RE: Support for Sites Reservoir Project Proposition 1 Application

Dear Chair Quintero:

I write in support of the Sites Reservoir Project in its application for Proposition 1 funding through the Water Supply Investment Program.

I deeply appreciate your work and the work of the California Water Commission to support storage projects that are vital for our water future. I have long worked to secure federal funding for feasibility studies on Sites and other CALFED storage projects, and I am grateful for the State's willingness to advance qualified projects through the Water Supply Investment Program.

Sites Reservoir offers a remarkable opportunity to reoperate California's longest and largest river, the Sacramento, to provide multiple benefits for fish, farms, and cities in an innovative manner. By partnering with the Sites Project Authority in the development of the Reservoir, the state would acquire water storage capacity and have management control over the resulting releases to ensure environmental benefits are achieved.

Sites is a 1,800,000 acre-foot off-stream reservoir that, if operating today, would increase water storage capacity in the Sacramento Valley by 15% and provide approximately 500,000 acre feet per year of additional water supply on average with approximately half for human use and half for the environment.

Sites Reservoir would allow reoperation of California's water infrastructure in numerous beneficial ways, including:

- Preserving more of Shasta's cold water pool for salmon by making early releases on behalf of Shasta to then enable Shasta to release an equal amount of cold water in summer and fall months;

- Coordinated operations with Folsom and Oroville Reservoirs could likewise offer both water supply and environmental benefits;

- Releases from Sites could increase flows through the Yolo Bypass and other side channels to the Sacramento-San Joaquin Delta that augment food supply for migrating salmon and delta smelt;

- Releases from Sites can provide Level 4 water for wildlife refuges; and

- For Central Valley farms and communities as well as for cities in the Bay Area and Southern California, improve water supply reliability and help to conserve local groundwater basins for use during prolonged droughts.

The past few years have starkly illustrated why California needs to store more water from the wet years for the dry years. As our climate changes, scientists expect the pattern of record-breaking drought and then floods to recur ever more often, elevating the importance of capturing more of the storm runoff that will increasingly dominate our water supply.

It has been a long time coming for major surface storage projects in California to be on the cusp of construction. I greatly appreciate your careful consideration of this important project as you disburse Proposition 1 funding. Please do not hesitate to contact me or John Watts of my staff with any questions.

Sincerely,

Dianne Feinstein

Dianne Feinstein

Congress of the United States
Washington, DC 20515

July 31, 2017

Armando Quintero
Chair, California Water Commission
P.O. Box 942836
Sacramento, California 94236-0001

Dear Chairman Quintero,

We write today to convey our support for the Sites Reservoir Project's application for funding from the Proposition 1 Water Storage and Investment Program. The Sites project has the potential to provide multiple benefits to California's farms, cities and to the environment.

As you know, the Sites Project is a 1.8 million acre-foot, off-stream regulating reservoir that would divert and store excess Sacramento River flows. The diversion levels would be dependent upon hydrologic conditions and would be structured to ensure that water taken out of the Sacramento River is truly in excess of downstream needs.

The operational flexibility that the Sites project would provide to the State's entire water system is what makes this project so unique and worthy of funding. A few of the reservoir's many uses include, but are not limited to, a reliable water supply for California cities and agriculture, dedicated water for fishery and environmental flow purposes, increased habitat for migratory birds on the Pacific Flyway, and improved flexibility and drought resiliency for the Central Valley Project and the State Water Project.

Opportunities to apply lessons learned during the last five years of drought must not be wasted. The drought, and this year's record breaking rainfall, have shown us how critical it is to develop smart storage that allows us to store more water in wet years for future use in dry ones. Sites Reservoir is that smart storage.

Thank you for the work that you and the Water Commission are doing to increase water supply reliability across California. We look forward to your announcement of funding awards.

Sincerely,

February 17, 2017

Joseph Byrne
Chair
California Water Commission
P.O. Box 942836
Sacramento, California 94236-0001

Dear Chair Byrne

I write today in support of the Sites Reservoir Project's request for funding under Proposition 1, the Water Quality, Supply, and Infrastructure Improvement Act. The Sites project has the potential to provide multiple benefits to California's water resources equation including public and environmental benefits for communities and habitat in Northern California.

As you are aware, the $4.4 billion Sites Reservoir Project calls for pumping Sacramento River water into an off-stream reservoir in Colusa and Glenn Counties. Should Sites be built, the 1.81 million acre-foot reservoir has the potential, depending on the watery year, to add up to a maximum of 500,000 acre-feet of water to California's water system annually.

In particular, I support the public and environmental benefits that Sites could provide. As you know, we must constantly balance the fresh water supplies in the Sacramento-San Joaquin Delta. The potential for Sites' public benefit portion is substantial, whether these benefits preserve additional cold water in Shasta Reservoir or support tributaries to the Sacramento River, including the American River. The project also may benefit reservoirs on these tributaries, such as Folsom Reservoir, and help balance their water resources in the best way possible.

With all of the water supply and environmental benefits that Sites has the potential to provide, I look forward to seeing the final environmental documentation that will assure the Proposition 1 public benefit portion of the project is truly attainable.

Thank you for your consideration and your continued efforts to invest in our state's water infrastructure. Should you have any questions feel free to contact me or have your staff reach out to my office at (202) 225-7163.

Sincerely,

Doris Matsui

July 10, 2017

Armando Quintero
Chair, California Water Commission
P.O. Box 942836
Sacramento, California 94236-0001

Dear Chairman Quintero:

We write today to convey our support for the Sites Reservoir Project's application for funding from the Proposition 1 Water Storage and Investment Program. The Sites project has the proven potential to provide multiple benefits to California's farms, cities and to the environment.

As you know, the Sites Project is a 1.8 million acre-foot, off-stream reservoir that would divert and store excess Sacramento River flows. The diversion levels would be dependent upon hydrologic conditions and would be structured to ensure that water taken out of the Sacramento River is truly in excess of downstream needs.

The operational flexibility that the Sites project would provide to the State's entire water system is what makes this project so unique and worthy of funding. The reservoir's many beneficial uses include, but are not limited to, dedicated water for fishery and flow purposes, a reliable water supply for California agriculture, increased habitat for migratory birds on the Pacific Flyway, and greater water security for urban areas.

Opportunities to apply lessons learned during the last five years of drought must not be wasted. The drought and this year's record breaking rainfall have shown us how critical it is to develop smart storage that allows us to store more water in wet years for future use in dry ones. Sites Reservoir is the kind of smart, well-planned water storage project that will achieve a multitude of beneficial uses.

Thank you for the work that you and the Water Commission are doing to increase water supply reliability across California. We look forward to your announcement of funding awards.

Sincerely,

Jim Nielsen

California Legislature

July 21, 2017

Armando Quintero
Chair, California Water Commission
P.O. Box 942836
Sacramento, California 94236-0001

Dear Chairman Quintero:

We write today to convey our support for the Site Reservoir Project's application for funding from the Proposition 1 Water Storage Investment Program (WSIP). The Sites project would provide valuable benefits to California's farms and cities, while providing much needed flexibility for water managers to adjust flows for the environment and for flood control.

As you know, the Sites Project is a 1.8 million acre-foot off-stream reservoir that would divert and store excess Sacramento River flows. The diversion levels would be dependent upon hydrologic conditions and would be structured to ensure that water taken out of the Sacramento River is truly in excess of downstream needs. If Sites Reservoir had been operational during the last wet season (October 2016-March 2017), 1.4 million acre-feet of water could have been diverted and stored.

The operational flexibility that the Sites project would provide to the State's entire water system is what makes this project so unique and worthy of funding. A few of the reservoir's many uses include, but are not limited to, dedicated water for fishery and flow purposes, a reliable water supply for California's agriculture, increased habitat for migratory birds on the Pacific Flyway, and greater water security for urban areas.

Opportunities to apply lessons learned during the last five years of drought must not be wasted. The drought and this year's record breaking rainfall have shown us how critical it is to develop smart storage that allows us to store more water in wet years for future use in dry ones. Sites Reservoir is that smart storage.

Thank you for the work that you and the Water Commission are doing to increase water supply reliability across California. We look forward to your announcement of funding awards. Please call us at (916)-319-2003 should you need any further information regarding our support for this vital project.

July 14, 2017

Jim Watson
General Manager
Sites Project Authority
PO Box 517
Maxwell, CA 95955

Dear Jim,

The California Agricultural Aircraft Association is pleased to offer its support for the Sites Project. The California Agricultural Aircraft Association (CAAA) is a non-profit trade association representing the professional aerial application industry in California.

California will continue to face intense water challenges including limited supplies, a growing population, the effects of climate change, increased flow requirements for native fish, and water for wetlands used by migratory birds. Now more than ever, California's water system needs a more flexible, environmentally friendly and sustainable solution to capturing and storing water for use when it's needed most.

The Sites Project would add up to 1,800,000 acre-ft. of capacity to produce 500,000 acre-feet of critical supplies to California's water system on an annualized basis. With its ability to integrate operations with the state's water system, Sites is an innovative and modern approach that will help the state capture, store and move water where it needs to be, when it is needed most.

The Sites Project will help make California's water system more efficient and reliable. The project helps meet the objectives of the California Water Action Plan by providing a substantial supply of high-quality water to support the economy and the environment. Sites Project reflects California's innovative approach to meeting the needs of the environment, economic growth, and our quality of life.

Sites Project works for the ecosystem, and for families, farms, and businesses across the state. We encourage the California Water Commission to invest in the public benefits that the Sites Project would provide.

We look forward to working with the Sites Project Authority to advance this important project.

Sincerely,

Terry Gage
President, CAAA

CALIFORNIA FARM BUREAU FEDERATION
GOVERNMENTAL AFFAIRS DIVISION
1127-11TH STREET, SUITE 626, SACRAMENTO, CA 95814 • PHONE (916) 446-4647

July 12, 2017

Jim Watson
General Manager
Sites Project Authority
P.O. Box 517
Maxwell, CA 95955

Dear Jim,

On behalf of more than 48,000 farm families and individual members, the California Farm Bureau Federation is pleased to offer our support for the Sites Project.

Farm Bureau's purposes are, among others, to work for the solution of the problems of the farm, the farm home and the rural community throughout California and to protect and advance the social, economic and educational interests of California farmers. Farm Bureau strives to protect and improve the ability of farmers and ranchers engaged in production agriculture to provide safe, reliable, and healthful food and farm products through responsible stewardship of California's diverse natural resource base.

With a diminished Sierra snowpack, punctuated by above normal snow and rainfall like we experienced this year, ever-increasing environmental policy demands such as increased flow requirements for native fish, water for wetlands and a growing population, California will continue to face intense water challenges. Now more than ever, California's water system needs a more flexible, environmentally friendly and sustainable solution for diverting and storing water during periods of excess flows for human and environmental uses during dry periods.

The Sites Project would add up to 1,800,000 acre feet of capacity and produce an average 500,000 acre feet of critical supplies to California's water system a year. With the ability to integrate with the state's water system, Sites is strategically located and provides an innovative approach that will help to capture, store and move water where and when it is needed most. The project would provide significant new water for instream flows, recreation, groundwater recharge and assist with the long-term success of the Sustainable Groundwater Management Act.

Providing a substantial supply of high-quality water to support farms, the economy and the environment, the Sites Project meets the objectives of the California Water Action Plan, making California's water system more efficient, flexible and reliable.

Sites works for the ecosystem, and for families, farms, and businesses across the state. We encourage the California Water Commission to invest in the public benefits that the Sites Project would provide.

We look forward to working with the Sites Project Authority to advance this important project.

Sincerely,

Danny Merkley

California Alfalfa &
Forage Association

July 20, 2017

Jim Watson
General Manager
Sites Project Authority
P.O. Box 517
Maxwell, CA 95955

Dear Jim,

The California Alfalfa & Forage Association, representing thousands of forage growers in the state, is pleased to offer its support for the Sites Project.

The Sites Project is a proposed above ground, off-stream water storage project located in Northern California and would add up to 500,000 acre-feet of critical supplies to California's water system annually. Sites is an innovative and modern approach that goes beyond water supply and flood protection by adding flexibility and generating a much-needed new water source for improved water quality, seasonal fish flows, climate change and drought relief.

The Sites Project creates an additional supply of reliable water that can be used for urban, agricultural, environmental, and industrial purposes. Sites would also improve water quality in the Sacramento-San Joaquin Delta (Delta) and enhance environmental flows to benefit the Delta's ecosystem.

California will continue to face severe water challenges including limited supplies, a growing population, the effects of climate change, and increased flow requirements for native fish. Now more than ever, California's water system needs a more flexible, environmentally friendly solution to capturing and storing water for use when it's needed most. The Sites Project would provide an additional tool for water managers to effectively balance competing demands and provide safe and reliable water to support the current and future needs of California's environment and economy.

We look forward to working with the Sites Project Authority to advance this important project.

Sincerely,

Jane Townsend

July 11, 2017

Jim Watson
General Manager
Sites Project Authority
P.O. Box 517
Maxwell, CA 95955

Dear Mr. Watson,

On behalf of the California Fresh Fruit Association I write to express support for the Sites Reservoir Project. The California Fresh Fruit Association is a non-profit, agricultural trade association representing permanent crops (fresh fruit) grown and packed throughout California. For the past five years, many of our organization's family farming operations were severely impacted by drought and water management decisions that reduced the availability of critically needed surface water supplies. Having additional above-ground surface storage north of the Delta better enables flexible water management as the added supply would help to address Delta salinity levels while relieving overall stress on the state's water system. Moreover, we believe the added capacity would allow other reservoirs to carry water into the summer months, a time that is very critical for crop development. With new supply comes an enhanced opportunity for greater flexibility in water management decision making, whether it's making supplies available, or enhancing fulfillment of water contracts. We are encouraged by the project's potential to free up water for you use through an exchange for irrigation or to put to use to alleviate environmental needs.

It is our understanding the Sites Project would add up to 1,800,000 acre-ft. of capacity to produce 500,000 acre-feet of critical supplies to California's water system on an annualized basis. With its ability to integrate operations with the state's water system, Sites is an approach that will help the state capture, store and move water where it needs to be, when it is needed most. California will continue to face intense water challenges including limited supplies, a growing population, the effects of climate change, increased flow requirements for native fish, and water for wetlands. Now more than ever, California's water system needs a more flexible and sustainable solution to capturing and storing water for beneficial uses, including irrigation, when it is critically needed.

We encourage the California Water Commission to invest in the Sites Project and to look to fund qualifying above-ground surface storage projects, which should also include the Temperance Flat Project, to best ensure our limited financial resources are put towards securing California's water future; a future where agricultural irrigation benefits from reduced uncertainty because of the enhanced ability to manage water more effectively. To strengthen the California water picture, first we must expand our capacity to capture more water for a growing state.

We look forward to advancing important above-ground surface storage projects.

Sincerely,

George Radanovich

RESOLUTION 15-02

A Resolution of the City of Williams to Support Construction of the Sites Reservoir Project.

WHEREAS, the City of Williams's mission includes protecting and enhancing the reliability, availability, affordability, and quality of water resources; and

WHEREAS, the City of Williams is in the center of one of the most productive agricultural areas of California; and

WHEREAS, 2014 was the driest year on record in California and the fourth consecutive drought year; and

WHEREAS, water is the lifeblood of our agricultural community and farming is the foundation of our economic wellbeing; and

WHEREAS, as additional water storage is needed to sustain our water needs for the continued prosperity of our City; and

WHEREAS, the Sites Reservoir, technically called the North of the Delta Off stream Storage project, will increase our water supply for our farming community and residents in the future; and

WHEREAS, the Sites Reservoir will improve the Delta water quality and be capable of holding up to 1.9 million acre feet of water; and

WHEREAS, many water purveyors are implementing or considering actions under their water shortage contingency plans; and

NOW, THEREFORE, BE IT RESOLVED that the City Council of the City of Williams encourage the construction of the Sites Reservoir.

MOVED, PASSED AND ADOPTED by the City Council of the City of Williams, California, this 21st day of January, 2015 by the following vote, to wit:

AYES: Council Member Troughton Jr., Sellers Jr., Bergson, Jauregui
NOES: Council Member Boes.
ABSTAIN: None.
ABSENT: None.

Dear Mr. Watson:

The County of Tehama took formal action this date to support the Sites Reservoir Project and its application for Proposition 1 funding.

The Sites Project is a proposed above ground, off-stream water storage project located ten miles west of Maxwell, in Northern California. When complete, this project would add up to 500,000 acre-feet to California's water system annually. Sites is an innovative and modern approach that goes beyond water supply and flood protection by adding flexibility and generating a much needed new water source for improved water quality, seasonal fish flows, climate change and drought relief.

The Sites Project creates an additional supply of reliable water that can be used for urban, agricultural, environmental, and industrial purposes. This project would also improve water quality in the Sacramento-San Joaquin Delta and enhance environmental flows which would benefit the Delta's ecosystem.

