizing releases from the reservoir. The ecosystem improvement is also consistent with three of the proposed actions listed in the Sacramento Valley Salmon Resiliency Strategy. These actions are: (1) increase productivity by improving spawning and incubation conditions (habitat and water quality); (2) increase productivity by increasing juvenile salmonid survival; and (3) support the full range of juvenile and adult migration conditions to maintain life history diversity. The project will meet these actions by providing increased flows and management of intake diversions to benefit salmonids in the Sacramento River below Keswick Dam. With improved flows, the project will also enhance and improve the quality of Essential Fish Habitat (EFH) and Designated Critical Habitat (DCH). Essential Fish Habitat is defined in the Magnuson-Stevens Act (MSA) as the waters and substrate necessary for fish spawning, breeding, feeding, or growth until maturity (MSA § 3(10)). The project will improve EFH for Pacific Coast Salmon (all four runs of Chinook included) by providing enhanced thermal refugia, floodplain habitats, and spawning habitat which included in the habitat areas of particular concern for Pacific Coast Salmon (Pacific Fishery Management Council [PFMC] and NMFS 2014). The US Fish and Wildlife Service defines DCH by considering those physical or biological features that are essential to the conservation of a given species, and designating specific areas within the geographic area occupied by the species at the time of listing. The project will provide enhanced DCH’s primary constituent elements (PCE) as defined in 70 FR 52488 for steelhead. These PCEs are as follow: more suitable flow conditions, additional rearing sites, and increase in downstream passage.

Ecosystem Priority 2: Provide flows to improve habitat conditions for in-river rearing and downstream migration of juvenile salmonids

The additional water stored in Shasta Reservoir will be released to augment Sacramento River flows downstream from Keswick Dam. These flows will simulate punctuated high flow events that would trigger increased activity in downstream movement of juvenile Chinook Salmon. The greatest value in providing increase in flows in the Sacramento River below Keswick Dam is to emigrating juvenile Winter-run, Fall-run, and Late fall-run Chinook salmon. Similarly, increased water stored from Lake Oroville and Folsom Lake will also be released to benefit habitat conditions for in-river rearing and downstream emigration of juvenile Chinook salmon in the Feather and American rivers.

Sites Reservoir would provide a 4.2% (338 cubic feet per second [cfs]) long term average increase in flows in the Sacramento River between Keswick Dam and the Red Bluff Diversion Dam (Table A2-4). Model results using different water year types show that there is a 7.0% (380 cfs) increase in flows in below normal water years and a 7.6% (334 cfs) increase in flows in dry water years. In 2030, there is a 2.5% (209 cfs) long term average increase in flows, a 3.4% (169 cfs) increase in below normal water years, and a 10.8% (495 cfs) increase in dry water year flows.

Table A2-4. Stabilize Sacramento River Fall Flows

Flow Increase (Nov-Feb)	Current Condition Increase (cfs)	Current Condition Increase (%)	2030 Increase (cfs)	2030 Increase (%)	2070 Increase (cfs)	2070 Increase (%)
Long Term Avg	338	4.2	209	2.5	93	1.1
Below Normal	380	7.0	169	3.4	127	2.2
Dry	334	7.6	495	10.8	163	3.8

Flow augmentation in the Sacramento River was estimated using the WSIP and provided CALSIM model that showed benefits to fall-run and late fall-run Chinook salmon productions (Table A2-5).

Table A2-5. Increased Juvenile Production Compared to Without Project (SALMOD 2030)

Year Type	Fall-run	Late fall-run
Long Term Avg	435,000	70,188
Wet	28,401	37,827

Ecosystem Priority 14: Ecosystem Priorities Application Worksheet– Terrestrial

Effects of Water Reductions at Refuges:

Reduction in water allocations of 50% to 25% of normal deliveries at Sacramento, Colusa and Delevan NWRs during dry or critically dry years would have the following impacts on wetland habitat and wetland dependent species (source: Drought Contingency Plans for Sacramento, Colusa and Delevan NWRs - USFWS 2011a, 2011b, 2011c).

For 50% of normal deliveries, wetland acreage at the three refuges would be reduced by 30–50%. Composite acreages of seasonal and permanent wetlands at all three refuges totals 15,525 acres (based on 2010 data), which includes 13,722 acres of seasonal wetlands (timothy grass and water grass) and 1,803 acres of permanent and semi-permanent wetland/brood ponds. A 30–50% reduction for permanent and seasonal wetlands would amount to a loss of 4,658 to7,762 acres. For 25% of normal deliveries, total wetland acreage at the three refuges would be reduced by 60-70%, amounting to loss of 9,315 to 10,867 acres. In addition to the direct loss of wetlands, longer term impacts would also occur to future wetland habitat quality throughout the refuges. Loss of permanent pond acreage would be 80% for both the 50% and 25% reductions of normal deliveries. Other impacts on wildlife of reductions to 50 to 25% of normal deliveries include:

- Very early spring draw-downs of wetlands which severely limits shorebird habitat and results in poor germination for important wildlife and waterfowl plants.
- Loss of permanent pond acreage adversely affects habitat for special-status species such as giant garter snakes, tricolored blackbirds, western pond turtles, and for duck broods.
- Complete elimination of irrigation for annual food plants and control of invasive species such as cocklebur, resulting in increased mowing/diesel fuel consumption to mitigate.
- Flood-ups delayed on remaining acreage, resulting in widespread crop depredation in nearby agricultural lands.
- Extreme waterfowl crowding and disease risk (avian botulism (Type C) and avian cholera).
- Reduced public use on all refuge habitats reduced (or eliminated for 25% of water delivery scenario) other than having the Sacramento National Wildlife Refuge (NWR) visitor center open, and visitor use would decrease to a fraction of normal.

Value of Ricelands to Wildlife

The Central Valley of California supports one of the largest concentrations of wintering waterfowl in the world, despite loss of 90% of its historic wetlands. The 6–7 million waterfowl that winter annually in the Central Valley rely upon a mix of wetland and agricultural food resources to meet their energetic needs (Eadie et al. 2008, Petrie et al. 2016). Flooded rice fields and surrounding refuge wetlands in the Sacramento-San Joaquin Valley function as some of the most important waterfowl wintering habitat on the Pacific Flyway, supporting the majority of Flyway population in some years (Migratory Bird Conservation Partnership 2014). Ricelands are indispensable components of waterbird habitat; residual rice, weed seeds, and invertebrates provide food for many avian species during fall and winter (Eadie et al. 2008). Ricelands also provide breeding habitat for a variety of birds, and rice fields that are flooded after harvest (i.e., winter flooded) to decompose rice straw provide many of the same habitat values for waterfowl as the wetlands that they replaced. Droughts adversely affect foraging habitat for wildlife that depend on Central Valley seasonal wetlands and ricelands. An analysis by Petrie et al. (2016) found that in droughts food supplies could be exhausted for ducks by mid- to late winter and by late winter or early spring for geese. For ducks, these results were strongly related to projected declines in winter-flooded rice fields that provide 45% of all the food energy available to ducks in the Central Valley in non-drought water years (Petrie et al. 2016).

CalSim Model Runs - Refuges

Table A2-6 summarizes CalSim II Model Runs conducted on June 21, 2017 and show the net increase in water supply available for all refuges with implementation of the project.

Table A2-6. Difference: WSIP 2030 With Project minus WSIP 2030 Without Project, Refuge Water Supplies (Central Valley Project [CVP] Contract, Sites and Acquisitions Supplies), Long-term Average and Average by Water Year Type

	Total Refuge L2 (Mar–Feb TAF)	Total Refuge L4 (Mar–Feb TAF)
Long-term		
Full Simulation Period[1]	8	35
Water Year Types[2]		
Wet (30%)	3	53
Above Normal 15%	3	47
Below Normal 21%	9	38
Dry 20%	14	21
Critical 15%	11	1

[1] Based on the 82-year simulation period
[2] As defined by the Sacramento Valley 40-30-30 Index Water Year

Deliveries of additional Level 2 and Level 4 water during dry and critically dry years would avoid loss of up to 10,867 acres of wetland habitat on the Sacramento, Colusa, and Delevan NWRs, and the other direct and indirect impacts of reduced water availability described above.

Refuges in the Mendota Pool and the Tulare Basin could also benefit from additional deliveries from the Sites Project. Refuges in these areas include the Kern and Pixley NWR and the CDFW Mendota Wildlife Area. Additional water supply is needed to meet the goals and objectives outlined in the Comprehensive Conservation Plan for Kern and Pixley National Wildlife Refuges (USFWS 2005) and also to improve management of seasonal and permanent wetlands in the Mendota Wildlife Area. Table A2-7 summarizes the results of CalSim II Model Runs that shows the average increased availability of water for refuges and other beneficiaries in the Mendota Pool and Tulare Basin in 2030 with the project, and also the increased water supply available during dry and critically dry years.

Table A2-7. Difference: WSIP 2030 With Project minus WSIP 2030 Without Project for Sites Deliveries of Incremental Level 4 Refuge

Modeled Beneficiaries	Average Increase in Deliveries (TAF/yr)	Dry and Critical Increase in Deliveries (TAF/yr)
Mendota Pool	28	10
Tulare Basin	6	2

CalSim Model Runs - Ricelands

As shown in Table A2-8 and Table A2-9, additional water would be available to support rice plantings in dry and critically dry years with the project. Table A2-8 and Table A2-9 summarize CalSim II Model Runs conducted on June 21, 2017 and show the net increase in water supply available for agricultural users in the Central Valley with implementation of the project.

Ecosystem Priority 15: Develop and Implement Invasive Species Management Plans

Consistent with this priority, the Authority will create habitat in the vicinity of reservoir on lands that are not accessible to the public. This area is currently covered with yellow star thistle (*Centaurea solstitialis*) and goatgrass (*Aegilops triuncialis*). The yellow star thistle will be eliminated and replaced with species characteristic of native California prairie.

Figure A2-3: Virgate tarplant

Central Valley Prairie

Plant Composition: Burcham (1957) mapped most of "pristine California Prairie" in the Central Valley before agriculture had converted most of this habitat to cropland. His mapping matches the early Valley's accounts by John Muir who described the California Central Valley (CV) Prairie as a sea of wildflowers with little grass. He identified numerous colorful forbs from the genera of Layia, Lasthenia, Lupinus, and Eschscholzia dominating the prairie in spring, and a second late summer domination by flowering forbs like virgate tarplant (*Holocarpha virgata*) and its other Asteraceae relatives. Additionally, there are summer blooming perennials like narrow-leaved mule's ears (*Wyethia angustifolia*) and perennial lupine (*Lupinus formosus*) that survive in CV Prairie relic areas where purple needlegrass (*Stipa pulchra*) would be expected.

Extent: Since Burcham's mapping, much of the CV Prairie habitat was lost to urbanization and cultivation. The CV Prairie closely corresponds with the extent of California Grassland habitat in the Central Valley.

Soils: Prairie soils do not support trees and shrubs because their hardpans and clay horizons keep most water too close the soil surface. Some believe California prairie was once covered by bunchgrasses (which are now uncommon), but there is little documentation or evidence for this belief. In fact annual wildflowers covered the floor of the Valley. California Central Valley Prairie typically occurs on alluvial valley soils that favor herbaceous vegetation because of their fine texture and often abundant clay. Before urbanization and cultivation, CV Prairie primarily occurred on "*recent alluvium*", so named by geologists because it was deposited during the 10,000 years since the last Ice Age. However, because of the high fertility and low relief, this soil type became the prime land for agriculture and development. Currently the last extant areas of CV Prairie are now found on "*older alluvium*" that was formed from 10,000 to 2 million years ago. Soils in these areas are coarser, less fertile, hillier, and farther from the Valley center. As a result of that, these areas are less often cultivated or urbanized and are very often used for grazing, a land use that in some cases preserves native prairie plants.

The CV Prairie fine and clayey soils are a great substrate for rhizomatous grasses and shallow rooted annual species because they can densely cover its moist and fertile surface. In contrast, coarse and sandy soils favor deep and wide extending roots of bunch grasses, trees and shrubs because water and air can penetrate freely, however, water and nutrients are scarce near the surface.

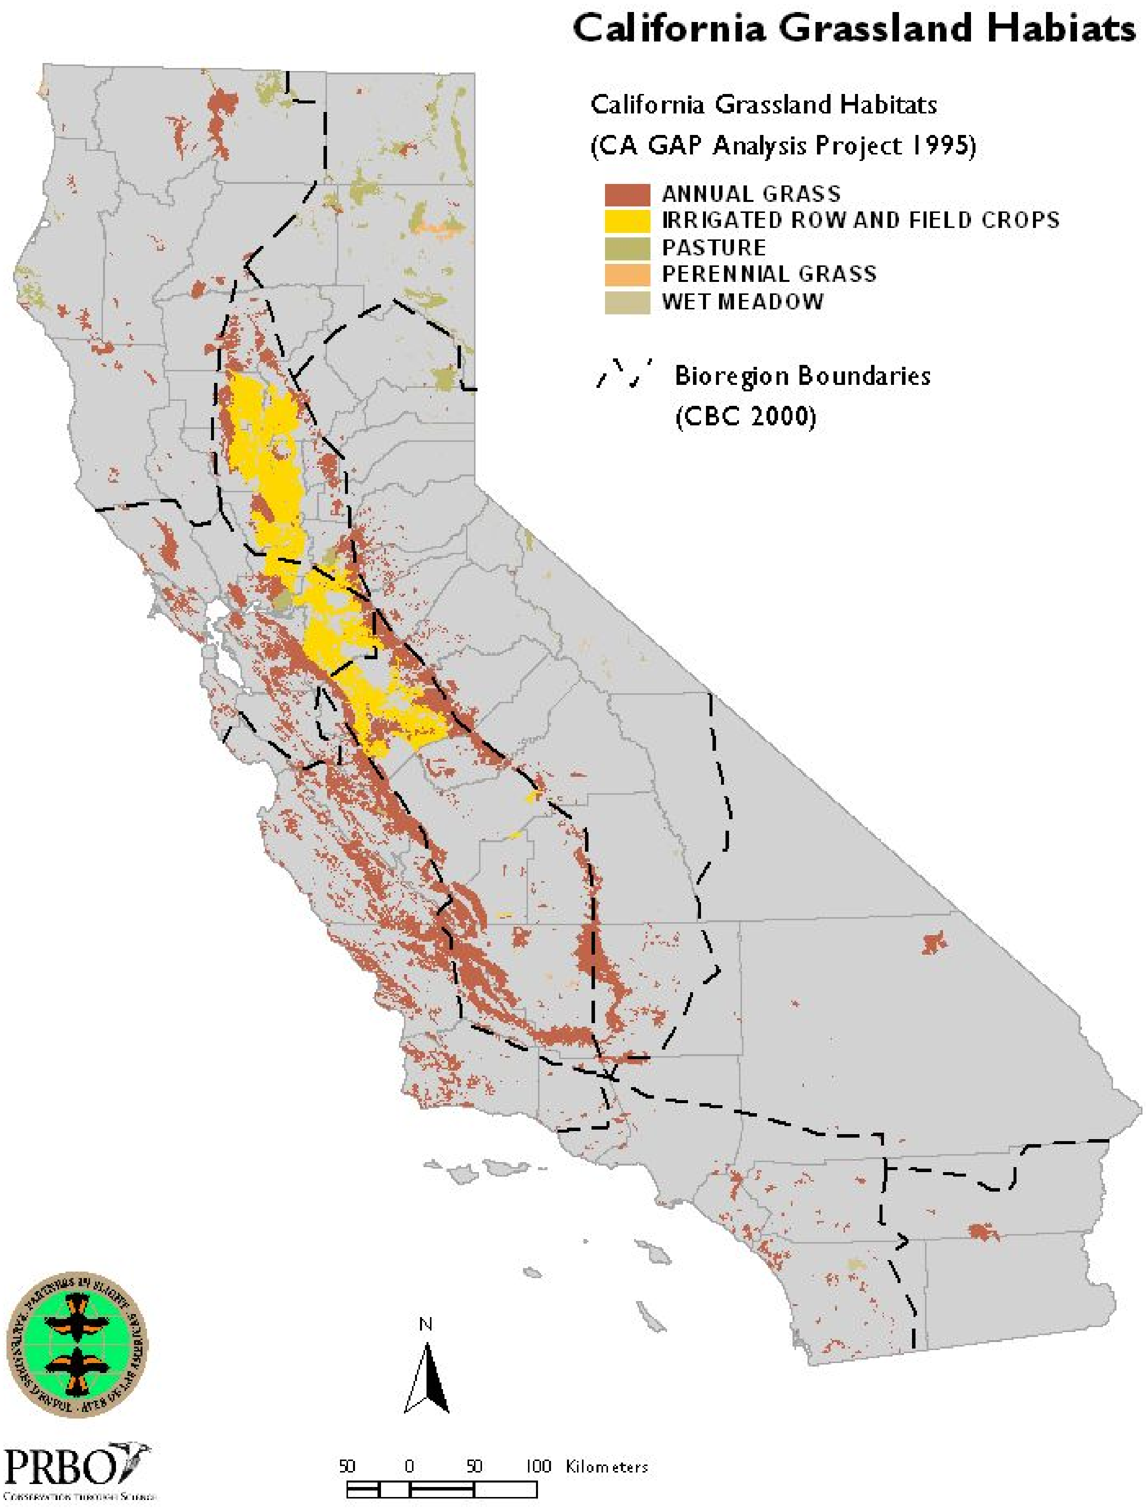

Figure A2-4 California Grassland Habitats mapped in 1995 by the GAP Analysis Project

Plants: The CV Prairie differs from other prairies of the world in both identity of the perennial species and the larger number and the importance of annuals (Beetle 1947). Typical fine clayey soils of the CV Prairie would have the creeping wildrye (*Leymus triticoides*) as a dominant grass species along with large number of annual forbs such as California poppy (*Eschscholzia californica*), purple owl clover (*Orthocarpus purpurascens*), virgate tarplant, tidytips (*Layia platyglossa*), narrowleaved mule's ears (*Wyethia angustifolia*), perennial lupine (*Lupinus formosus*), Ithuriel's spear (*Triteleia laxa*), tomcat clover (*Trifolium willdenovii*), gilia (Gilia tricolor), (*Orthocarpus erianthus*), blue-eyed grass (*Sisyrinchium bellum*), and various other species of the genera *Layia*, *Brodiaea*, *Calandrinia*, *Nemophila*, *Castilleja*, and *Lupinus*. On the marginal coarse soils along the edges of the valley, bunchgrasses such as purple needlegrass (*Stipa pulchra*), and nodding needlegrass (*Stipa cernua*), were dominant along with important associates such as blue wildrye (*Elymus glaucus*), pine bluegrass (*Poa scabrella*), and deergrass (*Muhlenbergia rigens*).

Central Valley Prairie Importance

Despite the fact that the CV Prairie provides critical foraging habitat for the golden eagle, nesting and feeding habitat for native bees, refuge borrows for amphibians, and habitat for rich native flora and fauna, CV Prairie does not receive as much attention as the often adjacent vernal pool and riparian habitats for which it serves as an important buffer.

Habitat for Native Plant Diversity: The CV Prairie provides the optimal habitat for hundreds of native plant species that have adapted to the fine clayey soils and high water table in these areas.

Golden Eagle Foraging Habitat: Golden Eagles live in open and semi-open country featuring native vegetation across most of the Northern Hemisphere.

Plant Pollinator Habitat: The spring growth of native forbs represents a tremendous food resource for pollinators. Bees, bumblebees, beetles, hummingbirds, bats, butterflies, moths, and flies are some of the pollinators needed by 90% of flowering plants and over 30% of food crops (Pollinator Partnership 2010). CV Prairie provides food and shelter for bees and other insects that pollinate our food crops. The importance of these native pollinators, especially ground and twig nesting bees, is increasing due to the current collapse of populations of the European honeybee.

Central Valley Prairie Creation Approach

Site Preparation: In areas where residual native species cover is present, it will be preserved. At the same time invasive species will be controlled and additional native species seeded. However, very often, there are virtually no residual native plants at heavily grazed sites and the "blank slate" restoration approach will be adopted if that is the case at the Sites Reservoir restoration areas. The soil texture, compaction, profile and chemistry, as well as hydrology will be closely analyzed during this phase to determine the best composition of native plant species to be seeded.

Existing Weed and Weed Seedbank Removal: Non-native vegetation eradication involves removal of the existing exotic species to the greatest extent possible (including the seed bank) and installing a native plant community from seed. Typically, existing vegetation eradication consists of three to four times repeated shallow tilling and irrigation cycles to exhaust the seed bank followed by re-seeding with native vegetation. Hard to eradicate weed species such as the yellow star thistle (*Centaurea solstitialis*) and goatgrass (*Aegilops triuncialis*) a more intense eradication methods such as burning, solarization and as a last resort herbicide spraying may be used. It will be also very important to control these invasive species in weed infested areas adjacent to and up-wind of the project. Increasing the cover and diversity of native forbs - either by actively planting them or by removing the invasive species with which they compete— will greatly contribute to the restoration success. As one example, hayfield tarplant (*Hemizonia congesta*) is often added to a native bunchgrass seed mix specifically to armor restored grasslands against re-invasion by yellow star thistle because it is the greatest impediment to successful grass establishment. Annual applications of a broadleaf herbicide are also often necessary to keep it at bay. While herbicides are effective, an ecosystem that depends on regular herbicide application does not meet the definition of self-sustaining. A promising technique for providing natural invasion resistance to restored grasslands is to select native species that compete strongly for the same resources as likely invaders (Young et al. 2009). Native tarplants are among the grassland species most analogous to yellow star thistle in the timing of growth and seed set. These late-season annual forbs germinate with the first fall rains and spend the winter and spring developing a tap root. Doing so allows them to take advantage of deep soil moisture in the summer and to flower and set seed long after the majority of annuals have completed their life cycle. Yellow star thistle is more effectively eliminated if a diversity of native late season forbs is planted that compete for resources with the thistle in slightly different ways. As another example, effective control of the invasive annual barbed goatgrass (*Aegilops triuncialis*) with analogous native species results in a natural resurgence of native forbs and a corresponding increase in the activity of native bees.

Seed Collection and Seeding: Because disturbed CV Prairie usually lacks any significant native seed bank, restoring prairie will require the reseeding of native species. Native species should be collected from the nearest vicinity around Sites Reservoir and can be seeded either manually with belly grinders, by the hydro-mulching method or with seed-drillers if the amounts of seed are small. Seed collection should be initiated immediately after project start so that sufficient seed amounts and diversity are available at the time of installation. The traditional approach to prairie restoration emphasizes the establishment of native bunch grasses. Following site preparation, a seed mix of up to seven native grass species is applied.

Ecosystem Priority 16: Ecosystem Priorities Application Worksheet– Terrestrial

CalSim Model Runs - Refuges

Table A2-10 summarizes CalSim II Model Runs conducted on June 21, 2017 and show the net increase in water supply available for all refuges with implementation of the project.

Native Species Benefiting from Implementation of the Project

The following native species occur on the Sacramento NWR Complex refuges and have commercial, recreational, scientific, or educational uses and values, and would benefit from implementation of the project:

Table A2-11. Waterfowl

Common Name	Scientific Name
Ross's Goose	*Chen rossii*
Snow Goose	*Chen caerulescens*
Green-winged Teal	*Anas crecca*
Gadwall	*Anas strepera*
Cinnamon Teal	*Anas cyanoptera*
Northern Shoveler	*Anas clypeata*
Greater White-fronted Goose	*Anser albifrons*
Northern Pintail	*Anas acuta*
Western Meadowlark	*Sturnella neglecta*
Ruddy Duck	*Oxyura jamaicensis*
American Wigeon	*Anas americana*
Mallard	*Anas platyrhynchos*
Ring-necked Duck	*Aythya collaris*
Lesser Scaup	*Aythya affinis*
Bufflehead	*Bucephala albeola*
Common Goldeneye	*Bucephala clangula*
American Green-winged Teal	*Anas crecca carolinensis*
Canada Goose	*Branta canadensis*
Blue-winged Teal	*Anas discors*

Table A2-12. Shorebirds/Egrets/Other Wetland-Dependent Species

Common Name	***Scientific Name***
American Bittern	*Botaurus lentiginosus*
Common Snipe	*Gallinago gallinago*
Eared Grebe	*Podiceps nigricollis*
Great Egret	*Ardea alba*
American White Pelican	*Pelecanus erythrorhynchos*
Black-necked Stilt	*Himantopus mexicanus*
White-faced Ibis	*Plegadis chihi*
Double-crested Cormorant	*Phalacrocorax auritus*
Great Blue Heron	*Ardea herodias*
Marsh Wren	*Cistothorus palustris*
Western Pond Turtle	*Actinemys marmorata*
Snowy Egret	*Egretta thula*
American Avocet	*Recurvirostra americana*
Killdeer	*Charadrius vociferus*
Common Gallinule	*Gallinula galeata*
Pied-billed Grebe	*Podilymbus podiceps*
Ring-billed Gull	*Larus delawarensis*
Long-billed Curlew	*Numenius americanus*
North American River Otter	*Lontra canadensis*
Greater Yellowlegs	*Tringa melanoleuca*
Virginia Rail	*Rallus limicola*
Clark’s Grebe	*Aechmophorus clarkii*
Caspian Tern	*Hydroprogne caspia*
Wilson’s Snipe	*Gallinago delicata*
American Herring Gull	*Larus argentatus smithsonianus*

Table A2-13. Special-Status Species

Common Name	***Scientific Name***
Peregrine Falcon	*Falco peregrinus*
Northern Harrier	*Circus cyaneus*
American White Pelican	*Pelecanus erythrorhynchos*
White-faced Ibis	*Plegadis chihi*
Greater Sandhill Crane	*Grus canadensis*
Bald Eagle	*Haliaeetus leucocephalus*
Double-crested Cormorant	*Phalacrocorax auritus*
Tricolored Blackbird	*Agelaius tricolor*
Loggerhead Shrike	*Lanius ludovicianus*
Cooper’s Hawk	*Accipiter cooperii*
White-tailed Kite	*Elanus leucurus*
Western Pond Turtle	*Actinemys marmorata*
Giant garter snake	*Thamnophis gigas*

Introduction

Flexible and Adaptable Operations: This document provides a summary description of the operations plan proposed by the Sites Project Authority (Authority) for the Sites Reservoir Project for its application to the California Water Commission for the Water Supply Investment Program (WSIP). Operations of the Sites Reservoir Project facilities are flexible and adaptable to meet a wide range of water supply and environmental needs. For the purposes of this application, the operations deemed to be most-responsive in providing water to the highest priorities as established by the Water Commission is provided. This operations strategy presents a prioritization of water-based public benefits in the upper Sacramento River and northern Delta. However, the Authority recognizes that over the life of the Sites Reservoir, these priorities may need to change and the Sites Project has the flexibility to adapt to a changing future. Consistent with other portions of this application, the Authority proposes to form a partnership with the State and Federal government resource agencies, so that the full potential of the Sites Project can be incorporated into the prerequisite operational permits.

Role of the Authority: Pursuant to California Water Code 79759(c), the Authority will own, govern, manage, and operate the Sites Project; which will be accomplished by working in partnership with the agencies participating in the project for both water supply and Proposition 1-eligible public benefits. As such, the Authority will, in addition to other responsibilities, be the holder of the water right, enter into water delivery contracts for both water supply and Proposition 1-eligible public benefits, coordination with the Central Valley Project (CVP) and State Water Project (SWP) operators, and be responsible for environmental compliance obligations, operations and maintenance, and dam safety. Organizationally, the Authority plans to establish a governing body, which is conceptually referred to as the Water Operations Committee. The Water Operations Committee's responsibility is to develop, in partnership, both long-term and annual operational plans that would be implemented by the Authority in cooperation with the operators of the State and Federal projects. As such, the Water Operations Committee will be comprised of investors and stakeholders in the project's development:

- the water agencies participating in the project's development; which is currently referred to as the Reservoir Committee;
- the state and federal resource agencies delegated the responsibility to have management control over the investment by the state and/or Federal government, respectively;
- the operators of the Central Valley Project and State Water Project, respectively; and
- operators of other facilities needed to move water to where it has been contracted for (i.e., both Proposition 1-eligible and non-Proposition 1-eligible benefits).
- Other stakeholders as deemed appropriate.

Additional details regarding how this process is proposed to work is provided as follows. However, the Authority anticipates that the concept presented in this document will evolve as the project evolves and information and insight from the other participants and stakeholders gets incorporated.

<u>Participation Agreements</u>: Agreements will be developed for Proposition 1-eligible and non- Proposition 1-eligible benefits (generally water supply augmentation contracts). These agreements will define the amount of Sites Reservoir storage allocated to the organization seeking the specific benefits and maximum and range of deliveries as well as cost associated with those deliveries. Water delivery contracts will also define the delivery request process, facilities repayment and OM&R charges (pro-rated by acre-foot of delivery). Since the WSIP contributions would cover facilities construction cost, costs associated with Proposition 1-eligible public benefit water delivery contracts would not include facilities repayment costs.

Water Operations Planning: The Water Operations Committee's leadership will manage the development of the 5-year and annual operating plans. The 5-year plan is intended to provide a guide to the overall operations of the Sites Reservoir Project, delineate the goals of the Sites Project operations for those years, provide linkage between the water operations consistent with the water delivery contracts, contracts with the State of California to support the development of public benefits, agreements with the federal government for WIIN Act benefits and the use of federal facilities (Shasta, Red Bluff diversion and Tehama-Colusa Canal, and potentially Folsom Dam), and any adaptive management activities. The 5-year plan will be subject to revision when required. Development of the subsequent 5-yr plan will be initiated in the spring of the 4th year to allow for adequate review, coordination and approvals. It is anticipated that the subsequent 5-year plan will be approved during the summer of the 5th year.

The annual operating plans will provide specific guidance regarding the operations of the Project for that year. These plans will be initiated in the spring of the prior year and completed and approved no later than the Authority Board meeting in August of the prior year. These plans will include the following:

- A summary of operations (including adaptive management actions and results) from the previous year
- A listing of any carry-over storage amount and location for public and non-public benefit contract holders
- Anticipated annual requests for each public and non-public benefit holder
- Projected operations by water year type, by month and
- Adaptive management activities planned and natural and Sites Projects conditions necessary to initiate those activities

Sites Project annual operating plans will also interface with the preparation of the annual Temperature Management Plan for the Sacramento River, consistent with WR 90-5 and applicable RPAs.

Through detailed coordination with the United States Bureau of Reclamation (Reclamation) and California Department of Water Resources (DWR), the Sites Project will develop and implement detailed operational agreements with these agencies to address issues related to operations of the Sites Project that optimize the use of existing facilities. Though the implementation of these agreements it is expected that the Sites Project will cooperatively interface with the existing ongoing real-time decision-making process and work groups (as identified in the California Water Fix 2017 Project Description) to avoid and minimize adverse effects to Central Valley Project and State Water Project facilities, operational plans, listed species, public health, safety and water supply reliability.

Cooperative Agreement with CVP & SWP: Water management agreements will be developed with Reclamation and DWR to support the use of existing facilities (e.g.; Shasta Dam and Reservoir, Tehama Colusa Canal and associated facilities, Oroville Dam and Reservoir, Folsom Dam and Reservoir). Initial Draft principles of agreements relating to the detailed water management agreement have been developed and circulated among the participants. Sample details of the contents of the detailed water management agreements are included in the adaptive management portion of this operations plan.

The Authority will also be responsible for general facility maintenance and upkeep, Authority accounting including payments to the following:

- Reclamation consistent with the Warren Act contracts for the use of Reclamation facility,
- Glenn-Colusa Irrigation District (GCID) for use of facilities
- Power supply for pumping and other power needs.

Authority accounting will also be responsible for receipt of funds from all contract deliveries and other arrangements for O&M cost associated with deliveries for public benefits.

Operations Assumptions and Criteria

This operations plan includes a description of project operations and public benefits under a range of hydrologic conditions, from wettest to driest years and multiple dry year periods. Water year types for this operations plan are classified based on the Sacramento Valley 40-30-30 Index per the SWRCB Water year Hydrologic Classification presented in D-1641. The primary actions that will be taken to meet desired public benefit objectives are described for the range of hydrologic conditions. In addition, monitoring of operations to ensure public benefits outcomes is described.

The with-project conditions include a 1.81-million-acre-foot (MAF) reservoir, which will be located in the Sacramento Valley west of the town of Maxwell, and associated conveyance facilities including use of existing Tehama-Colusa Canal (T-C Canal) and GCID Main Canal diversion and conveyance facilities, plus a proposed new diversion and discharge pipeline (see Sites_A3 Project Description under the ELIGIBILITY AND GENERAL PROJECT INFORMATION TAB for a more detailed description of the project).[1] The proposed reservoir will be filled by diversion of excess Sacramento River water that originates from unregulated tributaries to the Sacramento River downstream from Keswick Dam. These flows are “excess” to those needed to meet current regulatory requirements or other water demands. Operation of the proposed reservoir will be in cooperation with the operations of existing CVP and SWP system facilities to facilitate and maximize the potential for a wide range of benefits. Detailed operating agreements would need to be developed that define a framework and procedures for cooperative operations among the Authority, CVP, and SWP.

With-project operations are designed to improve the ability to meet the following primary objectives:

- Enhance overall system wide water management flexibility
- Provide increasing cold water conservation in Shasta, Oroville and Folsom to assist in temperature control downstream at critical times for salmonids.
- Increase reliability of water supplies
- Provide storage and operational benefits for programs to improve Sacramento-San Joaquin River Delta (Delta) and upstream ecosystems

The preliminary operations assumptions and criteria for the Sites Reservoir Project were developed through a series of meetings and coordination with Authority representatives including water district managers and county representatives, DWR, and Reclamation. The with-project condition builds on previous work conducted under the CALFED Bay-Delta Program (CALFED) by DWR and Reclamation. Subsequent to CALFED, DWR was the lead on technical studies in coordination with the Authority as part of the North-of-Delta Offstream Storage (NODOS) Project and associated investigations. Since 2014 the Authority has taken the lead role in these studies.

[1] With a 60 TAF hard dead storage, the operable storage for Sites Reservoir as 1.75 MAF

As noted in the description and assumptions response to A.1, the operations analyses conducted for the Sites Reservoir Project utilized the model products and assumptions described in section 6004(a)(1) of the California Code of Regulations. The models provided by the Commission were modified to include the facilities and operation of the Sites Project.

Operations Overview

Sites Reservoir will be filled by diversion of excess Sacramento River flows that originate from unregulated tributaries to the Sacramento River downstream from Keswick Dam. As described below, diversions are assumed to potentially occur in any month or water year type, but would likely be greatest in the winter months with wetter conditions (depending on storage conditions and flow events).

The primary operational criteria include the following:

- A defined ecosystem enhancement storage account will be established in Sites Reservoir to be managed by the State to provide water for ecosystem and water quality purposes.
- Each of the participating Authority members will be allocated a defined storage account in the Sites Reservoir Project to manage their water, as well as store water from other potential sources of supply
- It is assumed that a water market of some form would be facilitated by the Authority to promote efficient use and exchange of water in Sites Reservoir storage.
- All storage accounts would receive an equal proportional share of new water diversions into Sites Reservoir storage.
- Any water in storage beyond designated member account volumes would be “at risk” and would be “spilled” if the reservoir fills to capacity.
- A set of operating guidelines and rules will be developed to promote efficient water management for operations of Sites Reservoir and associated facilities.
- All water stored in Sites Reservoir storage accounts are subject to evaporation and other losses.

The Sites Reservoir Project could operate in cooperation with CVP and SWP system facilities to facilitate a wide range of benefits. Sites Reservoir will provide water through four primary mechanisms:

- Water stored in Sites Reservoir could be released directly to Colusa Basin users,
- Water could be released to the Sacramento River
- Water could be released through the Colusa-Basin Drain and Knights Landing Ridge Cut
- Water stored in Sites Reservoir could be exchanged for water stored in Shasta Lake or other CVP and SWP system reservoirs.

This last mechanism could be used to significantly increase upstream north-of-Delta storage and operational flexibility to support multiple water supply and ecosystem benefits.

The project employs a strategy to maximize the potential benefits of Sites Reservoir while not adversely affecting the CVP and SWP’s ability to meet existing system regulatory requirements including the following:

- Water rights
- Instream flow requirements

- Biological opinions
- Delta water quality requirements
- CVP and SWP requirements
- Central Valley Project Improvement Act (CVPIA)

Sacramento River water will be diverted at the three locations on the river as described above. Excess Sacramento River flow diversions to Sites Reservoir will only take place when flow monitoring indicates that bypass flows are present in the river due to storm event flows. Several existing and additional proposed bypass flow criteria were assumed at specified locations. These flow criteria are designed to make certain only excess water will be diverted into Sites Reservoir to maintain and protect existing downstream water uses.

As a mitigation measure to more fully avoid and minimize entrainment and impingement of juvenile salmonids and other poor-swimming aquatic species, diversions to Sites Reservoir will also be restricted to protect fish migration during naturally occurring, storm-induced, pulse flow events in the Sacramento River. The proposed pulse protection period will extend from October through May to address outmigration of juvenile winter-, spring-, fall- and late-fall-run Chinook salmon, as well as steelhead. Pulse flows during this period will provide flow continuity between the upper and lower Sacramento River to support fish migration. It is recognized that research regarding the benefits of pulse flows is ongoing, and further research and adaptive management will be required to develop and refine a pulse flow protection strategy for fish migration.

Diversions of excess Sacramento River water to Sites Reservoir using existing T-C Canal and GCID Main Canal conveyance facilities could occur at any time during the year, given the flow conditions described above are present in the river. Deliveries for Tehama-Colusa Canal Authority (TCCA) and GCID service areas have first priority at the existing T-C Canal and GCID intakes, with diversions to Sites Reservoir using the unused capacities of the two canals. Diversions through the proposed Delevan Pipeline could also occur at any time of the year assuming Sacramento River flow conditions are above the bypass and pulse flow criteria described above. In summer months, preference would generally be given to Sites Reservoir releases to the river, resulting in limited diversions to storage because the pipeline could only convey flows in one direction at a time.

The operation of Sites Reservoir Project will allow for the development and administration of an ecosystem enhancement storage account (EESA) that could be actively managed by the State to provide water for ecosystem and water quality purposes. Such an account would provide a pool of dedicated storage to manage in cooperation with existing operations to improve coldwater conservation storage, stabilize river flows during critical fisheries periods, increase flows through certain watercourses and/or facilities (such as, Yolo Bypass), increase availability of wetlands in wildlife refuges, and/or enhance habitat conditions.

Sites Reservoir Project will be operated in cooperation with CVP and SWP operations to coordinate releases from Shasta Lake, Lake Oroville, and Folsom Lake. Releases from Sites Reservoir will allow reduced releases from other reservoirs while still meeting requirements for minimum instream flow objectives, Sacramento River temperature requirements, and Delta salinity control assigned to CVP and SWP. Through this reduction in releases, storage could be conserved in Shasta Lake, Lake Oroville, and Folsom Lake to significantly increase operational flexibility to improve river water temperatures for fish survival, Delta ecosystem food-web enhancement, flood control, and recreation.

Sites Reservoir Project EESA operations will achieve multiple public benefits over a wide range of hydrologic conditions.

In drought conditions, Sites Reservoir Project could:

- Increase coldwater pool conservation in Shasta Lake, Lake Oroville, and Folsom Lake
- Help regulate Sacramento River summer flows for best use of cold water for control of temperature conditions adverse to anadromous fish

In non-drought hydrologic conditions, Sites Reservoir Project water could:

- Increase coldwater pool conservation in Trinity Lake, Shasta Lake, Lake Oroville, and Folsom Lake
- Help regulate Sacramento River summer flows for best use of cold water for control of temperature conditions adverse to anadromous fish
- Provide (via upstream actions) incidental Delta water quality improvements in the summer and fall
- Stabilize Sacramento River fall flows for improving spawning and rearing success of anadromous fish
- Provide water to the Yolo Bypass to support salmon migration and summer food production for delta smelt
- Provide water for Incremental Level 4 refuge deliveries per CVPIA

Operations over a Range of Hydrologic Conditions

This section provides a detailed description of proposed Sites Reservoir Project operations for a range of hydrologic conditions, including the actions that will provide public benefits under each of these differing hydrologic conditions.

The operations actions described below are an example of how the EESA could be used to meet public benefit objectives over a range of hydrologic conditions. Operations in any given year will be a function of the current year hydrology, as well as a function of the system conditions resulting from the previous year's hydrology and operations. The EESA provides the state with the operational flexibility to manage the water in Sites Reservoir storage to the highest priority needs on an adaptive management basis. Implementation of actions to provide public benefits will need to be evaluated on a continuing basis in response to changing system parameters (such as reservoir storage), ecological needs, forecasts of future hydrologic and atmospheric conditions, and system operations.

Total average annual diversions of excess Sacramento River flow to Sites Reservoir, based on CalSim-II model results, for current, 2030, and 2070 conditions are 514 TAF, 552 TAF, and 588 TAF, respectively. These results indicate that the Sites Project has the ability to adapt to predicted future hydrologic conditions provided by the CWC). The increase in average annual diversions of excess flow is a function of the reduction in spring snowmelt and increase in winter precipitation under the future climate conditions. Increased precipitation and resulting stream flow in the tributaries contributing to the Sacramento River between Keswick and Red Bluff Pumping Plant, in months of November through March, allow additional diversions of excess flow to Sites Reservoir storage. These increased diversions provide additional operational flexibility under future conditions to provide a wide range of public benefits such as critical ecosystem objectives.

Wet Hydrologic Conditions

Under wet year conditions, the primary EESA operations goal will be to maximize the diversion of excess water from the Sacramento River into Sites Reservoir storage during high flow winter months, subject to the proposed bypass flow criteria. The maximum diversions will occur between the months of November and March to minimize potential impacts to the riverine ecosystem. Monitoring will be conducted at Bend Bridge and other locations near Red Bluff Pumping Plant, Hamilton City Pumping

Facility, and proposed Delevan Pipeline Intake to identify when fish are present in the river so diversions to storage could be curtailed to promote pulse flow bypass protection to support salmonid out-migration to the lower Sacramento River.

Total average annual diversions of excess Sacramento River flow to Sites Reservoir for wet year types for current, 2030, and 2070 conditions are 574, 672, and 715 TAF, respectively. Sites Reservoir average end-of-month storage in May of wet years under simulated current, 2030, and 2070 conditions ranges from 1.77 to 1.71 MAF.

Proposed Sites Reservoir operations under wet year conditions will be largely a function of current system wide reservoir storage conditions and the need for water to support public benefit objectives. Generally, there is minimal demand for water from storage in wet years depending on the geographic variation and timing of late spring storm events and snow melt conditions. Actions that could be taken in wet years to provide public benefits include:

Yolo Bypass and Delta Outflow Improvement

Release of Sites water flow through the Colusa Basin Drain and Knights Landing Ridge Cut during summer and fall months (i.e., August through October) to help increase productivity in the lower Cache Slough and lower Sacramento River areas to increase desirable food sources for Delta smelt and other key fish species in the late summer and early fall.

Water Supply for Wildlife Refuges

Provide water toward meeting Incremental Level 4 wildlife refuge water needs north of the Delta and south of the Delta to supplement refuges supplies up to Level 4 criteria (CVPIA).

Above Normal to Dry Hydrologic Conditions

This range of hydrologic conditions includes Sacramento Valley 40-30-30 water year types for above normal, below normal, and dry year types. Under these hydrologic conditions, diversions of excess water from the Sacramento River into Sites Reservoir storage will occur during high flow winter months, subject to the proposed bypass flow criteria. Similar to wet years, the majority of diversions will occur between the months of November and March to minimize potential impacts to the riverine ecosystem. Monitoring will be conducted at Bend Bridge and other locations near Red Bluff Pumping Plant, Hamilton City Pumping Facility, and proposed Delevan Pipeline Intake to identify when fish are present in the river so diversions to storage could be curtailed to promote pulse flow bypass protection to support salmonid out-migration. Total average annual diversions of excess Sacramento River flow to Sites Reservoir for above normal water year types for current, 2030, and 2070 conditions range from 572 to 770 TAF. Total average annual diversions of excess Sacramento River flow to Sites Reservoir for dry water year types for current, 2030, and 2070 conditions range from 429 to 578 TAF. Sites Reservoir average end-of-month storage in May under simulated current, 2030, and 2070 conditions ranges from 1.2 to 1.7 MAF for above normal and dry hydrologic conditions.

Under these water year type conditions, EESA water in Sites Reservoir could provide operational flexibility to support a wide range of potential public benefits and ecosystem objectives. Operational actions to meet these objectives will be determined on an annual basis depending on the geographic variation and timing of late spring storm events, snow melt conditions, system wide reservoir storage, and ecological water needs.

Actions that could be taken in these years to provide public benefits will include:

Shasta Lake Coldwater Pool and Sacramento River Temperature Control

Maximum benefits will be realized with Sites Reservoir and Shasta Lake being operated in cooperation to preserve a greater volume of coldwater pool storage in Shasta Lake. This will be accomplished by substituting water from Sites Reservoir to meet a portion of an otherwise CVP water demand from Shasta (especially in the lower GCID and TCCA service areas) thus allowing water to be retained in storage in Shasta Reservoir. This allows additional cold water to be retained and will improve operational flexibility to provide releases to maintain appropriate water temperatures in the Sacramento River, with particular emphasis on the months of highest potential water temperature related impacts (i.e., July through November). Shasta Lake average end-of-month storage in May under simulated current, 2030, and 2070 dry water year conditions increases by 90 TAF to 100 TAF above the respective without-project conditions.

Through releases from Sites Reservoir to meet TCCA and GCID irrigation diversions and equivalent reductions in CVP Shasta Lake releases, demands on Shasta Lake storage could be reduced and the coldwater pool maintained for a longer time at higher levels than are currently achievable. Shasta Lake release patterns could be shifted in season and between adjacent years to improve coldwater storage and flow management for salmon and other species using the portion of the Sacramento River between Keswick Dam and the Red Bluff Diversion Dam as habitat.

EESA water released from Shasta Lake for temperature purposes could provide multiple benefits as it will increase lower Sacramento River flows, Delta inflow, and outflow. Some of the Shasta Lake EESA releases could also be recaptured downstream at the Delevan Intake and diverted back into EESA storage in Sites Reservoir to meet additional public benefit objectives. Increased flows in the Sacramento River could also reduce the need for releases and help maintain the coldwater pool from Folsom Lake. These types of multi-benefit operations provide a range options for managing EESA water to achieve maximum benefits.

Upper Sacramento River Fall Flow Enhancement

Additional storage in Shasta Lake could be used to stabilize fall flows in the Sacramento River between Keswick Dam and Red Bluff to avoid abrupt flow reductions due to changes in local tributary inflows as a result of storm events. This will reduce adverse conditions for spawning fall-run Chinook salmon (such as, dewatering of redds and scour damage).

Folsom Lake Coldwater Pool Improvement

Sites Reservoir Project operations in cooperation with Folsom Lake could improve the reliability of coldwater carryover storage at Folsom Lake, by increasing May storage and retaining coldwater pool storage, to allow additional operational flexibility to provide suitable water temperatures in the lower American River. This action will use additional coldwater pool storage by providing releases from Folsom Dam (and subsequently from Nimbus Dam) to help provide water temperatures at levels suitable for juvenile steelhead over summer rearing and fall run Chinook salmon spawning in the lower American River from May through November. The proposed operations have not been prioritized to maximize this benefit. Other cooperative operations could expand this benefit at the expense of other environmental benefits.

American River Flow Enhancement

Summer releases from Sites Reservoir could reduce the need for releases from Folsom Lake, resulting in increased carryover storage. Sites Reservoir releases could also provide additional Delta outflow and reduce short-term emergency flow reliance on Folsom Lake releases to improve Delta water quality.

Additional storage in Folsom Lake could be released to stabilize flows in the lower American River to minimize dewatering of fall run Chinook salmon redds (i.e., October through March) and steelhead redds (i.e., January through May), and reduce juvenile anadromous salmonids isolation events, particularly from October through June.

Reduction of the reliance upon Folsom Lake as a "real time first response facility" to meet Delta objectives and demands of the CVP, particularly from January through August, will reduce flow fluctuations and water temperature related impacts to fall run Chinook salmon and steelhead in the lower American River.

Lake Oroville Coldwater Pool Improvement and Feather River Flow Enhancement

Sites Reservoir releases in coordination with SWP operations could increase Lake Oroville carry over storage and operational flexibility. Additional storage will increase the reliability of the coldwater pool in Lake Oroville and provide flows to reduce lower Feather River water temperatures for juvenile steelhead and spring-run Chinook salmon over-summer rearing, and fall-run Chinook salmon. Additional storage will also provide opportunities to release higher and more stable flows in the lower Feather River at critical times to minimize redd dewatering, juvenile stranding, and isolation of anadromous salmonids. The proposed operations have not been prioritized to maximize this benefit. Other cooperative operations could expand this benefit at the expense of other environmental benefits.

Yolo Bypass and Delta Outflow Improvement

Release of Sites water flow through the Colusa Basin Drain and Knights Landing Ridge Cut during summer and fall months (i.e., August through October) is proposed to help increase productivity in the Yolo Bypass in the lower Cache Slough and lower Sacramento River areas to increase desirable food sources for Delta smelt and other key fish species in the late summer and early fall. Proposed operation will provide a long-term average delivery of about 56 TAF into the Yolo Bypass, with average dry year type deliveries ranging from 47 to 56 TAF.

Water Supply for Wildlife Refuges

A portion of the EESA supply is dedicated to provide water toward meeting Incremental Level 4 wildlife refuge water needs north of the Delta and south of the Delta to supplement refuges supplies up to Level 4 criteria (CVPIA). The proposed operations long-term average amount of water available North of the Delta for this purpose will be about 40 TAF (with averages ranges from about 20 to 70 TAF depending on year types) Proposed operation will provide a long-term average annual delivery of about 37 TAF to wildlife refuges, with average dry year type deliveries of up to 22 TAF.

Critical Hydrologic Conditions

Critical water years are the most extreme drought years per the Sacramento Valley 40-30-30 water year classification. Under Critical hydrologic conditions, diversions of excess water from the Sacramento River into Sites Reservoir storage could potentially occur during isolated high flow storm events in winter months, subject to the proposed bypass flow criteria.

Monitoring will be conducted at Bend Bridge and other locations near Red Bluff Pumping Plant, Hamilton City Pumping Facility, and proposed Delevan Pipeline Intake to identify when fish are present in the river so diversions to storage could be curtailed to promote pulse flow bypass protection to support salmonid out-migration. Diversions to Sites Reservoir storage will be very limited in Critical water year types.

The proposed operations for Sites Reservoir Project focused on retaining water from wetter years for use in Dry and Critical years. Under critical water year type conditions, Sites Reservoir EESA could provide water and operational flexibility to support a wide range of potential public benefits and ecosystem objectives. Sites Reservoir average end-of-month storage in May under simulated current, 2030, and 2070 conditions range from 836 TAF to 637 TAF.

Operational actions to meet these objectives would be determined on an annual basis depending on the geographic variation and timing of late spring storm events, snow melt conditions, system wide reservoir storage, and water demands. In critical water years it is assumed that EESA water in Sites Reservoir will be used to support Shasta Lake coldwater pool and Sacramento River temperature control to the greatest extent possible, as well as maintenance of cold water in Lake Oroville and Folsom Lake. If additional EESA water was available it could be used to support a number of other ecosystem objectives including Yolo Bypass flow enhancement and supplies to wildlife refuges. Actions that could be taken in these years to provide public benefits are described below:

Shasta Lake Coldwater Pool and Sacramento River Temperature Control

Maximum benefits could be realized assuming Sites Reservoir and Shasta Lake were operated in cooperation to increase Shasta Lake storage and preserve a greater volume of coldwater pool storage. This additional cold water will improve operational flexibility to provide releases to maintain appropriate water temperatures in the Sacramento River, with particular emphasis on the months of highest potential water temperature related impacts (i.e., July through November). Shasta Lake average end-of-month storage in May under simulated current, 2030, and 2070 dry water year conditions increases by 180 TAF to 247 TAF compared to without-project conditions.

Through releases from Sites Reservoir to meet TCCA and GCID irrigation diversions and equivalent reductions in CVP Shasta Lake releases, demands on Shasta Lake storage could be reduced and the coldwater pool maintained for a longer time at higher levels than are currently achievable. Shasta Lake release patterns could be shifted in season and between adjacent years to improve coldwater storage and flow management for salmon and other species using the portion of the Sacramento River between Keswick Dam and the Red Bluff Diversion Dam as habitat.

Folsom Lake Coldwater Pool Improvement

Sites Reservoir Project operations in cooperation with Folsom Lake could improve the reliability of coldwater carryover storage at Folsom Lake, by increasing May storage and retaining coldwater pool storage, to allow additional operational flexibility to provide suitable water temperatures in the lower American River. This action will use additional coldwater pool storage by providing releases from Folsom Dam (and subsequently from Nimbus Dam) to help provide water temperatures at levels suitable for juvenile steelhead over summer rearing and fall run Chinook salmon spawning in the lower American River from May through November. The proposed operations have not been prioritized to maximize this benefit. Other cooperative operations could expand this benefit at the expense of the other environmental benefits.

American River Flow Enhancement

Summer releases from Sites Reservoir could reduce the need for releases from Folsom Lake, resulting in increased carryover storage. Sites Reservoir releases could also provide additional Delta outflow and reduce short-term emergency flow reliance on Folsom Lake releases to improve Delta water quality.

Lake Oroville Coldwater Pool Improvement and Feather River Flow Enhancement

Sites Reservoir releases in coordination with SWP operations could increase Lake Oroville carry over storage and operational flexibility. Additional storage will increase the reliability of the coldwater pool in Lake Oroville and provide flows to reduce lower Feather River water temperatures for juvenile steelhead and spring-run Chinook salmon over-summer rearing, and fall-run Chinook salmon. The proposed operations have not been prioritized to maximize this benefit. Other cooperative operations could expand this benefit at the expense of other environmental benefits.

Yolo Bypass and Delta Outflow Improvement

Release of Sites water flow through the Colusa Basin Drain and Knights Landing Ridge Cut during summer and fall months (i.e., August through October) to help increase productivity in the Yolo Bypass in the lower Cache Slough and lower Sacramento River areas to increase desirable food sources for Delta smelt and other key fish species in the late summer and early fall. The ability to provide flow into the Yolo Bypass under critical year type conditions will be a function of ecosystem priorities based on the current year hydrology, as well as a function of the system storage conditions resulting from the previous year’s hydrology and operations.

Water Supply for Wildlife Refuges

Provide water toward meeting Incremental Level 4 wildlife refuge water needs north of the Delta and south of the Delta to supplement refuges supplies up to Level 4 criteria (CVPIA). The ability to provide deliveries to wildlife refuges under critical year type conditions will be a function ecosystem priorities based on the current year hydrology, as well as a function of the system storage conditions resulting from the previous year’s hydrology and operations.

Multiple Dry and Critical Year Drought Conditions

Under multiple dry and critical year drought conditions, diversions of excess water from the Sacramento River into Sites Reservoir storage will likely be very limited and carryover storage from previous years will be very important to meeting public benefits and ecosystem objectives.

Operational actions for use of EESA carry over storage in Sites Reservoir will be determined on an year to year basis depending on the severity of drought conditions, geographic variation and timing of late spring storm events, snow melt conditions, status of system wide reservoir storage, and ecosystem water needs. During extended drought periods, it is assumed that EESA water in Sites Reservoir will be used to support Shasta Lake coldwater pool and Sacramento River temperature control as the highest priority action. If additional EESA water was available it could be used to support a number of other ecosystem objectives including coldwater storage in Lake Oroville and Folsom Lake, Yolo Bypass flow enhancement and supplies to wildlife refuges. Primary actions that could be taken during extended drought periods to provide public benefits are described below:

Shasta Lake Coldwater Pool and Sacramento River Temperature Control

Maximum public (environmental) benefits are realized assuming Sites Reservoir and Shasta Lake are operated in cooperation to increase Shasta Lake storage and preserve a greater volume of coldwater pool storage. This additional cold water will improve operational flexibility to provide releases to maintain appropriate water temperatures in the Sacramento River, with particular emphasis on the months of highest potential water temperature related impacts (i.e., July through November).

Through releases from Sites Reservoir to meet TCCA and GCID irrigation diversions and equivalent reductions in CVP Shasta Lake releases, demands on Shasta Lake storage could be reduced and the coldwater pool maintained for a longer time at higher levels than are currently achievable. Shasta Lake release patterns could be shifted in season and between adjacent years to improve coldwater storage and flow management for salmon and other species using the portion of the Sacramento River between Keswick Dam and the Red Bluff Diversion Dam as habitat.

Yolo Bypass and Delta Outflow Improvement

Release of Sites water flow through the Colusa Basin Drain and Knights Landing Ridge Cut during summer and fall months (i.e., August through October) to help increase productivity in the Yolo Bypass in the lower Cache Slough and lower Sacramento River areas to increase desirable food sources for Delta smelt and other key fish species in the late summer and early fall. The ability to provide flow into the Yolo Bypass under drought conditions will be a function of ecosystem priorities based on current year hydrology, as well as a function of the system storage conditions resulting from the previous year's hydrology and operations.

Water Supply for Wildlife Refuges

Provide water toward meeting Incremental Level 4 wildlife refuge water needs north of the Delta and south of the Delta to supplement refuges supplies up to Level 4 criteria (CVPIA). The ability to provide deliveries to wildlife refuges under drought conditions will be a function of ecosystem priorities based on current year hydrology, as well as a function of the system storage conditions resulting from the previous year's hydrology and operations.

Adaptive Management Framework

This section presents a monitoring and adaptive management framework to guide the evaluation and improvement of the operations of the Sites Project – as well as assist in the operations of other water management facilities interacting with the Sites Project. Because the Sites Project has not reach final design, construction or operation, this document does not include the detailed protocols and site-specific, year-type specific sampling design necessary for implementation of a Monitoring and Adaptive Management Plan. A more detailed plan and decision-making process will be developed in future phases of the Sites Project.

The Adaptive Management Framework is intended to support the investigation of alternative operations of the Sites Project and test these operations regarding their ability to improve environmental conditions in the Sacramento River and Delta system and improve water supply reliability in the State water supply system. The environmental conditions of primary concern in the Sacramento River and Delta system include:

- Water temperature conditions necessary to support salmonid fish life-cycles in upstream tributaries (recruitment to spawning)
- Sediment supply and management (suspended material supply during winter flush events and spawning gravel supply and management)
- Habitat for juvenile salmonid development (floodplain management) for the development of smolts
- Nutrients chemistry (ammonia levels and its oxidation products)
- Food availability and the adverse effects of other non-native species
- Salinity in regard to habitat suitability for native estuarine species in tributaries to the Bay and Delta.
- Predation

- Entrainment

The water supply reliability concerns include:

- Water supply availability (particularly in dry and critically dry years)
- Regulatory and policy constraints on water delivery capability
- Water quality constraints (salinity related chloride and bromine)

Adaptive Management Process

Adaptive management is a process that promotes flexible decision-making that can be adjusted as new and improved information becomes available about outcomes of management actions and other events (Williams et. al 2007). Adaptive management provides the necessary flexibility and feedback to manage complex natural resources in the face of considerable uncertainty about the effectiveness of specific management actions. It is an iterative process with the following steps:

a. **Plan –** Define/redefine the problem, establish goals and objectives, develop restoration alternatives;

b. **Design –** Develop designs and operational scenarios for habitat ponds, develop monitoring framework;

c. **Implement –** Design, construct, and operate the project;

d. **Monitor –** Conduct monitoring to detect change and determine status of resources;

e. **Evaluate –** Analyze, synthesize, and manage data; and

f. **Adapt and Learn –** Make any necessary adjustments to management, share information.

Because uncertainties remain about natural hydrologic variations, project operations, and ecological responses, the Sites Project is being designed with a range of operational scenarios (Appendix YY, Project Operations) to evaluate the effectiveness of different management actions. A monitoring program will be implemented to collect data necessary to operate and evaluate the Project's success.

The adaptive management program will be developed in close coordination with the National Marine Fisheries Service (NMFS), U.S. Fish and Wildlife Service (USFWS) and California Department of Fish and Game (CDFW). Specific adaptive management investigations will be developed to build on the best available science on the range of issues listed above. Adaptive management will be implemented within a framework that is transparent, collaborative, and responsive to changes in scientific understanding.

Objective-based Monitoring

Monitoring is a fundamental element of adaptive management because effective evaluation and management requires information about the status of target resources and their response to management activities. The information obtained will be used to measure Project effectiveness, to refine operation and management of the Sites Project, to reduce uncertainties about key issues, and to inform subsequent stages of actions to improve environmental conditions in the Sacramento River and Delta system and improve water supply reliability in the State water supply system.

Monitoring can be defined as the collection and analysis of repeated observations or measurements to evaluate changes in condition and progress toward meeting a management objective (Elzinga et al. 1998). Inherent in defining monitoring as part of the adaptive management cycle are two key concepts (Elzinga et al. 1998). The first is that monitoring is driven by objectives. The objective describes the desired condition. Management is designed to meet the objective and monitoring is designed to determine if the objective is met. Objectives form the foundation of the entire monitoring project. The second concept is that monitoring is only initiated if opportunities for management change exist.

Monitoring efforts will be guided by the specific Sites Project objectives and desired outcomes for ecosystem priorities. The Project's objectives are to meet its primary goal to improve environmental conditions in the Sacramento River and Delta system and improve water supply reliability in the State water supply system. What is measured (indicator), how well it is measured, and how often it is measured are design features that will be defined by how an objective is articulated (Elzinga et al. 1998). Table ADF-1 provides examples of measurable objectives and performance measures for selected ecosystem priorities. Measures like these will be elements of a monitoring framework which will provide data to assess progress towards achieving Sites project objectives and ecosystem priorities, and which will inform adaptive management decision-making for operations. The proposed operations prioritize certain ecosystem priorities listed for the Water Storage Investment Program. Key scientific information for further monitoring and adaptive management activities related to those prioritized operations is:

Table ADF-1. Example of Sites Project Objective-Based Monitoring Framework

Objectives and Ecosystem Priorities	Measurable Objectives	Performance Measures and Monitoring
Ecosystem Priority 1: Provide cold water at times and locations to increase the survival of salmonid eggs and fry. Ecosystem Priority 2: Provide flows into the Yolo Bypass to flush nutrient laden water into the Cache Slough complex to improve food availability for Delta smelt and other pelagic fish in the Cache Slough complex and lower Sacramento River Ecosystem Priority 3: Maintain flows and appropriate ramping rates at times and locations that will minimize dewatering of salmonid redds and prevent stranding of juvenile salmonids in side channel habitat. Ecosystem Priority 4: Provide additional water for level 4 wildlife refuges. *NOTE: Need to Add Sites Reservoir Monitoring for Water Quality, Temperature and Phytoplankton species (need to look out for and control Blue Green algae)*	Measurable objectives include flows and temperatures of delivered water . Improvement in WUA is based on habitat for steelhead spawning, but improvements in all four runs of Chinook salmon in the Sacramento River will also be seen and could potentially be quantified approximately three to four years later (2033 to 2034) when 2030 cohort return to spawn.	Performance measures include the timing of releases from Shasta, Oroville, and Folsom to maximize benefits of the project to salmonid fish species, and estimates of salmonid out-migrants. Monitoring data sources include: CDFW Sacramento River monitoring: • Main stem Sacramento River Mark-recapture Program; • Upper Sacramento River Tributary Escapement Monitoring; • Sacramento River Tributary Mark-Recapture Monitoring; • Hatchery Brood stock and Angler Harvest Sampling. Existing Delta monitoring programs: • Interagency Ecological Program; • Delta Juvenile Fish Monitoring Program; • Anadromous Fish Restoration Program Monitoring for 12 years is recommended to assess increase in spawning by quantifying increasing trends of the first four consecutive cohorts. Monitoring will begin immediately after completion of Sites Reservoir.

- Quantification of the improvement in temperature for salmonids above that would have been available absent Sites.
- Benefits provided by river flow stabilization using Sites Reservoir Project water

- The amount of productivity increase in the Cache Slough area and increases in Delta smelt abundance in this area and Lower Sacramento River
- The amount of additional water provide to Level 4 refuges.

The next step will be to define, quantitatively or qualitatively, the specific desired outcomes for each objective and to identify appropriate indicators for measurement. Monitoring should focus on the most informative, efficient, and cost-effective indicators and methods. Types of potential indicators include:

a. Triggers for real-time diversion and release operations **–** flow rates, anticipated water year type, storage in Sites and other reservoirs, storm events, and salmonid out-migrant numbers, …;
b. Performance measures **–** attributes of target species and their habitat, such as physical habitat conditions, water quality in Sites and elsewhere in the Sacramento River/Delta system, extent of wetland acreage at refuges, and distribution, abundance and composition of aquatic invertebrates, fish, waterfowl, and other wetland-dependent wildlife; and
c. Threat indicators – potential for floods or droughts, contaminants of concern, mosquitoes and other vectors, disease outbreaks on Sites Reservoir or elsewhere

Sites Project Monitoring Plan Development

A detailed monitoring plan will be developed during the permitting phase of the final Sites Project and final designs and operations are approved. The actions identified in the monitoring plan will be based on the regulatory requirements and other information needed to operate the Sites Project facilities, to evaluate success and threats, and to help resolve remaining uncertainties, as well as available funding and monitoring requirements for compliance.

The Sites Project monitoring plan will be developed in coordination with other similar efforts in the Sacramento River watershed, including studies by the Interagency Ecological Program and ongoing studies by USFWS, NMFS, and CDFW in the Sacramento River Watershed. Design and implementation of Sites Project monitoring will also be coordinated with ongoing and proposed survey and monitoring efforts along the Sacramento River and within the Delta to share and build on available data. This coordination will be especially valuable for evaluating Sites Project performance relative to other reference sites and for understanding regional patterns of physical and biological change.

Monitoring Plan Elements

The Sites Project monitoring plan will include several monitoring elements, modeled on other similar plans for water management facilities (e.g., Delta Independent Science Board 2016) and acceptable to the permitting and operating organizations. Each monitoring element will include a description of the purpose and justification for the monitoring activity, location(s), time period(s) and frequency of monitoring, protocol(s) for data collection, a description of the data to be collected and the anticipated use of the data, proposed quality assurance measures, reporting, and an overview of similar monitoring activities and opportunities for integration. The frequency of data collection and evaluation will be guided by the purpose of monitoring. For example, operational triggers such as water supply flow rates would be measured daily or weekly, while status of target resources would be monitored seasonally or annually. A detailed monitoring protocol will be developed prior to initiating monitoring activities in the field. This protocol will include a description of the measures that will be taken to ensure the quality of the data collected and how those measures will be implemented. The data quality assurance measures may include, but will not be limited to, procedures for calibrating or ensuring the accuracy of any instruments (e.g., GPS) employed in the field, procedures for recording and transferring electronic data, methods for ensuring proper operation of field equipment during surveys, and methods for avoiding double counting or insufficient coverage of survey areas.

Key monitoring elements will include the following:

a. Physical Habitat in Sites Reservoir– diversions (inflow) and release flow rates, reservoir depth, snags, submerged vegetation, and other habitat elements;
    a. Water Quality – temperature, dissolved oxygen, nutrients;
    b. Aquatic Biota – algae, plankton, invertebrates, fish community (species, distribution, abundance);
b. Birds around the Sites Reservoir– species, abundance and distribution, use of habitat features, breeding and nesting, sick or dead birds; and
c. Contaminants in Sites Reservoir**–** contaminants of concern concentrations in water, sediment, terrestrial or avian biota.

Data Management and Assessment

Data collected, stored, or made accessible from the data management system will be available to the Sites Project team for the application of statistical and other analytical techniques. Data assessment will be used to foster the integration, consolidation, and review of data, updating of conceptual models, answering of key questions, reporting, and providing management recommendations. Consistent review and assessment of the data would be needed to assure that performance objectives are being met and that funding for data collection is effectively utilized. In addition to program-level data assessment and analysis, data assessment should take place at the individual monitoring activity level through regular evaluation and assessment of data collected over time. This individual monitoring would help ensure data quality and usefulness relative to meeting monitoring objectives.

An annual report would be generated for each year that surveys are conducted that summarizes the data collected during that year and updates prior reports in a cumulative fashion. A synthesis report would be periodically prepared (each 5 or 10-year period) with long-term observations and recommendations.

Data, analyses, and publications developed from this monitoring plan will be organized, stored, and made publicly accessible through a common distributed data management system, in coordination with the broader Sacramento River and Delta management efforts. Common protocols will be developed and applied when possible, and all geospatial data will include full metadata and will be compliant with the Federal Geographic Data Committee (FGDC) standards. Sites Project staff will establish and maintain the data management system. The data collected as part of the Sites Project will be transmitted to the California Department of Fish and Wildlife and stored in their Biogeographic Information and Observation System (BIOS) map viewer and all documentation including metadata will be accessible to the public via metadata clearinghouses and document library.

Adaptive Management and Operational Decision-Making Process

The Sites Reservoir Authority (Authority) is a Joint Powers Authority form within the laws of the State of California. The Authority Board of Directors holds the final decision-making authority for all actions pertaining to the Sites Reservoir Project. The Authority Board has delegated certain responsibilities to standing committees that do (or will) report to the Board. The Board and the Reservoir Committee have developed specific work groups to develop and refine specific products and information for consideration by standing committees and the Board. This Adaptive Management Framework, when approved by the Board, will be a chartering document for the Operations Committee and its staff.

Recognizing the many sources of uncertainty in predicting future environmental conditions, particularly in light of climate change, and knowledge gaps regarding factors controlling fish population dynamics and abundance, an adaptive management approach will be required to make informed decisions about operation management for the Sites Project. The adaptive management concept will be implemented to reduce operational uncertainty, enhance scientific knowledge, comply with the permit requirements of the Sites Project, and improve project performance in a constantly changing natural system. As with other adaptive management plans associated with major water management facilities in California, adaptive management will provide recommended operations intended to test operational hypotheses and provide input to the periodic operational reviews of the Sites Project, and will be developed with the best available science in collaboration with CDFW, USFWS, and NMFS.

It is expected that all agencies participating in the Sites Reservoir Project will adopt an adaptive management approach to reduce operational uncertainty associated with the operation of the Sites Project. At this time the participating agencies include the Authority, Reclamation, and the California Resources Agency (as the coordinating agency for the State with regard to WSIP participation). As the Site Project proceeds through WSIP, water right acquisition, and permitting processes, it is anticipated that other agencies (including the California Department of Fish and Wildlife, Department of Water Resources, the U.S. National Marine Fisheries Service and Fish and Wildlife Service) will be active participants in the adaptive management process. Together, this adaptive management organization will identify investments in related research, monitoring and other endeavors to support the Sites Project. Additional groups may be added to the adaptive management organization to support the decision-making process.

General Operational Objectives

The Sites Reservoir Project will include a large, off-stream reservoir that is independently owned, constructed, governed, managed and operated by the Authority under its own water rights and other regulatory requirements but in cooperation with both Reclamation and DWR in their operation of the CVP and SWP respectively.

The operation of Sites Reservoir is predicated on the acquisition of permits consistent with the operational assumptions, the assignment of water rights by the State of California, and the completion of agreements with the Bureau of Reclamation and DWR for the use of existing facilities. Each of these is necessary to obtaining most of the public benefits described in this application. While the implementation of the Sites Project may further the detailed evaluation of the management and allocation of water supplies in California, participation by Reclamation is allowed for by Water Infrastructure and Investment for the Nation (WIIN) Act. Likewise, the California natural resource agencies may participate in the Sites Reservoir Project under terms of Proposition 1, (2014). Both statues allow water acquired for environmental and water quality purposes to be used to improve ecologic conditions in the Sacramento-San Joaquin River Delta (Delta) relative to current conditions.

The ongoing permit acquisition, water right determinations, environmental analysis activities and the development of detailed water management agreements are all required to be complete in order to meet the following objectives of the Sites Reservoir Project.

a. The Sites Reservoir Project will be independently constructed, operated and managed by the Site Project Authority (Authority) under its own water rights and other regulatory requirements but in cooperation with both Reclamation operating the Federal Central Valley Project (CVP) and

DWR operating the State Water Project (SWP) according to separate cooperation agreements between the Authority, the United States and the State of California. The above agencies are also known as cooperating parties.

b. The operation of Sites Reservoir Project is planned to include State of California and/or accommodate federal participation in exchange for obtaining eligible public benefits; specifically, for environmental and water quality purposes. Such participation is allowed for by Water Infrastructure and Investment for the Nation (WIIN) Act and November 2014, Proposition 1, specifically chapter 8: "Statewide Water System Operational Improvement and Drought Preparedness (aka the California Water Commission's Water Storage Investment Program). Both allow water acquired for environmental and water quality purposes to be used to improve ecologic conditions in the Delta relative to current conditions.

c. The CVP operated by the Reclamation and the SWP operated by DWR have their own separate water rights and are regulated jointly by both the State Water Resources Control Board and the State and Federal Fishery Agencies under the Endangered Species Acts, and other applicable laws with regard to their respective operations including those in the Sacramento-San Joaquin Delta (Delta). The Sites Reservoir Project operations will not conflict with nor be contractually integrated into those separate water projects or regulatory requirements of the CVP or SWP.

d. The filling of water into Sites Reservoir will only occur when by-pass requirements at the diversion points and other key locations are met and the Delta is declared to be in "excess conditions" related to Delta Outflow or Delta salinity standards affected by inflow from the Sacramento River. Excess conditions as it is related to Sites Reservoir Project operations will be determined by the methods developed according to the Coordinated Operation Agreement (COA)[2] and agreed to by the cooperating parties.

e. Water deliveries from Sites Reservoir to water users, or for environmental purposes will be done in cooperation with the SWP and CVP operations in such a manner so that they will not conflict with or otherwise adversely affect the operations of the SWP or CVP but will instead provide new benefits to water users and the environment.

f. One of the major environmental benefits of the operations of the Sites Reservoir Project is the ability to allow a portion of the water demand within significant parts of the CVP service area along the Tehama Colusa Canal and Glen Colusa Canal south of Sites Reservoir to be met from Sites Reservoir in the summer and allow a like amount of water to be retained in Shasta Reservoir (via exchange) to assist in cold water pool management. As Sites water is stored via exchange with CVP obligations, it will create a Sites Water Account (SWA) in the Shasta Reservoir. The Authority, working on behalf of its member agencies, will manage this account in cooperation with Reclamation.

g. The same cooperative operations may be possible at times as it relates to the SWP or CVP in the meeting in-basin water demand obligation. The Authority, on behalf of its member agencies, may want to work with Reclamation and DWR to have some of the Sites water allocations of its customers managed in cooperation with the operations of the SWP and CVP.

h. When dealing with the SWA discussed above, the Authority will work with Reclamation and DWR to account for this water and its release latter in the summer or early fall to first meet Sites

[2] Agreement between the United States of America and the State of California for Coordinated Operation of the Central Valley Project and the State Water Project - November 24, 1986, which agreement is currently being renegotiated and updated.

water users' allocations while secondly assisting with temperature or flow control downstream of the above reservoirs. This SWA will be accounted for separately, but when needed, moved across the Delta as either project water or non-project under the conveyance agreements obtained separately between the organizations that obtain Sites water south or west of the Delta and Reclamation or DWR. Also, Reclamation, in cooperation with the Authority, will work with the NMFS, USFWS and CDFW to allow the SWA to be conveyed in the later summer and fall to Authority customers, potentially across the Delta, under current Biological Opinions as has been done for early summer water held for cold water pool purposes in the past. Also, the effects of the conveyance of Sites water across the Delta will be included in the project description in any SWP/CVP re-consultation process under the Federal Endangered Species Act.

i. Sites water users south or west of the Delta will be responsible for obtaining conveyance agreements with Reclamation or DWR to receive their allocation of the SWA and any Delta pumping costs and any losses associated with this moving the SWA from the release point and across the Delta including any Carriage Water losses.

j. The SWA held in Shasta, Oroville or Folsom reservoirs will be accounted for and subject to standard calculation of project losses as with other water held is storage in those reservoirs. At the Sites Authority discretion, some of the SWA held in storage may be carried over to other years but will be subject to "spill" when the reservoir in which it is held enters flood control operations.

k. Exchanges, Conveyance, and Purchases of Water Supply – Either cooperating party may make use of its facilities available to the other party for pumping and conveyance of water by written agreement. This includes the Authority use of both the Tehama Colusa and Glen Colusa Canals in order to fill Sites Reservoir and to deliver water to CVP customers as agreed to by the parties.

Table ADF-2. Description of Proposed Sites Project Authority Seasonal Operations

Sites Reservoir Project Operations Plan

Objective	Detail of Operation	Priority of Operation[a]	Year Type Most Suitable for Operation[b]	Months Most Suitable for Operation[c]											
				Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
General Operation															
Diversions to storage	Conduct diversions through the T-C Canal, GCID Canal, and the proposed Delevan Pipeline (diversions could occur in any month). Diversions would only occur once the D-1641, CVPIA 3406(b)(2), 2008 USFWS BiOp, and 2009 NMFS BiOp requirements have been met and existing authorized Delta diversions (e.g., Freeport Regional Water Project, Los Vaqueros Reservoir, cities of Fairfield, Vacaville, and Benicia) have been satisfied. Diversions to Sites Reservoir would be restricted by Sacramento River bypass criteria at Red Bluff, Hamilton City, Wilkins Slough, and Freeport, and mitigation restrictions for protecting fish outmigration pulse flows. Shading indicates the period in which diversion operations would occur, with the highest diversions during November through March. Diversions could also be limited by future regulatory requirements which may be placed on California and the United States.	n/a	n/a												
Seasonal Reservoir Operations	Fill Sites Reservoir by pumping water diverted and stored pursuant to Water Right Application A025517 throughout the winter and spring and drain during peak release periods throughout the summer and fall.	n/a	n/a	Fill Cycle High Point			Drain Cycle Low Point							Fill Cycle	
Water Supply Operations															
Sites Project Authority	Provide storage releases to participating TCCA districts on an as-needed basis to supplement CVP Agricultural Water Service Contract deliveries. Provide storage releases to GCID and RD 108 to supplement CVP Settlement Contract deliveries. Provide supplemental water supplies to project participants in the Sacramento Valley and south-of-the Delta to improve water supply reliability. Export would require new contracts for conveyance with Reclamation and DWR.	SPA-1	AN,BN,D,C												
Hydropower Operation															
Dispatchable Hydropower Generation	Provide more than 30 hours per week of uninterrupted operation, with dedicated afterbay/forebay (Holthouse Reservoir) with 6,500–acre-foot capacity.	n/a	ALL												
Ecosystem Enhancement Storage Account (EESA) Actions/Operation															
EESA-1: Shasta Coldwater Pool	Increase Shasta Lake storage levels to preserve additional coldwater pool storage. This action would have particular emphasis in Below Normal, Dry, and Critical water-year types. This benefit would be achieved by (1) exchanging environmental water from Sites Reservoir for environmental water storage in Shasta, and then releasing water from Sites Reservoir to meet CVP contract requirements for GCID, Reclamation District 108, and the Member Units of the TCCA; (2) releasing water from Sites Reservoir to meet CVP south-of-the-Delta needs instead of releasing water from Shasta; and (3) releasing water from Sites Reservoir to meet a portion of the CVP commitment for Delta outflow.	DP-1	BN, D, C												
EESA-2: Sacramento River Flows for Temperature Control	Maintain water temperatures year-round at levels suitable for all species and life stages of anadromous salmonids in the Sacramento River between Keswick Dam and Bend Bridge, and during the July through September period for Below Normal, Dry, and Critical water-year types. This objective would be achieved by releasing water from increased storage in Shasta.	DP-2	BN, D, C												
EESA-3: Folsom Lake Coldwater Pool	Increase Folsom Lake storage levels to preserve additional coldwater pool to achieve temperatures that are more suitable for juvenile steelhead summer rearing and fall-run Chinook salmon spawning in the lower American River from May through November during dry and critical water-year types. The additional storage would be achieved by releasing Sites Reservoir water to assist with meeting Delta objectives that are currently met through releases from Folsom, particularly from January through August.	DP-2	D, C												

Table ADF-2. Description of Proposed Sites Project Authority Seasonal Operations

Objective	Detail of Operation	Priority of Operation[a]	Year Type Most Suitable for Operation[b]	Months Most Suitable for Operation[c]
EESA-4: Augment American River Flows	Augment flows in the lower American River to reduce dewatering of fall-run Chinook salmon redds (i.e., October through March) and steelhead redds (i.e., January through May). This action would also reduce juvenile anadromous salmonid isolation events (through avoiding extreme fluctuations in flow), particularly from October through June. This objective would be accomplished by releasing a portion of the additional water stored at Folsom Reservoir resulting from Sites Reservoir releases to meet Delta objectives.	DP-2	ALL	
EESA-5: Yolo Bypass Flow Enhancement	Release flow through the Colusa Basin Drain and Knights Landing Ridge cut during summer and fall months (i.e., August through October) to help increase productivity in the Yolo Bypass in the lower Cache Slough and lower Sacramento River areas to increase desirable food sources for Delta smelt and other key fish species in the late summer and early fall.	AVG-1	AN,BN,D	
EESA-6: Lake Oroville Coldwater Pool	Improve the reliability of coldwater pool storage in Lake Oroville to improve water temperature suitability for juvenile steelhead and spring-run Chinook salmon over-summer rearing and fall-run Chinook salmon spawning in the lower Feather River from May through November during all water-year types. Additional storage would be accomplished through releases from Sites Reservoir to meet Lake Oroville compliance obligations. Provide releases from Oroville Dam to maintain water temperatures at levels suitable for juvenile steelhead and spring-run Chinook salmon over-summer rearing and fall-run Chinook salmon spawning in the lower Feather River. Augment flows in the lower Feather River to minimize redd dewatering, juvenile stranding, and isolation of anadromous salmonids.	DP-2	BN,D,C	
EESA-7: Incremental Level 4 Water Supply for Wildlife Refuges	Provide water toward meeting incremental Level 4 wildlife refuge water needs north-of-the-Delta and south-of-the-Delta to supplement refuges supplies up to Level 4 criteria (CVPIA).	AVG-2	AN,BN,D	
EESA-8: Augment Sacramento River Fall Flows	Augment flows in the Sacramento River between Keswick Dam and the Red Bluff Diversion Dam to minimize dewatering of fall-run Chinook salmon redds (for the spawning and embryo incubation life-stage periods extending from October through March), particularly during fall months. Avoid abrupt changes. Operations would avoid adverse impacts to coldwater pool operations in Dry and Critical water-year types.	AVG-3	AN,BN,D	

[a]Priority of operation "DP" indicates that the operational priority has a driest period's emphasis and "AVG" indicates an average-to-wet hydrologic emphasis. The number 1-4 indicates priority within the associated hydrologic emphasis. "n/a" indicates that operations are not or cannot be easily defined within the priority structure of the scenario. "SPA" indicates Sites Project Authority operation on an as-needed basis subject to storage availability.

[b]Year type most suitable for operation is the D1641 40-30-30 year types that are reflected in operations studies; operations in these year types occur when supplies would be available in Sites Reservoir to support the operation, when the operations criteria in the scenario allow for prioritization of the operations, and when conditions are suitable for developing the benefit associated with the operation.

[c]The heavier shaded parts of each bar highlight the months in which conditions would be most suitable to the operations; the lighter shaded parts of each bar highlight the months that would be less suitable to the operations; operations in these months would occur when supplies are available in Sites Reservoir to support the operation, when the operations criteria in the scenario allow for prioritization of the operations, and when conditions are suitable for developing the benefit associated with the operation.

Notes:

AN = Above Normal
AVG = Average
BN = Below Normal
C = Critical
D = Dry
DP = Driest periods
NMFS = National Marine Fisheries Service
USFWS = U.S. Fish and Wildlife Service

NODOS	North-of-the Delta Offstream Storage

Introduction

The proposed Sites Reservoir would be located in the Antelope Valley in Colusa and Glenn Counties. At maximum capacity, the reservoir would be the seventh largest reservoir in California, with a storage volume of approximately 1.81 million acre-feet (MAF) and surface area of approximately 14,000 acres. Sites Reservoir would provide new opportunities for surface-water recreation, such as boating, fishing, and swimming. In addition, new facilities would be developed to support other recreation activities like camping, hiking, picnicking, and sightseeing.

The suitability of lands to support reservoir-based recreation is determined by several factors, including topography, access, physical/aesthetic setting, projected reservoir operations, anticipated use, and competing uses. The following assumptions were made to characterize the potential recreational opportunities and benefits at Sites Reservoir:

- The maximum design water-surface elevation of Sites Reservoir, 520 feet above mean sea level (msl), is associated with a 1.81 MAF storage capacity and is considered to be the baseline scenario.
- The reservoir's water level would fluctuate considerably during normal operations. The maintained portion of the proposed recreation area would be limited to a designated footprint above the maximum designed reservoir water elevation, and access would be provided to the reservoir.
- General recreational activities include those common to the region, and that are usually of normal quality. Normal quality refers to experiences and activities that could be found in a more common setting, such as a regular city park, but are not an extraordinary recreational experience. These activities include picnicking, camping, day-use visits, hiking, horseback riding, cycling, fishing, boating, and passive recreation.
- Likelihood of success at fishing and wildlife viewing enhance the value of a recreation site.
- Overuse may adversely affect the quality of recreational values. Major aesthetic qualities to be considered in assessing recreational opportunities include wildlife, geology and topography, water, and vegetation.
- It is assumed that recreational development and types of recreational opportunities would be comparable to those available at Black Butte Reservoir located north of Sites Reservoir in Glenn and Tehama counties.

The location of the proposed recreation areas are shown on Figure 1 and described as follows:

- **Stone Corral Recreation Area** – The Stone Corral Recreation Area (see Figure 2) would be located on the east side of the reservoir, north of the existing Maxwell-Sites Road and the proposed Sites Dam. The maximum proposed size of the Stone Corral Recreation Area is 235 acres.
- **Peninsula Hills Recreation Area** – The Peninsula Hills Recreation Area (see Figure 3) would occupy approximately 516 acres on the northwest side of Sites Reservoir. The Authority is considering the installation of a separate boat launch facility approximately 2 miles south of this recreation area, with access to the reservoir south of Sites-Lodoga Road.

The facilities for each recreation area are summarized in Table 1 below.

Table 1. Summary of Recreation Facilities

Feature	Stone Corral	Peninsula Hills
Size	235 acres	516 acres
Location	East side of Sites Reservoir	West side of Sites Reservoir
Access	New Stone Corral Road	Existing Sites-Lodoga Road and new bridge and new Peninsula Road
Camp sites	50 (car and recreational vehicle)	100 (car and recreational vehicle) and 1 group camp area (group camp area can accommodate up to 24 people)
Picnic sites	10 (with parking at each site)	10 (with parking at each site)
Hiking trails	Yes	Yes
Vault toilets	10	10
Kiosk	1	1
Boat launch	Two lane ramp and parking area	Nearby two lane ramp and parking area approximately two miles from recreation area
Utilities	Electricity and water	Electricity and water
Other	35-acre overlook/interpretive (sightseeing) and additional parking areas	Equestrian trails and horse trailer parking area; vista point/sightseeing; additional parking areas

The design for these recreation areas was developed with input from Colusa County, a Sites Project Authority member. They would most likely be the operator/maintainer for the recreation facilities. These recreation areas could potentially be developed and commissioned in a phased approach to match recreational interest at Sites Reservoir. The Stone Corral Recreation Area and the west-side boat ramp would be constructed initially, followed by the remainder of Peninsula Hills Recreation Area, if warranted.

The Feasibility Report Appendix E Recreation supporting the North-of-the Delta Offstream Storage (NODOS) Investigation prepared for the Bureau of Reclamation provides more detailed discussion of the recreation facilities currently planned and budgeted for development (Found at https://www.sitesproject.org/information/FeasibilityReport).

BEFORE THE BOARD OF DIRECTORS OF THE

SITES PROJECT AUTHORITY

Resolution No. 2017-001

In the Matter of:

Authorizing Filing Application to California Water Commission under Water Storage Investment Program for the Sites Project.

WHEREAS, the Water Storage Investment Program ("WSIP") is provided for at Chapter 8 (commencing at Section 79750) of Division 26.7, of the California Water Code, which is part of the November 2014 voter-approved Proposition 1, the process for which is specified in regulations promulgated by the California Water Commission at California Code of Regulations, Title 23, Division 7, Chapter 1 ("WSIP Regulation"); and

WHEREAS, the Sites Project Authority ("Authority") is a joint powers authority formed by and existing among various irrigation districts and other local water districts and local governments within the Sacramento River hydrologic region pursuant to a Joint Exercise of Powers Agreement as last amended February 13, 2017, and through a Reservoir Committee established by the Authority has partners that are not located within said hydrologic region, participating with development of the Sites Project, all as authorized by Water Code Section 79759 of the WSIP authorizing act; and

WHEREAS, the Sites Project, very generally and as described in detail in the application authorize to be filed by this Resolution and its attachments, is a proposed off-stream reservoir to store unregulated water within the Sacramento River watershed when this outflow is not meeting critical environmental, water quality and water supply needs, and to subsequently release such store water from the reservoir for beneficial uses for consumptive and in-stream flow purposes; and

WHEREAS, the Sites Project is among the surface storage projects identified in the CALFED Bay-Delta Program Record of Decision, date August 28, 2000, and is therefore eligible for funding under Water Code Section 79751(a); and

WHEREAS, this Board is familiar with and concurs in the draft of the application authorized to be filed by this Resolution;

NOW, THEREFORE, BE IT RESOLVED by this Board of Directors as follows:

1. The foregoing recitals are true and correct;
2. The General Manager is authorized and directed to timely file an application for the Sites Project with the California Water Commission pursuant to WSIP and its implementing regulations referenced above; and

3. The Authority's officers and General Manager are authorized to do all things necessary and proper to carry out and implement filing the above referenced application with the California Water Commission.

PASSED, APPROVED AND ADOPTED by the Board of Directors of the Sites Project Authority this 31st day of July, 2017, by the following vote:

Ayes:	Colusa County, Reclamation District 108, Westside Water District, Glenn-Colusa Irrigation District, Tehama-Colusa Canal Authority, Maxwell Irrigation District, Colusa County Water District, Orland Artois Water District, Placer County Water Agency/City of Roseville, Proberta Water District/TC 6 Districts and Western Canal Water District.
Nays:	None.
Absent:	Glenn County.
Abstain:	None.

Ernest A. Conant, Counsel

Secretary's Certificate

I, Jamie Traynham, Secretary of the Sites Project Authority Board, do hereby certify that the resolution set forth above, is a true and accurate copy of a resolution adopted by the board of directors of the Sites Project Authority at a duly called meeting of the board on July 31, 2017. I further certify that said resolution has not been rescinded, amended, or modified and is in full force and effect as of the date hereof.

In witness whereof, I have executed this certificate this 2nd day of August 2017.

Jamie Traynham

Attachment 3: Physical and Monetized Benefits

Attach the analysis of all public and non-public monetized benefits. Identify at least one Program ecosystem or water quality priority for any ecosystem or water quality public benefit quantified. For each public and non-public benefit, describe the methods used to derive the physical and economic benefits and impacts at a level of detail that allows reviewers to verify your analysis.
Description must include:

- *The physical changes that are being monetized, consistent with information requested in the Physical Public Benefits Tab, and describing linkages between physical benefits and monetized benefits. See regulations sections 6004(a)(3) and 6004(a)(4); and*
- *The monetization method and sources for data used. See regulations section 6004(a)(4).*

Benefits Summary

In accordance with the Water Storage Investment Program (WSIP) Technical Report (TR) recommendations, CALSIM II modeling was used to determine the Sites Reservoir Project's (project) future water supply deliveries for 2030 and 2070 for each water-delivery-dependent purpose (e.g., municipal and industrial [M&I] deliveries, Incremental Level 4 deliveries) (CWC 2016). Other purposes were monetized based on other quantifications of their future operational performance (e.g., increased visitation for Recreation, supported habitat units for anadromous fish).

Table A3-1 shows the benefits quantified and monetized for the WSIP Application.

Table A3-1. Summary of Quantified Physical Benefits and Monetization Approaches

Benefit Type	Quantified Use	Physical Benefit Quantified	Monetization Method
WSIP Public Benefits	Ecosystem Improvement – Anadromous Fish	Habitat Units	Alternative Cost
	Ecosystem Improvement – Incremental Level 4 Refuge Water	Increased Deliveries	WSIP Unit Water Values
	Ecosystem Improvement – Oroville Coldwater Pool	Stored Water	WSIP Unit Water Values
	Ecosystem Improvement – Yolo Bypass	Delivered Water	WSIP Unit Water Values
	Recreation	Visitation	Facilities Assessment and Unit Day Values
	Flood Control	Flood Damage Reduction	Avoided Cost Savings
Non-Proposition 1 Eligible Benefits	Water Supply – M&I, Agricultural and Recaptured	Increased Deliveries	CWEST Modeling (M&I and Recaptured); WSIP Unit Water Values (Agricultural)
	Hydropower	Generated Power	PARO/PLEXOS Modeling

M&I = municipal and industrial
PARO = Power and Risk Office (DWR)
PLEXOS = PLEXOS® Integrated Energy Model
WSIP = Water Storage Investment Program

For each applicable project purpose, the CALSIM II operational analysis quantified its future water deliveries by water-year type and location. Corresponding physical benefits were estimated on an annual basis for the interim 2031 to 2069 period by interpolating individually (i.e., for each specific purpose by location, water-year type, and incidence rate). The 2070 physical benefit quantities were applied for the post-2070 study period (2071 to 2122). Each year's individual quantified water values were then used to determine a corresponding average expected water use amount. An average annual quantification was then estimated for the entire period of operations (2030 to 2122).

The majority of the benefits from the project purposes are expected to start producing their full benefits at the beginning of the project operations in 2030. The project's hydropower and recreation operations are the only facilities expected not to attain their full operating levels in 2030. Instead, a short initial ramp-up period is expected for those facilities before they achieve their full operating and benefit levels, in 2032. In a few other cases, the project facilities are expected to generate additional limited benefits before 2030. As a result, partial anadromous fish, Yolo Bypass, and flood damage reduction benefits are expected to be obtained before the end of construction.

The annualized benefit values for the 2030 to 2122 operating period were included the reduced benefits during the initial hydropower and recreation facilities' 2030 to 2031 ramp-up period. The project's pre-2030 additional benefits were not included in the annualized (2030 to 2122) values. However, the additional pre-2030 benefits are incorporated into the project's total net benefit value, benefit-cost ratio, and public benefit ratio calculations.

When applicable for the other project purposes, annual quantifications were similarly interpolated for the interim 2031 to 2069 period. The 2070 physical benefit quantities were also applied for the post-2070 study period (2071 to 2122).

Table A3-2 shows the estimated water supply deliveries and other quantified physical benefits by project purpose for 2030 and 2070, with the annualized average for the entire 2030 to 2122 operating period. More detailed information and discussion of each purpose's physical benefit quantification is provided in Sites_A5 Documentation under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB.

Table A3-2. Summary of Quantified Water Use by Purpose (TAF/year)

Average (2030–2122)	**94**	**39**	**32**	**161**	**114**	**11**	**451**

[a] Includes coldwater pool improvements for both Shasta Lake and Lake Oroville.
M&I = municipal and industrial
TAF = thousand acre-feet
WSIP = Water Storage Investment Program

Each project purpose benefit was monetized based on its quantified physical benefits. As shown in Table A3-1, a variety of monetization approaches were used to estimate the economic benefit values for the project's purposes. The benefit monetizations for each project purpose are summarized below in Table A3-3. More detailed information and discussion of each purpose's physical benefit quantification is provided in Sites_A5 Documentation under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB.

Table A3-3 shows the estimated monetized benefits by purpose in 2030, 2045, 2070, and the annual average for the entire 2030 to 2122 study period. More detailed information and discussion of each purpose's physical benefit quantification is provided in Section A.5.

Table A3-3. Summary of Monetized Benefits by Purpose (2015$; $1,000s)

Year	WSIP Public Benefits									Non-Prop. 1 Eligible Benefits			Total Benefits
		Total Ecosystem Improvement											
	Total WSIP Public Benefits	Total Ecosystem Improvement	Anadromous Fish & Other Aquatic	Incremental Level 4 Refuge	Lake Oroville Coldwater Pool	Yolo Bypass	Recreation	Flood Control	Total Non-Prop.1 Eligible Benefits	Total Water Supply	Hydropower (System)		
2030	$73,717	$62,343	$25,637	$16,047	$11,814	$8,845	$6,997	$4,377	$109,207	$89,024	$20,183		$182,925
2045	$119,700	$108,325	$48,505	$27,644	$22,986	$9,190	$6,997	$4,377	$177,417	$157,234	$20,183		$297,116
2070	$156,824	$145,449	$86,619	$24,634	$24,976	$9,220	$6,997	$4,377	$271,704	$251,521	$20,183		$428,527
Annualized (2030-2122) [a]	**$122,033**	**$110,900**	**$56,985**	**$23,811**	**$20,987**	**$9,117**	**$6,755**	**$4,377**	**$194,902**	**$175,418**	**$19,483**		**$316,934**

[a] Annualized benefit value was calculated using net present value over 93 years at a 3.5% discount rate. Annualized benefits assume interpolated annual physical benefits between 2030 and 2070, and then constant annual benefits after 2070. WSIP unit water values were interpolated between 2030 and 2045, after which 2045 unit water values were used.

Ecosystem Improvement (WSIP Public Benefits)

Sites Reservoir would provide a variety of ecosystem benefits. Four distinct ecosystem benefits were analyzed. Table A3-4 summarizes the physical benefits that were quantified and monetarized for the WSIP Application.

Table A3-4. Ecosystem Physical Benefits Quantified and Monetized

Benefit Category	Location	Physical Benefit Monetized
Anadromous Fish	Sacramento River watershed between Keswick Dam and Red Bluff	Increase in habitat units as determined by SALMOD
Incremental Level 4 Refuge Water Supply	National Wildlife Refuges, State Wildlife Areas, and privately managed wetlands	Increase in Incremental Level 4 refuge water supplies to achieve optimum habitat management
Lake Oroville Coldwater Pool	Lake Oroville	Additional water stored in Lake Oroville provides temperature and flow improvements for anadromous fish
Yolo Bypass Flows	Yolo Bypass discharging to the Sacramento River	August through October releases from Sites Reservoir to Yolo Bypass

Anadromous Fish

Physical Quantification

Sites Reservoir provides a variety of benefits to anadromous fish. SALMOD modeling results were used to evaluate the cost of an alternative project to raise the dam at Shasta Lake to estimate the benefits to anadromous fish. The SALMOD model combines flow and temperature information to forecast the population of Chinook salmon in the Sacramento River watershed between Keswick Dam and Red Bluff. Table A3-5 presents the projected increases in future fish population and habitat units by type of fish for 2030, 2070, and the annual average in the 2030 to 2122 study period.

Table A3-5. SALMOD Results for 2030 and 2070 (TAF/year)

Run	No Action (# of fish/yr)	Average Increase (# of fish/yr)	Habitat Units	Dry Year Increase (# of fish/yr)	Critical Year Increase (# of fish/yr)	Dry & Critical Year Increase (# of fish/yr)
2030 SALMOD Results						
Fall-Run Chinook	32,275,104	435,138	435	19,893	1,493,430	609,308

Average (2030–2122)						
Long-Term Average	—	1,539,301	1,539	2,190,480	4,546,667	3,132,955

Figure A3-1 shows the percentage growth in population increase projected for each fish type population in both 2030 and 2070.

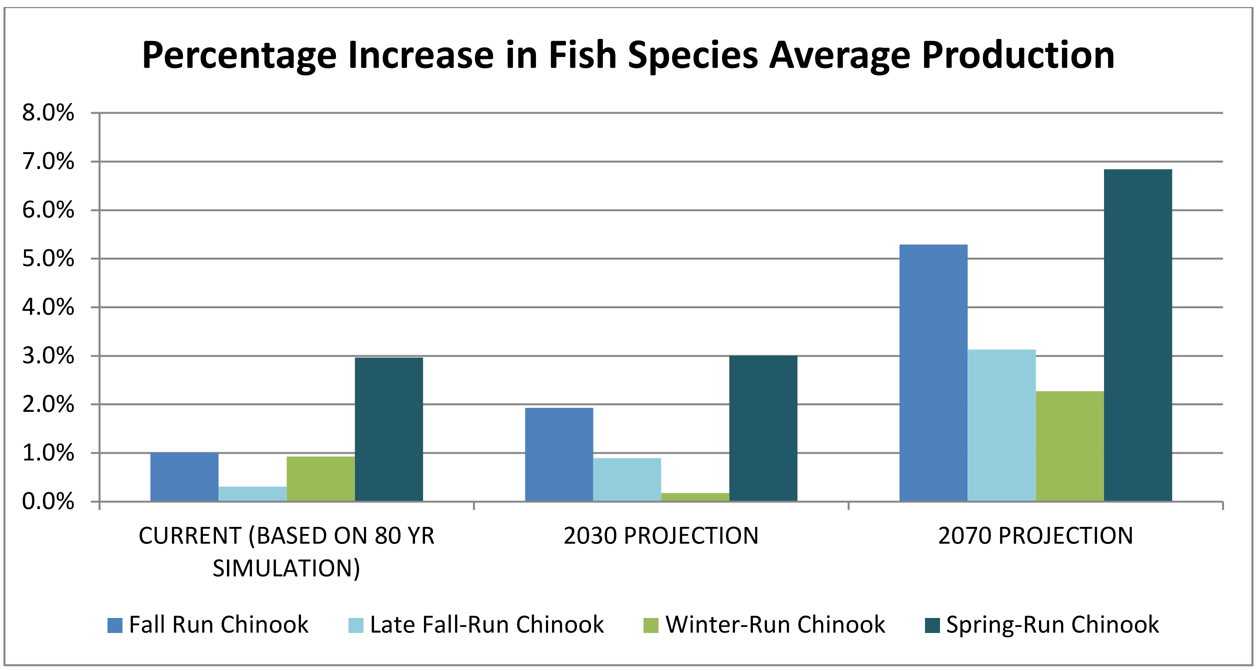

Figure A3-1.Percentage Increase in Fish Species Average Production for 2030 and 2070

Monetized Benefits

Sites Reservoir would enhance future water temperature and flow conditions in the Sacramento River as a means of improving the riverine ecosystem. The economic benefits of the project's contributions to anadromous fish survival were estimated based on the alternative cost approach. The cost of the most likely alternative is based on various Shasta Dam raises operated solely for the purpose of increasing the number of salmon smolt in the Sacramento River.

The Shasta Lake dam raise is considered a reasonable and feasible alternative source due to not only its potential capability to provide the necessary quantities of new water supplies but also its location, which ensures that it can benefit the same anadromous fish population locations and therefore result in the same ecosystem improvement outcomes. Furthermore, recent extensive planning and analysis has been completed for the Shasta Dam raise, which provides more confidence in the accuracy of both its construction cost estimate and its potential implementation viability.

Table A3-6 shows that Sites Reservoir's anadromous water supply benefits were estimated based on the least-cost alternative of expanding Shasta Lake's storage with a 12.5-foot raise of Shasta Dam as a single-purpose water storage project that would result in increased future habitat units. The base construction cost for the Shasta Lake Raise was obtained from the 2015 Shasta Lake Water Resource Investigation Feasibility Study. The costs were adjusted into current dollar terms and annualized using a 3.5 percent discount rate in accordance with the WSIP TR requirements.

Analysis of the numerous Shasta Dam Raise alternatives determined that the 12.5-foot dam raise was not only the most productive alternative, with 988 new habitat units, but also the most cost-effective alternative, with a unit cost of $47,539 per habitat unit. From this finding, the $47,539 per habitat unit benefit value was applied to the project's expected future habitat improvement to estimate Sites Reservoir's anadromous fish benefits. This estimate is conservative because it does not account for deteriorating river conditions that would likely result from the longer timeframe required to implement a raise of the Shasta Dam.

Table A3-6. Anadromous Fish Benefits: Least-Cost Alternative (2015$; $1,000s)

Alternative	Annual Benefits [a]		Annualized Benefit [b]
	2030	2070	
Average Conditions [c]			
Sites Reservoir	$25,637	$86,619	**$56,985[a]**

[a] Based on 12.5-foot raise of Shasta Dam as the alternative cost for achieving the ecosystem improvement.
[b] Annualized benefits interpolated annual physical benefits between 2030 and 2070 and were then constant after 2070. Net present value over 93 years at a 3.5% discount rate.
[c] Averaged over the entire hydrologic sequence (1922 to 2003).

The project's anadromous fish benefits were estimated to increase from $25.6 million in 2030 to approximately $86.6 million in 2070. The corresponding average annual benefit for the future 2030 to 2122 operating period was estimated to be $57.0 million.

Incremental Level 4 Refuge Water Supply

Physical Quantification

Table A3-7 shows improved deliveries to National Wildlife Refuges, State Wildlife Areas, and privately managed wetlands projected in 2030, 2070, and the annual average in the 2030 to 2122 study period. The distribution of water between north and south of Delta refuges was assumed and can be modified; however, additional infrastructure would be needed to significantly increase deliveries to north of Delta refuges.

Table A3-7. Incremental Level 4 Refuge Water Supply Increases
(2030 and 2070) (TAF/year)

Period	North-of-the-Delta	South-of-the-Delta	Total
2030 Results			
Long-Term Average	1	34	35

2030–2122 Results			
Long-Term Average	**1**	**31**	**32**

Source: CALSIM II.

The changes in incremental Level 4 refuge supply deliveries were interpolated between 2030 and 2070 to project the future refuge water supplies on an annual basis. In accordance with WSIP TR guidance, post-2070 deliveries were assumed to remain at 2070 levels.

Monetized Benefits

Sites Reservoir would increase water deliveries for incremental Level 4 refuge needs. The economic benefits of the project's contributions to incremental Level 4 refuge needs were estimated using the WSIP unit water values to determine the value of its supplied water. It was also assumed that the incremental Level 4 refuge water would otherwise likely be used for south-of-the-Delta deliveries.

Therefore, the estimated total benefit value is estimated based on the expected future average hydrological year type and the expected use location of the water supplies. Furthermore, the WSIP unit water values were adjusted to include the additional conveyance energy cost associated with its future use. Table A3-8 presents the estimated benefit values for the projected future increases in incremental Level 4 refuge water.

Table A3-8. Incremental Level 4 Refuge Benefits: WSIP Unit Water Values (2015$; $1,000s)

Alternative	Annual Benefits [a]		Annualized Benefit [b]
	2030	2070	
Average Conditions [c]			
Sites Reservoir	$16,047	$24,634	$23,811

[a] Based on WSIP unit water values adjusted by water-year type, expected delivery location, and conveyance energy costs.
[b] Annualized benefits assume interpolated annual physical benefits between 2030 and 2070 and then constant annual benefits after 2070. WSIP unit water values interpolated between 2030 and 2045, after which 2045 unit water values were used.
[c] Averaged over the entire hydrologic sequence (1922 to 2003).

The project's incremental Level 4 refuge water supply benefits were estimated to increase from $16.0 million in 2030 to approximately $24.6 million in 2070. The corresponding average annual benefit for the future 2030 to 2122 operating period was estimated to be $23.8 million, which is equal to an estimated average unit benefit value of $781 per acre foot for the incremental Level 4 refuge benefits. This valuation reflects the comparatively high benefit values for future south-of-the-Delta water uses.

Lake Oroville Coldwater Pool

Physical Quantification

Improvements to the coldwater pool and downstream releases to assist migrating fish would be beneficial to salmon, steelhead, and other fish in the lower Feather River. The benefits were anticipated to be less than the benefits downstream from Shasta Lake, but nevertheless significant. The SALMOD model does not include the Feather River area. The improvements in fish habitat in the Feather River watershed were therefore evaluated using an opportunity cost to secure an equivalent amount of storage in Lake Oroville. The storage increase based on CALSIM modeling is characterized below.

Table A3-9 shows the projected future increase in annual water storage for Lake Oroville.

Table A3-9. Lake Oroville Storage Increases for 2030 and 2070 (TAF/year)

TAF = thousand acre-feet

Monetized Benefits

Sites Reservoir would enhance future water temperature and flow conditions in the American River as a means of improving the riverine ecosystem. Sites would achieve these ecosystem improvements by enabling Lake Oroville to delay some of its water deliveries, which would increase its coldwater pool conditions and lower the water temperatures of its subsequent water releases.

The economic benefits of the project's contributions to anadromous fish survival were estimated based on use of the WSIP unit water values to determine the value of the water that would otherwise be needed to be withheld in Lake Oroville to improve its coldwater pool and the temperature conditions of its water releases. Based on Lake Oroville general water supplies, for the purposes of the benefit valuation it is assumed that the water supply that would otherwise need to be retained (and therefore not delivered) would be south-of-the-Delta deliveries.

Therefore, the estimated total benefit value is estimated based on the expected future average hydrological year type and the expected use location of the water supplies. Furthermore, the WSIP unit water values were also adjusted to include the additional conveyance energy cost associated with its future use. Table A3-10 presents the estimated benefit values for the projected future increases in the coldwater pool at Lake Oroville.

Table A3-10. Lake Oroville Coldwater Pool Benefits: WSIP Unit Water Values (2015$; $1,000s)

Alternative	Annual Benefits [a]		Annualized Benefit [b]
	2030	2070	
Average Conditions [c]			
Sites Reservoir	$11,814	$24,976	$20,987

[a] Based on WSIP unit water values adjusted by water-year type, expected delivery location, and conveyance energy costs.
[b] Annualized benefits assume interpolated annual physical benefits between 2030 and 2070 and then constant annual benefits after 2070. WSIP unit water values interpolated between 2030 and 2045, after which 2045 unit water values were used.
[c] Averaged over the entire hydrologic sequence (1922 to 2003).

The Lake Oroville coldwater benefits of the project were estimated to increase from approximately $11.8 million in 2030 to nearly $25.0 million in 2070. The corresponding average annual benefit for the future 2030 to 2122 operating period was estimated to be $21.0 million, which is equal to an estimated average unit benefit value of $781 per acre-foot.

Yolo Bypass Flows

Physical Quantification

In 2016, the California Department of Water Resources (DWR) performed a North Delta Food Web Study in collaboration with Federal and local water agencies. The study addressed the *Delta Smelt Resiliency Strategy* (DWR July 2016) recommendation for North Delta food web adaptive management projects. The resulting fall flows in the Yolo Bypass successfully produced a phytoplankton bloom, the major food source for endangered Delta smelt.

The Cache Slough area that receives water from the Yolo Bypass is the only place in the Delta estuary where the Delta smelt population is increasing. The purpose of this action is to help increase desirable food sources for Delta smelt in the lower Cache Slough and lower Sacramento River areas. This increase in food sources should improve Delta smelt growth and condition as they mature into adults, thereby increasing Delta smelt abundance.

The Sites Reservoir Project would provide two pulses of flow of at least 400 cubic feet per second (cfs) each over a two- to three-week period into the Yolo Bypass (via the Colusa Basin Drain, past the Wallace Weir and Ridge Cut, and into the Tule Drain) that will flow through the toe drain and out to the Sacramento River. Each flow pulse made into the Colusa Basin Drain would total about 20 thousand acre-feet (TAF) in each of the two- to three-week periods, resulting in an average total flow of 39 TAF per year. The flow pulses would be adaptively managed, but are currently thought to occur in late summer and early fall (e.g., August and September). The water deliveries would not have to occur every year, but would be desirable in most years.

Table A3-11 shows the projected future increase in annual water flows for Yolo Bypass for 2030, 2070, and the annual average in the 2030 to 2122 study period.

Table A3-11. Yolo Bypass Flow Increases for 2030 and 2070 (TAF/year)

Water-Year Type	Quantity
2030 Results	
Full	39
Dry	33
Critical	5
2070 Results	
Full	39
Dry	33
Critical	8
Average (2031–2122)	
Long-Term	**39**

TAF = thousand acre-feet

Monetized Benefits

Sites Reservoir would increase water deliveries to the Yolo Bypass. The economic benefits of the project's contributions to Yolo Bypass needs were estimated using the WSIP unit water values to determine the value of its supplied water. The Sacramento Valley WSIP unit water values were used to determine the benefit values of the water supplies used for the Yolo Bypass. These values do not include any conveyance cost benefit adjustment and were used because it was presumed that the necessary water supplies would otherwise be obtained from Sacramento Valley agricultural water users. Therefore, the estimated total benefit value is estimated based on the expected future average hydrologic year type and the expected use location of the supplies.

Table A3-12 presents the estimated benefit values for the projected future increases in Yolo Bypass deliveries.

Table A3-12. Yolo Bypass Supply Benefits: WSIP Unit Water Values (2015$; $1,000s)

Alternative	Annual Benefits [a]		Annualized Benefit [b]
	2030	2070	
Average Conditions [c]			
Sites Reservoir	$8,845	$9,220	$9,117

[a] Based on WSIP unit water values adjusted by water-year type and expected delivery location.
[b] Annualized benefits assume interpolated annual physical benefits between 2030 and 2070 and then constant annual benefits after 2070. WSIP unit water values interpolated between 2030 and 2045, after which 2045 unit water values were used.
[c] Average over the entire hydrologic sequence (1922 to 2003).

The project's Yolo Bypass supply benefits were estimated to increase from $8.8 million in 2030 to $9.2 million in 2070. The corresponding average annual benefit for the future 2030 to 2122 operating period was estimated to be $9.1 million, which is equal to an estimated average unit benefit value of $237 per acre-foot for the future ecosystem benefits from Yolo Bypass. This valuation reflects the comparatively lower benefit values for future north-of-the-Delta water uses.

Recreation (WSIP Public Benefit)

Physical Quantification

Recreation benefits were valued using visitation estimates for the new recreational areas planned for the Sites project. Annual visitation was estimated using a facilities-based approach that accounts for Sites planned facilities, carrying capacity, the regional population of potential users, the surface acreage of the reservoir, fluctuations in storage throughout the year, and the amenities and visitation levels of substitute reservoirs in the region.

Table A3-13 presents the annual visitor-day estimates and unit day values by activity type. The estimated total annual visitor-days assumed in this analysis was approximately 187,000.

Table A3-13. Annual Recreation Visitation by Primary Activity

Activities	Annual Visitor-Days
Shore fishing	16,254
Boat fishing	8,407
Picnicking	15,457
Sightseeing	27,514
Swimming / beach use	36,992
Walking	42,223
Bicycling/Motorcycling	5,418
Horseback riding	2,429
Boating / water-skiing	29,145
Hunting	560
Other	2,429
Total	186,829

Monetized Benefits

Recreation benefits were quantified using unit day values from Rosenberger, Recreation Use Values Database (RUVD) for North America (2016) and from Loomis, Updated Outdoor Recreation Use Values on National Forests and Other Public Lands for U.S. Forest Service (2005). These values were applied to the visitation projections for Sites Reservoir. It was also determined that 80 percent of the visitor-days at Sites Reservoir would represent new recreational visits, and that the remaining 20 percent of visits would reflect recreational visitor-days that, in the absence of Site Reservoir's development, would otherwise have occurred at nearby reservoirs. Table A3-14 presents the results of the recreation benefits analysis.

Table A3-14. Estimated Annual Recreation Benefits (2015$; $1,000s)

Alternative	Annual Benefits [a]		Annualized Benefit [b]
	2030	2070	
Average Conditions [c]			
Sites Reservoir	$6,997	$6,997	$6,754

[a] Annual benefits reflect consumer surplus value for various recreational activities supported by Sites Reservoir and water operation scenarios under year 2030 and year 2070 levels of development. Benefits were attributed for only 75 percent of future visitation expected as new recreational use after accounting for potential substitution effects on other reservoirs in the region.
[b] Annualized benefits represent avoided costs relative to the Future No Project conditions over the planning horizon (2030 to 2122). Annual average is less than 2030 and 2070 values due to initial short ramp-up period before full benefits are generated.
[c] Averaged over the entire hydrologic sequence (1922 to 2003).

The project's future recreation benefits were estimated to be approximately $7.0 million in 2030. Although future population growth might be expected to increase future recreation demand and visitation, it was conservatively assumed that the 2030 level of benefits would remain constant throughout the future 2030 to 2122 operating period. As a result, the average annual benefit for the future 2030 to 2122 operating period was estimated to be $6.8 million (slightly reduced due to an assumed 50 percent operation during its first two operating years).

Flood Damage Reduction (WSIP Public Benefit)

Physical Quantification

Development of the Sites project would reduce the magnitude of flood events in the area along Funks Creek and Stone Corral Creek, specifically for the town of Maxwell's residential, commercial, and public structures and contents. In addition, the project would reduce flood damage to adjacent agricultural lands and flood-related closures to Interstate 5 and State Route 20.

Hydraulic analysis (HEC-RAS 2-D) was used to quantify the project-related reduction in flood-impacted areas and flooding severity for six different flood event types (ranging from 5-year to 500-year flood events). Geographic information system (GIS) land use analysis inventoried the impacted areas. Flood reduction benefits were estimated for current hydraulic conditions to represent the expected 2030 conditions. No adjustments in the hydraulic modeling or other analytic methods were used to project 2070 conditions (including climate change) because the flood damage benefits are relatively limited and due to difficulty in quantifying the magnitude of changes in future flood events.

Additional details on flood damage reduction benefits are provided under the Sites_A1 Flood Control under the PHYSICAL PUBLIC BENEFITS TAB.

Monetized Benefits

The value of flood damage reduction benefits was estimated based on the average annual cost of flood damages under No Action conditions and the projected reduction in flooded area and damage costs for "with Project" conditions. The resulting Expected Annual Damages savings from the project-related reduction in flood impact incidence and severity were calculated for a comprehensive range of different flood event types (5 year to 500 year) and adjusted for their expected incidence rate. This approach corresponds to the "avoided cost" approach described in the WSIP TR report.

Table A3-15 presents the estimated benefit value of the project-related flood damage reduction.

Table A3-15. Flood Reduction Benefits (2015$; $1,000s)

Alternative	Annual Benefits [a]		Annualized Benefit [b]
	2030	2070	
Average Conditions [c]			
Sites Reservoir	$4,377	$4,377	$4,377

[a] Based on the project-related reduction in expected annual damages from future flood events.
[b] Annualized benefits assume interpolated annual physical benefits between 2030 and 2070 and then constant annual benefits after 2070.
[c] Averaged over the entire hydrologic sequence (1922 to 2003).

The project's future flood reduction benefits were estimated to be approximately $4.4 million in 2030. It was conservatively assumed that 2030 benefit values would remain constant throughout the future 2030 to 2122 operating period. As a result, the average annual benefit for the future 2030 to 2122 operating period was estimated to be $4.4 million.

Water Supply (Non-Proposition 1 Eligible Benefit)

Physical Quantification

Increases in water supply were monetized based on the increase in deliveries. Increases in deliveries for 2030 and 2070 were estimated using CALSIM II. CALSIM II determined future water deliveries for each applicable project purpose by water-year type and location. Corresponding physical benefits were estimated on an annual basis for the interim 2031 to 2069 period by interpolating individually (i.e., for each specific purpose, location, water-year type, and incidence rate). Each year's individual quantified values were then used to determine a corresponding average expected water use amount. Table A3-16 shows the estimated water supply deliveries by water-year type projected in 2030, 2070, and the annual average in the 2030 to 2122 study period. Sites is expected to reduce the flood area by 9,570 acres. Additional details on flood damage reduction benefits are provided in Sites_A1 Flood Control under the PHYSICAL PUBLIC BENEFITS TAB.

Table A3-16. Increase in Water Supply Deliveries (TAF/year)

Period	NOD Agriculture	SOD Agriculture	SOD M&I	SOD Recaptured	Total
2030 Results					
Long-Term Average	110	25	106	11	254
Wet	62	5	15		82
Above Normal	86	68	52		144
Below Normal	125	28	121		273
Dry	157	56	213		426
Critical	153	53	185		391
2070 Results					
Long-Term Average	137	30	117	11	295
Wet	110	5	15		130
Above Normal	146	12	72		230
Below Normal	152	26	116		294
Dry	161	69	257		488
Critical	133	41	145		319
Average (2030–2122)					
Long-Term Average	**131**	**29**	**114**	**11**	**286**

Source: CALSIM II.
M&I = municipal and industrial
NOD = north-of-the-Delta
SOD = south-of-the-Delta

Monetized Benefits

Sites Reservoir would improve water supply reliability to both M&I water users (primarily south of the Delta) and agricultural waters (both north and south of the Delta). CWEST modeling was used to estimate the project's future M&I water supply benefits. The CWEST values were also applied to the small quantity of recaptured water that the Sites Joint Powers Authority (JPA) intends to use as a revenue source to cover the future operations and maintenance (O&M) cost-share for the project's agricultural water supply benefits for ecosystem and other public benefit purposes based on the WSIP-recommended unit water values. The total benefit value was estimated based on the expected future average hydrological year type and the expected use location of the water supplies. The WSIP unit water values were also adjusted to include the additional conveyance energy cost associated with its future use.

Table A3-17 shows the project's total water supply reliability benefits.

Table A3-17. Total Water Supply Benefits: CWEST Results and WSIP Unit Water Values (2015$; $1,000s)

Alternative	Annual Benefits [a]		Annualized Benefit [b]
	2030	2070	
Average Conditions [c]			
Sites Reservoir	$89,024	$251,521	$175,418

[a] Based on CWEST and WSIP unit water values adjusted by water-year type, expected delivery location, and conveyance energy costs.
[b] Annualized benefits assume interpolated annual physical benefits between 2030 and 2070 and then constant annual benefits after 2070. WSIP unit water values interpolated between 2030 and 2045, after which 2045 unit water values were used.
[c] Averaged over the entire hydrologic sequence (1922 to 2003).

Based on the assumed water use split between agricultural, M&I, and recaptured water deliveries and their use location, the project's future water supply benefits are estimated to increase from $89.0 million in 2030 to approximately $251.5 million in 2070. The corresponding average annual benefit for the future 2030 to 2122 operating period is estimated to be $175.4 million, which is equal to an estimated average unit benefit value of $760 per acre-foot for water supply use.

Hydropower (Non-Proposition 1 Eligible Benefit)

Physical Quantification

Hydropower benefits were modeled by both DWR's Power and Risk Office (PARO) and United States Bureau of Reclamation contractors. These non-public benefits are difficult to forecast due to a rapidly changing market for valuing ancillary and systemwide capacity benefits due to the rapid and extensive new development of wind and solar resources. The fluctuation in revenue from hydropower generation over the last decade can be seen by looking at the variability in revenue from generation that has occurred for the State Water Project (SWP).

Hydropower analysis performed by Toolson and Zhang (2013) generally corroborated PARO's direct net energy benefits. Toolson and Zhang's PLEXOS modeling analysis also evaluated Sites Reservoir ancillary services (AS) and systemwide capacity performance and benefits. Sites is expected to increase the hydropower (system) by 215,542 MWh per year.

Monetized Benefits

The proposed Sites Reservoir Project includes new hydropower capacity and the ability to provide AS at Shasta Dam and other hydropower facilities throughout the Central Valley Project (CVP) and SWP systems. Estimates of net changes in hydropower capacity, generation, and AS in western interconnection electrical power grid were estimated using both DWR's PARO modeling and the PLEXOS® Integrated Energy Model (PLEXOS).

The PARO model is used to estimate the costs and revenues of hydropower facilities' operations. Power benefits were also valued by PLEXOS, a power market simulation model, to forecast energy and AS power market prices for the year 2022, when the 33 percent Renewable Portfolio Standard (RPS), mandated by California law, will have been implemented. The assumption is that power market prices stabilize once the RPS is achieved.

DWR's PARO analysis modeled future optimized pumping, generation, and pump-back operations to estimate the future energy use cost and power generation benefits optimized between peak and off-peak periods. The PARO analysis determined that the estimated net energy cost for Sites Reservoir operations would be $1.7 million, which was assigned to the facility's O&M costs.

The PLEXOS hydropower analysis confirmed DWR's direct net energy benefits and costs. The PLEXOS analysis also estimated annual AS benefits of approximately $2.4 million and systemwide capacity benefits of $17.8 million per year. As a result, the combined AS and systemwide capacity National Economic Development (NED) benefits potentially attributable to the hydropower facilities would be $20.2 million per year. Table A3-18 shows the projected future AS and systemwide capacity benefits projected for Sites Reservoir's hydropower operations. As discussed above, the reservoir's projected energy costs are recognized in its O&M cost and therefore were not included in hydropower system benefits shown in Table A3-18.

Table A3-18. Hydropower Benefits (2015$; $1,000s)

Alternative	Annual Benefits a		Annualized Benefit b
	2030	2070	
Average Conditions [c]			
Sites Reservoir	$20,183	$20,183	$19,483

[a] Based on projected ancillary service and systemwide capacity benefits. Facility pumping costs and generation revenues are included in the facilities' annual O&M costs.
[b] Annualized benefits assume interpolated annual physical benefits between 2030 and 2070 and then constant benefits after 2070. Annual average is less than 2030 and 2070 values due to initial short ramp-up period before full benefits are generated.
[c] Averaged over the entire hydrologic sequence (1922 to 2003).

Combined AS and systemwide capacity benefits of $20.2 million were determined for the project's hydropower operations in 2030. It was conservatively assumed that the project's 2030 level of benefits would remain constant throughout the future 2030 to 2122 operating period. As a result, the average annual hydropower benefit for the future 2030 to 2122 operating period was estimated to be $19.5 million (slightly reduced due to an assumed 50 percent operation during its first two operating years).

1. Introduction

This report describes the proposed Sites Reservoir Project (Project) and associated construction, operation, and maintenance of necessary facilities. This report is organized in the following manner:

- Description of Project features and facilities, including construction, operation, and maintenance descriptions specific to Project features (Section 2 Sites Reservoir Project Features and Facilities)
- Proposed construction, operations/maintenance activities required to construct, operate, and maintain all Project facilities (Section 3 Construction Operation/Maintenance)
- Proposed project operations (including diversions, releases, ecosystem enhancement actions, hydropower generation, and other benefits) (Section 4 Diversion and Reservoir Operations)
- Environmental commitments, including preventive measures, plans, and best management practices (BMPs) included as part of the Project (Section 5 Environmental Commitments Included as Part of the Project)

The operations of the Project are intended to be flexible and vary from year to year in response to the needs of the California water supply system to provide high-quality water to enhance the environment, the economy, and quality of life for Californians.

This page intentionally left blank.

2. Sites Reservoir Project Features and Facilities

This section identifies and describes the primary facilities as well as construction, operation, and maintenance specific to each Project facility. Facilities are grouped into "complexes," based on related function and location. The proposed complexes include the following:

- Sites Reservoir Complex
- Holthouse Reservoir Complex
- Terminal Regulating Reservoir (TRR) Complex
- Delevan Pipeline Complex
- Overhead Power Lines and Substations
- Project Buffer

Table 2-1 summarizes key Project features, by complex.

2.1 Project

The proposed Sites Reservoir Project would include the following primary features and facilities (Figure 2-1); associated Project-related storage, diversion rates, and power generation capabilities are shown in parentheses:

- Sites Reservoir capacity: 1.8 million acre-feet (MAF)
- Sacramento River diversions: Existing Tehama-Colusa Canal (Red Bluff) (2,100 cubic feet per second [cfs]) and GCID Main Canal (Hamilton City) (1,800 cfs) pumping plants and proposed Delevan Pipeline Intake/Discharge Facilities (2,000 cfs).
- Delevan Pipeline operation: 2,000-cfs intake and 1,500-cfs release
- Hydropower generation capability: Approximately 118 megawatts

Approximate permanent facility footprint sizes by complex are provided in Table 2-2.

2.1.1 Sites Reservoir Complex

The Sites Reservoir Complex includes the features and facilities that are geographically or functionally associated with the Sites Reservoir. This complex includes the Sites Reservoir Inundation Area, the dams that would form the reservoir, proposed borrow locations for materials required to construct the dams, the inlet/outlet facilities for the pumping/generating plant and associated electrical switchyards, the tunnel that would connect the pumping/generating plant to the inlet/outlet structure, and the bridge, roads, recreation areas, and office/maintenance area. Design, construction, and operation of all facilities would comply with applicable Division of Safety of Dams requirements regarding anticipated seismic activity, including fault rupture, ground shaking, ground failure, and liquefaction.

Table 2-1
New Project Facilities and Features and Existing Facilities Relied Upon[a]

Project Features/Facilities	Main Elements of the Project Features/Facilities
Sites Reservoir Complex	
Sites Reservoir Inundation Area	1.8-MAF capacity (14,200 acres)
Golden Gate Dam, Sites Dam, and Saddle Dams	Golden Gate Dam; Sites Dam; Saddle Dams 1, 2, 3, 4, 5, 6, 7, 8, and 9 (11 dams)
Borrow Areas (onsite)[b]	Approximately 920 acres in inundation area 200 acres northeast and east of the inundation area
Sites Reservoir Inlet/Outlet Structure and Associated Facilities	Multi-level valved tower, 4,000-foot tunnel; 260-foot-high structure; intake openings at nine levels; trash racks, fish screens; bridge; 15,200-cfs emergency release outlet capacity
Sites Pumping/ Generating Plant and Electrical Switchyard	5,900-cfs pumping capacity 5,100-cfs generating capacity
South Bridge and Roads	Temporary construction roads, several access roads to new facilities, and new roads to replace those currently in the Inundation Area. South Bridge to provide access between Maxwell and Ladoga.
Recreation Areas [c]	Stone Corral Peninsula Hills Boat Ramp Day Use Area
Field Office Maintenance Yard	Administration, maintenance buildings, and parking (also serves Holthouse and TRR reservoirs)
Holthouse Reservoir Complex	
Holthouse Reservoir	6,250 ac-ft active storage capacity
Holthouse Spillway and Stilling Basin and Spillway Bridge	15,200 cfs capacity
WAPA Transmission Line Relocation	Eight transmission line towers moved to the west
Sites Pumping/Generating Plant Approach Channel	6,300 feet long
Tehama-Colusa Canal Construction Bypass Pipeline/Operation and Maintenance Siphon to Tehama-Colusa Canal	12-foot-diameter approximately 2,600-foot-long siphon pipeline would divert Tehama-Colusa Canal water around Holthouse Reservoir during construction; during operation it would pass water to the canal downstream of the reservoir without pumping
Additional Pump at the Red Bluff Pumping Plant (in Secondary Study Area)	Install two additional 250-cfs capacity pumps

Table 2-1

Project Features/Facilities	Main Elements of the Project Features/Facilities
TRR Complex	
TRR	1,200 acre-feet capacity 120 acres Only a minimal drain would be required because of the close proximity of the TRR to Funks Creek.
TRR Pumping/ Generating Plant and Electrical Switchyard	1,800-cfs pumping capacity 900-cfs generating capacity 4-acre electrical switchyard
GCID Main Canal Connection to TRR	GCID Main Canal energy dissipation bay/check structure TRR inlet channel and inlet control structure
TRR Pipeline and TRR Pipeline Road	1,800-cfs pumped capacity 900-cfs gravity flow capacity 2.5-mile road
GCID Main Canal Modifications	Refurbished existing gates; canal lining immediately upstream and downstream of the TRR.
Delevan Pipeline Complex	
Delevan Pipeline Intake/Discharge Facilities	250-foot-long by 80-foot-wide facilities building with multiple stories; four 500-cfs capacity pumping/generating units; two 750 cfs turbines
• Flat Plate Fish Screen Structure and Forebay	560-foot-long structure; 13-foot-high by 15-foot-wide flat plate screens (32 total); 2,000 cfs capacity; forebay would be constructed between fish screen and pump turbine station
• Pumping/Generating Plant	2,000-cfs pumping capacity/ 1,500-cfs generating capacity
• Electrical Switchyard	4-breaker ring bus with poles 15 to 60 feet tall
• Maintenance and Electrical Buildings	Mechanical control building; electrical building; (each approximately 5,000 square feet)
Delevan Pipeline	West-east alignment from Delevan Pipeline Intake/Discharge Facilities to Holthouse Reservoir 2,000-cfs capacity pumping / 1,500-cfs capacity release
Overhead Power Lines and Substations	
Substations	Stepdown power from the existing WAPA 500 kV and 230 kV and the PG&E 230 kV lines near Funks/Holthouse Reservoir; Stepdown power from the existing WAPA 230 kV lines approximately 1 mile southwest of Colusa, north of Highway 20; Up to 6 acres each including multiple electrical components and related structures, concrete pad, overhead power line tower/pole, fencing
Electrical Connection for Sites Pumping/Generating Plant	New 1- to 4-mile-long, 230 kV or 115 kV, overhead power line from the proposed substation west to Sites Pumping/Generating Plant

Table 2-1
New Project Facilities and Features and Existing Facilities Relied Upon[a]

Project Features/Facilities	Main Elements of the Project Features/Facilities
Electrical Connection for TRR Pumping/Generating Plant	New 230 kV or 115 kV overhead power line from the proposed substation, east to TRR Pumping/Generating Plant
Electrical Connection for Delevan Pumping/Generating Plant	New 115 kV overhead power line along SR 45 from the proposed substation west of Colusa to the Delevan Pumping/Generating Plant; line will cross SR 45
Project Buffer	
	Total land acquired for the Project beyond the facility footprints, out to the nearest existing parcel boundaries[d]; applies to Sites Reservoir Complex, Holthouse Reservoir Complex, TRR Complex, Delevan Pipeline Complex (excluding the pipelines)

[a] The table is meant to provide an overview of the main components of each complex; not all facilities or features of the project are included in this table but are further detailed in Section 2 Sites Reservoir Project Features and Facilities.

[b] Offsite sources for filter, drain, and transition materials, and concrete aggregate would be required if the onsite sources of these materials are found to be unsuitable or if additional material is required. It is anticipated that approximately 80 percent of materials would come from onsite sources and 20 percent from existing, offsite, commercial sources

[c] Per discussions with Glenn and Colusa counties, not all recreation areas would be constructed; all five are included to provide flexibility and a conservative analysis. Development of recreation areas will be phased based on public demand.

[d] Where the parcel boundary is less than 100 feet from the facility, the Project Buffer will extend beyond the parcel boundary to result in a minimum 100-foot-wide buffer. Acquisition or establishment of temporary or permanent easements of private properties, either through voluntary or eminent domain processes, would be required prior to initiation of construction activities.

Notes:

ac-ft = acre-feet
PG&E = Pacific Gas and Electric
WAPA = Western Area Power Authority
SR = State Route

Table 2-2
Permanent Facility Footprint

Complex Name	Size (acres)
Sites Reservoir Complex	17,000
Holthouse Reservoir Complex	600
TRR Complex	300
Delevan Pipeline Complex	25
Overhead Power Lines and Substations	20
Project Buffer	10,000

Note: Acreages are based on permanent footprint; overlap of facilities (e.g., the Sites Pumping/Generating Plant located within the footprint for the Sites Pumping/Generating Plant Approach Channel) occurs in some cases. Construction footprint estimates are conservative and are described in resource analysis chapters, where applicable.

2.1.1.1 Sites Reservoir Inundation Area

The Sites Reservoir would be located in Antelope Valley, approximately 10 miles west of the town of Maxwell. The Inundation Area would be created by construction of eleven dams. The 1.8-MAF Sites Reservoir would have a maximum normal water surface elevation of 520 feet above mean sea level (msl) (the minimum operating water surface would be at elevation 340 feet) and an inundation area of approximately 14,200 acres. The dams would include Golden Gate Dam on Funks Creek, Sites Dam on Stone Corral Creek, and nine saddle dams (dams are discussed in Section 2.1.1.2 Golden Gate Dam, Sites Dam, and Saddle Dams).

Many areas within the Sites Reservoir Inundation Area would be used for staging materials and equipment prior to and during construction of the Sites Reservoir dams.

Construction

The majority of the total construction disturbance for this complex would occur within the Inundation Area. Anticipated ground-disturbing activities during construction include the following:

- **Clearing and grubbing:** Approximately 90 percent of the Sites Reservoir Inundation Area footprint is annual grassland, and clearing and grubbing would not be needed in these areas. The remaining areas consist of blue oak woodland, agricultural crops, and other vegetation, which would be cleared. Cleared vegetation materials would be disposed of at an appropriate landfill/green waste facility or on-site as appropriate and necessary.
- **Demolition of existing structures:** Acquisition or establishment of temporary or permanent easements of private properties, either through voluntary or eminent domain processes would be required prior to initiation of construction activities. Within the Sites Reservoir Inundation Area, approximately 20 houses, 25 barns, and 40 other structures (e.g., sheds, silos, and pump houses) would be demolished once all property owner negotiations were completed. Existing septic tanks and other underground storage tanks would also be removed. In addition, many miles of fencing and asphalt would be removed, as necessary. Demolition debris would be transported and disposed of at an approved landfill(s).
- **Cemetery relocation:** Two private cemeteries would be relocated.

- **Salt Lake:** Saline water has been observed to seep from underground salt springs near the Salt Lake Fault within the proposed Sites Reservoir Inundation Area. To avoid potential reservoir water quality issues, pressure grouting of seeps and/or concrete caps would be constructed where saline water seeps from the salt springs within the Inundation Area (Salt Lake). The existing salt deposits and highly saline soils in and surrounding Salt Lake will be capped with clay materials from construction of the dams and other project facilities. Subsurface investigations would be conducted to confirm the nature and extent of the springs and appropriate treatment. Saline seeps observed outside of the reservoir or changed conditions of the springs once the reservoir is filled would be addressed by regular reservoir and facilities maintenance procedures. Pressure grouting and capping would also be applied to new seeps surface in other areas. Grout and concrete caps would be designed using standard engineering practices to prevent seepage.[1]

Operations

Water from the Sacramento River would be pumped into Sites Reservoir each year during times and years that water is available for diversion in accordance with the criteria in Section 4 Diversion and Reservoir Operations. In wetter years, the facility would be anticipated to reach maximum storage levels; in drier years, storage would not likely be at full capacity. Given that the Sites Reservoir would be an “offstream” storage facility, it would receive little natural runoff (approximately 1 percent of the 1.8-MAF reservoir storage capacity) from its own 83-square-mile watershed. Releases would occur throughout the year to assist in meeting demands, depending on time of year and year type, in accordance with water user agreements. As such, it is anticipated that the reservoir level would fluctuate approximately 140 feet throughout the season, based on demands and the ability to divert water. Specific reservoir operations are discussed in Section 4 Diversion and Reservoir Operations.

Maintenance

Maintenance activities for the proposed Sites Reservoir Inundation Area and adjacent land are anticipated to include law enforcement (including enforcement activities associated with boating); garbage removal; and maintenance of signs, culverts, and buoys.

2.1.1.2 Golden Gate Dam, Sites Dam, and Saddle Dams

Eleven dams would be needed to create the proposed 1.8-MAF Sites Reservoir (Figure 2-1): Golden Gate Dam, Sites Dam, and nine saddle dams. The saddle dams would be located along the northern perimeter of the reservoir between the Funks Creek and Hunters Creek watersheds, near the Glenn-Colusa county line. The proposed Golden Gate Dam would be constructed on Funks Creek, approximately 1 mile west of the existing Funks Reservoir. The proposed Sites Dam would be constructed on Stone Corral Creek, approximately 0.25 mile east of the town of Sites and 10 miles west of the town of Maxwell.

Saddle Dams 1, 2, 4, and 9 would be small-sized dams, with heights ranging from approximately 40 to 50 feet. Saddle Dams 3, 5, 6, 7, and 8 would be medium-sized dams, with heights ranging from approximately 70 to 130 feet. Saddle Dams 3, 5, and 8 would be the tallest and largest of the nine proposed saddle dams, with embankment volumes of approximately 3.6, 1.5, and 1.9 million cubic yards, respectively. Table 2-3 lists the proposed height and length of the main and saddle dams, as well as the total volume of materials needed to construct the dam embankments. The nine proposed saddle dams are

[1] As detailed in 1.5 Section 5.4.2 Spill Prevention and Hazardous Materials Management, all hazardous materials and wastes, including contaminated soils, will be handled and disposed of in accordance with applicable policies, laws, and regulations.

anticipated to be earthfill embankment dams and would be constructed primarily of materials from borrow areas within the Sites Reservoir Inundation Area (Table 2-4 and Figure 2-1). Site topography, geology, seismicity, and foundation features were considered when selecting the dam alignments, design, and dam cross sections.

Table 2-3
Characteristics of Proposed 1.8-MAF Sites Reservoir Dams

Dam	Maximum Height Above Base[a] (feet)	Crest Length (feet)	Total Embankment Volume (cubic yards)
Sites Dam	290	850	3,836,000
Golden Gate Dam	310	2,250	10,590,000
Saddle Dam 1	50	490	93,000
Saddle Dam 2	80	420	86,000
Saddle Dam 3	130	3,810	3,577,000
Saddle Dam 4	40	270	18,000
Saddle Dam 5	100	2,290	1,505,000
Saddle Dam 6	70	530	144,000
Saddle Dam 7	75	1,040	196,000
Saddle Dam 8	105	2,990	1,915,000
Saddle Dam 9	45	340	49,000
Total			**22,009,000 cubic yards**

[a] Base is defined as ground surface elevation.

Table 2-4
Sites Reservoir Project Onsite or Nearby Dam Materials

Material	Facilities	Approximate Size (acres)
Sandstone[a]	Saddle Dams	80
Impervious	Saddle Dams 6 through 9	400
Conglomerate	Multiple	200
Impervious	Saddle Dam 3	80
Impervious	Saddle Dams 1 and 2	40
Sandstone[a]	Golden Gate Dam	70
Sandstone	Golden Gate Dam	60
Impervious	Golden Gate Dam	60
Impervious	Sites Dam	80
Sandstone[a]	Sites Dam	50

[a] Located east of the Sites Reservoir Inundation Area

The crest elevation of all 11 dams would be 540 feet, providing 20 feet of freeboard above the normal maximum operating level. Sites and Golden Gate dams would have crest widths of 30 feet and embankment slopes of 2.25:1 upstream and 2:1 downstream. The saddle dams would have crest widths of 20 feet and embankment slopes of 3:1 upstream and 2.5:1 downstream.

Saddle Dams 2, 3, and 5 would have fairly flat slopes on the left abutments,[2] which require low dam heights (less than approximately 10 feet high). At these locations, the dam embankments would be strictly providing residual freeboard. Therefore, the typical saddle dam sections would be replaced at these locations with a small homogenous impervious embankment with a bentonite slurry wall for foundation seepage control. The crest elevation and width and slopes of the homogeneous embankment would match that of the saddle dams. Construction of the slurry wall configuration is a more economical option than construction of the typical embankment and excavation section. The slurry wall would be excavated to a depth corresponding to the moderately weathered bedrock surface, with average dimensions estimated at 20 feet deep by 5 feet wide. At the left abutment of Saddle Dam 2, the slurry wall section would also provide a defensive measure to control foundation seepage if displacement occurs along the Salt Lake Fault. At this location, the slurry wall would be extended to a depth of 40 feet to minimize the potential of foundation seepage along the fault zone.

The 11 dams would be constructed as zoned, earthen embankments of soil and rock with clay cores. Earthen embankment zones are shown on Figures 2-2 through 2-5. All dams would be constructed under the jurisdiction of the California Department of Water Resources, Division of Safety of Dams (DSOD).

As part of project design, an updated deterministic and probabilistic seismic hazard analysis would be conducted to account for the anticipated estimated level of ground shaking due to regional earthquakes. Suitable dam zoning and materials would be included as part of project design to accommodate anticipated seismic activity, including fault rupture, ground shaking, ground failure, and liquefaction, in coordination with DSOD. In addition, a seismic monitoring array will be designed and implemented as part of the Project to monitor site seismic activity, including identifying increases in seismicity rate that could be attributed to potential reservoir-triggered seismicity (RTS). Although not anticipated to be a substantial concern, the potential for RTS will be monitored through the deployment of strong motion instruments at center crests, abutments, and toes of the two primary dams (the Golden Gate Dam and the Sites Reservoir Dam) before, during, and a minimum of 2 years after the reservoir first reaches the maximum normal storage level. As part of the initial impoundment/filling of the reservoir, the rate of impoundment will be monitored in conjunction with seismic monitoring and adjusted as needed in the event of increases in seismicity potentially attributable to RTS. The seismic monitors would remain in service over the life of the Project and would also be part of the dam safety monitoring program.

Material requirements for the Sites Reservoir dams constitute a major component of the overall Project. A construction materials investigation identified and evaluated material sources for construction of the proposed dams. The construction materials investigation program examined materials available in or near the proposed Sites Reservoir, including alluvial deposits (recent and older alluvium), Venado sandstone of the Cortina Formation (fresh and weathered), and mudstone of the Boxer Formation. Table 2-4 and Figure 2-6 present the results of the investigation of materials potentially available within the Sites Reservoir Inundation Area or nearby. Offsite sources for filter, drain, and transition materials, and concrete aggregate would be required if the onsite sources of these materials are unsuitable (i.e., preliminary testing indicates that it does not meet concrete aggregate durability criteria) or if additional material is required. Several existing commercial locations (over 30), ranging in distance from approximately 35 to 80 miles, are available to meet materials needs for high quality aggregates.

---

[2] Abutment direction is oriented looking downstream. For example, the dam’s left abutment would be the abutment on the left side of the dam when looking downstream.

It is anticipated that all earth and rockfill (approximately 80 percent of materials required) would come from onsite sources, and all aggregate (approximately 20 percent of material required) would come from existing, offsite, commercial sources.

The following material requirements and sources were investigated, and suitability was evaluated for construction of the dams:

- **Impervious core** – A large amount of impervious material exists within the Project area or nearby. The locations of potential borrow areas are illustrated on Figure 2-6. Previous studies by the Bureau of Reclamation (Reclamation) identified four main areas of alluvial deposits in the reservoir area that could provide approximately 36 million cubic yards of material. Additional impervious materials are located within required excavation and construction areas for the associated structures and the proposed Holthouse Reservoir Complex. Suitable material from the required excavation and construction areas would be used to the maximum extent practicable. The impervious materials are suitable for use in the proposed embankment dams and are generally classified as low to medium plasticity clays, with lesser amounts of high plasticity clays and clayey sand.

- **Filter, drain, and transition materials** – Filter, drain, and transition materials for the proposed embankment dams would be imported from the closest offsite sand and gravel deposits.

- **Rockfill and riprap –** The best available source of rockfill material for riprap within the Project area is fresh Venado sandstone. Sandstone quarry areas are located within the Sites Reservoir Inundation Area and are shown on Figure 2-6. Sufficient quantities of fresh sandstone for rockfill material could be obtained from these quarries to construct the proposed embankment dams. It is possible that one centrally located quarry would be developed for Golden Gate and Sites dams instead of developing a quarry for each dam. Note that fresh Venado sandstone was used as riprap for the existing Funks Dam and has performed well.

  Figure 2-6 also shows a proposed sandstone quarry location outside of the Inundation Area for construction of the saddle dams. The haul distance from this proposed quarry is approximately 3 to 4 miles from the saddle dam sites. A potential alternate source of rockfill and riprap material for construction of the saddle dams is a ridge of conglomerate within the reservoir area, near Saddle Dam 3 (Figure 2-6). This potential rockfill source offers a shorter haul distance to the saddle dams (1 to 2 miles). Development of the Venado sandstone quarry would be required for construction of the saddle dams, unless further testing of the conglomerate determines that it is a suitable material.

- **Random fill** – Random fill can include various types of soil or rock that do not necessarily have the defined physical characteristics of the other categories of materials used for construction. Random fill would be required for construction of all proposed dams. It is anticipated that two general types of random materials would be required for construction. One type of material would be composed of predominately weathered sandstone from the Cortina Formation; the other type would be predominately mudstone from the Boxer Formation. Mudstone from the Boxer Formation would tend to be “soil like” after excavation and compaction operations, because it is low-strength rock. The weathered Cortina Formation tends to have more fine materials and less well-graded rockfill.

  Random fill material needed for the dams will come from two sources: (1) excavations that are required for the dam foundations and excavations for other nearby structures and (2) onsite quarries in the Sites Reservoir Inundation Area, including suitable byproducts from processing sandstone for other construction needs. Random materials generated during construction of the dams would have haul distances of less than 1 mile.

Although the Boxer Formation material would function more as an upstream and downstream shell zone in the saddle dams, the term *random* is used for this material zone to be consistent with the terminology used for the design of Sites and Golden Gate dams.

- **Concrete aggregate** – Crushed Venado sandstone and offsite sand and gravel deposits were examined as potential sources of concrete aggregate. Preliminary small scale testing performed on crushed samples of Venado sandstone indicates that it does not meet concrete aggregate suitability criteria. Verification of the suitability of the Venado sandstone for use as a concrete aggregate would be further investigated in the future when large bulk fresh samples come available for testing. Potential sources of concrete aggregate borrow areas would be imported from the closest offsite aggregate deposit

The Project would be designed in accordance with DSOD requirements.[3]

A signal spillway would be located at Saddle Dam No. 6. The purpose of the signal spillway would be to release water in the event that water is still being pumped into the reservoir after the probable maximum flood (PMF)[4] has been stored (an unlikely occurrence). If the PMF were to occur when the reservoir is at the normal maximum pool elevation (520 feet), the water surface elevation would rise to 525.2 feet (with full PMF retention). The dam crest elevation would be 540.0 feet, leaving almost 15 feet of freeboard. This “morning glory” spillway[5] would be provided on a cut bench on the left abutment of the saddle dam. The outlet pipe would be installed under the dam on a cut bench on the dam abutment foundation. On the downstream side of the dam, the pipe would be installed downslope to the creek. An energy-dissipating structure would be located at the end of the pipeline to control the discharge of water to the creek. The spillway would consist of one 7-foot-diameter concrete pipe sized primarily for inspection and maintenance activities. The spillway pipe inflow elevation would be set at 526.0 feet, just above the estimated pool level with full PMF containment.

The potential for such an event and necessary actions would be addressed as part of an emergency action plan (Section 5.8 Emergency Action Plan).

To meet DSOD requirements, an emergency release outlet would be constructed to allow water levels in the reservoir to be lowered quickly if the integrity of a dam is at risk. The 30-foot-diameter tunnel with a release capacity of approximately 15,200 cfs is designed to meet DSOD’s emergency drawdown release criteria (10 percent drawdown of reservoir depth in 10 days). The emergency release capability is provided by a system of piping and energy dissipating valves located adjacent to the Sites Pumping/Generating Plant. The emergency release bypass outlet would be a 26-foot-diameter pipe that splits off from the tunnel/main inlet/outlet manifold. The 26-foot-diameter pipe would then split and reduce in size several more times to join four 8.5-foot dispersion valves located in a reinforced concrete and steel lined dissipation chamber adjacent to the Sites Pumping/Generating Plant. Emergency release

---

[3] Detailed seismic and geotechnical evaluations will be conducted as part of final design.

[4] The probable maximum flood is the flood that may be expected from the most severe combination of critical meteorological and hydrologic conditions that is reasonably possible in the drainage basin being studied. Estimated based on Hydro Meteorological Report 58/59.

[5] A morning glory spillway is an uncontrolled spillway with a funnel-shaped outlet that allows water to spill into the funnel rather than spilling over the dam.

flows would flow down the channel from the Sites Pumping/Generating Plant into Holthouse Reservoir. The spillway structure in the Holthouse Dam is sized to pass the emergency flow. Spills downstream of Holthouse Reservoir associated with a significant event could lead to potential downstream impacts. This would be addressed in an emergency action plan. The plan would include emergency notification flowcharts, notification procedures, inundation maps, and a variety of other important emergency response protocols if an emergency release is anticipated. The emergency action plan would address potential and actual emergency conditions and any uncontrolled release of water, including release of water through the signal spillway, and it would incorporate lessons learned from the recent Oroville Spillway and Oroville Emergency Spillway incident. These plans are typically reviewed annually and periodically tested through tabletop and functional exercises and drills.

Construction

The total construction disturbance area for the 11 proposed dams would be approximately 160 acres. The total construction disturbance area would include the footprint of the facilities, materials and equipment staging areas, areas needed to construct the facilities, borrow areas, and access roads. The construction disturbance area for the dams would be within the construction disturbance area for the Sites Reservoir Inundation Area. Temporary easements may be required for construction. Anticipated ground-disturbing activities during construction include the following:

- Surveying
- Setting up staging areas within the Sites Reservoir footprint
- Constructing access roads
- Transporting equipment to the Project site and setting up offices and batch plants
- Clearing, demolition of existing structures, and grubbing
- Diverting streams within the reservoir Inundation Area
- Excavating and stockpiling activities
- Grouting of dam foundations and the ridge
- Constructing of dam embankments
- Installing monitoring equipment
- Constructing roads and buildings for facility operation and maintenance
- Cleaning up the Project area, removing equipment, and restoring the area

The following key activities are discussed in greater detail below:

- **Funks Creek and Stone Corral Creek Diversion Construction** – Diversion of Funks and Stone Corral creeks during construction of the proposed Golden Gate Dam and Sites Dam and for the proposed facilities downstream, is anticipated to be accomplished by passing storm flows through an 18-inch-diameter diversion tunnel through the ridge at Sites Dam. A channel would be excavated within the reservoir to join the two creeks. Coffer dams at the upstream toes of Sites Dam and Golden Gate Dam would protect the work areas from flows being diverted to the Diversion Tunnel.

  The upstream random zone of Golden Gate and Sites dams would function as the coffer dam and upstream toe berm, provides a convenient place to put waste materials from foundation excavation work during the initial stages of construction and would be used to divert Funks and Stone Corral creeks from the dam footprint.

Sites and Golden Gate dams would have low-level outlet works capable of releasing stream maintenance flows of up to 10 cfs from October through May into Stone Corral and Funks creeks after construction is completed to mimic the ephemeral nature of these streams.

- **Obtaining and Stockpiling Borrow Materials** – Materials would be stockpiled near temporary rock-processing plants that would be constructed for the Project. It is anticipated that at least one rock-processing plant would be located within the reservoir footprint to service the impervious material borrow areas and the sandstone quarries.

  The rock processing operation would consist of rock crushers to produce required sizes, shakers, screens to sort material sizes, and conveyor belts to transport sorted material to stockpiles. Stockpiled materials would be loaded by bulldozers, loaders, and possibly conveyors into large dump trucks and transported to the dam construction sites. Material excavation, processing, and stockpiling are anticipated to occur throughout the dam construction period.

- **Foundation excavation** – Recent and older alluvium and decomposed and intensely weathered bedrock would be excavated from the entire footprint of the dam sites to obtain a moderately weathered bedrock surface. In addition, moderately weathered bedrock would be excavated from the impervious core footprint down to the top of slightly weathered and/or fresh bedrock surface. Additional shaping of the foundations would be done to meet requirements that: (1) no excavation slopes should be steeper than 1:1 and (2) the core foundation should be approximately level in sections transverse to the dam alignment. Excavation depths would average approximately 20 feet. Excavation would be performed by heavy equipment but may require blasting in the harder sandstone.

- **Foundation treatment grouting** – The foundation grouting for the proposed Golden Gate and Sites dams would consist of a two-row grout curtain, with one row of consolidation holes upstream and one row downstream of the curtain holes. The rows would parallel the dam centerline and would be spaced 10 feet apart. In addition, a 40-foot-wide by 3-foot-thick grout cap was included in the design to prevent grout surface leakage during grouting of the upper stage. Foundation grouting for the proposed saddle dams would consist of a two-row vertical grout curtain spaced 10 feet apart parallel to the dam centerline. The saddle dam foundation grouting would also include a 20-foot-wide by 3-foot-thick grout cap to prevent surface leakage of grout during grouting of the upper stage. Each row of consolidation and curtain grout holes for all dams would consist of mandatory primary and secondary holes spaced at 10-foot centers. Figures 2-2 through 2-5 show typical grouting at the proposed Golden Gate Dam, Sites Dam, and the saddle dams.

  The grout curtains would be constructed by drilling vertical holes into the bedrock and filling the holes with grout pumped in under pressure.