Into the future California will continue to face severe water challenges including limited supplies, a growing population, the effects of climate change, and increased flow requirements for native fish. Now more than ever, our water system needs a more flexible, environmentally friendly solution to capturing and storing water for use when it's needed most. The Sites Project would provide an additional tool for water managers to effectively balance competing demands and provide safe and reliable water to support the current and future needs of California's environment and economy.

We look forward to working with the Sites Project Authority to advance this important project.

Sacramento, CA 95814

Subject: Sites Reservoir Project-Support

Dear Chairman Byrne:

The Shasta County Board of Supervisors would like to express our strong support for the development of the Sites Reservoir Project.

Projects to protect and improve watersheds, wetlands, forests, and floodplains would provide clean, quality water into the Sacramento River system with supply and water quality benefits having a great effect on Northern and Southern California. Studying the feasibility of this project, among others, is a return on investment for both water supply reliability and the ecosystem, as well as encouraging these benefits to accrue sooner and in a cost-effective manner. The Shasta County Board of Supervisors supports the Sites Reservoir Project as a potential applicant under the voter-approved Water Storage Investment Program.

If you have any questions about our position, or wish to discuss the issue further, please contact Mr. Larry Lees, Shasta County Executive Officer, at (530) 225-5561.

Sincerely,

Pam Giacomini

Sacramento, California 94236-0001

RE: Proposition 1 Water Storage Investment Project Funds

Dear Chairman Quintero:

The California Water Commission has an opportunity with Proposition 1 Water Storage Investment Project (WSIP) funds to upgrade our state's aging water infrastructure system while also helping put Californians to work.

The California Alliance for Jobs writes today in support of the Sites Reservoir Project's application for funding through WSIP. This potential reservoir project has the ability to provide multiple levels of benefits to California communities – rural and urban – as well as benefits to the environment around it. As a "north of the Delta" reservoir site, Sites would be able to provide California's current water systems with additional water security, storage capacity, and delivery flexibility.

Sites Reservoir would hold almost two million acre-feet of water through off-stream diversions. This capacity would allow the project to: provide reliable water supplies to current and future California cities and industries, dedicate water for environmental flows and fisheries, increase current and potential habitats for migratory birds, and improve the economy of currently disadvantaged communities across California.

Investing in the Sites Project also puts people to work. Thousands of family-supporting jobs are produced with every billion dollars invested in water infrastructure. Funding a project like Sites would provide decades worth of well-paying, middle class jobs for all Californians.

California's recent five-year drought and wet winter of 2017 showed the importance of smart and flexible water infrastructure to allow for storage during wet years and convey water during the dry ones. Sites Reservoir is necessary for California's continued economic growth and environmental sustainability.

Respectfully yours,

M. P. Quigley

Sites Reservoir Supporters

California continues to face severe water challenges: limited supplies and a growing population, compounded by climate change, and increased flow requirements for native fish. Now more than ever, California's water system needs a more flexible, environmentally friendly solution to capturing and storing water for use when it's needed most. The Sites project is an innovative project and a 21st century solution to California's water crisis. Sites provides previously unachievable flexibility to the state's water system without impacting sensitive river channels and critical environmental flows that support endangered fish populations.

PASSMORE RANCH

July 31, 2017

Jim Watson
General Manager
Sites Project Authority
P.O. Box 517
Maxwell, CA 95955

Dear Mr. Watson,

Passmore Ranch is pleased to offer its support for the sites Project. My ranch's primary business is aquaculture and on top of that, I live here in California too. Water is precious to both me, my family, and my ranch.

California will continue to face intense water challenges including limited supplies, a growing population, the effects of climate change, increased flow requirements for native fish, and water for wetlands used by migratory birds. Now more than ever, California's water system needs a more flexible, environmentally friendly and sustainable solution to capturing and storing water for use when it's needed most.

The Sites Project will add up to 1,800,000 acre-ft. of capacity to produce 500,000 acre-feet of critical supplies to California's water system on an annualized basis. With its ability to integrate operations with the state's water system, Sites is an innovative and modern approach that will help the state capture, store and move water where it needs to be when it is needed most.

The Sites Project will help make California's water system more efficient and reliable. The project helps meet the objectives of the California Water Action Plan by providing a substantial supply of high-quality water to support the economy and the environment. Sites reflects California's innovative approach to meeting the needs of the environment, economic growth and our quality of life.

Sites works for the ecosystem, families, farms, and businesses across the state. We encourage the California Water Commission to invest in the public benefits that the Sites Project will provide.

I look forward to working with the Sites Project Authority to advance this important project.

Warm Regards,

Michael Passmore

YUBA-SUTTER
FARM BUREAU
Serving agriculture since 1919

July 28, 2017

Jim Watson
General Manager
Sites Project Authority
P.O. Box 517
Maxwell, CA 95955

Dear Jim,

The Yuba-Sutter Farm Bureau, is pleased to offer its support for the Sites Project.

YSFB is a non-governmental, non-profit, voluntary membership California Corporation whose purpose is to protect and promote agricultural interests throughout Yuba and Sutter counties and to find solutions to problems of the farm, the farm home and the rural community. YSFB represents more than 1,200 agricultural, associate and collegiate members in Yuba and Sutter counties.

YSFB is deeply interested in protecting the long-term viability of agricultural areas and rural communities located in our region as the stability of the local agricultural industry plays an integral role not only within our rural communities and counties, but regionally, nationally and internationally.

California will continue to face intense water challenges including limited supplies, a growing population, the effects of climate change, increased flow requirements for native fish, and water for wetlands used by migratory birds. Now more than ever, California's water system needs a more flexible, environmentally friendly and sustainable solution to capturing and storing water for use when it's needed most.

The Sites Project will add up to 1,800,000 acre-ft. of capacity to produce 500,000 acre-feet of critical supplies to California's water system on an annualized basis, while allowing other reservoirs to hold water later into the summer months. The Sites Project will increase Northern California water storage by 23 percent, providing supplies of water for use in dry and critical years. Summed up, the Sites Project, with its ability to integrate operations with the state's water

475 N. Palora Avenue, Suite A, Yuba City, CA 95991 ♦ (530) 673-6550 ♦ Fax (530) 671-5836 ♦ Email: ysfb@ysfarmbureau.com

system, is an innovative and modern approach that will help the state capture, store and move water where it needs to be when it is needed most.

The Sites Project will help make California's water system more efficient and reliable. The project helps meet the objectives of the California Water Action Plan by providing a substantial supply of high-quality water to support the economy and the environment. Sites reflects California's innovative approach to meeting the needs of the environment, economic growth and our quality of life.

Sites works for the ecosystem, families, farms, and businesses across the state. We encourage the California Water Commission to invest in the public benefits that the Sites Project will provide.

We look forward to working with the Sites Project Authority to advance this important project.

Sincerely,

David J. Burroughs

Maxwell, CA 95955

Dear Jim,

The City of Orland City Council is pleased to offer its support for the Sites Project.

The Sites Project is a proposed above ground, off-stream water storage project located in Northern California and would add up to 500,000 acre-feet of critical supplies to California's water system annually. Sites is an innovative and modern approach that goes beyond water supply and flood protection by adding flexibility and generating a much-needed new water source for improved water quality, seasonal fish flows, climate change and drought relief.

The Sites Project creates an additional supply of reliable water that can be used for urban, agricultural, environmental, and industrial purposes. Sites would also improve water quality in the Sacramento-San Joaquin Delta (Delta) and enhance environmental flows to benefit the Delta's ecosystem.

California will continue to face severe water challenges including limited supplies, a growing population, the effects of climate change, and increased flow requirements for native fish. Now more than ever, California's water system needs a more flexible, environmentally friendly solution to capturing and storing water for use when it's needed most. The Sites Project would provide an additional tool for water managers to effectively balance competing demands and provide safe and reliable water to support the current and future needs of California's environment and economy.

We look forward to working with the Sites Project Authority to advance this important project.

Sincerely,

Dennis G. Hoffman
Mayor

P.O. Box 517
Maxwell, CA 95955

Dear Jim,

Representing over 600 cotton growers and 27 operating gins in the State of California, the California Cotton Ginners and Growers Association wishes to express our support for the Sites Project. After the entire state was crippled by several years of drought, it is increasingly evident that innovative water storage projects are needed.

The Sites Project would create an additional 1.8 million acre-feet of storage which would produce up to 500,000 acre-feet of supplies to California's water system annually. This water would be extremely valuable in helping achieve a more efficient and reliable water supply system. Capturing and capitalizing on years of increased precipitation would not only help keep families and farms in business but it would also generate economic growth, produce jobs and help California achieve ecosystem benefits.

We have seen billions of gallons of precious water be lost to the ocean due to the lack of adequate infrastructure. The water challenges that California has encountered over the past several years will continue, however investing in opportunities such as the Sites Project will bring balance and sustainability to the most precious resource in the state.
We look forward to do anything we can to help advance the Sites project.

Sincerely,

Roger Isom
President/CEO

Chair
California Water Commission
PO Box 942836
Sacramento, CA 94236-0001
Emailed to: CWC@water.ca.gov

RE: Support for Sites and Temperance Flat Projects

Dear Chairman Quintero:

Founded in 1926, Western Growers members are local and regional family farmers growing fresh produce in Arizona, California, Colorado and New Mexico. Our members and their workers provide half the nation's fresh fruits, vegetables and tree nuts, including half of America's fresh organic produce. It is on their behalf that we express our strong support for both the Sites Reservoir and Temperance Flat Reservoir projects in their applications for Proposition 1 public benefit funding.

One of the consequences of climate change is that California's historic precipitation and runoff patterns will change, resulting in greater unreliability of the Sierra snowpack. We must now contend with less snowpack along with faster, flashier and more chaotic runoff into our existing storage and conveyance infrastructure. Indeed, we may have already begun to experience such changes. This year's record-breaking rain and snow accumulations, coming on the heels of the worst recorded drought ever experienced, vividly demonstrates the need to adapt and enhance a system designed in a climatic era that no longer exists, and for a state population less than half of what it is today.

From October 1, 2016 through July 9, 2017 (nine months of the current water year), more than 50 million acre feet of water flowed into the Sacramento-San Joaquin Delta. After accounting for diversions for in-Delta use and exports by the State Water Project and Central Valley Project, more than 46 million acre feet flowed out to the ocean.

The Sites Project would add up to 1.8 million acre feet of capacity in an off-stream reservoir north of the Delta. State and federal water project operations in recent years have demonstrated the great need for this project as operators struggled with conflicting demands on the Sacramento River system. The Sites Project would provide critically needed flexibility for system operators by capturing high runoff flows on the Sacramento River and allowing later releases from Sites or upstream reservoirs for environmental and economic uses.

Temperance Flat Reservoir would be located on the San Joaquin River in the foothills northeast of Fresno and would create an additional 1.26 million acre-feet of water storage. Combined with the existing Millerton Lake, the complex would provide storage capacity of 1.78 million acre feet. The need is obvious: In 17 of the last 40 years, water has been released from Millerton Lake (Friant Dam) for flood control purposes, due to lack of storage capacity. This season alone Millerton will have released approximately 2.5 million acre feet to the ocean, lost for groundwater recharge or water supply.

Mailing Address: P.O. Box 57089 · Irvine, CA 92619-7089 • **Street Address:** 15525 Sand Canyon · Irvine, CA 92618
T: 949.863.1000 • **F:** 949.863.9028 • **Internet:** www.wga.com

The voters of California approved Proposition 1 by a margin of more than two-to-one, and they had a clear understanding, in the midst of a historic drought, that they were being asked whether California should invest in new water storage projects. Governor Brown and other signatories of the official ballot argument in support of Proposition 1 wrote in relevant part: "Proposition 1 invests in *new storage increasing the amount of water that can be stored during wet years* for the dry years that will continue to challenge California." (Emphasis added.)

As surface water storage projects, Sites and Temperance Flat provide the only means of capturing and storing heavy snowmelt and rain runoff – especially in wet years – that can be later utilized for groundwater recharge. Without this surface storage supply, groundwater recharge opportunities are lost as flood flows cannot be accommodated by saturated recharge lands. As the Sustainable Groundwater Management Act is implemented, the need for this capacity and flexibility is greater than ever.

Both projects would also provide needed additional flood protection for communities throughout the Central Valley.

These projects will help make California's water system more efficient and reliable. The projects help meet the objectives of the California Water Action Plan by providing a substantial supply of high-quality water to support the economy and the environment.

We respectfully urge the Commission to support both the Sites Reservoir Project and the Temperance Flat Reservoir Project to the fullest extent possible.

Sincerely,

Dave Puglia

Re: Sites Reservoir Project – Support

Dear Chairman Quintero:

On behalf of the Southern California Water Committee, I am writing to express support for the Sites Reservoir Project, and upcoming consideration of the project's application for Proposition 1 funding.

California needs flexible and reliable solutions to address its water woes, especially in light of today's climate realities and our recurring drought cycles. After a crushing five-year drought, this past winter was the wettest in 122 years but California lost the opportunity to capture and store billions of gallons of surplus water due to restrictions on our delivery system and lack of storage options.

We must focus on ways to smooth out the boom or bust cycle, this means having the ability to move water during big storm events and the capacity to save it in reservoirs for drier times. California has had nine droughts since 1900, totaling 41 years. The likelihood that droughts will worsen in the future means we must invest now to improve our old and inefficient water infrastructure.

Californians have the right to expect a clean and reliable water supply not just for today but for generations to come, and the Sites Reservoir Project aligns with delivering on this expectation. For these reasons, we support the Sites Reservoir Project and appreciate your consideration of the project for Proposition 1 funding this fall.

Sincerely,

Charley Wilson

RE: Support for the Sites Reservoir Project Proposition 1 Application

Dear Chair Quintero:

As the representative organization for businesses in the East Bay, the East Bay Leadership Council (EBLC) has a vested interest in projects that will improve water supplies, resiliency and the environment – water is vital for the health of business, residents and the environment. The EBLC is writing to express support of the Water Supply Investment Program funding application submitted under Proposition 1 for the Sites Reservoir Project.

In 2014, California voters approved $2.7 billion in funding for water storage projects, signaling that residents understand the importance of water storage and want to invest in construction projects in exchange for receiving environmental benefits. The recent drought followed by the wettest year on record only further highlighted the state-wide need for more storage to prepare for drought and flood emergencies. The EBLC agrees that two of the storage proposals are superior to others in providing water supply and Delta ecosystem benefits; namely, Sites Reservoir and Los Vaqueros Reservoir. These off-stream reservoirs provide many environmental and water supply benefits that can be achieved through federal, state and local funding. This letter focuses on Sites Reservoir; a separate letter will be provided for Los Vaqueros.

A key component of the East Bay Leadership Council's water policy action plan includes advocating for new and expanded water storage to diversify and enhance regional water supplies. California's most recent drought provided a stark reminder of the importance of a reliable water supply portfolio capable of balancing the water demands across all users: residential, business, agricultural and environmental. Sites Reservoir would provide an additional tool for regional water managers to balance these competing needs. Additionally, public investment in Sites Reservoir would provide the state's environmental resource agencies with an amount of water they would prioritize and manage, on a real-time basis and in every water year type, to advance the long-term objectives of restoring the ecological health and improving water management for beneficial uses of the Delta. This "environmental water" would also create measurable ecosystem and water quality benefits in the Sacramento River and provide additional water for the national wildlife refuges in the Central Valley. Such a new and flexible tool will only increase in value as the state manages its limited water resources through an uncertain future that includes offsetting for the effects of climate change on people and the environment.

The EBLC appreciates the California Water Commission's consideration of this important project and encourages the Commission to approve the Proposition 1 funding application.

Thank you for your time and consideration. Please contact Josh Huber, EBLC's Policy Director, with any questions at 925-246-1880

Sincerely,

Kristin Connelly

RE: Sites Reservoir Project Application for Funding from the Proposition 1 Water and Storage Investment Program

Dear Chairman Quintero:

On behalf of the State Building and construction Trades Council, AFL-CIO I write today to convey our support of the Sites Reservoir Project's application for funding from the Proposition 1 Water Storage and Investment Program. The Sites project not only has the potential to provide multiple benefits to California's farms, cities, and environment, but will also create good paying construction jobs which will help the economy.

As you know, the Sites Project is a 1.8 million acre-foot, off-stream regulating reservoir that would divert and store excess Sacramento River flows. The diversion levels would be dependent upon hydrologic conditions and would be structured to ensure that water taken out of the Sacramento River is truly in excess of downstream needs.

The operational flexibility that the Sites project would provide to the State's entire water system is what makes this project so unique and worthy of funding. A few of the reservoir's many uses include, but are not limited to: dedicated water for fishery and environmental flow purposes, a reliable water supply for California cities and agriculture, increased habitat for migratory birds on the Pacific Flyway, and improved flexibility and drought resiliency for the Central Valley Project and the State Water Project.

Opportunities to apply lessons learned during the last five years of drought must not be wasted. The drought (exacerbated by climate change), and this year's record-breaking rainfall, have proven how critical it is to develop smart storage that allows us to store more water in wet years for future use in dry ones. Sites Reservoir is that smart storage.