- **Additional grouting** – Additional grouting will be performed along the east ridge of the reservoir north of Golden Gate Dam. Grouting will be in narrow ridge areas and is intended to minimize any seepage through the ridge when the reservoir is full. Grouting would extend from ground surface down into fresh rock.

- **Dam embankment construction** – All proposed dams composing the Sites Reservoir would be constructed as zoned earth rockfill embankment dams and would be constructed of four types of fill materials. The impervious core materials (finer material known as Zone 1), Zone 3 materials (rockfill and riprap), and Zone 4 materials (random materials) would be hauled in large dump trucks from the borrow sites that would be located within the reservoir footprint, spread by graders or bulldozers, moisture-conditioned with water trucks, and compacted with sheepsfoot rollers or compactors. Zone 2 materials (filter, drain, and transition materials) potentially would be hauled in large dump trucks from offsite commercial sources to be spread, watered, and compacted.

- **Monitoring equipment installation** – Monitoring equipment, including strong motion seismic detectors, piezometers, settlement points, and seepage weirs would be permanently installed at each proposed dam site.

Operations

Once the proposed dams are constructed and Sites Reservoir is filled, there would be few dam operations required other than release of water from the reservoir during normal or emergency operations.

Maintenance

Typical ongoing dam maintenance would consist of debris and vegetation removal from the embankment slopes, and periodic monitoring and evaluation of all instrumentation. Cleared debris and vegetation materials would be disposed of at an appropriate landfill/green waste facility or on-site as appropriate and necessary. Dam security and/or law enforcement staff would patrol the dams and other facilities. Additional security measures may include fences to prevent automobiles and pedestrians from accessing the dams and other Project features, booms to prevent boats from approaching the dams, security gates, 24-hour security patrols, and security cameras.

2.1.1.3 Sites Reservoir Inlet/Outlet Structure

The purpose of the proposed Sites Reservoir Inlet/Outlet Structure would be to regulate proposed Sites Reservoir inflows and releases through the proposed tunnel to the proposed Sites Pumping/Generating Plant. The structure would be located on the west end of the tunnel and southwest of the proposed Golden Gate Dam (Figure 2-7). As previously discussed, the structure would consist of a low-level inlet/outlet structure for emergency drawdown releases, a multi-level inlet/outlet tower, two fixed wheel gates to isolate the tunnel, a tower access bridge, and various valves and operators to regulate flows into and out of the reservoir.

The low-level inlet/outlet structure would be approximately 120 feet high from bottom of foundation to the top of trash racks. The rectangular structure dimensions would be approximately 100 feet by 120 feet. The three 30-foot by 30-foot intake openings would be covered by trash racks; the primary function is emergency release only.

The multi-level inlet/outlet tower would have multiple inlet ports with the capability of drawing water at different levels in the reservoir and trash racks with port valves (butterfly valves) embedded in the inlet tower tiers with four valves around each tier. The tower would also contain movable fish screens around two tiers for varied operational purposes (6,000 cfs for two tiers). Each port valve could be operated independently, or all valves could be operated together in each tier. The tiers would be spaced approximately 20 feet apart down the tower beginning approximately 30 feet below the maximum reservoir water level. The high inlet tower/shaft would also contain two 9-foot by 35-foot fixed wheel gates at the base of the tower to isolate the tower from the main tunnel for inspection and maintenance. The main tower shaft would have an inner diameter of 32 feet and an outer diameter of 39 feet. Cranes would be used to hoist the fish screens, port valves, and gates for necessary inspection and maintenance. Table 2-5 provides details regarding the proposed Sites Reservoir Inlet/Outlet Structure tower.

An approximately 440-foot-long bridge would provide access to the multi-level tower from the nearby access road. The bridge deck elevation would be approximately equal to the dam crest heights (approximately 500 feet). The bridge is expected to be a simple welded-plate girder system with a lightweight concrete deck. The girders would be supported by the multi-level inlet/outlet tower, cast-in-place reinforced concrete piers, and a reinforced concrete abutment.

Construction

The total construction disturbance area would be approximately 100 acres, mostly within the Sites Reservoir Inundation Area. It would include the footprint of the proposed facilities, the materials and equipment staging area, the area needed to construct the facilities, and access roads.

Table 2-5
Sites Reservoir Inlet/Outlet Structure Tower Details

Detail	Unit
Top elevation	540 feet
Bottom elevation (top of bench)	320 feet
Inside diameter	32 feet
Outside diameter	39 feet
Number of ports	28 (4 each at 9 levels)
Functional reservoir release elevations	480 feet to 340 feet

Anticipated ground-disturbing activities during construction include surveying and marking, clearing and grading, building access roads, installing temporary power to the site, preparing materials laydown and equipment staging areas, transporting construction materials and equipment to the site, hillside excavation and tower shaft excavation (separate from tunnel excavation), dewatering, building the multi-level tower base and deck, building the access bridge to the multi-level tower, installing cranes on the tower deck, building the low-level intake structure, finished grading, and site clearing.

Operations

The proposed multi-level inlet/outlet tower and low-level intake structure would be operated remotely. The multi-level tower port valves could be operated independently or by tier. Port valve operations could be adjusted locally or remotely via a supervisory control and data acquisition (SCADA) system. Port valve operations would be changed by adjusting the hydraulic operators.

Maintenance

Typical maintenance of the proposed inlet/outlet structure is expected to occur annually and would consist of servicing the hydraulic equipment (hoist cranes and control motors) and the fish screen lift mechanism. Hydraulic equipment maintenance service would primarily involve lube and filter replacements.

The fixed wheel gate maintenance would be performed annually. Maintenance would involve moving both gates through a full stroke (open and closed) position. Annual inspections for corrosion and wear would also be performed. As part of emergency preparedness checks, the gate operation electrical control panel would be tested every 6 months.

The port valve hydraulic operations would require a relatively higher level of maintenance including quarterly inspection and maintenance. Typical port valve maintenance would involve lube and filter replacements and inspections for hydraulic line damage.

The concrete low-level intake structure is considered a low-maintenance structure because it has no mechanical components, and it would be underwater. It is assumed that the stop logs that can be installed in the low-level intake at the upstream end of the tunnel would only be installed in the event of a problem with downstream wheel gate operation. The wheel gates would normally be down so that normal inflows to and from the reservoir would occur through the vertical Inlet/Outlet Tower, not through the low-level inlet. The low-level inlet provides the emergency release capability and permits removal of water from the reservoir between the lowest normal operating level for the tower and the dead storage level.

During the first few years of operation, it is anticipated that the Inlet/Outlet tower and tunnel downstream of the fixed wheel gates would be dewatered for inspection and maintenance. After this initial period of inspection demonstrates proper performance, the inspection period would be increased.

2.1.1.4 Sites Pumping/Generating Plant and Electrical Switchyard

The purpose of the proposed Sites Pumping/Generating Plant would be to pump water from the proposed Holthouse Reservoir into the proposed Sites Reservoir and to generate electricity during the release of water from Sites Reservoir to Holthouse Reservoir. The Sites Pumping/Generating Plant would be located approximately 3,300 feet southeast of the proposed Golden Gate Dam (Figure 2-7).

The Sites Pumping/Generating Plant would have a total pumping capacity of approximately 5,900 cfs and a release capacity of 5,100 cfs. Table 2-6 summarizes the pump and pump/turbine configuration for the 5,900-cfs plant. The pumping/generating plant would lift water from Holthouse Reservoir into Sites Reservoir and would be connected to Holthouse Reservoir by an approximately 6,300-foot-long excavated approach channel, as described in Section 2.1.2 Holthouse Reservoir Complex. The existing Funks Reservoir, which would be incorporated into the proposed Holthouse Reservoir, currently operates in coordination with the Tehama-Colusa Canal between elevations of 203 and 205 feet. The Sites Pumping/Generating Plant would operate with tailwater elevations down to elevation 190 feet during pumping to take advantage of the full 6,500 ac-ft of active capacity of the proposed Holthouse Reservoir. A 30-foot-diameter, 4,000-foot-long tunnel would be located on the inlet side of the Sites Pumping/Generating Plant connection to Sites Reservoir (the tunnel is discussed below).

Table 2-6
Sites Pumping-generating Plant Configuration

Unit Type	Number of Units	Net Head (feet)	Pumping Capacity (cfs)	Generating Capacity (cfs)	Total Pumping Capacity (cfs)	Total Generating Capacity (cfs)
Pump - Francis Vane (dual speed)	2 (+1 standby)	330	870	-	5,926	5,100
		202	870	-		
Pump - Francis Vane (dual speed)	2	330	435	-		
		202	435	-		
Pump/Turbine - Reversible Francis (dual speed)	4 (+1 standby)	330/310	663	1,020		
		202/182	663	1,020		
Pump/Turbine - Reversible Francis (dual speed)	2	330/310	332	510		
		202/182	332	510		

Water from Holthouse Reservoir would be drawn into the Sites Pumping/Generating Plant by the pumping and pumping-generating units. The number of units operating would be selected to be capable of providing the approximate pumping capacity needed to deliver all water stored in the Holthouse Reservoir on a daily basis during the off-peak pumping period. The Sites Pumping/Generating Plant would be a conventional, indoor-type pumping-generating plant with an inline arrangement of vertical pumping units, a reinforced concrete substructure, and a steel superstructure. The size of each unit bay was determined based on the minimum required spacing between each unit. Two service bays have been incorporated on both sides of the Sites Pumping/Generating Plant and have been sized to allow for two units to be serviced simultaneously while the remainder of the Sites Pumping/Generating Plant continues operation.

The pumps would be connected to a complex intake/outflow manifold. When water is drawn out of Holthouse Reservoir and pumped up to Sites Reservoir, the pumped water would flow through successive pipe connections until all 12 pipes coming from the pump units combine into a single 26-foot-diameter pipe. This pipe would then join the 26-foot-diameter pipe coming from the emergency bypass outlet, and the two pipes would connect to the 30-foot-diameter tunnel.

The 230-kilovolt-ampere (kVA) Sites Electrical Switchyard would handle pumping and generating power to the Sites Pumping/Generating Plant. Power would be supplied to the switchyard from a proposed substation near one of two existing 230 kVA transmission lines northeast of the proposed Holthouse Reservoir (substations are described further in Section 2.1.5 Overhead Power Lines and Substations). The Sites Electrical Switchyard would be approximately 3.5 acres and would be graded flat. Electrical equipment would be housed in the switchyard on concrete pads. An overhead power line tower/pole (approximately 50 feet tall) would receive the electrical line entering the site. (Note: While poles are anticipated for all overhead power lines, towers were included in the acreage assessment to provide a conservative estimate. The relocation of the WAPA transmission lines described under the Holthouse Reservoir Complex will include towers.) The switchyard would be approximately 500 feet by 300 feet, and would have multiple metallic poles with heights varying between 15 and 60 feet. The switchyard would be surrounded by a 6- to 8-foot-high chain-link fence with barbed wire or serpentine wire along the top.

The switchyard and overhead power lines connecting the pumping/generating plant to the substation at the grid would provide all the electricity needed by the pumping/generating plant. The switchyard and overhead power lines would also allow the pumping/generating plant to feed electricity back into the electrical grid during periods of generation.

Construction

The total site footprint of the proposed Sites Pumping/Generating Plant and approach channel would be approximately 75 acres. An additional 20 acres adjacent to the plant would likely be disrupted during construction.

Anticipated ground-disturbing activities include the following:

- Transporting materials to the construction site (including contractor’s temporary office and utility hookup)
- Clearing and grading the construction workspace
- Placing construction materials at staging areas
- Excavating the approach channel and pumping plant and hauling excavated material

- Dewatering
- Constructing the forebay, pump house, and pump bay
- Performing site restoration after construction is complete

The total construction disturbance area for the Sites Pumping/Generating Plant includes the footprint of the proposed switchyard, the materials and equipment staging area, electrical transformer area, and temporary access roads.

Anticipated major construction activities include clearing and grading the construction workspace, placing necessary construction materials at staging areas, and preparing the switchyard pad.

Operations

A SCADA system would control all proposed operational modes. The system would be located onsite and would broadcast status information to a manned location in the Operation and Maintenance Building. Plant operators would require continuous communication with the TRR Pumping/Generating Plant, Delevan Pipeline Intake/Discharge Facilities, and Tehama-Colusa Canal operators to coordinate flows into and out of the proposed Holthouse Reservoir and Sites Reservoir. The proposed switchyard would be operated remotely or by onsite operations/maintenance staff.

Hazardous materials and hazardous wastes including fuels, oils, grease, and lubricants would likely be used and stored for operation of the Sites Pumping/Generating Plant. These materials would be used, stored, and disposed of in accordance with applicable regulations (Section 5 Environmental Commitments Included as Part of the Project).

Maintenance

Routine maintenance and monitoring of the proposed Sites Pumping/Generating Plant would likely be required daily by onsite personnel. Regular maintenance and inspections would be required for each pump and pump turbine unit and the related equipment, such as gates, valves, electrical equipment, and other mechanical systems. The Sites Pumping/Generating Plant would be equipped with cranes to facilitate operation and maintenance. There would be a 100-ton capacity indoor bridge crane for assembly and maintenance of pumping/generating units and associated equipment. A 50-ton capacity outdoor traveling gantry crane would be installed for assembly and maintenance of butterfly valves. In addition, a 10-ton capacity outdoor traveling gantry crane would be installed to aid in the installation and removal of inlet gates and trash racks.

The proposed switchyard would require maintenance once or twice a year. Maintenance activities may include annual washing and cleaning of insulating equipment, preventive maintenance, scans of the switchyard under full load, and routinely scheduled testing to meet Western Electricity Coordinating Council (WECC) requirements. Regular maintenance activities would include inspections for damage by animals and landscape maintenance.

2.1.1.5 Tunnel from Sites Pumping/Generating Plant to Sites Reservoir Inlet/Outlet Structure

The purpose of the proposed tunnel is to transport water between the proposed Sites Pumping/Generating Plant and the proposed Sites Reservoir Inlet/Outlet Structure. The tunnel alignment would be located west of the existing Funks Reservoir and south of the proposed Golden Gate Dam on Funks Creek. The tunnel alignment would fall between the proposed Sites Pumping/Generating Plant location and the proposed Sites Reservoir Inlet/Outlet Structure location and would be approximately 4,000 feet long (Figure 2-7).

The proposed 30-foot-inside diameter tunnel was designed to meet DSOD emergency drawdown release criteria. The tunnel would have a maximum discharge capacity of 15,200 cfs with a corresponding tunnel velocity of 21.5 feet per second (fps). Pumping velocities through the tunnel would be approximately 8.20 fps for the 5,900-cfs pumping plant.

The full tunnel length between portals would be concrete-lined to prevent rock fallout and to provide a smooth interior surface, thus reducing head loss and minimizing seepage into the surrounding rock. The tunnel concrete liner would include an additional steel liner in the lower 1,000 feet adjacent to the pumping plant where rock cover over the tunnel is too shallow to confine the internal pressure.

Construction

The total construction disturbance area would be approximately 3 acres. It would include the footprint of the proposed facilities, the materials and equipment staging area, the area needed to construct the facilities, and access roads. There would be no permanent aboveground disturbance area for this facility.

Anticipated ground-disturbing and related activities during construction include the following:

- Surveying and marking
- Clearing and grading
- Building access roads
- Installing temporary power to site
- Developing staging and material laydown areas
- Transporting construction materials and equipment to the site, upstream cofferdam, and diversion facilities
- Excavating Portal at both ends
- Constructing Portal
- Tunnel blasting/excavating
- Dewatering and removing excavated material
- Installing concrete and steel liner
- Performing site restoration and cleanup

Operations

The typical operation scenario for the proposed tunnel would be 24 hours per day, 7 days per week. The tunnel would transport flows between the proposed multi-level Sites Reservoir Inlet/Outlet Structure upstream and the Sites Pumping/Generating Plant downstream. During emergency release operations, the tunnel could discharge a maximum flow rate of approximately 15,200 cfs.

Maintenance

Maintenance would likely occur on an annual basis in coordination with maintenance and inspection of the proposed Sites Reservoir Inlet/Outlet Structure and multi-level intake tower upstream and the proposed Sites Pumping/Generating Plant downstream.

The Inlet/Outlet tower wheel gates would be closed off to completely isolate the tunnel from the reservoir below the inlet/outlet structure for inspection and maintenance; to allow tunnel inspection and maintenance upstream of the wheel gates, stop logs would be used to shut off flow from the low-level inlet structure to the downstream tunnel section. The stop logs would be lowered from a barge above and dropped into the low-level inlet structure.

Typical tunnel inspection and maintenance may consist of checking for concrete cracks and leaks at joints between lining sections and around connections with the Sites Pumping/Generating Plant, Sites Reservoir Inlet/Outlet Structure tower gates, and low-level intake structure.

2.1.1.6 South Bridge and Roads

The proposed Sites Reservoir would inundate several existing roads within Colusa County's jurisdiction. Travel between the towns of Maxwell and Lodoga along the existing Maxwell Sites Road and Sites Lodoga Road would be blocked by the new reservoir. Approximately 6 miles of the existing Huffmaster Road, a gravel county road, would also be inundated. Huffmaster Road provides access to private properties primarily within the proposed Sites Reservoir footprint and the community of Leesville, southwest of the proposed reservoir. Peterson Road, which is also a gravel county road that provides access to private property, is located entirely within the proposed reservoir footprint. Existing roads would be rerouted, as necessary, to provide alternate access routes.

Approximately 50 miles of new paved and unpaved roads would provide construction and maintenance access to the proposed facilities, as well as provide public access to the proposed recreation areas. The locations of proposed roads, the proposed South Bridge, and existing roads near the proposed Sites Reservoir that would be affected by Project construction and/or operation are shown on Figures 2-8A and 2-8B.

Six road alternatives were evaluated to determine the best method of connecting the towns of Maxwell and Lodoga. To determine the best road alternative available, weighted criteria were independently assessed for shortest travel time, least total cost, least annual operations and maintenance cost, shortest emergency response time, least impact on wildlife habitat, least impact on wetlands and riparian areas, and least impact on public safety. Of the road alternatives, the South Bridge Alternative was selected as the Project alternative. The portions of Maxwell Sites and Sites Lodoga roads that would be inundated by the proposed reservoir would be replaced by the proposed South Bridge. The proposed road (including new bridge) would start approximately 1 mile east of the proposed Sites Dam on Maxwell Sites Road. The new route would consist of the proposed Eastside Road, Stone Corral Road, the South Bridge, and an approach road west to Sites Lodoga Road. This route would also provide access to the proposed Stone Corral and Peninsula Hills Recreation Areas.

The proposed South Bridge would be a two-lane concrete bridge, 35.5 feet wide and approximately 1.6 miles long. The top deck elevation would be 45 feet above the Sites Reservoir's maximum normal water surface elevation. For the roads leading up to and away from the bridge, the proposed road right-of-way would be 60 feet wide with a 4 percent maximum grade. Culverts and minor bridges would be constructed to provide passage for streams and drainage of surrounding areas, including the construction of a culvert where the proposed Eastside Road would cross Funks Creek. Guardrails, signs, striping, and lighting would be installed after the roads are completed pursuant to applicable county, California Department of Transportation (Caltrans), and American Association of State Highway and Transportation Officials (AASHTO) design specifications. Permanent fencing would be installed along both sides of the 60-foot-wide right-of-way.

The proposed North Road and Saddle Dam Road (both new gravel roads) would provide access to northern portions of the Sites Reservoir and saddle dams. The new Eastside Road would be gravel from the existing County Road 69 to near the proposed Sites Pumping/Generating Plant and paved south of the plant. Eastside Road would connect the proposed Stone Corral Road to County Road 69, providing access to the northern portions of the Sites Reservoir, Holthouse Reservoir Complex, Golden Gate Dam, and associated structures and to properties northeast of the Sites Reservoir. Along the west side of the Sites Reservoir, the proposed Peninsula Road would provide access from Sites Lodoga Road to the proposed Peninsula Hills Recreation Area. The proposed Sulphur Gap Road would provide access to southern portions of the Sites Reservoir, and private property adjacent to the proposed Com Road and would connect to Huffmaster Road.

Permanent facility access roads constructed from gravel and asphalt would facilitate operation and maintenance. These proposed access roads would require new construction or the relocation of existing County roads and bridges; these activities would follow Caltrans and AASHTO design standards as applicable. During construction, gravel roads would be constructed on the following detour and construction roads: the proposed Sulphur Gap and Lurline roads and an existing dirt road west of the proposed Lurline Headwaters Recreation Area to Huffmaster Road.

A new temporary bypass road at the north end of Sites Reservoir is provided to help expedite the closure of Sites Lodoga Road in the project area and the start of construction in borrow areas and for the main dams. The new bypass road would begin on the east where existing County Road 69 intersects the Tehama-Colusa Canal. Access to County Road 69 would be from Highway 5 at the County Road 68 interchange, then west along County Road 68 to County Road D and County Road 69. From the Tehama-Colusa Canal crossing, the planned access road would follow existing ranch roads and trails that are planned for use as the saddle dam access road. From the saddle dam access road near Saddle Dams 5, existing ranch roads and trails would also be followed to cross the bottom of the reservoir to the southwest and connect back to Sites Lodoga Road on the west side of the proposed reservoir, just above the planned Inundation Area for the reservoir. The bypass road would meet applicable County standards and would be paved along its full length for public use. Characteristics of the Project roadways and South Bridge approaches, the South Bridge, and the proposed minor structures are listed in Tables 2-7, 2-8, and 2-9, respectively.

Table 2-8
Proposed South Bridge Characteristics

Item	Dimension
Bridge length	Approximately 8,000 feet (1.5 miles)
Bridge width	35.5 feet
Bridge height[a]	Approximately 45 feet above maximum water surface elevation
Bridge depth[b]	20 feet maximum, 8 feet minimum
Spans	400 feet maximum, 260 feet minimum, 22 spans total
Columns – 1.3-MAF dimensions	22 feet by 14 feet square, hollow, maximum height approximately 260 feet, 24 columns total
Foundations	Large mat foundations under columns with 4-foot-diameter, cast-in-place, drilled shafts

[a] The bridge height is the distance from the top of the bridge deck to the maximum water surface elevation.
[b] The bridge depth is the distance from the top of the bridge deck to the bottom of the bridge structure that sits atop the columns.

Table 2-9
Characteristics of Proposed Minor Structures

Item	Typical Dimensions
Culverts (over unnamed streams), 17 total	6-foot diameter by 100-foot length
Minor bridge (over named streams), 1 total	40-foot width by 80-foot length

Note: Minor structures would be built using steel pipe or precast pieces.

Construction

The construction disturbance area would include the footprint of the proposed South Bridge structure and proposed roads and stream crossings, the materials and equipment staging areas, the area needed to construct the facilities, and access roads. Traffic that is not construction-related would be diverted around construction disturbance areas in accordance with a traffic control plan.

If necessary, a temporary asphalt batch plant would be built onsite and outside of the Sites Reservoir footprint. One possible location could be adjacent to the footprint of the proposed Field Office Maintenance Yard. This location would be centrally located to the Project’s paving needs, is relatively flat, and has shallow soil and impervious subsoil that should allow for easy spill containment and site cleanup. Alternatively, the construction contractor may obtain asphalt from regional commercial sources. Concrete bridge construction would include excavation for foundations and abutments; installing cast-in-place concrete formwork; placing reinforcing steel; installing bridge deck expansion joints; pouring and curing concrete; removing concrete forms; installing bridge barriers, bridge railings, bridge lighting, approach roadway guardrails, fences, signs, and reflectors; and painting approach and bridge deck striping.

Anticipated ground-disturbing and related activities during construction include the following:

- Surveying and marking
- Clearing and grading the construction workspace
- Preparing the construction materials laydown and equipment staging areas
- Transporting materials and equipment to the Project site
- Building concrete and/or asphalt batch plant

- Creating road cuts and fills; hauling excess cut materials
- Constructing bridge foundation, including drilled pier installation for foundations
- Constructing bridge columns
- Constructing bridge spans
- Installing culverts and minor bridges
- Laying aggregate road base and asphalt
- Installing fences, guardrails, and signs
- Installing roadway striping and reflectors
- Performing erosion and stormwater management
- Implementing BMPs
- Performing site restoration and cleanup

Operations

Standard nighttime bridge safety lighting would be provided in accordance with County requirements. Electricity would likely come from an existing overhead distribution line that currently parallels exiting Sites Lodoga Road. Daily management of the right of way (e.g., speed restrictions and closures) would be conducted by County and State law enforcement agencies.

Maintenance

Procedures will be incorporated to reduce impacts from lighting (e.g., directional lighting and non-reflective materials). Typical road maintenance would consist of chip sealing; patching; grading; crack filling; asphalt overlays; guardrail, fencing, and signage repairs; embankment erosion repair; and vegetation control. Typical culvert and minor bridge maintenance would consist of debris removal, cleaning, and repair of steel pipe corrosion and precast concrete cracks.

Typical bridge maintenance would consist of debris clearing from bridge deck and deck drainage outlets; barrier, railing, and light repairs; concrete deck and expansion joint repairs; occasional resurfacing; approach slab and guardrail repairs; and abutment erosion maintenance and repair. In addition, annual safety and maintenance inspections would be conducted pursuant to County, Caltrans, and AASHTO requirements as applicable to maintain a bridge condition monitoring record.

2.1.1.7 Recreation Areas

Construction of the recreation areas would be phased, based on public demand. The Project would include the development of two recreation areas (Stone Corral Recreation Area and Peninsula Hills Recreation Area). The Project would also include a boat ramp at the western end of the reservoir where the existing Sites Lodoga Road would be inundated. Development of the recreation areas would be phased, likely starting with Stone Corral. Development of additional recreation areas would be initiated based on public demand. The development of new recreation areas at the Sites Reservoir could meet public demand for recreation opportunities. The potential recreation areas at Sites Reservoir were evaluated based on the site topography, environmental considerations, and the effect of potentially large fluctuations in the water surface levels due to normal reservoir operations.

The Stone Corral Recreation Area (Figure 2-9A) would be located on the eastern shore of the Sites Reservoir, north of the existing Maxwell Sites Road and proposed Sites Dam. Access would be provided by either the proposed South Bridge or Eastside Road. The maximum proposed size of the Stone Corral Recreation Area would be 235 acres.

The Peninsula Hills Recreation Area (Figure 2-9B) would be located on the northwest shore of the Sites Reservoir, to the north of the existing Sites Lodoga Road. Access would be provided from the proposed Peninsula Road via the existing Sites Lodoga Road. The maximum proposed size of the Peninsula Hills Recreation Area would be 373 acres.

In addition to the Stone Corral and Peninsula Hills recreation areas, a boat ramp would be provided on the western side of the reservoir where the existing Sites-Lodoga Road intersects with the proposed Inundation Area for the reservoir (Figure 2-9C). The maximum proposed size of the boat ramp area would be 10 acres.

Potential recreation opportunities could include boating, camping, picnicking, fishing, swimming, and hiking. Facilities may include boat launch sites, trails, designated swimming and fishing access, picnic tables, shaded canopies, campfire rings/barbeques, vault toilets, and dumpsters. In addition, gravel parking areas would be provided for camp sites, day-use areas, and boat launch facilities. The approximate number of facilities at each proposed recreation area is listed in Table 2-10.

Table 2-10
Approximate Number of Facilities at the Proposed Recreation Areas

Recreation Areas	Features
Stone Corral Recreation Area	50 campsites (car and recreational vehicle) 10 picnic sites (with parking at each site) 6-lane boat launch[a] site Hiking trails Electricity Potable water[b] 1 kiosk 10 vault toilets
Peninsula Hills Recreation Area	200 campsites (car and recreational vehicle) 1 group camp area 10 picnic sites (with parking at each site) Hiking trails Electricity Potable water[b] 1 kiosk 19 vault toilets
Boat ramp on western side of the reservoir where Sites-Lodoga Road ends	Potable water[b] 1 kiosk 1 vault toilet

[a] Reducing the number of boat lanes with increasing water depth.

[b] Treated water from the reservoir would be the source of potable water.

Construction

It is anticipated that all construction activities associated with Stone Corral and Peninsula Hills recreation areas and the proposed boat ramp would occur within the proposed footprint of the recreation areas and the temporary and permanent access road areas. The total construction disturbance area would be approximately 620 acres. However, construction disturbance could be much less because recreational facilities would be designed and constructed to minimize vegetative disturbance, including tree removal. Anticipated ground-disturbing activities during construction include the following:

- Surveying

- Clearing and grubbing
- Excavating
- Backfilling
- Constructing road and parking lot
- Addressing potable water and power connections where they are planned to be provided
- Installing amenities
- Constructing boat ramp
- Performing site revegetation

Operations

It is anticipated that the proposed recreation areas would not have onsite staff. A fee collection box and camping information would likely be available at the kiosk near each recreation area's entrance. It is expected that the greatest use at the facilities would occur between Memorial Day (the end of May) and Labor Day (the beginning of September) of each year, but activities such as hiking and fishing may occur year-round. Regular boat inspections will be conducted to help address the potential for invasive mussels in the reservoir.

Maintenance

Maintenance activities would include collection of overnight and day-use fees at the fee collection boxes, road grading, water system maintenance, trash removal at picnic sites and overnight campsites, vegetation maintenance, restroom/vault toilet cleaning and restocking of paper goods, boat ramp debris removal, lake debris control, lake hazard marking, lake boom and barrier maintenance, signage, fence maintenance, fuels management, and law enforcement. During peak recreation use periods, these activities would likely occur daily, except for road grading, which is expected to occur once per year before the recreation season. During the non-peak seasons, the activities other than road grading would likely occur on a weekly basis.

2.1.1.8 Field Office Maintenance Yard

Because of the size of the Project area and the number of facilities, a staffed operation and maintenance complex (i.e., the Field Office Maintenance Yard) would be built onsite (Figure 2-7) to service Project facilities, as needed. Construction of the Project would be phased, and details regarding the Field Office Maintenance Yard would be based on Project needs. Assumptions discussed in the following sections are conservative to provide flexibility. An administration building and parking area would be constructed to meet Project needs.

Construction

The total construction disturbance area would be approximately 20 acres, with approximately 12 acres of permanent space for the proposed footprints of the administration and maintenance buildings. Buildings may include an administration/operation building, plant maintenance warehouse, service and supply warehouse, utility craft office, vehicle shop, heavy equipment shop, Project operations building, general maintenance headquarters, septic system, aboveground fuel and waste oil storage tanks. Oil/water separators will be provided in maintenance areas as necessary. A temporary asphalt batch plant may be located in this area but also could be located within the construction footprint for other facilities. Construction of the proposed Field Office Maintenance Yard would include the following:

- Transporting materials to the Project site
- Clearing and grading the site for construction, including demolition of existing structures

- Placing construction materials at staging areas
- Constructing administrative and maintenance buildings
- Constructing ancillary facilities (e.g., leach-field, water treatment, lighting, concrete pad for refueling island, aboveground fuel tanks, perimeter fencing)
- Performing site restoration after construction is complete

Operations

The typical operations scenario for the proposed Field Office Maintenance Yard would be 24 hours per day, 7 days per week. The facility would be fully staffed during normal business hours, when scheduled maintenance of Project facilities would occur. Minimum personnel staffing would occur during off-peak hours to respond to emergency situations. Spare parts for mechanical and electrical equipment would be stored in the warehouse along with lubricants, oils, and greases to maintain equipment. Daily operations could include personnel traveling from the Field Office Maintenance Yard to Project facilities and performing scheduled repairs, inspection, and maintenance of Project equipment, observing Project facilities and operations, and as-needed emergency repairs. Minor equipment repairs and overhauls (e.g., pumps and turbines) may take place onsite, but major repairs and overhauls would be offsite. The SCADA system would be operated and monitored remotely from the operations area of the administration building.

Daily operations are anticipated to include fueling and washing vehicles and equipment, gathering technical data on water quality and Project facilities conditions, and maintaining and repairing mechanical equipment.

Maintenance

Periodic maintenance would likely be performed on an as-needed basis including road, building, vegetation, fence maintenance, and debris removal. Procedures will be implemented to reduce impacts caused by lighting (e.g., by using directional lighting and non-reflective materials).

2.1.2 Holthouse Reservoir Complex

The Holthouse Reservoir Complex includes the features and facilities that are geographically or functionally associated with the Holthouse Reservoir. This complex would include the Holthouse Reservoir Inundation Area and dam including spillway and stilling basin and spillway bridge; a relocated WAPA transmission line; the approach channel for the Sites Pumping/Generating Plant; existing Tehama-Colusa Canal connections, the Tehama-Colusa Canal Construction Bypass Pipeline, and installation of two additional pumps at the Red Bluff Pumping Plant (RBPP).

2.1.2.1 Holthouse Dam and Reservoir

The existing 3,372-ac-ft Funks Reservoir is located 1 mile downstream of the proposed Golden Gate Dam site. This reservoir was constructed by Reclamation and is part of the Tehama-Colusa Canal system. Funks Reservoir serves as a re-regulating reservoir to stabilize flows in the canal downstream of Funks Reservoir as diverters come online and offline. The existing Funks Reservoir would be expanded to form the proposed Holthouse Reservoir (Figure 2-7) by constructing a new dam (Holthouse Dam) and reservoir east of Funks Reservoir, and breaching the existing Funks Dam so that the new and existing reservoirs would act as one unit, with an increased active storage capacity of approximately 6,500 ac-ft and a surface area of approximately 450 acres. The proposed Holthouse Reservoir would regulate Sites

Reservoir inflows and outflows through the proposed Sites Pumping/Generating Plant and provide sufficient supplemental storage to allow simultaneous pump back power generation during on-peak periods.

The 6,500-acre-foot Holthouse Reservoir would allow the Sites Pumping/Generating Plant to perform a pumped-storage function for up to 6 hours per day while simultaneously collecting and storing inflows from the Sacramento River through the Tehama-Colusa Canal, GCID Main Canal, and the proposed Delevan Pipeline. All water would be pumped into Sites Reservoir from Holthouse Reservoir during off-peak power periods on a daily basis.

The proposed Holthouse Dam would be constructed as a zoned earthen embankment for most of its required length. However, a concrete gravity section would be provided in a rock cut on the left abutment to accommodate the inlet/outlet structure for the TRR and Delevan Pipelines and a flood control spillway. Except for the left abutment, Holthouse Dam would be a zoned embankment dam similar to the existing Funks Dam. The total length of the dam would be approximately 8,500 feet with a height of approximately 48 feet. The crest elevation of the dam would be at elevation 214 feet to match the crest of the existing Funks Dam. Because a deep soil layer could potentially exist along the dam alignment, the central core zone would extend down to suitable foundation in dense soils. A slurry cutoff wall would be constructed to control seepage. A grout curtain, a barrier that would protect the foundation of the dam from seepage as well as minimize seepage to local agricultural lands, would be installed under the dam. A similar such curtain is in place at the existing Funks Reservoir, which has not experienced seepage issues to date. A downstream seepage collection drain system would also be installed to limit the potential for seepage in addition to a series of piezometers to monitor performance, several of which would be downstream of the dam section and foundation to monitor seepage.

A concrete gravity dam section on the left abutment would incorporate the inlet/outlet facilities for the four 12-foot-diameter Delevan and TRR pipelines (two pipes each) and the emergency spillway for Holthouse Reservoir. The spillway would be a multi-gate structure similar to the existing spillway at Funks Dam. The spillway capacity would be sized to pass the emergency drawdown flow for Sites Reservoir. A chute section and stilling basin would be provided for the spillway to dissipate energy before release flows enter Funks Creek. A gated low-level outlet pipe through the gravity dam section would also be provided to make environmental releases to Funks Creek and to help drain Holthouse Reservoir for inspection and maintenance.

Operating levels within Holthouse Reservoir would vary between elevation 206.0 and 190.0 feet, which would provide the required active storage capacity of approximately 6,500 ac-ft. Elevation 206.0 feet corresponds to the 2011 normal operating level in existing Funks Reservoir. There would be approximately 1,000 ac-ft of dead storage in Holthouse Reservoir because of topographic elevations near the new Holthouse Dam. This space could be allocated to sediment accumulation, disposal of excess excavated material from the Project, or disposal of existing sediment in Funks Reservoir.

Pump-back operations would involve the daily procurement of relatively inexpensive power sources (i.e., renewable energy) to pump water from the proposed Holthouse Reservoir up to the Sites Reservoir during off-peak hours of power usage and release of that pumped water from Sites Reservoir to Holthouse Reservoir during peak hours of power usage. Pump-back power production provides flexible generation that would be used to compensate for rapid changes in electric power demand, such as from increased air conditioning use on hot days, and to compensate for changes in power production from variable renewable power sources, such as wind and solar power projects. Although water delivery and power production are given equal weight in the planning goals for the Project, pump-back power operations would be secondary to water delivery operations because of water contracts and environmental restrictions. These operations would be optimized within those restrictions to produce the greatest value to users. Pump-back operations would be most beneficial at the Sites Pumping/Generating Plant. Pump-back operations at the other Project pumping/generating facilities is not justifiable because of the limited storage potential for water and limited power generation capability compared to the Sites Pumping/Generating Plant.

2.1.2.2 Western Area Power Authority Transmission Line Relocation

Eight WAPA transmission line towers are located within the footprint of the proposed Holthouse Reservoir. Based upon preliminary contacts with WAPA, the Project alternative would move a segment of the line to the west so that it would cross at a narrow spot in the existing Funks Reservoir at the existing dam.

2.1.2.3 Sites Pumping/Generating Plant Approach Channel

The Sites Pumping/Generating Plant would be connected to Holthouse Reservoir by an earthen approach channel approximately 6,300 feet long. The channel is expected to have relatively flat slope toward the Sites Pumping/Generating Plant and would be constructed at an elevation below the operating range of the reservoir. The channel would have a trapezoidal geometry with a bottom width of approximately 200 feet and a top width of 400 to 700 feet. When Holthouse Reservoir is full, the channel would be nearly entirely submerged. This channel would allow water from Holthouse Reservoir to flow by gravity to or from the pumping/generating plant and would allow upstream Funks Creek flows to enter Holthouse Reservoir via an approach channel spillway.

2.1.2.4 Existing Tehama-Colusa Canal Connections

The Tehama-Colusa Canal would continue to discharge into the reservoir at its current location on the north side.

2.1.2.5 Tehama-Colusa Canal Construction Bypass Pipeline

Installation of a bypass would be required during construction to divert Tehama-Colusa Canal flow before starting modifications to the existing Funks Reservoir. The Tehama-Colusa Canal Bypass Pipeline would be maintained as a permanent feature following modification of Funks Reservoir and construction of Holthouse Reservoir, as requested by Reclamation and the Tehama-Colusa Canal Authority (TCCA). The permanent bypass would provide operational flexibility to pass water to the canal segment below the reservoir without pumping when gravity flow is not possible. The proposed bypass would consist of a 12-foot-diameter pipeline starting approximately 2,600 feet upstream of the Tehama-Colusa Canal inlet into Funks Reservoir. The bypass would route the required flows around Funks Reservoir during construction of reservoir modifications. The bypass construction would require installation of two cofferdams on the upstream portions of the Tehama-Colusa Canal to isolate the area of embankment cut and pipe installation. The Funks Reservoir would be dewatered, and the existing check structure would be dismantled and reconstructed approximately 3,000 feet upstream. The check structure would consist of two 18-foot by 15.5-foot gates, electrical controls, hoists, and concrete supports and reinforcement. The facility would be relocated slightly downstream of the bypass. The bypass would be gated or valve-controlled to regulate releases downstream, as required by Reclamation and the TCCA.

Construction

The total construction disturbance area would include the proposed footprints of Holthouse Reservoir, Holthouse Dam, Holthouse Spillway and Stilling Basin, Tehama-Colusa Canal Construction Bypass Pipeline, and Project Buffer adequate for construction staging.

Construction materials for the earthen dam would come from required excavations for the Sites Pumping/Generating Plant and the channel connecting the enlarged reservoir with the Sites Pumping/Generating Plant. The material in the existing Funks Dam could also be reused to construct the new dam. Approximately 883,500 cubic yards of core material and 2,000,000 cubic yards of earth and rockfill would be required to construct the earthen dam section. Approximately 41,000 cubic yards of concrete would be required for the concrete gravity dam section on the left abutment.

Construction materials for the proposed Holthouse Dam would include imported sand and gravel. Processed rock from Project excavations could also be used if it is suitable for that use.

Because the existing Funks Reservoir is an onstream reservoir, a significant portion of the reservoir's active storage has been displaced because of sediment accumulation from Funks Creek. Although topographic data are available for the reservoir from the original construction drawings, there are no current bathymetric data to support an estimate of the amount of sedimentation that has actually accumulated. However, it is believed that the current active capacity could be as low as 1,500 ac-ft. This would mean that approximately 750 ac-ft (1.2 million loose cubic yards) of sediment have accumulated. A bathymetric survey of the existing reservoir would be performed as part of future design phases of the Project to establish the volume and physical characteristics of the sediment so the material can be properly managed during design and construction.

A portion of the accumulated sediment would be removed and relocated to construct the new Holthouse Reservoir, particularly the low-level flow channel connecting the reservoir with the Sites Pumping/Generating Plant. However, it may not be necessary to remove all sediment below the minimum normal operating level that does not affect the active storage of the reservoir. Once a diversion system is installed to route Funks Creek flows around the Holthouse Reservoir worksite, the sediment to be removed would be dewatered over a period of time by ditching and sumping. Once it is dry enough to be excavated and moved, the sediment would be disposed of in the lower elevations of the new Holthouse Reservoir, in a dead storage area, or in backwater areas around the perimeter of the existing reservoir. The construction schedule for the Project would allow adequate time to dewater and remove the material without affecting the new dam construction (which is outside the limits of sediment accumulation).

As described above, a grout curtain would be installed under the dam to minimize seepage to local agricultural lands. A downstream seepage collection drain system would also be installed to limit the potential for impacts on adjacent lands in addition to a series of piezometers to monitor potential seepage during the operation of the facility. Seismic instrumentation, piezometers, and settlement points would also be installed for long-term monitoring of dam performance.

Typical summer releases from Funks Reservoir to the Tehama-Colusa Canal range from 500 to 800 cfs. Total flows of 50 to 200 cfs for off-peak limited agricultural releases would be needed between November and February, and possibly to March, depending on the weather. The proposed Tehama-Colusa Canal Construction Bypass Pipeline is a 12-foot-diameter pipeline that would route the required flows around Funks Reservoir during construction of reservoir modifications.

Operations

Funks Reservoir is operated by TCCA pursuant to a contract with Reclamation. Operation of the proposed Holthouse Reservoir would be coordinated with TCCA, but it would be operated by the designated operator of the proposed Sites Reservoir. During fall and winter, inflows from the conveyance system and water for power generation would be stored during on-peak power periods. The stored water plus ongoing off-peak inflows from the conveyance systems would then be pumped to Sites Reservoir during the partial-peak/off-peak power period on a daily basis. During spring and summer, when releases are made from Sites Reservoir, released water would go through the Sites Pumping/Generating Plant to generate power. Holthouse Dam would maintain releases to Funks Creek of up to 10 cfs year-round, based on a recommendation by the California Department of Fish and Wildlife (CDFW). This flow is intended to replace the existing seepage flow on Funks Creek below Funks Dam.

Maintenance

Currently, periodic maintenance required for Funks Reservoir includes road, vegetation, and fence maintenance, and debris removal on an as-needed basis. The current Funks Reservoir is also drained annually. While annual draining would not be necessary for the larger Holthouse Reservoir, periodic drawdown may be conducted as needed. Periodic maintenance and inspection of Holthouse Reservoir would be coordinated with Tehama-Colusa Canal operators or could be conducted at a centralized maintenance and operation office for the Sites Reservoir.

2.1.2.6 Additional Pumps at the Red Bluff Pumping Plant

The RBGPP, which is located in the Secondary Study Area, is adjacent to Reclamation's Red Bluff Diversion Dam and was completed in 2012. The plant, which was constructed as part of the Fish Passage Improvement Project (Figure 2-10), included a fish screen, a pumping plant at the Mill Site (i.e., the RBPP), canal, siphon, a forebay, switchyard, and a bridge across Red Bank Creek. The fish screen structure was designed to meet National Marine Fisheries Service (NMFS) and CDFW criteria for diversion flows of 80 to 2,500 cfs. The 2,500-cfs RBPP includes 11 vertical axial-flow pumps. Of the 11 pumps, 9 pumps (seven 250-cfs and two 125-cfs pumps) were installed to provide a total capacity of 2,000 cfs.

The Project would require a pumping capacity that exceeds the current capacity of the RBPP. The pumping plant includes two additional pump bays designed for the future installation of two 250-cfs vertical axial-flow pumps. Installation of two additional 250-cfs vertical axial-flow pumps into an existing concrete pump bay at the pumping plant would be required (Figure 2-10).

The Project also includes the operation and maintenance of the proposed additional pumps. Only one pump would be used for operations, the second would provide redundancy if needed. The proposed additional pumps at the pumping plant would allow for a total diversion up to 2,160 cfs in winter and spring, including up to 2,100 cfs for diversion to the proposed Sites Reservoir, and an additional 50 to 60 cfs for maintaining existing winter and spring flow operations of the Tehama-Colusa Canal.

Construction

Because the RBPP was designed for the future installation of additional pumps, construction activities would be minor and would include the following:[6]

- Removing the existing blind flange on the afterbay side of the pumping plant and replacing it with an 84-inch butterfly valve. A new 84-inch-diameter flanged steel pipe spool (approximately 3 feet long) would be connected to the new butterfly valve. Permanent supports would be required beneath the butterfly valve and flap gate.
- Installing the pump during the non-irrigation season to minimize interruptions to the irrigation delivery system. A mobile crane would be required to install the piping and appurtenances.
- Installing pumping plant unit bay stop logs, using a mobile crane if afterbay dewatering is necessary.
- Inspecting the pump bay and removing all sediment. Access to the bottom floor of the pumping plant would be provided at each bay via 4.5-foot by 7-foot access hatches and ladders.
- Removing roof hatches over the pump unit bay by using a mobile crane.
- Installing the pump in accordance with the pump manufacturer's written installation instructions, including constructing the pump pedestal and connecting the pump discharge nozzle to the discharge pipe via a new flexible coupling.
- Installing motor control centers, electrical equipment, electrical conductors, and SCADA system to integrate the pumps into plant operation.

Operations

The RBPP includes a control system to provide remote manual and remote auto control of pumps and associated appurtenances. The pumping plant and associated gravity conveyance system are designed to deliver water to the existing 17-acre settling basin located west of the Red Bluff Diversion Dam. Once in the settling basin, water would flow to Check No. 1 on the Tehama-Colusa Canal and the Corning Pumping Plant.

Maintenance

It is anticipated that the following preventive maintenance would be performed regularly for the vertical axial-flow pumps and appurtenances installed at the RBPP as part of the Project:

- Washing down or pressure washing, as necessary
- Checking for rust and corrosion, annually; maintaining all coatings
- Visually inspecting for damage or wear, monthly
- Assessing fluids and lubrication; address as necessary
- Inspecting pumping plant trash racks daily and removing debris as necessary
- Visually inspecting butterfly valves and flap gates, monthly

The additional pumps would neither increase the frequency of maintenance activities required at the RBPP nor require additional personnel to perform pump maintenance. However, the volume and timing of non-TCCA water diversions, through any of the pumps, could affect the sediment load distributed to

[6] A formal work plan that describes all construction activities would be required prior to the start of construction.

the TCCA system (i.e., the pumping plant forebay and settling basin). Increased sedimentation associated with non-TCCA water diversions may require more frequent dredging within the pumping plant forebay and settling basin.

2.1.3 Terminal Regulating Reservoir Complex

The TRR Complex includes the Project features and facilities that are geographically or functionally associated with the TRR. This complex would include the TRR Inundation Area, the dam that would form the reservoir, the TRR Pumping/Generating Plant and electrical switchyard, the GCID Main Canal Connection to TRR, the TRR Pipeline, TRR Pipeline Road, and the GCID Main Canal facilities modifications.

2.1.3.1 Terminal Regulating Reservoir

Water conveyed down the GCID Main Canal would be directed into the proposed TRR (Figure 2-11). A new pump station (the proposed TRR Pumping/Generating Plant) would then convey the water from the TRR via the proposed TRR Pipeline to the proposed Holthouse Reservoir. The TRR would be required to provide operational storage for the TRR Pumping/Generating Plant to balance normal and emergency flow variations between the upstream GCID Main Canal Pump Station, the 40 miles of connecting canal, and the TRR Pumping/Generating Plant.

The TRR would be located approximately 3 miles northeast of Holthouse Reservoir, adjacent to the GCID Main Canal. It would be constructed by a combination of excavation and embankment. The TRR would be composed of an earth embankment dam, concrete emergency overflow weir, an outfall standpipe, and a drain/spillway to Funks Creek to allow the reservoir to be drained for operation and maintenance and for emergency purposes. A 15-foot-wide gravel road (the proposed TRR Pipeline Road) would be constructed on top of the embankment to provide access to the TRR for operation and maintenance.

The embankment materials would be impervious earthen material compacted to DSOD specifications. The facility would be lined with plastic to limit the potential for seepage to adjacent agricultural lands. The TRR would be approximately 15 feet deep, with a maximum water depth of 12 feet, leaving 3 feet of freeboard. The maximum excavation depth of the TRR would be approximately 9 feet, and the maximum embankment height would be approximately 6 feet above existing grade. The total storage volume in the TRR would be divided into three operational components: (1) 2 feet of dead storage beneath the lower operating limit of the pump station; (2) 5 feet of normal operational storage; and (3) 5 feet of emergency storage. The maximum water surface elevation in the TRR could not exceed the water surface elevation in the GCID Main Canal because it is a gravity flow system. The plan area of the TRR would be approximately 150 acres (including the pond and embankments), and the reservoir would have a maximum storage capacity of 1,200 ac-ft. The TRR capacity is designed to provide normal operating and emergency storage as well as a forebay for the proposed TRR Pumping/Generating Plant.

Major associated features would include a GCID Main Canal transition bay, a connecting channel from the GCID Main Canal to the TRR, and a flow control inlet structure.

Construction

The total construction disturbance area would be approximately 150 acres. The proposed TRR site is currently in agricultural production (rice crops, annual row crops, and orchards). The total construction disturbance area would include the footprint of the facilities, the materials and equipment staging area, the area needed to construct the facilities, and access roads. This staging area could be the same as or near the

GCID Main Canal Connection staging area because the construction sites are adjacent to each other. In addition, the portion of the proposed Delevan Pipeline construction disturbance area adjacent to the TRR would also be used for the TRR staging area. As previously described, the TRR would be lined with plastic to limit the potential for seepage to adjacent agricultural lands.

Anticipated major construction activities include transportation of materials to the proposed worksite, clearing and grading the construction work area, staging of construction materials, dewatering, constructing fencing around the perimeter, constructing lighting, and excavation and embankment construction.

Operations

In coordination with GCID Main Canal operations, water would be diverted to the proposed TRR by gravity. Flow into the TRR would be controlled by the TRR inlet control gates. An integrated SCADA and communication system would coordinate operation between the Main Pump Station, GCID Main Canal, and the proposed TRR, TRR Pumping/Generating Plant, and Holthouse Reservoir. Flow to Holthouse Reservoir and the water surface in the TRR would be regulated by the TRR Pumping/Generating Plant. TRR pump operators would need continuous communication with GCID Main Canal and Pump Station operators to coordinate water allocations for irrigation demands and Sites Reservoir deliveries. TRR operation would likely be controlled remotely and would not require daily onsite personnel. The reservoir would be designed to allow emergency releases during operation first to the GCID Main Canal via the GCID Main Canal Connection to the TRR (when hydrologically feasible), and then to Funks Creek via the proposed drain/spillway. Release flows would be controlled by an energy dissipater and small concrete structure at the terminal end of the pipeline.

Maintenance

Typical maintenance of the proposed TRR would include dredging to remove sediment when it is drained, clearing vegetation from the slopes of the embankments, and maintaining the gravel service road atop the embankment. Draining the TRR for maintenance would be accomplished by a standpipe and drain structure at the invert of the reservoir. Drained water would be conveyed to Funks Creek via the proposed TRR to Funks Creek Pipeline. Draining/dredging of the TRR would likely be required every 7 to 10 years, depending on variable sediment transport conditions in the Sacramento River and the surrounding areas. Sediment removed during the dredging activities would be placed on the surrounding levees' embankments.

Procedures will be incorporated to reduce impacts from lighting (e.g., directional lighting and non-reflective materials).

2.1.3.2 Terminal Regulating Reservoir Pumping/Generating Plant and Electrical Switchyard

The purpose of the proposed TRR Pumping/Generating Plant would be to pump water from the proposed TRR to the proposed TRR Pipeline, which would convey water to the proposed Holthouse Reservoir. Return flows from the proposed Holthouse Reservoir to the proposed TRR would flow through the TRR Pumping/Generating Plant to generate power.

The TRR Pumping/Generating Plant would pump 1,800 cfs of water from the TRR to Holthouse Reservoir. The TRR Pumping/Generating Plant would generate power from flows released through it, with a maximum return flow of 900 cfs. The return flow would provide up to 800 cfs for the GCID Main Canal west of Funks Creek (the canal capacity) plus an additional 100 cfs that would be released from

TRR directly to other local irrigation ditches or to Funks Creek to meet water supply demands. The minimum water elevation in Holthouse Reservoir for operation of the TRR Pumping/Generating Plant would be 112 feet, and the maximum water elevation for operation would be 121.5 feet.

The TRR Pumping/Generating Plant would be located adjacent to the north side of the TRR (Figure 2-11), approximately 3 miles northeast of Holthouse Reservoir. The TRR Pipeline would begin on the north side of the TRR. The TRR Pumping/Generating Plant would include two 620-cfs and two 325-cfs Francis Vane pumps for pumping and one 750-cfs Kaplan turbine for generating during release flows.

Structures associated with the TRR Pumping/Generating Plant would include the following features:

- Mechanical features:
  - 84-inch online spherical valve on each discharge line
  - Air chambers and butterfly valves with hydraulic power units
  - Compressors
  - Generators
  - Gantry crane – 100 tons
  - Service air and water system
  - Acoustical flowmeter on each discharge line
- Electrical features:
  - Switchyard transformers
  - Control system
  - Switchgears
  - Grounding grids
  - Control cabinets
- Refilling of pump units

The discharge lines may periodically need to be dewatered for inspection and maintenance. These lines would need to be filled at a slow rate to allow the release of air through air and vacuum valves. To accomplish this, one or two 100-cfs pump units would be installed or filling bypass pipelines can be provided around isolation valves.

The proposed TRR Electrical Switchyard would be located within the footprint of the TRR Pumping/Generating Plant (Figure 2-11) and would be approximately 100 feet long by 50 feet wide.

Construction

The total construction disturbance area would be approximately 1 acre and would include the footprint of the facilities, the materials and equipment staging area, the area needed to construct the facilities, and access roads. The construction disturbance area would fall within the construction disturbance area of the proposed TRR Pipeline (discussed below).

Excavation would be conducted using temporary slopes of 1.5:1 for the 25-foot-deep trench along the pipelines and a temporary slope of 2:1 for the 40-foot-deep foundation of the pump stations. Tied back sheet pile walls can also be used for the pump station excavation. The pump station foundations would be excavated in in situ materials, and no major improvements to the foundations would be required. During construction, the topsoil material would be excavated, stockpiled separately, and replaced to support native grass and plant growth.

The total construction disturbance area for the switchyard would include the footprint of the proposed switchyard, the materials and equipment staging area, electrical transformer area, and temporary access roads. The construction disturbance area for the TRR Electrical Switchyard would be located within the Delevan Pipeline construction disturbance area.

Anticipated major construction activities include clearing and grading the construction workspace, placing necessary construction materials at staging areas, and preparing the switchyard pad. Anticipated ground-disturbing activities during construction include the following:

- Transporting materials to the Project site
- Clearing and grading the construction workspace
- Placing construction materials at staging areas
- Dewatering
- Excavating the forebay (approach channel) and pumping plant
- Pile driving if required
- Constructing the forebay, pump house, and pump bay
- Installing the pond liner
- Performing site restoration after construction is complete

Operations

An integrated SCADA and communication system would be used for the proposed TRR Pumping/Generating Plant. Flows to the proposed Holthouse Reservoir and the water surface in the proposed TRR would be regulated by the TRR Pumping/Generating Plant. TRR pump operators would need continuous communication with GCID Main Canal and Pump Station operators to coordinate water allocation for irrigation delivery and for proposed Sites Reservoir filling. The proposed switchyard would be operated remotely.

Maintenance

Daily maintenance and monitoring would likely be required. Regular maintenance and inspections would be required for each pump unit and the related equipment, such as gates, valves, and electrical equipment, with possible additional inspections and maintenance needed after earthquakes, storms, or floods.

The proposed switchyard and associated overhead power lines would require maintenance once or twice a year. Maintenance activities may include annual washing and cleaning of insulating equipment, preventive maintenance, scans of the switchyard under full load, and routinely scheduled testing to meet WECC requirements. Regular maintenance activities would include landscape maintenance and inspections for damage by animals.

2.1.3.3 GCID Main Canal Connection to Terminal Regulating Reservoir

The purpose of the proposed connection from the GCID Main Canal to the TRR would be to allow water from the canal to enter the TRR.

The connection from the GCID Main Canal to the TRR would be located in the east bank of the canal north of Funks Creek (Figure 2-11). An inlet control structure with multiple radial control gates would be provided to regulate flows into and out of TRR. On the main canal, the existing Funks Check at Funks Creek can be refurbished to help balance and regulate flows in and out of the TRR, or a new check structure could be constructed based on future condition assessments. The benefit to keeping the existing

Funks Check operational is that it would minimize impacts to GCID Canal operations during TRR construction.

Construction

The total construction disturbance area would be approximately 1 acre and would include the footprint of the facilities, the materials and equipment staging area, the area needed to construct the facilities, and access roads. This construction disturbance area would be within the larger construction disturbance area for the proposed TRR. Anticipated ground-disturbing activities during construction include the following:

- Transporting materials to the Project site
- Clearing and grading the construction workspace
- Placing construction materials at staging areas
- Dewatering and building a temporary bypass channel
- Excavating canal energy dissipation bay
- Performing reservoir inlet excavation and embankment construction
- Constructing check structure

It is anticipated that the proposed reservoir inlet from the GCID Main Canal to the proposed TRR would be constructed by first building a temporary bypass channel to the west of the existing canal alignment. The temporary bypass channel would be approximately 1,000 feet long and would connect into the GCID Main Canal upstream and downstream of the construction zone to supply water to the remaining reach of the canal downstream of the TRR area. The temporary bypass channel would be constructed using a combination of excavation, earth embankment, and sheetpile walls to isolate the construction site from the diversion canal. Following completion of the new check structure, the temporary bypass channel would be filled in, earth embankments and sheetpile walls would be removed, and the area would be restored to preconstruction conditions.

Operations

Gate operation of the new GCID Main Canal check structure would normally be controlled automatically, with an option for local or remote manual control. Gate operation would be established using either upstream or downstream water-level controls, depending on the overall operating regime for the future canal system.

Flow into the reservoir would be controlled by the proposed TRR inlet control gates. An integrated SCADA and communication system would be required to coordinate operations between the GCID Pump Station, GCID Main Canal, and the proposed TRR, TRR Pumping/Generating Plant, and Holthouse Reservoir. SCADA operation and monitoring would be conducted remotely and would not require daily onsite personnel. Instead, daily operation and monitoring would be managed from a central location.

Maintenance

Maintenance activities would include: (1) removing debris that could collect upstream of check structures, (2) maintaining gate operators to provide adequate control of gates, (3) periodically repairing and repainting the connection, and (4) dredging the dissipation bay and inlet channel for sediment concurrently with the proposed TRR dredging.

2.1.3.4 Terminal Regulating Reservoir Pipeline and Terminal Regulating Reservoir Pipeline Road

The proposed 3.5-mile-long TRR Pipeline would convey water from the proposed TRR to the proposed Holthouse Reservoir (Figure 2-11). The TRR Pipeline would be bi-directional, allowing water to be pumped from the TRR to Holthouse Reservoir for storage and allowing water to flow by gravity from Holthouse Reservoir for release to the TRR/GCID Main Canal and other canals. Water released from Holthouse Reservoir would flow through the turbine at the proposed TRR Pumping/Generating Plant at the end of the TRR Pipeline to generate electricity.

The proposed TRR Pipeline would have a capacity of 1,800 cfs to convey water that is pumped from the TRR to Holthouse Reservoir. The capacity of the TRR Pipeline to convey water by gravity flow from Holthouse Reservoir to the TRR would also be 1,800 cfs, but the demand would only be approximately 900 cfs based on the GCID Canal capacity west of the TRR and other local irrigation ditch demands to be met by the TRR. The TRR Pipeline would consist of two 12-foot-diameter reinforced concrete pipes to convey the pumping flow. It would be buried a minimum of 10 feet (to top of pipe) below the ground surface. Facilities associated with the TRR Pipeline would include blowoff and air valve structures.

The proposed alignment of the TRR Pipeline would cross the existing GCID Main Canal and a primary PG&E natural gas transmission line. At these locations, the bore-and jack-construction method would be used. Bore-and-jack construction would entail excavating a large pit on each side of the existing infrastructure (highway, railroad, or canal) and then tunneling horizontally under the structure. Because of the high water table in the area, this construction method would require that the area be dewatered. All additional work required for bore-and-jack construction would be conducted within the construction disturbance area and would not require the disturbance of additional land.

The TRR Pipeline would also cross the easement of an existing PG&E 230 kV line. It is expected that the pipeline can be trenched across the utility easement and that boring and jacking will not be required. No permanent aboveground structures associated with the pipeline would be constructed, other than a 16-foot-wide, 2.1-mile-long gravel maintenance road (the proposed TRR Pipeline Road), from the GCID Main Canal to the proposed Holthouse Reservoir Spillway and Stilling Basin.

Crossing of other existing facilities such as gas lines, water lines, sewer lines, and communications lines would be accomplished using the bore-and-jack or tunneling method or existing facilities would be relocated as determined most appropriate. Disruptions to these utilities would be minimized to the extent possible, and the ground surface would be restored to preconstruction conditions after installation of the TRR Pipeline. Construction activities for the proposed TRR Pipeline would occur within the identified construction disturbance area and would require only slightly more excavation than is required for the pipeline.

<u>**Construction**</u>

The construction disturbance area for the proposed TRR Pipeline would be approximately 335 feet wide from the TRR to the proposed Holthouse Reservoir (3.5 miles). The Delevan and TRR Pipelines would be in a common trench excavation in the disturbance area. The total construction disturbance area, which would also include a temporary concrete batch plant, would be within the construction disturbance area for the proposed Delevan Pipeline (discussed below). Anticipated major construction activities include the following:

- Clearing and grading the construction workspace

- Stockpiling topsoil
- Placing necessary construction materials at staging areas
- Transporting materials to the Project site
- Trenching/excavation of pipeline route
- Dewatering
- Performing bedding preparation
- Performing onsite fabrication of pipe
- Installing pipe and valves
- Addressing crossings of roads and utilities
- Backfilling and compacting trench
- Replacing topsoil
- Revegetating and restoring pipeline route
- Constructing a gravel maintenance road

Operations

Operation of the proposed TRR Pipeline would not require daily workers at the site.

Maintenance

Periodic inspection and maintenance of the proposed TRR Pipeline facilities would likely occur once per year, with possible additional inspections and maintenance needed after storm or flood events. Annual inspections would not necessarily include dewatering of the pipelines. Dewatering for inspection may occur on a 5-year cycle, or when a pipeline problem is expected. Permanent rights-of-way for the land overlying the pipeline would be maintained to provide future access. The proposed gravel maintenance road would be graded, as needed.

2.1.3.5 GCID Main Canal Facilities Modifications

The GCID Main Canal delivers water from the Sacramento River to water users along its route from its diversion point northwest of Hamilton City to southeast of the city of Williams. The canal is an unlined earthen channel, with capacity varying from 3,000 cfs at the upstream end to 300 cfs at the southern terminus.

Water is pumped by the Hamilton City Main Pump Station into the GCID Main Canal. The existing canal facilities include the intake and bypass channels, fish screens, main pump station and forebay, headgates, and the gradient facility. These facilities are located approximately 5 miles northwest of Hamilton City. Project improvements in this area include a new headgate structure and canal lining. A railroad siphon replacement is also proposed near Willows.

For the Project, the existing headgate structure would be left in place and continue to serve as a bridge between County Road 203 and County Road 205. The existing headgate structure would continue to operate during construction of the new headgate structure, and diversion activities would continue throughout construction. The existing headgate would not be adequate for proposed winter operation during high river flows, because of the large head-drop (decrease of water elevation) across the structure during high river levels. A new headgate structure would be constructed upstream of the existing structure. The new headgate structure would include three automated gates (two vertical roller gates and one radial gate).

The water level and flow control functions would involve operating conditions that would result in water surface drops across the headgate of between 3 and 15 feet, which would require a set of energy dissipater blocks immediately below the gates to slow down and stabilize the water discharging under each gate.

The canal reach immediately downstream of the new headgate structure would be lined with concrete for approximately 200 feet to prevent erosion due to the turbulent flow conditions.

The Union Pacific Railroad siphon at Mile 26.6 does not meet design and operation criteria for the Project and would need to be replaced. The existing railroad siphon structure was built in the early 1900s and includes two 6-foot-diameter barrels and five 7.25-foot by 6-foot barrels. At the existing maximum flows of approximately 2,000 cfs, the head loss across the railroad siphon due to high flow velocities and poor entrance and exit transitions reduces upstream canal freeboard to marginal conditions. Because of the structure’s age, hydraulic capacity restrictions, and use as a major transportation link, it should be replaced. The new structure would consist of three prefabricated box culverts. Typical future maximum velocity and head losses would be approximately 4 fps and 0.2 foot, respectively.

The proposed replacement of the railroad siphon would require coordination and planning with railroad operators. Construction restrictions may exist regarding minimizing interference with regular railroad operations. To the extent possible, replacement of the railroad siphon would take place during periods of lowest train traffic, and railroad shutdown time would be minimized.

Construction

The total construction disturbance area would consist of the existing canal prism, existing operation and maintenance roads, and an additional 50 feet on both sides. The total construction disturbance area would include the footprint of the facilities (new headgate structure, canal lining, and replacement of railroad siphon), the materials and equipment staging area, the area needed to construct the facilities, and access roads. All the construction activities for the new facilities would occur within the existing GCID right-of-way.

Water delivery to the GCID service area would be maintained during the primary irrigation season (early April through mid-October). The GCID Main Canal is typically out of service each year between early January and late February for maintenance. Construction activities would be scheduled during this maintenance period whenever possible. If construction activities are required outside of the maintenance period, a temporary bypass channel would be built around the construction site to allow diversion water to flow past and maintain regular canal operation. The temporary bypass channel would be constructed within the existing GCID right-of-way by using a combination of excavation, earth embankment, and sheetpile walls to isolate the construction site from the canal. After completion of construction, the temporary bypass channel would be filled in, earth embankments and sheetpile walls would be removed, and the area would be restored to preconstruction conditions.

Operations

The intake and fish screen facility would operate year-round and would be similar to existing operations. Use of the canal for conveyance to the Sites Reservoir would require increased automation between the GCID facilities and other Project conveyance systems. The available capacity for winter operation (October through March) of Project conveyance would range from a minimum of approximately 1,270 cfs during an average November to a maximum of approximately 1,750 cfs during an average March. There is currently little to no available capacity from April through September. To accommodate the Project, flows need to be monitored and controlled consistently. SCADA operations and monitoring could be conducted remotely and would not require daily onsite personnel. Instead, daily operation and monitoring would be managed from a central location and would not require additional staff beyond existing personnel.

Maintenance

Required maintenance activities would be similar to current maintenance. Periodic inspection and maintenance of mechanical systems, such as the screen cleaning system, would be required. Water levels would continue to be monitored automatically. Additional sediment and debris removal activities may also be required because of increased diversions during high river water levels.

Debris that enters the intake channel can block flows in the channel, get entangled at the face of the fish screen, block the water control structure, or cause other disruptions to proper operating conditions. Typically, debris builds up during winter flood flows and is removed at the beginning of the irrigation season in late March to early April. Because of winter diversions, a larger debris load is expected at the intake channel, screen structure, and bypass channel. It is expected that debris removal would be required during the winter to maintain proper operating conditions. It may be necessary to retrofit the mouth of the intake channel with a floating log boom to deflect larger debris and increase protection to the fish screens.

The upper one-third of the intake channel is typically dredged once every 3 years, and the entire channel is dredged once every 10 years. The volume of the dredged materials varies from approximately 30,000 to 130,000 cubic yards. The future volume of sediment in the intake channel is expected to increase with increased Project-related winter operation, and the following assumptions were made regarding future dredging operations:

- A larger dredge with increased capacity and working depth than is currently used would be required. Supporting equipment, such as a high-capacity crane equipped with a grappling hook and clamshell, would be required to assist in debris removal.
- Dredging operation would occur year-round.

Dredged materials would continue to be placed on the 11-acre offsite disposal location southwest of the pump station, at sites on Montgomery Island, and along the canal banks. The new headgate structure would require annual inspection and maintenance including painting and motor control unit inspections, similar to typical check structures along the canal. Expected periodic maintenance activities for the canal that would require onsite personnel include the following:

- Maintaining canal banks to repair sloughing and erosion damage
- Filling in animal burrow holes
- Removing vegetation
- Removing debris from upstream of the check structures
- Maintaining gate operators
- Repairing and repainting gates

2.1.4 Delevan Pipeline Complex

The Delevan Pipeline Complex includes the Project features and facilities that are geographically or functionally associated with the Delevan Pipeline. This complex would include the Delevan Pipeline and the Delevan Pipeline Intake/Discharge Facilities (flat plate fish screen structure, forebay, pumping/generating plant and switchyard, maintenance and electrical buildings, and other electrical and mechanical features).

2.1.4.1 Delevan Pipeline Intake/Discharge Facilities

The proposed Delevan Pipeline Intake/Discharge Facilities were designed to divert water from the Sacramento River to the proposed Holthouse Reservoir for storage in the Sites Reservoir (Figure 2-12). The facilities would be used to release water from Sites Reservoir to the Sacramento River for downstream uses and to generate electricity.

The proposed Delevan Pipeline Intake/Discharge Facilities would be located on the Sacramento River at River Mile 158.5 in Colusa County. The river intake/outlet would be located immediately downstream of the existing Maxwell Irrigation District intake and across the river from Moulton Weir, approximately 10 miles northeast of the town of Maxwell. The total footprint of the site would be approximately 20 acres including the pumping/generating plant buildings, fish screen, and forebay.

Water that passes through the fish screen would be pumped up approximately 150 feet vertically through two 12-foot-diameter concrete pipes to Holthouse Reservoir. Water would also be able to flow by gravity back from Holthouse Reservoir to the Sacramento River. Reverse-flow water would flow through the turbines to generate electricity. The water would then flow through the forebay and fish screen at a velocity of 1 fps into the Sacramento River. The 1-fps exit velocity is based on NMFS criteria for adult salmon diffusers to allow the water to exit the screen without extending a false attraction flow to the salmon.

The proposed pumping capacity of the Delevan Pipeline Intake/Discharge Facilities would be 2,000 cfs when diverting water from the Sacramento River and 1,500 cfs when releasing water to the Sacramento River (and generating electricity). Total lift capacity of the facility would be approximately 150 feet.

The facilities at this site would include the following:

- **Flat plate fish screen structure –** The fish screen structure would prevent fish in the Sacramento River from entering the pump station. The fish screen would also function as an outlet structure, dissipating the energy of the water being released to the river.

  The fish screen structure would consist of thirty-two 13-foot-tall by 15-foot-wide flat plate screens. The structure would be approximately 560 feet long (the distance created by the 32 screens bays, the additional two blowout bays, and room for the screen cleaning equipment). Panels would be positioned with minimum protrusion into the river channel parallel to river flow. This facility would be designed in compliance with NMFS and CDFW fish screen criteria.

- **Forebay –** After water passes through the fish screen, it would flow into the forebay for the pump station. The forebay would allow fine sediment that is carried in the water to settle out. The forebay would store water before it is pumped out by the pumping/generating plant. The forebay would be lined with a generally impervious layer of material to limit the potential for seepage to adjacent agricultural lands.

  A sediment spoil area would be provided on the northeastern end of the forebay for sediment removal. To remove sediment, a long-arm excavator would be required in combination with a suction dredge or a clamshell. The suction dredge or clamshell would be used to remove the additional sediment in the area where the excavator could not reach.

- **Pumping/generating plant and electrical switchyard –** The Delevan Pipeline Intake/Discharge Facilities would pump water from the afterbay to Holthouse Reservoir and would release water from

Holthouse Reservoir. The Delevan Pipeline Intake/Discharge Facilities building would be approximately 250 feet long by 80 feet wide and would have multiple stories to accommodate mechanical and electrical equipment. The pumping/generating plant would consist of four 500-cfs pumping/generating units (plus one standby unit) to provide a total pumping capacity of 2,000 cfs. Water would be pumped by the pumping/generating plant 150 feet up through the 13.5-mile-long Delevan Pipeline. When water is released from Sites Reservoir and through Holthouse Reservoir, the intake facilities would function in reverse, capturing the energy and generating electricity. Release flows of up to 1,500 cfs could be passed through two 750 cfs turbines in the pumping/generating plant.

An electrical switchyard would be required adjacent to the pumping/generating plant that would step down the electrical voltage from high-voltage lines to a lower voltage that can be used by the pumps and other machinery in the plant. A four-breaker ring bus would be required at the switchyard. The ring bus would have multiple metallic poles with heights varying between 15 and 60 feet. The switchyard would be surrounded by a 6- to 8-foot-high chain-link fence with barbed wire or concertina wire along the top.

- **Mechanical and electrical buildings –** Mechanical and electrical buildings would be constructed on the site to house equipment needed for the operation of the pumping/generating plant. The mechanical and electrical buildings would each be approximately 5,000 square feet. Facilities would be sited and designed such that electrical equipment would be sealed or installed at an elevation above the 100-year flood stage plus 2 feet of freeboard (elevation 82 feet).
- **Other mechanical and electrical features –** Miscellaneous features may include the following:
  - Spherical valves
  - Air chambers and butterfly valves
  - Compressors, generators, and cranes
  - Service air and water systems
  - Acoustical flowmeters
  - Governors and other control devices
  - Transformers
  - Switchgears
  - Grounding grids
  - Controls cabinets

The proposed Delevan Pipeline Intake/Discharge Facilities site would be protected from flood conditions by installing all mechanical and electrical equipment above the 100-year flood elevation (82 feet above msl). The forebay would be submerged during extreme flood events and would be designed to withstand these conditions. The site naturally slopes upward away from the river, and a flood protection levee with a height of 90 feet above msl exists along the river approximately 275 feet west of the river. A wide berm or ring levee would be constructed behind the flood protection levee to provide additional protection for the equipment and facilities. The berm would encircle the afterbay; the Delevan Pipeline Intake/Discharge Facilities and the mechanical and electrical buildings would be constructed on top of the berm.

Construction

The total construction disturbance area would be approximately 20 acres. An additional disturbance area around the construction site would be required for staging of materials, equipment, and construction offices. This staging area would be within the construction disturbance area for the proposed Delevan

Pipeline; the area is estimated to be 1,700 feet by 1,000 feet (a total of 40 acres) and would be located north of and adjacent to the facility site.

To isolate the proposed construction area from the Sacramento River, a cellular sheetpile coffer dam would be installed in the river at the location of the fish screen. Approximately 1,200 feet of sheet piles would be required to build the cofferdam. From the river bank at the upstream and downstream ends of the fish screen structure, the cofferdam would extend approximately 40 feet into the water from the river bank. Installation of the coffer dam would involve driving interlocking metal sheet piles into the ground one section after another until the entire length of the intake structure is isolated from the river. The height of the coffer dam would match the height of the surrounding levees. The fish screen structure would be constructed within the coffer dam. This will include driving foundation piles, placing a bottom seal mat, dewatering the cofferdam, and constructing the fish screen structure. These features would be removed after the fish screen structure is complete. The area behind the fish screen structure would be dewatered prior to construction of the pumping plant.

Anticipated major construction activities include the following:

- Transporting materials to the construction site
- Clearing and grading the construction workspace
- Placing necessary construction materials at staging areas
- Constructing a coffer dam within the Sacramento River
- Driving foundation piles for fish screen structure within the coffer dam
- Placing seal mat within the cofferdam
- Constructing the fish screen structure
- Dewatering the work area within the river
- Excavating the forebay and pumping plant site
- Constructing electrical switchyard
- Constructing the berm/ring levee
- Constructing the pump house and pump bays
- Constructing the forebay structure
- Constructing the fish screens
- Removing the coffer dam
- Filling and regrading where needed at site
- Restoring disturbed areas following the completion of construction

As previously discussed, the forebay would be constructed with a generally impermeable material to minimize or eliminate seepage to adjacent properties. Construction of the proposed Delevan Pipeline Intake/Discharge Facilities would require relocation of sections of the Maxwell Irrigation District and Tuttle Ranch pipelines located within the construction disturbance area. To minimize impacts on the operations of the Maxwell Irrigation District facilities during construction, either a temporary bypass pipeline would be constructed to provide water to Maxwell Irrigation District users, or arrangements would be made for supplemental water to be conveyed into the Colusa Basin Drain for the Maxwell Irrigation District to deliver to its users. A temporary bypass pipeline would be constructed to provide water to Tuttle Ranch to irrigate its orchards.

Operations

Proposed diversion operations would be such that a minimum of 4,000 cfs would remain in the river channel immediately downstream of the diversion point. The assumed associated minimum water surface elevation at this design condition is 51 feet. The invert of the screen structure would be set at 38 feet, 4 feet above the invert of the river, to reduce sediment deposition in front of the screen panels.

Operation intake and discharge modes are summarized as follows:

- **Intake mode** – Intake mode refers to the proposed operation of pumping Sacramento River water to the Sites Reservoir when suitable flows and velocities occur in accordance with pre-established diversion criteria (see Section 4.1 Operational Scenario). Water would move through the proposed fish screen and into the forebay, through the proposed Delevan Pipeline to the proposed Holthouse Reservoir, and then to Sites Reservoir. During this operation, the screen cleaning mechanism would be working continuously to prevent buildup on the screen panels, the sediment removal system would be operating, the pumps would be operating, and the SCADA system would be monitoring water levels and pressures across the screen.