Thank you for the work that you and the Water Commission are doing to increase water supply reliability across California. We look forward to your announcement of funding awards.

Sincerely,

CESAR DIAZ
Legislative Director

August 9, 2017

Mr. Joe Yun, Executive Director
California Water Commission
P.O. Box 942836
Sacramento, California 94236-0001

Re: Support for Sites Reservoir

Dear Mr. Yun,

On behalf of the California Women for Agriculture (CWA) membership I would like to express support for the Sites Reservoir Project and additional surface water storage in California. Our state's ongoing water crisis demands varied and comprehensive solutions, including ample new water storage and infrastructure south of the Delta, to help ensure the ongoing viability of agriculture in California, as well as the communities and families that rely on this great industry. The Sites Project is a critical component of such solutions.

CWA is an all-volunteer organization with over 1,000 members engaged public relations, education and legislative advocacy on behalf of California agriculture at the local, state and national level. Our membership includes farmers and ranchers, individuals involved in support industries such as insurance, banking and consulting, and interested consumers from throughout the state. As a group focused on actively promoting the importance of a healthy and vibrant agricultural industry, we have been consistently engaged in discussions around the California drought, water management, and ensuring available water supplies are maximized for the benefit of all Californians. The impacts of the drought were devastating for our industry and forced family farmers to make very difficult decisions. Groundwater wells are an option for some growers, but many are located in areas where groundwater is not available, quality is less than optimal, or costs associated with pumping from deep wells are not feasible for the return on the crop being grown. Growers throughout the state have been severely negatively impacted, and some permanently, by significantly reduced surface water allocations.

The need for surface storage has never been more apparent as it has been in recent years. Water is a scarce commodity and for this reason growers have implemented state of the art irrigation technology over the years. Without that, impacts of the drought would have been much more severe on agriculture. As agriculture continues to conserve and do more with less, the allocations of water directed to environmental purposes increase. An increase to water in the system will be the only solution to ensure all needs will be met. There is an immediate need for balance because a safe and affordable food supply is essential for California.

CWA has supported increased surface storage, including the Sites Reservoir Project, from the early discussions and negotiations for the Prop 1 Water Bond. We were particularly vocal about the need for continuous appropriations in an amount sufficient to incorporate both Sites and Temperance Flat in the scope of the proposition. That was the intention of the funding. The 1.8 million acre feet of additional water storage Sites would provide operational flexibility to the State's entire water system, making this project unique and worthy of funding.

Sites will provide benefits to California cities, agriculture and the environment, including dedicated water for fishery and environmental flow purposes, increased habitat for migratory birds on the Pacific Flyway, and improved flexibility and drought resiliency for the Central Valley Project and the State Water Project.

We ask that you consider the myriad of regional and state benefits that will be provided for by the construction of this project. There is strong local support for this project and we ask that you allocate sufficient funds from Section 8 of the Prop 1 Water Bond to the Sites Flat Project.

Respectfully,

Sara Reid Herman
State President Elect
California Women for Agriculture

RESOLUTION NO. 17-19

SUPPORTING THE SITES RESERVOIR PROJECT ON BEHALF OF THE CITY OF ROSEVILLE

WHEREAS, the State of California is in the midst of a multi-year drought that has severely strained the state and federal water systems; and

WHEREAS, the City of Roseville, which relies on the Central Valley Project's Folsom Reservoir for its water supply; and

WHEREAS, Folsom Reservoir saw a record low reservoir level in 2015 with the reservoir reaching 135,000 acre-feet; and

WHEREAS, Folsom Reservoir provides beneficial cold water in the American River and is relied upon by the Bureau of Reclamation as a first responder reservoir to send water to the Sacramento-San Joaquin Delta to repel salinity and meet water quality objectives; and

WHEREAS, Roseville values the development of surface water storage infrastructure that provides for more water system reliability north of the Sacramento-San Joaquin Delta; and

WHEREAS, the proposed North of Delta Offstream Storage Project (or Sites Reservoir Project) would add up to 1.8 million acre-feet of potential off-stream water supply storage to be operated for human consumptive uses, the production of food, and environmental benefits; and

WHEREAS, the proposed Sites Reservoir Project is an offstream regulating reservoir that does not impede fish passage and it can provide an environmental block of water that could be used for various purposes, including: improved reliability of flows to support migratory birds of the Pacific Flyway, increased cold water pools available for salmon north of the Sacramento-San Joaquin Delta, water quality and ecosystem improvements in the Delta and recreational value; and

WHEREAS, if Sites Reservoir is built, it could be operated in tandem to relieve pressure off of Folsom Reservoir in cold water and environmental releases of water; and

WHEREAS, if Sites Reservoir is built, could support the state's renewable energy goals; and

WHEREAS, the potential multiple benefits of Sites Reservoir could help Roseville's water supply reliability and ensure the city's future prosperity;

NOW, THEREFORE, BE IT RESOLVED that the City Council of the City of Roseville supports the construction and operation of Sites Reservoir; and directs the City Manager to allocate the appropriate advocacy, communications and technical resources to ensure that Sites

Reservoir is built and operated, to benefit the Roseville community and economy, through added water supply reliability, for generations to come.

PASSED AND ADOPTED by the Council of the City of Roseville this 18th day of January, 2017, by the following vote on roll call:

AYES COUNCILMEMBERS: Gore, Alvord, Herman, Allard, Rohan

NOES COUNCILMEMBERS: None

ABSENT COUNCILMEMBERS: None

Susan Rohan

Sites Reservoir Supporters

California continues to face severe water challenges: limited supplies and a growing population, compounded by climate change, and increased flow requirements for native fish. Now more than ever, California's water system needs a more flexible, environmentally friendly solution to capturing and storing water for use when it's needed most. The Sites project is an innovative project and a 21st century solution to California's water crisis. Sites provides previously unachievable flexibility to the state's water system without impacting sensitive river channels and critical environmental flows that support endangered fish populations.

Benefit Calculation, Monetization, and Resiliency Tab

Attachment 7: Non-Monetized Benefits

If applicable, provide a summary of public benefits that cannot be monetized. Provide the following information for each non-monetized benefit.

- *Justification why benefit cannot be monetized,*
- *Qualitative description of importance of benefit (who is affected, how and how often),*
- *Evidence to show how the physical change is beneficial and important to Californians.*

WSIP Application Instructions, March 2017

Response

There are several benefits from the Sites Project that have not been monetized. These are described below.

Operational Flexibility: The addition of the Sites Project would provide increased operational flexibility for the SWP and CVP that would support both public and non-public benefits. It is difficult to find a suitable metric for this benefit without double counting the monetized benefits; nevertheless this is a real benefit. This flexibility is beneficial to the Sacramento River watershed, the Delta, and all beneficiaries served by the SWP and CVP. This is consistent with the Natural Resources Agency, California Water Action Plan (2016) which states:

> "Today, water storage is also needed to help provide widespread public and environmental benefits, such as seasonal fish flows, improved water quality, water cool enough to sustain salmon, and increased flexibility to meet multiple demands, especially in increasingly dry years. The financing of additional water storage in California must reflect not just specific local benefits, but also these broader public benefits."

Groundwater Sustainability: As indicated in the response to Q6 and Sites_A6C Groundwater Basins under the ELIGIBILITY AND GENERAL PROJECT INFORMATION TAB, water from Sites Reservoir would be used by project participants to help prevent undesirable results. The details of how the specific participants will use water from Sites for direct or in lieu recharge have not yet been developed, but are expected to be incorporated into forthcoming sustainable groundwater management plans if this project is approved. At a minimum, Sites Reservoir would contribute to improved groundwater management practices for Glenn and Colusa.

Ecosystem Enhancement – Anadromous Fish - Other Species in Sacramento River: This application includes monetized benefits for Chinook salmon (all runs) downstream of the Sacramento River. Other species in the portion of the Sacramento River between Keswick Dam and Red Bluff would also benefit from improved temperature conditions. These include steelhead and green sturgeon which receive protection from the Federal Endangered Species Act and have recreational value as gamefish. These benefits were not monetized because models for these species are not available for this watershed.

Ecosystem Enhancement – Anadromous Fish – Lower American River: The Sites Project would also provide temperature benefits in the American River watershed below Folsom Dam. These benefits have not been monetized. These benefits were not monetized because models for are not available to estimate the improvement in returning spawners for this watershed.

Recreation – Benefits to Nearby Reservoirs: The addition of Sites Reservoir would improve water surface elevations in existing reservoirs, including Lake Oroville, Shasta Lake and Folsom Lake. Both of these reservoirs are popular for recreation that is dependent on maintaining an adequate surface water elevation. This benefit was not monetized.

Recreation – Benefits to Fishing: Sites Reservoir operations will provide additional coldwater and augment flows to support the migration of important game fish, including Chinook salmon and steelhead.

Benefit Calculation, Monetization, and Resiliency Tab

Attachment 8: Total Project Cost and Basis of Estimate Report

Attach an estimate of the total project costs that includes construction cost, interest during construction, land acquisition, monitoring, environmental mitigation or compliance obligations, operations and maintenance, repair, and replacement costs during the planning horizon using methods described in TR section 6. If the project costs are located in another attachment, identify the location.

WSIP Application Instructions, March 2017

Response

The project cost estimate for the Sites Project is a Class 4 estimate as defined by the Association for the Advancement of Cost Estimating, International, and includes all of the components required for the WSIP Application. Provided in this attachment are the cost estimates, and the Basis of Estimate Report.

EXECUTIVE SUMMARY

E-1 INTRODUCTION

Project Alternative D is being developed by the Sites Project Authority (Authority) to reflect the Authority's preferences and those of the local stakeholders for the Sites Reservoir Project (Project). Alternative D is an addition to three other alternatives (Alternatives A, B, and C) developed by the United States Department of the Interior, Bureau of Reclamation (Reclamation) and the California Department of Water Resources (DWR).

AECOM Technical Services, Inc. (AECOM) is assisting the Authority to develop and evaluate Alternative D by preparing conceptual plans, feasibility-level cost estimates, a preliminary construction schedule, and other information needed to prepare the Project Feasibility Report and the application for bond funding under the Water Storage Investment Program (WSIP).

This Basis of Estimate (BOE) Report for Alternative D provides brief descriptions for the major project components and supporting information for the Project cost estimate and preliminary construction schedule. Appendices included in this BOE contain the cost estimate and preliminary construction schedule. To support estimating and scheduling, AECOM developed a set of conceptual plans for the Project, which is provided separately.

E-2 Facilities Comprising Project Alternative D

The Authority developed Alternative D by modifying the facilities in Reclamation Alternative C to reflect the Authority's vision for the project. Table E-1 provides a list of the key project facilities that comprise Alternative D, which are briefly described in Section 2. More detailed facility descriptions can be found in the Feasibility Report (Reclamation, 2017). Figure E-1 shows facility locations.

Table E-1. Sites Reservoir Project Facilities - Alternative D

Sites Reservoir (Approximately 1.8 Million Acre-Foot [MAF] Maximum Storage)
Two Main Dams (Sites Dam and Golden Gate Dam)
Nine Saddle Dams (Numbered 1 Through 9)
Sites Reservoir Inlet/Outlet Facility, Including Inlet Tower and Tunnel
Sites Pumping/Generating Plant
Holthouse Reservoir
Holthouse Reservoir Inlet/Outlet Facility and Spillway
Terminal Regulating Reservoir (TRR) and TRR Pumping/Generating Plant
TRR and Delevan Pipelines
Delevan Intake and Pumping/Generating Plant on Sacramento River
Sites Lodoga Road Relocation and South Bridge
Other Temporary and Permanent Project Roads
Substation Interconnections to existing Western Area Power Administration (WAPA) and Pacific Gas and Electric (PG&E) Transmission Lines
Two Recreation Areas and Day-use Boat Ramp

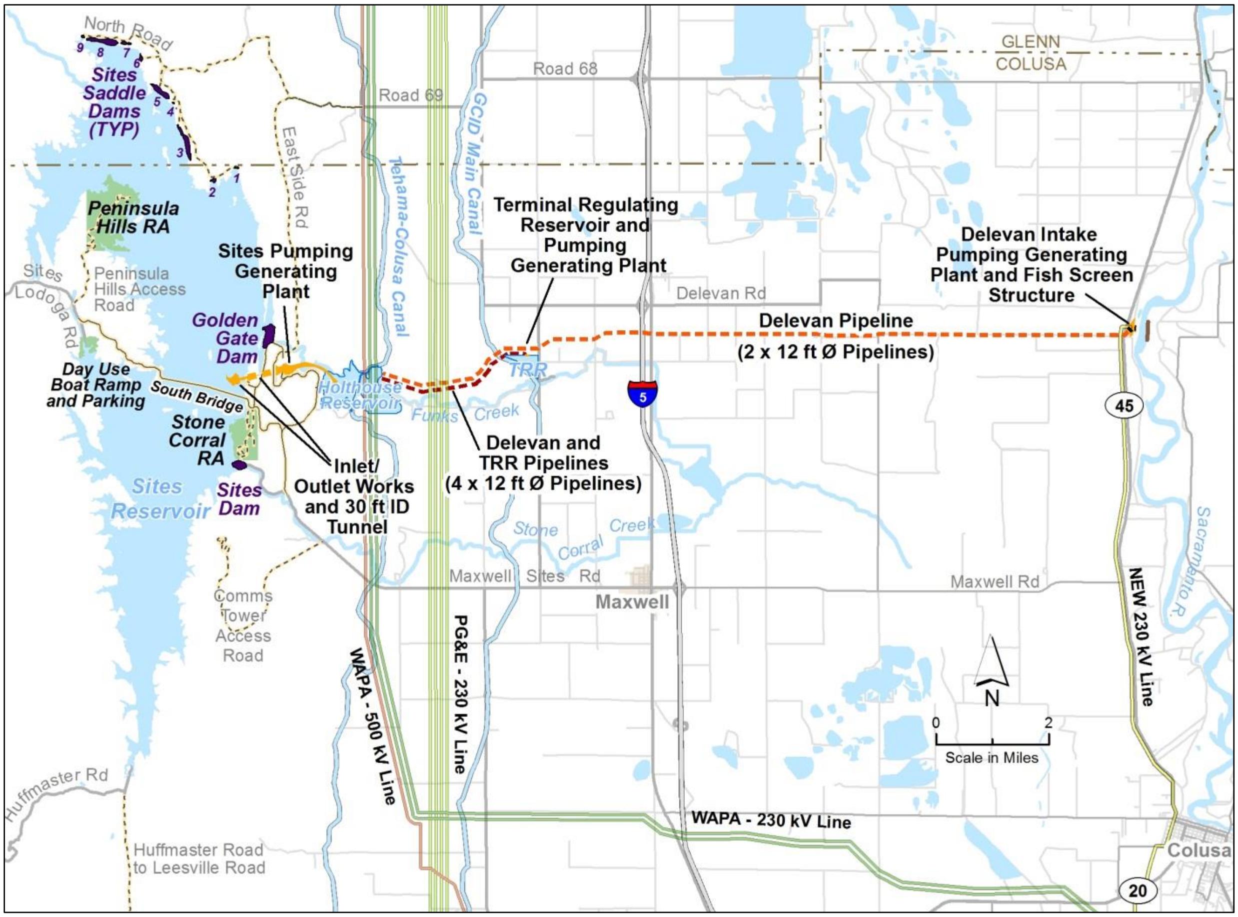

Figure E-1 Project Plan

The more significant modifications made to Reclamation Alternative C to develop Alternative D include the following:

- Delevan Intake and Pumping/Generating Plant site arrangements are modified to make better use of the site and improve constructability of Delevan Pipeline.
- The east-west cross country transmission line between the Terminal Regulating Reservoir (TRR) and the Delevan Intake on the Sacramento River in Alternative C is replaced by a north-south transmission line paralleling Highway 45 from the City of Colusa to the south. The north-south line would begin at a new substation connected to an existing WAPA line.
- The Delevan Pipeline alignment for Alternative D is shifted to the south to address local stakeholder concerns and to incorporate public and local irrigation district easements to reduce private land impacts.
- The TRR Reservoir is downsized from 2,000 acre-feet to approximately 1,200 acre-feet based on information provided by the Glen-Colusa Irrigation District (GCID) regarding the storage volume needed for GCID Canal regulation.

- One of the two generating units in the TRR Pumping/Generating Plant has been removed following consultation with GCID. The GCID system downstream of the TRR can only accommodate a return flow from Holthouse Reservoir of approximately 900 cfs.
- The configuration of Holthouse Reservoir has been adjusted based on additional engineering work that incorporated LiDAR topography. Configuration changes include relocating the concrete dam segment to the left abutment to reduce the risk of encountering poor foundation conditions. The pipeline inlet/outlet and flood control spillway structures are located in the concrete dam section.
- The proposed south bridge alignment across Sites Reservoir has been moved to avoid potential construction conflict with the Inlet/Outlet Structure for Sites Reservoir.
- The design of the south bridge has been modified based on additional design work to better reflect anticipated foundation conditions and take advantage of more cost effective construction methods for the superstructure.
- A new temporary public bypass road has been added across the north end of the reservoir to replace the section of Sites Lodoga Road that must be taken out of service to construct Sites Dam and the reservoir. This bypass facilitates an earlier construction start date and relieves schedule pressure for the completion of the south bridge.
- Only two recreation areas and a day-use boat launch ramp are being provided for Alternative D.

E-3 FEASIBILITY-LEVEL COST ESTIMATE

E-3.1 WSIP Requirements and Cost Estimate Class

The feasibility-level cost estimate presented in this BOE fully reflects the directions and recommendations on estimating project costs for economic analysis presented in Technical Reference Section 6 for the WSIP application (Water Commission, 2016).

As stated in the WSIP Technical Reference, the Project cost estimate must be a Class 4 estimate or better as defined by the Association for the Advancement of Cost Estimating (AACE), International. Overall, the Project cost estimate presented in this BOE represents a mid-range Class 4 estimate. The current level of design for the various project features varies. Some of the more costly facilities (like the dams and portions of the pipelines) are at a level of geotechnical investigation and design that would support a higher Class 3 estimate. The design for other facilities is less advanced, but still well enough defined to support preparing Class 4 estimates.

E-3.2 Estimate Development and Type

The cost estimate for Alternative D was prepared using the Reclamation estimating forms and following Reclamation's estimating guidelines to be consistent with other estimates prepared for Alternatives A, B, and C. Guidelines used include Reclamation's Cost Estimating Handbook (Reclamation, 1989), FAC-09-01 (Reclamation, 2007a), and FAC-09-02 (Reclamation, 2007b).

The Reclamation plant account numbering system was used and Reclamation's cost rounding guidelines were followed.

The cost estimate is characterized as a unit price estimate. Unit prices were developed using a combination of techniques, including detailed analyses of equipment, material, and manpower costs; vendor catalogs and quotes; recent bid results; and corporate experience on projects with similar facilities.

E-3.3 Project Cost Summary

E-3.3.1 Capital Cost Summary

Table E-2 summarizes the estimated feasibility-level capital cost summary for Alternative D in October 2015 dollars. Detailed cost estimate worksheets supporting Table E-2 are provided in Appendix A. The costs in Table E-2 reflect:

- All construction costs, including, but not limited to, mobilization and demobilization, labor, construction equipment, supply and installation of permanent materials and equipment with an expected useful life of 2 years or more, contractor indirect and overhead costs and profit, and bonds and insurance.
- Initial environmental mitigation or compliance obligations.
- Land acquisition, including legal, administrative, and relocation costs.
- Modifications to existing canal headworks structures to be able to reliably supply water to the Project.
- Contingencies for engineering (10 percent) and construction (15 percent), and a non-contract cost allowance (17 percent).

Incidental costs are covered by applying the non-contract cost allowance of 17 percent to the construction cost. Incidental costs directly related to construction or acquisitions, including planning, geotechnical site investigations, engineering and design, construction management, environmental mitigation and compliance, permitting, and other Authority costs directly related to project construction.

E-3.3.2 Total Project Cost Summary

Table E-3 summarizes the total project cost estimate for Alternative D in October 2015 dollars. Total project cost includes the capital cost; finance costs (interest during construction); operation, maintenance repairs, and replacements; and ongoing mitigation and water quality monitoring costs. The estimated annual operation and maintenance, repair and replacement costs, and the mitigation costs (totaling approximately $26.6 million) were applied over a 93-year operating period beginning in 2030. The net present value was then estimated in October 2015 dollars using the WSIP required discount rate (3.5 percent).

E-3.3.3 Other Potential Costs

The estimates presented in Table E-2 and Table E-3 may not be a complete tabulation of all potential Authority costs to implement the project. An example of other costs might include electric utility owner costs for system improvements to provide power to the project or accept power from project generation. Further PG&E and WAPA system connection studies and discussions with these utilities would be part of future Project design activities that would identify if such costs would be incurred.

Table E-2. Capital Cost Summary

Facility	Field Cost ($ Million)	Non-Contract Cost ($ Million)	Construction Cost ($ Million)
Develop Sites Reservoir	310	50	360
Main Dams	520	90	610
Saddle Dams	230	40	270
Holthouse Dam	160	30	190
Terminal Regulating Reservoir	33	6	39
Inlet/Outlet Structure and Tunnel	180	30	210
Sites Pumping/Generating Plant	680	120	800
Terminal Regulating Reservoir Pumping/Generating Plant	135	25	160
Sacramento River Pumping/Generating Plant	220	40	260
Sacramento River Fish Screen Structure	47	8	55
Red Bluff Addition	3	1	4
Sites Pumping/Generating Plant Conveyance Channel	42	7	49
Delevan Pipeline	560	100	660
Terminal Regulating Reservoir Pipeline	300	50	350
Utility Transmission Line Interconnections	160	30	190
General Property	26	4	30
Land Acquisition and Rights	100	10	110
Environmental Mitigation/Monitoring	340	10	350
Subtotals	4,046	651	4,697
Capital Cost	-	-	**4,697**

Note: All costs are October 2015 costs

Table E-3. Total Project Cost Summary

Item	Construction Cost[1] ($ Million)
Capital Cost	4,697
Interest During Construction	789
Operation, Maintenance, Repairs, Replacement (Note 2)	554
Ongoing Water Quality and Mitigation Monitoring Costs (Note 2)	175
Allowance for Utility Systems	50
Total Project Cost	6,265

Note: 1. All costs are October 2015 costs

2. Net present value of annual costs for assumed 100 year operating period beginning in 2030

E-4 PRELIMINARY CONSTRUCTION SCHEDULE

Appendix B provides a preliminary construction schedule for Alternative D developed by AECOM to support the feasibility-level cost estimate. The construction schedule presents a reasonable approach to construct the project that accounts for the logical sequencing of the work, procurement of equipment, and reasonable durations to complete construction activities. Durations reflect the estimated labor and equipment spreads needed to complete activities, including earthwork, balancing the movement of excavated soil and rock to placement sites, supplying and placing all materials, erecting structures, and installing major equipment. Labor and equipment costs are reflected in the cost estimate.

The schedule presents construction activities with an assumed construction start date in late March 2022. Completing the Delevan Intake on the Sacramento River and the Sites Pumping/Generating Plants in early 2030 are the final critical activities to achieve project construction completion and begin pumping operations. It may be possible to begin filling the reservoir using natural runoff from Stone Corral and Funks Creek beginning with the 2028 and 2029 wet season as the dams will have been completed by then.

Activities such as design, permitting, packaging the work, and bidding the construction packages are not included because of the uncertainty in scheduling these activities between now and 2022. With hydroelectric generation being a part of the project, the FERC permitting process may also affect the actual start date.

1. INTRODUCTION

The Sites Project Authority (Authority) is developing a locally preferred plan for the Sites Reservoir Project (Project) that incorporates the Authority's preferences and those of the local stakeholders. This plan, identified as Project Alternative D, is an addition to three other plans being evaluated by the U. S. Bureau of Reclamation (Reclamation), which are identified as Alternatives A, B, and C. AECOM Technical Services, Inc. (AECOM) is providing support to the Authority to develop the feasibility-level cost estimate and preliminary implementation schedule for Alternative D. This Basis of Estimate (BOE) Report for Alternative D contains a brief description of the major project components and provides supporting information for the feasibility-level cost estimate and preliminary construction schedule. The cost estimate worksheets and construction schedule are included herein in Appendices A and B.

The feasibility-level cost estimate and this Basis for Estimate (BOE) Report were prepared in accordance with Task 6, *Refine Engineering, Cost Estimate, and Schedule*, in the August 28, 2015 *Scope of Work Sites Reservoir Feasibility Study*. The estimating methodology is consistent with the requirements in Section 6 of the *Draft Technical Reference* (November 2016) published for the Water Storage Investment Program by the California Water Commission. Unit prices for labor, materials, land, and other inputs reflect an October 2015 pricing basis.

The feasibility-level cost estimate incorporates alignment refinements and additional design information for the south bridge and the Delevan and Terminal Regulating Reservoir (TRR) Pipelines to address stakeholder comments provided on Reclamation alternatives. The bridge and pipelines refinements were prepared in accordance with Task 7, *Roadway, Bridge, and Pipeline Alignment Modifications*. The engineering refinements for the bridge and pipelines, and for other facilities, are reflected in the set of Plans for Project Alternative D that accompanies the Basis of Estimate Report in a separate volume.

To support feasibility-level cost estimating, a preliminary construction schedule was developed for Alternative D in accordance with Task 6. The assumed schedule is based on a construction start day in spring or summer of 2022, and implementation of the project construction by the Authority. The schedule is discussed further in Section 5.

For consistency with previous estimates prepared for Reclamation Alternatives A, B, and C, the feasibility-level cost estimate for Alternative D also follows the Reclamation format and guidelines. This provides a common base for economic comparisons and facilitates incorporating all four estimates into the Federal Feasibility Report being prepared for the project.

This page intentionally left blank.

2. WATER SUPPLY AND DELIVERY, HYDROELECTRIC GENERATION

The water supply to fill Sites Reservoir will come from three conveyance facilities that draw water from the Sacramento River. Two of the conveyance facilities are existing canals; the Tehama Colusa (TC) Canal with its intake at Red Bluff and the Glen Colusa Irrigation District (GCID) Canal with its intake near Hamilton City. The third facility is the planned new Delevan Intake located on the Sacramento River. Figure 2-1shows the two existing canals and the new intake. Diversions to the reservoir from the three Sacramento River sources would occur during the winter and spring seasons governed by permit requirements and mitigation measures being developed for the Project.

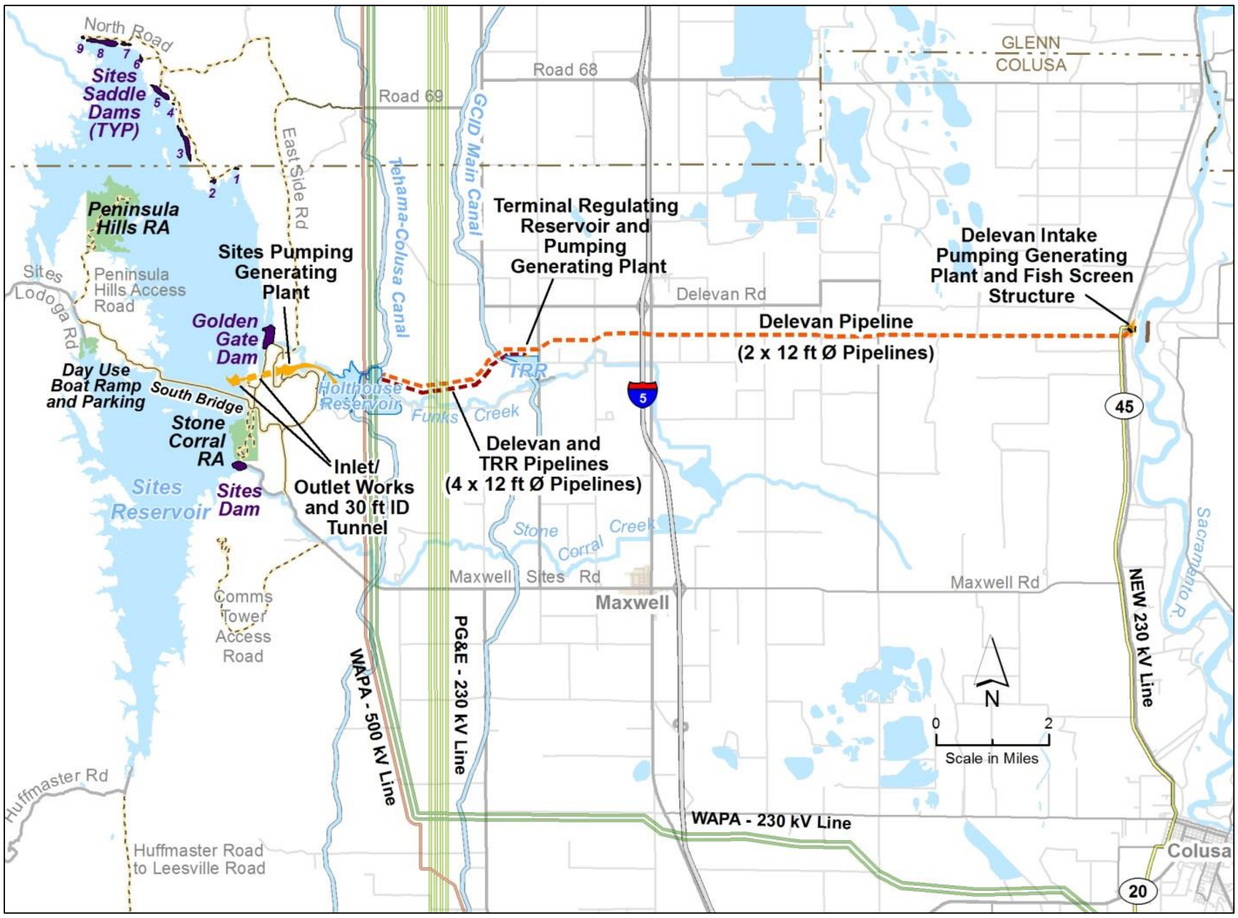

Figure 2-1 Project Plan

Water would be released from Sites Reservoir during the summer and fall back to the canals to meet irrigation demands and back to the Sacramento River to meet downstream demands and environmental commitments. Table 2-1 summarizes the maximum diversion and release flows planned for Alternative D.

Table 2-1 Maximum Planned Water Diversions and Releases

Conveyance	Diversions to Sites Reservoir	Release from Sites Reservoir
T-C Canal	2,100 cfs	2,000 cfs
GCID Canal	1,800 cfs	900 cfs
Sacramento River	2,000 cfs	1,500 cfs
Total	5,900 cfs	4,400 cfs

As shown on Figure 2-1, Holthouse Reservoir would be the collection and release point for all water moving into and out of Sites Reservoir through the Sites Pumping/Generating Plant. Because the TC Canal connects directly to Holthouse Reservoir, TC Canal water diversions and releases would be managed within Holthouse Reservoir. Diversions and releases for the GCID Canal would be managed in the Terminal Regulating Reservoir (TRR) using the TRR Pumping/Generating Plant connected to Holthouse Reservoir by the TRR Pipeline. Water diversions and releases for the Sacramento River would be managed at the Delevan Intake using the Sacramento River-Pumping/Generating Plant connected to Holthouse Reservoir by the Delevan Pipeline.

Releases to Holthouse Reservoir from Sites Reservoir would be used for hydroelectric power generation using pump-turbines located in the Sites Pumping/Generating Plant. Holthouse Reservoir is sized to allow the Sites Pumping/Generating Plant to operate as a pumped-storage facility to enhance renewable energy generation. Releases to the GCID Canal and the Sacramento River would also be used for power generation on release only (no pumped-storage) using dedicated turbines in the TRR and Sacramento River Pumping/Generating Plants.

Note that the planned 900 cfs release flow from Sites Reservoir to the GCID Canal shown in Table 2-1 is less than the 1,800 cfs used for other alternatives. The lower release was provided by GCID based on their canal and distribution system capacities downstream from the TRR. Currently, GCID has no plan to increase these capacities.

3. PROJECT DESCRIPTION

This section presents a brief overview of the main project features for Alternative D shown on Figure 2-1. Alternative D resembles Reclamation Alternative C, but reflects Authority and local stakeholder refinements and preferences.

3.1. Sites Reservoir

3.1.1. RESERVOIR PARAMETERS

Table 3-1 summarizes the reservoir parameters for Alternative D.

Table 3-1 Sites Reservoir Parameters

Approximate Total Storage Capacity (With Dead Storage)	1.81 MAF
Approximate Useable Active Storage	1.65 MAF
Maximum Operating Water Elevation	520.0 feet
Minimum Operating Water Elevation	340.0 feet
Top of Dead Pool Elevation	300.0 feet
Approximate Inundation Area (at elevation 520.0 feet)	14,200 acres

The reservoir area is characterized as open grazing lands with limited tree. Demolition of the small town of Sites, several ranches, and associated infrastructure located within the reservoir inundation area will be required. Fencing and asphalt concrete paving will be removed, abandoned gas wells within the reservoir will be checked for proper abandonment, and several small salt springs identified within the reservoir will be capped.

3.1.2. DAMS FORMING SITES RESERVOIR

The Sites Reservoir Dams and Saddle Dams for Project Alternative D are at the same locations and have similar design details as the corresponding dams used for other Project alternatives. Embankment locations are shown on Figure 2-1. To form Sites Reservoir, Golden Gate Dam would be constructed on Funks Creek and Sites Dam would be constructed on Stone Corral Creek. In addition, nine saddle dams of varying sizes would be constructed to close off topographic low point saddles around the eastern rim of the reservoir between Funks Creek and the north end of the reservoir.