- **Discharge mode** – Discharge mode refers to the operation when water from Sites Reservoir would be released through the pumping plant into Holthouse Reservoir to generate electricity, into the Delevan Pipeline to discharge to the forebay, and then released through the fish screen into the Sacramento River.

As is customary for any large-scale diversion on a river, if a pressure differential greater than 1.5 feet across the fish screen occurs, an “emergency mode” would be activated. The pumps would stop operating, and the sluice gates would close to allow the forebay to fill up to match the water surface of the Sacramento River. If the pressure differential increases to above 3 feet, the two blowout panels would trigger and release to allow an inflow of river water so that the water levels equalize.

A SCADA system would control all operational modes for the diversion without the need for onsite staffing. The system would be located onsite and would broadcast status information to a manned remote location. A sediment removal system would be installed within the fish screen bays, moving sediment back into the river channel or into the forebay. Sediment in the forebay would be mechanically removed annually to maintain optimal operational hydraulics.

Maintenance

The proposed Delevan Pipeline Intake/Discharge Facilities would likely be staffed daily to maintain, operate, and monitor the facility. It is anticipated that employees would be onsite during diversions (predominantly in winter) and releases (predominantly in summer). Activities would include:

- Periodic checking and adjustment of flow distribution through fish screens
- Inspection and periodic maintenance of fish screen cleaning system, debris removal as needed
- Periodic removal of accumulated sediment
- Inspection and periodic maintenance (including lubrication) of operating equipment
- Periodic testing of standby equipment

2.1.4.2 Delevan Pipeline

The proposed Delevan Pipeline would convey water approximately 13.5 miles from the Sacramento River to the proposed Holthouse Reservoir to fill the Sites Reservoir and to release water from Holthouse Reservoir to the Sacramento River (Figure 2-1). The Delevan Pipeline would parallel the proposed TRR Pipeline at its western end and would share a common trench and outlet structure into Holthouse Reservoir (Figure 2-1).

The Delevan Pipeline would have a 2,000-cfs capacity to convey water from the proposed Delevan Pipeline Intake/Discharge Facilities (on the Sacramento River) to Holthouse Reservoir. The capacity of the Delevan Pipeline to convey water from Holthouse Reservoir to the Sacramento River would be 1,500 cfs. Because of the available head elevation, releases through the Delevan Pipeline could be made to the river by gravity without the need for pumping. The Delevan Pipeline would consist of two 12-foot-diameter reinforced concrete steel cylinder pipes with gasketed bell and spigot joints. The pipeline would begin at the Delevan Pipeline Intake/Discharge Facilities near the Sacramento River and would be aligned to the west until reaching the GCID Main Canal. At the GCID Main Canal, the Delevan Pipeline would be aligned southwesterly and would parallel the TRR Pipeline in a shared trench until it reaches the Holthouse Reservoir Complex.

Facilities associated with the Delevan Pipeline would include blowoff structures, air valve structures, and an outlet and energy dissipater structure. Blowoff structures would clean low points in the pipeline and allow dewatering. Blowoff valves would release water from the pipeline. These valves are located at major water conveyances so that water can be drained directly into the river or canal and carried downstream. Air and vacuum valves would be needed to evacuate air within the pipeline during filling and to supply air during normal dewatering, as well as to release accumulated air. Manholes would be used to access the pipeline for future maintenance or inspections. Aboveground features associated with the Delevan Pipeline are listed in Table 2-11.

Table 2-11
Aboveground Features Associated with the Proposed Delevan Pipeline

Aboveground Feature	Height Above Ground	Color	Appearance	Feature Locations
Manhole and air valve	4 feet maximum, 108-inch-diameter	Gray	Concrete box	At high points and at a minimum of every 2,500 feet along the pipeline
Manhole and blowoff valve	1 foot maximum, 108-inch-diameter	Gray	Concrete box	At low points and at the Sacramento River and the GCID Main Canal crossing

The proposed alignment of the Delevan Pipeline would require five major crossings: SR 45, SR 99, Interstate 5 (I-5), Union Pacific Railroad, and the GCID Main Canal. The proposed pipeline route would also cross easements of the existing PG&E 230 kVA transmission line and a major PG&E natural gas pipeline. Other than a gravel maintenance road (i.e., the TRR Pipeline Road), no permanent aboveground structures would be constructed where electric utility easements and the pipeline easements would intersect. Other existing infrastructure that the pipeline could cross include gas lines, water lines, sewer lines, and communications lines. The pipeline would also cross the Colusa Basin Drain and Hunter's Creek (also called Logan Creek). These major crossings would be accomplished by using bore-and-jack construction techniques or the facilities would be relocated within the construction corridor.

The Colusa Basin Drain and Hunter's Creek crossing locations would be at the northern end of the drain. The crossing will be made by boring and jacking the pipes under the drain.

Construction

Assuming open-trench construction methods, the construction disturbance area to install the proposed Delevan Pipeline would be large enough to accommodate temporary stockpiling of the trenching spoils. Because of the large volume of spoils and the linear construction process (the entire length would not be constructed at the same time), the area would also be used for construction staging associated with other facilities, such as a temporary concrete batch plant (the same plant as used for the proposed TRR Pipeline).

The Delevan Pipeline would likely be constructed in three independent and concurrent sections. Two of the sections would likely begin from the same point and move in opposite directions. As pipelines are installed and tested, the trench would be backfilled to minimize the amount of open trenching. The construction disturbance area for the Delevan Pipeline would be a linear area, 13.5 miles long and approximately 300 feet wide from the Sacramento River to the proposed TRR (10 miles), and approximately 335 feet wide from the TRR to the proposed Holthouse Reservoir (3.5 miles). The additional width of the construction disturbance area would accommodate the TRR Pipeline from the TRR to Holthouse Reservoir. An additional construction disturbance area of 20 acres would be required for a concrete batch plant. Construction disturbance area boundaries would be marked with tape, flagging, or fencing. The construction disturbance area would pass through multiple areas close to residences and would intersect with several roads. The entire Delevan Pipeline construction disturbance area would not be fenced. In high-visibility areas or where the construction site requires a higher level of protection for security or safety, a temporary 6-foot-high chain-link fence would be installed around the worksite.

Anticipated major construction activities include the following:

- **Trenching/excavation approach** – Approximately 6.3 million cubic yards of material would need to be excavated for the Delevan Pipeline trench. Topsoil would be stockpiled separately from other excavated materials and backfilled to pre-Project soil profiles. Trench excavation would be approximately 23 feet deep. For the portion of the Delevan Pipeline that would be installed between the Sacramento River and the TRR, the trench would be approximately 120 feet wide. Two 12-foot-diameter pipelines would be installed from the Sacramento River to the TRR. Trench excavation for the 3.5 miles from the TRR to Holthouse Reservoir would be approximately 165 feet wide to accommodate both the Delevan and the TRR pipelines. Four 12-foot-diameter pipes would be installed from the TRR to Holthouse Reservoir. Trench side slopes would be approximately 1:1.5. No shoring would be installed under normal excavation conditions. Special conditions at some locations (unknown at this time) may require additional depth or width, steeper or flatter side slopes, or shoring to accommodate localized soil conditions.

  The Delevan Pipeline trench would be excavated using trenchers and tracked and/ or wheeled excavators and backhoes, or pushed up using bulldozers. The type of soils encountered would determine the type of equipment used for trenching. Harder soils, such as caliche, would require larger trenchers. In specific areas, vacuum excavation, "pot-holing" with a backhoe, or manual digging may be necessary to locate buried utilities. Excavation activities similar to the Delevan Pipeline excavation would also be conducted for electrical transmission pole footings that would be installed within the pipeline right-of-way. The following activities would occur simultaneously with the pipeline excavation:

- **Dewatering** – Dewatering of the trench would be necessary in many locations and could be permitted to discharge into local irrigation ditches and drainage canals and/or the Colusa Basin Drain after settling of silt. Silt would be disposed of with excavated material. Dewatering would be in accordance with Central Valley Regional Water Quality Control Board (RWQCB) requirements and California Storm Water Quality Association BMPs for dewatering.

- **Onsite fabrication of pipes** – It is possible that all pipes would be fabricated onsite with a concrete batch plant. A fabrication and curing area for the pipes would be located within the 20-acre batch plant footprint. Pipes would be fabricated onsite using imported steel cylinder and straight lengths of reinforcing steel. It is also possible that pipe would be manufactured off site and shipped to the site by truck or rail.
- **Bedding preparation** – Bedding material would be installed in the trench before installation of the pipeline. Bedding material would likely be sand, or cemented, controlled density fill. The bedding material would be poured into the trench by dump truck and spread along the bottom of the trench by a small grader or similar equipment.
- **Installation of pipe and valves** – The finished sections of the pipes would be transported from the fabrication and curing area to the installation location primarily along the pipeline route on flatbed trucks traveling along the construction access roadway (within the construction disturbance area). These trucks would cross public roadways. Pipe sections would be offloaded from flatbed trucks and placed in the excavated pipeline trench by a 50-ton capacity crane. Once in place, the joint would be covered with a cement-based sealing compound. At valve locations, prefabricated valves would be delivered to the site on flatbed trucks and installed into previously constructed structures within the trench using the same crane.
- **Backfill of trench** – Approximately 5 million cubic yards of material would be needed to backfill the trench after the pipes are installed. Excavated material would be reused to backfill the trench or moved to other Project locations for use, to the extent possible, after placement of pipes. Topsoil would be returned to approximate pre-Project soil profiles. Excess spoils from the excavation (estimated 1.3 million cubic yards) would be spread on adjacent agricultural lands of willing landowners within the 800-yard-wide corridor along the pipeline (outside of potential flood inundation areas), used as backfill at the proposed Delevan Pipeline Intake/Discharge Facilities, or placed in the Sites Reservoir footprint. Excess spoils may also be used to reinforce existing levees in the area as part of a separate program, which would be subject to a separate environmental analysis. Reuse of excavated material may be limited by water content of excavated material and soil compaction requirements. Spreading or stockpiling of excess soils would only occur outside of potential flood inundation areas in accordance with U.S. Army Corps of Engineers and local flood control district requirements.

Operations

Operation of the proposed Delevan Pipeline would not require daily workers at the site.

Maintenance

Periodic inspection and maintenance of the proposed Delevan Pipeline would likely occur once per year, typically in April and May, with possible additional inspections and maintenance needed after earthquakes or storm or flood events. Permanent 50-foot rights-of-way for the land overlying the pipeline would be maintained for future access. Disturbed lands would be returned to agricultural production after pipeline construction.

2.1.5 Overhead Power Lines and Substations

Power for the Delevan Pipeline Intake/Discharge Facilities would be provided from the south to avoid placement of new overhead power line corridor next to residences and agricultural operations adjacent to

Delevan Road. An approximately 6-acre substation would be constructed west of the City of Colusa and would tie into an existing WAPA lines. The new 115 kV Delevan Overhead Power Line would run north from the proposed substation, adjacent to and in parallel with the existing PG&E 65 kV transmission lines along Highway 45 to the proposed intake/discharge facility on the Sacramento River. Approximately 114 towers/poles would be required for the north-south alignment.

In addition, a proposed substation associated with an overhead line tie-in to the existing WAPA transmission line (500 or 230 kV) or PG&E transmission line (230 kV) (two possible options), would be constructed in the general vicinity of the existing Funks Reservoir. The substation would be approximately 6 acres and would serve the Sites Reservoir Pumping/Generating Plant, the TRR Pumping/Generating Plant, the Delevan Pipeline Intake/Discharge, and the Delevan Pumping/Generating Plant. The proposed electrical substations, switchyards, and overhead power lines that would connect the pumping/generating plants to the grid would provide the electricity needed by the pumping plants, as well as back to the grid from the generating process. Switchyards were described in Section 2.1.1.4 Sites Pumping/Generating Plant and Electrical Switchyard, Section 2.1.3.2 Terminal Regulating Reservoir Pumping/Generating Plant and Electrical Switchyard, and Section 2.1.4.1 Delevan Pipeline Intake/Discharge Facilities.

The west-east aligned Delevan Overhead Power Line would be constructed within a 150-foot-wide permanent overhead power line easement, approximately 150 feet north of the permanent easement for the proposed Delevan and TRR pipelines[7] from the TRR to the Sites Pumping/Generating Plant. At about the GCID Main Canal crossing, the proposed Delevan Overhead Power Line would travel southwesterly for approximately 9,600 feet, then northwesterly for approximately 3,600 feet, and, finally, west for approximately 5,300 feet, where the overhead power line would cross the proposed Eastside Road. From Eastside Road, the Delevan Overhead Power Line would travel southwesterly for approximately 1,700 feet to connect to the proposed Sites Electrical Switchyard.

Lower voltage overhead power lines would be connected to the proposed Golden Gate Dam, Sites Dam, South Bridge, and Stone Corral Recreation Area. Electricity to Golden Gate Dam would likely come from the Sites Pumping/Generating Plant through an easement along Funks Creek. Electricity to Sites Dam, South Bridge, and the two recreation areas would likely come from an existing overhead distribution line that parallels Sites Lodoga Road. The power line would be extended to Sites Dam along the canyon walls, through the Stone Corral Recreation Area (following roads when available), along the new Stone Corral Road to the South Bridge. Power on the west side of the Sites Reservoir Inundation Area would be extended across the proposed South Bridge from the proposed substation if needed.

Construction

As previously described, the proposed north-south aligned Delevan Overhead Power Line would run north from the proposed substation, parallel to the existing PG&E 65 kV transmission line along Highway 45 to the proposed intake/discharge facility on the Sacramento River. Approximately 114 towers/poles would be required, for a total of approximately 4 acres of permanent disturbance. An additional 40 towers/poles would be constructed west of the TRR, for a total of approximately 1 acre of permanent disturbance. The construction disturbance area would be completely contained within a new permanent easement. The permanent easement would be approximately 150 feet wide along the entire alignment and

[7] The overhead power line cannot be constructed within the same permanent easement as the pipeline because the footprint of the transmission tower footings would impede access to the pipeline during future maintenance activities.

would accommodate construction activities, staging areas, and stockpile areas. A portion of the existing agricultural fields within the overhead power line alignment would need to be fallowed and not watered during construction of tower footings and placement of towers. Anticipated major construction activities include clearing and grading the construction workspace, placing necessary construction materials at staging areas, excavating and constructing tower footings, erecting transmission towers, and stringing the conductor.

Construction of the overhead power lines would comply with requirements and precautions for construction near other utilities and would meet design and utility requirements. Power towers/poles are anticipated to be approximately 100 feet tall.

Operations

Operation of the proposed Delevan Overhead Power Line and associated distribution lines would be an unmanned activity.

Maintenance

The proposed Delevan Overhead Power Line and associated distribution lines would require periodic maintenance (once or twice a year), which would include equipment inspections and vegetation maintenance. Permanent easements and limitations on uses (row crops only) would be maintained to provide future access.

2.1.6 Project Buffer

The Project Buffer (Figure 2-1) would consist of the land acquired for the Project beyond the facility footprints, out to the nearest existing parcel boundaries. If the nearest parcel boundary is less than 100 feet beyond the facility footprint, the Project Buffer would extend beyond the parcel boundary to result in at least a 100-foot buffer. The Project Buffer would surround the proposed Sites Reservoir Complex, Holthouse Reservoir Complex, and all facilities between these two complexes; the proposed TRR and associated facilities; and the proposed Delevan Pipeline Intake/Discharge Facilities.[8] The intent of the Project Buffer is to create a "buffer" around Project facilities; while following existing parcel boundaries, the area and width of the buffer around Project facilities would vary. The Project Buffer would serve several purposes:

- Avoiding splitting parcels and rendering parcel remnants unusable by existing landowners
- Providing a buffer between Project facilities and adjacent existing land uses to avoid potential conflicts in land uses
- Preventing shoreline development around the proposed Sites Reservoir
- Preventing livestock access to the reservoirs, and prevent livestock wastes from entering the proposed reservoirs

[8]The proposed Delevan Overhead Power Line, Delevan Pipeline, TRR Pipeline, and TRR Pipeline Road would not have an associated buffer. These Project facilities would not require additional lands for long-term operation and maintenance. The Delevan and TRR pipelines would be underground features that would have periodic aboveground structures that include access structures, blowoff structures, air valve structures, and an outlet and energy dissipater structure. The TRR Pipeline Road would be located above the TRR Pipeline. The Sites/Delevan Overhead Power Line would result in aboveground development only at each transmission tower.

Construction

Land within the Project Buffer would remain undeveloped; the existing vegetation would be maintained as wildlife habitat and protected from fuelwood harvest, grazing, and other environmental degradation. Existing structures would be demolished, and the remaining land would be managed as wildlife habitat. Existing agricultural lands would not be maintained as agriculture but would be converted and managed as wildlife habitat.

The Project Buffer boundary would be fenced using standard three-strand barb wire fences with posts in areas where the parcels are not already fenced, so that the entire Project Buffer boundary would be fenced. A fuel break would be constructed around the perimeter of the Project Buffer.

Operations

Not applicable.

Maintenance

Maintenance activities that are proposed to be undertaken within the Project Buffer boundary include fence maintenance and periodic boundary fuel break maintenance.

3. Construction and Operation/Maintenance

Construction, operation, and maintenance activities specific to each Project facility are described under the associated facilities, starting with Section 2.1.1 Sites Reservoir Complex. Operations related to Sacramento River diversions and operation of Sites Reservoir to assist in meeting agricultural, municipal and industrial, and environmental needs are described in Section 4 Diversion and Reservoir Operations.

3.1 Construction

Prior to initiation of construction activities, acquisition or establishment of temporary or permanent easements of private properties, either through voluntary or eminent domain processes, would be required. Overall, construction of the Project is expected require approximately 8 years to complete all necessary facilities. Several factors affect this anticipated schedule, including funding, the implementing agency, environmental compliance, contracting methods and strategies, materials and construction equipment availability, lead time for fabrication of major pumping and generating equipment, labor force constraints, weather, and access road capacity limitations. Additional adjustments to the schedule would be addressed during Project development and implementation.

At the peak of Project construction, the labor force is expected to be approximately 400 workers. Table 3-1 provides a list of the typical construction equipment expected to be onsite during construction of the major facilities and estimated equipment days. The information provided in Table 3-1 may vary as the design of the project is further refined and depending on how the various facilities comprising the project are packaged for construction.

Construction activities are anticipated to occur between 7:00 a.m. and 7:00 p.m. Nighttime and weekend construction may occur on an as-needed basis and would be coordinated with residents. If nighttime construction is necessary, construction lighting and noise constraints consistent with applicable federal, State, and local requirements would be used. Nighttime construction would not be conducted between 10:00 p.m. and 7:00 a.m. within 1,000 feet of occupied residences. Haul times through residential communities would be limited to 7:00 a.m. to 10:00 p.m. There would be air brake restrictions in residential communities.

Construction activities associated with the Project would be confined to designated construction disturbance areas. Construction vehicles and equipment would also be parked within these construction disturbance areas. In addition, construction materials would be stored within the construction disturbance areas. Construction bid specifications and design packages would include site designation regarding special or sensitive sites. Special or sensitive sites within the construction disturbance areas where construction equipment and materials would not be allowed would be clearly marked and fenced with orange barrier fencing before any construction or surface-disturbing activity begins. Construction personnel would be trained to recognize these markers and understand the equipment movement restrictions involved. Lath, fencing, or flags would be maintained until final cleanup and/or site restoration is completed, after which they would be removed.

3.1.1 Access Routes

Traffic-generating construction activities associated with the Project would include trucks hauling equipment and materials to and from the worksites and the daily arrival and departure of the construction workers. Construction traffic on local roadways would include dump trucks, bottom dump trucks, concrete trucks, flatbed trucks for delivering construction equipment and permanent project equipment, pickup trucks, water trucks, equipment maintenance vehicles, and other delivery trucks. Dump trucks and bottom-dump trucks would be used for earth-moving and clearing, removing excavated material, and importing other structural and paving materials. Other delivery trucks would deliver heavy construction equipment, job trailer items, concrete forming materials, reinforcing steel and structural steel, piping materials, foundation piles and sheet piling, sand and gravel from offsite sources, new facility equipment, and other miscellaneous deliveries.

Table 3-1

This page intentionally left blank.

Table 1-21 lists the anticipated typical construction access routes to be used for access in the construction to some of the major Project features (routes are illustrated on Figures 1-7A and 1-7B):

Project-related construction personnel and highway truck trips are identified in Tables 3-2 and 3-3. Of the Project construction-related trips, construction worker trips would compose the majority. Construction workers would likely commute to construction sites from regional population centers, including Maxwell, Willows, Orland, Williams, and Colusa, and from other places in northern California when specialty trades or skillsets are not available locally.

3.2 Facility Operation and Maintenance

Project facility operations and maintenance would include any activities that must occur at each facility. Operation activities include those related to the movement of water (such as proposed Sites Reservoir level fluctuations, or the intake or release of water through the proposed Delevan Pipeline Intake/Discharge Facilities), the generation/transmission of electricity, the use of roads during operations and maintenance activities, and recreation activities associated with Sites Reservoir.

Table 3-2
Expected Roadway Access Routes to Project Facilities

Project Feature	Access Route
Sites Reservoir Inundation Area (northern area)	From I-5, travel west on County Road 68, turn south on County Road D, turn west on County Road 69, and continue straight
Sites Reservoir Inundation Area (central area)	From I-5, travel west on Maxwell Sites Road
Sites Reservoir Inundation Area (southern area)	From I-5, travel west on Maxwell Sites Road, turn left on Sulphur Gap Road (new permanent), and turn right on Huffmaster Road
Sites Dam	From I-5, travel west on Maxwell Sites Road
Golden Gate Dam	From I-5, travel west on County Road 68, turn left on County Road D, turn right on County Road 69, turn left on Eastside Road (new permanent), and turn right on new permanent O&M road From I-5, travel west on Maxwell Sites Road, turn right on Eastside Road, and turn left on new permanent O&M road
Saddle Dams	From I-5, travel west on County Road 68, turn left on County Road D, turn right on County Road 69, continue straight on North Road (new permanent) for Saddle Dams 7, 8, and 9, or turn left from North Road onto Saddle Dam Road (new permanent) for Saddle Dams 1, 2, 3, 4, and 5, or turn left from North Road onto new permanent O&M road for Saddle Dam 6, or turn left from County Road 69 onto Eastside Road (new permanent) and turn right on new permanent O&M road for the Golden Gate Saddle Dam (Saddle Dam 10) From I-5, travel west on Maxwell Sites Road, turn right on Eastside Road and turn left on new permanent O&M road
Saddle Dam Recreation Area Saddle Dam Road	From I-5, travel west on County Road 68, turn left on County Road D, turn right on County Road 69, continue straight on North Road (new permanent), and turn left on Saddle Dam Road (new permanent)

Table 3-2
Expected Roadway Access Routes to Project Facilities

Project Feature	Access Route
Temporary North Bypass Road	From I-5, travel west on County Road 68, turn left on County Road D, turn right on County Road 69, continue straight on North Road to the vicinity of Saddle Dam No. 5, continue west and south-west on the paved temporary bypass road to the intersection with Sites Lodoga Road on the west side of the reservoir.
Antelope Island Recreation Area	From I-5, travel west on Maxwell Sites Road, turn left on Sulphur Gap Road (new permanent), turn right on Huffmaster Road, and turn left on new temporary construction road
Stone Corral Recreation Area Stone Corral Road	From I-5, travel west on Maxwell Sites Road, turn right on Eastside Road (new permanent), turn left on Stone Corral Road (new permanent), and turn left on Stone Corral Recreation Area Road (new permanent)
Peninsula Hills Recreation Area Peninsula Road	From I-5, travel west on Maxwell Sites Road to Sites Lodoga Road, and turn right on Peninsula Road (new permanent campground spur road) From I-5, travel west on Maxwell Sites Road, turn right on Eastside Road (new permanent), turn left on Stone Corral Road (new permanent), across the South Bridge (new permanent) onto Sites Lodoga Road, and turn right on Peninsula Road (new permanent campground spur road)
South Bridge	From I-5, travel west on Maxwell Sites Road, and turn right on Peterson Road to reach central footings (this route is only available if the bridge is constructed before Sites Dam, which will block access on Maxwell Sites Road) From I-5, travel west on Maxwell Sites Road and continue straight on Sites Lodoga Road to reach the western approach/footings From I-5, travel west on Maxwell Sites Road, turn right on Eastside Road (new permanent), and turn left on Stone Corral Road to reach the eastern approach/footings
Com Road	From I-5, travel west on Maxwell Sites Road, turn left on Com Road (new permanent) at the crest road of Sites Dam. From I-5, travel west on Maxwell Sites Road, turn left on Sulphur Gap Road (new permanent), and turn right on Com Road (new permanent) (if Sulphur Gap Road option is constructed)
Eastside Road Sites Pumping/Generating Plant Field Office Maintenance Yard	From I-5, travel west on County Road 68, turn left on County Road D, turn right on County Road 69, and turn left on Eastside Road (new permanent) From I-5, travel west on Maxwell Sites Road and turn right on Eastside Road (new permanent)
Sulphur Gap Road	From I-5, travel west on Maxwell Sites Road, and turn left on Sulphur Gap Road (new permanent)
North Road	From I-5, travel west on County Road 68, turn left on County Road D, turn right on County Road 69, continue straight on North Road (new permanent) From I-5, travel west on Maxwell Sites Road, and turn right on Eastside Road (new permanent) and follow to North Road
Holthouse Reservoir Complex	

Table 3-2
Expected Roadway Access Routes to Project Facilities

Project Feature	Access Route
Holthouse Reservoir Electrical Switchyard	From I-5, travel west on County Road 68, turn left on County Road D, turn right on County Road 69, turn left on Eastside Road (new permanent), turn left on access road on south side of Funks Reservoir From I-5, travel west on Maxwell Sites Road and turn right on Eastside Road (new permanent), turn right on access road on south side of Funks Reservoir
Sites Electrical Switchyard Tunnel from Sites Pumping/Generating Plant to Sites Reservoir Inlet/Outlet Structure	From I-5, travel west on County Road 68, turn left on County Road D, turn right on County Road 69, turn left on Eastside Road (new permanent), and turn left on new permanent O&M road From I-5, travel west on Maxwell Sites Road, turn right on Eastside Road (new permanent), turn right on new permanent O&M road
Sites Reservoir Inlet/Outlet Structure	From I-5, travel west on Maxwell Sites Road, turn left onto Sulphur Gap Road, to Huffmaster Road, to Peterson Road
GCID Canal Facilities Modifications Headgate Modifications Railroad Siphon Modifications	From I-5, travel east on SR 32 and turn left on Canal Road From I-5 northbound, exit County Road 53, immediately turn left onto SR 99, and proceed 1.1 miles north to the intersection with the GCID Main Canal. Turn right at GCID Main Canal; the railroad siphon is approximately 200 feet east of SR 99
GCID Canal Connection to the TRR TRR TRR Pumping/Generating Plant TRR Electrical Switchyard GCID Canal Connection to the TRR	From I-5, travel west on Delevan Road, and turn left on McDermott Road or turn left on Noel Evan Road
TRR Pipeline TRR Pipeline Road Delevan Pipeline Electrical Switchyard	From I-5, travel west on Delevan Road, turn left on McDermott Road, turn right on temporary construction access road
Delevan Pipeline (western portion) Delevan Overhead Power (western portion)	From I-5, travel west on Delevan Road, then turn left on Sutton Road, McDermott Road, or County Road D
Delevan Pipeline Intake Facility Delevan Pipeline Discharge Facility Delevan Pipeline (eastern portion) Delevan Overhead Power Line (eastern end) Delevan Overhead Power Line (northern portion of north-south alignment on SR 45)	From I-5, travel east on Maxwell Road, and turn left on SR 45 From I-5, travel east on SR 162, and turn right on SR 45
Delevan Pipeline (central portion) Delevan Overhead Power Line (central portion)	From I-5, travel east on Maxwell Road, and turn left on Four Mile Road or Two Mile Road From I-5, travel east on Delevan Road, and turn right on Four Mile Road or Two Mile Road
Delevan Overhead Power Line (northern portion of north-south alignment on SR 45)	From I-5, travel east on Maxwell Road, and turn left on SR 45

Table 3-2
Expected Roadway Access Routes to Project Facilities

Project Feature	Access Route
Delevan Overhead Power Line (southern portion of north-south alignment on SR 45)	From I-5, travel east on Maxwell road and turn right on SR 45
Delevan Pipeline (far western portion)	From I-5, travel west on County Road 68, turn left on County Road D, turn right on County Road 69, and turn left on Eastside Road (new permanent) From I-5, travel west on Maxwell Sites Road, and turn right on Eastside Road (new permanent)
Borrow Areas (generally within the Inundation Area or adjacent on Logan Ridge)	From I-5, travel west on County Road 68, turn left on County Road D, turn right on County Road 69, and turn left on Eastside Road (new permanent) From I-5, travel west on Maxwell Sites Road, turn left on right on Eastside Road (new permanent) From I-5, travel west on Maxwell Sites Road, turn left on Sulphur Gap Road (new permanent), turn right on Lurline Road (new permanent, detour during construction), turn right on Huffmaster Road, and travel straight on Peterson Road From I-5, travel west on Maxwell Sites Road

Note:
O&M = operations and maintenance

Table 3-3
Project-related Construction Personnel and Highway Truck Trips

Facility	Total Highway Truck Trips[a]	Construction Days[b]	Highway Truck Trips per Day	Total Personnel Trips[c]	Personnel Trips per Day	Construction Trips per Day
Sites Reservoir Inundation Area and Dams	235,240	1,523	154	969,664	637	**868**

Delevan Pipeline Intake/Discharge Facilities and Delevan Pipeline P/G Plant	8,800	874	10	257,752	295	**310**
Substations, Switchyards, and Overhead Power Lines	6,810	251	27	49,712	198	**239**

Table 3-3
Project-related Construction Personnel and Highway Truck Trips

Facility	Total Highway Truck Trips[a]	Construction Days[b]	Highway Truck Trips per Day	Total Personnel Trips[c]	Personnel Trips per Day	Construction Trips per Day
Total Peak Construction Trips per Day						**3,665**

[a] Average of five highway trips per equipment day
[b] Construction work would be conducted during 5-day work weeks, excluding holidays
[c] One incoming and one outgoing trip per worker per day
Note:
P/G = pumping and generating

Maintenance for the Project facilities would include activities such as debris removal, dredging, vegetation control, rodent control, erosion control and protection, routine inspections (dams, tunnels, pipelines, pumping/generating plants, inlet/outlet works, fence, signs, gates), painting, cleaning, repairs, and other routine tasks to maintain facilities in accordance with design standards after construction and commissioning. Routine visual inspection of the facilities would be conducted to monitor performance and prevent mechanical and structural failures of Project elements. Maintenance activities associated with proposed river intakes could include cleaning, removal of sediments, debris, and biofouling materials. These maintenance actions could require suction dredging or mechanical excavation around intake structures; dewatering; or use of underwater diving crews, boom trucks or rubber wheel cranes, and raft- or barge-mounted equipment.

Proposed operations and maintenance activities could occur daily, annually, periodically (as needed), and on a long-term basis. Approximately 45 operations and maintenance workers would be needed to perform operations and maintenance activities (based on three shifts per day). Table 3-4 shows the estimated equipment and hours of operation for operations and maintenance at Project facilities.

Table 3-4

4. Diversion and Reservoir Operations

The operations evaluated in this report are designed to provide a range of statewide benefits including ecosystem enhancement actions, water supply reliability improvement for statewide agricultural, urban, and environmental uses (including increasing the survival of anadromous and endemic fish); and Sacramento-San Joaquin Delta (Delta) water quality improvement. The Project would also provide flexibility in hydropower generation to support integration of renewable energy sources. The Project is intended to improve overall system reliability by making more water available at any given time, for release and use for a variety of potential benefits (see Benefit Calculation, Monetization, and Resiliency tab and attachments, A.1 and A.2).

The proposed Project is intended to be operated in a cooperative manner with Central Valley Project (CVP) and State Water Project (SWP) facilities to assist in providing additional storage and release capability to support improving stream temperatures, in-stream habitat, supply deliveries (including refuges), instream flows, and water quality requirements to the extent possible each year as determined most needed. Among existing system constraints, the maintenance of the cold-water pool in various existing reservoirs to support suitable (and improved) in-river fishery habitat conditions is a key operational concern that today is increasingly difficult to meet, particularly during dryer years. In addition, providing water to support improved habitat in the Yolo and Sutter bypasses is also increasingly becoming a potential priority.

Providing water to improve storage conditions in CVP and SWP facilities is a primary objective of the proposed Project. The Project would be operated to make releases from Sites Reservoir in a cooperative manner with CVP/SWP releases from Trinity Lake, Shasta Lake, Lake Oroville, and Folsom Lake. Often, and especially in drought (driest periods) hydrologic conditions, proposed releases from Sites Reservoir would be made to meet an otherwise CVP or SWP obligation. Sites Reservoir releases would allow an equivalent amount of water to be retained in CVP or SWP storage while meeting requirements for minimum instream flow objectives and Delta salinity control objectives. Through this reduction in SWP and CVP facility releases, storage could be conserved in Trinity Lake, Shasta Lake, Lake Oroville, and Folsom Lake. This increase in storage conditions would substantially improve operational flexibility to provide water for the environment and meeting the Project’s primary objectives.

The Project incorporates the ability to achieve multiple objectives over a range of hydrologic and operational conditions. Operations in any given year would be a function of the current year hydrology, as well as a function of the system conditions resulting from the previous year’s hydrology and operations. The Project provides the operational flexibility to manage the water in Sites Reservoir storage to the highest priority needs on an adaptive management basis. Implementation of actions to meet the various objectives would be evaluated on a continuing basis in response to changing system parameters (such as reservoir storage), ecological needs, forecasts of future hydrologic and atmospheric conditions, and system operations.

4.1 Operational Scenario

The proposed operational scenario incorporates three primary components:

1. Operating criteria for diversion of water when all other regulatory criteria are met (including diversion rate in cfs, duration of the diversion, the season of diversion and the water year type of the diversion) from the Sacramento River to fill the Sites Reservoir

2. Operating criteria for timing and rate of releases of water to achieve the primary objectives of the Project (and associated benefits) in specific year types (such as drought or driest periods) and other hydrologic conditions
3. Project cooperative operations[9] with the CVP and SWP operations and facilities

The operation scenario incorporates operation flexibility to adapt to a range of hydrologic conditions, to address various future uncertainties, and to allow for consideration of a range of future water management actions.

4.1.1 Diversions to Sites Reservoir

The proposed Sites Reservoir would be filled through the diversion of Sacramento River water that originates from unregulated tributaries to the Sacramento River downstream from Keswick Dam. These unregulated tributaries contribute over 3 MAF of flow to the Sacramento River on an average annual basis. Less than 1 percent of diversions to Sites Reservoir are assumed to be provided by flood releases or spills that flow through Lake Shasta. Sacramento River water would be diverted at the existing Hamilton City and Red Bluff diversion locations, described in detail above; Sacramento River water would also be diverted via a new Delevan intake and pipeline. Flows available for diversion are considered river flows in addition to those required to meet the following:

- Senior downstream water rights, existing CVP and SWP and other water rights diversions including SWP Article 21 (interruptible supply), and other more senior flow priorities (diversions associated with Freeport Regional Water Project and Los Vaqueros Reservoir)
- Existing regulatory requirements including State Water Resources Control Board D-1641, CVPIA 3406(b)(2), the 2008 U.S. Fish and Wildlife Service biological opinion, and the 2009 National Marine Fisheries Service biological opinion and other instream flow requirements
- Specific bypass requirements that may be placed on Project operations to protect fish migration and avoid possible Delta water quality effects associated with Sites storage operations

A description of proposed minimum bypass flow requirements to protect existing and future water uses are provided below.

4.1.2 Sites Reservoir Diversion Bypass Flow Protection

Sacramento River flow diversions to Sites Reservoir would only take place when flow monitoring indicates that bypass flows are present in the river because of storm event flows. Several existing and additional proposed bypass flow criteria were assumed at specified locations, as part of the Project. These flow criteria are designed to make certain that available water would be diverted into Sites Reservoir to maintain and protect existing downstream water uses, as follows:

- A bypass flow of 3,250 cfs downstream from Red Bluff Diversion Dam must be present to maintain flows in the upper Sacramento River that are required in State Water Resources Control Board WR 90-5 to prevent dewatering salmonid redds and maintain water temperatures. Diversions at RBPP

[9] The term “cooperative operations” means that water from Sites Reservoir can be used, in some cases, as a substitute for water from these other reservoirs. The needs and uses of the CVP and SWP systems could be enhanced by operating Sites Reservoir (a new source of water storage) in cooperation with the other reservoirs.

for filling Sites Reservoir would only be allowed when flows in the river are above the 3,250 cfs bypass flow criteria.

- Diversions at the Hamilton City intake for Glenn-Colusa Canal currently require a bypass flow of 4,000 cfs to prevent fish entrainment. Diversions at RBPP and Glenn-Colusa Canal intake for filling Sites Reservoir would only be allowed when flows in the river are above the 4,000-cfs bypass flow requirement downstream from Hamilton City.
- Diversions for filling Sites Reservoir would only be allowed when flows below Wilkins Slough were above 5,000 cfs, given the current minimum flow requirements. Wilkins Slough Navigation Control Point minimum flows currently range from 3,250 to 5,000 cfs, depending on hydrologic conditions.
- Diversions for filling Sites Reservoir would only be allowed when a Sacramento River flow of 15,000 cfs is present at Freeport in January; 13,000 cfs in December and February through June; and 11,000 cfs in all other months. This flow threshold protects and maintains existing downstream water uses and water quality in the Delta.

Table 4-1
Proposed Seasonal Schedule for Project Operations

Objective	Detail of Operation	Priority of Operation[a]	Year Type Most Suitable for Operation[b]	Months Most Suitable for Operation[c]											
				Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
General Operation															
Conveyance	Diversions at Red Bluff (Tehama-Colusa Canal), at Hamilton City (GCID Main Canal) and at the proposed Delevan Pipeline could occur in any month. Diversions of excess flows would only be allowed once SWRCB D-1641, CVPIA 3406(b)(2), 2008 USFWS BO and 2009 NMFS BO requirements were met and SWP Article 21 demands were satisfied, and other excess Delta flow diversions (e.g., Freeport Regional Water Project, Los Vaqueros Reservoir, cities of Fairfield, Vacaville, and Benicia) were satisfied. Diversions would be restricted by Sacramento River bypass criteria at Red Bluff, Hamilton City, Wilkins Slough, and Freeport. Shading highlights the period in which diversion operations would occur, with the November through March period shaded the heaviest.	N/A	N/A												
Seasonal Storage Operation	Fill Sites Reservoir during excess flow events throughout the winter and spring and drain during peak release periods throughout the summer and fall. The months in which the high and low storage points would occur in the typical seasonal cycle are indicated.	N/A	N/A		Fill Cycle High Point					Drain Cycle Low Point				Fill Cycle	
Water Supply Operations															
Sites Project Authority	Provide storage releases to participating TCCA districts on an as-needed basis to supplement CVP Agricultural Water Service Contract deliveries. Provide storage to GCID and Reclamation District 108 to supplement CVP Settlement Contract deliveries. Provide supplemental water supplied to project participants outside the Sacramento Valley to improve water supply reliability	Authority-1	AN, BN, D, C												
Incremental Level 4 Water Supply for Wildlife Refuges	Provide water to meet Incremental Level 4 wildlife refuge water needs north-of-the-Delta and south-of-the-Delta to supplement refuge supplies up to Level 4 criteria (CVPIA). Shading highlights period in which transfer operations would occur.	AVG-3	AN, BN, D												
Water Quality Operation															
Water Quality	Upstream release actions would improve water quality conditions by augmenting Delta inflow and outflow. Operations could augment Delta flows above base D-1641 operations for up to 6 months. Shading highlights period in which Delta benefits could be augmented.	AVG-1	AN, BN, D												
Hydropower Operation															
Flexible Hydropower Generation	Include dedicated pump/generation facilities with a dedicated afterbay/forebay of 6,500 ac-ft to allow more than 30 hours per week of uninterrupted operation and generation.	N/A	ALL												
Ecosystem Enhancement Storage Account (EESA) Actions/Operation															
EESA-1: Shasta Coldwater Pool	Improve the reliability of cold-water pool storage in Shasta Lake to increase operational flexibility to provide suitable water temperatures in the Sacramento River. This action would operationally translate into the increase of Shasta Lake's May storage levels and improved retention of cold-water pool storage with particular emphasis on Below Normal, Dry, and Critical water year types.	DP-1	BN, D, C												
EESA-2: Sacramento River Flows for Temperature Control	Provide releases from Shasta Dam at appropriate water temperatures, and subsequently from Keswick Dam, to improve water temperatures year-round at levels suitable for all species and life stages of anadromous salmonids in the Sacramento River between Keswick Dam and Red Bluff Pumping Plant, with particular emphasis on the months of highest potential water temperature-related impacts (i.e., July through November) during Below Normal, Dry, and Critical water year types.	DP-2	BN, D, C												
EESA-3: Folsom Lake Cold Water Pool	Increase the availability of cold-water pool storage in Folsom Lake by increasing May storage and retaining cold-water pool storage to allow additional operational flexibility to provide suitable water temperatures in the lower American River. This action would use additional cold-water pool storage by providing releases from Folsom Dam (and subsequently from Nimbus Dam) to help provide water temperatures at levels suitable for juvenile steelhead over-summer rearing and fall-run Chinook salmon spawning in the lower American River from May through November during all water year types.	DP-2	D, C												
EESA-4: Stabilize American River Flows	Stabilize flows in the lower American River to minimize dewatering of fall-run Chinook salmon redds (i.e., October through March) and steelhead redds (i.e., January through May), and reduce juvenile anadromous salmonid isolation events, particularly from October through June. Reduce the reliance upon Folsom Lake as a "real-time first response facility" to meet Delta objectives and demands, particularly from January through August, to reduce flow fluctuation and water temperature-related impacts to fall-run Chinook salmon and steelhead in the lower American River.	DP-2	ALL												

Table 4-1
Proposed Seasonal Schedule for Project Operations

Objective	Detail of Operation	Priority of Operation[a]	Year Type Most Suitable for Operation[b]	Months Most Suitable for Operation[c]											
				Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
EESA-5: Habitat Improvement (Summer/Fall)[e]	Upstream release actions could provide supplemental flow during summer and fall months (i.e., May through December) to improve X2 position and increase estuarine habitat, reduce entrainment, and improve food availability for anadromous fishes and other estuarine-dependent species (e.g., delta smelt, longfin smelt, Sacramento splittail, starry flounder, and *Crangon franciscorum*). Shading highlights period in which flow would be augmented (operation coordinated with Water Quality action).	AVG-2	ALL												
EESA-6: Lake Oroville Coldwater Pool	Improve the reliability of cold-water pool storage in Lake Oroville to improve water temperature suitability for juvenile steelhead and spring-run Chinook salmon over-summer rearing and fall-run Chinook salmon spawning in the lower Feather River from May through November during all water year types. Provide releases from Oroville Dam to maintain water temperatures at levels suitable for juvenile steelhead and spring-run Chinook salmon over-summer rearing and fall-run Chinook salmon spawning in the lower Feather River. Stabilize flows in the lower Feather River to minimize redd dewatering, juvenile stranding, and isolation of anadromous salmonids.	DP-2	BN, D, C												
EESA-7: Stabilize Sacramento River Fall Flows	Stabilize flows in the Sacramento River between Keswick Dam and the Red Bluff Pumping Plant to minimize dewatering of fall-run Chinook salmon redds (for the spawning and embryo incubation life stage periods extending from October through March), particularly during fall months. Avoid abrupt changes. Operations would be limited to not adversely impacting cold-water pool operations in dry and critical years. Shading highlights period of greatest effect on stabilization or flows on a daily basis.	AVG-1	AN, BN, D												

[a] Priority of operation "DP" indicates that the operational priority has a driest period's emphasis and "AVG" indicates an average-to-wet hydrologic emphasis. The numbers 1 through 4 indicate the priority within the associated hydrologic emphasis. "N/A" indicates that operations are not or cannot be easily defined within the priority structure of the scenario. "Authority" indicates Sites Project Authority operation on an as-needed basis subject to storage availability.

[b] Year type most suitable for operation is the D-1641 40-30-30 year types that are reflected in operations studies; operations in these year types occur when supplies would be available in Sites Reservoir to support the operation, when the operations criteria in the scenario allow for prioritization of the operations, and when conditions are suitable for developing the benefit associated with the operation.

[c] The heavier shaded parts of each bar highlight the months in which conditions would be most suitable to the operations; the lighter shaded parts of each bar highlight the months that would be less suitable to the operations; operations in these months would occur when supplies are available in Sites Reservoir to support the operation, when the operations criteria in the scenario allow for prioritization of the operations, and when conditions are suitable for developing the benefit associated with the operation.

[d] Implementation of this action would include increasing the reliability of floodplain inundation in the Sutter and Yolo bypasses. In coordination with the operation of proposed bypass water control devices (e.g., the proposed Fremont Weir Adult Fish Passage Modification Project), this action would make water available to facilitate better management of the frequency, duration, and timing of inundation within the floodplain of the Sacramento River and the Sutter and Yolo bypasses. This action could provide flow to create floodplain inundation, extend the duration of floodplain inundation, or influence the timing of floodplain inundation. Water made available through Sites Reservoir releases could be used to temporarily increase or continue the flow of water through the weirs for the purpose of incrementally improving floodplain rearing for juvenile salmonids, spawning Sacramento splittail, and other sensitive aquatic species.

[e] Implementation of this action is anticipated to be lower priority and would likely not be implemented in lieu of other actions such as increasing the reliability of floodplain inundation in the Sutter and Yolo bypasses.

Notes:

ALL = All year types

AN = Above normal

Authority = Sites Project Authority
AVG = Average
BN = Below normal

BO = biological opinion
C = Critical

CVPIA = Central Valley Project Improvement Act
D = Dry
DP = Driest periods
Authority = Sites Project Authority

GCID = Glenn-Colusa Irrigation District

N/A = Operations are not or cannot be easily defined within the priority structure of the scenario.
NMFS = National Marine Fisheries Service

SWRCB = State Water Resources Control Board
TAF = thousand ac-ft
USFWS = U.S. Fish and Wildlife Service

X2 = The location of the 2 percent [parts per thousand] salinity isohaline – as measured in kilometers from the Golden Gate Bridge.

4.1.3 Diversions to Fill Sites Reservoir Storage

Diversions of available Sacramento River water to Sites Reservoir via existing Tehama-Colusa Canal and Glenn-Colusa Canal conveyance facilities could occur at any time during the year if flow conditions described above are present in the river. Deliveries for TCCA and GCID service areas would have first priority at the existing Tehama-Colusa Canal and GCID intakes; diversions to Sites Reservoir would come from the unused capacity of the two canals.

Diversions through the proposed Delevan Pipeline could also occur at any time of the year assuming Sacramento River flow conditions are above the previously described bypass flow criteria. In summer months, preference would generally be given to Sites Reservoir releases to the river, which would result in limited diversions to storage because the pipeline could only convey flows in one direction at a time.

The annual diversion amount would range between zero in critical and dry years to more than 1,000 TAF in wetter years. Based on modeling results, the average annual diversions for Sites Reservoir would range from 480 to more than 540 TAF of available Sacramento River flow. Most diversions would occur from December through March during wet and above normal water years but could occur at any time during the year if the flow criteria can be met and capacity exists within the diversion facilities described below.

The existing TCCA and GCID diversion facilities and main canals would be used for the Project, and a new proposed Delevan Pipeline and inlet/outlet would be used to divert and convey water to the proposed reservoir. Total river diversions would be no greater than 5,900 cfs at any given time, in total for the three diversion points. Deliveries for TCCA and GCID service areas would have first priority; diversions to Sites Reservoir would come from the unused capacity of the two canals. Water provided for local uses would be conveyed through existing or proposed upland facilities. The TCCA and GCID diversion facilities have state-of-the-art fish screens and would divert during months when water is available, in accordance with the criteria identified above, depending on year type and Sites Reservoir levels. The proposed Delevan Pipeline diversion facility would be constructed with a similar fish screen that would meet federal and State criteria and divert water in a similar manner, in prescribed operational approach that complies with the criteria identified above.

Tehama-Colusa Canal Authority's Red Bluff Pumping Plant and Canal. The RBPP, located on the Sacramento River near Red Bluff, would be used as the primary diversion point and would have a total conveyance capacity to divert up to 2,100 cfs after the installation of an additional 250 cfs pump to the existing pump grouping at RBPP. Any unused capacity remaining after meeting existing agricultural demands would be used, as necessary, to convey water to fill Sites Reservoir by conveying water via the Tehama-Colusa Main Canal. Approximately 50 to 60 cfs of the Tehama-Colusa Main Canal capacity is assumed to be used for existing winter operations.

Glenn-Colusa Irrigation District's Hamilton City Pumping Plant and Main Canal. The GCID Hamilton City Pumping Plant would be used to divert water from the Sacramento River and the GCID Main Canal used to convey water to Sites Reservoir. This facility has a 3,000 cfs diversion capacity at the Sacramento River intake and the GCID Main Canal capacity at the TRR is 1,800 cfs. Diversions at the GCID diversion facility would be made to supplement those made at the RBPP and the Delevan Pipeline facility described below. Unused Main Canal capacity, remaining after existing agricultural operations, would be used as necessary to convey water to the Sites Reservoir.

Delevan Pipeline Intake/Discharge Facilities. The proposed Delevan Pipeline Intake/Discharge Facilities would divert up to 2,000 cfs from the Sacramento River and convey water through the Delevan

Pipeline to Sites Reservoir when flows were available. Diversions through the proposed Delevan Pipeline would occur at any time of the year, as needed, in conjunction with the two existing diversions previously described and in accordance with the same criteria. It is anticipated in summer the pipeline would often be used to release flows to the river. Preference would generally be given to release operations resulting in limiting diversions to storage in the summer because the pipeline could only convey flows in one direction at a time.

4.1.4 Releases from Sites Reservoir

Operation of the Delevan Pipeline Intake/Discharge Facilities would include releases from Sites Reservoir to the Sacramento River. As is common to all larger reservoirs throughout the Central Valley, Sites Reservoir is expected to become stratified because of warming within the upper layer of the reservoir in the summer.

The Project would be operated to achieve a variety of benefits associated with the Project's primary objectives in specific year types and times of year as determined most needed. A maximum of up to 2,500 cfs could be released from the Delevan Pipeline to meet downstream needs. Typical releases would be 1,500 cfs. Additional releases could also be made at Funks Creek, Stone Corral Creek, the TCCA Canal, and the GCID Main Canal to support other downstream uses. In drought conditions, priority operations would include:

- Support improved cold-water pool conservation and stabilize Sacramento River fall flows for improving spawning and rearing success of anadromous fish
- Provide water to the Cache Slough area via the Yolo Bypass in summer
- Provide water for Incremental Level 4 refuge deliveries per CVPIA
- Provide water to Sites water users North and South of the Delta
- Potentially improve flows to stabilize river flows in the fall to help protect fish habitat

The reservoir outlet structures included in the Project would allow withdrawal of water from the reservoir over a range of depths to manage release temperatures to match Sacramento River temperatures to the extent possible; and, as such, releases would be managed to limit potential temperature effects.

4.1.5 Hydropower Generation

Hydropower generation would be an incidental benefit of conveying water through specific Project facilities and would be influenced by the timing of releases and movement of water and seasonal operational decisions. Four categories of hydropower operations are anticipated:

- Seasonal hydropower as produced by the normal water operations of the Project. As the Project pumps or releases water for its normal operation, power would be consumed or generated by Project hydropower facilities.
- Daily pump-back hydropower operation would be determined by the leftover capacity in the proposed Sites Pumping/Generating Plant and Holthouse Reservoir. When those facilities have enough capacity, the Sites Reservoir would release water through the Sites Pumping/Generating Plant into Holthouse Reservoir during on-peak electrical times to generate high revenue power. During off-peak times, water would be pumped back into Sites Reservoir.
- The Project could release water through the Sites Pumping/Generating Plant to generate power to supplement other renewable power sources (such as wind and solar) in times when those sources typically produce less power. Similarly, power could be consumed by pumping water into Sites

Reservoir from Holthouse Reservoir when renewable sources peak and the grid has a surplus of power that can be “saved” for later generation when the renewable peak has diminished.

- Hydropower could also reduce greenhouse gas emissions when paired with solar and wind energy. To ensure that the greenhouse gas emissions from construction activities are mitigated within the first 15 years of operation, the Project would: (1) obtain at least 20 percent of the power used for pumping water from the Sacramento River and the proposed Holthouse Reservoir into the Sites Reservoir from wind and/or solar energy and (2) use at least 20 percent of the Project’s generated power and/or served pump load to provide integration services needed to firm up highly variable wind and/or solar generation. The 20 percent integration with wind and/or solar energy goal will be achieved by using variable-speed, pumping-generating units installed at Project pumping/generating plants.

4.2 Ecosystem Enhancement Storage Account

Sites Reservoir would be operated in a cooperative manner with other state and federal reservoirs to support ecosystem benefits and enhancements, including actions to increase survival of anadromous and endemic fish populations. Operational actions would include improving conditions related to water temperatures, river flows, and releases to improve Delta water quality.

The operation of Sites Reservoir to provide a variety of ecosystem benefits would allow for the potential development and administration of an ecosystem enhancement storage account, which could be managed by either the Authority or the State to provide water for ecosystem and water quality purposes. Such an account could provide a pool of dedicated storage to manage in cooperation with existing operations to improve cold-water conservation storage, stabilize river flows during critical fisheries periods, increase flows through certain watercourses and/or facilities (e.g., Yolo Bypass), improve water quality, and/or enhance habitat restoration.

During early development of this Project, meetings were held with the Sacramento River Flow Regime Technical Advisory Group (Technical Advisory Group), which comprises environmental advocacy groups, academics, and representatives from federal and California water resource and wildlife agencies (the Technical Advisory Group is described in more detail in Chapter 36 Consultation and Coordination). The Technical Advisory Group convened in 2007 to identify benefits and potential impacts of the Project to the flow regime of the Sacramento River and related ecosystem processes. Through meetings that continued for more than 2 years, the group and proponents of Sites Reservoir identified a list of potential operational strategies for the Project that could be used to improve ecosystem conditions related to increased survival of anadromous and endemic fish populations. These operational strategies include cooperation with the Authority and Reclamation for the Project to divert, store, and release water to meet obligations that would otherwise be met through the operations of Shasta Lake, Trinity Lake, Folsom Lake, or Lake Oroville. In this manner, cooperative operational strategies could improve ecosystem conditions by:

- Improving the reliability of cold-water pool storage in Shasta Lake in May to increase operational flexibility to provide flows in late summer and fall to maintain suitable water temperatures in the Sacramento River, with particular emphasis on Below Normal, Dry, and Critical water year types.

- Increasing available water in Shasta Lake to increase operational flexibility to release flows from Keswick Reservoir to maintain appropriate mean daily water temperatures year-round at levels suitable for all species, races, runs, and life stages of anadromous salmonids in the Sacramento River between Keswick Dam and Red Bluff, with particular emphasis on the months of highest potential water temperature-related impacts (i.e., July through November) during Below Normal, Dry, and Critical water year types.

- Increasing available water in Shasta Lake to increase operational flexibility to release flows from Keswick Reservoir in a manner to stabilize flows in the Sacramento River between Keswick Dam and the Red Bluff to minimize dewatering of fall-run Chinook salmon redds, especially during spawning and embryo incubation life stage periods from October through March.
- Improving the reliability of cold-water pool storage in Folsom Lake in May to increase operational flexibility to provide appropriate flows with suitable water temperatures in the lower American River for juvenile steelhead over-summer rearing and fall-run Chinook salmon spawning from May through November during all water year types.
- Increasing available water in Folsom Lake to improve operational flexibility to release flows from Lake Natoma in a manner that stabilizes flows in the lower American River to: (1) minimize dewatering of fall-run Chinook salmon redds from October through March; (2) minimize dewatering of steelhead redds from January through May; and (3) reduce the occurrence of stranding of juvenile anadromous salmonids due to isolation events that occur when flows of 4,000 cfs or greater are reduced to less than 4,000 cfs, particularly from October through June.
- Improving the reliability of cold-water pool storage in Lake Oroville in the spring to increase operational flexibility to provide appropriate flows with suitable water temperatures in the lower Feather River for juvenile steelhead and spring-run Chinook salmon over-summer rearing and fall-run Chinook Salmon spawning from May through November during all water year types.
- Increasing available water in Lake Oroville and Thermalito Reservoir to increase operational flexibility to release flows in a manner to stabilize flows in the lower Feather River to: (1) minimize redd dewatering, (2) minimize juvenile stranding, and (3) reduce the occurrence of isolation or stranding of anadromous salmonids.
- Providing water to meet Incremental Level 4 wildlife refuge water needs north of the Delta and south of the Delta to supplement refuge supplies up to Level 4 criteria (CVPIA)
- Operating in a flexible manner to support storage and associated releases that could be adaptively managed to support operational actions found to produce the greatest benefits over time. Ecosystem-specific objectives could include the release of water through the Colusa Basin Drain into the Yolo Bypass to deliver nutrient-laden water into the Cache Slough area to increase delta smelt productivity.
- Operating Sites Reservoir diversions and releases to increase the reliability of floodplain inundation in the Sutter and Yolo bypasses. In coordination with the operation of proposed bypass water control devices (e.g., the proposed Fremont Weir Adult Fish Passage Modification Project), this action would make water available to facilitate better management of the frequency, duration, and timing of inundation within the floodplain of the Sacramento River and the Sutter and Yolo bypasses.

5. Environmental Commitments Included as Part of the Project

The following standardized environmental measures, plans, protocols, and BMPs would be incorporated into the Project, including construction contract specifications, as appropriate, to avoid or minimize potential impacts during construction, operations, and maintenance. These commitments are generally based on current adopted rules and regulations; established regulatory agency plans, policies, and programs; and accepted industry standards.

5.1 Worker Environmental Awareness Program

A Worker Environmental Awareness Program (WEAP) would be prepared, and all construction crews and contractors will be required to participate in WEAP training prior to starting work on the Project. The WEAP training will include a review of the special-status species, cultural, archaeological, paleontological, and other sensitive resources and areas that could exist in the Project area; the locations of sensitive biological resources, their legal status, and protections; measures to be implemented for avoidance of these sensitive resources; and other required environmentally related resources. A record of all personnel trained will be maintained.

5.2 Environmental Site Assessment

Federal and State regulations and policies, including the Comprehensive Environmental Response, Compensation and Liability Act, All Appropriate Inquiry, California Public Resources Code 21151.4, and the Certified Unified Program administered by the respective county agencies, would require environmental site assessment procedures (due diligence) for future development on or near any potentially hazardous or contaminated sites. A Phase I Environmental Site Assessment (ESA) would be conducted as appropriate for property considered for purchase, transfer, retirement, or sale in fee or easement for the Project. The evaluation would assess the potential for hazardous substance contamination in accordance with all applicable federal, State, and local statutes and regulations. Subsequent actions, such as Phase II ESA and III ESA, would be taken as necessary and appropriate. A Phase II ESA would involve sample collection and analysis to identify and characterize contamination as needed. A Phase III ESA would provide a plan for design and implementation of mitigation or remediation (including, but not limited to, removal of underground storage tanks, drums, buried waste, or other items potentially associated with contamination) and would identify the proper storage, handling, transport, and disposal of designated and hazardous waste if so required.

5.3 Construction Management Procedures

Required construction management procedures would be incorporated into all construction contractor specifications to avoid or minimize construction-related impacts, including those on public health and safety, in accordance with applicable federal, State, and local laws and regulations. All adjacent property owners would be notified of project construction activities prior to initiation of construction. The plan would include the following standard requirements and would be incorporated into the construction specifications for all contractors:

- Informing contractors and subcontractors of work hours, modes and locations of transportation, and parking for construction workers
- Locating overhead and underground utilities

- Obtaining all necessary utilities excavation or encroachment permits
- Staging utility line modifications and relocations in a manner that minimizes interruption of service
- Requiring worker health and safety provisions
- Identifying all approved truck routes, access roads, and management
- Providing stockpiling and staging procedures
- Issuing terms and conditions of all Project permits and approvals
- Providing local and regional emergency response services contact information
- Providing construction notification procedures for Glenn, Colusa, and Tehama county police, public works, fire departments, and other public service providers
- Making all required lighting during construction be directional in nature to minimize glare impacts to humans and wildlife

5.3.1 Fire Safety and Suppression

The Authority would incorporate into contract specifications that all contractors would be required to implement onsite BMPs to reduce the potential for accidental fires, including the following:

- Making sure all motorized equipment used during construction has an approved spark arrestor.
- Preparing a fire safety plan for Glenn and Colusa county review. This plan would include precautions during times of high-fire danger, a list of fire-suppression equipment and tools to have available, a description of available communications, specifications for the supply of water to have available, and descriptions of other actions that would reduce the risk of ignition and facilitate immediate control of an accidental fire.
- Having easily accessible fire-suppression equipment available at all work locations.

5.3.2 Construction Equipment, Truck, and Traffic Management

The following measures would be implemented as part of all applicable contractor specifications to minimize potential road and traffic impacts in and near the project area, related to facility construction, access to all work sites, and hauling of necessary materials:

- Identifying specific haul and access routes with all contractors when multiple facility sites are under construction concurrently, so that project-generated construction traffic is dispersed to the extent practicable and necessary.
- Installing traffic control devices, as specified in Caltrans' Manual of Traffic Controls for Construction and Maintenance Work Zones, where needed to maintain safe driving conditions, including use of signage to alert motorists of construction activities, potential hazards, and travel detours, as well as the use of flaggers when appropriate.
- Ensuring that the Authority or its contractors would survey and describe the preconstruction roadway conditions of all existing roads to be used for access to Project facilities prior to construction. Within 30 days after construction is completed, the Authority would survey the same roadways to identify

any damage that has occurred. Roads damaged by construction would be repaired to a structural condition equal to the condition that existed prior to construction activity.

During operations and maintenance, truck and other maintenance equipment will be used in a manner to limit impacts and use per applicable federal, State, and local regulations.

5.4 Stormwater Pollution Prevention Plan, Erosion Control, Management, and Dewatering

The Project is subject to construction-related stormwater permit and dewatering requirements of the federal Clean Water Act, National Pollutant Discharge Elimination System. The Authority and Reclamation would obtain required permits through the RWQCB before any Project-related ground-disturbing construction activity occurs. As required by the State Water Resources Control Board Construction General Permit, a stormwater pollution prevention plan (SWPPP) would be prepared and implemented before construction starts and throughout the Project construction period. The SWPPP would identify BMPs to prevent and minimize the introduction of contaminants into surface waters. In addition, all BMPs identified below would be employed as necessary during all Project operation and maintenance activities anticipated to require ground disturbance.

The objectives of the SWPPP would be to: (1) identify pollutants, and their sources, associated with Project construction activities that may affect stormwater quality, (2) identify BMPs to reduce pollutants in stormwater discharges during and after construction and (3) identify non-stormwater discharges and develop a plan to eliminate, control, or treat all non-stormwater discharges. BMPs (which would also be employed during operation and maintenance activities as necessary) would include site management/BMP installation; non-stormwater management; erosion and sediment controls; and an inspection, monitoring, and maintenance program, including the following:

- Temporary erosion control measures (e.g., silt fencing, weed-free straw bale barriers, fiber rolls, storm drain inlet protection, hydraulic mulch, and stabilized construction entrances) would be employed for all disturbed areas. The SWPPP would also include development of site-specific structural and operational BMPs to prevent and control impacts on runoff water quality, measures to be implemented before each storm event, inspection and maintenance of BMPs, and monitoring of runoff quality by visual and/or analytical means.
- No disturbed surfaces would be left without erosion control measures in place during the winter and spring.
- Sediment would be retained onsite by a system of sediment basins, traps, or other appropriate measures.
- Post-construction erosion control measures would be implemented (including silt fencing, weed-free straw bale barriers, fiber rolls, hydraulic mulch/seeding, and vegetative plantings) and monitored to ensure minimization of water quality and associated impacts. Revegetation treatments would be integrated into grading plans to create favorable planting environments that would aid plant establishment and natural regeneration. Whenever feasible, local native plant species would be used.
- Groundwater/dewatering would be handled in a manner that would not impact non-stormwater discharges.

During operations and maintenance, Project facilities including, but not limited to, roads (including access roads), other paved and unpaved surfaces, structures, and equipment, will be properly maintained to avoid the potential for erosion and sediment/siltation into local waterbodies and in compliance with all applicable federal, State, and local regulations. Project operation and maintenance erosion and sediment control plans will be prepared and implemented as determined necessary depending on the specific activity and potential for erosion or other impacts.

5.4.1 Compliance with the Requirements of RWQCB Order No. 5-00-175

Groundwater pumped as part of construction-related dewatering will be contained onsite within bermed areas adjacent to the construction areas to avoid impacts to surface waters. As necessary, the Authority will ensure that the water is pumped into Baker tanks or an approved equivalent with either a filter or gel coagulant system or other containment to remove sediment, as required. Remaining water will be discharged to a designated receiving water body or applied to land in accordance with the requirements of RWQCB Order No. 5-00-175. On upland areas, sprinkler systems may be used to disperse the water in support of revegetation efforts. BMPs described in the SWPPP will also be implemented to retain, treat, and dispose of groundwater. Measures will include, but are not limited to the following:

- Directly conveying pumped groundwater to a suitable land disposal area capable of percolating flows
- Retaining pumped groundwater in surface facilities to reduce turbidity and suspended sediment concentrations
- Testing water collected during dewatering for contamination prior to disposal if contamination is suspected
- Treating (i.e., flocculating) pumped groundwater to reduce turbidity and concentrations of suspended sediments if turbidity exceeds RWQCB effluent limitations as defined in General Order 5-00-175.

5.4.2 Spill Prevention and Hazardous Materials Management

Hazardous materials and hazardous wastes including fuels, oils, grease, and lubricants would be used and stored for construction, operation, and maintenance of the proposed Project. These materials would be used, stored, and disposed according to applicable regulations (Chapter 4 Regulatory Requirements and Permit Summary and Chapter 28 Public Health and Environmental Hazards). As part of the SWPPP, a spill prevention and control plan would be developed and implemented to minimize effects from spills of hazardous or petroleum substances during construction and operation/maintenance of the Project. The spill prevention and control plan would include measures to avoid the accidental release of chemicals, fuels, lubricants, and non-stormwater into channels and account for all applicable federal, State, and local laws and regulations, including the Resource Conservation and Recovery Act. Spill prevention kits would always be in close proximity when hazardous materials are used (e.g., crew trucks and other logical locations). Feasible measures would be implemented so that hazardous materials would be properly handled by all reasonable means when working in or near any waterway. No fueling would be done within the ordinary high water mark, immediate floodplain, or full pool Inundation Area unless equipment would be provided so that any accidental fuel spill would not be able to enter the water, contaminate sediments that may come into contact with water, or damage wetland or riparian vegetation. Any equipment that can readily moved out of the channel would not be fueled in the channel or immediate floodplain. For all fueling of stationary equipment at the construction sites, containments would be provided to the degree that any spill would not enter the channel or damage wetland or riparian vegetation. Equipment would not be serviced within the ordinary high water mark or immediate floodplain, unless the equipment stationed in these locations cannot be readily relocated (e.g., pumps and generators).

Additional BMPs designed to avoid spills from construction equipment and equipment used for the operation and maintenance of Project facilities would also be implemented, including the following:

- Storing hazardous materials in double containment
- Disposing all hazardous and nonhazardous products in a proper manner
- Monitoring onsite vehicles for fluid leaks and regular maintenance to reduce the chance of leakage
- Providing containment (e.g., a prefabricated temporary containment mat, a temporary earthen berm, or other measure) of bulk storage tanks having a capacity of more than 55 gallons

In addition, existing federal, State, and local worker safety and emergency response regulations require that if any unforeseen hazardous conditions are discovered during construction, the contractor must coordinate with the appropriate agencies, including Colusa and Glenn counties, for the safe handling, sampling, transportation, and disposal of encountered materials. The contractor will also be required to comply with California Occupational Safety and Health Administration standards that ensure worker health and safety.

5.5 Mosquito and Vector Control

All Project contractors shall coordinate with Glenn County Mosquito and Vector Control District, the Colusa County Environmental Health Department, and the Colusa County Mosquito Abatement District regarding implementation of federal, State, and local vector control requirements during construction of all Project facilities. The Authority will work with Glenn and Colusa counties to ensure appropriate vector control for the operation and maintenance of all project facilities, including recreation areas, to minimize potential impacts to human health.

5.6 Groundwater/Dewatering Water Supply

In the unlikely event that adjacent existing groundwater well users experience temporary, localized impacts to groundwater availability during construction of Project facilities because of construction dewatering (rather than climatic conditions or an increase in non-project groundwater production) such that an existing local well no longer temporarily supports its current use, an alternate water supply will be provided to the landowner during the construction dewatering period.

5.7 Visual and Aesthetic Design, Construction, and Operation Practices

Standard and best practice approaches will be implemented during the design, construction, and operation phases to minimize visual and aesthetic impacts to potential residents and other viewers caused by the construction and operation of all Project facilities, including the following:

- Using native trees, bushes, and shrubs, in a manner that does not compromise facility safety, and access, to screen Project facilities that may substantially degrade the existing visual character of the site(s)
- Incorporating high-quality site design and architecture that does not detract from the rural nature of the surroundings

- Locating, designing, and constructing retaining walls and erosion control devices or structures to avoid detracting from the scenic quality of surrounding areas to the extent possible

5.8 Emergency Action Plan

An emergency action plan would be implemented for Project construction and operation. The plan would include emergency notification flowcharts, notification procedures, inundation maps, and a variety of other important emergency response protocols for notifying downstream entities if an emergency release was anticipated to occur. The emergency action plan would address potential and actual emergency conditions and any uncontrolled release of water, including release of water through the signal spillway. These plans are typically reviewed annually and periodically tested through tabletop and functional exercises and drills.

Feasibility and Implementation Risk Tab Attachment 3: Schedule

Attach an estimated schedule for the proposed project until the first year of operation. If the schedule is included in another attachment, identify the location. See section 6003(a)(1)(G) of the regulations.

* UNIDENTIFIED STRUCTURES AND WELL PUMP ENCLOSURES

OTHER ITEMS TO BE DEMOLISHED

ITEM	COUNT	UNIT
MAXWELL SITES & SITES LOGODA ROADS, ASPHALT PAVED	20,840	FEET
HUFFMASTER ROAD, ASPHALT PAVED	740	FEET
STANDING TIMBER	700	ACRES
METAL FENCING, WITH AND WITHOUT BARBED WIRE	40	MILES
UNDERGROUND STORAGE TANKS (UST), OIL-FILLED	15	UST
NATURAL SPRING CAPS AT SALT LAKE (ONE IN LAKE; TWO UPSTREAM)	3	CAPS

NOTES:

1. ASPHALT CONCRETE PAVEMENT TO BE REMOVED WITHIN THE LIMITS OF THE RESERVOIR BELOW EL.540.
2. ALL METAL FENCING (WITH AND WITHOUT BARBED WIRE) AND FENCE POSTS TO BE REMOVED WITHIN THE LIMITS OF THE RESERVOIR BELOW EL.540.
3. TABULATED STRUCTURES HAVE NOT BEEN VISUALLY INSPECTED.
4. STRUCTURES IDENTIFIED FROM 2013 GROUND SURVEY BY DWR.
5. STRUCTURES AND OTHER FACILITIES AND ITEMS TO BE DEMOLISHED SHALL BE REMOVED AND PROPERLY DISPOSED OF AT LANDFILLS LICENSED TO RECEIVE THE DEMOLITION WASTE. BURNING OR BURIAL ON SITE WILL NOT BE PERMITTED.
6. ONE SEPTIC SYSTEM ASSUMED TO EXIST FOR EVERY HOUSE AND MOBILE HOME. SEPTIC SYSTEMS TO BE ABANDONED IN ACCORDANCE WITH LOCAL, STATE AND FEDERAL REGULATIONS.
7. ONE GROUNDWATER WELL ASSUMED TO EXIST FOR EVERY OCCUPIED PARCEL OR HABITABLE DWELLING ON AN OCCUPIED PARCEL. GROUNDWATER WELLS TO BE PLUGGED AND ABANDONED IN ACCORDANCE WITH DWR WATER WELL STANDARDS SECTION 23, BULLETIN 74-90.
8. STANDING TIMBER QUANTITY BASED ON DWR ESTIMATE OF REMAINING TIMBER.
9. ONE UNDERGROUND STORAGE TANK (UST) ASSUMED FOR EVERY TWO BARN STRUCTURES. UST TO BE REMOVED OR ABANDONED IN ACCORDANCE WITH LOCAL, STATE AND FEDERAL REGULATIONS.
10. EACH NATURAL SPRING AT SALT LAKE TO BE CAPPED AND GROUTED WITH 4' X 4', 1-FOOT THICK CONCRETE SLAB.

GENERAL NOTES:

MATERIALS FOR DAM CONSTRUCTION

THE MATERIAL DESCRIPTIONS PROVIDED BELOW ARE SUMMARIZED FROM DWR MATERIAL INVESTIGATION AND DAM DESIGN REPORTS. NOTE THAT THE ZONE DESIGNATIONS FOR THE SADDLE DAMS DIFFER IN SOME RESPECTS FROM THE ZONE DESIGNATIONS FOR SITES AND GOLDEN GATE DAMS. WHILE ZONE DESIGNATIONS DIFFER, MATERIALS ARE GENERALLY THE SAME. MATERIAL ZONES ARE INDICATED ON THE VARIOUS DAM SECTION DRAWINGS.

SITES AND GOLDEN GATE DAMS.

1. ZONE 1 – IMPERVIOUS CORE MATERIAL WILL BE COMPRISED OF LOW TO MEDIUM PLASTICITY CLAYS (CL), WITH LESSER AMOUNTS OF HIGH PLASTICITY CLAYS (CH) AND CLAYEY SANDS (SC). THE IMPERVIOUS MATERIAL WILL BE OBTAINED FROM A DESIGNATED BORROW AREA UPSTREAM OF THE DAM IN THE RESERVOIR AND FROM REQUIRED EXCAVATION AREAS FOR THE DAM EMBANKMENT, APPURTENANT STRUCTURES, AND FUNKS RESERVOIR ENLARGEMENT. HAUL DISTANCES WILL BE LESS THAN 1 MILE. PROCESSING OF THE IMPERVIOUS MATERIAL, BEYOND NORMAL DISKING AND MOISTURE CONDITIONING IN THE DESIGNATED BORROW AREAS, WILL NOT BE REQUIRED.
2. ZONE 2 – FILTER, DRAIN, AND TRANSITION MATERIALS CONSISTING OF FRESH ROCK PROCESSED TO VARIOUS SIZES TO MEET FILTER COMPATIBILITY AND HYDRAULIC CONDUCTIVITY REQUIREMENTS. ON-SITE VENADO SANDSTONE OF THE CORTINA FORMATION MAY NOT BE SUITABLE FOR USE AS THESE EMBANKMENT MATERIALS. THEREFORE, IT IS ASSUMED THAT THE FILTER, DRAIN, AND TRANSITION MATERIALS WILL BE IMPORTED FROM THE CLOSEST OFF-SITE SAND AND GRAVEL SOURCE. THE CLOSEST SOURCE IS AN OLD ABANDONED CHANNEL ON STONY CREEK BETWEEN ORLAND AND WILLOWS, APPROXIMATELY 35 ROAD MILES FROM THE GOLDEN GATE DAM SITE. THE SOURCE HAS AN ESTIMATED MATERIAL AVAILABILITY OF 160 MILLION CUBIC YARDS THAT FAR EXCEEDS THE CONSTRUCTION REQUIREMENT. IT IS ASSUMED THE QUARRY IS UNDEVELOPED AND DEVELOPMENT OF THE QUARRY AND SUPPLY AND SETUP OF ALL CRUSHING, SCREENING, AND WASHING FACILITIES WILL BE NECESSARY. QUARRY DEVELOPMENT COST SHOULD BE A PART OF THE MATERIAL SUPPLY COST ESTIMATE FOR PROVIDING ZONE 2 AND OTHER PROCESSED MATERIAL.
3. ZONE 3 – SHELL MATERIAL WILL BE COMPRISED OF PROCESSED CLEAN ROCKFILL WITH MAXIMUM PARTICLE SIZE UP TO 30-INCH. THE SHELL MATERIAL WILL BE OBTAINED FROM FRESH VENADO SANDSTONE OF THE CORTINA FORMATION FROM A QUARRY DEVELOPED IN THE RIDGE ON THE EAST SIDE OF THE RESERVOIR IN NEAR VICINITY OF THE DAM SITE WITH HAUL DISTANCES OF LESS THAN 1 MILE. QUARRY OPERATIONS WILL REQUIRE DRILLING AND BLASTING WITH SELECTIVE PROCESSING TO PRODUCE THE REQUIRED PARTICLE SIZES AND GRADATION.
4. ZONE 4 – RANDOM MATERIAL COMPRISED OF MATERIALS UNSUITABLE FOR USE AS CLEAN ROCKFILL. RANDOM MATERIAL WILL CONSIST OF WEATHERED SANDSTONE, MUDSTONE, SLOPEWASH, ETC. OBTAINED FROM EXCAVATION FOR THE DAM FOUNDATION, APPURTENANT STRUCTURES, AND THE ROCKFILL QUARRY. HAUL DISTANCES WILL BE LESS THAN 1 MILE AND PROCESSING WILL NOT BE REQUIRED.

SADDLE DAMS

1. ZONE 1 – IMPERVIOUS CORE MATERIAL COMPRISED OF LOW TO MEDIUM PLASTICITY CLAYS (CL), WITH LESSER AMOUNTS OF HIGH PLASTICITY CLAYS (CH) AND CLAYEY SANDS (SC). THE IMPERVIOUS MATERIAL WILL BE OBTAINED FROM DESIGNATED BORROW AREAS UPSTREAM OF THE DAMS IN THE RESERVOIR WITH HAUL DISTANCES OF LESS THAN 1 MILE. PROCESSING OF THE IMPERVIOUS MATERIAL, BEYOND NORMAL DISKING AND MOISTURE CONDITIONING IN THE DESIGNATED BORROW AREAS, WILL NOT BE REQUIRED.
2. ZONE 2 – RANDOM SHELL MATERIAL COMPRISED PREDOMINATELY OF MUDSTONE FROM THE BOXER FORMATION. RANDOM MATERIAL WILL BE OBTAINED FROM DESIGNATED BORROW AREAS UPSTREAM OF THE DAMS IN THE RESERVOIR AND FROM REQUIRED FOUNDATION EXCAVATION FOR THE DAM EMBANKMENTS WITH HAUL DISTANCES OF LESS THAN 1 MILE. PROCESSING OF THE RANDOM SHELL MATERIALS WILL NOT BE REQUIRED.
3. ZONE 3 – UPSTREAM SHELL MATERIAL AND RIPRAP CONSISTING OF PROCESSED CLEAN ROCKFILL UP TO 30-INCH MAXIMUM PARTICLE SIZE. THE ROCKFILL AND RIPRAP WILL BE OBTAINED FROM FRESH VENADO SANDSTONE OF THE CORTINA FORMATION FROM A QUARRY DEVELOPED IN THE RIDGE ON THE EAST SIDE OF THE RESERVOIR APPROXIMATELY 3 TO 4 MILES FROM THE SADDLE DAM SITES. QUARRY OPERATIONS WILL REQUIRE DRILLING AND BLASTING WITH SELECTIVE PROCESSING TO PRODUCE THE REQUIRED PARTICLE SIZES AND GRADATION.
4. ZONE 4 – FILTER AND DRAIN MATERIALS CONSISTING OF SAND AND GRAVEL PROCESSED TO VARIOUS SIZES TO MEET FILTER COMPATIBILITY AND HYDRAULIC CONDUCTIVITY REQUIREMENTS.IT IS ASSUMED THAT THE FILTER AND DRAIN MATERIALS WILL BE IMPORTED FROM THE CLOSEST OFF-SITE SAND AND GRAVEL SOURCE TO ENSURE CONSERVATIVE ESTIMATION OF MATERIAL COSTS. THE CLOSEST OFF-SITE SOURCE IS AN OLD ABANDONED CHANNEL ON STONY CREEK BETWEEN ORLAND AND WILLOWS, APPROXIMATELY 30 ROAD MILES FROM THE SADDLE DAM SITES.THE SOURCE HAS AN ESTIMATED MATERIAL AVAILABILITY OF 160 MILLION CUBIC YARDS THAT FAR EXCEEDS THE CONSTRUCTION REQUIREMENT. IT IS ASSUMED THE QUARRY IS UNDEVELOPED AND DEVELOPMENT OF THE QUARRY AND SUPPLY AND SETUP OF ALL CRUSHING, SCREENING, AND WASHING FACILITIES WILL BE NECESSARY. QUARRY DEVELOPMENT COST SHOULD BE A PART OF THE MATERIAL SUPPLY COST ESTIMATE FOR PROVIDING ZONE 4 AND OTHER PROCESSED MATERIAL.

FOUNDATION OBJECTIVES AND FOUNDATION GROUTING

GOLDEN GATE DAM

1. TO MEET THE FOUNDATION OBJECTIVES, RECENT AND OLDER ALLUVIUM, DECOMPOSED, AND INTENSELY WEATHERED BEDROCK WILL BE EXCAVATED FROM THE ENTIRE FOOTPRINT OF GOLDEN GATE DAM TO OBTAIN A MODERATELY WEATHERED BEDROCK SURFACE. IN ADDITION, MODERATELY WEATHERED BEDROCK WILL BE EXCAVATED FROM THE IMPERVIOUS CORE FOOTPRINT DOWN TO THE TOP OF SLIGHTLY WEATHERED AND/OR FRESH BEDROCK SURFACE. EXCAVATION WILL BE PERFORMED BY THE USE OF HEAVY EQUIPMENT BUT MAY REQUIRE SOME BLASTING IN THE HARDER SANDSTONE.
2. WATER PRESSURE TEST DATA INDICATES SOME AREAS OF HIGHER HYDRAULIC CONDUCTIVITY IN THE UPPER PORTION OF THE DAM FOUNDATION. CONSOLIDATION AND CURTAIN GROUTING WAS INCLUDED IN THE DAM DESIGN TO REDUCE SEEPAGE THROUGH THE DAM FOUNDATION. THE GROUT PROGRAM WILL CONSIST OF A 2-ROW GROUT CURTAIN WITH 1-ROW OF CONSOLIDATION HOLES UPSTREAM AND ONE ROW DOWNSTREAM OF THE CURTAIN HOLES. THE ROWS WILL PARALLEL THE DAM CENTERLINE AND BE SPACED 10 FEET APART. IN ADDITION, A 40-FOOT WIDE BY 3-FEET THICK GROUT CAP IS INCLUDED TO PREVENT SURFACE LEAKAGE OF GROUT DURING GROUTING OF THE UPPER STAGE.
3. EACH ROW OF CONSOLIDATION AND CURTAIN GROUT HOLES WILL CONSIST OF MANDATORY PRIMARY AND SECONDARY HOLES SPACED AT 10-FOOT CENTERS. IN ADDITION, IT WAS ASSUMED THAT TERTIARY HOLES, SPLIT SPACED BETWEEN THE PRIMARY AND SECONDARY HOLES, WILL BE REQUIRED OVER HALF THE LENGTH OF THE DAM TO MEET GROUT CLOSURE CRITERIA. CONSISTENT WITH DAM FOUNDATION GROUTING PRACTICES, THE DRILLING DEPTH OF CONSOLIDATION HOLES WAS ESTIMATED TO BE ONE QUARTER THE HEIGHT OF THE DAM, TOGETHER WITH A MINIMUM DEPTH OF 50 FEET. ADDITIONALLY, THE DRILLING DEPTH OF CURTAIN HOLES WAS ESTIMATED TO BE ONE HALF THE HEIGHT OF THE DAM, TOGETHER WITH A MINIMUM DEPTH OF 100 FEET.
4. VERIFICATION TESTING WILL BE CONDUCTED TO A DEPTH EQUIVALENT TO THE CURTAIN GROUT HOLES. VERIFICATION HOLES WILL BE DRILLED BETWEEN THE CURTAIN GROUT ROWS, ALONG THE DAM CENTERLINE. THESE HOLES ARE ASSUMED TO HAVE AN AVERAGE HOLE SPACING OF 75 FEET.
5. IN ADDITION TO THE GROUTING PROGRAM DESCRIBED HERE, ADDITIONAL GROUTING AND/OR TREATMENT OF SPECIAL FEATURES SUCH AS THE GG-2 FAULT WILL LIKELY BE REQUIRED. COST ESTIMATE FOR GROUTING TO INCLUDE APPROPRIATE ALLOWANCE FOR SUCH TREATMENT.

SITES DAM

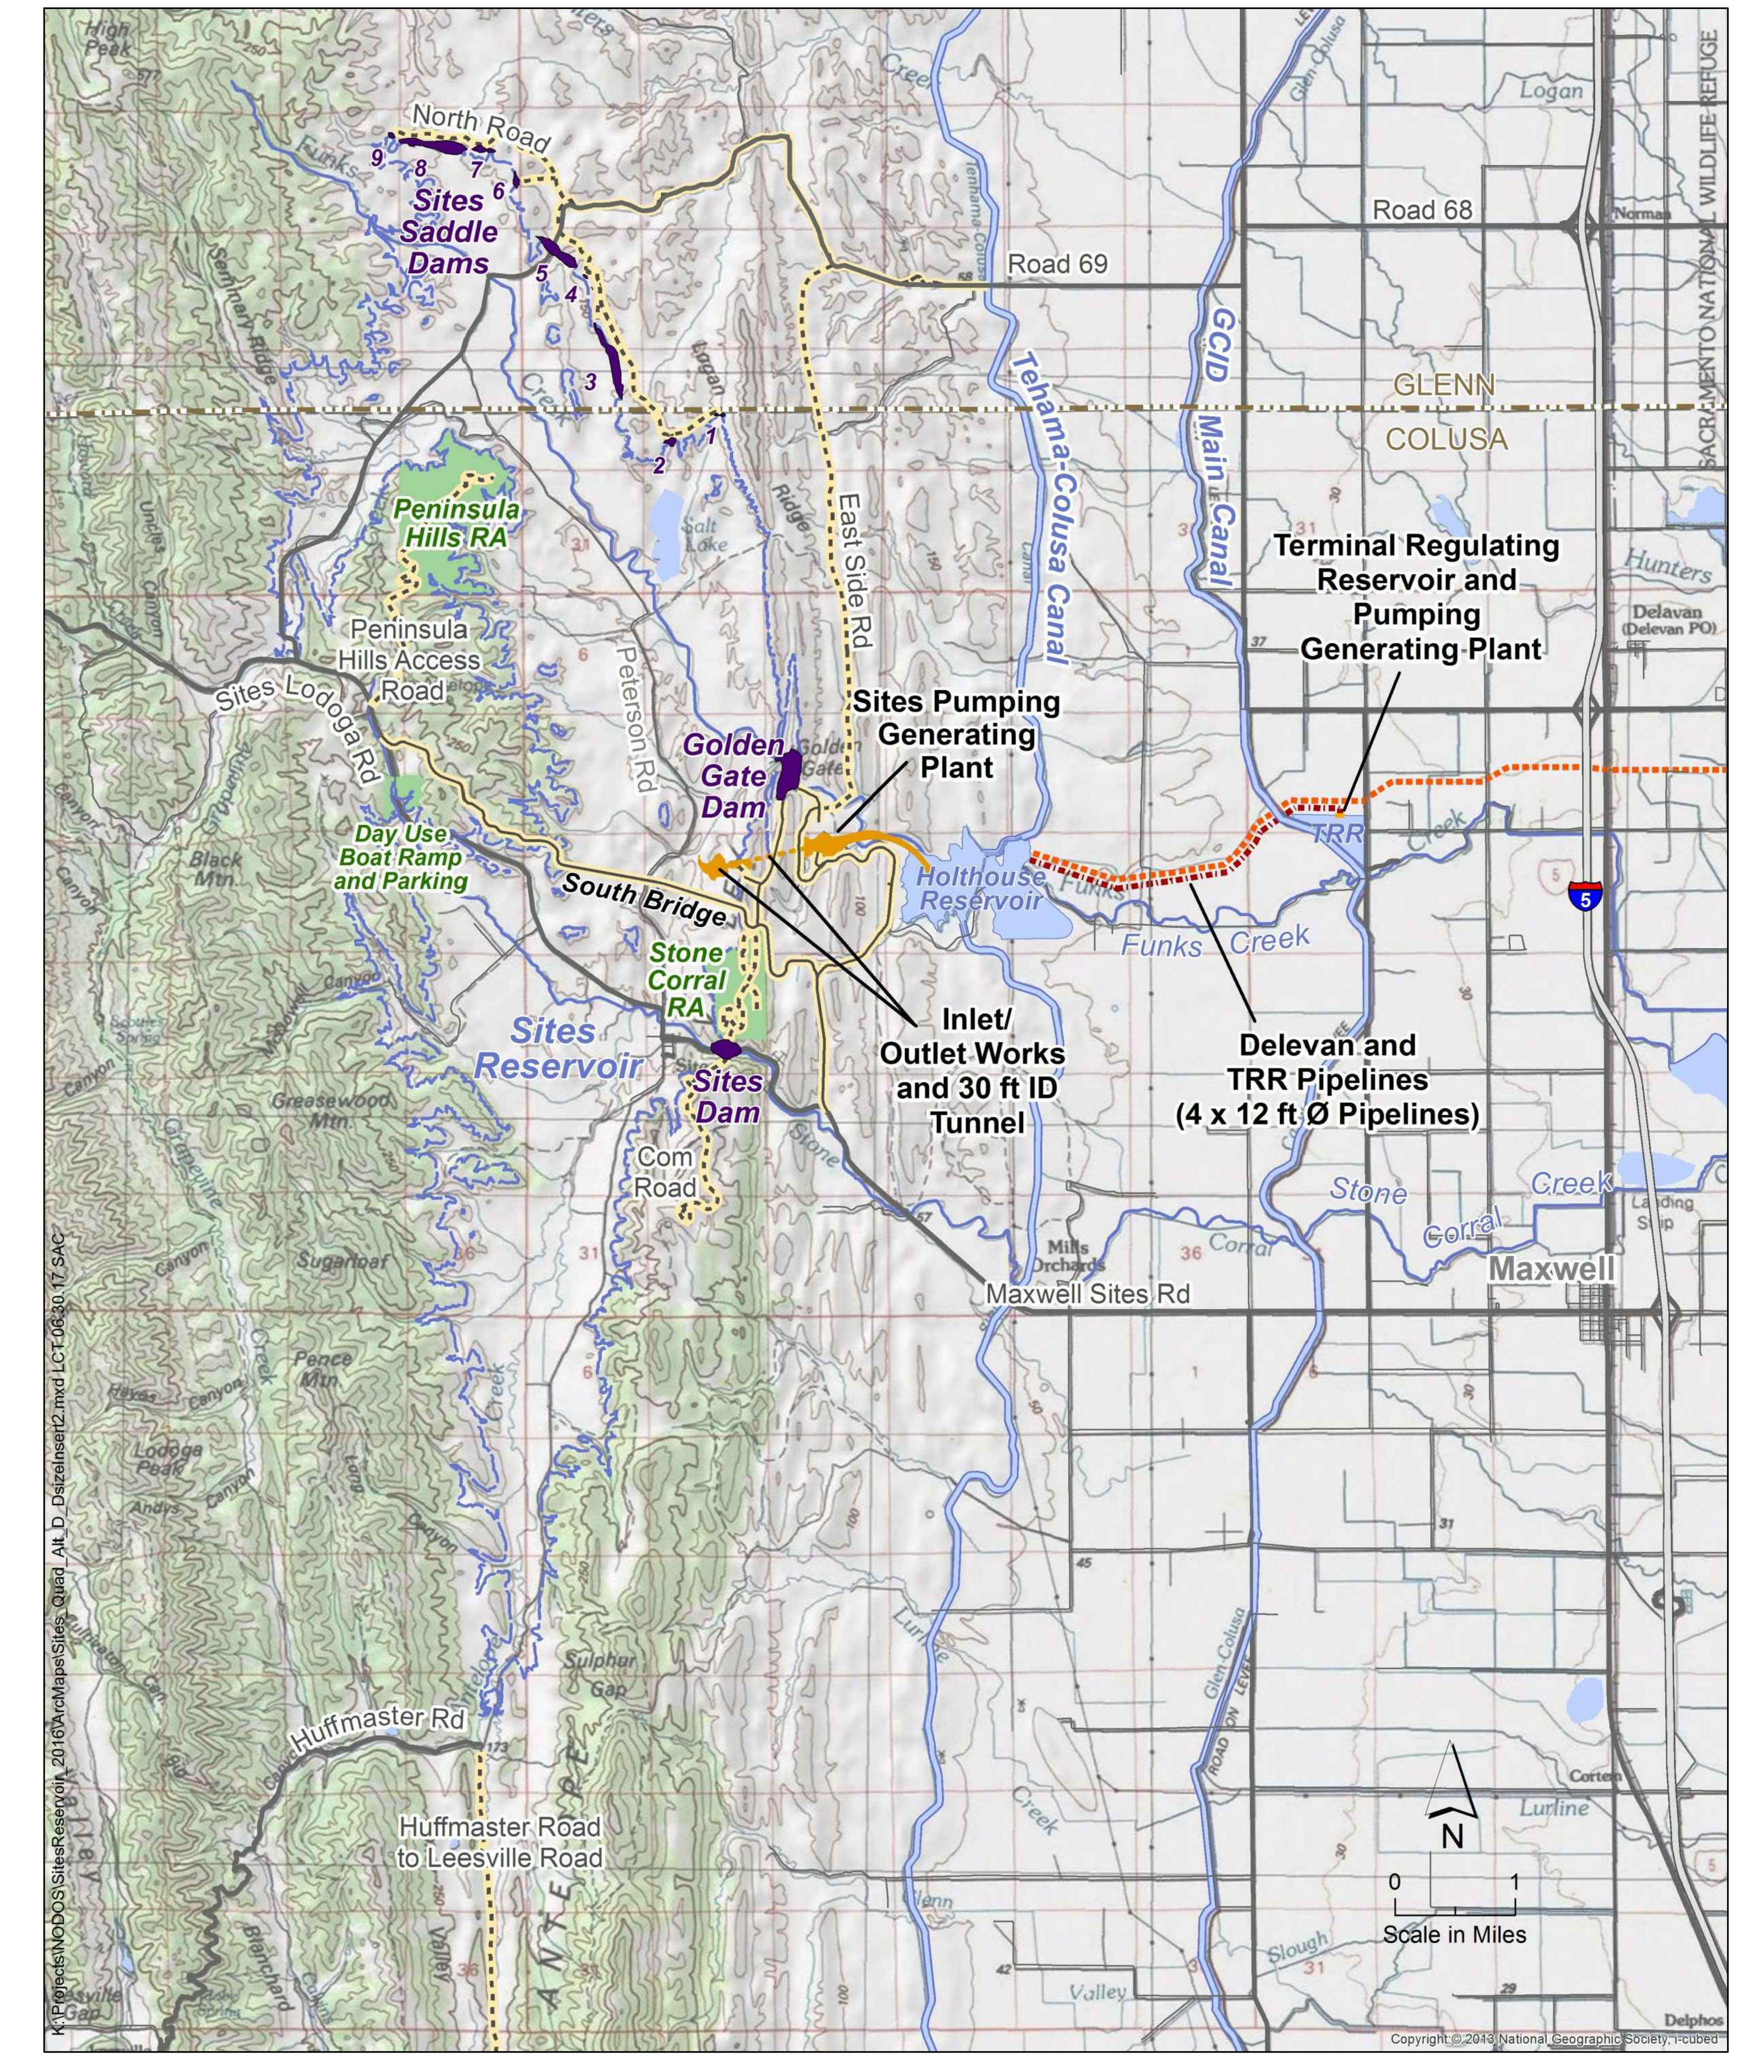
1. SIMILAR TO GOLDEN GATE DAM, MODERATELY WEATHERED BEDROCK IS CONSIDERED TO BE A SUITABLE FOUNDATION SURFACE FOR THE SHELL, TRANSITION, FILTER, AND DRAIN MATERIALS FOR SITES DAM. IN ADDITION, SLIGHTLY WEATHERED TO FRESH BEDROCK IS CONSIDERED TO BE A SUITABLE FOUNDATION SURFACE FOR THE CENTRAL IMPERVIOUS CORE MATERIAL.
2. THE GROUTING PROGRAM FOR SITES DAM IS ASSUMED TO BE THE SAME AS PRESENTED ABOVE FOR GOLDEN GATE DAM.
3. ADDITIONAL GROUTING AND/OR TREATMENT OF SPECIAL FEATURES SUCH AS THE S-2 FAULT WILL LIKELY BE REQUIRED. COST ESTIMATE FOR GROUTING TO INCLUDE APPROPRIATE ALLOWANCE FOR SUCH TREATMENT.

SADDLE DAMS

1. BEDROCK UNDERLYING THE SADDLE DAM FOOTPRINTS IS THE BOXER FORMATION THAT IS PREDOMINATELY MUDSTONE WITH SILTSTONE, SANDSTONE, AND CONGLOMERATE.
2. BASED UPON GEOLOGIC CHARACTERIZATION AND VISUAL OBSERVATION OF LIMITED AMOUNTS OF DRILL CORE, INTENSELY WEATHERED BEDROCK IS CONSIDERED TO BE A SUITABLE FOUNDATION SURFACE FOR THE SHELL (ZONE 3), RANDOM (ZONE 2), FILTER (ZONE 4), AND DRAIN MATERIALS (ZONE 4). IN ADDITION, MODERATELY WEATHERED BEDROCK IS CONSIDERED TO BE A SUITABLE FOUNDATION SURFACE FOR THE CENTRAL IMPERVIOUS CORE MATERIAL (ZONE 1).
3. COLLUVIUM AND DECOMPOSED BEDROCK WILL BE EXCAVATED FROM THE ENTIRE FOOTPRINT OF THE SADDLE DAMS TO OBTAIN AN INTENSELY WEATHERED BEDROCK SURFACE. IN ADDITION, INTENSELY WEATHERED BEDROCK WILL BE EXCAVATED FROM THE IMPERVIOUS CORE FOOTPRINT TO OBTAIN A MODERATELY WEATHERED BEDROCK SURFACE.
4. EXCAVATION AND FOUNDATION SHAPING CAN BE PERFORMED FAIRLY EASILY WITH THE USE OF HEAVY EQUIPMENT DUE TO THE RELATIVELY LOW STRENGTH OF THE BOXER FORMATION BEDROCK.
6. GROUTING WAS NOT INCLUDED IN THE FOUNDATION DESIGN OF THE SMALL SADDLE DAMS (NOS. 1, 2, 4, AND 9) SINCE A RELATIVELY LARGE PORTION OF THESE DAMS IS FREEBOARD. FOUNDATION SEEPAGE WAS NOT CONSIDERED TO BE SIGNIFICANT FOR THE SMALL SADDLE DAMS DUE TO THE RELATIVELY LOW HEAD AND LONG FLOW PATH BELOW THE CORE TRENCH.
7. SINCE DWR WATER PRESSURE TEST DATA INDICATES THAT SOME AREAS OF HIGHER HYDRAULIC CONDUCTIVITY OCCUR IN THE DAM FOUNDATIONS, CURTAIN GROUTING WAS INCLUDED IN THE DESIGN OF THE LARGE SADDLE DAMS (NO. 3, 5, 6, 7, AND 8) TO REDUCE SEEPAGE THROUGH THE DAM FOUNDATIONS.
8. THE GROUT PROGRAM WILL ALSO INCLUDE A 20-FOOT WIDE BY 3-FEET THICK GROUT CAP TO PREVENT SURFACE LEAKAGE OF GROUT DURING GROUTING OF THE UPPER STAGE. FOUNDATION GROUTING WILL CONSIST OF A 2 ROW VERTICAL GROUT CURTAIN SPACED 10 FEET APART PARALLEL TO THE DAM CENTERLINE. EACH ROW OF CURTAIN GROUT HOLES WILL CONSIST OF MANDATORY PRIMARY AND SECONDARY HOLES SPACED AT 10-FOOT CENTERS. IN ADDITION, IT WAS ASSUMED THAT TERTIARY HOLES, SPLIT SPACED BETWEEN THE PRIMARY AND SECONDARY HOLES, WILL BE REQUIRED OVER HALF THE LENGTH OF THE DAMS TO MEET GROUT CLOSURE CRITERIA. THE DRILLING DEPTH OF CURTAIN HOLES WAS ESTIMATED TO BE ONE HALF THE HEIGHT OF THE DAM, OR A MINIMUM DEPTH OF 30 FEET.
9. SINCE WATER PRESSURE TESTING IN THE EXPLORATION HOLES INDICATES THAT THE ROCK VARIES FROM FAIRLY TIGHT TO HAVING A RELATIVELY HIGH HYDRAULIC CONDUCTIVITY, GROUT TAKES IN THE CURTAIN HOLES WERE ESTIMATED AT 0.2 SACKS OF CEMENT PER LINEAR FOOT OF GROUT HOLE. THIS ESTIMATE CORRESPONDS TO TYPICAL GROUT TAKES OBSERVED DURING CONSTRUCTION OF OTHER DAM PROJECTS WITH SIMILAR FOUNDATION CONDITIONS.
10. THE GROUTING QUANTITY ESTIMATES ALSO INCLUDED VERIFICATION TESTING AS PART OF THE GROUTING PROGRAM. VERIFICATION HOLES WILL BE DRILLED BETWEEN THE CURTAIN GROUT ROWS, ALONG THE DAM CENTERLINE WITH AN AVERAGE HOLE SPACING OF 75 FEET COMMENSURATE WITH TYPICAL SPACING USED FOR OTHER DAM FOUNDATION GROUTING PROGRAMS. VERIFICATION TESTING WILL BE CONDUCTED TO A DEPTH EQUIVALENT TO THE CURTAIN GROUT HOLES.
11. ADDITIONAL GROUTING AND/OR TREATMENT OF SPECIAL FEATURES WILL LIKELY BE REQUIRED

SADDLE DAM SPECIAL FOUNDATION TREATMENT (SOIL-BENTONITE SLURRY CUTOFF WALLS)

1. NOTE THAT SADDLE DAMS 2, 3, AND 5 INCORPORATE A SOIL-BENTONITE SLURRY CUTOFF WALL AS PART OF THE FOUNDATION TREATMENT AT ABUTMENTS. SEE SADDLE DAM PLAN DRAWINGS FOR NOTES REGARDING CUTOFF WALL CONSTRUCTION REQUIREMENTS.



PLAN - EMBANKMENT AND SADDLE DAMS

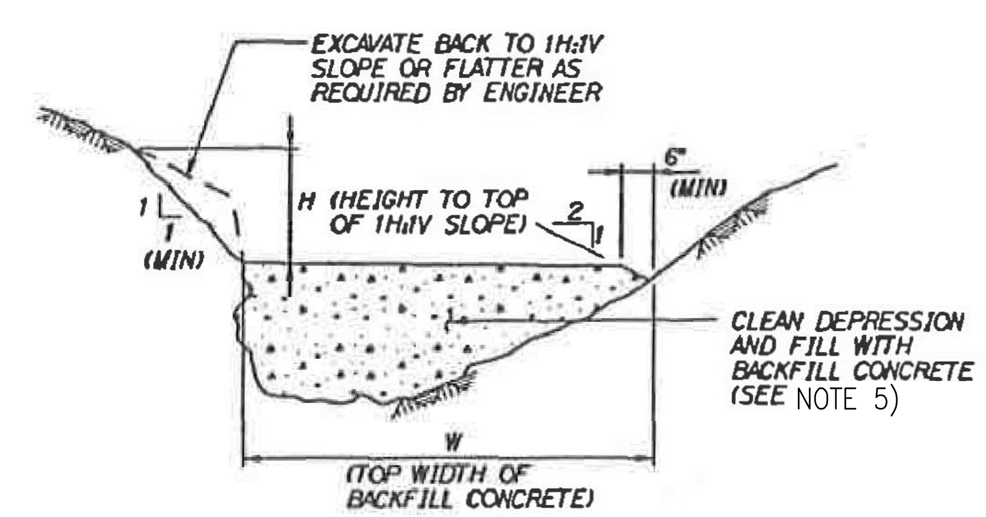
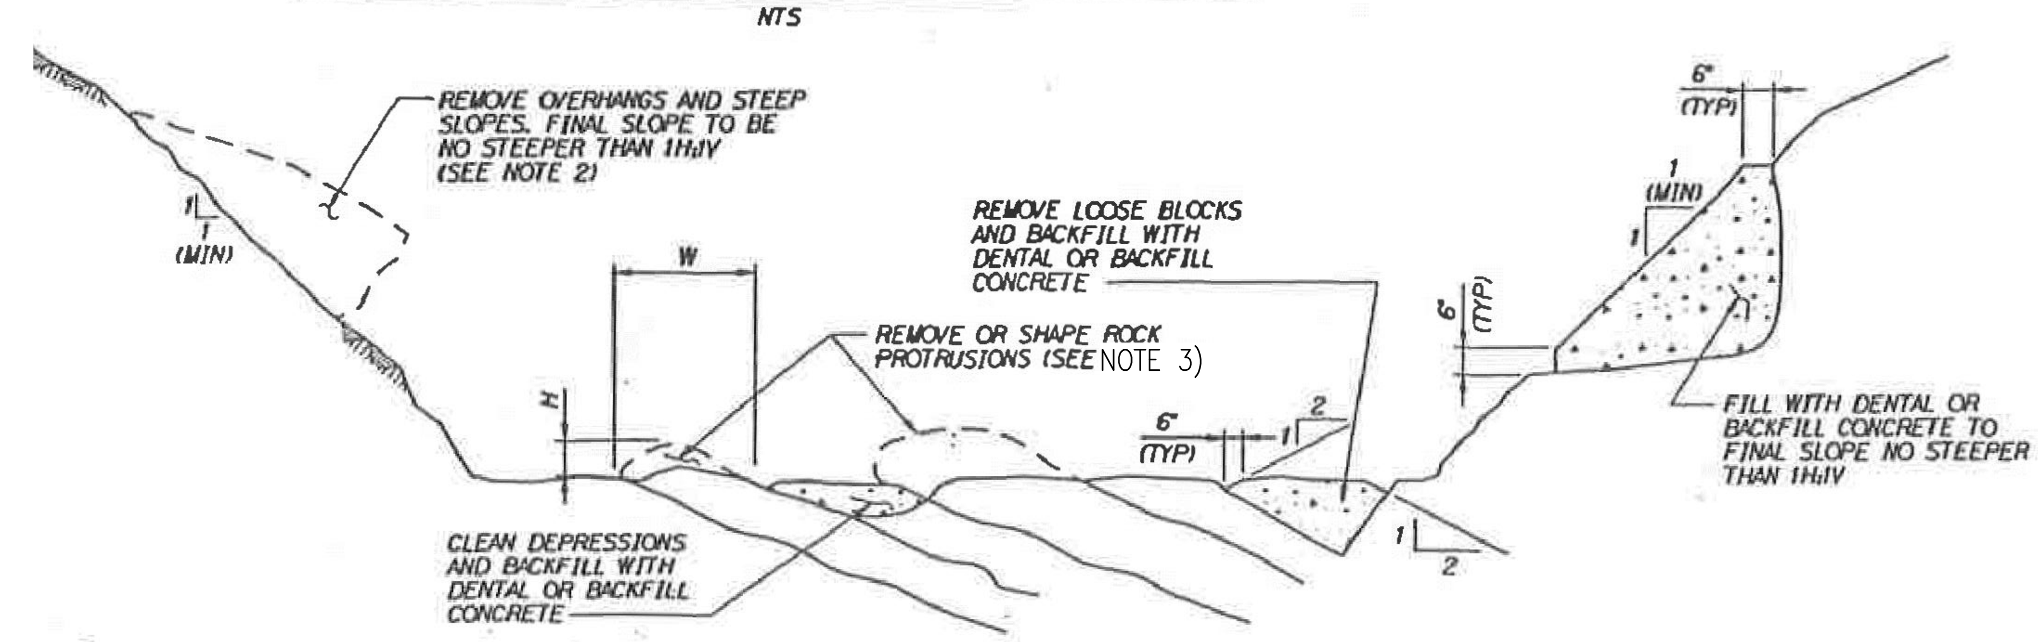
DENTAL TREATMENT OF SHEAR ZONES, CAVITIES, CRACKS, AND SEAMS IN CORE TRENCH

NTS



BACKFILL CONCRETING AND SHAPING IN CORE TRENCH

NTS



LOCAL SURFACE TREATMENT AND SHAPING IN CORE TRENCH

NOTES:

1. THE TREATMENT AND SHAPING DETAILS SHOWN ARE GUIDELINES. CONTRACTOR SHALL PERFORM UNRIPPABLE ROCK EXCAVATION, SHAPING, TREATMENT AND CLEANUP. THE DAM FOUNDATION WILL BE GEOLOGICALLY MAPPED BY THE ENGINEER.
2. REMOVE OVERHANGS AND STEEP SLOPES IN BOTH LONGITUDINAL AND TRANSVERSE DIRECTIONS, SO THAT THE FINAL SLOPE IS NO STEEPER THAN 1H:1V.
3. REMOVE OR SHAPE LOCAL ROCK PROTRUSIONS, IN BOTH LONGITUDINAL AND TRANSVERSE DIRECTIONS, WITH HEIGHT (H) GREATER THAN 2-FEET, SO THAT THE RATIO OF WIDTH (W) TO HEIGHT (H) IS GREATER THAN 2.
4. THE BASE OF THE CORE TRENCH SHALL BE EXCAVATED BELOW THE LIMITS OF COMMON EXCAVATION TO REDUCE EXCESSIVE UPSTREAM-TO-DOWNSTREAM DOWNWARD SLOPE. IN THOSE AREAS WHERE THE UNRIPPABLE ROCK EXCAVATION SURFACE OR THE COMMON EXCAVATION II SURFACE SLOPES DOWNWARD IN THE DOWNSTREAM DIRECTION, THE MAXIMUM ELEVATION DIFFERENCE IN ANY TRANSVERSE SECTION SHALL NOT EXCEED 10 FEET.

   THE BASE OF THE CORE TRENCH SHALL BE EXCAVATED SO THAT THE SLOPES ARE NOT STEEPER THAN THE FOLLOWING REQUIREMENTS:
   TRANSVERSE SLOPES: 4:1 DOWNWARD IN UPTREAM-TO-DOWNSTREAM DIRECTION
   2:1 UPWARD IN UPSTREAM-TO-DOWNSTREAM DIRECTION.
   LONGITUDINAL SLOPES: 2:1
5. FILL WITH BACKFILL CONCRETE UNTIL RATIO OF W TO H IS GREATER THAN 3 AND W IS AT LEAST 6 FEET, OR AS OTHERWISE REQUIRED BY ENGINEER.
6. EXTEND DENTAL TREATMENT OF SHEAR ZONES 20 FEET UPSTREAM AND DOWNSTREAM OF THE CORE TRENCH WHERE SHEAR ZONES, CAVITIES, CRACKS AND SEAMS EXTEND BEYOND THE CORE TRENCH.

GOLDEN GATE DAM
GROUTING DETAIL

SPEC NO.:
DRAWING NO.: CG-501
REV.:
SHEET NO.: 38

NOTES – SADDLE DAMS 2, 3 AND 5

1. AT SADDLE DAMS 2, 3 AND 5, THE ABUTMENT SLOPES ARE FAIRLY FLAT RESULTING IN AREAS WITH DAM HEIGHTS LESS THAN ABOUT 10 FEET OVER LENGTHS OF UP TO 620 FEET. AT THESE LOCATIONS THE DAM EMBANKMENTS ARE PROVIDING RESIDUAL FREEBOARD ONLY AND THE TYPICAL SADDLE DAM SECTIONS WILL BE REPLACED WITH A SMALL HOMOGENOUS IMPERVIOUS EMBANKMENT WITH A BENTONITE SLURRY WALL FOR FOUNDATION SEEPAGE CONTROL. CONSTRUCTION OF THE SLURRY WALL CONFIGURATION IS A MORE ECONOMICAL OPTION THAN CONSTRUCTION OF THE TYPICAL SECTION. THE SLURRY WALL WILL BE EXCAVATED TO A DEPTH CORRESPONDING TO THE MODERATELY WEATHERED BEDROCK SURFACE, WITH AVERAGE DIMENSIONS ESTIMATED AT 20-FEET DEEP BY 5-FEET WIDE.
2. AT THE LEFT ABUTMENT OF SADDLE DAM NO. 2, THE SLURRY WALL SECTION ALSO PROVIDES A DEFENSIVE MEASURE TO CONTROL FOUNDATION SEEPAGE IN THE EVENT THAT DISPLACEMENT OCCURS ALONG THE SALT LAKE FAULT. ALTHOUGH THE EXACT LOCATION OF THIS FAULT HAS NOT BEEN IDENTIFIED AT THIS TIME, IT IS BELIEVED TO TRANSVERSE THE LEFT ABUTMENT OF SADDLE DAM NO. 2. AT THIS LOCATION THE SLURRY WALL WAS EXTENDED TO A DEPTH OF 40-FEET TO MINIMIZE THE POTENTIAL OF FOUNDATION SEEPAGE ALONG THE FAULT ZONE.

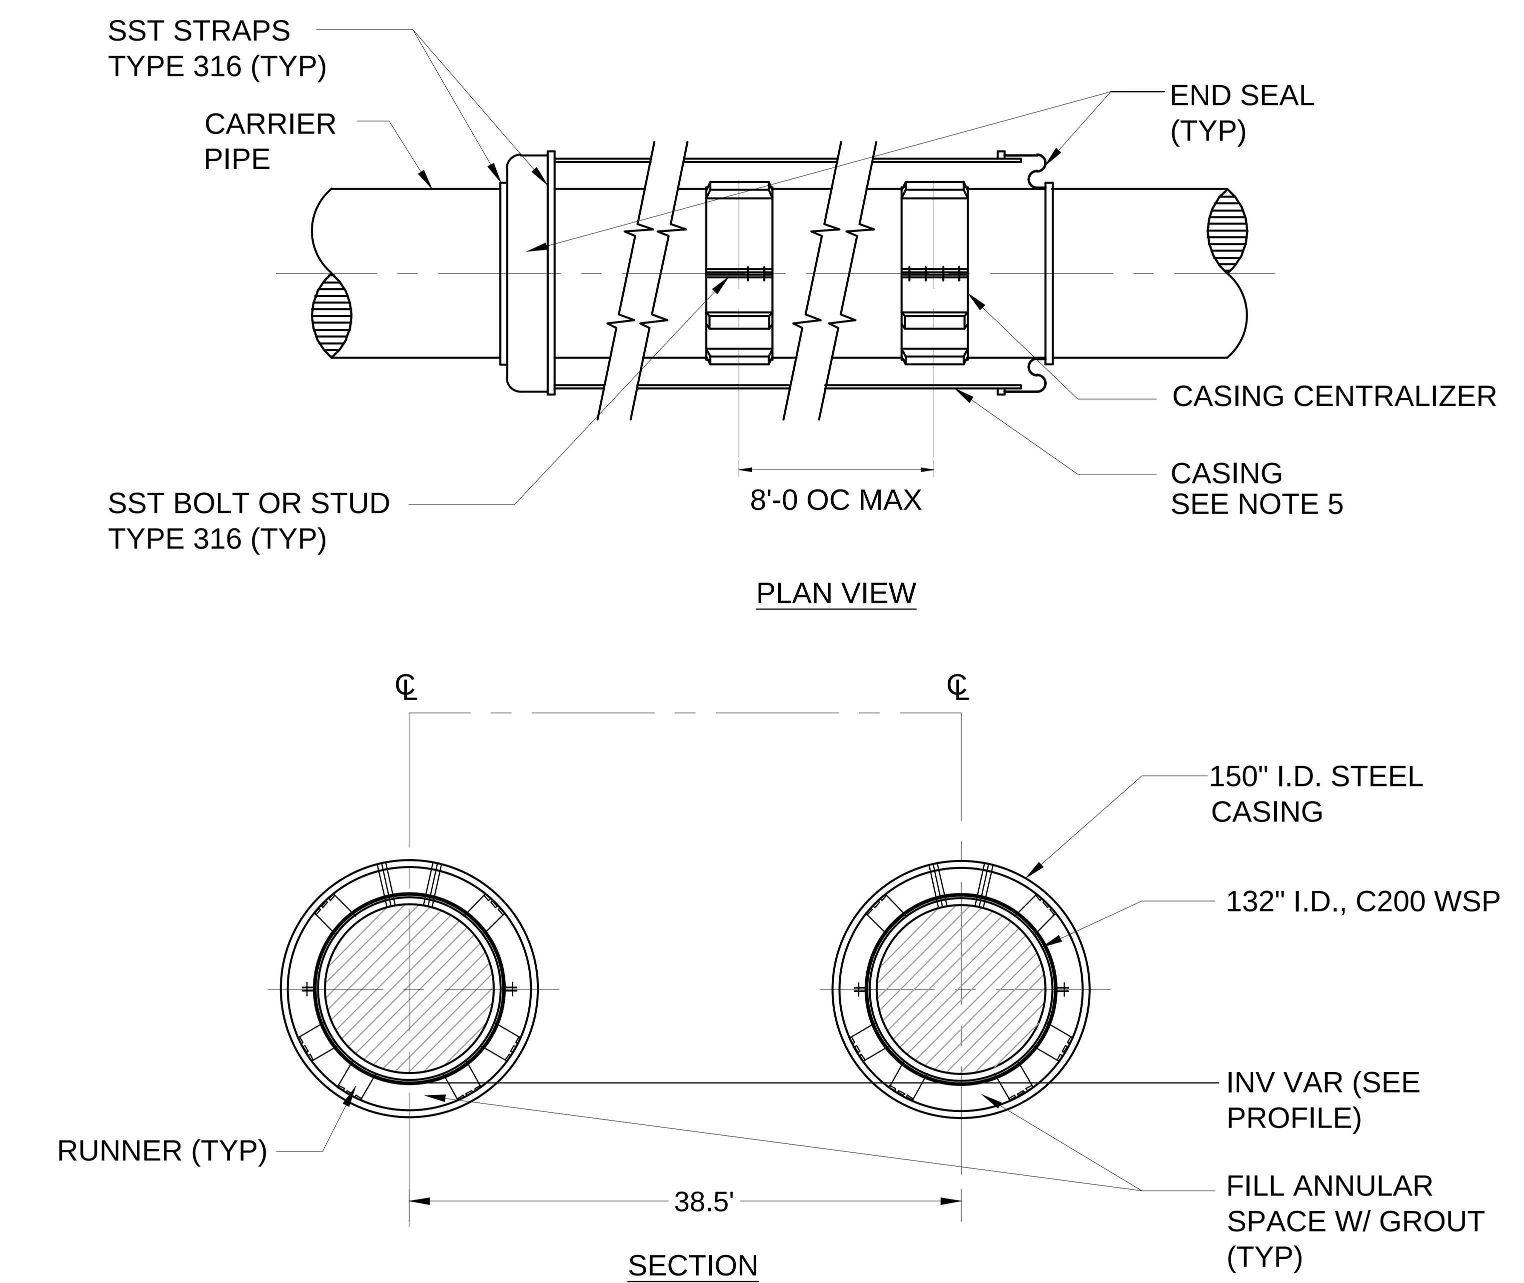
2 REINFORCED CONCRETE CYLINDER PIPE RESTRAINED JOINT

SCALE: NTS

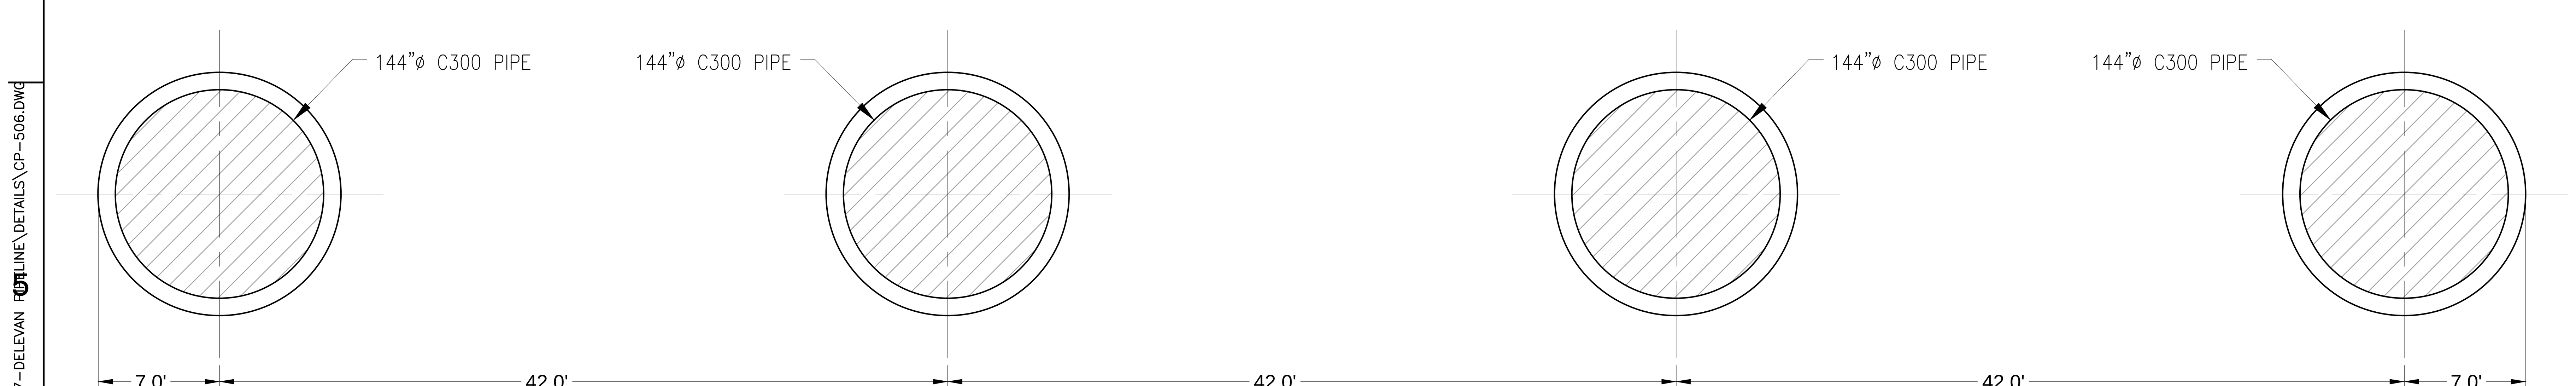


NOTES:

1. THE JOINTS OF THE CASING SHALL BE WATERTIGHT.
2. CARRIER PIPE SHALL BE TESTED BEFORE INSTALLATION OF END SEALS ON CASING AND FILLING OF ANNULAR SPACE. FLOATATION CALCULATION SHALL BE PROVIDED PRIOR TO FILLING OF ANNULAR SPACE. CONTRACTOR SHALL BLOCK THE TOP OF THE CARRIER PIPE TO PREVENT FLOATATION WHEN ANNULAR SPACE BACKFILL IS INSTALLED.
3. CASING SPACERS SHALL BE BOLTED AROUND THE PIPE SUCH THAT THE RUNNERS ARE LOCATED SYMMETRICALLY ABOUT THE LONGITUDINAL AXIS OF PIPE.
4. PROVIDE GROUT PORTS TO ENABLE FILLING VOIDS OUTSIDE OF THE CASING.
5. SUBMIT CALCULATIONS THAT DEMONSTRATE THAT THE YIELD STRENGTH OF THE CASING IS SUFFICIENT TO CARRY ANTICIPATED JACKING LOADS.
6. THE SEPARATION BETWEEN CASING PIPES 2xO.D. (26 FEET)
7. THE DEPTH BELOW INTERSTATE 5 AND THE RAIL ROAD IS 2 x O.D. (26 FEET)

3 CASING PIPE CROSSING

SCALE: NTS



NOTES:

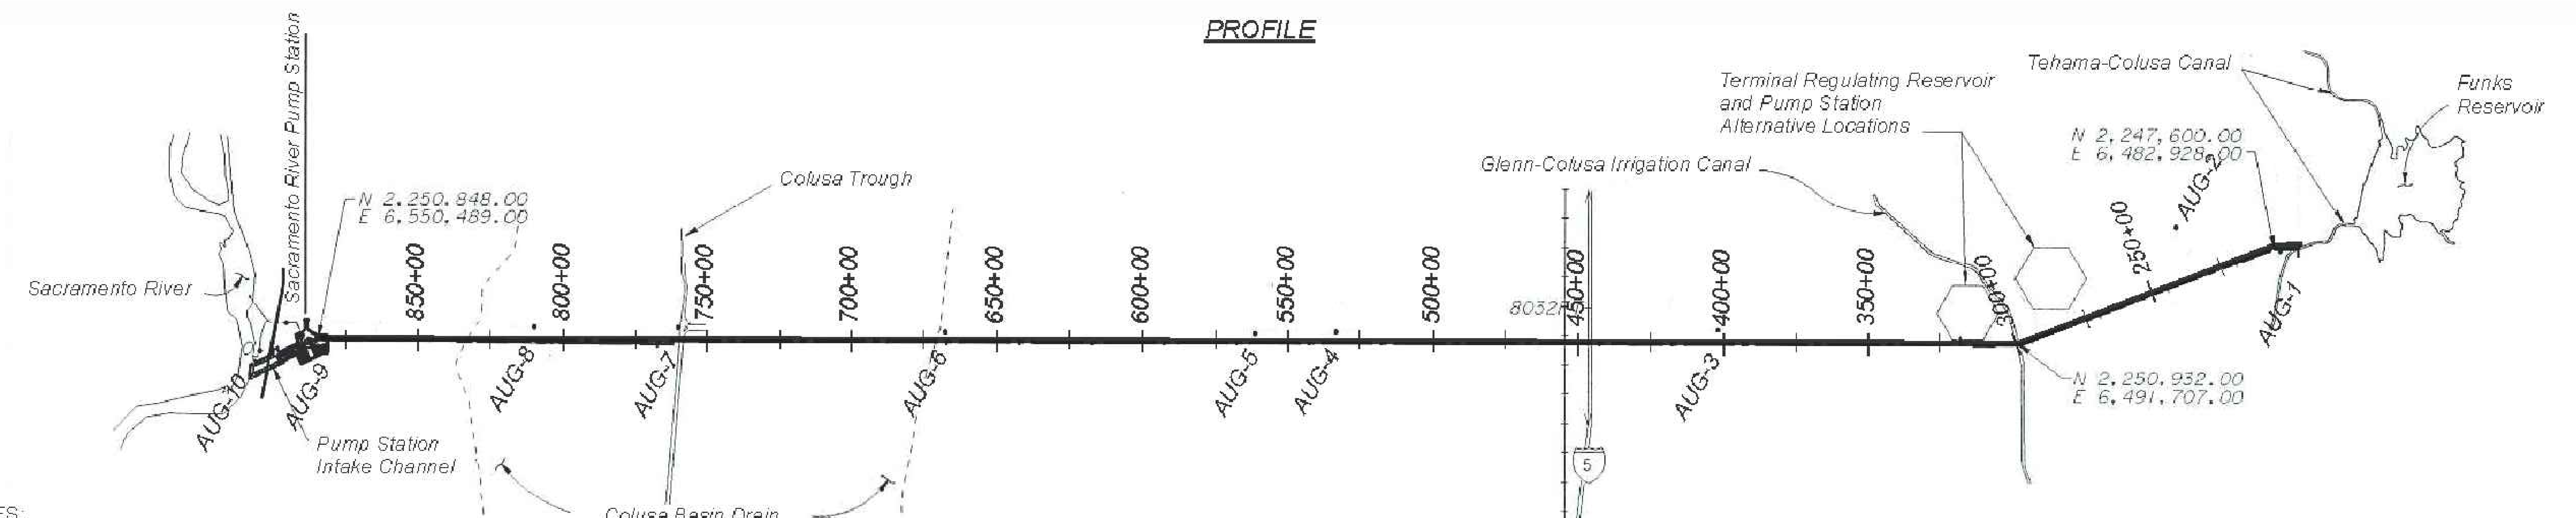
PROFILE



NOTES:
1. Existing boring log data (Sheets B-0801 – B-0805) was used to construct a preliminary cross-section of the hydrostratigraphy along the proposed alignment
2. Dewatering wells are fully penetrating wells in a water table aquifer
3. Required depth of dewatering is 3-feet below the center line of the excavation, which is approximately 25 feet below existing ground surface
4. Dewatering wells will be spaced on 100-foot centers, both sides of the excavation
5. Dewatering wells will be 75-foot deep in sections characterized as clay or clay and silt and 100-feet in sections characterized as sand or gravel
6. Dewatering wells are assumed to be 6-inch diameter

SPEC NO.
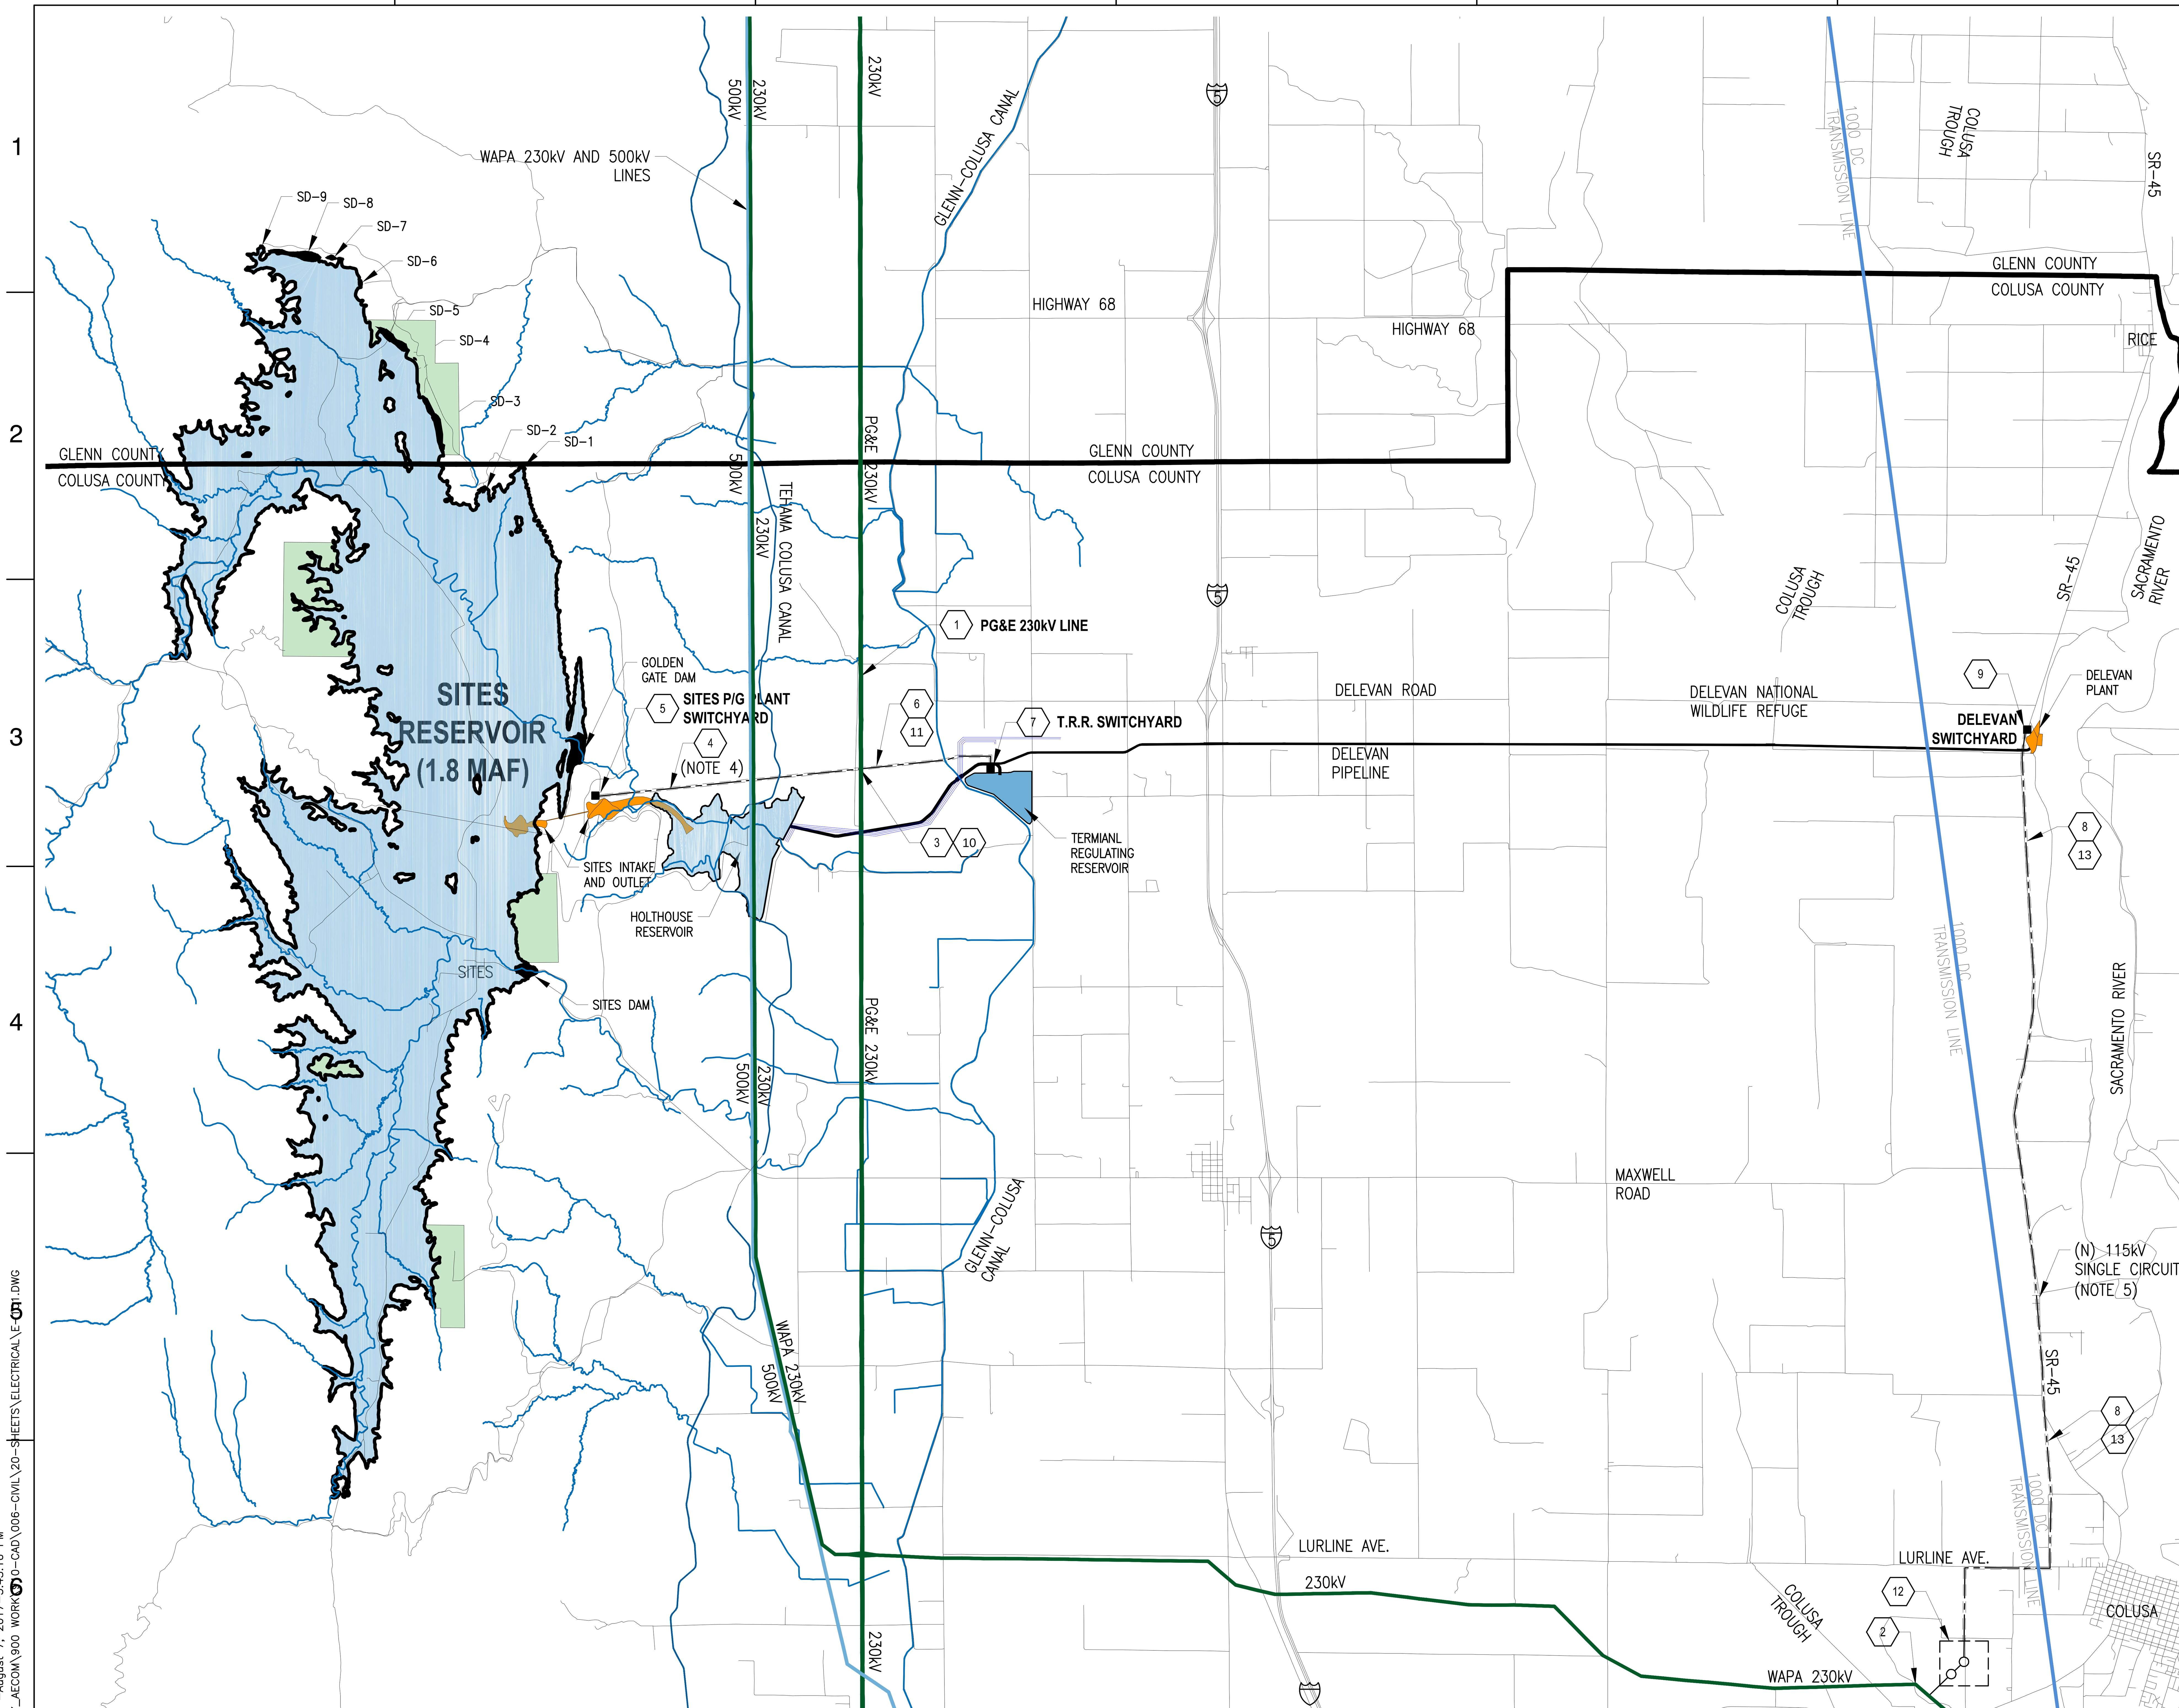
DRAWING NO. CN-302
REV.
SHEET NO. 102



SHEET NOTES:

1. BEFORE WORK IS STARTED, CONTRACTOR SHALL VERIFY SITE CONDITIONS. COORDINATE ALL ELECTRICAL WORK WITH OTHER DISCIPLINES AND GOVERNMENT PROJECT PERSONNEL.
2. ELECTRICAL WORK SHALL BE PROVIDED IN ACCORDANCE WITH ANSI/IEEE STANDARDS, WESTERN (WAPA) REQUIREMENTS, FERC/WECC, AND THE NATIONAL ELECTRICAL SAFETY CODE (ANSI C2-2017), AS APPLICABLE. ANY CONFLICTS WITH THE DESIGNS AS SHOWN SHALL BE RESOLVED BY THE ENGINEER.
3. POLE LOCATION, ELECTRICAL CONDUIT, AND EQUIPMENT SHOWN ARE DIAGRAMMATIC. CONTRACTOR SHALL BE RESPONSIBLE TO VERIFY FINAL LOCATION AND ROUTING SO AS NOT TO DISTURB EXISTING UTILITIES. MINOR CHANGES IN WORK DUE TO EXISTING CONDITIONS SHALL BE MADE WITHOUT ADDITIONAL COST TO THE OWNER.
4. 230KV LINE SHALL BE ROUTED INTO NEW SITES PLANT SUBSTATION. OUTAGE SHALL BE PLANNED AND COORDINATED WITH UTILITY DURING A SCHEDULED OUTAGE. ANY DAMAGE TO EXISTING UTILITIES SHALL BE THE FULL RESPONSIBILITY OF THE CONTRACTOR. CONTRACTOR SHALL REPAIR OR REPLACE ALL UTILITIES DAMAGED DURING CONSTRUCTION TO THE OWNER'S SATISFACTION.
5. CONTRACTOR SHALL PROVIDE 230KV CONSTRUCTION IN ACCORDANCE WITH CA GENERAL ORDER NO. 95 AND UTILITY STANDARD CONSTRUCTION DRAWINGS.
6. TRANSMISSION LINE COST ESTIMATE IS BASED ON THE FOLLOWING DESIGN BASIS AND QUANTITIES: 700 FT RULING SPAN; 128-120' TANGENT LATTICE TOWERS; 6-120' DEADEND LATTICE TOWERS; 4-120' LARGE ANGLE LATTICE TOWERS; AND , 2-160' DEADEND TUBULAR STRUCTURES (MONPOPOLES).

KEYED NOTES:

1. EXISTING PG&E 230KV LINES. LINES MAY BE ROUTED INTO NEW SITES SUBSTATION AND THEN RETURN TO SOUTHERN PORTION OF EXISTING LINE.
2. EXISTING WAPA 230KV KESWICK-O'BANION LINE, SOUTHERN PART. LINE WILL ROUTE INTO NEW DELEVAN SUBSTATION AND THEN CONTINUE TO SOUTHERN PORTION OF EXISTING LINE.
3. LOCATION OF 230KV LINE TAKEOFF TO SITES SUBSTATION. NEW 230KV DEADEND STRUCTURES WILL BE REQUIRED. START OF DOUBLE CIRCUIT 230KV LINE TO SITES SUBSTATION. LINES WILL CROSS EXISTING WAPA 500KV AND 230KV LINES.
4. ONE DOUBLE CIRCUIT AND ONE SINGLE CIRCUIT 230KV LINES TO/FROM SITES SUBSTATION. ONE DOUBLE CIRCUIT IS THE UTILITY, AND SINGLE CIRCUIT IS THE TRR PLANT 230KV LINE. LATTICE TOWER CONSTRUCTION.
5. SITES SUBSTATION AND P/G PLANT. SEE DWG E-104 FOR SITE PLAN. SEE SHEET E-601 FOR SINGLE LINE DIAGRAM.
6. ONE SINGLE CIRCUIT 230KV LINE FOR THE TRR PLANT, ORIGINATING FROM SITES SWITCHYARD. LATTICE TOWER CONSTRUCTION. LINE WILL CROSS UNDER 500KV LINE. LINE WILL ALSO CROSS EXISTING PG&E 230KV LINE. COST SHALL ASSUME UNDERBUILD OF EXISTING PG&E LINE.
7. TRR SWITCHYARD AND P/G PLANT. 230 KV LINE PROVIDES RADIAL FEED TO SUBSTATION. SEE DWG E-108 FOR SITE PLAN. SEE DWG E-603 FOR SINGLE LINE DIAGRAM.
8. SINGLE CIRCUIT 115KV LINE FROM WAPA TO DELEVAN PLANT. MONOPOLE STEEL TOWER CONSTRUCTION. LINE SHALL CROSS SR-45 AND WILL REQUIRE FULL COORDINATION WITH CALTRANS.
9. DELEVAN SWITCHYARD AND P/G PLANT. 115 KV LINE PROVIDES FEED FROM SUBSTATION. SEE DWG E-107 FOR SITE PLAN. SEE DWG E-602 FOR SINGLE LINE DIAGRAM.
10. 230KV LINE ESTIMATE IS BASED ON SINGLE 2156 ACSR "BLUEBIRD" FOR EACH CIRCUIT WITH LINE CONSTRUCTION CONSISTING OF DOUBLE CIRCUIT LATTICE TOWERS.
11. TRANSMISSION LINE ESTIMATE IS BASED ON A SINGLE CURCUIT CONSTRUCTION FROM SITES SWITCHYARD TO TRR SWITCHYARD (3.5 MILES).
12. NEW SUBSTATION FOR DELEVAN PUMP STATION. INCOMING 230KV FROM WAPA, 230KV TO 115KV POWER TRANSFORMER, WITH 115KV TO DELEVAN.
13. OH LINE ROUTING IS PRELIMINARY.

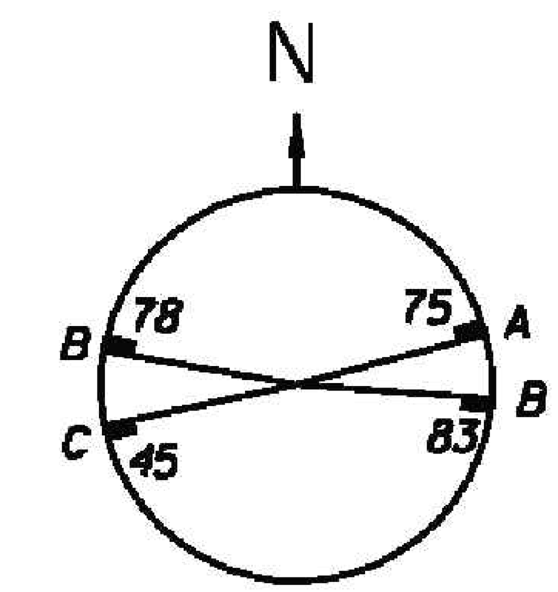
Notes

Contour maps prepared by Mapping and Photogrammetry Section, Division of Land and Right of Way, DWR, from 1:7200 Photography WR-BMV-C-3, November 12 and 19, 1998. Mapping Projection is NAD-83, CA Zone 2 NAVD 88.

Contour interval shown on this map is 10 feet. The current topography includes 2 foot contour intervals but that level is turned off to avoid masking the geology.

Geologic mapping and exploration performed by Division of Planning and Local Assistance, Northern District. Division of Engineering, Project Geology Section assisted.



JOINT ROSE. Average strike and dip of various indicated joint sets present within the immediate dam site area.