The main dams and saddle dams would be zoned earth and rockfill embankments. This type of construction is suitable for the Project area considering the current understanding of geotechnical, geological, and seismologic conditions existing in the reservoir area. The earth and rockfill zoning also make best use of soils and rock materials from borrow areas within the reservoir area and from mandatory excavations required to construct other project facilities. Table 3-2 summarizes embankment parameters and earthwork volumes for each dam. Earthwork volumes were originally estimated by DWR and have been verified by AECOM using available topographic information at the dam sites.

Table 3-2 Parameters for Main Dams and Saddle Dams

Dam	Height Above Streambed (feet)	Crest Length (feet)	Embankment Volume (cubic yards)
Golden Gate Dam	310	2,250	10,590,000
Sites Dam	290	850	3,836,000
Saddle Dam 1	50	490	93,000
Saddle Dam 2	80	420	86,000
Saddle Dam 3	130	3,810	3,577,000
Saddle Dam 4	40	270	18,000
Saddle Dam 5	100	2,290	1,505,000
Saddle Dam 6	70	530	144,000
Saddle Dam 7	75	1,040	196,000
Saddle Dam 8	105	2,990	1,915,000
Saddle Dam 9	45	340	49,000
Total			**22,009,000**

3.1.3. RESERVOIR RIM GROUTING

Narrow reservoir rim areas between Golden Gate Dam and the northern most saddle dam could provide a potential for through seepage when the reservoir water level is high. For the current study, rim seepage is addressed by installing a grout curtain down into relatively tight rock. AECOM performed a preliminary evaluation of the rim grouting requirement and determined that approximately 6,000 feet of additional curtain measured along the ridge would be require (primary, secondary, and some tertiary grouting). The curtain would be an extension of the embankment foundation grout curtain for Golden Gate Dam and the saddle dams extending out into the adjacent narrow areas. This cost for additional single line rim grouting has been included in the estimate for Alternative D. The average depth of grout treatment would be approximately 60 feet, which represents the estimated distance from the design dam crest elevation (540.0 feet) down to competent rock. The section of drill holes from grade down to elevation 540.0 feet would be backfilled with cement after the lower portion of the hole is pressure grouted. Additional geotechnical investigations would be needed during future phases of the project to further evaluate the seepage risk and confirm the amount of grouting needed.

3.1.4. RESERVOIR SPILLWAY

Sites Reservoir is an off-stream reservoir with a small drainage area relative to reservoir storage. The freeboard provided for the main dams and saddle dams (20 feet above normal maximum pool) allows for the full storage of runoff from the probable maximum flood (PMF) while leaving approximately 15 feet of residual freeboard. Because the reservoir can fully store the PMF above the normal maximum water level with adequate remaining freeboard, there is no flood control spillway. However, a small signal spillway is provided at Saddle Dam 6 to alarm facility operators in the event the water level ever exceeds the PMF storage level due to over-pumping.

3.1.5. CREEK DIVERSION DURING CONSTRUCTION

Storm water runoff from Funks and Golden Corral creeks must be routed around construction sites. Funks Creek is of particular concern because this creek runs through the Golden Gate Dam site and potentially affects downstream work at the Sites Pumping/Generating Plant, the channel from the plant to Holthouse Reservoir, Funks Reservoir, Holthouse Dam Construction, and other activities, many of which fall on the critical path. Construction of these facilities will cover multiple years on the schedule and Funks Creek can produce significant creek flows during the winter seasons. To minimize impact to the large construction area downstream of Golden Gate Dam, AECOM has identified a construction diversion plan for the reservoir that would collect water from Funks Creek in the reservoir area and rechannel it south through a low ridge to Stone Corral Creek, which flows through the Sites Dam site. The volume of material that must be excavated to construct the channel connecting the two creek drainages would be stockpiled and reused in permanent construction for the dams and cofferdams. At the Sites Dam site, a diversion tunnel would be constructed through one abutment of the dam to pass all flood flows. The diversion tunnel would work in combination with upstream cofferdams at the two dam sites and channels in the reservoir to control and direct water.

The drainage area is approximately 84 square miles. Based on National Oceanic and Atmospheric Administration data for a 100-year storm event, the estimated design rainfall depth is 5.2 inches in 24 hours. The resulting design runoff flow routed through the tunnel would be approximately 4,500 cfs. The maximum upstream water level during flood routing would reach approximate Elevation 295.0, which is below the assumed top of cofferdam level at Elevation 300.0. For estimating, the tunnel is sized at 20 feet in diameter finished to 18 feet. It is estimated that this tunnel will have to be approximately 3,000 feet long to avoid conflict with the Sites Dam construction. Tunnel would be constructed using drill and blast methods and using steel sets, lagging, and rock bolts for support. The inside perimeter would be shotcrete lined. Heavy riprap will be used for energy dissipation at the discharge area in Stone Corral Creek.

The inlet to the diversion tunnel at Sites Dam will be plugged at the upstream end to begin initial filling of the reservoir. A 24-inch-diameter outlet pipe will run through the plug to the downstream end of the tunnel. A shutoff valve will be provided at the downstream end of the tunnel plug and an energy dissipation valve will be provided on the pipe at the downstream end of the tunnel. The pipe will be used to make environmental releases to Stone Corral Creek after construction of Sites Dam.

3.2. Sites Reservoir Inlet/Outlet facility

The Sites Reservoir Inlet/Outlet Facilities are shown on Figure 2-1 and include the following components:

- The 4,000-foot long pressure tunnel through the ridge
- The vertical Inlet/Outlet tower with control gates located in the reservoir, and
- The low level Inlet/Outlet structure on the bottom of the reservoir at the upstream end of the pressure tunnel.
- The emergency drawdown release facility.

The current design details and estimated cost for these facilities will be further evaluated in future phases of the project. Based on the current understanding of site seismicity, it is possible that the vertical intake tower described below would be converted to a sloping intake configuration firmly anchored to the reservoir slope. This reconfiguration would also eliminate the need for an access bridge to the tower and improve operation and maintenance flexibility.

3.2.1. I/O PRESSURE TUNNEL

The pressure tunnel is approximately 4,000 feet long. It would be constructed using drill and blast methods after the upstream and downstream portals are excavated and developed. The neat line excavated diameter would be approximately 36 feet and the internal diameter after lining would be 30 feet. The geology along the tunnel alignment consists of sandstones and mudstones of the Boxer and Cortina Formations and the alignment was selected to avoid faults and shears identified from currently available geological mapping. Rock bolting and steel sets and lagging should be adequate for tunnel support.

The tunnel would be reinforced concrete lined for the full length. At the lower end, a steel liner would be incorporated into the concrete lining where the depth-of-rock cover over the tunnel is inadequate to provide sufficient confinement for the internal design pressure.

The tunnel is sized to meet the Division of Safety of Dams (DSOD) emergency reservoir drawdown guidelines, which requires the outlet facilities have a flow capacity to reduce the maximum reservoir storage depth by 10 percent within 10 days. For Sites Reservoir, this correlates to drawing down the reservoir by 22 feet from maximum pool by releasing approximately 300,000 AF of water in 10 days. The average tunnel outflow over ten days would be approximately 15,100 cfs and the corresponding average tunnel velocity would be approximately 21.5 fps. This design case far exceeds the maximum normal operating case (5,900 cfs pumping flow and velocity of 8.3 fps).

3.2.2. INLET/OUTLET TOWER

The multi-level inlet/outlet tower provides the capability to move water in and out of Sites Reservoir. The tower extends up through the reservoir from its base connection to the pressure tunnel. Four ports with butterfly valves spaced around the tower at nine levels move water in and out of the reservoir. Valves on any tier can be operated independently or all valves can be operated together. Movable fish screens would be provided to cover operating ports when releases are being made. Table 3-3 provides a summary of key Inlet/Outlet Tower parameters.

Table 3-3 Sites Reservoir Inlet/Outlet Tower

Top Elevation	580.0 feet
Bottom Elevation (Top of Bench)	320.0 feet
Inside Diameter	32 feet
Outside Diameter	39 feet
Number of Ports	36 (4 each at 9 levels)
Functional Reservoir Release Elevations	520 feet to 340 feet

The intake tower would also house fixed wheel gates and associated operating equipment that would be used to isolate the tunnel from the tower intersection downstream for inspection and maintenance of the tower and tunnel. These gates also serve as an emergency shutoff device.

A multi-span bridge provides access to the Inlet/Outlet tower from the nearby access road. As mentioned above, the bridge may be eliminated if a sloping intake arrangement is adopted in future design phases of the project.

3.2.3. EMERGENCY RELEASE FACILITY

To control the emergency reservoir drawdown release described in Paragraph 3.2.1 above, four 102-inch diameter fixed-cone (Howell Bunger) dispersion valves would be located in a reinforced-concrete energy dissipation valve chamber located adjacent to the Sites Pumping/Generating Plant. Isolation valves would be located upstream of the energy dissipation valves. The valves would connect back to the pressure tunnel downstream portal through a dedicated buried penstock system branching off of the main buried penstock that connects the tunnel to the Sites Pumping/Generating Plant. The fixed-cone valve discharge would be conveyed downstream in the channel connecting the Sites Pumping/Generating Plant with Holthouse Reservoir.

3.3. Sites Pumping/Generating Plant

3.3.1. PENSTOCKS AND MANIFOLDS

A system of buried steel penstocks and manifolds would connect the pumping and pumping/generating units in the Sites Pumping/Generating Plant with the downstream tunnel portal. The manifold lines are sized for flow velocities of 10 fps or less. All buried penstocks and manifolds would be concrete-encased, with concrete anchor blocks to resist the thrust forces on bends, reduction bifurcations and branches. Penstocks steel thicknesses for cost estimating have been selected considering a pressure equivalent to the maximum pumping head at full reservoir elevation, plus surge allowance, plus an additional 10 percent.

3.3.2. PUMPING/GENERATING PLANT

The Sites Pumping/Generating Plant lifts water from Holthouse Reservoir into Sites Reservoir (refer to Figure 2-1). The SPGP is connected to Holthouse Reservoir by an unlined excavated approach channel. The channel is sized so that flow velocity under all conditions does not exceed approximately 2 fps.

Table 3-4 provides a summary of the SPGP equipment included with Alternative D.

Table 3-4 Sites Pumping/Generating Plant Equipment

Unit Type	Number of Units	Net Head (feet) (Pump/Gen)	Pumping Capacity Per Unit (cfs)	Generating Capacity Per Unit (cfs)	Motor Power Total (MW)[1]	Generating Power Total (MW)[1]
Pump Francis Vane Dual-Speed	2 and 1 Spare	330	870	None	58.9	None
		202	870	None	36.0	None
Pump Francis Vane Dual-Speed	2	330	435	None	29.5	None
		202	435	None	18.0	None
Pump/Turbine Reversible Francis, Dual-Speed	4 and 1 Spare	330/310	663	1,020	89.8	88.3
		202/182	663	1,020	55.0	51.9
Pump/Turbine Reversible Francis, Dual-Speed	2	330/310	332	510	22.5	22.0
		202/182	332	510	13.8	12.9
Totals	10 and 2 Spares	-	5,926 (Max Combined)	5,100 (Max Combined)	200.7 (Max)	110.3 (Max)

1. Motor power and generation based on 82.5% combined efficiency (unit and transformer), no power factor adjustment, higher efficiencies are likely.

The units selected would be dual-speed units to accommodate the wide variations in water levels that can be expected in Sites Reservoir. The head difference on the units between pumping and generating modes is within a range that permits some of the units to be pump-turbines to provide the needed generating capability when releases are being made. Generation water not needed to meet downstream needs would be stored in Holthouse Reservoir. The number of pumping units selected to operate on a daily basis would provide the capacity to pump all water delivered to Holthouse Reservoir up to Sites Reservoir during the off-peak pumping period. Water delivered to Holthouse Reservoir would include generation water plus inflows from the canals and the Sacramento River. The pumping plant would be a conventional, indoor-type pumping/generating plant with an in-line arrangement of vertical units. The SPGP would have a reinforced concrete substructure and a steel superstructure.

Adding variable frequency drive (VFD) capability to the pumping and generating units could help to maximize pumping and generating efficiencies, and improve the generation response to changes in the power grid demand. The benefits of adding VFD capability will be further evaluated in future design phases.

3.3.3. INTAKE AND DISCHARGE CHANNEL TO HOLTHOUSE RESERVOIR

An excavated intake and discharge channel connects the Sites Pumping/Generating Plant with Holthouse Reservoir (described in the next section). The channel would have a bottom width of 100 feet, 2-horizintal to 1-vertical side slopes, and would require excavating approximately 4.0 million cubic yards of soil and rock. Excavated material is assumed to be suitable for use in dam construction and for other site grading needs. Road benches would be provided in the excavation above the maximum water level for inspection and maintenance.

The channel is capable of providing pumping flows to the Sites Pumping/Generating Plant (up to 5,900 cfs) from Holthouse Reservoir when the water level in the Reservoir is at its planned minimum operating level (elevation 190.0 feet). Flow velocity in the channel under this condition would be approximately 2 feet per second. Under emergency release flows (approximately 15,000 cfs) with Holthouse Reservoir at approximate elevation 206.0 feet, the velocity would still be approximately 2 fps. No riprap or other lining is provided for the channel. Some of the accumulated sediment in the existing Funks Reservoir would need to be removed before excavating the channel. Excavated sediment can be disposed of in Holthouse Reservoir below the minimum operating level.

3.4. Holthouse Reservoir

3.4.1. SIZING

The required active storage in Holthouse Reservoir should be approximately 6,500 acre-feet to permit the Sites Pumping/Generating Plant to operate as a pumped-storage facility. This volume provides for storage of the generating flows (up to 5,900 cfs) during on-peak periods and storage of inflows to the reservoir that might be occurring in spring or fall from the TC and GCID Canals and Sacramento River. The collected volume of water would then be pumped up into Sites Reservoir during off-peak and partial-peak periods as necessary on a daily cycle. Diversion flows were estimated from available CalSIM modeling. Note that additional operational studies should be performed in future phases of the project to confirm optimal reservoir size for pumped-storage operation.

The current active storage capacity of Funks Reservoir is estimated to be approximately 2,100 acre-feet after removing sediment that has accumulated in the reservoir since it was commissioned. To provide 6,500 acre-feet of storage, the new Holthouse Dam would be constructed downstream of the existing Funks Dam to extend the reservoir limits. Holthouse dam would have the same crest elevation as the existing Funks Dam (El. 214.0). The required active storage would be located between elevation 206.0 feet and elevation 190.0 feet and would be the sum of the storage provided in the expanded reservoir, Funks Reservoir and the channel connecting the reservoir with the Sites Pumping/Generating Plant.

3.4.2. HOLTHOUSE DAM

Except at the left abutment, Holthouse dam would be a zoned embankment similar to Funks Dam with a maximum height of approximately 48 feet. The dam will be approximately 8,500 feet long. Because a deep soil layer could potentially exist along the dam alignment, the central core zone would extend down to suitable foundation in dense soils. To control seepage under the core section, a slurry cutoff wall would be constructed down through the dense soils to refusal in weathered rock. A grout curtain line would then be installed adjacent to the cutoff wall on both sides to fresh rock to treat remaining weathered rock below the refusal level for the cutoff wall.

On the left abutment, a concrete gravity dam section would be provided that will incorporate the inlet/outlet facilities for the four 12-foot diameter pipes that comprise the Delevan and TRR pipelines (two pipes each), and the emergency spillway for Holthouse Reservoir. The gravity structure has been located on the abutment to position it far enough into the hillside to minimize the risk of encountering unsuitable foundation conditions for the concrete structure. Foundation conditions would be further investigated in future phases of the project.

The inlet/outlet facility for the Delevan and TRR pipelines will incorporate formed concrete transitions for hydraulic efficiency, roller gates to shut off flow in each pipe for dewatering, stop log guides upstream of the roller gates, and a bar rack structure to prevent entry of large debris. The transition entrance for each pipe is sized to limit inlet and outlet flows to approximately 2 fps.

3.4.3. SPILLWAY AND LOW LEVEL RELEASE

The spillway located in the gravity structure will be similar to the existing Funks Dam spillway and will incorporate three motor driven cable operated radial gates with a total bypass capacity of approximately 15,200 cfs, which matches the emergency release requirement for Sites Reservoir discussed previously.

The gravity section would also include an outlet pipe with energy dissipating valve that would provide water to Funks Creek for stream maintenance and facilitate draining the reservoir to permit inspections of the inlet facilitates. The design capacity at maximum head would be approximately 500 cfs.

3.5. Terminal Regulating Reservoir and Pumping/Generating Plant

The TRR is the collection point for water being conveyed down the GCID Canal for ultimate delivery to Sites Reservoir. The TRR Pumping/Generating Plant located within TRR then moves the water to Holthouse Reservoir through the TRR Pipeline. The TRR Pipeline also returns irrigation releases back to the TRR from which the water is directed into the GCID Canal or other local irrigation canals. The return flows pass through a turbine generating unit located in the TRR Pumping/Generating Plant.