Chapters **Pages**

Executive Summary ES-1
Acronyms and Abbreviations xxv
1. Introduction 1-1
  1.1 Project Description 1-2
  1.2 Project Operations 1-6
  1.3 Project Background 1-7
  1.4 Project Objectives, and Purpose and Need 1-11
  1.5 Summary of CEQA and NEPA Requirements 1-12
  1.6 Existing Conditions/No Project/No Action Condition 1-14
  1.7 Intended Use of this Draft EIR/EIS 1-15
  1.8 Study Areas 1-22
  1.9 Areas of Controversy/Issues to be Resolved 1-26
  1.10 Public Involvement 1-33
  1.11 Organization of the Draft EIR/EIS 1-33
  1.12 Preparers of the Draft EIR/EIS 1-35
2. Alternatives Analysis 2-1
  2.1 Introduction 2-1
  2.2 Approach to Alternatives Analysis 2-2
  2.3 Existing Conditions, No Project Alternative, and No Action Alternative (Existing Conditions/No Project/No Action Condition) 2-8
  2.4 Sites Reservoir Alternatives 2-12
3. Description of the Sites Reservoir Project Alternatives 3-1
  3.1 Sites Reservoir Project Features and Facilities 3-2
  3.2 Construction and Operation/Maintenance Common to All Alternatives 3-92
  3.3 Diversion and Reservoir Operations Common to All Action Alternatives 3-102
  3.4 Proposed Operations by Alternative 3-110
  3.5 Environmental Commitments Included as Part of the Project and Alternatives 3-113
4. Environmental Compliance and Permit Summary 4-1
  4.1 Federal Policies or Approvals 4-1
  4.2 State Policies or Approvals 4-14
  4.3 Local/Regional Policies or Approvals 4-21
  4.4 Primary Permits and Authorizations 4-22
5. Guide to the Resource Analyses 5-1
  5.1 Introduction 5-1
  5.2 Establishment of the Base Condition for the Environmental Setting/Affected Environment 5-2
  5.3 Project Facilities Evaluated 5-3
  5.4 Alternatives Analysis 5-4
  5.5 Types of Impacts 5-6
  5.6 Determination of Significance of Impacts 5-7
  5.7 Mitigation Measure Development and Implementation 5-7
  5.8 Topics Eliminated from Further Analytical Consideration 5-8
  5.9 Tools, Analytical Methods, and Applications 5-8
  5.10 Limitations of the Modeling Tools and Analytical Methods 5-18
6. Surface Water Resources 6-1
  6.1 Introduction 6-1

Chapters **Pages**

6.2 Environmental Setting/Affected Environment....6-1
6.3 Environmental Impacts/Environmental Consequences 6-33
6.4 Evaluation of Changes to CVP/SWP Operational Flexibility 6-54
7. Surface Water Quality....7-1
7.1 Introduction....7-1
7.2 Environmental Setting/Affected Environment....7-2
7.3 Environmental Impacts/Environmental Consequences 7-29
7.4 Mitigation Measures 7-84
8. Fluvial Geomorphology and Riparian Habitat....8-1
8.1 Introduction....8-1
8.2 Environmental Setting/Affected Environment....8-1
8.3 Environmental Impacts/Environmental Consequences 8-15
8.4 Mitigation Measures 8-30
9. Flood Control and Management 9-1
9.1 Introduction....9-1
9.2 Environmental Setting/Affected Environment....9-1
9.3 Environmental Impacts/Environmental Consequences 9-14
9.4 Mitigation Measures 9-41
10. Groundwater Resources....10-1
10.1 Introduction....10-1
10.2 Environmental Setting/Affected Environment....10-1
10.3 Environmental Impacts/Environmental Consequences 10-26
10.4 Mitigation Measures 10-55
11. Groundwater Quality 11-1
11.1 Introduction....11-1
11.2 Environmental Setting/Affected Environment....11-1
11.3 Environmental Impacts/Environmental Consequences 11-14
11.4 Mitigation Measures 11-35
12. Aquatic Biological Resources....12-1
12.1 Introduction....12-1
12.2 Environmental Setting/Affected Environment....12-1
12.3 Environmental Impacts/Environmental Consequences 12-51
12.4 Mitigation Measures 12-114
13. Botanical Resources....13-1
13.1 Introduction....13-1
13.2 Environmental Setting/Affected Environment....13-1
13.3 Environmental Impacts/Environmental Consequences 13-44
13.4 Mitigation Measures 13-112
14. Terrestrial Biological Resources....14-1
14.1 Introduction....14-1
14.2 Environmental Setting/Affected Environment....14-1
14.3 Environmental Impacts/Environmental Consequences 14-44
14.4 Mitigation Measures 14-126
15. Wetlands and Other Waters 15-1
15.1 Introduction....15-1
15.2 Environmental Setting/Affected Environment....15-1
15.3 Environmental Impacts/Environmental Consequences 15-13
15.4 Mitigation Measures 15-53
16. Geology, Minerals, Soils, and Paleontology....16-1
16.1 Introduction....16-1

Chapters **Pages**

16.2 Environmental Setting/Affected Environment....16-1
16.3 Environmental Impacts/Environmental Consequences 16-28
16.4 Mitigation Measures 16-62
17. Faults and Seismicity....17-1
17.1 Introduction....17-1
17.2 Environmental Setting/Affected Environment....17-1
17.3 Environmental Impacts/Environmental Consequences 17-24
17.4 Mitigation Measures 17-31
18. Cultural/Tribal Cultural Resources....18-1
18.1 Introduction....18-1
18.2 Affected Environment....18-1
18.3 Environmental Impacts/Environmental Consequences 18-36
18.4 Mitigation Measures 18-56
19. Indian Trust Assets 19-1
19.1 Introduction....19-1
19.2 Regulatory Background for ITAs 19-1
19.3 Environmental Setting/Affected Environment....19-2
19.4 Environmental Impacts/Environmental Consequences 19-7
19.5 Mitigation Measures 19-9
20. Land Use....20-1
20.1 Introduction....20-1
20.2 Environmental Setting/Affected Environment....20-1
20.3 Environmental Impacts/Environmental Consequences 20-18
20.4 Mitigation Measures 20-39
21. Recreation Resources....21-1
21.1 Introduction....21-1
21.2 Environmental Setting/Affected Environment....21-1
21.3 Environmental Impacts/Environmental Consequences 21-23
21.4 Mitigation Measures 21-59
22. Socioeconomics 22-1
22.1 Introduction....22-1
22.2 Environmental Setting/Affected Environment....22-1
22.3 Environmental Impacts/Environmental Consequences 22-14
22.4 Mitigation Measures 22-68
23. Environmental Justice....23-1
23.1 Introduction....23-1
23.2 Environmental Setting/Affected Environment....23-1
23.3 Environmental Impacts/Environmental Consequences 23-7
23.4 Mitigation Measures 23-19
24. Air Quality 24-1
24.1 Introduction....24-1
24.2 Environmental Setting/Affected Environment....24-1
24.3 Environmental Impacts/Environmental Consequences 24-12
24.4 Mitigation Measures 24-30
25. Climate Change and Greenhouse Gas Emissions 25-1
25.1 Introduction....25-1
25.2 Background....25-2
25.3 Greenhouse Gas Emissions....25-6
25.4 Climate Change....25-25

Chapters **Pages**

26. Navigation, Transportation, and Traffic 26-1
 26.1 Introduction....26-1
 26.2 Environmental Setting/Affected Environment....26-1
 26.3 Environmental Impacts/Environmental Consequences 26-18
 26.4 Mitigation Measures 26-40
27. Noise 27-1
 27.1 Introduction....27-1
 27.2 Environmental Setting/Affected Environment....27-1
 27.3 Environmental Impacts/Environmental Consequences 27-7
 27.4 Mitigation Measures 27-35
28. Public Health and Environmental Hazards 28-1
 28.1 Introduction....28-1
 28.2 Environmental Setting/Affected Environment....28-1
 28.3 Environmental Impacts/Environmental Consequences 28-18
 28.4 Mitigation Measures 28-34
29. Public Services and Utilities 29-1
 29.1 Introduction....29-1
 29.2 Environmental Setting/Affected Environment....29-1
 29.3 Environmental Impacts/Environmental Consequences 29-15
 29.4 Mitigation Measures 29-34
30. Visual Resources....30-1
 30.1 Introduction....30-1
 30.2 Environmental Setting/Affected Environment....30-1
 30.3 Environmental Impacts/Environmental Consequences 30-15
 30.4 Mitigation Measures 30-39
31. Power Production and Energy 31-1
 31.1 Introduction....31-1
 31.2 Environmental Impacts/Environmental Consequences 31-20
 31.3 Mitigation Measures 31-49
32. Relationship Between Short-term Uses and Long-term Productivity....32-1
 32.1 Introduction....32-1
 32.2 Short-term and Long-term Effects of the Alternatives 32-1
 32.3 Conclusion 32-5
33. Irreversible or Irretrievable Resource Commitments....33-1
 33.1 Introduction....33-1
 33.2 Commitments of Resources by the Project's Action Alternatives....33-1
 33.3 Potential Environmental Accidents....33-3
 33.4 Commitment of Future Generations to Similar Uses....33-4
34. Growth-inducing Impacts 34-1
 34.1 Introduction....34-1
 34.2 Environmental Impacts/Environmental Consequences and Growth-inducement Potential 34-2
 34.3 Mitigation Measures 34-26
35. Cumulative Impacts 35-1
 35.1 Introduction....35-1
 35.2 Cumulative Project Selection....35-2
 35.3 Cumulative Effects Analysis by Resource....35-15
36. Consultation and Coordination 36-1
 36.1 Introduction....36-1
 36.2 Notice of Preparation and Notice of Intent 36-1

Chapters **Pages**

36.3 Public Scoping 36-1
36.4 Consultation 36-3
36.5 Coordination 36-6
36.6 Draft EIR/EIS and Project/Action Approval Process 36-10

Glossary

Appendixes

Appendix 1 Introduction
- 1A Mitigation Monitoring Plan

Appendix 2 Alternatives Analysis
- 2A Alternatives Screening Process

Appendix 4 Environmental Compliance and Permit Summary
- 4A Environmental Compliance

Appendix 6 Surface Water Resources
- 6A Modeling of Alternatives
- 6B Water Resources System Modeling
- 6B1 Project Operations
- 6B2 River Operations
- 6B3 Delta Operations
- 6B4 Regional Deliveries
- 6C Upper Sacramento River Daily River Flow and Operations Modeling
- 6D Sensitivity Analysis Using the Latest CALSIM II Model

Appendix 7 Surface Water Quality
- 7A California State Water Resources Control Board Constituents of Concern of Water Bodies in the Study Area
- 7B Central Valley Regional Water Quality Control Board Basin Plan Criteria
- 7C Surface Water Quality Analysis for Electrical Conductivity at Proposed Intakes
- 7D Sacramento-San Joaquin Delta Modeling
- 7E River Temperature Modeling
- 7F Sites Reservoir Discharge Temperature Modeling

Appendix 8 Fluvial Geomorphology and Riparian Habitat
- 8A Sedimentation and River Hydraulics Modeling
- 8B Sacramento River Ecological Flows Tool

Appendix 10 Groundwater Resources
- 10A Groundwater Modeling

Appendix 11 Groundwater Quality
- 11A Groundwater Study Results 2007

Appendix 12 Aquatic Biological Resources
- 12A Aquatic Species Life Histories
- 12B Fisheries Impact Assessment Methodology
- 12C Fisheries Impact Summary
- 12D Water Temperature Index Value Selection Rationale
- 12E Fisheries Water Temperature Assessment Summary Tables
- 12F Reservoir Water Surface Elevation Summary Tables
- 12G Smelt Analysis
- 12H Early Life-Stage Salmon Mortality Modeling
- 12I Salmonid Population Modeling
- 12J Winter Run Chinook Salmon Life Cycle Modeling

12K Delta Passage Modeling
12L Weighted Useable Area Analysis
12M Sturgeon Analysis
12N Yolo and Sutter Bypass Flow and Weir Spill Analysis
Appendix 13 Botanical Resources
13A Special-Status Plant Species Potentially Occurring in Secondary Study Area Aquatic Habitats
Appendix 16 Geology, Minerals, Soils, and Paleontology
16A Soil Types within the Primary Study Area
16B Colusa County Fossil Sites
16C Results of the Paleontological Resources Literature Review
Appendix 21 Recreation Resources
21A Impact of Sites Reservoir Project Operations on Recreation-Day Benefit Values
21B Impact of Sites Reservoir Project Operations on Usability of Reservoir Boat Ramps
Appendix 22 Socioeconomics
22A Economics Analytical Framework
22B Reporting Metrics Tool
22C Regional Economics Modeling
22D Urban Water Supply Economics Modeling
22E Urban Water Quality Economics Modeling
22F Agricultural Supply Economics Modeling
Appendix 24 Air Quality
24A Methodology for Air Quality and GHG Emissions Calculations
Appendix 25 Climate Change and Greenhouse Gas Emissions
25A Climate Change and Sea Level Rise Sensitivity Analysis
25B Climate Change Sensitivity Analysis using WSIP Climate Change Projections
Appendix 28 Public Health and Environmental Hazards
28A California Superfund and Brownfield Sites
28B Mosquitoes and Other Vectors
28C Environmental Records Searches
Appendix 31 Power Production and Energy
31A Power Planning Study (PARO)
31B CVP-SWP Power Modeling
Appendix 34 Growth Inducing Impacts
34A Growth-Inducing Considerations for Municipal and Industrial Water Users
Appendix 36 Consultation and Coordination
36A Supplemental Scoping Report
36B Scoping Report

Tables

Pages

1-1 Primary Anticipated Permits, Approvals, and Authorizations for the Sites Reservoir Project...1-17
2-1 Summary of Dams and Embankment Volume of Potential Sites Reservoir Storage Sizes........2-15
2-2 Conveyance Facilities Alternatives Considered for Sites Reservoir..2-16
2-3 Sacramento River Direct Release Potential for the Sites Reservoir Conveyance Options.........2-18
2-4 Sites Reservoir Storage and Conveyance Options Combinations...2-20
2-5 Preliminary Sites Reservoir Storage and Conveyance Options Combinations..........................2-21
3-1 Comparison of New Project Facilities and Features and Existing Facilities Relied Upon...........3-3
3-2 Permanent Facility Footprint – Alternative A...3-9
3-3 Characteristics of Proposed 1.3-MAF Sites Reservoir Dams for Alternative A........................3-13
3-4 Sites Reservoir Project Onsite or Nearby Dam Materials...3-14
3-5 Sites Reservoir Inlet/Outlet Structure Tower Details 3-26
3-6 Sites Pumping-generating Plant Configuration for Alternative A 3-28
3-7 Characteristics of Project Roadways and South Bridge Approaches..3-35
3-8 Proposed South Bridge Characteristics...3-37
3-9 Characteristics of Proposed Minor Structures 3-37
3-10 Approximate Number of Facilities at the Recreation Areas..3-46
3-11 Aboveground Features Associated with the Proposed Delevan Pipeline 3-73
3-12 Permanent Facility Footprint − Alternative B..3-77
3-13 Characteristics of the Proposed Sites Reservoir Dams for Alternative B (and Alternatives C and D) 3-79
3-14 Proposed Sites Pumping-generating Plant Configuration for Alternative B 3-81
3-15 Permanent Facility Footprint – Alternative C..3-83
3-16 Sites Pumping-generating Plant Configuration for Alternative C 3-84
3-17 Permanent Facility Footprint − Alternative C_1 3-84
3-18 Permanent Facility Footprint − Alternative D 3-87
3-19 Approximate Number of Facilities at the Proposed Recreation Areas 3-88
3-20 Estimated Construction Durations and Equipment Days for Construction of Sites Reservoir Project...3-93
3-21 Expected Roadway Access Routes to Project Facilities 3-95
3-22 Project-related Construction Personnel and Highway Truck Trips 3-98
3-23 Estimated Equipment Hours for Operation and Maintenance of Sites Reservoir Project 3-100
3-24 Description of Proposed Seasonal Schedule for Project Operations 3-103
3-25 Comparison of Project Operations by Alternative..3-111
4-1 Applicable Federal, State, and Local Permits and Approvals...4-24
5-1 Impact Naming Convention for each of the Resources Evaluated 5-5
5-2 Overview of Sites Reservoir Project EIR/EIS Modeling Tools, Analytical Methods, and Applications 5-9
6-1 Summary of CVP and SWP Existing Conditions/No Project/No Action Condition Demands (TAF/Year) 6-12
6-2 Trinity River Record of Decision Annual Flow Volumes and Peak Flows...............................6-15
6-3 Stone Corral Creek Daily and Monthly Flows Near Sites, USGS 11390672 Period of Record 4/1/1958 – 9/30/1964 and 10/1/1965 – 9/30/1985 Drainage Area = 38.2 Square Miles 6-32
6-4 Colusa Basin Drain Daily and Monthly Flows at Highway 20 Period of Record 11/1/1944 - 9/30/1994 Drainage Area = 973 square miles..6-33

Tables **Pages**

6-5 Annual CVP Deliveries (TAF) Alternatives A, B, C, and D Compared to the Existing Conditions/No Project/No Action Condition 6-39
6-6 Annual SWP Regional Deliveries (TAF) Alternatives A, B, C, and D Compared to the Existing Conditions/No Project/No Action Condition 6-41
6-7 Sites Reservoir End of Month Storage (TAF) Alternatives A, B, C, and D Compared to the Existing Conditions/No Project/No Action Condition 6-52
6-8 Delevan Pipeline Intake/Discharge Facilities Monthly Flow (cfs) Alternatives A, B, C, and D Compared to the Existing Conditions/No Project/No Action Condition 6-53
6-9 Total Annual North-of-the-Delta Storage (TAF) 6-55
7-1 Designated Beneficial Uses within the Extended, Secondary, and Primary Study Areas 7-3
7-2 Water Quality Objectives for Temperature in the Trinity River 7-11
7-3 Trinity River Temperature Criteria for the Hoopa Valley Indian Reservation 7-12
7-4 Water Quality Objectives for Temperature in the Sacramento River 7-14
9-1 Sacramento River Basin Multi-Purpose Flood Management Reservoirs 9-3
9-2 Sacramento River Leveed Capacity 9-9
9-3 Feather River Leveed Capacity 9-9
10-1 Major Lithologic Units of the Sacramento Valley 10-9
10-2 Wells Located within a 1-mile Radius of the Proposed Sites Reservoir Footprint 10-18
10-3 Summary of Well Data by Well Type for Wells Located within a 1-mile Radius of the Sites Reservoir Footprint 10-19
10-4 Wells Located within a 1-mile Radius of the Proposed Holthouse Reservoir Complex and Terminal Regulating Reservoir Pipeline 10-20
10-5 Wells Located within 1 Mile of the Delevan Pipeline and Associated Facilities 10-21
10-6 Wells Located within a 1-mile Radius of the Terminal Regulating Reservoir Complex 10-25
12-1 Fish Species of Management Concern in Export Service Area Reservoirs in the Extended Study Area 12-4
12-2 Species of Management Concern in the Secondary Study Area 12-6
12-3 Fish Species of Management Concern in the Primary Study Area 12-45
12-4 Project Facilities in the Primary Study Area and the Potentially Affected Waterways 12-46
12-5 Fish Species Observed by CDFW during Sampling Efforts in the Proposed Sites Reservoir Inundation Area 12-49
12-6 Fish Species Observed by CDFW during Sampling Efforts in the Colusa Basin Drain 12-50
12-7 Construction- and Operation-related Impact Indicators 12-66
12-8 Summary of Mitigation Measures for Sites Reservoir Project Impacts on Aquatic Biological Resources 12-114
13-1 Invasive Weed Species Potentially Present in Wildlife Refuges Receiving Level 4 Water Supply in the Extended Study Area 13-3
13-2 Special-status Species Potentially Present in the Extended Study Area 13-6
13-3 Manual of California Vegetation Alliances in the Secondary Study Area 13-9
13-4 Number of Special-status Plant Species by Rank in the Secondary Study Area 13-10
13-5 Number of Special-status Plant Species by Region and Status 13-13
13-6 Vegetation Types within the Primary Study Area 13-31
13-7 Vegetation Types at Each Project Facility Location 13-35
13-8 Noxious Weed Species Known or Likely to Occur in the Primary Study Area 13-36
13-9 Federal- and State-listed Plant Species with Potential to Occur in the Primary Study Area 13-40
13-10 CNPS Rare Plant Rank 1, 2, and 3 Plant Species with Potential to Occur in the Primary Study Area 13-41
13-11 Special-status Plant Species and Occurrences Found during Field Surveys by Species for Surveyed Primary Study Area 13-43

Tables **Pages**

13-12 Permanent Vegetation Loss Due to the Construction of the 1.3-MAF Sites Reservoir and Associated Dams: Alternative A 13-65
13-13 Permanent Vegetation Loss and Temporary Disturbance Due to the Construction of Recreation Areas and Associated Electrical Distribution Lines: Alternative A 13-70
13-14 Permanent Vegetation Loss and Temporary Disturbance Due to the Construction of the Road Relocations and South Bridge: Alternative A 13-73
13-15 Permanent Vegetation Loss Due to Construction of the Sites Pumping/Generating Plant, Sites Reservoir Inlet/Outlet Structure, Sites Electrical Switchyard, and the Field Office Maintenance Yard: Alternative A 13-78
13-16 Permanent Vegetation Loss and Temporary Disturbance Due to the Construction of the Holthouse Reservoir Complex: Alternative A 13-81
13-17 Temporary Disturbance of Vegetation Communities Due to Modifications of the Glenn-Colusa Irrigation District Canal Facilities: Alternative A 13-85
13-18 Permanent Vegetation Loss and Temporary Disturbance Due to the Construction of the Terminal Regulating Reservoir Facilities: Alternative A 13-87
13-19 Permanent Vegetation Loss and Temporary Disturbance Due to the Construction of the Delevan and Terminal Regulating Reservoir Pipelines, Terminal Regulating Reservoir Pipeline Road, and Delevan Pipeline Electrical Switchyard: Alternative A........ 13-88
13-20 Temporary Disturbance of Vegetation Due to the Construction of the Sites/Delevan Overhead Power Line: Alternative A 13-92
13-21 Permanent Vegetation Loss Due to the Construction of the Delevan Pipeline Intake/ Discharge Facilities: Alternative A........ 13-95
13-22 Acres of Vegetation Types Within the Project Buffer: Alternative A 13-97
13-23 Acres of Vegetation Types Subject to Alternative A Construction Impacts........ 13-99
13-24 Permanent Vegetation Loss Due to the Construction and Filling of the 1.8-MAF Sites Reservoir and Associated Dams: Alternative B Compared to Alternative A 13-104
13-25 Temporary Disturbance of Vegetation Due to the Construction of the Sites/Delevan Overhead Power Line: Alternative B Compared to Alternative A 13-105
13-26 Permanent Vegetation Loss Due to the Construction of the Delevan Pipeline Discharge Facilities: Alternative B Compared to the Alternative A Delevan Pipeline Intake/ Discharge Facilities........ 13-106
13-27 Acres of Vegetation Subject to Alternative B Construction Impacts 13-107
13-28 Acres of Vegetation Types Subject to Alternative C Construction Impacts........ 13-109
13-29 Acres of Vegetation Types Subject to Alternative D Construction Impacts from Delevan Overhead Power Line and Substation........ 13-111
13-30 Summary of Mitigation Measures for North-of-the-Delta Offstream Storage Project Impacts on Botanical Resources 13-112
14-1 Wildlife Habitat Types within the Primary Study Area........ 14-18
14-2 Wildlife Habitat Types at Each Project Facility Location 14-22
14-3 State- and Federally Listed Terrestrial Wildlife Species that Potentially Occur in the Primary Study Area........ 14-23
14-4 Nearest Bank Swallow Colony Locations to the Delevan Pipeline Intake/Discharge Facilities........ 14-26
14-5 Terrestrial Wildlife Species of Special Concern that Potentially Occur in the Primary Study Area 14-29
14-6 Commercially or Recreationally Important Wildlife Species that May Occur within the Primary Study Area........ 14-42
14-7 Acres of Wildlife Habitat Subject to Direct Permanent Loss from the Construction and Filling of the 1.3-MAF Sites Reservoir and Associated Dams: Alternative A 14-69

Tables **Pages**

14-8 Avian Species Expected to Benefit from an Increase in Open Water Habitat within the Sites Reservoir Inundation Area 14-71
14-9 Permanent Wildlife Habitat Loss and Temporary Disturbance Due to the Construction of the Recreation Areas and Associated Electrical Distribution Lines: Alternative A 14-76
14-10 Permanent Wildlife Habitat Loss and Temporary Disturbance Due to the Construction of the Road Relocations and South Bridge: Alternative A........ 14-79
14-11 Acres of Wildlife Habitat Subject to Direct and Permanent Habitat Loss from Construction of the Sites Pumping/Generating Plant, Sites Reservoir Inlet/Outlet Structure, Sites Electrical Switchyard, and the Field Office Maintenance Yard: Alternative A........ 14-84
14-12 Permanent Wildlife Habitat Loss and Temporary Disturbance Due to the Construction of the Holthouse Reservoir Complex: Alternative A 14-87
14-13 Temporary Disturbance of Wildlife Habitat Due to Modifications of the Glenn-Colusa Irrigation District Canal Facilities: Alternative A........ 14-91
14-14 Permanent Wildlife Habitat Loss and Temporary Disturbance Due to the Construction of the Terminal Regulating Reservoir Facilities: Alternative A 14-93
14-15 Permanent Wildlife Habitat Loss and Temporary Disturbance Due to the Construction of the Delevan and Terminal Regulating Reservoir Pipelines, Terminal Regulating Reservoir Pipeline Road, and Delevan Pipeline Electrical Switchyard: Alternative A........ 14-96
14-16 Temporary Disturbance of Wildlife Habitat from Construction of the Sites/Delevan Overhead Power Line: Alternative A 14-101
14-17 Permanent Wildlife Habitat Loss Due to the Construction of the Delevan Pipeline Intake/Discharge Facilities: Alternative A........ 14-104
14-18 Acres of Wildlife Habitat within the Project Buffer: Alternative A 14-108
14-19 Acres of Wildlife Habitat Subject to Alternative A Construction Impacts........ 14-110
14-20 Permanent Wildlife Habitat Loss Due to the Construction and Filling of the 1.8-MAF Sites Reservoir and Associated Dams: Alternative B Compared to Alternative A 14-116
14-21 Temporary Disturbance of Wildlife Habitat Due to the Construction of the Sites/Delevan Overhead Power Line: Alternative B Compared to Alternative A 14-117
14-22 Direct and Permanent Wildlife Habitat Loss Due to the Construction of the Delevan Pipeline Discharge Facility: Alternative B Compared to the Alternative A Delevan Pipeline Intake/Discharge Facilities........ 14-119
14-23 Acres of Wildlife Habitat Subject to Alternative B Construction Impacts........ 14-120
14-24 Acres of Wildlife Habitat Subject to Alternative C Construction Impacts........ 14-122
14-25 Acres of Wildlife Habitat Subject to Direct Permanent Loss from the Construction and Operational Impacts from the Delevan Overhead Power Line and Substation: Alternative D........ 14-125
14-26 Summary of Mitigation Measures for NODOS Project Impacts to Terrestrial Biological Resources 14-126
14-27 Avoidance Distances and Restrictions for Nesting Species........ 14-130
15-1 Potentially Affected Wetlands and Other Waters in the Extended Study Area (National Wetlands Inventory Types)........ 15-2
15-2 Potentially Affected Waters in the Secondary Study Area: Rivers and Streams........ 15-4
15-3 Potentially Affected Waters in the Secondary Study Area: Lakes and Reservoirs........ 15-5
15-4 Potentially Affected Waters in the Secondary Study Area: Wetlands........ 15-5
15-5 Presence of Wetlands and Other Waters at Each Proposed Project Facility........ 15-7
15-6 Acre Summary of Wetlands and Other Waters in the Primary Study Area........ 15-8
15-7 Direct Loss of Wetlands and Other Waters Due to the Construction of the 1.3-MAF Sites Reservoir Inundation Area and Dams 15-20
15-8 Direct Loss of Wetlands and Other Waters Due to the Construction of the Recreation Areas 15-23

Tables **Pages**

15-9 Direct Loss of Wetlands and Other Waters Due to the Construction of the Road Relocations and South Bridge....15-26
15-10 Direct Loss of Wetlands and Other Waters Due to the Construction of the Sites Reservoir Inlet/Outlet Structure, Sites Pumping/Generating Plant, Sites Electrical Switchyard, Tunnel from Sites Pumping/Generating Plant to Sites Reservoir Inlet/Outlet Structure, and Field Office Maintenance Yard....15-29
15-11 Direct Loss of Wetlands and Other Waters Due to the Construction of the Holthouse Reservoir Complex....15-30
15-12 Direct Loss of Wetlands and Other Waters Due to the Construction of the TRR, TRR Pumping/Generating Plant, TRR Electrical Switchyard, and the GCID Main Canal Connection to the TRR....15-33
15-13 Direct Loss of Wetlands and Other Waters Due to the Construction of the Sites/Delevan Overhead Power Line East of the Sites Electrical Switchyard....15-34
15-14 Loss of Wetlands and Other Waters Due to the Construction of the Delevan Pipeline, Terminal Regulating Reservoir Pipeline, Terminal Regulating Reservoir Pipeline Road, and Delevan Pipeline Electrical Switchyard....15-36
15-15 Direct Loss of Wetlands and Other Waters Due to the Construction of the Delevan Pipeline Intake/Discharge Facilities....15-39
15-16 Affected Acres of Wetlands and Other Waters for All Project Facilities: Alternative A....15-42
15-17 Direct Loss of Wetlands and Other Waters Due to the Construction of the 1.8-MAF Sites Reservoir Inundation Area and Dams....15-44
15-18 Direct Loss of Wetlands and Other Waters Due to the Construction of the Delevan Pipeline Discharge Facilities....15-47
15-19 Affected Acres of Wetlands and Other Waters for All Project Facilities: Alternative B....15-49
15-20 Affected Acres of Wetlands and Other Waters for All Project Facilities: Alternative C....15-51
15-21 Summary of Mitigation Measures for Sites Reservoir Project Impacts to Wetlands and Other Waters....15-54
16-1 Fossils and Fossil Locations within the Extended Study Area....16-5
16-2 Fossils and Fossil Locations within the Secondary Study Area....16-10
16-3 Coast Range Rock Units in the Primary Study Area....16-13
16-4 Major Soil Types at Sites Reservoir (Alternative A)....16-18
16-5 Major Soil Types at Sites Reservoir (Alternatives B, C, and D)....16-18
16-6 Results of Paleontological Records Search by Geological Unit for the Primary Study Area....16-23
16-7 Great Valley Sequence Units in the Primary Study Area that Yield Megafossils....16-24
16-8 Paleontological Sensitivity of the Rock Units within 1 Mile of Any Proposed Primary Study Area Project Facility....16-27
16-9 Summary of Mitigation Measures for Sites Reservoir Project Impacts to Paleontological Resources....16-62
17-1 Comparison of Fault Activity Classification between the California Geological Survey and Division of Safety of Dams....17-2
17-2 Comparison of Richter Magnitude and Modified Mercalli Intensity....17-3
17-3 Regional Faults in the Secondary Study Area....17-8
17-4 Faults in Proximity to the Proposed Sites Reservoir and Sites and Golden Gate Dam sites....17-13
18-1 Built Environment Resources Identified Outside of the Sites Reservoir Inundation Area in the Primary Study Area....18-21
18-2 Native American Consultation Per AB 52....18-24
18-3 Summary of Mitigation Measures for Project Impacts on Cultural Resources....18-56
19-1 Federally Recognized Tribes in the Vicinity of the Extended, Secondary, and Primary Study Areas Organized by County....19-3

21-7 Lake Oroville Boat Ramp Bottom Elevations 21-18
21-8 Folsom Lake Boat Ramp Bottom Elevations 21-20
22-1 Counties in Water Delivery Regions – Extended Study Area 22-2
22-2 Historical, Current, and Projected Population and Average Annual Growth Rate within the Extended Study Area and California 22-2
22-3 Economic Activity within the Extended Study Area and California in 2015 (2015 Dollars) 22-3
22-4 Average Irrigated Acreage and Annual Value of Production (2008 to 2010) within the Extended Study Area (2010 Dollars) 22-3
22-5 Counties in Water Delivery Regions – Secondary Study Area 22-4
22-6 Historical, Current, and Projected Population and Average Annual Growth Rate within the Secondary Study Area and California 22-4
22-7 Economic Activity within the Secondary Study Area and California in 2015 (2015 Dollars) 22-5
22-8 Historical, Current, and Projected Population and Average Annual Growth Rate within the Primary Study Area and California 22-6
22-9 Age Distribution within the Primary Study Area Counties and California 22-7
22-10 Housing Distribution within the Primary Study Area and California 22-7
22-11 Personal Income and Industry Earnings within the Primary Study Area and California in 2015 (2015 Dollars) 22-8
22-12 Employment within the Primary Study Area and California in 2015 22-9
22-13 Employment by Industry for the Primary Study Area – Glenn County 22-9
22-14 Employment by Industry for the Primary Study Area – Colusa County 22-10
22-15 Demographics of the Primary Study Area 22-10
22-16 Glenn County General Fund Revenues and Expenditures 22-11
22-17 Colusa County General Fund Revenues and Expenditures 22-12
22-18 Glenn County Average Agricultural Production, 2012 to 2015 (2015 Dollars) 22-13
22-19 Colusa County Average Agricultural Production, 2012 to 2015 (2015 Dollars) 22-13
22-20 Permanent Change in Extended Study Area Regional Employment and Income Associated with Implementation of Alternative A when Compared to the Existing Conditions/No Project/No Action Condition 22-21

Tables **Pages**

22-21 Change in Acres and Value of Agricultural Production Associated with Implementation of Alternative A when Compared to the Existing Conditions/No Project/No Action Condition 22-23
22-22 Change in Volume and Cost of Groundwater Pumping Associated with Implementation of Alternative A when Compared to the Existing Conditions/No Project/No Action Condition 22-24
22-23 Change in M&I Water Supply Deliveries and Costs from Alternative A when Compared to the Existing Conditions/No Project/No Action Condition....22-25
22-24 Change in M&I Water Supply Salinity Costs Associated with Implementation of Alternative A when Compared to the Change from the Existing Conditions/No Project/No Action Condition....22-26
22-25 Temporary Change in Regional Employment and Income Associated with Implementation of Alternative A when Compared to the Existing Conditions/No Project/No Action Condition 22-27
22-26 Permanent Change in Regional Employment and Income Associated with Implementation of Alternative A when Compared to the Existing Conditions/No Project/No Action Condition 22-28
22-27 Change in Property Tax Receipts Associated with Implementation of Alternative A when Compared to the Existing Conditions/No Project/No Action Condition 22-30
22-28 Estimated Sites Reservoir Recreation Visitation and Expenditures Associated with Implementation of Alternative A 22-30
22-29 Change in Crop Acres and Value of Agricultural Production Associated with Implementation of Alternative A when Compared to the Existing Conditions/No Project/No Action Condition....22-31
22-30 Change in Extended Study Area Regional Employment and Income Associated with Implementation of Alternative B when Compared to the Existing Conditions/No Project/No Action Condition....22-33
22-31 Change in Acres and Value of Agricultural Production Associated with Implementation of Alternative B when Compared to the Existing Conditions/No Project/No Action Condition 22-35
22-32 Change in Volume and Cost of Groundwater Pumping Associated with Implementation of Alternative B when Compared to the Existing Conditions/No Project/No Action Condition 22-36
22-33 Change in M&I Water Supply Deliveries and Costs from Alternative B when Compared to the Existing Conditions/No Project/No Action Condition....22-37
22-34 Change in M&I Water Supply Salinity Costs Associated with Implementation of Alternative B when Compared to the Change from the Existing Conditions/No Project/No Action Condition....22-38
22-35 Temporary Change in Regional Employment and Income Associated with Implementation of Alternative B when Compared to the Existing Conditions/No Project/No Action Condition 22-40
22-36 Permanent Change in Regional Employment and Income Associated with Implementation of Alternative B when Compared to the Existing Conditions/No Project/No Action Condition 22-41
22-37 Estimated Sites Reservoir Recreation Visitation and Expenditures Associated with Implementation of Alternative B 22-43
22-38 Change in Crop Acres and Value of Agricultural Production Associated with Implementation of Alternative B when Compared to the Existing Conditions/No Project/No Action Condition....22-44

Tables **Pages**

22-39 Change in Extended Study Area Regional Employment and Income Associated with Implementation of Alternative C when Compared to the Existing Conditions/No Project/No Action Condition 22-45
22-40 Change in Acres and Value of Agricultural Production Associated with Implementation of Alternative C when Compared to the Existing Conditions/No Project/No Action Condition 22-47
22-41 Change in Volume and Cost of Groundwater Pumping Associated with Implementation of Alternative C when Compared to the Existing Conditions/No Project/No Action Condition 22-48
22-42 Change in M&I Water Supply Deliveries and Costs from Alternative C when Compared to the Existing Conditions/No Project/No Action Condition 22-49
22-43 Change in M&I Water Supply Salinity Costs Associated with Implementation of Alternative C when Compared to the Change from the Existing Conditions/No Project/No Action Condition 22-50
22-44 Temporary Change in Regional Employment and Income Associated with Implementation of Alternative C when Compared to the Existing Conditions/No Project/No Action Condition 22-52
22-45 Permanent Change in Regional Employment and Income Associated with Implementation of Alternative C when Compared to the Existing Conditions/No Project/No Action Condition 22-52
22-46 Estimated Sites Reservoir Recreation Visitation and Expenditures Associated with Implementation of Alternative C 22-54
22-47 Change in Crop Acres and Value of Agricultural Production Associated with Implementation of Alternative C when Compared to the Existing Conditions/No Project/No Action Condition 22-55
22-48 Change in Extended Study Area Regional Employment and Income Associated with Implementation of Alternative C when Compared to the Existing Conditions/No Project/No Action Condition 22-57
22-49 Change in Acres and Value of Agricultural Production Associated with Implementation of Alternative D when Compared to the Existing Conditions/No Project/No Action Condition 22-58
22-50 Change in Volume and Cost of Groundwater Pumping Associated with Implementation of Alternative D when Compared to the Existing Conditions/No Project/No Action Condition 22-59
22-51 Change in M&I Water Supply Deliveries and Costs from Alternative D when Compared to the Existing Conditions/No Project/No Action Condition 22-61
22-52 Change in M&I Water Supply Salinity Costs Associated with Implementation of Alternative D when Compared to the Change from the Existing Conditions/No Project/No Action Condition 22-62
22-53 Temporary Change in Regional Employment and Income Associated with Implementation of Alternative D when Compared to the Existing Conditions/No Project/No Action Condition 22-63
22-54 Permanent Change in Regional Employment and Income Associated with Implementation of Alternative D when Compared to the Existing Conditions/No Project/No Action Condition 22-64
22-55 Estimated Sites Reservoir Recreation Visitation and Expenditures Associated with Implementation of Alternative D 22-66
22-56 Change in Crop Acres and Value of Agricultural Production Associated with Implementation of Alternative D when Compared to the Existing Conditions/No Project/No Action Condition 22-67

Attachment 4: Existing Mitigation and Compliance

For each net public benefit claimed, where applicable, identify any existing environmental mitigation or compliance obligations that are accounted for in each net public benefit as of the date of the CalSim-II model product in section 6004(a)(1).

- *Applicants that use the CalSim-II and DSM2 models to analyze their projects can indicate "within models" for any existing environmental mitigation and compliance obligations contained in those models.*
- *If applicable to their claimed net public benefit such projects shall also list and account for the non-flow related mitigation and compliance obligations of the State Water Project and Central Valley Project.*

Introduction

This attachment describes how existing environmental mitigation and compliance obligations were handled in the WSIP application for Sites Reservoir.

All modeling for current, 2030, and 2070 with-project and without-project conditions presented in this application used the CalSim-II and DSM2 model products provided by the Commission for the WSIP application. The Sites Project does not modify, or in any other manner change the existing environmental mitigation and compliance obligations included within in these models.

Net public benefits were monetized for the following purposes:

- Ecosystem enhancement
- Recreation
- Flood Damage Reduction

Costs for all mitigation actions (flow-related and non-flow related obligations) identified in the draft environmental document, are included in the Basis of Estimate Report (see Sites_A8 Estimate under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB). The Mitigation Monitoring Plan is Appendix 1A in the Draft EIR/EIS (Posted at http://sitesproject.org/information/DraftEIR-EIS).

There are no additional mitigation or compliance obligations for recreation and flood control benefits. Potential ecological impacts are addressed through both operational constraints and mitigation actions. These are further elaborated on below.

Operations to Avoid and Mitigate Ecosystem Impacts

The proposed operation of the Sites Project incorporates additional mitigation and operational constraints to flexibly to adapt to a range of hydrologic conditions, to minimize impacts to prior right holders and the environment, to address various future uncertainties, and to allow for consideration of a range of future water management actions. The proposed operations include compliance with existing criteria and the addition of constraints that are not included in existing regulations. The proposed operational scenario incorporates three primary components:

1. Operating criteria for diversion of water when all other regulatory criteria are met (including diversion rate, duration of the diversion, the season of diversion and the water year type of the diversion) from the Sacramento River to fill the Sites Reservoir
2. Operating criteria for timing and rate of releases of water to achieve the primary objectives of the Project (and associated benefits) in specific year types (such as drought or driest periods) and other hydrologic conditions
3. Project cooperative operations with the CVP and SWP operations and facilities

The proposed Sites Reservoir would be filled through the diversion of Sacramento River water that originates from unregulated tributaries to the Sacramento River downstream from Keswick Dam. Sacramento River water would be diverted at the existing Hamilton City and Red Bluff diversion locations. Sacramento River water would also be diverted via a new Delevan intake and pipeline. Flows available for diversion are considered river flows in addition to those required to meet the following:

- Senior downstream water rights, existing CVP and SWP and other water rights diversions including SWP Article 21 (interruptible supply), and other more senior flow priorities (diversions associated with Freeport Regional Water Project and Los Vaqueros Reservoir)

- Existing regulatory requirements including State Water Resources Control Board D-1641, VPIA 3406(b)(2), the 2008 U.S. Fish and Wildlife Service biological opinion, and the 2009 National Marine Fisheries Service biological opinion and other instream flow requirements
- Flow conditions needed to maintain and protect anadromous fish survival and Delta water quality

Sacramento River flow diversions to Sites Reservoir would only take place when flow monitoring indicates that bypass flows are present in the river because of storm event flows. Several existing and additional proposed bypass flow criteria were assumed at specified locations, as part of the Project. These flow criteria are designed to make certain that available water would be diverted into Sites Reservoir to maintain and protect existing downstream water uses and environmental resources, as follows.

- A bypass flow of 3,250 cfs downstream from Red Bluff Diversion Dam must be present to maintain lows in the upper Sacramento River that are required in State Water Resources Control Board WR 90-5 to prevent dewatering salmonid redds and maintain water temperatures. Diversions at RBPP for filling Sites Reservoir would only be allowed when flows in the river are above the 3,250 cfs bypass flow criteria.
- Diversions at the Hamilton City intake for Glenn-Colusa Canal currently require a bypass flow of 4,000 cfs to prevent fish entrainment. Diversions at RBPP and Glenn-Colusa Canal intake for filling Sites Reservoir would only be allowed when flows in the river are above the 4,000-cfs bypass flow requirement downstream from Hamilton City.
- Diversions for filling Sites Reservoir would only be allowed when flows below Wilkins Slough were above 5,000 cfs, given the current minimum flow requirements. Wilkins Slough Navigation Control Point minimum flows currently range from 3,250 to 5,000 cfs, depending on hydrologic conditions.
- Diversions for filling Sites Reservoir would only be allowed when a Sacramento River flow of 15,000 cfs is present at Freeport in January; 13,000 cfs in December and February through June; and 11,000 cfs in all other months. This flow threshold protects and maintains existing downstream water uses and water quality in the Delta.

This operating strategy greatly reduces the impact associated with diversions.

To further address the potential for impacts to anadromous fish migration and impacts resulting from fish exposure to the proposed diversion facilities, the Project shall establish and fund an ongoing juvenile salmon trapping program and data collection network to collect real-time data to inform the operation of Sites diversions on behalf of minimizing potential fish impacts. The program shall be developed in coordination with CDFW and NMFS, and designed to augment and draw from other ongoing fish and environmental data collection efforts in the Sacramento River. The data collection and monitoring program is intended to inform the ongoing refinement of fish protection operations.

Based on proposed ongoing monitoring for fish presence, the Project shall protect naturally occurring, storm-induced pulse flows in the Sacramento River from October through May to minimize mortality of out-migrating juvenile winter-, spring-, fall- and late fall-run Chinook salmon, and steelhead. Fish protection shall be accomplished by managing diversions at the three Project diversion points during those pulse flow events that stimulate an important spike in juvenile salmon out-migration.

When a pulse in flow is followed by a rapid increase in juvenile salmon downstream migration, as detected by the monitoring program, the Sites Project will do the following:

- Manage diversions to limit potential impacts to juvenile salmon in the Sacramento River. The allowable level of diversion will be determined based on the results of fish monitoring and flow conditions, and different diversion rates may be assigned to operations during daylight and nighttime hours.

- The above limitations will apply to each diversion, and operations at each facility will be managed independently to fine-tune fish protection, to the extent possible. The limitations on diversion will remain in effect until real-time monitoring associated with that facility indicates that the out-migration pulse in juvenile salmon has past.

Pulse flows during periods of peak out-migration are expected to provide flow continuity between the upper and lower Sacramento River that will help support fish migration. It is recognized that research regarding the benefits of pulse flows is ongoing, and results of the Project monitoring program as well as further research and adaptive management will be needed to refine the pulse flow protection strategy.

This measure is expected to reduce potential mortality of juvenile salmon from the Sites Project during their peak out-migration periods by accomplishing the following: (1) minimizing the effects on fish exposed to the diversion facilities, (2) minimizing diversion-related effects on survival, and (3) minimizing reductions in migration travel time.

For impact analysis and simulation modeling purposes, pulse flow events are assumed to be initiated when the 3-day trailing average Bend Bridge flow exceeds 15,000 cfs. Such an event would be considered a “qualified” event limiting diversion if the pulse flow was greater than 15,000 cfs for 7 to 10 days. A pulse flow event would be considered terminated under the following conditions: (1) the 3-day trailing average flow remained greater than 15,000 cfs for 7 to 10 days after initiation (constituting a qualified pulse event), or (2) the 3-day trailing average flow dropped below 15,000 cfs before reaching the 7-day duration (not a qualified event). Up to one qualified pulse event would be recognized in each month during the pulse protection period to minimize potential impacts on fish migration. Diversions to Sites Reservoir storage would be restricted under the following conditions: (1) pulse conditions exist at Bend Bridge, and a qualified pulse event has not already occurred within the given month, and (2) Bend Bridge flows were less than 25,000 cfs during the pulse event (flows above 25,000 cfs are considered to provide lesser benefits to fish migration).

Benefit Calculation, Monetization, and Resiliency Tab

Attachment 5: Physical and Monetized Benefits

Provide additional information that supports the physical and monetary quantification of the public and non-public benefits and impacts of the project as required by subsection 6004(a)(4) of the regulations. This includes data, assumptions, analytical methods and modeling results, calculations and relevant sources of information. For reference documents or studies relied upon, applicants may provide links to an existing website in lieu of attaching those documents to the application.

A5.1 All Benefits

This section provides an overview of the analytic approaches, data, and calculations used for two or more of the benefit purposes to quantify their economic benefits. Subsequent sections discuss the analyses specific to the individual benefit purposes in more detail.

Table A5-1 shows the Sites Reservoir Project (project) purposes and benefits quantified and monetized for the Water Storage Investment Program (WSIP) Application. The key data, assumptions and analytical methods used to determine each project purpose's physical and monetary benefits are provided below. The following methodology discussion also describes the modeling results, calculations, and relevant information sources for the benefit analysis.

A5.1.1.a Analytic Methods

Table A5-1 shows (1) the analytic methods used to determine the monetized economic benefits for the WSIP Application and (2) the alternate methodologies considered for use for the economic benefit valuation analysis. In most cases, analyses using the alternate methodologies were also performed to evaluate their suitability for the WSIP Application's final benefit determination and to estimate the findings with their use.

The discussion of analytic methods in the following sections identifies and describes the analytic methods selected for use in the WSIP benefit value determination and those that were not selected.

Similarly, the discussion of the data, calculations, and modeling results below identifies and describes benefit valuation approaches that were selected and those that were not.

CALSIM II

The economic benefit analyses for project-provided water supply relied on CALSIM II modeling to quantify the project's expected future water deliveries under different water-year conditions. The California Water Commission's WSIP Technical Reference (November 2016) (TR) recognizes CALSIM II as "the model most capable of providing inter-regional or statewide analysis of water operations in the Central Valley of California." The WSIP TR also provides a detailed description of the CALSIM II model approach and use (TR, Section 4.3.8.9 and Appendix B).

Per WSIP TR recommendations, CALSIM II modeling was used to determine the project's future water supply deliveries under different water-year conditions to its expected water users and locations. The CALSIM II operational studies determined future water deliveries for both 2030 and 2070 conditions. The CALSIM II analysis also incorporated the WSIP TR required future climate change assumptions to determine its 2070 future water system operations and deliveries.

The CALSIM II analysis both accounts for water conveyance losses and recognizes water system operating constraints (both infrastructure and scheduling) to determine the water quantities that can be delivered to water users (whether municipal and industrial [M&I], agricultural, or for environmental improvement purposes).

Unless otherwise noted, CALSIM II was used to determine the water quantities that support the benefit valuation of the project purposes.

Table A5-1. Summary of Quantified Physical Benefits and Monetization Approaches

Benefit Type	Quantified Use	Physical Benefit Quantified	Selected Monetization Approach	Alternative Monetization Approaches
WSIP Public Benefits	Ecosystem Improvement – Anadromous Fish	Habitat Units	Alternative Cost	WSIP Unit Water Values; WSIP Unit Fish Values
	Ecosystem Improvement – Incremental Level 4 Refuge Water	Increased Deliveries	WSIP Unit Water Values	Alternative Cost
	Ecosystem Improvement – Oroville Coldwater	Stored Water	WSIP Unit Water Values	Alternative Cost
	Ecosystem Improvement – Yolo Bypass	Delivered Water	WSIP Unit Water Values	Alternative Cost
	Recreation	Visitation	Facilities Assessment and Unit Day Values	WSIP Recreational Visitation Model
	Flood Control	Flood Damage Reduction	Avoided Cost Savings	HEC-FDA
Non-WSIP Benefits	Water Supply – M&I, Agricultural, and Recaptured	Increased Deliveries	CWEST Modeling (M&I and Recaptured); WSIP Unit Water Values (Agricultural)	WSIP Unit Water Values (M&I and recaptured); SWAP (Agricultural)
	Hydropower	Generated Power	PARO/PLEXOS Modeling	—

CWEST = California Water Economics Spreadsheet Tool

M&I = municipal and industrial
PARO = Power and Risk Office (DWR)
PLEXOS = PLEXOS® Integrated Energy Model
WSIP = Water Storage Investment Program

Alternative Cost

The WSIP TR identified the Alternative Cost approach as an acceptable monetization approach for determining the economic benefit value for both WSIP public benefits and non-WSIP benefits. The Alternative Cost-benefit value for a project benefit is “the cost of the least-cost means of providing at least the same amount of physical benefit” (TR, Section 5.3).

In accordance with WSIP TR guidance, two alternative projects were identified and analyzed to provide comparable physical benefits as those that would be produced by Sites Reservoir: Shasta Lake Water Resource Investigation (SLWRI or “Shasta Raise”) and the proposed Auburn Dam Project. Due to its location on the Sacramento River upstream of Sites Reservoir, Shasta could readily provide water to the same end users as Sites Reservoir. The Auburn Dam would be on the American River, which is a tributary to the Sacramento River and therefore could also serve most of the benefit purposes of the Sites Reservoir. In addition, both alternative projects are large water storage projects that would provide major quantities of new water supplies. Given the large magnitude of the necessary water supplies for the project’s benefit purposes, it is highly unlikely that they could be obtained from existing water users, and if such long-term water transfers occurred, they would result in major adverse economic externalities (e.g., major reductions in agricultural-sector activity).

The United States Bureau of Reclamation (Reclamation) previously analyzed both alternative projects and determined them to be technically and economically feasible. Of the two, Shasta Raise has been most recently analyzed with its final feasibility study completed in 2015. Raising Shasta Lake Dam is projected to be substantially less costly to construct than Auburn Dam. In addition, there are major environmental concerns and other constraints to future construction of Auburn Dam. These concerns and constraints greatly reduce the likelihood that Auburn Dam would be authorized, funded, and constructed.

Consequently, Shasta Raise was determined to be the lower-cost and more-feasible alternative project. Enlargement of Lake Shasta was also determined to be the least-cost means to obtain similar ecosystem improvement and water supply outcomes. Therefore, the Shasta Raise was used as the basis for all Alternative Cost analyses for Sites Reservoir.

WISP Unit Water Values

The California Water Commission (CWC) provided unit values for water were used to estimate the willingness to pay for several of the project’s ecosystem improvement benefit purposes in accordance with the Technical Memorandum (TM) guidance (TR, Appendix D). WSIP Unit Water Values were also used to determine the economic benefits from the project’s future agricultural water supply increases. The unit values were then adjusted as appropriate to account for the delivered water’s additional benefit value to its users represented by the conveyance costs expected to be incurred in addition to the water transfer cost. This approach is consistent with the benefit valuation methodologies recently used by the feasibility analyses for Reclamation’s Draft Upper San Joaquin River Basin Storage Investigation (2015) and Shasta Lake Water Resource Investigation (2015). Both these analyses used a similar water transfer data set and model to develop base Unit Water Values that were then adjusted to include applicable conveyance costs and carriage losses to determine the full benefit value of the project’s water supplies to its water users.

However, the Sites Reservoir benefits valuation analysis conservatively only increased the WSIP unit water benefit values to account for the additional conveyance energy costs. As discussed below, a majority of the project's expected water users are likely to be SWP water contractors that may be able to obtain their future deliveries through the SWP with minimal non-energy conveyance costs. The Cal-Sim 2 water modeling incorporates allowance for water system losses in its calculation of the delivery quantities. It was unclear from the WSIP TM whether and to what extent its unit water values (i.e. its transfer transactions) implicitly included any allowances for significant delivery water losses in their transactions and in the absence if information on the general nature of the transfers it was considered potentially speculative to apply any such adjustment. Consequently, the Sites Reservoir made no delivery water loss adjustment to increase the WSIP unit benefit value as a conservative assumption.

However, if a 25 percent adjustment to the unit water benefit value (similar to that used by the Shasta Lake Water Resource Water Investigation Feasibility Analysis), was applied the corresponding benefit values for the benefit-purpose would be similarly increased. This would result in higher benefit values for the project and increased benefit cost and public benefit ratio findings for the project.

The WSIP TM guidance also notes an important limitation to the use of its unit values:

> "(U)nit water values are appropriate for relatively small incremental amounts of water supply relative to the existing water uses available as feasible alternative sources. If an action or water supply will provide a large amount of water relative to available alternative sources, then the unit values in Table 5-5 may not be appropriate."

As the WSIP TM acknowledges, there are several reasons why, under certain circumstances, the WSIP unit values would undervalue the benefits for specific water uses. The WSIP unit values implicitly assume that there would be a sufficient number of willing sellers for the price and quantity of water that could supply the water being valued. This assumption may be difficult to meet for large quantities of water (especially those quantities required for the project's anadromous fish or M&I deliveries).

The project would provide long-term, reliable deliveries. Such deliveries would contrast with the current water transfer market, which predominantly consists of limited-term contracts and where the demand, supply, and prices vary considerably depending on the recent and projected water-year type. The Sites Reservoir has been designed to add more than 340 thousand acre-feet (TAF) in new long-term water supplies to California's water supply for ecosystem improvements and water users through the state. Consequently, the project's total quantity of new water and that provided for its individual benefit purposes generally exceed past water transfer quantities. Therefore, it is highly unlikely that the water transfers implicit in the WSIP unit water values could actually occur—or be achieved—in a manner that would result in comparable water quantities and reliability as that provided by the project.

Furthermore, as the WSIP TM also notes, there may be major third-party effects (e.g., externalities or related adverse effects on employees and other businesses in related economic sectors) that are not represented in the unit water values, which focus on the compensation to water sellers. Major and/or long-term reallocations of water use resulting from water transfers can be expected to potentially result in direct and indirect economic impacts to the region's workers, supporting businesses, and consumers. The WSIP unit water values are predominantly derived from past water transfers and are therefore solely based on the financial relationship between the water buyer and sellers. As a result, these values incorporate costs or losses to third-party entities or the larger economy. Inclusion of any additional third-party costs would be expected to increase the unit values and hence the benefit values of other water sources. As a result, the WSIP unit water values are considered conservative benefit valuations for the project's new water supply.

As discussed below, Alternative Cost analysis for benefit monetization reported considerably higher benefit water use benefit values. Nonetheless, to be conservative in its analysis and findings, the WSIP benefit value analysis has selected WSIP unit water values to monetize the benefits of several of its ecosystem improvement purposes and future increased agricultural water deliveries.

LTGEN/SWP

Conveyance energy costs for the majority of locations expected to receive water supply deliveries were calculated by using the LTGen/SWP power with the Sites CALSIM II operations model. Conveyance cost information from the California Department of Water Resources (DWR), as reported in 2016 unit costs for State Water Project (SWP) system deliveries, was also evaluated.

WSIP Technical Reference Guidelines

Generally, the Sites Reservoir benefit valuation analysis closely follows the WSIP TR guidelines. As shown in Table A5-1, WSIP unit water values were used to estimate the economic benefit values for several project purposes. As permitted by the guidelines, alternate benefit valuation approaches can also be used, provided they are technically sound and adequately justified.

The rationale for each selected benefit monetization approach is provided below. Generally, additional analyses using the alternate methodologies were also performed to better understand the sensitivity of the findings of each benefit analysis. Consequently, the findings for both the selected and the alternate benefit monetization approaches are presented and discussed below.

Other key WSIP requirements generally applied to the benefit analysis include:

- A planning horizon totaling 100 years (including the project construction period) (Consequently, future project benefits were determined for the 93-year operating period of 2030 to 2122.)
- A discount rate of 3.5 percent to determine annualized average benefit values, net present values, and applicable interest during construction costs (TR, Section 5.2.4)
- Analysis of benefits and costs in constant 2015 dollars and adjusted to 2015 price levels (TR, Section 5.2.5)
- Escalation of pre-2015 cost and benefit values into constant 2015 dollars using the yearly average consumer price index for California (CPI-U) (TR, Section 5.2.6)

Whenever possible, future real energy costs were escalated 1.7 percent annually to 2024 (TR, Section 5.2.7). In cases where this energy price escalation could not be incorporated into the model analysis, additional analysis was performed to determine adjustments to the analysis results to approximate the expected effects of the prescribed future escalation in real energy prices.

A5.1.1.b Data and Assumptions

Water Supply Quantities

The CALSIM II modeling analysis accounts for water conveyance losses in its quantification of delivered water supplies. Consequently, no water loss adjustments were applied to WSIP Unit Water Values. Table A5-2 shows the 2030 and 2070 water-year incidence rates for both the Sacramento River and the San Joaquin River Hydrologic Regions. The 2070 water-year frequencies have been adjusted to account for the WSIP-required climate change assumptions (TR, Section 2.12 and Appendix A).

Table A5-2. Water-Year Type Incidence Rates by Hydrologic Region: 2030 and 2070

Year Type	Hydrologic Region			
	Sacramento River		San Joaquin River	
	2030	2070	2030	2070
Wet	30%	32%	26%	18%
Above Normal	15%	13%	20%	21%
Below Normal	21%	16%	15%	11%
Dry	20%	24%	18%	16%
Critical	15%	15%	22%	34%
Total	100%	100%	100%	100%

Source: Calculated from historical hydrologic year type information.
Note: Total may not sum exactly due to rounding.

The Sacramento River Hydrologic Region water-year incidence rates were used in the CALSIM II modeling to determine the Sites Reservoir water delivery quantities.

Water Supply Benefit Values

Table A5-3 provides the WSIP-recommended unit water values, as discussed in Section 5.3.3 (and more extensively in Appendix D) of the WSIP TR. The WSIP Unit Water Values shown below were based for statistical analysis of past water transfers and application of the Statewide Agricultural Production Model (SWAP), including assumptions to account for the effects of future implementation of the Sustainable Groundwater Management Act (SGMA).

As discussed in the WSIP TR, the unit water values are also based on actual past water transfer transactions and sale prices, which generally require the buyer to also cover the conveyance costs for the deliveries. As a result, the full water price paid by the water buyer will be the combined sales price and the conveyance costs. This combined price also more accurately represents the water user's full willingness to pay for the supplied water.

Table A5-3. WSIP Unit Water Values by Water Year and Location ($/AF)

Water-Year Type	Sacramento Valley	Delta Export
2030 – Unit Water Values ($/AF)		
Wet	$145	$205
Above Normal	$190	$255
Below Normal	$255	$265
Dry	$275	$285
Critical	$345	$360
2045 – Unit Water Values ($/AF)		
Wet	$150	$415
Above Normal	$200	$520
Below Normal	$265	$635
Dry	$285	$675
Critical	$355	$1,055

Source: WSIP TR, Appendix D, Table D6, Page D-11.

The CALSIM II analysis also accounts for the ability of the state's water system to deliver the water supplies to the expected users. The majority of the project's water supply deliveries will be for either north-of-the-Delta (NOD) users or south-of-the-Delta (SOD) users through the SWP to its water contractors. The conveyance costs for NOD users will be minor, both in terms of wheeling costs and energy use. To be conservative in the attributed benefits, they were assumed to be zero and the WSIP values for Sacramento Valley users were not adjusted. However, as discussed in more detail below, the energy necessary to convey water to SOD users will be a significant expense and will indicate additional willingness-to-pay value to the WSIP Unit Water Values. As a result, to represent the full value of water supplied to end users, the expected conveyance energy costs to those end users are added to the WSIP Unit Water Values to represent their actual willingness to pay and full benefit value.

The SWP generally has considerable unused service capacity (which CALSIM II has accounted for in its operational modeling). The current annual fees and charges for SWP water contractors are determined to ensure full recovery of the SWP system's annual capital and operating costs. For a variety of reasons, the SWP generally cannot provide its contractors with their full Table A allocation. As a result, SWP water contractors are expected to incur only the marginal cost of their system use to convey deliveries because they already fully meet their annual required capital share. The marginal cost for SWP users will be predominantly the additional energy use because cost increases for other system operation and maintenance (O&M) components would be minor. As a result, the benefit analysis conservatively limits its adjustments of WSIP Unit Water Values to SOD users' expected energy costs for conveyance. The actual values are discussed further in Section A5.1.1.c.

Table A5-4 provides the expected benefit start date and the percentage of their 2030 levels. The majority of benefits are expected to start in 2030, except for anadromous fish, Yolo Bypass, and flood damage reduction, as partial benefits will begin before the end of construction. In the case of hydropower (system) and recreation, a short initial ramp-up period is expected before their operations reach their full 2030 benefit levels in 2032.

The additional benefits occurring before the project operations begin in 2030 are not included in the annualized (2030 to 2122) values calculated for each benefit category below and are not reported in their modeling result. Consequently, the pre-operation benefits are also not included in the Sites_A3 Physical Monetized under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB, results. This approach was used to facilitate comparisons both between the study-year results (i.e., 2030 and 2070) with the annualized value and between different benefit categories.

Although the pre-construction benefits are relatively minor, they nonetheless should be included when determining the project's total benefits. Consequently, the pre-construction benefits are shown in Future Economic Benefit in Sites_A6 Annual Benefits Table under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB, and factored into the project's total net benefit value, benefit-cost ratio, and public benefit ratio calculations in Sites_A10 Allocation under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB, and Physical and Economic Benefits Summary in Sites_A11 Benefits Table under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB.

Table A5-4. Benefit Start Dates with Percentage of 2030 Benefits

Year	Anadromous Fish	Incremental Level 4 Refuge	Oroville Coldwater Pool	Yolo Bypass	Recreation	Flood Control	Water Supply	Hydropower (System)	Total Benefits
2024	—	—	—	—	—	—	—	—	—
2025	—	—	—	—	—	—	—	—	—
2026	10%	—	—	10%	—	50%	—	—	10%
2027	15%	—	—	15%	—	50%	—	—	10%

A5.1.1.c Calculations

Water Supply Projections

The CALSIM II model results for 2030 and 2070 were used as the basis for determining both future annual water use quantities during the interim period (i.e., 2031 to 2069) and the subsequent post-2070 period.

For the interim period, straight-line interpolation between the 2030 and 2070 model results was used to determine the expected 2031 to 2069 annual values for applicable project purposes.

Annual averages for each intervening year were calculated based on appropriate weighting of the water-year type for the Sacramento River Hydrologic Region (Table A5-5). The weightings for the interim period are determined as straight-line interpolations between the 2030 and the 2070 model results. The 2070 water quantities are used for all years after 2070. The 2070 water-year frequencies have been adjusted to account for the WSIP-required climate change assumptions (TR, Section 2.12; Appendix A).

Table A5-5. Water-Year Type Incidence Rates: Sacramento River Hydrologic Region

Year	Wet	Above Normal	Below Normal	Dry	Critical	Avg. Water Year
2030	30%	15%	21%	20%	15%	100%
2031	31%	15%	21%	20%	15%	100%
2032	31%	15%	20%	20%	15%	100%

Source: Based on historical hydrologic year type information.

Table A5-6 provides a representative calculation of the annual average based on the interpolation of the CALSIM II 2030 and 2070 water quantity projections for north-of-the-Delta agriculture water supplies.

Table A5-6. North-of-the-Delta Agricultural Water Deliveries (TAF/year)

Year	Wet	Above Normal	Below Normal	Dry	Critical	Avg. Water Year
2030	62	86	125	157	153	110
2031	63	87	125	157	152	111
2032	64	89	126	158	152	112
2033	65	90	127	158	151	112
2034	66	92	127	158	151	113
…	…	…	…	…	…	…
…	…	…	…	…	…	…
2066	105	140	149	161	135	135
2067	106	141	150	161	134	135
2068	107	143	151	161	134	136
2069	109	144	151	161	133	137
2070	110	146	152	161	133	137
2071	110	146	152	161	133	137
2072	110	146	152	161	133	137

Estimated Annual WSIP Unit Water Values

Unit Water Values were interpolated on a straight-line basis between 2030 and 2045 to derive water annual unit estimates for each year between 2031 and 2044. The 2030 unit values were used for all years before 2030. The 2045 unit values were used for all years after 2045.

The average water-year value is calculated based on hydrologic regions, with Sacramento Valley prices based on the Sacramento River Hydrologic Region and the Delta Export value based on the San Joaquin River Hydrologic Region. As the relative weightings during the interim period are determined by straight-line interpolation between the 2030 and the 2070 model results, the average annual value can vary through 2070. Table A5-7 provides a representative selection of these values.

Water sold to south-of-the-Delta water users will also necessarily incur the conveyance energy cost. This cost is in addition to the WSIP Unit Water Values, which were largely determined based on past water transfer transactions. Buyers typically negotiate purchase of the water from the seller's location. As a result, the buyer then incurs the wheeling and energy cost to convey the water to its location. As discussed previously, the conveyance energy costs estimates were based almost entirely on LTGEN/SWP energy use modeling. DWR data were used to project the conveyance energy cost only for American Canyon water district deliveries, which was not estimated by the LTGEN/SWP energy use models.

Table A5-7. Adjusted WSIP Unit Water Values ($/AF)

Year	WSIP Unit Water Value		Average Conveyance Energy Cost [a]	Adjusted WSIP Unit Water Value	
	Sacramento Valley	Delta Export		Sacramento Valley	Delta Export
2028	$229	$272	$185	$229	$457
2029	$230	$298	$185	$230	$483
2030	$229	$272	$185	$229	$457
2031	$230	$298	$185	$230	$483

2072	$238	$621	$185	$238	$806

Source: WSIP TR, Table D6, Page D-11 and LTGEN/SWP energy use modeling.
[a] Average conveyance cost for deliveries to south-of-the-Delta water contractors based on LTGEN/SWP energy use modeling.

- No conveyance adjustment was applied to north-of-the-Delta deliveries because the energy use for those water quantities would be limited.
- No conveyance cost adjustment was made for agricultural water supplied to north-of-the-Delta users (per discussion in Section A5.1.1.b, above).
- The estimated average conveyance energy cost for south-of-the-Delta agricultural water users was $185/AF.
- Unit Water Values were interpolated on a straight-line basis between 2030 and 2045. Constant Unit Water Values were applied after 2045. Note that average water values still change between 2045 and 2070 based on changing water supply quantities due to climate change.
- San Joaquin River Hydrologic Region water-year incidence rates are used to determine applicable unit values for Delta export deliveries.

The WISP Unit Water Values (see Table A5-3) were applied to the CALSIM II projected future water supply quantities (interpolated between 2030 and 2070). The WISP unit water values were also applied based on (1) expected water-year type frequencies and (2) use location. Based on these factors, weighted average unit prices were calculated specifically for each year in the study period. The WSIP Unit Water Values were also adjusted to include the additional conveyance energy cost required for its future use, as shown in Table A5-7.

A5.1.1.d Modeling Results

Table A5-8 shows the summary results of the average water quantities used by each project purpose. Several purposes are water non-consumptive and/or indirectly rely on project-related water (e.g., hydropower, recreation); consequently, they do not have any applicable assigned water use quantities.

Table A5-8. Summary of Quantified Water Use by Purpose (TAF/year)

Period	WSIP Public Benefits			Non-WSIP Benefits			Total Water
	Coldwater Pool [a]	Yolo Bypass	Incremental Level 4 Refuge	Agricultural Water Supply	M&I Water Supply	Recaptured Water Supply	
2030	109	39	35	137	106	11	437
2045	102	39	33	148	110	11	443
2070	90	39	31	167	117	11	455
Average (2030-2122)	**94**	**39**	**32**	**161**	**114**	**11**	**451**

[a] Includes coldwater pool improvements for both Shasta Lake and Lake Oroville

The modeling results for each specific project purpose are reported and discussed under their corresponding section below.

A5.2 Ecosystem Improvement (WSIP Eligible Benefits)

Sites Reservoir would provide a variety of ecosystem benefits. Four distinct ecosystem benefits were quantified and monetized. Table A5-9 summarizes the physical benefits that were quantified and monetarized for the WSIP Application.

Table A5-9. Ecosystem Physical Benefits Quantified and Monetized

Benefit Category	Location	Physical Benefit Monetized
Anadromous Fish	Sacramento River watershed between Keswick Dam and Red Bluff	Increase in habitat units as determined by SALMOD
Incremental Level 4 Refuge Water Supply	National Wildlife Refuges, State Wildlife Areas, and privately managed wetlands	Increase in Incremental Level 4 refuge water supplies to achieve optimum habitat management
Lake Oroville Coldwater Pool	Lake Oroville	Additional water stored in Lake Oroville to provide temperature and flow improvements for anadromous fish
Yolo Bypass Flows	Yolo Bypass discharging to the Sacramento River	August through October releases from Sites Reservoir to Yolo Bypass

The specific analysis approach and results for each ecosystem improvement purpose are provided below.

A5.2.1 Anadromous Fish

Sites Reservoir provides a variety of benefits to anadromous fish. The Salmon Population Model (SALMOD) results were used to determine the cost of an alternative project to raise the dam at Shasta Lake to estimate the benefits to anadromous fish.

A5.2.1.a Analytic Methods

Salmon Population Model (SALMOD)

SALMOD simulates the dynamics of the freshwater life history of anadromous and resident salmonid populations using streamflow, water temperature, and habitat type. SALMOD combines flow and temperature information to forecast the population of Chinook salmon in the Sacramento River watershed between Keswick Dam and Bend Bridge, near Red Bluff. It provides potential fish production values reflecting the suitability of riverine habitat for Winter-run, Spring-run, Fall-run, and Late-Fall-run Chinook salmon. The model simulates salmon habitat conditions in the Sacramento River between Keswick Dam and Bend Bridge.

Alternative Cost – Shasta Lake Dam Raise (WSIP Benefit Monetization Approach)

Sites Reservoir would enhance future water temperature and flow conditions in the Sacramento River as a means of improving the riverine ecosystem. The economic benefits of the project's contributions to anadromous fish survival were estimated based on the Alternative Cost approach. As discussed in Section A5.1.1.a, this approach involves identifying the next-best (i.e., least-cost) alternative project to achieve the same outcomes (i.e., increasing salmon habitat) and using its development cost to represent the project's benefits.

Unlike other possible benefit valuation approaches (e.g., use of WSIP Unit Water Values), the Alternative Cost approach relies on direct comparisons of the two projects' expected fishery benefits for the Sacramento River as modeled by SALMOD. The Alternative Cost approach also represents a more permanent and reliable basis for the fish habitat improvement than that represented by reliance on future water transfers and changes in future water use.

Consequently, it was considered that the Alternative Cost of the Shasta Lake Dam raise would provide the most direct and reliable benefit valuation, and therefore this method was selected for use in the WSIP benefit valuation of the project's anadromous fish benefits.

WSIP Unit Water Values (Alternate Monetization Approach)

As previously discussed in Section A5.1.1.a, WSIP Unit Water Values modeling can also be used to determine the project's ecosystem benefits. However, to represent the project's anadromous fish benefits, the project's expected habitat unit improvements were not determined directly but instead were based on an estimated equivalent water quantity that would allow Shasta Lake to maintain its coldwater pool sufficiently and deliver the water supplies necessary to improve the fishery habitat conditions along the Sacramento River.

Based on the estimated water supply quantities, adjusted WSIP Unit Water Values can be applied to derive a corresponding anadromous fish benefit valuation. The appropriate Unit Water Values for the benefit valuation should be based on the expected likely source of the water to be "transferred" to replace the reduced Shasta deliveries.

WSIP Unit Fish Values (Alternate Monetization Approach)

The WSIP TR also provides guidance on benefit valuations for fishery recovery benefits based on escapement projections for winter-run and spring-run Chinook salmon (TR, Section 5.4.2.2; Appendix E). The WSIP TR indicates that a benefit of $100,000 per fish-year (one fish escaping one year) is reasonable. The TR recommended value for non-listed fall-run Chinook salmon is $2,500 per fish-year.

Although SALMOD and other fish models can be used to project future increases in smolt and juvenile salmon populations, no fish models are available to project the project-related future improvement in escapement for the Sacramento River. However, general estimates of expected juvenile fish survival rates were used to derive preliminary anadromous fish benefit values based on the WSIP Unit Fish Values.

A5.2.1.b Data and Assumptions

The cost of the most likely feasible alternative to the Sites Reservoir was based on various Shasta Lake Dam raises operated solely for the purpose of increasing the number of salmon smolt in the Sacramento River. As discussed in Section A5.1.1.a, the Shasta Lake Dam raise is considered a feasible alternate source based on the key factor that its additional surface storage could ensure the availability of a greater and new supply of coldwater to reduce downstream water temperatures on the Sacramento River. The Shasta Lake Dam raise would benefit the same anadromous fish populations' locations and therefore result in the same ecosystem improvement outcomes. The Shasta Lake Dam raise could thereby also achieve the same benefits as Sites Reservoir would. Furthermore, recent extensive planning and analysis for the Shasta Lake Dam raise provides greater confidence in both the accuracy of its construction cost estimates and its potential implementation viability.

Nevertheless, the Shasta Lake Dam raise cost estimates are expected to result in conservative Alternative Cost-benefit valuations because the 2015 Final Feasibility Report construction cost estimates likely underestimate the actual full construction cost for its future storage expansion. Higher construction costs (or reduced ecosystem improvement outcomes) for the Shasta Lake Dam raise alternative would increase the Alternative Cost benefit values attributable for the Sites Reservoir project.

Key factors contributing to the Alternative Cost approach's underestimate of the project's benefit values include:

- The 2015 construction cost estimates do not factor in the full costs that would be necessary for project development. Given the project's unavoidable adverse wild and scenic river impacts and the current level of known opposition to the project, actual development of the project may be expected to be more costly and time-consuming than anticipated by the Feasibility Study analysis. The costs for overcoming the likely environmental and legal challenges to the project could significantly increase its overall future development cost.
- The schedule necessary to complete any expansion of Shasta Lake would be expected to be considerably longer than the schedule to complete Sites Reservoir not only because of the previously discussed environmental and legal challenges expected for a Shasta Lake Dam raise, but also because of the need to rely on Federal appropriations. On a present value basis, all else being equal, a 10-year delay in construction completion would result in nearly a 30 percent comparative reduction in the project's first year of benefits.

- Salmon populations within the Sacramento River and other related water systems are in decline and their future viability threatened by deterioration in river and habit conditions. Delayed development would result in further declines in fishery habitat and Chinook populations before any project-related ecosystem improvements would occur. The resulting habitat and population losses would reduce the comparative effectiveness of the eventual Shasta Lake expansion. In this case, the unit benefit cost of the Shasta Lake alternative would increase and result in a higher Alternative Cost benefit valuation for the project.
- The WSIP 2030 baseline scenario presumes overly optimistic Shasta Lake storage levels and coldwater conditions. It is equally probable that the future 2030 conditions at Lake Shasta will in fact have lower storage conditions. Past and current Federal government operation and management of the Central Valley Project (CVP) suggest that actual future 2030 conditions for Shasta Lake would be expected to have lower storage levels and reduced coldwater conditions. As a result, the project's comparative ecosystem improvement is underestimated, which reduces its quantified physical improvements and related benefit values. Furthermore, the near-term occurrence of this benefit diminishment results in a greater underestimate in the benefit valuation because the present value calculations give greater weight to the project's early-year benefits.

These factors indicate that the benefit value for Sites Reservoir as derived from the Alternative Cost approach applied to the Shasta Lake Dam raise should be recognized as conservative benefit valuations that likely understate the actual full benefit values of the ecosystem improvements resulting from Sites Reservoir.

A5.2.1.c Calculations

Fish Population Projections

Table A5-10 presents the projected increases in future fish population and habitat units by type of fish for 2030, 2070, and the annual average in the 2030 to 2122 study period. The SALMOD results show that the project would result in greatly increased future anadromous fish habitat improvements. This outcome is largely attributable to the projected deterioration in future water conditions for salmon species as a result of future climate change effects.

Table A5-10. SALMOD Results for 2030 and 2070 (TAF/year)

Run	No Action (# of fish/yr)	Average Increase (# of fish/yr)	Habitat Units	Dry Yr Increase (# of fish/yr)	Critical Yr Increase (# of fish/yr)	Dry & Critical Yr Increase (# of fish/yr)
2030 SALMOD Results						
Fall-Run Chinook	32,275,104	435,138	435	19,893	1,493,430	609,308
Late Fall-Run Chinook	7,911,118	70,188	70	57,277	208,800	117,886
Winter-Run Chinook	3,892,177	20,627	21	-62,557	207,285	45,380
Spring-Run Chinook	866,601	13,331	13	14,088	40,324	24,582
Total All Runs		**539,284**	**539**	**28,701**	**1,949,839**	**797,156**
2070 SALMOD Results						
Fall-Run Chinook	27,506,156	1,454,968	1,455	2,574,746	3,427,234	2,915,741
Late Fall-Run Chinook	7,525,505	235,595	236	169,866	1,137,267	556,826
Winter-Run Chinook	3,711,513	84,433	84	-12,471	673,467	261,904
Spring-Run Chinook	688,048	47,068	47	69,601	42,975	58,951
Total All Runs		**1,822,064**	**1,822**	**2,801,742**	**5,280,943**	**3,793,422**
Average (2030–2122)						
Long-Term Average		**1,539,301**	**1,539**	**2,190,480**	**4,546,667**	**3,132,955**

Figure A5-1 shows the percentage growth in population increase projected for each fish-type population in both 2030 and 2070.

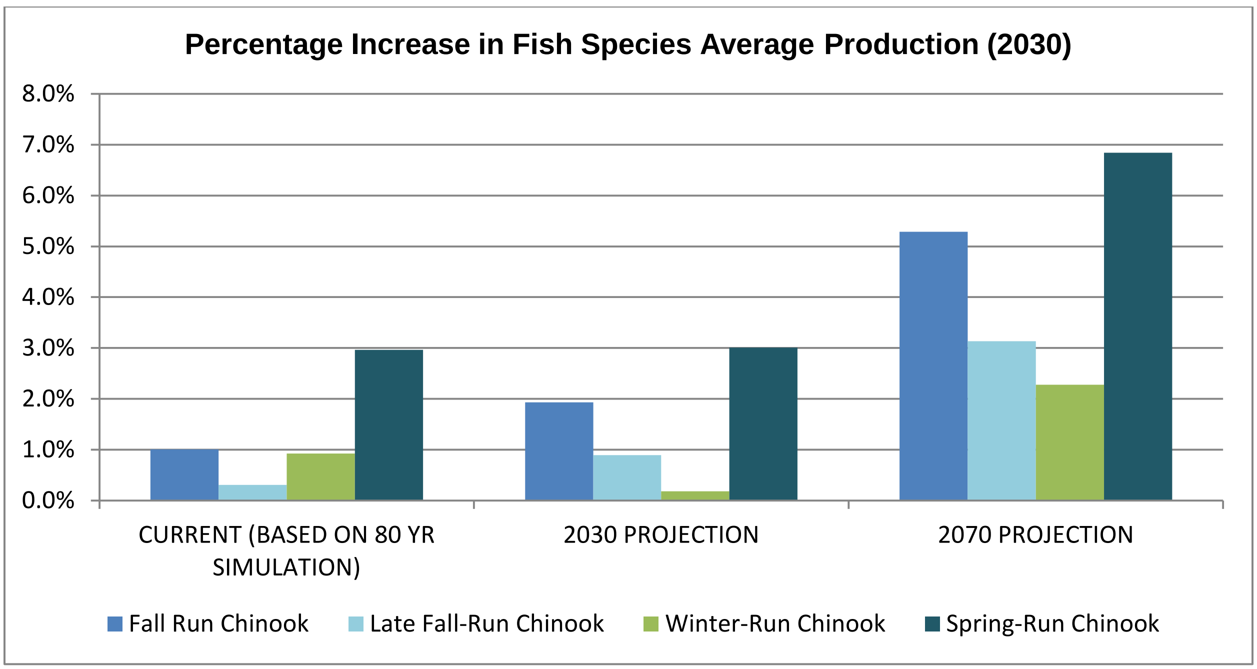

Figure A5-1. Percentage Increase in Fish Species Average Production for 2030 and 2070

As shown in Table A5-10, in 2030, 6.3 percent of the fish population increase would be composed of the Federal-protected Winter- and Spring-run Chinook, increasing to 7.2 percent in 2070. For the purposes of the WSIP Unit Fish Value approach, it was assumed 1 percent of the increased fish population would subsequently return as adults to spawn.

Alternative Cost (Selected Monetization Approach)

Sites Reservoir's anadromous fish benefits were estimated based on the least-cost alternative of expanding Shasta Lake's future storage with a 12.5-foot raise of Shasta Dam as a single-purpose water storage project that would provide increased habitat units.

The base construction cost for the Shasta Lake Dam raise was obtained from the 2015 Shasta Lake Water Resource Investigation Feasibility Study. The costs were adjusted into 2015 dollar terms and annualized using a 3.5 percent discount rate in accordance with the WSIP TR requirements. Table A5-11 shows the estimated single-purpose cost for six Shasta Lake Dam raise alternatives with their projected habitat unit improvement and the corresponding unit cost per habitat unit.

Table A5-11. Salmon Production and Annual Costs for Shasta Lake Dam Raise Scenarios

Dam Raise (feet)	Habitat Units (HU) [a]	2014$		2015$	
		Annual Cost ($1,000s)	Cost per Habitat Unit ($/HU)	Annual Cost ($1,000s) [b]	Cost per Habitat Unit ($/HU)
0.5	63	$35,585	$564,840	$36,103	$573,059
1.7	212	$36,407	$171,729	$36,936	$174,228
3.2	381	$37,771	$99,137	$38,321	$100,580
6.5	684	$40,831	$59,694	$41,425	$60,563
12.5	988	$46,295	$46,857	$46,968	$47,539
18.5	975	$51,761	$53,088	$52,514	$53,860

Source: Reclamation, Shasta Lake Water Resource Investigation Feasibility Study (2015).
[a] Each habitat unit equals 1,000 additional salmon produced.
[b] Costs have been adjusted into 2015 dollars and are based on a 3.5 percent annual discount rate.

Table A5-11 indicates that the 12.5-foot dam raise at Shasta Lake Dam is both the most-productive alternative, with 988 new habitat units, and the most cost-effective, with a unit cost of $47,539 per habitat unit. This unit value was applied as a conservative benefit value estimate for Sites Reservoir's anadromous fish benefit.

Table A5-12 shows the project's 2030, 2045, 2070, and annualized average over the project's entire 2030 to 2122 study period based on their corresponding SALMOD-projected increase in future habitat units. As shown in Table A5-12, the project's future increase in habitat units is projected to be up to 1,822 in 2070 and average 1,539 habitat units over the 93-year study period for the project.

Table A5-12. Estimated Anadromous Fish Benefits: Alternative Cost (2015$)

Year	Fishery Improvement Habitat Unit	Benefit Value	
		Unit Value $/Habitat Unit	Total ($1,000s)
2030	539	$47,539	$25,637
2045	1020	$47,539	$48,505
2070	1,822	$47,539	$86,619
Annualized (2030–2122) [a]	**1,539**	-	**$56,985**

[a] Annualized average benefit value is calculated using net present value over 93 years and a 3.5 percent discount rate.

The project's future habitat conditions would average 551 habitat units (56 percent increase) more than those provided by the 12.5-foot Shasta Lake Dam raise. The 2070 habitat conditions would be nearly 834 habitat units (84 percent increase) higher than the Shasta Lake Dam raise would achieve.