3.5.1. TERMINAL REGULATING RESERVOIR

In addition to receiving project water, the TRR provides operational storage for GCID to balance out flow variations in the canal, to distribute releases to their system downstream of the reservoir, and to support operation of the pumping plant. Operational storage in the reservoir is 1,200 acre-feet for Alternative D compared with 2,000 acre-feet assumed for other alternatives. GCID indicates the reduced size is adequate for canal regulation based on their operating experience.

The reservoir would be constructed partially above and below grade by a cut and fill operation. The levee portion around the reservoir perimeter would average approximately 6 feet high and the top elevation would match the existing levees for the GCID Canal at the tie-in point. The excavated portion would be limited to 6 to 10 feet below grade to minimize groundwater issues. The pond would be plastic lined to minimize seepage loss from the pond.

Regulation of flow into and out of the reservoir would be controlled by the existing control gate structure on the GCID Canal just upstream of Funks Creek and a new control gate structure parallel to the canal at the reservoir connection point. Other facilities associated with TRR are a spillway sized for approximately 500 cfs and a release pipe and control valve with a capacity of 100 cfs to 150 cfs to supply local irrigation canals. Spillway flows would be conveyed to the south to Funks Creek in an upgraded existing canal and pipe with the required capacity.

3.5.2. TRR PUMPING/GENERATING PLANT

The pumping and generating equipment provided in the plant is summarized in Table. The structural building for the TRR Pumping/Generating Plant would be similar to that described below for the Sacramento River Pumping/Generating Plant.

Table 3-5 TRR Pumping/Generating Plant Equipment

Unit Type	Number of Units	Net Head (feet) (Pump/Gen)	Pumping Capacity Per Unit (cfs)	Generating Capacity Per Unit (cfs)	Motor Power Total (MW)[1]	Generating Power Total (MW)[1]
Pump Francis	2 (+1 standby)	114	620	-	14.5	-
Pump Francis	2	98	325	-	6.5	-
Turbine Kaplan	1	84	-	750	-	4.4
Totals	5 and 1 Spares	-	945 (Max Combined)	750 (Max Combined)	21.0 (Max)	4.4

1. Motor power and generation based on 82.5% combined efficiency (unit and transformer), no power factor adjustment, higher efficiencies are likely.

In addition, the following equipment would also be included with the plant:

- 32-foot-diameter spherical air chambers to control surge pressures in the TRR pipeline.

- Bypass and shutoff valves, manifold piping, mechanical systems, electrical and control systems, switchyard facility.

The switchyard for the TRR Pumping/Generating Plant will be tied back to the main switchyard at the Sites Pumping/Generating Plant by overhead transmission line.

3.6. DELEVAN INTAKE AND PUMPING/GENERATING PLANT

3.6.1. SITE DEVELOPMENT

Site arrangements for Alternative D differ in some respects from the arrangements used for the other alternatives. The Pumping/Generating Plant orientation was rotated toward the south to provide more working room between the plant and Highway 45 to facilitate pipeline construction. The forebay pond was also modified for Project Alternative D to remove the levee earthwork and culverts connecting the fish screen structure afterbay with the pump station forebay. Based on a preliminary discussion with the U. S Army Corps of Engineers, the fill and culverts included with the other alternatives can be removed as long as the earthwork to construct the pumping plant grade is above the 100-year flood level, fill materials conform to the fill requirements for levee construction, and fill is integrally tied to the existing flood control levees along the Sacramento River. In addition, based on current understanding of seepage issues through and under the existing river levee system, it is likely that a suitable slurry cutoff wall (or other cutoff method) would be required under the pump station fill around the forebay pond area to control underseepage.

3.6.2. PUMPING/GENERATING PLANT

The SRPGP would be constructed with a pumping capacity of 2,000 cfs, an intake and fish screen structure at the Sacramento River, and the Delevan Pipeline from the SRPGP to the Holthouse Reservoir. The conveyance system would also be capable of releasing up to 1,500 cfs from Holthouse Reservoir back to the Sacramento River. The return flow would be used to generate hydroelectric energy.

The pumping/generating plant would involve the construction of (1) a pumping/generating plant, (2) forebay/afterbay pond, (3) four air chambers for surge control, (4) manifold piping to connect the pumping and generating units to the Delevan Pipeline (6) a control building, (7) an electrical switchyard, and (8) fish screening facilities on the Sacramento River.

Table 3-6 summarizes the pumping and generating equipment provided in the plant. The pumping/generating plant would also consist of pipelines, mechanical and electrical equipment, aboveground control and O&M buildings, and related equipment. The overall dimension of the plant building is approximately 300 feet long by 80 feet wide with multiple story structure to provide spaces for mechanical and electrical equipment. A gantry crane would be installed on the finish floor of the plant for moving pumps, generators, motors and turbines, valves, and electrical/mechanical equipment.

Table 3-6 Sacramento River Pumping/Generating Plant

Unit Type	Number of Units	Net Head (feet) (Pump/Gen)	Pumping Capacity Per Unit (cfs)	Generating Capacity Per Unit (cfs)	Motor Power Total (MW)[1]	Generating Power Total (MW)[1]
Pump Francis	4 (+1 standby)	282	600	-	14.5	-
Turbine Kaplan	2	94	-	750	-	4.4
Totals	6 (+1 Standby)	-	2,400 (Max Combined)	750 (Max Combined)	21.0 (Max)	4.4

1. Motor power and generation based on 82.5% combined efficiency (unit and transformer), no power factor adjustment, higher efficiencies are likely.

3.6.3. FISH SCREEN STRUCTURE

The fish screen facilities are located on the west side of the Sacramento River, slightly downstream of RM 158.5 and east side of Highway 45. The fish screen structure is designed for a flow of 2,000-cfs and includes thirty-two 13-foot by 15-foot flat plate screens, two blowout bays, two fish screen brush cleaners, a sediment removal system, and tuning baffles. Each item is necessary for the proper function of the proposed fish screen. Construction of the screening facility will require a temporary cofferdam in the river.

3.7. Delevan and Terminal Regulating Reservoir Pipelines

Except for the alignment, the Delevan and TRR Pipeline design arrangements for Project Alternative D are the same as used for the other alternatives. The alignments have been shifted to address stakeholder feedback on previous alignments and make better use of existing County and MID easements, particularly between the Sacramento River and the Colusa Basin Drain.

The Delevan Pipeline runs from the Sacramento River Pumping/Generating Plant to Holthouse Reservoir and includes two adjacent 12-foot-diameter pipelines. Delevan Pipeline is approximately 13.5-mile-long. The TRR Pipeline runs from the TRR Pumping/Generating Plant to Holthouse Reservoir and also includes two adjacent 12-foot diameter pipelines. TRR Pipeline is approximately 3.5-mile-long. There is no interconnection of the Delevan and TRR Pipelines.

The pipelines will be American Water Works Association (AWWA) C-300 Pipe with 12-foot inside diameter (ID). Pipe design will be in accordance with AWWA *Manual M9* (AWWA, 1995). Design internal pressure for the pipelines is taken to be the hydraulic grade line for pumping with a 40 percent additional allowance for surge pressures. All pipe will have Carnegie-style bell and spigot joints with O-ring gaskets. Controlled low-strength material will be used for pipe bedding. Note that trench and bedding details were reviewed by Hanson Pipe (Hanson) and Ameron Pipe (Ameron).

Typically, the Delevan and TRR Pipelines would be constructed in a cut and fill trench along the alignment. Between the TRR Reservoir and Holthouse Reservoir the four 12-foot diameter pipelines would be located in a common trench. Placing the pipelines in a common trench is considered the practical approach under the current design since the likelihood of having to re-excavate a pipe in the future is very low. Placing pipes in individual trenches would also increase real estate needs.

Approximately 10 feet of cover over the top of the pipe is planned to permit ongoing rice and row crop production. This cover also facilitates going under an extensive network of water supply and drainage channels without vertical alignment changes. To facilitate a return to agricultural production after pipeline construction, topsoil will be removed an stockpiled for reuse over backfilled pipe trenches

Dewatering of pipe trench excavations will be required along the pipeline alignments, particularly across the Colusa Basin Drain. The cost estimate includes a series of dewatering wells and associated water collection and sediment control facilities to manage water, which will be discharged to local channels along the alignment. The dewatering wells will be removed as the trench is backfilled and advanced to locations ahead of the excavation as the pipeline installation progresses.

To construct pipelines under major infrastructure facilities, bore/jack construction methods would be used at road crossings (I-5, I-99, and Highway 45); railroad crossings, the crossing under the Colusa Basin Drain, gas transmission line crossings, and the crossing under the GCID Canal.

Facilities associated with both the Delevan and TRR pipelines include:

- Blowoff structures
- Air and vacuum valve assembly structures, access manholes
- Cathodic protection systems

3.8. Red Bluff Pump Addition

The existing Red Bluff Diversion on the Sacramento River includes a fish screen facility and pumping station that supplies water to the T-C Canal. Two spare pump bays were provided in the facility at the time of construction. As part of the Sites reservoir Project, new pumps would be installed in the spare bays. The pumps would be 250 cfs capacity matching the larger pumps already installed and operating. For each pump, 84-inch diameter motor operated butterfly valve and discharge flap gates will be provided along with a pump flange coupling (similar to those installed on the operating units). Electrical connections and control connections to existing systems would also be provided along with start-up support from equipment manufacturers.

3.9. Transmission Lines

For Alternative D, the Sites and TRR Pumping/Generating Plants and other facilities west of TRR would be serviced from existing PG&E or WAPA transmissions located close by. A new substation and short section of new transmission line would be provided to make the necessary connection to the selected utility. To supply power to the Sacramento River Intake and Pumping/Generating Plant, a new transmission line would be added that runs north from an existing WAPA transmission line near Colusa along Highway 45 to the intake. WAPA was selected for service because PG&E does not have existing line capacity in the area. A new substation would be provided at the connection point near Colusa. The transmission line along Highway 45 included in Alternative D replaces the east-west line included in other alternatives, which addresses local stakeholder concerns regarding the impact of the cross country transmission line on farming operations and wildlife.

3.10. ROADS

3.10.1. SITES LODOGA ROAD REPLACEMENT WITH SOUTH BRIDGE

The Sites Lodoga Road realignment with the new South Bridge over the reservoir replaces the current Sites Lodoga road segment that will be inundated when the reservoir is filled. The road and bridge provide for single lane traffic in each direction. Road and bridge designs follow County rural road and CALTRANS standards. Additional engineering work has been performed to refine the selection of span lengths and further define foundation requirements to improve the accuracy of the cost estimate. The span lengths currently being considered permit deck construction using the balanced cantilever construction method with precast units, which was determined to be less costly than cast-in-place methods.

3.10.2. NORTH TEMPORARY BYPASS ROAD.

A new temporary bypass road at the north end of Sites Reservoir is provided to help expedite close of Sites Lodoga Road in the project area. The new bypass road would begin on the east where existing Road 69 intersects the TC Canal. From there, the planned access road would follow existing ranch roads and trails and connect back to Sites Lodoga Road on the west side of the proposed reservoir outside the inundation area. Access to Road 69 would be from Highway 5 at the Road 68 interchange, then west along Road 68 to Road D and Road 69. The bypass road would be paved for public use. No additional environmental impacts would be anticipated since the route follows existing County roads, roads already planned for the project, and new segment that is located within the reservoir footprint.

3.10.3. OTHER PROJECT ROADS

Table 3-7 provides a list of the significant public and private roads that will be constructed as part of the project. These new roads and road relocations are reflected in the cost estimate for the project.

Table 3-7 Project Roadways and South Bridge

Road or Segment Name	Gravel (miles)	Paved (miles)	Bridge (miles)	Total (miles)
Lurline Road				
Maxwell-Sites Road to Com Road	5.05			5.05
Lurline Rd. to Lurline Headwaters Recreation Area	0.21			0.21
Com Road	**2.95**			**2.95**
Eastside Road				
Field Office Maintenance Yard Access to Sites PGP Access		0.93		0.93
Golden Gate Dam/Electrical Switchyard Access Roads to Property North of Golden Gate Dam	1.52			1.52
Maxwell Sites Road to Stone Corral Road		1.12		1.12
Property North of Golden Gate Dam to North Road	3.63			3.63
Sites Pumping/Generating Plant Access to Golden Gate Dam/Electrical Switchyard Access Roads		0.95		0.95
Stone Corral Road to Field Office Maintenance Yard		1.09		1.09
North Road				
County Road 69 at T-C Canal to Saddle Dam Road	4.69			4.69
Saddle Dam Road to Saddle Dam 9	1.84			1.84
Peninsula Road				
Sites Lodoga Road to Peninsula Hills Recreation Area (East Segment)	0.53			0.53
Sites Lodoga Road to Peninsula Hills Recreation Area (West Segment)	0.94			0.94
North Road to Saddle Dam 1	3.17			3.17
South Bridge			**1.57**	**1.57**
South Bridge East Approach		**0.28**		**0.28**
South Bridge West Approach		**2.25**		**2.25**
Stone Corral Road				
Eastside Road to South Bridge East Approach		1.39		1.39
South Bridge East Approach to Stone Corral Recreation Area	0.26			0.26
Private Access				
Eastside Road to bottom of Golden Gate Dam		0.25		0.25
Eastside Road to Sites Pumping/Generating Plant Electrical Switchyard		0.12		0.12
Eastside Road to Field Office Maintenance Yard		0.04		0.04
Eastside Road to Sites Pumping/Generating Plant		0.18		0.18
North Road to Saddle Dam 6	0.28			0.28
Saddle Dam Road to Saddle Dam 1	3.17			3.17
Saddle Dam Road to Saddle Dam 2	0.03			0.03
Saddle Dam Road to Saddle Dam 3	0.16			0.16
Saddle Dam Road to Saddle Dam 5	0.11			0.11
South Bridge East Approach to Inlet/Outlet Tower		0.11		0.11
South Bridge East Approach to top of Golden Gate Dam		0.75		0.75
Leesville Connector Road	5.5			5.5

3.11. Recreation Areas

Alternative D includes two recreation areas, Stone Corral and Peninsula Hills. In addition, a day use boat ramp facility would be provided on the west side of the reservoir near where the existing Sites Lodoga Road leaves the inundation area. Fewer recreation facilities are provided in Alternative D compared with other alternatives because recent reevaluation of recreational needs, which included Colusa County, indicate a lower recreational demand than previously envisioned.

3.12. Other Ancillary Facilities

The cost estimate includes costs for an operation and maintenance complex to be located near the Sites Pumping/generating Plant. In addition to the control room, the facility would include offices, vehicle maintenance and fueling facilities, warehousing space, package water and sewage treatment facilities, emergency generator, and parking. Note that local operation of the Project is assumed via SCADA systems from the operation and maintenance facility. Discussions of project operation and integration between the Authority and Federal and State agencies will be ongoing as project development continues. Integration of the Project with other Federal and State facilities could change the criteria for the operation and maintenance complex.

This page intentionally left blank.

4. ESTIMATING APPROACH

4.1. Format

The estimate for Project Alternative D was prepared using the same Bureau *Estimate Summary and Estimate Worksheet* templates used to prepare costs for other alternatives. AECOM also followed the estimating instructions contained in Reclamation's *Cost Estimating Handbook* (Reclamation, 1989) and Reclamation's Manual, *Directives and Standards*, FAC 09-01, FAC 09-02, and FAC 09-03. Rounding of estimated costs at the facility summary level and above was performed following the guidelines in the *Cost Estimating Handbook*. Project features were identified in the estimate in accordance with the property classes and plant account codes identified in the *Cost Estimating Handbook*.

4.2. Definitions

The terminology used in this report and on the various estimating worksheets follows Reclamation and WSIP conventions wherever possible. The following terms are used:

Contract Cost (Reclamation): The contract cost is the cost to construct the project by the general contractor, including mobilization/demobilization, all subcontractors, direct and indirect costs, labor, equipment, bonds and insurance, profit and an allowance for potential design modifications unrelated to the contractor's activities. This contract cost would be equivalent to the bid price.

Field Cost (Reclamation): The field cost is the contract cost with an appropriate allowance for construction contingency. The field cost is the cost the Authority would plan for to cover the bid price and potential change orders or other modifications to the contract during construction.

Construction Cost (Reclamation): The construction cost is the field cost adjusted for non-contract costs. Non-contract costs are project-related expenses that the Authority must also plan for that are over and above the field cost, including Authority expenses, program management, site investigations, engineering and design, construction management, and the like. Non-contract costs are presented as a percentage of the construction cost. The non-contract cost allowance can also include real estate acquisition and environmental mitigation. However, these costs are not part of the non-contract cost allowance because they have been estimated and are included in the cost estimate on estimate worksheets.

Escalation (Reclamation): The construction cost is escalated from the base estimate date to the anticipated start of construction date. The base date for the cost estimate is October 2015. Start of construction is planned for the spring/summer of 2022. This represents approximately 7 years of escalation.