Nonetheless, the 12.5-foot Shasta Lake Dam raise benefit value was used because (1) no other alternative projects could be identified that would result in comparable higher habitat improvements for the Sacramento River; and (2) no other suitable project could be developed in conjunction with the 12.5-foot Shasta Lake Dam raise to provide the additional 834 habitat units in 2070. Furthermore, the fish habitat improvement results for the 18.5-foot raise suggest that any further economies of scale are unlikely to occur with higher raises of the Shasta Lake Dam.

As a result, it was considered reasonable and conservative to use the unit benefit value from the Shasta Lake Dam raise to estimate future anadromous fish benefits at Sites Reservoir.

WSIP Unit Water Values (Alternative Monetization Method)

Preliminary operational analysis determined that for 2030 conditions an approximately 83 TAF increase in end-of-September storage at Shasta Lake should be sufficient to result in the coldwater improvements necessary to achieve the corresponding 539 habitat unit increase. Under 2070 conditions, approximately a 59 TAF increase in end-of-September storage at Shasta Lake should be sufficient to result in the coldwater improvements necessary to achieve the corresponding 1,822 habitat unit increase. As discussed in Section A5.2.1.b, above, these values are expected to be conservative.

The economic benefits of the increase in anadromous fish were also estimated using the adjusted WSIP unit water values (see Table A5-7) applied to the projected average annual delivery quantities on a year-by-year basis over the project's entire 2030 to 2122 study period. WSIP unit water values are for Delta export and include conveyance energy adjustment because the water would otherwise be used in the south-of-the-Delta area. Table A5-13 shows the estimated annual benefit values of future anadromous fish in 2030, 2045, 2070 and as an annualized average over the project's entire 2030 to 2122 study period.

Table A5-13. Estimated Anadromous Fish Benefits: WSIP Unit Water Values (2015$)

Year	Fishery Improvement (Supply Equivalent) TAF	Benefit Value: WSIP Unit Water Value $/AF	Benefit Value: Total ($1,000s)
2030	83	$457	$38,042
2045	74	$828	$61,408
2070 [b]	59	$806	$47,684
Annualized (2030–2122) [a]	**65**	**—**	**$51,069**

[a] Annualized average benefit value is calculated using net present value over 93 years and a 3.5 percent discount rate.
[b] The 2070 unit value is lower than the 2045 unit value because of the change in the hydrological year type incidence result in a wetter average year.

However, these benefit values do not account for any adverse economic effects of such a permanent and major shift in water use (e.g., for agricultural-dependent businesses and workers) that would increase the societal value of the continued use of the water for agricultural production. Allowances for that and other factors (e.g., difficulty and limited options for increasing habitat units) can be expected to explain the differential between the WSIP unit and Alternative Cost benefit value estimates.

WSIP Unit Fish Values (Alternative Monetization Method)

The project's anadromous fish economic benefits were also estimated using the WSIP Unit Fish Values (Section A5.2.1.a). Unit fish values for Fall-run, Winter-run, and Spring-run Chinook salmon were applied to their expected project-related increases in their 2030 and 2070 populations. Table A5-14 shows the estimated annual benefit values of future anadromous fish increases in 2030, 2045, 2070, and as an annualized average over the project's entire 2030 to 2122 study period.

Table A5-14. Estimated Anadromous Fish Benefits: WSIP Unit Fish Values (2015$)

			Benefit Value	
	Fishery Improvement		WSIP Unit Fish Value	Total
Year	**Fall-Run Chinook**	**Winter- & Spring-Run Chinook**	**$1,000/Fish**	**($1,000s)**
2030	5,053	340	$2.5/$100	$46,591
2045	9,498	705	$2.5/$100	$94,281
2070	16,906	1,315	$2.5/$100	$173,765
Annualized (2030–2122) [a]	**14,293**	**1,100**	**—**	**$111,966**

[a] Annualized average benefit value is calculated using net present value over 93 years at a 3.5 percent discount rate.

The WSIP Unit Fish Value approach resulted in much higher benefit value estimates than those obtained from the Alternative Cost approach. Therefore, as a conservative assumption and in accordance with WSIP TM guidance, WSIP Unit Fish Value approach was not used to estimate Sites Reservoir's anadromous fish benefits.

A5.2.1.d Modeling Results (Selected Monetization Approach)

Table A5-15 shows Sites Reservoir's anadromous water supply benefits as estimated based on the 12.5-foot raise of Shasta Dam as the least-cost alternative to the project.

Table A5-15. Anadromous Fish Benefits: Least-Cost Alternative (2015$; $1,000s)

	Annual Benefits [a]		
Alternative	**2030**	**2070**	**Annualized Benefit** [b]
Average Conditions [c]			
Sites Reservoir	$25,637	$86,619	**$56,985**[a]

[a] Based on 12.5-foot raise of Shasta Dam as the Alternative Cost for achieving the ecosystem improvement.
[b] Annualized benefits are interpolated annual physical benefits between 2030 and 2070 and then constant after 2070. Annualized benefits calculated as net present value over 93 years at a 3.5 percent discount rate.
[c] Averaged over the entire hydrologic sequence (1922 to 2003).

The project's Anadromous Fish benefits were estimated to increase from $25.6 million in 2030 to approximately $86.6 million in 2070. The corresponding annualized benefit for the future 2031 to 2132 operating period was estimated to be $57.0 million. As discussed above this was based on an estimated average unit benefit value of $47,539 per habitat unit.

A5.2.2 Incremental Level 4 Refuge Water Supply

Sites Reservoir will increase water deliveries for Incremental Level 4 Refuge needs located south-of-the-Delta.

A5.2.2.a Analytic Methods

CALSIM II

As previously discussed in Section A5.1, CALSIM II modeling was used to determine the project's 2030 and 2070 Incremental Level 4 water supply deliveries by location under different water-year conditions.

WISP Unit Water Values (Selected Monetization Approach)

As previously discussed in Section A5.1 All Benefits, WSIP Unit Water Value modeling is an approved benefit monetization approach and it was used to determine the project's 2030 and 2070 Incremental Level 4 Refuge water supply benefit values under different water-year conditions.

Alternative Cost (Alternate Monetization Approach)

As previously discussed in Section A5.1 All Benefits, the Alternative Cost method can be used to determine the project's 2030 and 2070 ecosystem improvement benefits of increased Incremental Level 4 Refuge deliveries under different water-year conditions. Shasta Lake Dam raise has been determined to be the least cost alternative for the project.

A5.2.2.b Data and Assumptions

Future increase in Incremental Level 4 Refuge supplies are not associated with any existing mitigation or compliance requirements per WSIP requirements (TR Section 8.1). Consequently, the project's ecosystem improvements represent new environmental benefits that would not otherwise be achieved.

A5.2.2.c Calculations

Project Water Use

Table A5-16 shows improved deliveries to National Wildlife Refuges, State Wildlife Areas, and privately managed wetlands projected in 2030, 2070, and the annual average in the 2030 to 2122 study period.

Table A5-16. Incremental Level 4 Refuge Water Supply Increases (2030 and 2070) (TAF/year)

Period	North-of-the-Delta	South-of-the-Delta	Total
2030 Results			
Long-Term Average	1	34	35
Wet	1	52	53
Above Normal	1	46	47
Below Normal	1	38	38
Dry	0	20	21
Critical	0	1	1
2070 Results			
Long-Term Average	1	30	31
Wet	1	50	51
Above Normal	1	40	41
Below Normal	1	29	30
Dry	0	16	17
Critical	0	1	1
2030-2122 Results			
Long-Term Average	**1**	**31**	**32**

Source: CALSIM II.

The changes in the Incremental Level 4 Refuge supply deliveries were interpolated between 2030 and 2070 to project the future refuge water supplies on an annual basis. In accordance with WSIP Technical Reference guidance, post 2070 deliveries were assumed to occur at 2070 levels.

Consistent with the approach used to determine the benefit values for Yolo Bypass supply, the annual average water quantities were based on use of the Sacramento River Hydrologic Region's water-year incidence rates during the 2030 to 2070 study period.

WISP Water Unit Values (Selected Monetization Approach)

The economic benefits of the increase future water deliveries for Incremental Level 4 Refuges were estimated using the adjusted WSIP Unit Water Values (see Table A5-7) applied to the projected average annual delivery quantities on a year by year basis over the project's entire 2030 to 2122 study period. The Delta Export adjusted WSIP Unit Water Values were used for the Incremental Level 4 Water Refuge benefit because the majority of the Refuges are located south-of-the-Delta and the project supplied water would otherwise be used for south-of-the-Delta deliveries.

Table A5-17 shows the estimated annual benefit values of future Incremental Level 4 Refuge deliveries in 2030, 2045, 2070 and as an annualized average over the project's entire 2030 to 2122 study period.

Table A5-17. Incremental Level 4 Refuge Supply Benefit Valuation: WSIP Unit Water Values (2015$; $1,000s)

	Incremental Level 4 Refuge Deliveries	Benefit Value	
		WSIP Unit Water Value [b]	Total
Year	TAF	$/AF	($1,000s)
2030	35	$457	$16,047
2045	33	$828	$27,644
2070 [c]	31	$806	$24,634
Annualized (2030–2122) [a]	**32**	**-**	**$23,811**

[a] Annualized benefit value is calculated using net present value for 93 years at a 3.5 percent discount rate.
[b] Adjusted WSIP Unit Water Values for Delta export supplies.
[c] The 2070 unit value is lower than the 2045 unit value because of the change in the hydrological year type incidence result in a wetter average year.

Alternative Cost (Alternate Monetization Approach)

The economic benefits of the increase water deliveries to Incremental Level 4 Refuge were also estimated on an Alternative Cost basis. The Alternative Cost for achieving the Incremental Level 4 Refuge deliveries' ecosystem benefits is based on the cost of a Shasta Lake Dam raise developed and operated solely for the purpose of providing the water quantities necessary for the Incremental Level 4 Refuge supply purpose.

As discussed in Section A5.1.1.a, the Shasta Lake Dam raise was determined to be a reasonable and feasible alternate source due both to its potential ability to provide the necessary large quantities of new water supplies and its location which ensures that it could provide the same Incremental Level 4 Refuge supply deliveries and therefore result in the same ecosystem improvement outcomes. Furthermore, recent extensive planning and analysis has been completed for the Shasta Lake Raise which provides more confidence in both the accuracy of its construction cost estimates and its potential implementation viability.

The Alternative Cost was estimated on a per acre-foot unit basis using the 2015 Shasta Lake Water Resource Investigation Feasibility Study (2015) dam raise alternatives and cost estimates. The feasibility study evaluated six different dam raise alternatives and the Comprehensive Plan 4A (CP4A) alternative was selected as the National Economic Development Plan.

The CP4A alternative would construct an 18.5 foot Shasta Lake dam raise to provide 634,000 TAF in additional reservoir storage capacity, augmented spawning gravel and reserve 30 percent of the new storage capacity to increase its coldwater pool.

The per acre cost for both M&I and agricultural water supply purposes were determined by dividing each's single purpose cost estimated full annualized cost (i.e., including both O&M and construction) by its expected average water-year supply quantity.

The CP4A alternative's $9.4 million total annual O&M cost was allocated between its numerous benefit purposes proportionally based on their relative benefit values as shown in Table A5-18.

Table A5-18. Annual Benefits and Cost for Enlargement of Shasta Lake: CP4A (2014$; $millions)

CP4A	Anadromous Fish	Water Supply	Hydropower	Recreation	Total
Benefits	$33	$27	$14	$14	**$89**
O&M	$4	$3	$2	$2	**$9.4**

Source: Tables 4-7 and 4-8, SLWRI 2015.

The $3 million water supply O&M cost was further split proportionally between the agricultural and M&I uses based on their average annual water supply quantities. The resulting O&M costs were then added to the single purpose annualized construction costs. The resulting annual water supply cost estimates were then converted from their reported 2014 dollar cost estimates into 2015 dollar terms. No adjustment to the annualized costs was necessary since the Shasta Feasibility Study used the same 3.5 percent discount rate as that required by the WSIP TR guidelines.

Table A5-19 shows the annualized single purpose costs, the average year water deliveries, and the unit benefit value estimated for both agricultural and M&I water supply for the CP4A Shasta Lake 18.5 foot dam raise alternative. To be conservative, the Alternative Cost approach selected for Sites Reservoir was based on the lower water supply unit cost for Shasta Lake's agricultural supply. This alternate cost was used to value the economic benefits of Sites Reservoir's future 32 TAF of increased average annual Incremental Level 4 Refuge supply deliveries.

Table A5-19. Single Purpose Cost for Enlargement of Shasta Lake: CP4A ($1,000s)

Water Use	Deliveries (Average Year) (TAF/yr)	Annualized Cost (2014$)		Total Annualized Cost (2015$)	Alternative Cost: Unit Benefit Value ($/AF)
		Construction	O&M		
Agricultural	31.4	$43,600	$1,741	$46,001	$1,465
M&I	19.9	$44,500	$1,103	$46,267	$2,325

Source: Tables ES-7 and 4-5, SLWRI 2015.

The estimated annualized unit cost for the enlargement of Shasta Lake was determined to be $1,465 per acre foot. This annual cost represents the Alternative Cost for the Sites Reservoir and was then used to estimate the total benefit value for the future Incremental Level 4 Refuge deliveries in 2030, 2045, 2070 and the annualized average over the project's full 2030 to 2122 study period. Table A5-20 shows the resulting estimated benefit values of Sites Reservoir's future Incremental Level 4 Refuge deliveries using this Alternative Cost approach. The Alternative Cost approach resulted in much higher benefit value estimates than those obtained from the WSIP Unit Water Value approach. Therefore, as a conservative assumption and in accordance with WSIP TM guidance, the Alternative Cost approach was not used to estimate Sites Reservoir's Incremental Level 4 Refuge and similar Ecosystem Improvements.

Table A5-20. Incremental Level 4 Refuge Supply Benefit Valuation: Alternative Cost Approach (2015$; $1,000s)

Year	Incremental Level 4 Refuge Deliveries TAF	Benefit Value: Alternate Cost – Unit Value $/AF	Benefit Value: Total ($1,000s)
2030	35	$1,465	$51,418
2045	33	$1,465	$48,927
2070	31	$1,465	$44,774
Annualized (2030–2122) [a]	**32**	**—**	**$48,055**

[a] Annualized benefit value was calculated using net present value over 93 years at a 3.5 percent discount rate.

A5.2.2.d Modeling Results (Selected Monetization Approach)

Table A5-21 shows Sites Reservoir's Incremental Level 4 refuge water supply benefits as estimated based on WSIP Unit Water Values.

Table A5-21. Incremental Level 4 Refuge Benefits: WSIP Unit Water Values (2015$; $1,000s)

Alternative	Annual Benefits [a] 2030	Annual Benefits [a] 2070	Annualized Benefit [b]
Average Conditions [c]			
Sites Reservoir	$16,047	$24,634	$23,811

[a] Based on WSIP Unit Water Values adjusted by water-year type, expected delivery location and conveyance energy costs.
[b] Annualized benefits assume interpolated annual physical benefits between 2030 and 2070, and then constant annual benefits after 2070. WSIP Unit Water Values interpolated between 2030 and 2045, after which 2045 unit values are used.
[c] Averaged over the entire hydrologic sequence (1922 to 2003).

The project's Incremental Level 4 Refuge water supply benefits were estimated to increase from $16.0 million in 2030 to approximately $24.6 million in 2070. The corresponding annualized benefit for the future 2030 to 2132 operating period was estimated to be $23.8 million. This is equal to an estimated average unit benefit value of $781 per acre foot for the Incremental Level 4 refuge benefits. This valuation reflects the comparatively high benefit values for future south-of-the-Delta water uses.

A5.2.3 Lake Oroville Coldwater Pool

Improvements to the coldwater pool and downstream releases to assist migrating fish would be beneficial to salmon, steelhead, and other fish in the lower Feather River. The benefits to Anadromous Fish were anticipated to be less than the benefits downstream from Shasta Lake, but nevertheless significant. The storage increase based on CALSIM II modeling is characterized below.

Sites Reservoir will enhance future water temperature and flow conditions in the American River as a means of improving the riverine ecosystem. Sites will achieve these ecosystem improvements by enabling Lake Oroville to delay some of its water deliveries which will increase its coldwater pool conditions and subsequently improve water temperatures of its water releases.

A5.2.3.a Analytic Methods

CALSIM II

As previously discussed in Section A5.1, CALSIM II modeling was used to determine the project's 2030 and 2070 water quantity increases to improve Lake Oroville Coldwater Pool conditions.

WSIP Unit Water Values (Selected Monetization Approach)

The SALMOD model does not include the Feather River area. No other fishery models for American River exist and therefore the habitat or fish population increase from future improvements in Lake Oroville's coldwater pool improvements cannot be directly evaluated. Consequently, the benefit value of fishery improvements within the Feather River watershed were evaluated based on an opportunity cost to secure an equivalent amount of storage in Lake Oroville.

The economic benefits of the project's contributions to anadromous fish survival were estimated based on use of the WSIP Unit Water Values to determine the value of the water that would otherwise be needed to be withheld in Lake Oroville to improve its coldwater pool and temperature conditions of its water releases.

As previously discussed in Section A5.1 All Benefits, WSIP Unit Water Values modeling was used to determine the project's 2030 and 2070 water benefit values for the Lake Oroville Coldwater Pool under different water-year conditions.

The WISP unit value benefit method used to value the water supply necessary for the projected Lake Oroville coldwater pool improvements was the same as that used for the Incremental Level 4 Refuge supplies benefits (Section A5.2.2). The Lake Oroville benefit valuation analysis also similarly used the adjusted Unit Water Values for south-of-the-Delta supplies applied to the CALSIM II determined water quantities determined specifically necessary to achieve Lake Oroville's coldwater benefits.

Alternative Cost (Alternate Monetization Approach)

As previously discussed in Section A5.1 All Benefits and for Incremental Level 4 Refuge purposes (Section A5.2.2), an Alternative Cost method can be used to determine the project's 2030 and 2070 ecosystem improvement benefits under different water-year conditions. Furthermore, given the comparability of their estimated future water quantity needs (annual averages of 30 TAF for Oroville Coldwater Pool and 32 TAF for Incremental Level 4 Refuges); the Alternative Cost analysis for the Oroville Coldwater Pool benefits was very similar to that performed for the Incremental Level 4 Refuge supply increases.

A5.2.3.b Data and Assumptions

Lake Oroville's late spring and early summer water deliveries that would instead be met Sites Reservoir water releases would generally be for south-of-the-Delta water users. Consequently, south-of-the-Delta WSIP Unit Water Values were used to represent the benefit value of those releases which would otherwise need to be cancelled.

Similarly, based on Lake Oroville current water supplies, for the purposes of the benefit valuation it is assumed that the water supply that would otherwise need to be retained (and therefore not delivered) would be south-of-the-Delta deliveries. Consequently, south-of-the-Delta WSIP Unit Water Values were used to represent the benefit value of those releases which would otherwise need to be retained.

A5.2.3.c Calculations

Projected Water Use

Table A5-22 shows the projected future increase in annual end of May water storage for Lake Oroville projected by CALSIM II.

Table A5-22. Lake Oroville Storage Increases for 2030 and 2070 (TAF/year)

Water-Year Type	Quantity
2030 Results

Dry	39
Critical	111
Average (2030–2122)	
Long-Term	30

Source: CALSIM II.

WISP Unit Water Values (Selected Monetization Approach)

The economic benefits of the increase future water deliveries for Lake Oroville coldwater pool were estimated using the adjusted WSIP Unit Water Values (see Table A5-7) applied to the projected average annual delivery quantities on a year by year basis over the project's entire 2030 to 2122 study period. Table A5-23 shows the estimated annual benefit values of future Lake Oroville coldwater pool improvements in 2030, 2045, 2070 and the annualized average over the project's full 2030 to 2122 study period.

Table A5-23. Lake Oroville Coldwater Pool Benefit Valuation: WSIP Unit Water Values (2015$; $1,000s)

Year	Lake Oroville Coldwater Pool Deliveries TAF	Benefit Value: WSIP Unit Water Value $/AF	Benefit Value: Total ($1,000s)
2030	26	$457	$11,814
2045	28	$828	$22,986
2070 [b]	31	$806	$24,976
Annualized (2030–2122) [a]	**30**	-	**$20,987**

[a] Annualized benefit value was calculated using net present value over 93 years at a 3.5 percent discount rate.
[b] The 2070 unit value is lower than the 2045 unit value because of the change in the hydrological year type incidence result in a wetter average year.

Alternative Cost (Alternate Monetization Approach)

As discussed above, the Alternative Cost approach for monetization of the project's future Incremental Lake Oroville Coldwater Pool deliveries was the same as that used for the project's Incremental Level 4 Refuge deliveries in Section A5.2.2. As a result, an estimated annualized per acre foot unit cost for the enlargement of Shasta Lake of $1,465/AF was used to estimate the total benefit value for the Lake Oroville coldwater pool deliveries in 2030, 2045, 2070 and the annualized average over the project's full 2030 to 2122 study period.

Table A5-24 shows the estimate the benefit values of Sites Reservoir's future Lake Oroville coldwater pool deliveries using the Alternative Cost approach.

Table A5-24. Lake Oroville Coldwater Pool Benefit Valuation: Alternative Cost Approach (2015$; $1,000s)

Year	Lake Oroville Coldwater Pool Deliveries TAF	Benefit Value: Alternate Cost – Unit Value $/AF	Benefit Value: Total ($1,000s)
2030	26	$1,465	$37,857
2045	28	$1,465	$40,683
2070	31	$1,465	$45,394
Annualized (2030–2122) [a]	**30**	**—**	**$41,731**

[a] Annualized benefit value is calculated using net present value over 93 years and 3.5 percent discount rate.

A5.2.3.d Modeling Results (Selected Monetization Approach)

Table A5-25 presents the estimate benefits values for the projected future increases in Lake Oroville's coldwater pool.

Table A5-25. Lake Oroville Coldwater Pool Benefits: WSIP Unit Water Values (2015$; $1,000s)

Alternative	Annual Benefits [a] 2030	Annual Benefits [a] 2070	Annualized Benefit [b]
Average Conditions [c]			
Sites Reservoir	$11,814	$24,976	$20,987

[a] Based on WSIP Unit Water Values adjusted by water-year type, expected delivery location, and conveyance energy costs.
[b] Annualized benefits assume interpolated annual physical benefits between 2030 and 2070 and then constant annual benefits after 2070. WSIP Unit Water Values interpolated between 2030 and 2045, after which 2045 unit values are used.
[c] Averaged over the entire hydrologic sequence (1922 to 2003).

The project's Lake Oroville coldwater pool benefits were estimated to increase from $11.8 million in 2030 to $25.0 million in 2070. The corresponding annualized benefit for the future 2030 to 2132 operating period was estimated to be $21.0 million. This is equal to an estimated average unit benefit value of $1,465 per acre foot. This valuation reflects the comparatively high benefit values for future south-of-the-Delta water uses.

A5.2.4 Yolo Bypass

Sites Reservoir will increase water deliveries to the Yolo Bypass which are expected to result in ecosystem improvements.

In 2016, DWR performed a North Delta Food Web Study in 2016 in collaboration with Federal and local water agencies. The study addressed the *Delta Smelt Resiliency Strategy* (California Department of Natural Resources, July 2016) recommendation for North Delta food web adaptive management projects. The resulting fall flows in the Yolo Bypass successfully produced a phytoplankton bloom, the major food source for endangered Delta smelt.

The Cache Slough area that receives water from the Yolo Bypass is the only place in the Delta estuary where the Delta smelt population is increasing. The purpose of this action is to help increase desirable food sources for Delta smelt in the lower Cache Slough and lower Sacramento River areas. This should improve Delta smelt growth and condition as they mature into adults, thereby increasing Delta smelt abundance.

The Sites Reservoir Project will provide two pulses of flow of at least 400 cfs each over a two to three week period into the Yolo Bypass (via the Colusa basin drain past the Wallace Weir and Ridge Cut into the Tule Drain) that will flow through the Toe drain and out to the Sacramento River. Each flow pulse made into the Colusa basin Drain would total about 20 TAF in each two to three week period resulting in an average total flow of 39 TAF per year. The flow pulses would be adaptively managed but are currently thought to occur in late summer and early fall (e.g., August and September). The water deliveries would not have to occur every year but would be desirable in most years.

A5.2.4.a Analytic Methods

CALSIM II

As previously discussed (see Section A5.1 All Benefits), CALSIM II modeling was used to determine the project's 2030 and 2070 water quantities for Yolo Bypass deliveries and ecosystem improvement under different water-year conditions.

WSIP Unit Water Values (Selected Monetization Approach)

The WISP unit value benefit method used to value the water supply necessary for the Yolo Bypass water supplies was the same as that used for both the Incremental Level 4 Refuge supplies benefits (Section A5.2.2) and Lake Oroville coldwater pool improvements. However, the Yolo Bypass benefit valuation analysis instead used the lower Unit Water Values for Sacramento Valley water supplies applied to the CALSIM II determined water delivery quantities.

Alternative Cost (Alternate Monetization Approach)

As previously discussed and applied to both the project's Incremental Level 4 Refuge supply and Lake Oroville coldwater purposes, an Alternative Cost method can be used to determine the project's 2030 and 2070 ecosystem improvement benefits from increased Yolo Bypass deliveries under different water-year conditions. Shasta Lake Dam raise has been determined to be least cost alternative. Furthermore, given the comparability of their estimated future water quantity needs (annual averages of 39 TAF for Yolo Bypass and 32 TAF for Incremental Level 4 Refuges), the Alternative Cost analysis for the Yolo Bypass benefits was very similar to that performed for the Incremental Level 4 Refuge supply increases.

A5.2.4.b Data and Assumptions

It was assumed that the water provided for the purpose of increasing Yolo Bypass flows would otherwise likely be delivered to south-of-the-Delta water contractors. Consequently, south-of-the-Delta unit values were used for the benefit valuation of the Yolo Bypass flows.

A5.2.4.c Calculations

Projected Water Supply Requirements

Table A5-26 shows the projected future increase in annual water flows for Yolo Bypass for 2030, 2070, and the annual average for the 2030 to 2122 study period.

Table A5-26. Yolo Bypass Flow Increases for 2030 and 2070 (TAF/year)

Water Year Type	Quantity
2030 Results	
Full (All Water Years)	39
Dry	33
Critical	5
2070 Results	
Full (All Water Years)	39
Dry	33
Critical	8
Average (2030–2122)	
Long-Term	39

WSIP Unit Water Values (Selected Monetization Approach)

The economic benefits of the increase future water deliveries to the Yolo Bypass were estimated using the unadjusted WSIP Unit Water Values (see Table A5-7) applied to the projected average annual delivery quantities on a year by year basis over the project's entire 2030 to 2122 study period. The Sacramento Valley WSIP Unit Water Values are used. These values do not include any conveyance cost benefit adjustment and were used since it was presumed that the necessary water supplies would otherwise be expected to be obtained from Sacramento Valley agricultural water users.

Table A5-27 shows the estimated annual benefit values of future Yolo Bypass deliveries in 2030, 2045, 2070 and their annualized average quantity and benefit value over the project's entire 2030 to 2122 study period.

Table A5-27. Yolo Bypass Flows Benefit Valuation: WSIP Unit Water Values (2015$; $1,000s)

		Benefit Value	
	Yolo Bypass Deliveries	WSIP Unit Water Value	Total
Year	TAF	$/AF	($1,000s)
2030	39	$229	$8,845
2045	39	$238	$9,190
2070	39	$238	$9,220
Annualized (2030–2122) [a]	**39**	—	**$9,117**

[a] Annualized benefit value was calculated using net present value over 93 years at a 3.5 percent discount rate.

Alternative Cost (Alternate Monetization Approach)

The Alternative Cost approach for monetization of the project's future Incremental Level 4 Refuge deliveries was also performed. As a result, an estimated annualized per acre foot unit cost for the enlargement of Shasta Lake of $1,465/AF was used to estimate the total benefit value for the Incremental Level 4 Refuge deliveries in 2030, 2045, 2070 and the annualized average over the project's entire 2030 to 2122 study period. Table A5-28 shows the results from use of the Alternative Cost approach to estimate the benefit values of Sites Reservoir's future Yolo Bypass deliveries.

Table A5-28. Yolo Bypass Flows Benefit Valuation: Alternative Cost Approach (2015$; $1,000s)

Year	Yolo Bypass Deliveries TAF	Benefit Value: Alternate Cost – Unit Value $/AF	Benefit Value: Total ($1,000s)
2030	39	$1,465	$56,577
2045	39	$1,465	$56,654
2070	39	$1,465	$56,783
Average (2030–2122) [a]	**39**	**—**	**$56,683**

[a] Annualized benefit value is calculated using net present value over 93 years at a 3.5% discount rate.

A5.2.4.d Modeling Results (Selected Monetization Approach)

Table A5-29 shows Sites Reservoir's Yolo Bypass water supply benefits as estimated based on the use of the applicable adjusted WSIP Unit Water Values (see Table A5-7).

Table A5-29. Yolo Bypass Supply Benefits: WSIP Unit Water Values (2015$; $1,000s)

Alternative	Annual Benefits [a] 2030	Annual Benefits [a] 2070	Annualized Benefit [b]
Average Conditions [c]			
Sites Reservoir	$8,845	$9,220	$9,117

[a] Based on WSIP Unit Water Values adjusted by water-year type, expected delivery location, and conveyance energy costs.
[b] Annualized benefits assume interpolated annual physical benefits between 2030 and 2070 and then constant annual benefits after 2070. WSIP Unit Water Values interpolated between 2030 and 2045, after which 2045 unit values are used.
[c] Averaged over the entire hydrologic sequence (1922 to 2003).

The project's Yolo Bypass supply benefits were estimated to remain relatively unchanged between 2030 ($8.8 million) and 2070 ($9.2 million). The corresponding annualized benefit for the future 2030 to 2132 operating period was estimated to be $9.1 million. This is equal to an estimated average unit benefit value of $237 per acre foot for the future ecosystem benefits from the Yolo Bypass. This valuation reflects the comparatively lower benefit values for future north-of-the-Delta water uses.

A5.3 Recreation (WSIP Eligible Benefit)

Development of the Sites Reservoir would provide new recreational facilities and opportunities.

A5.3.1.a Analytic Methods

Facilities-Based Visitation Model

Recreation benefits were valued using visitation estimates for the new recreational areas planned for the Sites Project. Annual visitation was estimated using a facilities-based approach that accounts for Sites planned facilities, carrying capacity, the regional population of potential users, surface acreage of the reservoir and fluctuations in storage throughout the year, as well as the amenities and visitation levels of substitute reservoirs in the region. Additional information and recreation analysis is available in Appendix C of the NODOS Draft Feasibility Study (USBR 2017). These variables for consideration are consistent with those outlined in the WSIP Technical Reference (TR Section 5.4.5). Annual visitation was calculated as a measure of total visitor days, which represents one person visiting for any part or all of a calendar day. This metric is commonly used to inform recreational benefits, and should not be confused with a recreational *visit*, which could last for more than one calendar day (e.g., camping).

WSIP Recreational Visitation Model

A sample WSIP Visitation Model was obtained from CWC and considerable efforts was made to apply the model in accordance with the technical guidance provided by the WSIP Technical Appendix (TR Section 5.4.5). The required inputs were obtained and run through the model, but the model results did not fall within the expected range. The WSIP Recreational Visitation model's visitation estimates were highly sensitive to a few of the model variables including; the number of boat lanes, the regional population of potential users, and the reservoir's surface acreage. Collectively, these factors indicated that Sites was too dissimilar from the other recreation facilities that were used to construct and benchmark the WSIP Visitation Model to permit the model's use. As a result, the facilities-based approach was instead used to project Sites Reservoir's future visitation levels.

User Day Values (Selected Monetization Approach)

Recreation benefits were quantified using unit day values from the Recreation Use Values Database (RUVD) for North America (Rosenberger 2016) and the U.S. Forest Service (Loomis 2005). Both of these resources provided a meta-analysis of hundreds of studies that estimated the use value of recreation activities in the U.S. over the past half-century. These recreation use value estimates reflect the average net willingness-to-pay or consumer surplus, in per person per activity day units for different activities and regions in the U.S. This benefit measure was considered to be consistent with the WSIP Technical Reference guidance (TR Section 5.4.5).

The WSIP Technical Report also suggests possible use of USACE Unit Day Values (TR Section 5.4.5.7) as unit day values for recreation. However, these unit values are national recreation use value estimates while the U.S. Forest Service values are for recreation use within the Western Pacific region. In addition, the USACE data identifies only four general recreational use categories while the U.S. Forest Service data provides specific use values for more than a dozen different recreation categories applicable to the project. Consequently, it was determined that the U.S. Forest would provide a more accurate estimate of Sites Reservoir's future recreation use benefits and were therefore used for the recreation benefit value analysis.

The selected U.S. Forest Service unit values were then applied to the visitation projections to determine the total annual user benefits for recreation at Sites Reservoir. The net recreational benefit for the project was then calculated by accounting for the potential substitution of recreational use from nearby reservoirs.

A5.3.1.b Data and Assumptions

Table A5-30 presents the annual visitor day estimates and unit day values by activity-type.

Table A5-30. Annual Recreation Visitation by Primary Activity

Activity	Annual Visitor-Days	Unit Day Values
Shore fishing	16,254	$86.23
Boat fishing	8,407	$86.23
Picnicking	15,457	$42.96
Camping	27,514	$47.51
Sightseeing	36,992	$51.29
Swimming / beach use	42,223	$44.11
Walking	5,418	$72.33
Bicycling/Motorcycling	2,429	$94.26
Boating / water-skiing	29,145	$52.48
Hunting	560	$72.29
Other	2,429	$40.77
Total	**186,829**	**$46.81** (avg.)

A majority of the unit day estimates that were incorporated in this analysis come from the most recent 2016 study (Rosenberger 2016), using Western Region values (as defined by U.S. Census regions). Only in a few cases the 2005 activity values (Loomis 2005) used, as the reported activity types more accurately reflected the planned recreational uses at Sites (e.g., horseback riding).

The databases informing the unit day value estimates do not contain information on marginal values for changes in site quality, condition or other factors that would allow for adjusting the net willingness to pay estimates with consideration of the unique attributes of Sites. However, these are average values, and have been endorsed for use by Federal actors such as the U.S. Bureau of Reclamation for estimating recreational benefits at reservoirs in California.

It is assumed that 80 percent of visitor days at Sites represent new recreational visits, and that the remaining 20 percent of visits reflect existing recreational visitor days that would have occurred at nearby reservoirs. This substitution factor is considered conservative given the limited number of reservoirs in the area, as well as results from the WSIP Visitation. As detailed in the WSIP Technical Reference (Appendix F), the acreage of nearby reservoirs did not significantly affect day visitation, except for a small, but measurable contribution in the fall months. In addition, even for those people who have recreated elsewhere (particularly at overcrowded facilities) and shift their trip to Sites, the quality of the recreational experience at Sites Reservoir may be higher, thereby generating additional recreation benefits that are not captured in this analysis.

A5.3.1.c Calculations

Table A5-31 presents the results of the recreation benefits analysis for both a scenario with no substitution and the assumed substitution level of 20 percent. The estimated annual visitor days assumed in this analysis is approximately 187,000.

Table A5-31. Annual Recreation Benefits (2015$; $1,000s)

Activity	Annual Visitor Days	Unit Day Values ($/day)	Annual Benefits ($1,000s)	
			0% Substitution	**20% Substitution**
Shore fishing	16,254	$86.23	$1,402	$1,121
Boat fishing	8,407	$86.23	$725	$580
Picnicking	15,457	$42.96	$664	$531
Camping	27,514	$47.51	$1,307	$1,046
Sightseeing	36,992	$51.29	$1,897	$1,518
Swimming / beach use	42,223	$44.11	$1,863	$1,490
Walking	5,418	$72.33	$392	$314
Bicycling/Motorcycling	2,429	$94.26	$229	$183
Boating / water-skiing	29,145	$52.48	$1,530	$1,224
Hunting	560	$72.29	$41	$32
Other	2,429	$40.77	$99	$79
Total	**186,829**	**$46.81** (avg.)	$8,746	$6,997

A5.3.1.d Modeling Results (Selected Monetization Approach)

Table A5-32 presents the results of the recreation benefits analysis.

Table A5-32. Estimated Annual Recreation Benefits (2015$; $1,000s)

Alternative	Annual Benefits [a]		Annualized Benefit [b]
	2030	**2070**	
Average Conditions [c]			
Sites Reservoir	$6,997	$6,997	$6,754

[a] Annual benefits reflect consumer surplus value for various recreational activities supported by Sites Reservoir and water operation scenarios under year 2030 and year 2070 levels of development. Benefits were attributed for only 75 percent of future visitation expected as new recreational use after accounting for potential substitution effects on other reservoirs in the region.

[b] Annualized benefits represent avoided costs relative to the Future No Project conditions over the planning horizon (2030 to 2122). Annual average is less than 2030 and 2070 values due to initial short ramp-up period before full benefits are generated.

[c] Averaged over the entire hydrologic sequence (1922 to 2003).

The project's future recreation benefits were estimated to be approximately $7.1 million in 2030. Although future population growth might be expected increase future recreation demand and visitation, it was conservatively assumed that 2030 level of benefits would remain constant throughout the future 2030 to 2132 operating period. As a result, the annualized benefit over the 2030 to 2132 operating period was estimated to be $6.9 million (slightly reduced due to an assumed 50 percent operation during its first two operating years).

A5.4 Flood Reduction (WSIP Eligible Benefit)

Development of the Sites project would reduce the magnitude of flood events in the area along Funks Creek and Stone Corral Creek, providing a direct public benefit. Flood damage reduction benefits were estimated based on avoided costs. In the case of the Sites project, flood damage costs would be reduced for the Town of Maxwell's residential, commercial and public structures and contents. In addition, the project would reduce flood damages to adjacent agricultural lands and flood-related closures to

Interstate 5 (I-5) and State Route (SR) 20. Other flood damage savings include avoided clean-up, emergency response, and disruption costs for workers and businesses.

A5.4.1.a Analytic Methods

The benefit value of the project-related flood damage reduction was estimated based on the annualized net cost savings of flood damages for the future "with Project" conditions compared to the existing "No Action" conditions. The resulting Expected Annual Damages (EAD) savings was estimated based on hydraulic analysis that quantified the project-related reduction in flood impacted areas and flooding severity for six different flood event types (ranging from 5-year to 500-year flood events). GIS land use analysis inventoried the impacted areas. This approach corresponds to the "avoided cost" approach described in the WSIP Technical Reference report (TR Section 5.4.3).

Flood reduction benefits were estimated for current hydraulic conditions to represent the expected 2030 conditions. No adjustments in the hydraulic modeling or other analytic methods were used to project 2070 conditions (including Climate Change) since the flood damage benefits are relatively limited and difficulty in quantifying the changes in future flood events' magnitude.

As a result, the 2030 flood reduction benefits are applied for 2070. This was considered a conservation assumption since the WSIP's future climate changes conditions project more frequent and severe wet water years. This can be expected to result in more frequent flood events of greater magnitude.

Hydraulic Analysis

A HEC-RAS 2-D hydraulic model was used develop with and with-out project floodplains for the 5-, 10-, 25-, 50-, 100-, and 500-year flood events. A 50 percent capture scenario of runoff was used to inform the benefit analysis. While the HEC-RAS model was geographically constrained to lands west of I-5 (location of Maxwell), additional hydraulic modeling was conducted for the primarily agriculturally zoned lands east of the I-5.

Land Use Analysis

HEC-RAS floodplains were imported into GIS and overlaid on parcel data from Colusa County to identify lands, structures, and infrastructure exposed to flooding under with-project and without-project conditions. The acreage exposed to flooding was calculated for each event, and summarized by primary land use type. Further analysis was done to identify parcels and their respective land use characteristics to estimate avoided costs for each event.

Expected Annual Damages (Selected Monetization Approach)

The damage costs for each flood event were determined using cost-estimating approaches and data from USACE, FEMA and DWR's Flood Rapid Assessment Model (F-RAM). Expected annual damages were estimated by calculating total avoided costs (i.e., without project damages minus with project damages) for each of the six events modeled, then multiplying the sum of each interval probability by the average damage in that interval, followed by summing over all interval probabilities. This approach is consistent with the WSIP Technical Reference guidance (TR Section 5.4.3).

HEC-FDA and Other Flood Damage Models (Alternative Monetization Approach)

More detailed and extensive flood analysis and modeling (such as HEC-FDA or similar models outlined in the WSIP Technical Reference Section 5.4.3) was not performed because: (1) there is not a substantial urban flood reduction and (2) the flood benefits are a relatively small proportion of the project's total benefits. These more extensive and probabilistic analysis offered by these other models are generally used for more densely populated and urban areas and was not expected they would substantially change the benefit valuation for the project.

A5.4.1.b Data and Assumptions

Figure A5-2 shows the expected area of flooding for a 100-Year Flood Event. Three primary categories of avoided flood damage costs were analyzed: (1) agriculture; (2) structures and contents; and (3) transportation.

Agriculture

Agricultural damages were modeled based on crop loss estimates. Values were estimated for representative crop types in the Central Valley and account for both short-duration and long-duration flood events. The short duration (i.e., less than 5 days of inundation) per acre estimates, which include both weighted average crop income losses and land cleanup and rehabilitation costs, were applied to the equivalent crop types and acreage across the modeled flood events. The primary crop types in modeled floodplains include rice, pasture, tomatoes, and alfalfa.

Table A5-33 shows the acres at risk by crop type for a 100-yr flood event with their corresponding crop damage estimates used to estimate the agricultural flood damages.

Table A5-33. Projected Damages per Acre: 100-Year Flood Event (2015$; $1,000s)

Crop Type	Average Annual Damages ($/ac) [a]	Land Cleanup and Rehabilitation ($/ac)	Total Damage per Acre ($/ac) [b]	Reduced Flood Area (ac)	Total Damages ($1,000s)
Rice	$245	$262	$508	6,035	$3,066
Almonds	$1,746	$262	$2,008	266	$534
Tomatoes	$1,096	$253	$1,349	731	$986
Wine Grapes	$3,498	$253	$3,751	15	$55
Alfalfa	$269	$262	$532	731	$389
Pasture	-$16	$293	$277	1,779	$493
Other	$0	$265	$265	15	$4
Total				**9,570**	**$5,526**

Sources: DWR, *Flood Rapid Assessment Model (F-RAM)*. Developed by URS (November 2008); USACE, *National Economic Development Manual Series* (2010); USACE, *Sutter Basin Feasibility Report (*2013).
[a] Weight averages calculated based on expected crop income losses, variable costs not expended, and probability of flooding on a monthly basis.
[b] Represents a short-term flood event, which typically results in only limited damages to perennial crops.

Structures and Contents

Structures and content damages were modeled according to principles and guidelines prescribed by the USACE (USACE 2010). All structures intersecting with a floodplain in the Town of Maxwell were categorized as either residential or non-residential, based on the attribute data embedded in the Colusa County parcel file, and are assumed to have only one story. This taxonomy was used to assign specific damage functions to estimate both structures and content losses. Structure value was estimated by applying regional construction cost per square foot factors developed by Marshall & Swift to the reported structure size(s). The extent of damage (in this case, estimated replacement costs), were determined by multiplying the estimated structure value by depth damage curves and content-to-structure ratios used by USACE economists in the Sacramento District (USACE 2013). A constant flood depth of 5 feet above the first floor's elevation was assumed across all event types.

Indirect damages to account for cleanup costs, temporary housing, relocation assistance and other potential emergency costs were modeled as a proportion of direct damages, in this case 25 percent, according to estimates provided in the F-RAM model documentation.

It should be noted that damages to structures and contents represent full replacement value, not the depreciated value. This approach, used by FEMA, more accurately reflects the true cost to replace the damaged asset.

Only structures in the Town of Maxwell were included in this assessment of flood damages. There are additional structures scattered across the agriculturally zoned parcels outside of the Town center that would also be subject to damage but are not included to be conservative.

Table A5-34 shows the depth damage functions, indirect cost assumption, square footage of residential and non-residential structures that would avoid damage during a 100-year flood event from the without-project conditions compared to the with-project conditions. The damage estimates also include estimated avoided secondary damages (e.g., emergency response).

Table A5-34. Avoided Cost Assumptions and Estimates: 100-Year Flood Event (2015$; $1,000s)

Structure Type	Structure [a]	Content [a]	Indirect [b]	Square Feet [c]	Avoided Damage
Residential (1-story)	53%	29%	25%	76,584	$11,701
Non-Residential (1-story)	31%	100%	25%	52,666	$12,470
Total Avoided Costs					**$24,171**

[a] Assumes 5-foot flood depth based on Sutter Basin Feasibility Report (USACE 2013).
[b] F-RAM indirect cost factor.
[c] The difference in building square feet impacted by the 100-year flood event between without-project and with-project conditions.

Transportation

The roads I-5, adjacent to the Town of Maxwell, and SR 20, between I5 and the City of Colusa, are subject to flood related closures. The damages stemming from transportation disruptions were modeled according to USACE guidance (USACE 1991), accounting for the value (i.e., opportunity cost) of time. Data on average daily trips at the identified transportation corridors, vehicle mileage costs, and median household income for adjacent counties were applied to assumptions on trip type (i.e., work, social, recreation, personal business, vacation) distributions by weekday and weekend, distance to reroute, and duration of delay. Collectively this information informed a daily weighted average damage estimate for both the I-5 and State Route 20. A one-day closure was assumed for all six flood events modeled.

Additional roadway repair damages were estimated using assumptions of the amount of roadway exposed, and cost-per-mile factors for different roadway classifications. Indirect damages to account for cleanup costs, emergency costs, and losses from disruption to employment and commerce were modeled as a proportion of direct damages, in this case 50 percent. Both repair and indirect damages were informed according to estimates provided in the F-RAM model documentation.

A5.4.1.c Calculations

Table A5-35 presents the estimated avoided costs across the primary damage categories for the six flood events modeled.

Table A5-35. Flood Benefits by Event and Impact Category (2015$; $1,000s)

Flood Type	Agriculture	Structure and Contents	Transportation	Total
500-Year	$4,856	$10,199	$1,365	$16,420
100-Year [a]	$5,526	$24,171	$1,552	$31,249
50-Year	$5,959	$23,337	$1,690	$30,986
25-Year	$6,323	$11,472	$1,767	$19,562
10-Year	$5,829	$7,912	$1,570	$15,311
5-Year	$5,211	$24,546	$1,410	$31,167

[a] Values shown in Tables A5-33 and A5-34.

Table A5-36 presents the steps that were taken to calculate the EAD (described above), integrating the damages across the six flood events modeled.

Table A5-36. EAD Calculation (2015$; $1,000s)

Frequency	Interval	Damages at Stage	Average	Interval	Summation
					EAD
0.002 →		$16,420			$4,377
	0.008		$23,835	$191	
0.01 →		$31,249			$4,187
	0.010		$31,118	$311	
0.02 →		$30,986			$3,876
	0.020		$25,274	$505	
0.04 →		$19,562			$3,370
	0.060		$17,437	$1,046	
0.1 →		$15,311			$2,324
	0.100		$23,239	$2,324	
0.2 →		$31,167			

A5.4.1.d Modeling Results (Selected Monetization Approach)

Table A5-37 presents the estimated benefit value of the project-related flood damage reduction.

Table A5-37. Flood Reduction Benefits (2015$; $1,000s)

Alternative	Annual Benefits [a]		Annualized Benefit [b]
	2030	2070	
Average Conditions [c]			
Sites Reservoir	$4,377	$4,377	$4,377

[a] Based on the project-related reduction in expected annual damages from future flood events.
[b] Annualized benefits interpolated annual physical benefits between 2030 and 2070, and then constant annual benefits after 2070.
[c] Averaged over the entire hydrologic sequence (1922 to 2003).

The project's future flood reduction benefits were estimated to be $4.4 million in 2030. It was conservative assumed that 2030 benefit values would remain constant throughout the future 2030 to 2132 operating period. As a result, the annualized benefit for the future 2030 to 2132 operating period was estimated to be $4.4 million.

A5.5 Water Supply (Non-Proposition 1 Eligible Benefit)

Increased future water deliveries and improved water supply reliability are expected to be the project's largest non-public benefit. The project's water supply improvements are expected to ultimately serve both agricultural producers (located both north- and south-of-the-Delta) and south-of-the-Delta M&I users. The benefit valuation analysis assumes that the majority (approximately 58 percent) of the project water deliveries will be for agricultural use. This was considered a realistic characterization of the JPA current partnering water contractors and conservative assumption given the far higher value placed on M&I water supplies.

In addition, it is expected that Sites Reservoir will be able to recapture some quantities of the Shasta's future deliveries that are scheduled as a result of the project's coldwater pool benefits. It is currently envisioned that the reclaimed would be allocated to JPA and used to provide supplementary water deliveries for south-of-the-Delta M&I users. The sales revenues from the reclaimed water supplies would then be used to cover the O&M costs assigned to the project's various public benefits. The water supply benefit analysis therefore accordingly analyzed the project's future water deliveries separately and then combined the findings to report a single overall water supply benefit value.

A5.5.1 M&I Water Supply

Sites Reservoir will improve future water supply reliability for M&I water users predominantly located south of the Delta.

A5.5.1.a Analytic Methods

Two approaches that provide M&I water supply benefits at 2030 and 2070 conditions in average annual value (2015 dollars): Economic Model Approach: California Water Economics Spreadsheet Tool (CWEST) and Unit Value Approach using WISP provided Unit Water Values as dollar value per acre-foot.

The M&I water supply benefit analysis relies on CALSIM II modeling to quantify the project's expected future M&I deliveries under different water-year conditions. CWEST modelling to determine the project's future M&I water supply benefits. Consequently, the economic benefits of increased future M&I water deliveries were estimated on a "willingness to pay" basis.

CALSIM II

As previously discussed in Section A5.1, CALSIM II modeling was used to determine the project's 2030 and 2070 M&I water supply deliveries by location under different water-year conditions. The water quantities for the intervening years were interpolated individually by purpose, water-year type and location.

The WSIP 2030 and 2070 without Project CALSIM II model runs were compared to the WSIP 2030 and 2070 with Project CALSIM II model runs to quantify the annual deliveries to Sites Project Participants. Delivery is the calculated quantity at the location of each Sites Project Participant after accounting for conveyance losses, consistent with WSIP TR Guidelines (TM Section 4.12.3).

CWEST (California Water Economics Spreadsheet Tool) (Selected Monetization Approach)

CWEST was developed for the US Bureau of Reclamation's Coordinated Long Term Operation of the Central Valley Project and State Water Project Environmental Impact Statement (LTO EIS) Environmental Consequences analysis.

CWEST is an economic benefit valuation tool developed to provide consistent and transparent analysis of economic benefits of M&I water supplies for CVP contractors and SWP Table A contract holders. CWEST is an economic simulation and optimization tool that represents each individual CVP and SWP M&I water user's decision making under 2030 and 2070 conditions based on publicly available information. CWEST determines how CVP and SWP M&I water users will meet their 2030 and 2070 water demand levels at their minimum economic cost given their supply constraints and alternatives. Detailed technical discussion of the CWEST model is available from the Appendix 19A of the Draft Long Term Operation EIS (USBR 2015).

CWEST quantifies M&I water supply benefit by simulating the water management decisions made at the district or agency level. The model's objective is to select each Sites Project participant's set of management actions that meet their annual water demand at the lowest cost. The estimated cost difference between the with and without Sites Reservoir scenarios determines the project's M&I water supply benefit. Similar to the other existing California M&I water economics tools, CWEST minimizes the total costs of meeting annual M&I water demands subject to applicable operational and supply constraints. These costs include:

- Conveyance and operations costs;
- Existing and new permanent supplies, transfer or other option costs;
- Local surface and groundwater operations;
- Lost water sales revenues; and
- End-user shortage costs.

CWEST incorporates level of demand, quantity and type of local water supplies, and costs for both 2030 and 2070 development conditions into its benefit value estimates.

CWEST was selected to estimate M&I water supply benefits in the WSIP application based on the criteria in Technical Reference document Section 4.12 Water Supply Analysis (CWC, 2016). CWEST was updated for the WSIP benefit valuation analysis to evaluate nine representative participants for the M&I Sites Project. The updates to CWEST include 2030 and 2070 analysis using 2015 UWMP data, inclusion of only Sites Project participants, and all relevant assumptions outlined in the CWC Technical Reference document. Appendix 19A of the LTO EIS details the economic tool's development history, methodology, and assumptions (Reclamation, 2015).

WSIP Unit Water Values (Alternate Benefit Monetization Approach)

As previously discussed in Section A5.1 All Benefits, WSIP Unit Water Values modeling is an approved benefit monetization approach and it was used to determine the project's 2030 and 2070 M&I water supply benefit values under different water-year conditions.

This approach applies a dollar value per acre-foot ($/AF) values for water by region, water-year type, and future condition. Conveyance costs were included in the benefit calculation to better represent the full willingness to pay by south-of-the-Delta water contractors.

As the WSIP TM acknowledges, there are several reasons and factors that may ensure that the WSIP unit values would undervalue the M&I benefits. As previously discussed in Section A5.1.1.a, the WSIP unit values implicitly assume that there would be a sufficient number of willing sellers for the price and quantity of water that could supply the water being valued. This assumption may be difficult to meet for large quantities water (especially such as those required for the project's M&I deliveries).

The project would provide long-term and reliable deliveries. This contrasts with the current water transfer market which predominantly consists of limited term contracts and where the demand, supply and prices vary considerably depending on the recent and projected water-year type.

The third-party costs of water transfers are not included in the Unit Water Values. Major and/or long-term reallocations of water use resulting from water transfers can be expected to potentially result in direct and indirect economic impacts to the region's workers, supporting businesses and consumers. The WSIP Unit Water Values are predominantly derived from past water transfer and therefore based on the financial relationship solely between the water buyer and sellers. As a result, it does incorporate any costs or losses to third-party entities or the larger economy. Inclusion of any additional third-party costs would be expected to increase the unit values and hence the benefit values or other water sources.

A5.5.1.b Data and Assumptions

The major update to CWEST was removing non- Sites Project Participants from the model and including any Sites Project Participants that were not including in the existing version on the model. CWEST updates for the WSIP application allows for analysis at 2030 and 2070 and is in 2015 dollars. The main data source for the update was individual Sites Project participants Urban Water Management Plans (UWMPs).

A5.5.1.c Calculations

Water Supply Projections

Table A5-38 shows the estimated water deliveries by water-year type projected in 2030, 2070, and the annual average in the 2030 to 2122 operating period.

Table A5-38. Increase in Water Supply Deliveries (TAF/year)

Period	NOD Agriculture	SOD Agriculture	SOD M&I	SOD Recaptured	Total
2030 Results					
Long-Term Average	110	25	106	11	254

CWEST Model Results (Selected Monetization Approach)

Tables A5-39 and A5-40 show the detailed CWEST modeling results for the project under the future 2030 and 2070 without Project CALSIM II model runs and the WSIP 2030 and 2070 with Project CALSIM II model runs. Similar to many impact models, CWEST generally evaluates the conditions and estimates outcomes for both a “with project” and “without project” scenarios. The project’s impacts are then determined by the differences between the two scenarios.

Both tables show the average annual delivery and conveyance cost for each of the representative M&I water users. The delivery cost is subtracted from the total estimated benefit for each M&I water user from their expected cost savings gained by using the project water supply rather than other alternate sources. The tables also show potential water supply quantity from their alternate water sources (e.g.,

Table A5-39. M&I Water Supply Benefits: 2030 CWEST Modeling Detailed Model Results (2015$; $1,000s)

conservation, recycling, and desalination). These are the alternate supplies that can be adopted as management actions to reduce their future water shortage costs. The new supply quantity is a key decision variable in the CWEST model analysis.

As shown in Tables A5-39 and A5-40, the CWEST analysis projects that between 2030 and 2070, Sites Reservoir's annual M&I net supply benefits would increase from $46.7 million to $177.8 million. Unsurprisingly the majority of the M&I benefits would be gained by the four water agencies that would receive the largest M&I deliveries.

The largest share of the Sites Reservoir's projected 2030 M&I benefits would be expected to result from its avoided shortage costs which would total $26.2 million and would account for 42.5 percent of the total benefits. The other important sources of M&I benefits in 2030 would be savings in groundwater pumping costs ($14.1 million), avoided development costs for other new supply sources ($8.4 million) and reduced water purchase costs ($6.9 million). Together these additional three cost savings categories would account for 47.7 percent of the project's total M&I benefits.

In 2070 the project's benefits from avoided shortage costs are projected to increase to approximately $72.5 million but would account for only 37.3 percent of the $177.8 million in total benefits. Instead the avoided development of other new supply sources would result in $107.4 million cost savings and the largest share (55.3 percent) of the project's 2070 M&I benefits.

Table A5-41 summarizes M&I Water Supply benefit values from the CWEST modeling. The equivalent Unit Water Values for M&I are estimated to be $440 per acre foot in 2030 and $1,521 in 2070.

Table A5-41. M&I Water Supply Benefit Valuation: CWEST Water Values (2015$; $1,000s)

Year	M&I TAF	Benefit Value CWEST $/AF	Total ($1,000s)
2030	106	$440	$46,737
2045	110	$874	$95,883
2070	117	$1521	$177,793
Annualized (2030 - 2122) [a]	**114**	-	**$114,107**

Note:
[a] Annualized benefit value is calculated using net present value over 93 years and 3.5% discount rate.

WSIP Unit Water Values (Alterative Monetization Approach)

The economic benefits of the increase future water deliveries for M&I were estimated using the adjusted WSIP Unit Water Values (see Table A5-7) applied to the projected average annual delivery quantities on a year by year basis over the project's entire 2030 to 2122 study period. Table A5-42 shows the estimated annual benefit values of future M&I water supply in 2030, 2045, 2070 and the annualized average over the project's full 2030 to 2122 study period.

Table A5-42. M&I Water Supply Benefit Valuation: WSIP Unit Water Values (2015$; $1,000s)

Year	M&I Water Supply TAF	Benefit Value WSIP Unit Water Value $/AF	Total ($1,000s)
2030	106	$457	$48,517
2045	110	$828	$90,761
2070 [b]	117	$806	$94,208
Annualized (2030–2122) [a]	**114**	-	**$81,742**

[a] Annualized benefit value is calculated using net present value over 93 years and 3.5 percent discount rate.

[b] The 2070 unit value is lower than the 2045 unit value because of the change in the hydrological year type incidence result in a wetter average year.

A5.5.1.d Modeling Results (Selected Monetization Approach)

Table A5-43 shows the estimated future M&I water supply benefit values obtained from the CWEST for 2030 and 2070.

Table A5-43. M&I Water Supply Benefits: CWEST Modeling (2015$; $1,000s)

Alternative	Annual Benefits [a]		Annualized Benefit [b]
	2030	2070	
Average Conditions [c]			
Sites Reservoir	$46,737	$177,793	$114,107

Source: CWEST

[a] Based on CWEST Modeling adjusted by water-year type, expected delivery location and conveyance energy costs.

[b] Annualized benefits represent avoided costs relative to the Future No Project conditions over the planning horizon (2030 to 2122), and are adjusted for expected variations in surface area conditions.

[c] Averaged over the entire hydrologic sequence (1922 to 2003).

The model results indicate an increase in M&I benefits from $46.7 million in 2030 to $177.8 million in 2070. The corresponding annualized benefit for the future 2030 to 2132 operating period is estimated to be $114.1 million. This is equal to an estimated average unit benefit value for M&I of $1,302 per acre foot.

The major increase in future M&I benefits is only partly the result of the 11 TAF (10.4 percent) increase in 2070 average annual M&I deliveries that are projected to occur as a result of future climate change conditions enabling greater diversions of Sacramento River flows.

Instead major factors driving the M&I benefit increase are increased water demand, reduced water availability from other water supplies (including groundwater depletion and climate change reductions in future Sierra snowpack levels) and the limited availability of alternate water sources.

A5.5.2 Agricultural Water Supply

Sites Reservoir will improve water supply reliability to agricultural water users, particularly during dry years. Over 80 percent of the future agricultural water deliveries are current expected to be for water contractors located within the Sacramento Valley. The remaining agricultural deliveries are expected to be for south-of-the-Delta agricultural water users.

A5.5.2.a Analytic Methods

CALSIM II

As previously discussed in Section A5.1 All Benefits, CALSIM II modeling was used to determine the project's 2030 and 2070 agricultural water supply deliveries by location under different water-year conditions.

WISP Unit Water Values (Selected Monetization Approach)

WSIP Unit Water Value modeling was used to determine the project's 2030 and 2070 agricultural water supply prices under different water-year conditions. The WISP unit value benefit approach used to value the project's future increases in agricultural water supplies was the same as that used for the Incremental Level 4 refuge, Lake Oroville coldwater pool and Yolo Bypass supply benefits (Sections A5.2.2-4). The agricultural benefit valuation analysis also similarly used the adjusted Unit Water Values (for the south-of-the-Delta deliveries) and the Sacramento Valley values (its future north-of-the-Delta deliveries) correspondingly applied to the CALSIM II determined future agricultural water supply quantities.

LTGEN/SWP

As previously discussed in Section A5.1 All Benefits, LTGEN/SWP was used to determine the project's 2030 and 2070 average conveyance energy costs and when appropriate adjust the water benefit values for south-of-the-Delta deliveries.

SWAP Model (Alternate Monetization Approach)

The SWAP model is a regional agricultural production and economic optimization model that simulates the decisions of farmers across 93 percent of agricultural land in California. The model assumes that farmers maximize profits (revenue minus cost) by choosing total input use (e.g., total crop acres) and input use intensity (e.g., applied water per acre) subject to market, resource, and technical constraints.

Although the SWAP model is not specifically recommended in the WSIP TM Section 5 – Monetizing the Value of Project Benefits, the CWC discussed the SWAP model in Appendix D – Unit Values for Water. The CWC also provided the SWAP version 6.1 model for public use. The Sites Reservoir his version of the SWAP model was used to provide an alternative benefit value of the project's agricultural benefits. As discussed in the WSIP TM (Appendix D), the model was calibrated using 2010 crop acreage and water use information. Crop prices and cost data from 2011 and 2012 were used to calibrate it is economic factors.

However, for reasons discussed below, it was determined that the SWAP Model majorly misrepresented and underestimated the project's future agricultural benefit values. As a result, the SWAP model was not selected as the monetization approach to determine Sites Reservoir's agricultural benefits for the WSIP application.

A5.5.2.b Data and Assumptions

In addition to the Appendix D discussion of the SWAP model and its relationship to the WSIP Unit Water Values, extensive discussion of the SWAP model's methodology, data sources and assumptions are available in agency technical reports and the technical appendices of several recent federal feasibility studies of proposed water storage project and water management programs in California. The SWAP Model Update and Application to Federal Feasibility Analysis provides a comprehensive overview of the SWAP model and its application (USBR/DWR 2012). The Final Modeling Appendix to the Shasta Lake Water Resources Investigation also provides extensive discussion of the SWAP Model and its use for economic valuation of agricultural water supply increases (USBR 2014).

A5.5.2.c Calculations

Water Quantities

Table A5-38 shows the estimated agricultural water deliveries by water-year type projected in 2030, 2070, and the annual average in the 2030 to 2122 operating period.

WSIP Unit Water Values

Future adjusted WSIP Unit Water Values by water-year type and location are previously shown in Table A5-7. As previously discussed in Section A5.1, future annual agricultural water supply quantities were interpolated based on water-year type and location.

The adjusted WSIP Unit Water Values were used for south-of-the-Delta use (i.e. including expected conveyance energy cost necessary to deliver the agricultural water) (Table A5-44). No conveyance energy cost adjustments were applied to the locally supplied agricultural water (i.e. for north-of-the-Delta agricultural water users) since the energy need for their deliveries will be minor.

Table A5-44. Agricultural Water Supply Benefit Valuation: WSIP Unit Water Values (2015$; $1,000s)

Year	Agricultural Supply		Benefit Value	
	NOD (TAF)	SOD (TAF)	WSIP Unit Water Value [b] $/AF	Total ($1,000s)
2030	110	27	$229 / $457	$37,443
2045	121	28	$238 / $828	$51,732
2070 [b]	137	30	$238 / $806	$56,995
Annualized (2030–2122) [a]	**131**	**29**	**—**	**$50,188**

[a] Annualized benefit value is calculated using net present value over 93 years at a 3.5 percent discount rate.
[b] The 2070 unit value is lower than the 2045 unit value because of the change in the hydrological year type incidence result in a wetter average year.

SWAP Model (Alternate Monetization Approach)

The Sites Reservoir SWAP analysis used the CWC provided SWAP version 6.1 model without any modifications to its model code or baseline data. Review of the CWC SWAP model concluded that the water supply portfolios in the Sacramento Valley, especially Tehama and Colusa Counties, were not consistent with their actual current and future conditions. The CWC SWAP model was not updated to more accurately quantify existing or future Sacramento Valley baseline water supply portfolios due to time constraints, data limitations, and fundamental concerns about SWAP's applicability for determining the project's agricultural supply benefits.

The uncorrected CWC SWAP model was nonetheless run to estimate the project's agricultural supply benefits. Tables A5-45 and A5-46 show the SWAP model results for 2030 and 2070 conditions.

Table A5-45. Agricultural Water Supply Benefit Valuation: 2030 SWAP Values (2010$; $1,000s)

Benefit Factor	2030 Conditions (Average Water Year)		
	Without Project	With Project	Difference
Total Surface Water Use (TAF)	14,099	14,127	27.9
Income Over Expenses	$12,337,876	$12,339,675	$1,799
Groundwater Total Cost [a]	$462,889	$462,889	$0
Groundwater Pumped (TAF)	4,384	4,384	0
Acres Irrigated (1,000s)	6,148	6,154	6.9
Variable Fallow Expenses [b]	na	na	($263)
Consumer Surplus Change			$7,451
NODOS NED Benefits			**$9,513**

[a] Decreased groundwater use and costs represent avoided cost benefits for the project.
[b] Decreased variable fallow expenses represent avoided cost benefits for the project.

Table A5-46. Agricultural Water Supply Benefit Valuation: 2070 SWAP Values (2010$; $1,000s)

Benefit Factor	2070 Conditions (Average Water Year)		
	Without Project	**With Project**	**Difference**
Total Surface Water Use (TAF)	13,532	13,661	129
Income Over Expenses	$13,250,159	$13,257,471	$7,312
Groundwater Total Cost [a]	$599,805	$598,563	($1,242)
Groundwater Pumped (TAF)	4,356	4,346	(10.3)
Acres Irrigated (1,000s)	5,946	5,973	27.5
Variable Fallow Expenses [b]	na	Na	($1,046)
Consumer Surplus Change			$22,211
NODOS NED Benefits			**$31,811**

[a] Decreased groundwater use and costs represent avoided cost benefits for the project.
[b] Decreased variable fallow expenses represent avoided cost benefits for the project.

Total surface water use reported in the tables were solved within the model and may not represent the total surface water available to agriculture calculated in CALSIM II. Therefore, the difference in total surface water use between the without project and with project does not match with the reported Sites water deliveries in Table A5-44. There are multiple influences on the quantity of surface water use within SWAP such as technology, crop prices, groundwater pumping constraints from SGMA, and the price of surface water deliveries. These results further resigned the use the CWC provided SWAP model to estimate the benefits of agricultural water supply.

The largest share of the agricultural water benefit estimated by SWAP is expected from the consumer surplus benefits from the increased agricultural production enabled by the project's water deliveries. This corresponds to the total net value for food consumers obtain from the increased food production (and includes the value above the market price that many consumers may possess).

The other major source of agricultural benefit results from gains in the "income over expenses" (or producer surplus) generated by the increase and/or change in the agricultural activity enabled by the additional agricultural water supplies.

The SWAP agricultural supply benefit estimates in Tables A5-45 and A5-46 are shown in 2010 dollar terms. These values were adjusted into 2015 dollar terms using the Consumer Price Index and their results are summarized in Table A5-47. Table A5-47 also shows the corresponding annualized average benefit value of the agricultural benefits based on the SWAP analysis.

Table A5-47. Incremental Agricultural Water Supply Benefit Valuation: SWAP (SGMA) Values (2015$; $1,000s)

Year	Agricultural Supply TAF	Benefit Value	
		SWAP (SGMA) Water Value $/AF [b]	**Total ($1,000s)**
2030	137	$76	$10,465
2045	148	$132	$19,664
2070	167	$209	$34,996
Annualized (2030–2122) [a]	**161**	**—**	**$23,075**

Note:
[a] Annualized benefit value is calculated using net present value over 93 years and 3.5 percent discount.
[b] Water value is based on total TAF; SWAP underestimates north-of-the-Delta water use.

The CWC SWAP model was determined inadequate to quantify agricultural water supply benefits largely due to its incorrect baseline Sacramento Valley water supply, use and pricing assumptions.

A5.5.2.d Modeling Results (Selected Monetization Approach)

The estimated total benefit value was estimated based on the expected future average hydrological year type and the WSIP Unit Water Values applicable based on the use location of the delivered agricultural water. Table A5-48 shows the estimated future agricultural water supply benefit values.

Table A5-48. Agricultural Water Supply Benefits: WSIP Unit Water Values (2015$; $1,000s)

Alternative	Annual Benefits [a]		Annualized Benefit ($) [b]
	2030	2070	
Average Water Conditions [c]			
Sites Reservoir	$37,443	$56,995	$50,188

[a] Based on WSIP Unit Water Values adjusted by water-year type, expected delivery location, and conveyance energy costs.
[b] Annualized benefits assume interpolated annual physical benefits between 2030 and 2070 and then constant annual benefits after 2070. WSIP Unit Water Values interpolated between 2030 and 2045, after which 2045 unit values are used.
[c] Averaged over the entire hydrologic sequence (1922 to 2003).

The agricultural supply analysis estimates that future agricultural benefits will increase from $37.4 million in 2030 to approximately $57.0 million in 2070. The corresponding annualized benefit for the future 2030 to 2132 operating period is estimated to be $50.2 million. This is equal to an estimated average unit benefit value of $337 per acre foot for agricultural water use. This benefit valuation reflects the high proportion of future north-of-the-Delta agricultural use envisioned by the project.

A5.5.3 Recaptured Water Supply

Sites Reservoir will also collect limited quantities of additional “Recaptured” water related to its releases supporting its anadromous fish deliveries. Rescheduled Shasta Lake deliveries that occur when Sacramento River flows exceed its required “maintenance” levels would add “surplus” supplies that Sites Reservoir would be entitled and able to divert without adversely affect the downstream river conditions or deliveries.

These recaptured water quantities are expected to average approximately 10 TAF per year and would be assigned to the JPA. The JPA would sell the recaptured water predominantly to south-of-the-Delta M&I water contractors. The recaptured water’s sales revenues will then be used to cover the future annual O&M expenses assigned to the public benefit uses.

A5.5.3.a Analytic Methods

CALSIM II

As previously discussed in Section A5.1 All Benefits, CALSIM II modeling was used to determine the project’s 2030 and 2070 recaptured water quantities and its supply deliveries by location under different water-year conditions.

CWEST Model Results (Selected Monetization Approach)

The recaptured water is expected to be predominantly delivered to south-of-the-Delta water contractors and will therefore represent supplemental M&I deliveries. Therefore, the M&I analyses and findings (Section A5.5.1) are similarly applicable to the recaptured water supplies.

WSIP Unit Water Values (Alternate Benefit Monetization Approach)

As previously discussed above, WSIP Unit Water Values modeling for the M&I analysis (Section A5.5.1) are similarly applicable to the recaptured water supplies.

A5.5.3.b Data and Assumptions

The data and assumptions for the M&I analysis (Section A5.5.1) are similarly applicable to the recaptured water supplies.

A5.5.3.c Calculations

Water Supply Projections

The future recaptured water supply quantities determined by CALSIM II are shown above in Table A5-44.

CWEST Model Results (Selected Monetization Approach)

Unit benefit values for the project's M&I deliveries were estimated based on the M&I supply's average quantities and CWEST benefit value estimates under future 2030, 2045 and 2070 conditions.
Table A5-49 shows the estimated unit values. These unit M&I benefit values were applied to their corresponding project future water delivery quantity to determine benefit value estimates for the project's recapture water supplies under future 2030, 2045 and 2070 conditions. Table A5-49 shows the estimated benefit values for the project's future recaptured water supply.

Table A5-49. Recaptured Water Supply Benefit Valuation: CWEST Water Values (2015$; $1,000s)

Year	Recaptured Water Supply TAF	Benefit Value CWEST $/AF	Total ($1,000s)
2030	11	$440	$4,845
2045	11	$874	$9,619
2070	11	$1521	$16,733
Annualized (2030–2122) [a]	**11**	**-**	**$11,123**

[a] Annualized benefit value is calculated using net present value over 93 years at a 3.5 percent discount rate.

WSIP Unit Water Values (Alternative Monetization Approach)

The WSIP Unit Water Value analysis for the recaptured water supplies was the same as that applied to the project's M&I supplies. The recaptured water supply's economic benefits were estimated using the adjusted WSIP Unit Water Values (see Table A5-7) applied to the projected average annual delivery quantities on a year by year basis over the project's entire 2030 to 2122 study period.

Table A5-50 shows the estimated annual benefit values of future recaptured water supply in 2030, 2045, 2070 and the annualized average over the project's full 2030 to 2122 study period.

Table A5-50. Recaptured Water Supply Benefit Valuation: WSIP Unit Water Values (2015$; $1,000s)

Year	Recaptured Water Supply TAF	Benefit Value WSIP Unit Water Value $/AF	Total ($1,000s)
2030	11	$457	$5,029
2045	11	$828	$9,619
2070 [b]	11	$806	$8,866
Annualized (2030–2122) [a]	**11**	**—**	**$8,038**

[a] Annualized benefit value is calculated using net present value over 93 years at a 3.5 percent discount rate.
[b] The 2070 unit value is lower than the 2045 unit value because of the change in the hydrological year type incidence result in a wetter average year.

A5.5.3.d Modeling Results (Selected Monetization Approach)

Table A5-51 shows the estimated future recaptured water supply benefit values obtained based on the CWEST values for 2030 and 2070.

Table A5-51. Recaptured Water Supply Benefits: CWEST Modeling (2015$; $1,000s)

Alternative	Annual Benefits [a]		Annualized Benefit [b]
	2030	2070	
Average Conditions [c]			
Sites Reservoir	$4,845	$16,733	$11,123

Source: CWEST.
[a] Based on CWEST modeling adjusted by water-year type, expected delivery location, and conveyance energy costs.
[b] Annualized benefits represent avoided costs relative to the Future No Project conditions over the planning horizon (2030 to 2122) and are adjusted for expected variations in surface area conditions.
[c] Averaged over the entire hydrologic sequence (1922 to 2003).

The model results indicate an increase in recaptured water supply benefits from $4.8 million in 2030 to $16.7 million in 2070. The corresponding annualized benefit for the future 2030 to 2132 operating period is estimated to be $11.1 million. This is equal to an estimated average unit benefit value for Recaptured Water Supply of $1,302 per acre foot.

Same as it is for M&I, the major increase in recaptured water supply benefits is driven by increased water demand, reduced deliveries from other water supplies (including groundwater depletion and climate change reductions in future Sierra snowpack levels) and the limited availability of alternate water sources.

A5.5.4 Total Water Supply

The project's total water supply reliability benefits are shown in Table A5-52. The total water supply benefit is the project's combined agricultural water supply benefits (estimated using adjusted WSIP Unit Water Values) and its M&I and recaptured water supply benefits (estimated by the CWEST model).

Table A5-52. Total Water Supply Benefits: CWEST Results and WSIP Unit Water Values (2015$; $1,000s)

Alternative	Annual Benefits [a]		Annualized Benefit [b]
	2030	2070	
Average Conditions [c]			
Sites Reservoir	$89,024	$251,521	$175,418

[a] Based on CWEST model results and WSIP Unit Water Values adjusted by water-year type, expected delivery locations, and conveyance energy costs.
[b] Annualized benefits assume interpolated annual physical benefits between 2030 and 2070 and then constant annual benefits after 2070. WSIP Unit Water Values interpolated between 2030 and 2045, after which 2045 unit values are used.
[c] Averaged over the entire hydrologic sequence (1922 to 2003).

Based on the assumed water use split between agricultural, M&I and recapture water use and their use location, the water supply analysis estimate that the project's future water supply benefits will increase from $89.0 million to $251.5 million in between 2030 and 2070. The corresponding annualized benefit over the entire future 2030 to 2132 operating period is estimated to be $175.4 million. This is equivalent to a $760 per acre foot average water supply unit benefit value.

Based on the benefit value differentials, the water supply analysis also indicates the project's total water supply benefits could be increased under different water use allocation that increase south-of-the-Delta and/or M&I water deliveries.

A5.6 Hydropower – System-wide (Non-Proposition 1 Benefit)

The proposed Sites Reservoir project will include new hydropower capacity, generation and pump-back facilities. The seasonal water diversions for the reservoir require power while subsequent water releases would generate power. A pump-back component of the project operations was also modeled and pump-back operations would occur throughout the year as conditions allow.

The hydropower facilities will enable the Sites Reservoir to generate power from its water releases to offset its pumping costs. The pump-back operations were designed to enhance the project's economic performance by capturing opportunities offered by the energy market (energy price differentials between on-peak and off-peak hours). The pump-back facilities also provide the support and products needed to integrate renewable energy (e.g., wind and solar) and thereby potential result in ancillary service[1] and system-wide capacity[2] benefits for the state's power system.

A5.6.1.a Analytic Methods

Future hydropower benefits were modeled by both DWR's Power and Risk Office (PARO) and by Bureau of Reclamation Contractors using the PLEXOS model. These non-public benefits are very difficult to forecast due to a rapidly changing market for valuing ancillary and system-wide capacity benefits due to the rapid and extensive new development of wind and solar resources. The revenue variability for hydropower generation over the last decade can be seen by looking at the fluctuations in the State Water Project past hydropower revenues (add source).

DWR PARO Analysis:

DWR's PARO analysis modeled Sites Reservoir's future incidental and optimized hydropower operation strategies. The incidental scenario that assumes that pumping and generation are scheduled according to expected demand for water deliveries. The optimization scheme maintains the alternatives' operations, constraints, and assumptions as envisioned by the water operations modeling team, but optimizes operations to maximize the Power Portfolio value of the assets.

PARO used two power portfolio models to estimate the costs and revenues from hydropower facilities' operations: Electric Power Research Institute's (EPRI) Energy Portfolio Model (EPM), Version 5; and the EPRI's Fast Fit model, Version 2.5.

Energy Portfolio Model (Selected Monetization Approach)

PARO used the EPRI (EPM, Version 5, as a power portfolio model to project the Reservoir future power costs and revenues. EPM is a computer software model designed to help businesses manage value and risk in the power and energy markets.

The EPM translates the facility operations and underlying commodity prices into a representative set of financial instruments and incorporated into the EPM to determine the probabilistic monetary value of the power portfolio under the study's operational scenario. The EPM provides a set of templates to facilitate describing and evaluating common types of power and fuel contracts (supply contracts,

---

1 Ancillary services benefits are power facility functions that support the power system's generating capacity, energy supply, and delivery. Ancillary services include improved capabilities for the power "grid" to respond to electricity demand, supply, or other market imbalances.

2 System-wide capacity benefits include improvements to the energy planning capacity market that ensure better power system performance. These improvements include improved resource adequacy, renewable energy integration services and renewable energy generation.

standard and customized forward, and option contracts). The model characterizes each commodity market by a forward price curve and a term volatility structure. The model also uses a correlation matrix to characterize the behavior of pairs of commodity markets.

EPRI's Fast Fit Model

EPRI's Fast Fit Model (Version 2.5) was used to characterize the needed power, fuel price volatilities, pricing structures, and the correlations between the different energy markets in which the hydropower facility would participate, or would compete with.

PLEXOS (Selected Monetization Approach)

Toolson and Zhang's PLEXOS® Integrated Energy Model (PLEXOS) analysis also evaluated the project's expected net changes in hydropower capacity, generation, and ancillary services in Western Interconnection electrical power grid. PLEXOS is a power market simulation model that was used to estimate Sites Reservoir's future Ancillary Services (AS) and system-wide capacity performance and benefits.

In addition to projecting Sites Reservoir's future hydropower operations and benefits, PLEXOS also forecast energy and ancillary service power market prices for the year 2022 when the 33 percent Renewable Portfolio Standard (RPS), mandated by California law, will have been implemented.

A5.6.1.b Data and Assumptions

The PLEXOS hydropower benefit study used findings from the California Public Utilities Commission (CPUC) 2012 Long Term Procurement Plan (LTPP) proceedings as the basis for the majority of the assumptions. This study reflects the inputs from multiple resources and has been reviewed by multiple stakeholders in the California power sector. WECC's Transmission Expansion Planning Policy Committee (TEPPC) oversees and maintains a public database for production cost and related analysis. In the LTPP study the latest TEPPC 2022 base case, along with the 2012 WECC Loads and Resources Subcommittee (LRS)'s report, were used for the majority of the assumptions.

The assumptions for the California energy market were further updated with CPUC's inputs from 2010 LTPP assumptions, RPS, and scenario selection tool; with California Energy Commission (CEC)'s inputs on load forecast from Integrated Energy Policy Report (IEPR) and natural gas price forecast; with California ISO's inputs on generator data and operation data, etc.

The PLEXOS analysis used the 2012 LTPP Base Case's 2022 base energy monthly price projections. Their energy prices varied from $32.85 per MWh to $51.07 per MWh (in 2015 dollars) with a mean value of $41.60 per MWh.

The WSIP hydropower benefit analysis assumed that:

- The PLEXOS AS and Capacity values for 2025 can be applied as a conservative estimate of Sites Reservoir's future annual values
- PLEXOS assumes that future power market prices will stabilize once the RPS is achieved.
- Increases in future real energy prices (per WSIP energy escalation requirement) would be expected to increase ancillary service and system-wide value capacity benefit values.

A5.6.1.c Calculations

Energy Use and Hydropower Generation

Table A5-53 shows the PARO analysis estimates of Sites Reservoir's annualized average future pumping costs and hydropower revenues.

Table A5-53. Sites Reservoir Pumping Use and Power Generation

	Total Pumping (MWh)			Generation (MWh)	
	On-Peak	**Off-Peak**	**Pump-Back**	**On-Peak**	**Off-Peak**
Q1 Average	21,285	113,368	21,441	17,814	0
Q2 Average	5,296	15,650	56,563	71,244	351
Q3 Average	3,147	3,275	27,391	77,496	526
Q4 Average	8,957	22,982	31,323	48,111	0
Annual Average	38,685	155,275	136,718	214,665	877

Power Costs and Hydropower Revenues

Table A5-54 shows the PARO analysis estimates of Sites Reservoir's annualized average future pumping costs and hydropower revenues. The PARO analysis determined that the estimated net energy cost for the Site Reservoir future operations would average $1.7 million per year.

Table A5-54. Sites Reservoir Power Costs and Generation Revenues (2015$; $1,000s)

	Hydropower Operations	
Facility	**Incidental**	**Optimized**
Pumping Operations – Revenues (Costs)		
T-C Canal Pumping	($303)	($303)
GCID Pumping	($486)	($486)
Delevan Pipeline Intake Facilities	($1,628)	($1,628)
TRR Pumping	($603)	($603)
Sites Pumping	($8,675)	($7,975)
Subtotal	**($11,695)**	**($10,995)**
Generation – Revenues (Costs)		
Sites Generation	$5,960	$6,434
TRR Generation	$464	$464
Sacramento River Generation	$2,017	$2,017
Subtotal	**$8,442**	**$8,916**
Pump-Back Operations – Revenues (Costs)		
Pump-Back during Diversion Cycle	N/A	$127
Pump-Back during Release Cycle	N/A	$66
Pure Pump-Back Operations Cycle	N/A	$156
Subtotal		$349
Total Net Revenues (Costs)	**($3,253)**	**($1,730)**

GCID = Glenn-Colusa Irrigation District
N/A = not applicable
T-C = Tehama-Colusa
TRR = Terminal Regulating Reservoir

The reservoir's projected energy costs are recognized in its operating and maintenance cost, and were consequently not included in the hydropower system benefit values shown in Table A5-55.

A5.6.1.d Modeling Results (Selected Monetization Approach)

PLEXOS hydropower analysis confirmed DWR's direct energy benefit and cost results. The PLEXOS modeling also determined that the proposed hydropower facilities could be expected to result in substantial ancillary service and system-wide capacity benefits. Table A5-55 shows the estimated future combined ancillary service and system-wide capacity benefits from Sites Reservoir's hydropower operations.

Table A5-55. Hydropower Benefits (2015$; $1,000s)

Alternative	Annual Benefits [a]		Annualized Benefit [b]
	2030	2070	
Average Conditions [c]			
Sites Reservoir	$20,183	$20,183	$19,483

[a] Based on projected ancillary service and system-wide capacity benefits. Note that facility pumping costs and generation revenues are included in the facilities' annual O&M costs.
[b] Annualized benefit is interpolated annual physical benefits between 2030 and 2070 and held constant after 2070. Annual average is less than 2030 and 2070 values due to the initial short ramp-up period before full benefits are generated.
[c] Averaged over the entire hydrologic sequence (1922 to 2003).

The PLEXOS analysis also estimated annual ancillary service benefits of approximately $2.4 million and system-wide capacity benefits of $17.8 million per year. As a result, combined ancillary services and system-wide capacity benefits of $20.2 million are potentially attributable to the project's hydropower operations.

Feasibility and Implementation Risk Tab

Attachment 5: Summary of Environmental Impacts and Tribal Consultation

Summarize the project's impacts on environmental or cultural resources and how the project will mitigate or minimize impacts to those resources, or identify where in the CEQA document this information can be found. If any environmental or cultural impacts will not be fully mitigated, explain. See regulations section 6003(a)(1)(T).

If applicable, identify whether Tribal consultation has been initiated for the project. If it has, provide supporting documentation, or identify the location in the CEQA document. If consultation has not been initiated, state whether consultation is expected and when consultation is expected to be initiated. See regulations section 6003(a)(1)(U).

WSIP Application Instructions, March 2017

Response

This attachment describes the environmental (**see Section A.5 on Page 2**) and cultural impacts (**see Tribal Consultation on Page 34**) associated with Sites Project, as well as the initiated tribal consultations with tribes affected by the implementation of Sites Reservoir and its associated facilities.

Summary of Environmental Impacts and Tribal Consultation

(Relevant Excerpts from the Executive Summary of the Draft Environmental Impact Report [EIR]/Environmental Impact Statement [EIS])

Environmental Commitments Included as Part of the Project

The Authority and Reclamation would incorporate a number of standardized environmental measures, plans, protocols, and best management practices as environmental commitments as part of the Project. The Authority and Reclamation would also coordinate planning, engineering, design and construction, operation, and maintenance phases of the Project with applicable resource agencies. The following environmental commitments would be incorporated for any Project-related construction as well as operations/maintenance (as appropriate) activities:

- Worker Environmental Awareness Program (WEAP)
- Environmental Site Assessment (ESA)
- Construction Management Procedures
  - Fire Safety and Suppression
  - Construction Equipment, Truck, and Traffic Management
- Stormwater Pollution Prevention Plan, Erosion Control, Management, and Dewatering
  - Compliance with the Requirements of Regional Water Quality Control Board (RWQCB) Order No. 5-00-175
  - Spill Prevention and Hazardous Materials Management
- Mosquito and Vector Control
- Groundwater/Dewatering Water Supply
- Visual/Aesthetic Design, Construction, and Operation Practices
- Emergency Action Plan

Summary of Potential Environmental Effects and Mitigation Commitments

The Project would affect environmental resources in all three study areas to varying degrees, with most impacts potentially occurring in the Primary Study Area. Anticipated impacts would vary from construction-related effects that would be less than significant or would be reduced to less-than-significant levels through mitigation to those that would remain significant and unavoidable despite proposed mitigation measures. In addition, many effects of the Project would be beneficial, particularly related to improved water supply reliability in drier years and potential ecosystem benefits.

Table 1 (provided at the end of this attachment) summarizes the impacts by environmental resource, the level of significance of the impact prior to mitigation, the proposed mitigation measure (as applicable), and the level of significance of the impact after mitigation. The proposed Project Mitigation Monitoring Plan is included as Appendix 1A of the Draft EIR/EIS.

Identified Significant and Unavoidable Impacts

As shown in Table 1, the proposed Project would likely result in the following potentially significant and unavoidable direct and indirect impacts.

Terrestrial Biological Resources (Golden Eagle)

Construction and filling of the proposed Sites Reservoir Inundation Area, as well as construction of the proposed Recreation Areas, would result in the permanent loss of foraging and nesting habitat for the golden eagle. Although implementation of compensatory mitigation including land preservation and/or acquisition is proposed, these measures would not reduce this loss of habitat to less-than-significant levels.

Cultural Resources (Historical and Tribal Resources, Human Remains)

Construction of the proposed Project facilities would affect built historical and tribal resources, as well as human remains associated with a designated cemetery and adjacent areas. If these resources and/or areas are determined to be eligible for listing in the California Register of Historical Resources or National Register of Historic Places, mitigation measures would not reduce the impact to less-than-significant levels.

Land Use (Community of Sites, Existing Land Uses, Zoning, and Designations)

Construction and filling of the proposed Sites Reservoir Inundation Area would result in the physical division of the community of Sites, resulting in a significant and unavoidable impact. Construction of the proposed Project facilities would result in conflicts or incompatibilities with existing and designated land uses and existing zoning for agricultural, as well as the conversion of Prime Farmland, Unique Farmland or Farmland of Statewide Importance to non-agricultural use, resulting in significant and unavoidable impacts. Implementation of mitigation measures would not reduce these impacts to less-than-significant levels.

Air Quality (PM_{10}, ROG, and NO_X)

Construction activities associated with all proposed Primary Study Area Project facilities, as well as activities (such as use of roads, recreation, electricity generation and consumption, and sediment dredging) associated with the long-term operation and maintenance of the Project, would result in significant and unavoidable emissions of particulate matter less than 10 microns in diameter (PM_{10}), reactive organic gas (ROG), and nitrogen oxide (NO_X).

Climate Change and Greenhouse Gas Emissions

The greenhouse gas (GHG) emissions estimated for construction, operation, and maintenance of the Project when compared to applicable county standards would contribute to a cumulatively considerable effect that would be significant and unavoidable.

Visual Resources (Terminal Regulating Reservoir)

The proposed Terminal Regulating Reservoir (TRR) and associated TRR facilities would be visually dominant and in high contrast to the surrounding landscape, resulting in a significant and unavoidable impact on a scenic vista.

Growth-inducing Impacts

Implementation of the Project would improve water supply reliability for agricultural, urban, and environmental uses; provide more options for water management; increase recreational opportunities; and increase temporary and permanent employment opportunities. These Project-related changes would not be expected to result in growth-inducing effects as described below.

Improved Water Supply Reliability for Urban, Agricultural, and Refuge Uses

The expected increase in water deliveries in Dry and Critical years (to primarily State Water Project (SWP) municipal and industrial water users) associated with Project implementation would be anticipated to result in the decreased need for water transfers and/or decreased groundwater pumping in dryer years. Such dry year actions are generally identified in Urban Water Management Plans and would be expected to be required relatively less often with the implementation of the Project. Given long-term average water supplies (including normal and wetter years) are not projected to increase as part of Project implementation, increased dry year water supply reliability is not expected to be growth inducing.

The expected increase in water deliveries to agricultural water users in the Primary and Extended Study Areas in Dry and Critical years is anticipated to decrease the need for water transfers and groundwater pumping and associated land idling. Improved dry year water supply reliability is not expected to be growth inducing, and would not promote conversion of agricultural lands to urban uses.

Refuge water supplies would be similar to the Existing Conditions/No Project/No Action Condition, with the source potentially changing to some degree to be provided by the Project and to a lesser degree through water transfers. Regardless, such changes would not result in growth inducement.

Increased Temporary and Permanent Employment Opportunities

The expected magnitude of Project-related increased employment opportunities in the agricultural sector would be less than 1 percent, when compared to the regional economy of the Extended Study Area, and is therefore not anticipated to result in growth-inducing impacts. Although the expected increased water supply deliveries could result in increased employment and other economic benefits, the effects on housing and population are expected to be minor in the Extended Study Area, when compared to the total housing and population.

Project construction and operation would be expected to result in a minor increase in jobs and population in the Primary Study Area, which could be accommodated within available housing units. An adequate housing supply exists to accommodate the change in population; thus, this expected increase associated with Project implementation is not anticipated to be growth inducing.

Improved Recreational Opportunities

Expected Project-related increased recreation expenditures would represent less than 0.2 percent of total industrial expenditures in the Primary Study Area and are, therefore, not anticipated to increase growth within the entire Primary Study Area.

Cumulative Impacts

The California Code of Regulations' Guidelines for the Implementation of the California Environmental Quality Act (CEQA Guidelines) and federal National Environmental Policy Act (NEPA) regulations require that the cumulative impacts of a proposed project be addressed in an Environmental Impact

Report/Environmental Impact Statement (EIR/EIS). Cumulative impacts are impacts on the environment that result from the incremental impacts of a proposed action when added to other past, present, and reasonably foreseeable future actions.

The cumulative impact assessment for the Project considered projects and programs identified under Existing Conditions (which includes the current effects of past projects) and reasonably foreseeable and probable future projects. The criterion for considering whether a project was reasonably foreseeable and probable in this EIR/EIS was whether the project had been defined in adequate detail, either through the completion of publicly available preliminary evaluations, feasibility studies, or draft environmental and engineering documents, to estimate potential impacts.

Projects considered in the cumulative impacts analysis included 7 multi-region projects and actions; 7 water supply, water quality, and hydropower projects and actions in the vicinity of the proposed Project facilities and/or potentially affected by Central Valley Project (CVP) and SWP operations; and 5 ecosystem improvement projects and actions in the vicinity of the proposed Project facilities and/or potentially affected by CVP and SWP operations (refer to Chapter 35 Cumulative Impacts in the Draft EIR/EIS for the names and descriptions of each of project considered).

Implementation of the Project would not result in the cumulatively considerable incremental contribution to an overall significant cumulative adverse effects.

Secondary Study Area	LS	LS	LS	LS	LS	N/A	N/A
Primary Study Area							
Sites Reservoir Inundation Area, Sites Reservoir Dams; TRR, TRR Pumping/Generating Plant, TRR Electrical Switchyard, GCID Canal Connection to the TRR, Delevan Transmission Line, Delevan Pipeline, TRR Pipeline, TRR Pipeline Road, Delevan Pipeline Electrical Switchyard, Delevan Pipeline Intake Facilities; Project Buffer; Overhead Power Lines and Substations, Holthouse Reservoir Complex and Holthouse Reservoir Electrical Switchyard	S	S	S	S	S	**Cul-1a** **Cul-2a:** Follow the Secretary of the Interior's Standards for the Treatment of Historical Resources/Historic Properties **Cul-2b:** Record Built Environment Resources	SU (if eligible for CRHR or NRHP listing)
Impact Cul-3: Disturb a Traditional Cultural Property or a Tribal Cultural Resource as defined in PCR section 21074							
Extended Study Area	LS	LS	LS	LS	LS	N/A	N/A
Secondary Study Area	LS	LS	LS	LS	LS	N/A	N/A
Primary Study Area							
Sites Reservoir Inundation Area, Sites Reservoir Dams; TRR, TRR Pumping/Generating Plant, TRR Electrical Switchyard, GCID Canal Connection to the TRR, Delevan Transmission Line, Delevan Pipeline, TRR Pipeline, TRR Pipeline Road, Delevan Pipeline Electrical Switchyard, Delevan Pipeline Intake Facilities; Project Buffer; Overhead Power Lines and Substations, GCID Canal Facilities Modifications	S	S	S	S	S	**Cul-1a** **Cul-3:** Consult with Affected Communities Regarding How to Mitigate for Impacts on TCPs/TCRs	SU (if eligible for CRHR or NRHP listing)
Impact Cul-4: Disturb Human Remains, including those Interred Outside of Dedicated Cemeteries							
Extended Study Area	LS	LS	LS	LS	LS	N/A	N/A
Secondary Study Area	LS	LS	LS	LS	LS	N/A	N/A
Primary Study Area	S	S	S	S	S	**Cul-1a** **Cul-4a:** Relocation of Dedicated or Known Cemeteries **Cul-4b:** Immediately Halt Construction if Human Remains Are Discovered and Implement a Burial Treatment Plan	SU (if eligible for CRHR or NRHP listing)
19. Indian Trust Assets							
Extended, Secondary, and Primary Study Areas	LS	LS	LS	LS	LS	N/A	N/A
20. Land Use – CONFIRMING IMPACT CALLS WITH COUNTIES							
Impact Land-1: Physical Division of an Established Community							
Extended Study Area	NI	NI	NI	NI	NI	N/A	N/A
Secondary Study Area	NI	NI	NI	NI	NI	N/A	N/A
Primary Study Area							
Sites Reservoir Inundation Area and Sites Reservoir Dams (construction, operation, and maintenance effects on the town of Sites)	S	S	S	S	S	No Feasible Mitigation	SU
Impact Land-2: Conflict with an Applicable Land Use Plan, Policy, or Regulation of an Agency with Jurisdiction over the Project Adopted for the Purpose of Avoiding or Mitigating an Environmental Effect							
Extended Study Area	NI	NI	NI	NI	NI	N/A	N/A
Secondary Study Area	NI	NI	NI	NI	NI	N/A	N/A
Primary Study Area							

Impact	Anticipated Impact in Comparison to Existing Conditions/No Action/No Project Condition Prior to Mitigation A	B	C	C_1	D	Recommended Mitigation Measure	Level of Significance after Mitigation
Sites Reservoir Inundation Area and Sites Reservoir Dams; Recreation Areas; Road Relocations; South Bridge, and TRR Pipeline Road; Sites Pumping/Generating Plant; Sites Electrical Switchyard; Tunnel from Sites Pumping/Generating Plant to Sites Inlet/Outlet Structure; Sites Reservoir Inlet/Outlet Structure; Field Office Maintenance Yard; Asphalt Batch Plant; Holthouse Reservoir Complex; Holthouse Reservoir Electrical Switchyard; Delevan Pipeline Electrical Switchyard; TRR; TRR Pumping/Generating Plant; GCID Canal Connection to the TRR; TRR Electrical Switchyard; Delevan Pipeline Intake Facilities; Delevan Pipeline Discharge Facility (construction, operation, and maintenance)	S	S	S	S	S	**Land-2:** Work with Glenn and Colusa Counties to Modify or Amend Counties General Plans and/or Zoning Ordinances to Bring lands into Consistency with the Proposed Project Land Uses	SU
Impact Land-3: Conflict with Existing Zoning for, or Cause Rezoning of, Forest Land (as Defined in Public Resources Code Section 12220(g)), Timberland (as Defined by Public Resources Code Section 4526), or Timberland Zoned Timberland Production (as Defined by Government Code Section 51104(g))							
Extended Study Area	NI	NI	NI	NI	NI	N/A	N/A
Secondary Study Area	NI	NI	NI	NI	NI	N/A	N/A
Primary Study Area	NI	NI	NI	NI	NI	N/A	N/A
Impact Land-4: Involve Other Changes in the Existing Environment which, Because of their Location or Nature, could Result in Conversion of Farmland to Non-agricultural Use or Conversion of Forest Land to Non-forest Use							
Extended Study Area	NI	NI	NI	NI	NI	N/A	N/A
Secondary Study Area	NI	NI	NI	NI	NI	N/A	N/A
Primary Study Area	LS	LS	LS	LS	LS	N/A	LS
Impact Land-5: Changes in Land Use that are Considered to be Incompatible with the Existing Land Uses Adjacent to the Project Facilities							
Extended Study Area	NI	NI	NI	NI	NI	N/A	N/A
Secondary Study Area	NI	NI	NI	NI	NI	N/A	N/A
Primary Study Area	NI	NI	NI	NI	NI	N/A	N/A
Impact Land-6: Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as Shown on the Maps Prepared Pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to Non-agricultural Use							
Extended Study Area	NI	NI	NI	NI	NI	N/A	N/A
Secondary Study Area	NI	NI	NI	NI	NI	N/A	N/A
Primary Study Area	S	S	S	NI	S	No Feasible Mitigation	SU
Impact Land-7: Permanent Conflict with Existing Zoning for Agricultural Use, and/or the Permanent Conversion of Lands that have a Williamson Act Contract							
Extended Study Area	NI	NI	NI	NI	NI	N/A	N/A
Secondary Study Area	NI	NI	NI	NI	NI	N/A	N/A
Primary Study Area							
Sites Reservoir Inundation Area and Sites Reservoir Dams; Recreation Areas; Road Relocations; South Bridge, and TRR Pipeline Road; Sites Pumping/Generating Plant; Sites Electrical Switchyard; Tunnel from Sites Pumping/Generating Plant to Sites Inlet/Outlet Structure; Sites Reservoir Inlet/Outlet Structure; Field Office Maintenance Yard; Asphalt Batch Plant; Holthouse Reservoir Complex; Holthouse Reservoir Electrical Switchyard; Delevan Pipeline Electrical Switchyard; TRR; TRR Pumping/Generating Plant; GCID Canal Connection to the TRR; TRR Electrical Switchyard; Delevan Pipeline Intake Facilities; Delevan Pipeline Discharge Facility (construction, operation, and maintenance)	S	S	S	S	S	**Land-7a:** Acquire Lands through Eminent Domain or Work with Land Owners to Acquire Properties and Pay Any Cancellation Fees Associated with Removing Lands from Williamson Act Contracts **Land-7b:** For Land Permanently Acquired other than by Eminent Domain, Seek County Approvals to Rescind Williamson Act Contracts and Enter in Open Space Contracts or Open Space Easements	LS
21. Recreation Resources							
Impact Rec-1: Increase the Use of Existing Neighborhood and Regional Parks or Other Recreational Facilities such that Substantial Physical Deterioration of the Facility would Occur or be Accelerated							
Extended Study Area	NI	NI	NI	NI	NI	N/A	N/A
Secondary Study Area	NI	NI	NI	NI	NI	N/A	N/A

Impact	Anticipated Impact in Comparison to Existing Conditions/No Action/No Project Condition Prior to Mitigation					Recommended Mitigation Measure	Level of Significance after Mitigation
	A	B	C	C_1	D		
Primary Study Area							
All Primary Study Area Project Facilities except for the Delevan Pipeline Intake/Discharge Facilities	NI	NI	NI	NI	NI	N/A	N/A
Delevan Pipeline Intake Facilities	LS	N/A	LS	LS	LS	N/A	N/A
Delevan Pipeline Discharge Facility	LS	LS	LS	LS	LS	N/A	N/A
Impact Rec-2: Include Recreational Facilities or Require the Construction or Expansion of Recreational Facilities which might Have an Adverse Physical Effect on the Environment							
Extended Study Area							
Wildlife Refuge Water Use, San Luis Reservoir, Other Reservoirs	NI	NI	NI	NI	NI	N/A	N/A
Secondary Study Area	NI	NI	NI	NI	NI	N/A	N/A
Primary Study Area							
Sites Reservoir Complex	LS	LS	LS	LS	LS	N/A	N/A
Impact Rec-3: Reduce Recreation Use Levels at Existing Nearby Recreation Facilities by Providing an Alternative New Site for Recreation Visitors							
Extended Study Area							
Wildlife Refuge Water Use, San Luis Reservoir, Other Reservoirs	NI	NI	NI	NI	NI	N/A	N/A
Secondary Study Area							
Trinity Lake, Trinity River, Klamath River downstream of the Trinity River, Shasta Lake, Sacramento River, Clear Creek, Feather River, American River, Sutter Bypass, Yolo Bypass, Sacramento-San Joaquin Delta, Suisun Bay, San Pablo Bay, San Francisco Bay	NI	NI	NI	NI	NI	N/A	N/A
Lake Oroville, Folsom Lake, Other Reservoirs	LS	LS	LS	LS	LS	N/A	N/A
Pump Installation at the Red Bluff Pumping Plant	NI	NI	NI	NI	NI	N/A	N/A
Primary Study Area	NI	NI	NI	NI	NI	N/A	N/A
Impact Rec-4: Affect Recreation Use Levels and/or Recreation Benefits at Existing Reservoirs or Rivers due to Changes in Operating Criteria							
Extended Study Area							
San Luis Reservoir, Other Reservoirs	NI	NI	LS	LS	LS	N/A	N/A
Secondary Study Area							
Trinity Lake, Shasta Lake, Lake Oroville, Folsom Lake	Beneficial	Beneficial	Beneficial	Beneficial	Beneficial	N/A	N/A
Clear Creek, Sacramento-San Joaquin Delta; Suisun Bay, San Pablo Bay, San Francisco Bay, Other Reservoirs, Sacramento River, Feather River	NI	NI	NI	NI	NI	N/A	N/A
Trinity River, Sutter Bypass, Yolo Bypass, American River	LS	LS	LS	LS	LS	N/A	N/A
Pump Installation at the Red Bluff Pumping Plant	NI	NI	NI	NI	NI	N/A	N/A
Primary Study Area	NI	NI	NI	NI	NI	N/A	N/A
Impact Rec-5: Reduce Recreation Use Levels at Existing Recreation Facilities During the Period of Construction							
Extended Study Area	NI	NI	NI	NI	NI	N/A	N/A
Secondary Study Area	NI	NI	NI	NI	NI	N/A	N/A
Primary Study Area							
Sites Reservoir Inundation Areas, Sites Reservoir Dams; Recreation Areas, Road Relocations and South Bridge; Sites Pumping/Generating Plant; Sites Electrical Switchyard; Tunnel; Sites Reservoir Inlet/Outlet Structure; Field Office Maintenance Yard; Holthouse Reservoir Complex; Holthouse Reservoir Electrical Switchyard, GCID Canal Facilities Modifications; GCID Canal Connection to the TRR; TRR; TRR Pumping/Generating Plant; TRR Electrical Switchyard, TRR Pipeline; TRR Pipeline Road, Delevan Pipeline Electrical Switchyard, Project Buffer	NI	NI	NI	NI	NI	N/A	N/A
Delevan Pipeline	LS	LS	LS	LS	LS	N/A	N/A
Sites/Delevan Overhead Power Line	LS	LS	LS	LS	LS	N/A	N/A

Impact	Anticipated Impact in Comparison to Existing Conditions/No Action/No Project Condition Prior to Mitigation A	B	C	C_1	D	Recommended Mitigation Measure	Level of Significance after Mitigation
Delevan Pipeline Intake Facilities	LS	N/A	LS	LS	LS	N/A	N/A
Delevan Pipeline Discharge Facility	LS	LS	LS	LS	LS	N/A	N/A
Impact Rec 6: Create Hazardous Conditions for Water Based Activities due to Changes in Operating Criteria							
Extended Study Area							
Wildlife Refuge Water Use, San Luis Reservoir, Other Reservoirs	LS	LS	LS	LS	LS	N/A	N/A
Secondary Study Area							
Trinity River, Sacramento River, Lake Oroville, Sutter Bypass, Yolo Bypass, American River	LS	LS	LS	LS	LS	N/A	N/A
Trinity Lake, Klamath River downstream of the Trinity River, Clear Creek, Feather River, Folsom Lake, Sacramento-San Joaquin Delta, Suisun Bay, San Pablo Bay, San Francisco Bay, Other Reservoirs	NI	NI	NI	NI	NI	N/A	N/A
Pump Installation at the Red Bluff Pumping Plant	NI	NI	NI	NI	NI	N/A	N/A
Primary Study Area	LS	LS	LS	LS	LS	N/A	N/A
22. Socioeconomics – TO BE COMPLETED							
Impact Socio-1: Substantial Adverse Effects on Regional Economics							
Extended, Secondary, and Primary Study Areas	LS	LS	LS	LS	LS	N/A	N/A
Impact Socio-2: Substantial Adverse Effects on Population and Housing							
Extended, Secondary, and Primary Study Areas	LS	LS	LS	LS	LS	N/A	N/A
Impact Socio-3: Substantial Adverse Effects on Local Government Fiscal Conditions							
Extended, Secondary, and Primary Study Areas	LS	LS	LS	LS	LS	N/A	N/A
Impact Socio-4: Substantial Adverse Effects on Recreation Economics							
Extended, Secondary, and Primary Study Areas	Beneficial	Beneficial	Beneficial	Beneficial	Beneficial	N/A	N/A
Impact Socio-5: Substantial Adverse Effects on Agricultural Economics							
Extended, Secondary, and Primary Study Areas	LS	LS	LS	LS	LS	N/A	N/A
Impact Socio-6: Substantial Adverse Effects on M&I Water Use Economics							
Extended and Secondary Study Areas	LS	LS	LS	LS	LS	N/A	N/A
Primary Study Area	NI	NI	NI	NI	NI	N/A	N/A
23. Environmental Justice							
Impact Env Jus-1: A Disproportionate Share of an Adverse Impact (such as Traffic, Noise, Dust, Hazards, and/or Socioeconomic Effects) on a Minority or Low-income Population, Including the Potential for Minority or Low-income Populations to be Disproportionately Affected by Multiple Adverse Exposures Impacts							
Extended Study Area	NI	NI	NI	NI	NI	N/A	N/A
Secondary Study Area	NI	NI	NI	NI	NI	N/A	N/A
Primary Study Area							
Minority and Low-income Populations	NI	NI	NI	NI	NI	N/A	N/A
Job and Recreational Opportunities	NI	NI	NI	NI	NI	N/A	N/A
24. Air Quality							
Impact Air Qual-1: Conflict with an Applicable Air Quality Plan, Contribute Substantially to an Air Quality Violation, and/or Result in a Cumulatively Considerable Net Increase of Nonattainment Pollutants							
Extended Study Area	NI	NI	NI	NI	NI	N/A	N/A
Secondary Study Area	LS	LS	LS	LS	LS	N/A	N/A
Primary Study Area	S	S	S	S	S	**Air Qual-1a:** Develop a Fugitive Dust Control Plan	SU (for Emissions of PM_{10})
						Air Qual-1b: Implement Measures to Reduce Equipment and Vehicle	SU (for Emissions of NO_x, PM_{10}, and

Impact	Anticipated Impact in Comparison to Existing Conditions/No Action/No Project Condition Prior to Mitigation					Recommended Mitigation Measure	Level of Significance after Mitigation
	A	B	C	C_1	D		
						Exhaust Emissions	ROG) LS (for Emissions of SO_x, CO, and $PM_{2.5}$)
Impact Air Qual-2: Expose Sensitive Receptors to Substantial Pollutant Concentrations							
Extended and Secondary Study Areas	NI	NI	NI	NI	NI	N/A	N/A
Primary Study Area	LS	LS	LS	LS	LS	N/A	N/A
Impact Air Qual-3: Create Objectionable Odors Affecting a Substantial Number of People							
Extended and Secondary Study Areas	NI	NI	NI	NI	NI	N/A	N/A
Primary Study Area	LS	LS	LS	LS	LS	N/A	N/A
25. Climate Change and Greenhouse Gas Emissions – TO BE COMPLETED							
Impact GHG-1: Generation of Cumulative GHG Emissions							
Extended, Secondary, and Primary Study Areas							
Construction, Operation, and Maintenance of the Proposed Project	S	S	S	S	S	No Feasible Mitigation	SU
Open Water Surfaces and Tailraces	LS	LS	LS	LS	LS	N/A	N/A
26. Navigation, Transportation, and Traffic							
Impact Nav-1: Conflict with Navigation Along any of the Navigable Waterways within the Extended, Secondary, and Primary Study Areas							
Extended and Secondary Study Areas	NI	NI	NI	NI	NI	N/A	N/A
Primary Study Area (Delevan Complex)	LS	LS	LS	LS	LS	N/A	N/A
Impact Trans-1: Conflict with an Applicable Plan, Ordinance, or Policy Establishing Measures of Effectiveness for the Performance of the Circulation System, Considering all Modes of Transportation							
Extended and Secondary Study Areas	NI	NI	NI	NI	NI	N/A	N/A
Primary Study Area	LS	LS	LS	LS	LS	N/A	N/A
Impact Trans-2: Conflict with an Applicable Congestion Management Program, Including, but not Limited to, Level of Service Standards and Travel Demand Measures, or Other Standards Established by the County Congestion Management Agency for Designated Roads or Highways							
Extended and Secondary Study Areas	NI	NI	NI	NI	NI	N/A	N/A
Primary Study Area	LS	LS	LS	LS	LS	N/A	N/A
Impact Trans-3: Substantially Increase Hazards Due to a Design Feature or Incompatible Uses							
Extended and Secondary Study Areas	NI	NI	NI	NI	NI	N/A	N/A
Primary Study Area	LS	LS	LS	LS	LS	N/A	N/A
Impact Trans-4: Result in Inadequate Emergency Access							
Extended and Secondary Study Areas	NI	NI	NI	NI	NI	N/A	N/A
Primary Study Area	LS	LS	LS	LS	LS	N/A	N/A
Impact Trans-5: Conflict with Adopted Policies, Plans, or Programs Regarding Public Transit, Bicycle, or Pedestrian Facilities, or Otherwise Decrease the Performance or Safety of Such Facilities							
Extended and Secondary Study Areas	NI	NI	NI	NI	NI	N/A	N/A
Primary Study Area	LS	LS	LS	LS	LS	N/A	N/A
27. Noise							
Impact Noise-1: Expose Persons to or Generation of Noise Levels in Excess of Established Standards							
Extended Study Area	NI	NI	NI	NI	NI	N/A	N/A
Secondary Study Area							
Trinity Lake, Lewiston Lake, Trinity River, Klamath River downstream of the Trinity River, Whiskeytown Lake, Spring Creek, Shasta Lake, Keswick Reservoir, Clear Creek, Lake Oroville, Thermalito Complex; Feather River; Sutter Bypass; Yolo Bypass; Folsom Lake; Lake Natoma; American River; Sacramento-San Joaquin Delta; Suisun Bay; San Pablo Bay; San Francisco Bay	NI	NI	NI	NI	NI	N/A	N/A

Impact	Anticipated Impact in Comparison to Existing Conditions/No Action/No Project Condition Prior to Mitigation A	B	C	C_1	D	Recommended Mitigation Measure	Level of Significance after Mitigation
Pump Installation at the Red Bluff Pumping Plant	LS	LS	LS	LS	LS	N/A	N/A
Primary Study Area	LS	LS	LS	LS	LS	N/A	N/A
Impact Noise-2: Expose Persons to or Generation of Excessive Ground-borne Vibration or Ground-borne Noise Levels							
Extended Study Area	NI	NI	NI	NI	NI	N/A	N/A
Secondary Study Area							
Trinity Lake, Lewiston Lake, Trinity River, Klamath River downstream of the Trinity River, Whiskeytown Lake, Spring Creek, Shasta Lake, Keswick Reservoir, Clear Creek, Lake Oroville, Thermalito Complex; Feather River; Sutter Bypass; Yolo Bypass; Folsom Lake; Lake Natoma; American River; Sacramento-San Joaquin Delta; Suisun Bay; San Pablo Bay; San Francisco Bay	NI	NI	NI	NI	NI	N/A	N/A
Pump Installation at the Red Bluff Pumping Plant	LS	LS	LS	LS	LS	N/A	N/A
Primary Study Area	LS	LS	LS	LS	LS	N/A	N/A
Impact Noise-3: Result in a Substantial Permanent Increase in Ambient Noise Levels in the Project Vicinity							
Extended Study Area	NI	NI	NI	NI	NI	N/A	N/A
Secondary Study Area							
Trinity Lake, Lewiston Lake, Trinity River, Klamath River downstream of the Trinity River, Whiskeytown Lake, Spring Creek, Shasta Lake, Keswick Reservoir, Clear Creek, Lake Oroville, Thermalito Complex; Feather River; Sutter Bypass; Yolo Bypass; Folsom Lake; Lake Natoma; American River; Sacramento-San Joaquin Delta; Suisun Bay; San Pablo Bay; San Francisco Ba	NI	NI	NI	NI	NI	N/A	N/A
Pump Installation at the Red Bluff Pumping Plant	LS	LS	LS	LS	LS	N/A	N/A
Primary Study Area	LS	LS	LS	LS	LS	N/A	N/A
Impact Noise-4: Result in a Substantial Temporary or Periodic Increase in Ambient Noise Levels in the Project Vicinity							
Extended Study Area	NI	NI	NI	NI	NI	N/A	N/A
Secondary Study Area							
Trinity Lake, Lewiston Lake, Trinity River, Klamath River downstream of the Trinity River, Whiskeytown Lake, Spring Creek, Shasta Lake, Keswick Reservoir, Clear Creek, Lake Oroville, Thermalito Complex; Feather River; Sutter Bypass; Yolo Bypass; Folsom Lake; Lake Natoma; American River; Sacramento-San Joaquin Delta; Suisun Bay; San Pablo Bay; San Francisco Bay	NI	NI	NI	NI	NI	N/A	N/A
Pump Installation at the Red Bluff Pumping Plant	LS	LS	LS	LS	LS	N/A	N/A
Primary Study Area	LS	LS	LS	LS	LS	N/A	N/A
Impact Noise-5: Expose People Residing or Working in the Project Area to Excessive Noise Levels (when the Project is Located within an Airport Land Use Plan or within 2 Miles of a Public Airport)							
Extended and Secondary Study Areas	NI	NI	NI	NI	NI	N/A	N/A
Primary Study Area	LS	LS	LS	LS	LS	N/A	N/A
Impact Noise 6: Expose People Residing or Working in the Project Area to Excessive Noise Levels (for a Project within the Vicinity of a Private Airstrip)							
Extended, Secondary, and Primary Study Areas	NI	NI	NI	NI	NI	N/A	N/A
28. Public Health and Environmental Hazards							
Impact Pub Health-1: Create a Significant Public or Environmental Hazard from the Routine Transport, Use, or Disposal of Hazardous Materials							
Extended Study Area	NI	NI	NI	NI	NI	N/A	N/A
Secondary and Primary Study Areas	LS	LS	LS	LS	LS	N/A	N/A
Impact Pub Health-2: Create a Significant Public or Environmental Hazard from the Release of Hazardous Materials into the Environment							
Extended Study Area	NI	NI	NI	NI	NI	N/A	N/A
Secondary Study Area	LS	LS	LS	LS	LS	N/A	N/A
Impact Pub Health-3: Effects from Hazardous Emissions or Hazardous Materials, Substances, or Wastes within 0.25 Mile of an Existing or Proposed School							
Extended Study Area	NI	NI	NI	NI	NI	N/A	N/A

Impact	Anticipated Impact in Comparison to Existing Conditions/No Action/No Project Condition Prior to Mitigation A	B	C	C_1	D	Recommended Mitigation Measure	Level of Significance after Mitigation
Secondary and Primary Study Areas	NI	NI	NI	NI	NI	N/A	N/A
Impact Pub Health-4: Create a Significant Hazard to the Public or the Environment from the Project being Located on a Listed Hazardous Materials Site							
Extended and Secondary Study Areas	NI	NI	NI	NI	NI	N/A	N/A
Primary Study Area	LS	LS	LS	LS	LS	N/A	N/A
Impact Pub Health-5: Effects on Adopted Emergency Response Plan or Emergency Evacuation Plan Implementation							
Extended Study Area	NI	NI	NI	NI	NI	N/A	N/A
Secondary and Primary Study Areas	LS	LS	LS	LS	LS	N/A	N/A
Impact Pub Health-6: Expose People or Structures to a Significant Risk of Loss, Injury, or Death from Wildland Fires							
Extended and Secondary Study Areas	NI	NI	NI	NI	NI	N/A	N/A
Primary Study Area	LS	LS	LS	LS	LS	N/A	N/A
Impact Pub Health-7: Create a Safety Hazard for People Residing or Working in the Project Area (if Located within an Airport Land Use Plan or within 2 Miles of a Public Airport or Public Use Airport if no Plan has been Adopted)							
Extended and Secondary Study Areas	NI	NI	NI	NI	NI	N/A	N/A
Primary Study Area	NI	NI	NI	NI	NI	N/A	N/A
Impact Pub Health-8: Creation of a safety hazard for people residing or working in the Project area (if located within the vicinity of a private airstrip).							
Extended, Secondary, and Primary Study Areas	NI	NI	NI	NI	NI	N/A	N/A
Impact Pub Health-9: Expose People to an Increased Risk of Mosquito-borne or Other Vector-borne Illnesses, or Increased Exposure to Nuisance Problems							
Extended and Secondary Study Areas	NI	NI	NI	NI	NI	N/A	N/A
Primary Study Area	LS	LS	LS	LS	LS	N/A	N/A
29. Public Services and Utilities							
Impact Services-1: A Substantial Adverse Physical Impact Associated with the Provision of New or Physically Altered Governmental Facilities or the Need for New or Physically Altered Governmental Facilities (the Construction of which Could Cause Significant Environmental Impacts) in Order to Maintain Acceptable Service Ratios, Response Times, or Other Performance Objectives for the Following Public Services: Fire Protection, Police Protection, Schools, Parks, and/or Other Public Facilities, and Disruptions to Local or Regional Utility Services							
Extended, Secondary, and Primary Study Areas	NI	NI	NI	NI	NI	N/A	N/A
Impact Services-2: A Decline in Property Tax or Fee Revenues that Would Lead to a Substantial Decrease in Public Services							
Extended and Secondary Study Areas	NI	NI	NI	NI	NI	N/A	N/A
Primary Study Area	LS	LS	LS	LS	LS	N/A	N/A
Impact Services-3: Exceed the Wastewater Treatment Requirements of the Applicable Regional Water Quality Control Board							
Extended, Secondary, and Primary Study Areas	NI	NI	NI	NI	NI	N/A	N/A
Impact Services-4: The Need for Expansion of Existing Wastewater Treatment, Water Treatment, Stormwater, and/or Landfill Facilities							
Extended, Secondary, and Primary Study Areas	NI	NI	NI	NI	NI	N/A	N/A
Impact Services-5: Require New or Expanded Water Supply Entitlements and Resources							
Extended and Secondary Study Areas	LS	LS	LS	LS	LS	N/A	N/A
Primary Study Area	LS	LS	LS	LS	LS	N/A	N/A
Impact Services-6: Non-compliance with Federal, State, and Local Statutes and Regulations Related to Solid Waste							
Extended, Secondary, and Primary Study Areas	NI	NI	NI	NI	NI	N/A	N/A
30. Visual Resources							
Impact Vis-1: A Substantial Adverse Effect on a Scenic Vista							
Extended, Secondary, and Primary Study Areas	NI	NI	NI	NI	NI	N/A	N/A
Impact Vis-2: Substantial Damage to Scenic Resources, Including, but not Limited to, Trees, Rock Outcroppings, and Historic Buildings within a State Scenic Highway							
Extended Study Area							
Agricultural Water Use, Municipal and Industrial Water Use, and Wildlife Refuge Water Use	NI	NI	NI	NI	NI	N/A	N/A

Secondary and Primary Study Areas	?	?	?	?	?	?	?
Impact Power-3: A Substantial Reduction in the Generation of Renewable Energy							
Extended, Secondary, and Primary Study Areas	?	?	?	?	?	?	?

Notes:

LS = less than significant
N/A = not applicable
NI = no impact
S = significant
SU = significant and unavoidable

BMP = best management practices
CDFW = California Department of Fish and Wildlife
CNPS = California Native Plant Society
CO = carbon monoxide
CRHR = California Register of Historical Resources
CVP = Central Valley Project
GCID = Glenn-Colusa Irrigation District
GHG = greenhouse gas
M&I = municipal and industrial
NO_x = nitrogen oxides
NRHP = National Register of Historic Places
PM_{10} = respirable particulate matter with an aerodynamic diameter of 10 microns or less
$PM_{2.5}$ = respirable particulate matter with an aerodynamic diameter of 2.5 microns or less
SOX = sulfur oxide
SWP = State Water Project
TRR = Terminal Regulating Reservoir
USACE = U.S. Army Corps of Engineers
USFWS = U.S. Fish and Wildlife Service

Tribal Consultation

Consultation with Native American tribes was initiated. The Authority contacted the California Native American Heritage Commission (NAHC) on January 27, 2017, with a request for a list of tribes that have a traditional and cultural affiliation with the Primary Study Area. Table 2 summarizes the information NAHC provided on February 8, 2017, under Public Resources Code (PRC) Section 21080.3.1.

Table 2. Native American Consultation

Tribe	Contact	Notification Letter	Tribal Response	Consultation Actions to Date
Colusa Indian Community Council (Cachil Dehe Band of Wintun Indians)	Oscar Serrano, Principal Engineer	February 10, 2017	Letter requesting consultation was received by the Authority on February 6, 2017.	The Authority sent a letter in preparation for an initial meeting on March 6, 2017.
Cortina Indian Rancheria of Wintun Indians	Charlie Wright, Chairperson	February 10, 2017	No response, to date.	
Estom Yumeka Maidu Tribe of the Enterprise Rancheria	Glenda Nelson, Chairperson	February 10, 2017	No response, to date.	
Grindstone Indian Rancheria of Wintun-Wailaki	Ronald Kirk, Chairperson	February 10, 2017	No response, to date.	
Mechoopda Indian Tribe	Denis. E. Ramirez, Chairperson	February 10, 2017	No response, to date.	
Paskenta Band of Nomlaki Indians	Andrew Alejandre Chairperson	February 10, 2017	No response, to date.	
Yoche Dehe Wintun Nation	Leland Kinter, Chairperson	February 10, 2017	No response, to date.	

The Colusa Indian Community Council, the governing body of the Cachil Dehe Band of Wintun Indians, had previously notified the Authority that they wished to be notified of projects, pursuant to PRC Section 21080.3 in a letter dated January 3, 2017. Furthermore, the tribe contacted the Authority by letter dated February 6, 2017, in which they expressed their desire to consult on the Project. The Authority responded, by letter on March 6, 2017, acknowledging receipt of the request for consultation letter and informing the tribe that they would be in contact soon to set up a meeting date.

Although not prepared for PRC Section 21080.3.1 consultation, the Cortina Band of Wintun Indians prepared a report in 2010 (Cortina, 2010) to outline their concerns about the Project. In addition to expressing concerns about fish and water associated with the Project, the tribe provided recommendations regarding cultural resources, including, among other recommendations, the following (Cortina, 2010):

- "The Cortina Band wishes to be consulted at all phases of planning and build out to ensure that impacts on cultural resources are mitigated or avoided. When impacts are unavoidable, the Cortina Band wishes to be involved in determining the best course of action. In particular, the Site's [sic] Reservoir has a need for site testing, borings, and soil column sampling to ensure that cultural resources are not adversely impacted."
- "There is the potential for the project to increase the availability of crafts materials, medicines and foods from riparian and wetland areas. Cortina would like to be consulted on the biological mitigations and enhancements to ensure the tribal perspective is considered in these processes."

The Authority will continue to consult with tribes that have a traditional and cultural affiliation with the Primary Study Area throughout development and construction of the Project.

Eligibility and Project Information Tab

Attachment 6: Groundwater Basins Affected by the Sites Reservoir Project

Q.6 - Does the proposed project affect groundwater basins, as defined by Water Code section 10722 *et seq*.? If not, enter "Not Applicable"; if so, identify the affected groundwater basins and describe how the project would be integrated with future GSP(s). Explain how the project would reduce, eliminate, or have an effect on undesirable results (as defined in regulations section 6001(a)(85)) within the affected groundwater basin(s). Describe how the applicant would work with GSA(s) or adjudicated participants of the basin. See regulations section 6003(a)(1)(K).

No groundwater benefits have been monetized; however, the Sites Reservoir project would potentially beneficially affect groundwater basins within service areas of project participants, particularly those within the Sacramento River Hydrologic Region. Some of the participants are designated as a Groundwater Sustainability Agency (GSA) for affected groundwater basins, including but not limited to Colusa County, Colusa County Water District, Santa Clara Valley Water District, and Zone 7 Water Agency. Many other agencies participating in the Sites Project also participate in Groundwater Sustainability Agencies. These member agencies will be involved in the future integration of the Sites Project into their respective Groundwater Sustainability Plans (GSPs). Coachella Valley Water District, Desert Water Agency, Santa Clara Valley Water District, and Zone 7 Water Agency have each submitted prescribed Alternatives to a GSP, consisting of groundwater management plans or an analysis of basin conditions. The Sites Reservoir Project could be incorporated into future updates of these Alternatives.

In addition, Sites participants: Desert Water Agency, California Water Service, San Bernardino Valley Municipal Water District, Metropolitan Water District of Southern California and San Gorgonio Pass Water Agency are affiliated with adjudicated groundwater basins. Antelope Valley - East Kern Water Agency is affiliated with a groundwater basin that is pending adjudication. Water deliveries from the Sites Reservoir Project could be incorporated into the management strategy for these basins. The associated operations by participating agencies with adjudicated basins would be included in annual monitoring and reporting activities.

Undesirable conditions include chronic lowering of groundwater levels; reduction of groundwater storage, seawater intrusion; degraded water quality; land subsidence; and depletions of interconnected surface water. The Sites Reservoir project has the potential to improve these undesirable results within groundwater basins associated with its participants.

Table A.6-1 presents a listing of groundwater basins that could be beneficially affected by the project, depending on the exact application of the Sites Project deliveries to those regions. In order to retain water management flexibility at a local level, Sites Project deliveries are not specifically designated for a specific use. **Figures A.6-1 through A.6-3** show the location these groundwater basins in relation to service areas of the current Sites Project participants. A further discussion how the project would reduce undesirable results within the affected groundwater basins is presented below.

Reduction of groundwater storage and chronic lowering of groundwater levels

As shown in **Table A.6-1**, significant decline in groundwater levels or overdraft has been reported in many groundwater basins overlaid by the service areas of Sites Project participants. In general, the Sites Reservoir project would result in an increased use of surface water and could decrease use of groundwater through conjunctive use and management operations by its participants. These operations would increase surface water deliveries and change the timing of available surface and groundwater supplies by providing Sites participants with surface water for storage, use or replenishment (typically in above normal and wet year conditions) and then recovering a portion of the water during periods of water supply shortages (in dry and critical year conditions). These changes would improve operational flexibility on a regional basis while providing a water supply benefit that could increase groundwater storage and reduce chronic lowering of groundwater levels.

Table A.6-2 presents the average annual increase in water deliveries by hydrologic region based on the current Sites Project participants and their water delivery requests. The Sacramento River Hydrologic Region would receive the greatest water supply benefits, primarily for agricultural uses. It should be noted that the modeled allocation of water to each hydrologic region is an approximation of how the flows would be distributed. The actual distribution would vary based on the final participants of the project and their level of participation. The project would improve groundwater sustainability by supplying surface water for replenishment to enhance aquifer storage recovery. Replenishment of groundwater can be accomplished using direct recharge and in-lieu recharge. Replenishment occurs when a groundwater basin is managed so that recharge is increased when compared with existing or baseline conditions, and ultimately groundwater levels are either maintained or improved. Direct recharge includes direct spreading of water on land surfaces and aquifer injection. In-lieu recharge may also be accomplished by providing an alternative source to users who would normally use groundwater, thereby leaving groundwater in place for later use and increasing the potential to improve groundwater levels.

Recent research by the University of California on the flooding of agricultural lands to increase groundwater replenishment has led to the development of a Soil Agricultural Groundwater Banking Index (SAGBI) and an associated map application (available at http://casoilresource.lawr.ucdavis.edu/sagbi/). The SAGBI identifies the suitability of soils for additional on-farm groundwater recharge in California. Much of the service areas of Sites participants within the Sacramento Valley are identified as having excellent or good potential for groundwater recharge (**Figure A.6-4**). Should a local groundwater bank be created, Sites Reservoir has the potential to provide water at rates and times to improve its effectiveness and include the banking of water within the aquifer system for future use, which can improve various undesirable aquifer conditions.

Seawater intrusion and degraded water quality

There are several groundwater basins within and overlain by the Sites Project participant's service area that are experiencing salt water intrusion and other water quality degradation issues (See Table A.6-1). Over-pumping may result in inversion of the groundwater flow causing expanded saltwater intrusion. Supplemental surface supplies provided by the project and conjunctive use management practices by project participants may result in reduced groundwater pumping that can assist with reducing the potential for seawater intrusion and water quality degradation. Conjunctive use could enable blending of surface and groundwater which could result in higher quality supply of water. Utilizing better quality surface water for direct recharge of groundwater may also result in groundwater quality improvements.

Land subsidence

Recent drought conditions have led to relatively large declines in groundwater levels throughout the state and within groundwater basins affiliated with Sites participants. Conjunctive use operations by Sites participants to increase water levels would also reduce inelastic (permanent) land subsidence.

Depletions of interconnected surface water

The interconnection of surface water features and groundwater are important for maintaining ecosystems and wetland habitat, particularly in the Sacramento Valley. Chronic lowering of water levels due to over pumping and stream diversions result in depletions of interconnected surface water and groundwater in some areas. Groundwater basins potentially affected by the project that provide important connections to surface water are identified in Table A.6-1. The Sites Reservoir project would allow for greater operational flexibility to support maintaining hydrologic connection between surface water and groundwater. Conjunctive use practices by Sites participants could reduce surface water diversions and improve surface water flows by using stored groundwater during dry and critical periods. In addition, supplemental water supplies from the Sites Reservoir project would assist with improving aquifer storage and groundwater levels.

Table A.6-1. Groundwater Basins Potentially Affected by the Sites Reservoir Project

Hydrologic Region	Basin Number	Basin/Sub Basin Name	Groundwater Basin Rating	Sites Participant	Comments/Existing Undesirable Groundwater Conditions
San Francisco Bay	2-02.03	NAPA-SONOMA VALLEY	Very Low	American Canyon County WSA	--
San Francisco Bay	2-10	LIVERMORE VALLEY	Medium	California Water Service Co. Zone 7 Water Agency	Some areas have boron concentrations exceeding 2 mg/L (Bulletin 118).
San Francisco Bay	2-11	SUNOL VALLEY	Very Low	Zone 7 Water Agency	--
San Francisco Bay	2-32	VISITACION VALLEY	Very Low	California Water Service Co.	--
San Francisco Bay	2-35	WESTSIDE	Very Low	California Water Service Co.	--
San Francisco Bay	2-9.02	SANTA CLARA VALLEY - SANTA CLARA	Medium	California Water Service Co. Santa Clara Valley Water District	Elevated nitrate in some wells in the southern portion of the Basin.
San Francisco Bay	2-9.03	SANTA CLARA VALLEY - SAN MATEO PLAIN	Very Low	California Water Service Co.	--
Central Coast	3-03.01	GILROY-HOLLISTER VALLEY - LLAGAS AREA	High	Santa Clara Valley Water District	Nitrate has impacted a significant number of private domestic wells across the Llagas Subbasin due to historic and ongoing sources including agricultural activities and septic systems.
Central Coast	3-03.03	GILROY-HOLLISTER VALLEY - HOLLISTER AREA	Medium	Santa Clara Valley Water District	West portion of the basin has an impermeable barrier to groundwater flow. Salinity, nitrate, boron, hardness, and trace elements.
Central Coast	3-03.04	GILROY-HOLLISTER VALLEY - SAN JUAN BAUTISTA AREA	Medium	Santa Clara Valley Water District	Salinity, nitrate, boron, hardness, and trace elements occasionally exceed drinking water standards.
Central Coast	3-04.01	SALINAS VALLEY - 180/400 FOOT AQUIFER	High	California Water Service Co.	Critically overdrafted basin.
Central Coast	3-04.02	SALINAS VALLEY - EAST SIDE AQUIFER	High	California Water Service Co.	Coastal basin with saline intrusion in both 180-Foot and 400-Foot aquifers due to excessive groundwater pumping.
Central Coast	3-04.05	SALINAS VALLEY - FOREBAY AQUIFER	Medium	California Water Service Co.	Poor quality water along the eastern side of subbasin. Water system above MCL for inorganics and nitrates (Bulletin 118).
Central Coast	3-04.09	SALINAS VALLEY - LANGLEY AREA	Medium	California Water Service Co.	Portion of the subbasin has been affected by elevated nitrate levels in shallow aquifers
Central Coast	3-04.10	SALINAS VALLEY - CORRAL DE TIERRA AREA	Medium	California Water Service Co.	Lowering of water levels, TDS, hardness
South Coast	4-05	ACTON VALLEY	Very Low	Antelope Valley - East Kern Water Agency	--
South Coast	4-06	PLEASANT VALLEY	High	Metropolitan Water District	Critically over drafted basin; Discharge of poor quality groundwater from dewatering wells and effluent discharge from the wastewater treatment facility into the Arroyo Simi have led to rising water levels in the basin along with higher TDS and Chloride levels.
South Coast	4-07	ARROYO SANTA ROSA VALLEY	Medium	Metropolitan Water District	Elevated sulfates, nitrates, and TDS in the basin.(Bulletin 118)
South Coast	4-08	LAS POSAS VALLEY	High	Metropolitan Water District	TDS is generally high in this basin. REH - Pubic Comment includes reports of subsidence, overdraft and saline intrusion (chloride from adjacent basin).
South Coast	4-09	SIMI VALLEY	Low	Metropolitan Water District	--
South Coast	4-10	CONEJO	Low	California Water Service Co.	--
South Coast	4-10	CONEJO	Low	Metropolitan Water District	--
South Coast	4-11.01	COASTAL PLAIN OF LOS ANGELES - SANTA MONICA	Medium	Metropolitan Water District	MTBE contamination has led to significant reduction in groundwater production and locally high TDS.
South Coast	4-11.02	COASTAL PLAIN OF LOS ANGELES	Very Low	Metropolitan Water District	--
South Coast	4-11.03	COASTAL PLAIN OF LOS ANGELES - WEST COAST	Medium	California Water Service Co. Metropolitan Water District	Adjudicated basin. Basin in overdraft since 1960's. Saline intrusion problems. A seawater barrier project is in effect to reduce seawater intrusion.
South Coast	4-11.04	COASTAL PLAIN OF LOS ANGELES - CENTRAL	High	California Water Service Co. Metropolitan Water District	Adjudicated basin. Basin was adjudicated in the early 1960's due to overdraft. Several public supply wells are known to be impacted by various water quality issues.
South Coast	4-12	SAN FERNANDO VALLEY	Medium	Metropolitan Water District	Adjudicated basin. Several public supply wells have shown contamination (Bulletin 118)
South Coast	4-13	SAN GABRIEL VALLEY	High	Metropolitan Water District	Superfund sites are present within the basin and other areas with water quality impacts are known.
South Coast	4-15	TIERRA REJADA	Very Low	Metropolitan Water District	--
South Coast	4-16	HIDDEN VALLEY	Very Low	California Water Service Co. Metropolitan Water District	--
South Coast	4-18	HUNGRY VALLEY	Very Low	Antelope Valley - East Kern Water Agency	--
South Coast	4-19	THOUSAND OAKS AREA	Very Low	California Water Service Co. Metropolitan Water District	--
South Coast	4-20	RUSSELL VALLEY	Very Low	California Water Service Co.	--
South Coast	4-22	MALIBU VALLEY	Very Low	Metropolitan Water District	--
South Coast	4-23	RAYMOND	Medium	Metropolitan Water District	Water quality impacts and a superfund site.
South Coast	4-4.02	SANTA CLARA RIVER VALLEY - OXNARD	High	Metropolitan Water District	Saline intrusion, nitrates, pesticides, and PCBs have impacted some water wells per (Bulletin 118).
South Coast	4-4.03	SANTA CLARA RIVER VALLEY - MOUND	Medium	Metropolitan Water District	Some primary and secondary inorganic contaminants above the MCL (Bulletin 118).
South Coast	4-4.06	SANTA CLARA RIVER VALLEY - PIRU	High	Castaic Lake Water Agency	Groundwater quality impacts: nitrates, storm runoff, leaking tanks, etc. (Bulletin 118). High Selenium and other inorganics, average TDS was 1450 mg/L/

Table A.6-1. Groundwater Basins Potentially Affected by the Sites Reservoir Project

Hydrologic Region	Basin Number	Basin/Sub Basin Name	Groundwater Basin Rating	Sites Participant	Comments/Existing Undesirable Groundwater Conditions
South Coast	4-4.07	SANTA CLARA RIVER VALLEY - SANTA CLARA RIVER VALLEY EAST	High	Castaic Lake Water Agency	Groundwater quality impacts: Nitrates, TCE, TDS, perchlorates, etc. (Bulletin 118)
Sacramento River	5-21.50	SACRAMENTO VALLEY - RED BLUFF	Medium	Proberta Water District	Some groundwater quality impairments as per B-118, declining groundwater levels in west-side subdivision, and very high number of domestic groundwater use wells.
Sacramento River	5-21.51	SACRAMENTO VALLEY - CORNING	Medium	Glenn County California Water Service Co. Glenn-Colusa Irrigation District	Continued groundwater level decline over most of the basin. This basin is becoming increasing dependent on groundwater due to uncertain reliability of CVP TCCA surface water supply.
Sacramento River	5-21.52	SACRAMENTO VALLEY - COLUSA	Medium	4-M Water District California Water Service Co. Colusa County Colusa County Water District Cortina Water District Davis Water District Glenn County Glenn-Colusa Irrigation District LaGrande Water District Maxwell Irrigation District Orland-Artois Water District Reclamation District 108 Westside Water District	Severely declining groundwater levels along the west-side of Glenn Co. Moderately declining groundwater levels in the Capay area. High TDS shallow aquifer in Maxwell-Williams area. Increase in housing development along I5. Groundwater-surface water interaction is important to maintaining waterfowl refuges. Area is being highlighted as solution area for Delta outflow issues and area of increased conjunctive use.
Sacramento River	5-21.57	SACRAMENTO VALLEY - VINA	High	California Water Service Co. Glenn County Glenn-Colusa Irrigation District	Groundwater from this basin is a key source of surface water inflow and serves eastside creeks which have endangered spring run.
Sacramento River	5-21.58	SACRAMENTO VALLEY - WEST BUTTE	High	California Water Service Co. California Water Service Co. California Water Service Co. Colusa County California Water Service Co.	Declining groundwater levels within the City of Chico and Durham areas (30-40' decline in mid-aquifer groundwater levels since 1998. High nitrates in north and west Chico area. High density of groundwater contamination plumes surrounding City of Chico. Groundwater serves as a source of underflow to Butte Creek, which has endangered spring-run salmon.
Sacramento River	5-21.59	SACRAMENTO VALLEY - EAST BUTTE	Medium	California Water Service Co. Western Canal Water District	Groundwater basin provides underflow to Butte Creek which supports endangered spring-run salmon.
Sacramento River	5-21.60	SACRAMENTO VALLEY - NORTH YUBA	Medium	California Water Service Co.	Strong surface water-groundwater interaction with Feather and Yuba River
Sacramento River	5-21.61	SACRAMENTO VALLEY - SOUTH YUBA	Medium	California Water Service Co.	Lowering of water levels.
Sacramento River	5-21.62	SACRAMENTO VALLEY - SUTTER	Medium	Garden Highway Mutual Water Company Reclamation District 108	Lowering of water levels, high concentrations of naturally occurring levels of minerals.
Sacramento River	5-21.64	SACRAMENTO VALLEY - NORTH AMERICAN	High	City of Roseville WSA Placer County Water Agency Zone 1 Placer County Water Agency Zone 2	Elevated levels of TDS, chloride, sodium, bicarbonate, boron, fluoride, nitrate, iron manganese, and arsenic may be of concern in some locations. There are 3 sites with significant groundwater contamination in the basin (B118). Groundwater levels in southwestern Placer County and northern Sacramento County have generally declined with many wells declining at a rate of about one and one-half feet per year for the last 40 years or more (Bulletin 118).
Sacramento River	5-21.66	SACRAMENTO VALLEY - SOLANO	Medium	California Water Service Co.	Overdraft. Documented impacts of nitrates and sulfates. (Bulletin 118)
Sacramento River	5-21.67	SACRAMENTO VALLEY - YOLO	High	Colusa County Water District Dunnigan Water District Reclamation District 108	Localized TDS problems preclude using groundwater for some M&I uses without treatment. Some subsidence in northeast of Davis and in northern Yolo.
Sacramento River	5-21.69	SACRAMENTO VALLEY - WYANDOTTE CREEK BASIN	--	California Water Service Co.	Proposed basin boundary revision request.
San Joaquin	5-22.01	SAN JOAQUIN VALLEY - EASTERN SAN JOAQUIN	High	California Water Service Co.	Critically overdrafted basin. Estimated that 70,000 af/year of overdraft occurs in northeastern San Joaquin County and about 35,000 af/year of overdraft occurs in the Stockton East Water District. Basin experiencing long term groundwater overdraft 160,000AF/yr as a result of overdraft, poor quality groundwater has been moving east along a 16- mile front on the east side of the Delta and has continued to migrate eastward. Large areas of nitrate contamination are located in the subbasin. (Bulletin 118).
San Joaquin	5-22.08	SAN JOAQUIN VALLEY - KINGS	High	California Water Service Co.	Critically overdrafted basin
San Joaquin	5-22.10	SAN JOAQUIN VALLEY - PLESANT VALLEY	Low	Pacific Resources MWC	--
Tulare Lake	5-22.11	SAN JOAQUIN VALLEY - KAWEAH	High	California Water Service Co.	Critically overdrafted basin; overdraft, water quality issues.

Table A.6-1. Groundwater Basins Potentially Affected by the Sites Reservoir Project

Hydrologic Region	Basin Number	Basin/Sub Basin Name	Groundwater Basin Rating	Sites Participant	Comments/Existing Undesirable Groundwater Conditions
Tulare Lake	5-22.13	SAN JOAQUIN VALLEY - TULE	High	Pacific Resources MWC	Critically overdrafted basin; High Nitrate and TDS in some locations and some inorganic contamination issues.
Tulare Lake	5-22.14	SAN JOAQUIN VALLEY - KERN COUNTY	High	California Water Service Co. Pacific Resources MWC Wheeler Ridge-Maricopa Water Service District	Critically overdrafted basin; Important agricultural region. Subsidence, overdraft, water quality degradation
San Joaquin	5-22.15	SAN JOAQUIN VALLEY - TRACY	Medium	Zone 7 Water Agency	Poor water quality throughout the subbasin.(Bulletin 118)
Tulare Lake	5-22.18	SAN JOAQUIN VALLEY - WHITE WOLF	--	Wheeler Ridge-Maricopa Water Service District	Proposed basin boundary revision request.
Sacramento River	5-61	CHROME TOWN AREA	Very Low	Glenn County	--
Sacramento River	5-62	ELK CREEK AREA	Very Low	Glenn County	--
Sacramento River	5-63	STONYFORD TOWN AREA	Very Low	Glenn County	--
Tulare Lake	5-82	CUDDY CANYON VALLEY	Very Low	Antelope Valley - East Kern Water Agency	--
Sacramento River	5-88	STONY GORGE RESERVOIR	Very Low	Glenn County	--
Sacramento River	5-89	SQUAW FLAT	Very Low	Glenn County	--
Sacramento River	5-90	FUNKS CREEK	Very Low	Glenn County	--
South Lahontan	6-41	MIDDLE MOJAVE RIVER VALLEY	Low	Antelope Valley - East Kern Water Agency	--
South Lahontan	6-43	EL MIRAGE VALLEY	Medium	Antelope Valley - East Kern Water Agency	Groundwater levels have declined significantly in parts of the basin, some have recovered. Water is rated marginal to inferior for domestic and irrigation purposes. (Bulletin 118). Some documented VOCs issues also.
South Lahontan	6-44	ANTELOPE VALLEY	High	Antelope Valley - East Kern Water Agency Pacific Resources MWC	Pending Adjudication. Water reliability issues, and renewed subsidence. Closed basin. Water quality impacts per IRWMP, DWR B-118, and other sources. Extractions likely exceed natural recharge.
South Lahontan	6-46	FREMONT VALLEY	Low	Antelope Valley - East Kern Water Agency	--
South Lahontan	6-47	HARPER VALLEY	Low	Antelope Valley - East Kern Water Agency	--
South Lahontan	6-54	INDIAN WELLS VALLEY	Medium	Pacific Resources MWC Antelope Valley - East Kern Water Agency	Critically overdrafted basin. Overdraft has been documented since the 1960's. Water quality issues with respect to overdraft and mixing of aquifers.
Colorado River	7-21.01	COACHELLA VALLEY - INDIO	Medium	Coachella Valley Water District Desert Water Agency	Nitrates and addition of salts due to Colorado River imported water. Local areas of elevated fluoride.
Colorado River	7-21.02	COACHELLA VALLEY - MISSION CREEK	Medium	Coachella Valley Water District Desert Water Agency	Radiological and nitrate issues in the basin (Bulletin 118). Mission Creek groundwater also supplies drinking water to Desert Hot Springs and part of Indio subbasins.
Colorado River	7-21.03	COACHELLA VALLEY	Low	Coachella Valley Water District Desert Water Agency	--
Colorado River	7-21.04	COACHELLA VALLEY - SAN GORGONIO PASS	Medium	Desert Water Agency San Gorgonio Pass Water Agency	Adjudicated basin. Overdraft.
Colorado River	7-22	WEST SALTON SEA	Very Low	Coachella Valley Water District	--
Colorado River	7-31	OROCOPIA VALLEY	Very Low	Coachella Valley Water District	--
Colorado River	7-32	CHOCOLATE VALLEY	Very Low	Coachella Valley Water District	--
Colorado River	7-33	EAST SALTON SEA	Very Low	Coachella Valley Water District	--
Colorado River	7-63	VANDEVENTER FLAT	Very Low	Desert Water Agency	--
South Coast	8-01	COASTAL PLAIN OF ORANGE COUNTY	Medium	Metropolitan Water District	Saline intrusion issues.
South Coast	8-02.01	UPPER SANTA ANA VALLEY - CHINO	High	Metropolitan Water District San Bernardino Valley Municipal Water District	Adjudicated basin. Locally high nitrates and TDS. REH, per Pub Com, to include subsidence, historic overdraft, ground fissuring, problems mitigated with OBMP. REH Pub Com, program of controlled overdraft of 400,000 AF from the Chino Basin through 2030 to control the outflow of poor-quality rising groundwater.
South Coast	8-02.02	UPPER SANTA ANA VALLEY - CUCAMONGA	Medium	Metropolitan Water District	High nitrates reported in 14 of 24 wells tested (Bulletin 118)
South Coast	8-02.03	UPPER SANTA ANA VALLEY - RIVERSIDE-ARLINGTON	High	Metropolitan Water District San Bernardino Valley Municipal Water District	Water quality degradation issues known in several public supply wells (Bulletin 118).
South Coast	8-02.04	UPPER SANTA ANA VALLEY - RIALTO-COLTON	Medium	Metropolitan Water District San Bernardino Valley Municipal Water District	Extensive perchlorate contamination in basin.
South Coast	8-02.05	UPPER SANTA ANA VALLEY	Very Low	San Bernardino Valley Municipal Water District	--

Table A.6-1. Groundwater Basins Potentially Affected by the Sites Reservoir Project

Hydrologic Region	Basin Number	Basin/Sub Basin Name	Groundwater Basin Rating	Sites Participant	Comments/Existing Undesirable Groundwater Conditions
South Coast	8-02.06	UPPER SANTA ANA VALLEY - BUNKER HILL	High	San Bernardino Valley Municipal Water District	Adjudicated basin (Western San Bernardino). The Bunker Hill sub-basin is impacted with PCE and TCE from the Newmark Superfund site and with perchlorate from the Crafton-Redlands plume.
South Coast	8-02.07	UPPER SANTA ANA VALLEY - YUCAIPA	Medium	San Bernardino Valley Municipal Water District San Gorgonio Pass Water Agency	Overdraft. Documented impacts of nitrates and sulfates. (Bulletin 118)
South Coast	8-02.08	UPPER SANTA ANA VALLEY - SAN TIMOTEO	Medium	Metropolitan Water District San Bernardino Valley Municipal Water District San Gorgonio Pass Water Agency	Parts of the subbasin are adjudicated. Locally high nitrates and salinity (Bulletin 118). GAMA reported upper basin water quality issues.
South Coast	8-02.09	UPPER SANTA ANA VALLEY - TEMESCAL	Medium	Metropolitan Water District	Groundwater quality impaired by nitrates and inorganics in some wells (Bulletin 118).
South Coast	8-04	ELSINORE	High	Metropolitan Water District	High TDS due to Nitrate and Sulfate in some portions of the basin. Some fluoride impacts to groundwater (Bulletin 118). Study done for Elsinore Basin groundwater Advisory Committee (Nov. 2012) indicates an average annual groundwater budget deficit of 1,800 af/yr for the last 11 years. Between 1990 and 2000 cumulative deficit was 19,000 af.
South Coast	8-05	SAN JACINTO	High	Metropolitan Water District San Bernardino Valley Municipal Water District	Adjudicated basin. Basin is in overdraft (MWD). Groundwater quality issues documented in DWR B-118. Pumping has increased some contaminant distribution in the basin.
South Coast	8-06	HEMET LAKE VALLEY	Very Low	Desert Water Agency Metropolitan Water District	--
South Coast	8-08	SEVEN OAKS VALLEY	Very Low	San Bernardino Valley Municipal Water District	--
South Coast	9-01	SAN JUAN VALLEY	Low	Metropolitan Water District	--
South Coast	9-02	SAN MATEO VALLEY	Very Low	Metropolitan Water District	--
South Coast	9-03	SAN ONOFRE VALLEY	Very Low	Metropolitan Water District	--
South Coast	9-04	SANTA MARGARITA VALLEY	Medium	Metropolitan Water District	Adjudicated basin (Federal). Groundwater in surface water part of basin is marginal to inferior for domestic and agricultural uses (Bulletin 118). Mg, SO4, Cl, NO3, and TDS concentrations are locally high for domestic. Use; Cl, B, and TDS are locally high for ag use (Bulletin 118).
South Coast	9-05	TEMECULA VALLEY	High	Metropolitan Water District	Adjudicated basin (Federal). Groundwater source is impaired in various parts of the basin due to elevated nitrates, fluoride, sulfates, TDS, and VOCs (Bulletin 118).
South Coast	9-07	SAN LUIS REY VALLEY	Medium	Metropolitan Water District	TDS is a concern according to MWD. B-118 indicates problems with nitrates, inorganics, radiologicals, and VOCs. Desalination generally required in all areas of the basin.
South Coast	9-09	ESCONDIDO VALLEY	Very Low	Metropolitan Water District	--
South Coast	9-10	SAN PASQUAL VALLEY	Medium	Metropolitan Water District	Nitrate problems are widespread (Bulletin 118). TDS is also known to be high in places. During dry years, the basin has experienced water level declines up to 20 feet in one year.
South Coast	9-11	SANTA MARIA VALLEY	Very Low	Metropolitan Water District	--
South Coast	9-12	SAN DIEGUITO CREEK	Very Low	Metropolitan Water District	--
South Coast	9-13	POWAY VALLEY	Very Low	Metropolitan Water District	--
South Coast	9-14	MISSION VALLEY	Very Low	Metropolitan Water District	--
South Coast	9-15	SAN DIEGO RIVER VALLEY	Medium	Metropolitan Water District	High Nitrates, Iron and Manganese treatment is required, high TDS (>3,000 mg/l) in western portion of basin
South Coast	9-16	EL CAJON VALLEY	Very Low	Metropolitan Water District	--
South Coast	9-22	BATIQUITOS LAGOON VALLEY	Very Low	Metropolitan Water District	--
South Coast	9-23	SAN ELIJO VALLEY	Very Low	Metropolitan Water District	--
South Coast	9-32	SAN MARCOS AREA	Very Low	Metropolitan Water District	--
South Coast	9-33	COASTAL PLAIN OF SAN DIEGO	Low	Metropolitan Water District	--

Benefit - Ecosystem Enhancement Storage Account (EESA) Actions												
Shasta Lake Cold Water Pool												
Improve the reliability of coldwater pool storage in Shasta Reservoir to increase the operational flexibility to provide suitable water temperatures in the Sacramento River. This action would operationally translate into the increase of Shasta Reservoir May storage levels, and increased coldwater pool in storage, with particular emphasis on Below Normal, Dry and Critical water year types.