Capital Cost (WSIP): Capital costs are the costs of construction or acquisition of a tangible physical property with an expected useful life of 15 years or more. Capital costs include: 1) construction, initial environmental mitigation or compliance obligations, and land acquisition, 2) equipment with an expected useful life of 2 years or more, and 3) costs incidentally but directly related to construction or acquisition, including planning, engineering, construction management, architectural and other design work, environmental impact reports and assessments, environmental mitigation or compliance obligation expenses, permitting, appraisals, legal expenses, site acquisitions, and easements. Financing costs such as interest during construction are not included in capital costs.

Total Project Cost (WSIP): The total project cost includes the capital costs, interest during construction, environmental mitigation or compliance obligations after completion of construction, and O&M, repair, and replacement costs during the planning horizon.

The contract cost, field cost, construction cost and escalated construction cost are tabulated on separate lines on each estimate summary worksheet form for each facility. Capital Cost and Total Project Cost are tabulated separately from the estimate worksheets and presented in tables.

4.3. Allowances and Contingencies

Table 4-1 presents the allowances and contingency percentages that have been adopted and applied to the feasibility-level cost estimate for Project Alternatives D. Each is briefly discussed in the following paragraphs

Table 4-1 Allowances and Contingencies

Mobilization	5 percent
Design Contingency	10 percent
Construction Contingency	10 percent
Non-Contract Costs	17 percent

4.3.1. MOBILIZATION

As defined in the Public Contract Code, mobilization includes preparatory work and operations, including, but not limited to, those necessary for the movement of personnel, equipment, supplies and incidentals to the project site, for the establishment of all offices, buildings and other facilities necessary for work on the project, and for all other work and operations which must be performed or costs incurred prior to beginning work on the various items on the project site. Mobilization is covered in the estimate by increasing the direct construction cost by approximately 5 percent for each facility.

4.3.2. DESIGN CONTINGENCY

Design contingencies are intended to account for uncertainties as the project progresses from the planning phase to the final design phase. These uncertainties include unlisted items, design and scope changes, and cost estimating refinements. Design contingencies are listed as a separate line item in the cost estimate summary work sheets. For the estimates provided in this BOE, 10 percent of the direct construction cost has been used for each facility.

4.3.3. CONSTRUCTION CONTINGENCY

Construction contingencies represent the dollar values of the uncertainties in the estimates to compensate for unforeseen or changed site conditions, minor changes in plans, quantity overruns, and other uncertainties. The percentage allowance used should be based on engineering judgment of the major pay items in the cost estimate, reliability of the data, adequacy of the projected quantities, and general knowledge of site conditions and level of uncertainty. The allowance amount for contingencies varies inversely with the certainty of the engineering and geological information and data. The level of data available to support cost estimating varies from facility to facility for the Project. Overall, the construction contingency has been set at 15 percent for the cost estimates provided in this BOE.

4.3.4. NON-CONTRACT COSTS

Non-contract costs are incidental but directly related to construction or acquisition, including planning, engineering, construction management, architectural and other design work, environmental impact reports and assessments, environmental mitigation or compliance obligation expenses, permitting, appraisals, legal expenses, site acquisitions, and easements, and the like. The cost estimates provided in this BOE include estimates developed for land acquisition and environmental mitigation that are normally covered in the non-contract cost allowance.

Since land development and mitigation are estimated separately, 17 percent has been used to cover the allowance for other non-contract costs in this BOE. The non-contract cost percentage reflects the assumption that the Project would be implemented by the Authority, not Reclamation or the State. It does, however, include an allowance for some costs for Reclamation involvement in the project because Reclamation owns the existing Funks Reservoir and the T-C Canal that will require some modification/upgrade. Future phases of the project will evaluate various alternative contracting strategies to implement the project, which could affect the non-contract costs. Table 4-2 presents the breakdown of cost allocations to non-contract costs.

Table 4-2 Non-Contract Cost Allowances

Authority Program Management and Administration	4.5 percent
Site Investigations, Surveys, Planning, Design, etc.	6.5 percent
Construction Management Services and Related Expenses	6.0 percent
Total	17 percent

4.4. Estimate Base and Escalation

Escalation of construction costs from October 2015 to an assumed notice to proceed date in mid-2022 has been included on the estimate worksheets for information. Escalation was evaluated using various sources, including USACE CPI and the Consumer Price Index. Results varied from 15.3 percent to 15.8 percent over the escalation period. For Project Alternative D, 15 percent has been applied. Escalation is assumed to follow projected inflation trends. Escalation does not represent material or equipment price increases above the normal inflation rate.

4.5. Quantities

Quantities used to prepare the cost estimate for Project Alternative D were taken from the previous estimate for Alternative C where facilitates were identical, or were developed from the plans for new or modified facilities.

4.6. Labor Rates

Wages and benefits for labor were determined from the *General Prevailing Wage Determinations for Colusa County, Northern California*, as provided by the State of California Department of Industrial Relations on their website.

4.7. Construction Equipment Rates

Construction equipment operating costs were developed from recent AECOM experience or using data published in the current State of California Department of Transportation publication titled *Labor Surcharge and Equipment Rental Rates*.

4.8. Mechanical and Electrical Equipment Costs

Mechanical and electrical equipment costs developed for Alternative C have been updated to for use in Alternative D. Updating included vendor contacts. These costs include the turbine, motor or generator, exciter units, and unit installation. Motor control centers were allocated with two per large unit and one per smaller unit. Two direct current (DC) systems and two uninterruptable power supply (UPS) systems were estimated for use at all three pumping/generating plants for redundancy and greater reliability.

4.9. Pipeline Fabrication Costs

Pipeline fabrication costs were obtained previously for Alternative C and have been verified with potential suppliers for the current estimating exercise.

4.10. Miscellaneous Costs

Costs for miscellaneous items were developed from recent AECOM experience, or by referencing estimating data books like *RS Means Heavy Construction Cost Data*.

4.11. References

Section 9 provides a list of important references that are applicable for the project.

This page intentionally left blank.

5. BASIS OF ESTIMATE AND ESTIMATING ASSUMPTIONS

5.1. Sites Reservoir (Property Class 01)

5.1.1. LAND AND RIGHTS

Appendix D, Real Estate, in the Feasibility Report for the North of the Delta Offstream Storage Project documents the evaluation of acquisition and administrative costs that would be incurred to acquire land in fee and for temporary/permanent easements to develop the project. These costs are included in the project cost estimate as land and rights costs.

5.1.2. PUBLIC AND PRIVATE ROADS

Construction of Site Reservoir and adjoining facilities will require replacement of public roads that will be inundated by the reservoir, temporary public bypass roads during construction, and the construction of new public and private roads to support project operation and access to recreation areas. These costs are included in the project cost estimate as part of the reservoir development costs.

5.1.3. SOUTH BRIDGE

The Project includes a major reservoir bridge crossing referred to as the South Bridge. Estimating assumptions for the bridge include the following:

- The estimate is based on precast concrete deck construction using the balanced cantilever method.
- Pier footings/caps are estimated at 64 feet square and 10 feet thick.
- Based on preliminary designs and assumed depths to fresh rock, bridge pier foundations will be founded on reinforced cast-in-place drilled hole (CIDH) piles socketed into fresh rock. Pile length is approximately 40 feet measured from the underside of the footing mat.
- Thirty six 3-foot diameter CIDH piles are provided under each footing.
- The bridge is broken into two spans by a small hill near mid-span. The short section of road between the two spans on the island is a short causeway formed using mechanically stabilized earth (MSE) walls.
- Bridge deck rails are assumed to be 3-foot-high concrete with a top pipe rail.

5.1.4. RESERVOIR CLEARING AND DEMOLITION

Based on a search of the California Division of Oil, Gas, and Geothermal Resources on-line database, there are many abandoned gas wells in the reservoir area and along the Delevan Pipeline alignment. The cost estimate assumes that some of these abandoned wells may require replugging if disturbed by excavation or other construction-related activities.

Estimating assumptions for clearing and demolition include the following:

- The land area for woodlands is estimated at 700 acres.
- Gas wells exist in the valley. Cost estimate includes an allowance for replugging approximately 20 percent of the existing wells in the reservoir area.
- In accordance with anticipated environmental requirements, demolition includes removal of all structures, metal fencing, barbed wire, fence posts, and asphalt concrete paving.
- Septic tanks and water wells will be abandoned in accordance with Colusa County standards.
- Septic tank waste, septic tanks, buried fuel/oil tanks, waste from building demolition, and other waste will be disposed of offsite in licensed dumps that can receive the material.
- No allowances are made in the estimate for salvage.

5.1.5. SIGNAL SPILLWAY

Saddle Dam 6 incorporates the signal spillway for Sites Reservoir (refer to Paragraph 3.1.4 for description).

5.2. Creek Diversion During Construction

Diversion of Funks Creek and Stone Corral Creek to construct Golden Gate and Sites Dams is described in Paragraph 3.1.5. Estimating assumptions for creek diversion during construction include the following:

- Funks Creek to be diverted south in excavated channel to Stone Corral Creek. Combined creek flows to be discharged through diversion tunnel around the Sites Dam construction site.
- The base of the diversion channel connecting Funks Creek and Stone Corral Creek will be 300 feet wide with 1:1 slopes on both sides and bottom at elevation 290.0 feet.
- Temporary cofferdams to elevation 300.0 feet at the upstream toes of Golden Gate Dam and Sites Dam will contain flood flows and prevent flooding of dam construction sites. The cofferdams will be surfaced with riprap on the waterside slope to prevent erosion.
- The diversion tunnel will be approximately 3,000 feet long, 20 feet in outside diameter, finished to inside diameter of 18 feet. Construction by drill and blast methods using steel sets, lagging, and rock bolts for support. The inside perimeter would be shotcrete lined.
- Riprap will be used for energy dissipation at the point of diversion of Stone Corral Creek downstream of Sites Dam.

5.3. Main Dams (Property Class 01)

5.3.1. AGGREGATE FOR FILTER AND DRAIN ZONES

Sand and aggregate for filter and drain zones in the dams (and for concrete aggregate) would come from alluvial deposits in borrow areas about 35 miles from the project site. On-site sandstone is not suitable for processing and use in filters and drains, or in structural concrete, because of marginal durability based on available testing. Future design phases of the project will further investigate if suitable sources can be found closer to the project site.

5.3.2. SITES DAM

Table 5-1 provides a summary of the major estimated quantities for Sites Dam.

Table 5-1 Summary of Major Quantities for Sites Dam

Item	Quantity
Strip Foundation Areas	30 acres
Foundation Excavation	793,500 cy
Core Zone	1,070,000 cy
Filter Drain and Transition Zones (35 Mile Haul)	852,400 ton
Rock Fill Zones (1 mile haul)	1,180,500 cy
Random Fill Zones (1 mile haul)	1,085,000 cy
Drill Curtain Grout Holes	84,805 lf

Estimating assumptions for Sites Dam include the following:

- Materials for dam construction (other than aggregates) will come from borrow areas identified by DWR within the reservoir and from sandstone rock quarries along the eastern ridge of the reservoir. Material will also come from mandatory excavations for other project facilities located within a reasonable distance from the dam.
- Sand and gravel for filter and drain zones will be processed and hauled from off-site borrow areas approximately 30 to 35 miles from the site.
- Suitable material from the in reservoir stream diversion, tunnels, and other mandatory excavations for construction can be used for dam construction.
- Construction of this dam will not start until the north bypass road is completed to replace Sites-Ladoga Road through construction areas.
- Suitable core material will be available within 1 mile of the project.
- Foundation grouting quantities are based on a grout take of approximately 0.75 sacks per foot for all holes.
- Estimated drilling and grouting quantities from grouting profiles were increased by 25 percent to cover stitch grouting at faults and other field contingencies.
- Excavated material not suitable for use in the dam will be deposited within the reservoir dead pool below elevation 300 feet.
- Instrumentation would include piezometers, settlement points, seepage weirs, and seismic monitors.

5.3.3. GOLDEN GATE DAM

Table 5-2 provides a summary of the major estimated quantities for Golden Gate Dam.

Table 5-2 Summary of Major Quantities for Golden Gate Dam

Item	Quantity
Strip Foundation Areas	50 acres
Foundation Excavation	2,910,000 cy
Core Zone	3,460,000 cy
Filter Drain and Transition Zones (35 Mile Haul)	2,494,000 ton
Rock Fill Zones (1 mile haul)	2,870,000 cy
Random Fill Zones (1 mile haul)	1,470,000 cy
Drill Curtain Grout Holes	185,600 lf

Estimating assumptions for Golden Dam are similar to those for Sites Dam and include the following:

- Materials for dam construction (other than aggregates) will come from borrow areas identified by DWR within the reservoir and from sandstone rock quarries along the eastern ridge of the reservoir. Material will also come from mandatory excavations for other project facilities located within a reasonable distance from the dam.
- Sand and gravel for filter and drain zones will be processed and hauled from off-site borrow areas approximately 30 to 35 miles from the site.
- Suitable material from the in reservoir stream diversion, tunnels, and other mandatory excavations for construction can be used for dam construction.
- Construction of this dam will not start until the north bypass road is completed to replace Sites-Ladoga Road through construction areas.
- Suitable core material will be available within 1 mile of the project.
- Foundation grouting quantities based on a grout take of approximately 0.75 sacks per foot for all holes.
- Estimated drilling and grouting quantities from grouting profiles increased by 25 percent to cover stitch grouting at faults and other field contingencies.
- Excavated material not suitable for use in the dam will be deposited within the reservoir dead pool below elevation 300 feet.
- Instrumentation would include piezometers, settlement points, seepage weirs, and seismic monitors.

5.4. Saddle Dams (Property Class 01)

Table 5-3 provides a summary of the major estimated quantities for Golden Gate Dam.

Estimating assumptions for saddle dams include the following:

- Materials for dam construction (other than aggregates) will come from borrow areas identified by DWR within the reservoir and from sandstone rock quarries along the eastern ridge of the reservoir. Material will also come from mandatory excavations for other project facilities located within a reasonable distance from the dam.

- Sand and gravel for filter and drain zones will be processed and hauled from off-site borrow areas approximately 30 to 35 miles from the site.
- Suitable core material will be available within 1 mile of the project.
- Excavated material that is not suitable for use in the dam will be deposited within the reservoir dead pool below elevation 300 feet.
- Instrumentation for the larger dams (numbers 3, 5, and 8) would include piezometers, settlement points, seepage weirs, and seismic monitors.

Table 5-3 Summary of Major Quantities for Saddle Dams

Item	Saddle Dam Number								
	1	2	3	4	5	6	7	8	9
Strip Foundation (cy)	2.0	2.0	40.0	1.0	20.0	3.0	5.0	30.0	2.0
Foundation Ex (cy)	26,000	26,300	512,000	7,100	270,000	40,200	67,000	373,000	19,000
Core Zone (cy)	27,600	25,300	832,000	7,700	378,000	39,000	60,500	542,000	16,600

5.5. Holthouse Reservoir (Property Class 01)

Table 5-4 provides a summary of the major estimated quantities for Holthouse Dam.

Table 5-4 Summary of Major Quantities for Holthouse Dam

Item	Quantity
Strip Foundation Areas	50 acres
Foundation Excavation	463,550 cy
Core Zone	883,500 cy
Filter Drain and Transition Zones (35 Mile Haul)	255,000 ton
Shell Zones (1 mile haul)	822,000 cy
Rock Fill Zones (1 mile haul)	109,500 cy
Gravity Section Concrete	42,500 cy
Drill Curtain Grout Holes	185,600 lf
Soil/Bentonite Slurry Cutoff Wall	265,500 sf
Spillway Chute, Stilling Basin, and Walls	3,500 cy
Pipeline Inlet/Outlet Structure Concrete	1,560 cy

5.5.1. RELOCATIONS

There are a number of relocations required to construct Holthouse Reservoir.

- The existing Western Area Power Authority (WAPA) transmission lines currently pass through the expanded Holthouse Reservoir area. A relocation of the segment in the reservoir area would be required to be able to span the new reservoir without a tower in the inundation area.

- A temporary bypass pipeline for the T-C Canal will be needed to maintain canal operation during construction. The current plan is to leave the bypass in place after construction. This bypass would be a backup conveyance to supply water to the canal downstream of Holthouse Reservoir if the level in Holthouse Reservoir is too low to supply the canal by gravity or if the reservoir is drained down for maintenance. For estimating, it is assumed that a bypass pipeline will be buried under the bottom of the new Holthouse Reservoir.

Estimating assumptions for Holthouse Dam include the following:

- Materials for dam construction (other than aggregates) will come from borrow areas within the expanded reservoir area, excavations for the concrete dam section on the left abutment, and surplus suitable material from Delevan and TRR pipeline trenches.
- Sand and gravel for filter and drain zones will be processed and hauled from off-site borrow areas approximately 30 to 35 miles from the site.
- Sandstone rock for rip rap would come from rock quarries developed for the main dams.
- The core section would extend down to dense soils. Below the core, a slurry cutoff wall would extend through remaining dense soils to refusal in weathered rock. The cutoff wall would be embedded into the core on top. Below the bottom of the cutoff wall, pressure grout holes would extend from weathered rock down into moderately fresh rock.
- Foundation grouting would be performed under the concrete dam section to control seepage. This grouting would be continuous with the grouting under the earth dam section.
- Construction of the dam would follow installation of the bypass pipeline for the TC Canal.
- Instrumentation would include piezometers, settlement points, seepage weirs, and seismic monitors.

5.5.2. T-C CANAL CONNECTION TO HOLTHOUSE RESERVOIR

Estimating assumptions for the TC Canal connection to Holthouse Reservoir include the following:

- The T-C Canal will enter the new Holthouse Reservoir at its current location in existing Funks Reservoir.
- A baffle block energy dissipating spillway structure would be provided at the discharge point to allow canal discharges to enter the reservoir in a controlled fashion over the full range of reservoir operation. The spillway would be sized for 2.000 cfs.

5.5.3. FUNKS HOLTHOUSE CONNECTION

Estimating assumptions for the Funks Reservoir – Holthouse Reservoir connection include the following:

- The existing Funks and the new Holthouse Reservoir pools would be connected by demolishing and removing the existing Funks three-gate spillway structure.
- If required to enlarge the gap for hydraulic reasons, a portion of the adjacent Funks Dam could also be removed.

5.6. TRR Reservoir (Property Class 01)

Refer to Section 3.5.1for a description of the facility. Estimating assumptions for the TRR Reservoir include the following:

- Soils for embankment construction would come from the excavated portion of the basin below grade. Soil could also come from surplus pipeline excavated material.
- The TRR liner is assumed to be 60 mil UV-resistant PVC or HDPE.
- A drain pipe and spillway would be provided. Flows would be routed to Funks Creek. Spillway would be sized to accommodate the return flow (up to 900 cfs).

5.7. Pumping and Generating Plants (Property Class 03)

5.7.1. I/O PRESSURE TUNNEL

Refer to Section 3.2.1 for a description of the facility. Estimating assumptions for the I/O Pressure Tunnel include the following:

- The I/O tunnel is a lined tunnel with finished inside diameter of 30 feet.
- For the last 1,000 feet of tunnel at the downstream end, the tunnel includes a 1-inch-thick steel liner with concrete backfill due to shallow rock cover conditions.
- Upstream of the liner, a reinforced concrete liner is used.
- Tunnel is sized for the California Division of Safety of Dams emergency reservoir drawdown criteria.
- Tunnel is constructed using drill and blast methods.
- Tunnel support using rock bolting, steel sets, and lagging.
- Tunnel seepage handled by sumping and pumping.
- No allowance for gassy tunnel conditions.

5.7.2. SITES PUMPING/GENERATING PLANT

Estimating assumptions for SRPGP include the following:

- One 2,500 kilovolt ampere (kVA) double-ended unit switchyard (fed from two 2,500 kVA transformers) will be required.

- Two DC systems and two UPS systems will be used for redundancy.
- Circuit breakers for the 38,280 horsepower pumps will be 2000 amperes (A).
- 250 kW standby generator is assumed for SPGP.
- Main transformers at the Sites Switchyard are rated 100 MVA.
- All 13.8 kV circuits are assumed to be connected via MV-105 shielded cable.
- Main 13.8 kV circuits are assumed to be in duct banks with average length of 2,000 feet.
- All 13.8 kV connections to machines are assumed to be in cable tray or exposed conduit.
- Machine connections at SPGP are assumed to average 600 feet long.
- One motor control center (MCC) is assumed per machine.
- Equipment labeled as standby is not included in the estimate.

5.7.3. TRR PUMPING/GENERATING PLANT

Estimating assumptions for TRR PGP include the following:

- One 2,000 kVA double ended unit switchyard (fed from two 2,000 kVA transformers) will be required.
- Two DC systems and two UPS systems will be used for redundancy.
- Main transformers at the TRR Switchyard match the one-line drawing requirements.
- All 13.8 kV circuits are assumed to be connected via MV-105 shielded cable.
- Main transformer 13.8 kV circuits are assumed to be in duct banks with average length of 500 feet.
- All 13.8 kV connections to machines are assumed to be in cable tray or exposed conduit.
- Machine connections at the TRR are assumed to average 200 feet long.
- One MCC is assumed per machine.
- Equipment labeled as standby is not included in the estimate.

5.7.4. SACRAMENTO RIVER PUMPING/GENERATING PLANT

Estimating assumptions for Sacramento River Pumping/Generating Plant include the following:

- One 2,500kVA double ended unit switchyard (fed from two 2,500 kVA transformers) will be required.
- Two DC systems and two UPS systems will be used for redundancy.
- Main transformers at the SRPGP Switchyard match the one-line drawing’s requirements.
- All 13.8 kV circuits are assumed to be connected via MV-105 shielded cable.
- Main transformer 13.8 kV circuits are assumed to be in duct banks with average length of 750 feet.
- All 13.8 kV connections to machines are assumed to be in cable tray or exposed conduit.
- Machine connections at the SRPGP are assumed to average 300 feet long.

- One MCC is assumed per machine.
- Equipment labeled as standby is not included in the estimate.

5.7.5. FISH SCREEN STRUCTURE

Refer to Section 3.6.3 for a description of the facility. Estimating assumptions for the I/O Pressure Tunnel include the following:

- Construction in the river within a steel sheet pile braced cofferdam.
- Foundation piles driven to required capacity after initial excavation within cofferdam in the wet.
- Tremie seal mat placed in bottom of cofferdam after pile driving. Cofferdam dewater after seal mat is placed, structure constructed.
- Fish screen and solid metal closure panels to be stainless steel.
- Screens cleaned using conventional brush cleaning mechanisms (assume two provided).
- Fish screen structure length is taken as 560 feet based on preliminary design.

5.7.6. RED BLUFF PUMP ADDITION

Refer to Section 3.8 for a description of the facility. Estimating assumptions for the pump additions include the following:

- Two pumps would be procured and installed. The pumps would be 250 cfs capacity matching the larger pumps already installed and operating.
- For each pump, 84-inch diameter motor operated butterfly valve and discharge flap gates will be provided along with a pump flange coupling (similar to those installed on the operating units).
- Estimate includes pump, electrical connections and control connections to existing systems.
- Cost is included for manufacturer’s representation assistance during installation and start-up of equipment.

5.8. Canals and Conduits (Property Class 05)

5.8.1. HOLTHOUSE CHANNEL

Refer to Section 3.3.3 for a description of the facility. Estimating assumptions for the channel include the following:

- Excavation would be performed using bull dozers with rippers and scrapers, with minimal blasting required.
- Dewatering will be accomplished by ditching, sumping, and pumping.

- Suitable material from this excavation may be used for Golden Gate Dam or Holthouse Dam construction, or to meet other site grading requirements.
- Unsuitable material and sediment removed from Funks Reservoir to build the channel would be deposited within the Sites Reservoir dead pool area below elevation 300 feet.
- The schedule allows adequate time for dewatering the sediment after Funks Reservoir is dewatered so that the material can be loaded and hauled without the need for dredging.
- No rip rap or concrete lining for the channel.

5.8.2. DELEVAN PIPELINE AND TRR PIPELINE

Refer to Section 3.7 for a description of the Pipelines. Since these pipelines represent a significant cost to the project, AECOM worked with Hanson, Sacramento, to prepare a detailed evaluation of pipe fabrication and installation costs and schedule. Hanson evaluated setting up and fabricating on-site fabrication versus fabrication at an existing plant with ground transportation to the site. On-site fabrication proved to the preferred alternative, but not by a significant margin. Hanson also prepared feasibility level designs for three pipe classes based on the hydraulic grade lines for the project (with surge allowances) and prepared cost estimates to set up fabrication facilities and fabricate the pipe on site. AECOM used these costs to price the pipeline supply. Hanson also confirmed the planned bedding details for the pipe shown on the drawings, and provided estimates of typical production and installation rates for similar pipe on other projects. The production and installation rates were factored into the required manpower and equipment spreads used in the estimates.

Estimating assumptions for the pipelines include the following:

- The estimate is based upon the pipeline plan and profile details developed for the project.
- Dewatering is based on preliminary construction dewatering estimate developed from available data.
- 144-inch AWWA C300 pipe material estimate is based on updated Hansen information.
- 22 access manholes with air/vacuum relief at 5,000-foot spacing and four blowoff valves for the Delevan Pipeline segment.
- 12 access manholes with air/vacuum relief at 5,000 spacing and four blowoff valves for the TRR Pipeline segment.
- Costs are based on an installation rate of approximately 128 feet of pipe per day (total sum of pipe installed daily all active headings).
- Primary installation is assumed to be cut-and-cover with the top of pipe approximately 10 feet below the surface.
- Pricing includes jacked sections under Highway 5, Highway 45, the railroad, the Colusa Basin Drain, and the GCID Canal.

5.9. Transmission and Interconnection (Property Class 13)

5.9.1. SITES SUBSTATION

The substation configuration assumes a connection to the existing WAPA 230 kV Keswick-O’Banion transmission line based upon a WAPA *System Impact Study* (WAPA, 2013). This substation would service the western facilities (SPGP and TRR). Note that the cross country transmission line running to the Sacramento River Pumping/Generating Plant has been eliminated for Project Alternative D. Rather the Sacramento River Pumping/Generating Plant would be supplied through a new transmission line from a new substation north of Colusa connected to the WAPA line. The transmission line would run north from the new substation roughly paralleling Highway 45.

In addition to the information provided above, estimating assumptions include the following:

- Estimates are based on the *System Impact Study* (WAPA, 2013), Option 1, dated February 2013.
- Substation general arrangement and ratings are based on the one-line diagrams prepared for the project.
- All 230 kV substation equipment is rated at 1,200 A and transformer ratings are as shown on the one line diagrams.
- Survey of substation sites and associated geotechnical investigation is included in engineering allowances and contingencies.
- Communication requirements for the substation sites are by others and are not included in the estimate.
- The *System Impact Study* (WAPA, 2013) mentions the needs for VAR support. This equipment is not shown on the one-line diagrams at this time. A 230 kV, 65 MVAR series capacitor bank has an estimated cost of $300,000 plus auxiliary equipment for a total estimated cost of $450,000. This cost has been included in the Sites Substation cost estimate.

5.9.2. TRR PUMPING/GENERATING PLANT

Switchyard costs developed from the single-line diagram details for the TRR Pumping/Generating Plant Switchyard.

5.9.3. SACRAMENTO RIVER PUMPING/GENERATING PLANT SWITCHYARD

Switchyard costs developed from the single-line diagram details for the Sacramento River Pumping/Generating Plant.

5.9.4. TRANSMISSION LINES

Estimating assumptions include the following:

- The transmission line estimate is based on a single 2156 Aluminum Conductor Steel-Reinforced Bluebird for each circuit, with line construction consisting of double-circuit lattice towers or single-circuit tubular poles (monopoles).
- The transmission line estimate is based on 700-foot ruling span.

5.10. General Property (Property Class 15)

5.10.1. RECREATION AREAS

Estimating assumptions include the following:

- Alternative D includes Stone Corral Creek and Peninsula Hills recreation areas and a boat launch facility located on the west side of the reservoir where the current Sites Lodoga Road exits the reservoir near elevation 520.0 feet. All camping and picnic area equipment is assumed to be anchored in concrete.
- Camping and picnic equipment listed on component cost page.
- All boat ramps are assumed to be 50 feet wide built with 6-inch reinforced concrete for durability.

5.10.2. OPERATIONS AND MAINTENANCE FACILITY

Estimating assumptions include the following:

- The field office is assumed to be 10,000 square feet, including 8,000 square feet of shop space.
- The entire site, including paving, is assumed to be 100,000 square feet.
- The entire site is to be fenced with 6-foot chain link.
- A pre-fabricated metal building shell is assumed.
- Tenant improvements are allowed for space development for offices and shops.
- Water well and septic system are provided.
- Vehicle fueling island is provided.

5.11. Mitigation Costs

AECOM has developed planning-level mitigation cost suitable for Sites Reservoir Alternative C for the Authority that is also applicable to Alternative D. AECOM held a series of mitigation workshops in May 2016 with the Environmental Impact Report (EIR)/Environmental Impact Statement (EIS) Team comprised of DWR, Reclamation and CH2M HILL staff.

During the mitigation workshops, a total of 155 mitigation measures from the NODOS Preliminary Administrative Draft EIR were reviewed. Revised mitigation cost assumptions, schedule impacts associated with mitigation measures and modifications to mitigation that could potentially reduce project costs were discussed during the workshops. The 2013 mitigation cost estimate was also reviewed. Mitigation cost assumptions developed during the mitigation workshops were then used to update mitigation costs, as well as inform construction and operation and maintenance costs, where appropriate.

5.12. Interest During Construction

AECOM developed an estimate for interest during constriction (IDC) based on the construction schedule presented in Section 7. As shown in **Error! Reference source not found.**, project design, real estate procurement, and construction costs (in 2015 dollars) were distributed over the construction period and IDC (in 2015 dollars) was calculated using an interest rate of 3.5 percent.

Table 5-5 Annual Construction Spending and IDC (2020 - 2030)

No IDC Adjustment from Federal or WSIP Construction Funding

Year	Milestone	Construction		IDC	Total
		% Complete	Cost ($M)	-3.50%	
2020	Design	2.5%	$ 117.40	$ 2.00	$ 119.50
2021	Design	2.5%	$ 117.40	$ 6.20	$ 123.60
2022	Land Acquisition	0.3%	$ 133.20	$ 10.80	$ 144.00
2023	Construction	14.7%	$ 691.90	$ 25.60	$ 717.50
2024	Construction	17.4%	$ 819.10	$ 52.90	$ 872.00
2025	Construction	18.8%	$ 882.50	$ 84.50	$ 967.00
2026	Construction	16.9%	$ 794.20	$116.80	$ 911.00
2027	Construction	12.1%	$ 567.60	$144.80	$ 712.30
2028	Construction	6.2%	$ 291.00	$164.90	$ 455.90
2029	Construction	6.0%	$ 282.80	$180.70	$ 463.50
2030	Fully Operational	0.0%	$ -	$ -	$ -
	Total	100%	$ 4,697.2	$ 789.2	$ 5,486.4

Note: 50% IDC is attributed to spending in the year of construction based a mid-year average expenditure date.

5.13. Operation, Maintenance, Repair, and Replacement

AECOM developed estimates for the operation, maintenance, repair, and replacement (OMRR) costs for the Project. Annual costs developed included facility staffing, contract maintenance, tools and equipment, fixed and variable operation and maintenance costs (including expenses for power and water system operations), major repairs, periodic major equipment component refurbishment/replacement, power costs adjusted for power revenues, canal wheeling costs and the like. Costs for Costs for ongoing environmental mitigation and water quality monitoring were also considered. The annual costs for OMRR and mitigation and water quality monitoring were distributed over an assumed 93-year[1] period beginning in 2030 (start of operation). The NPV of the time series was then determined in October 2015 dollars using a discount rate of 3.5

[1] Based on a 100-year study period beginning at construction per WSIP guidance.

percent. The NPV costs for OMRR and mitigation and monitoring are included in the cost summary tables provided in Section 6.

5.14. Feasibility-Level Cost Estimate

The feasibility-level cost estimates are included in Appendix A.

This page intentionally left blank.

6. COST ESTIMATE SUMMARY

Table 6-1 summarizes the estimated feasibility-level capital cost summary for Alternative D in October 2015 dollars. Detailed cost estimate worksheets supporting the table are provided in Appendix A.

Table 6-1 Capital Cost Summary

Facility	Field Cost ($ Million)	Non-Contract Cost ($ Million)	Construction Cost ($ Million)
Develop Sites Reservoir	310	50	360
Main Dams	520	90	610
Saddle Dams	230	40	270
Holthouse Dam	160	30	190
Terminal Regulating Reservoir	33	6	39
Inlet/Outlet Structure and Tunnel	180	30	210
Sites Pumping/Generating Plant	680	120	800
Terminal Regulating Reservoir Pumping/Generating Plant	135	25	160
Sacramento River Pumping/Generating Plant	220	40	260
Sacramento River Fish Screen Structure	47	8	55
Red Bluff Addition	3	1	4
Sites Pumping/Generating Plant Conveyance Channel	42	7	49
Delevan Pipeline	560	100	660
Terminal Regulating Reservoir Pipeline	300	50	350
Utility Transmission Line Interconnections	160	30	190
General Property	26	4	30
Land Acquisition and Rights	100	10	110
Environmental Mitigation/Monitoring	340	10	350
Subtotals	4,046	651	4,697
Capital Cost	-	-	**4,697**

All costs are October 2015 costs

Table 6-2 summarizes the total project cost estimate for Alternative D in October 2015 dollars.

Table 6-2 Total Project Cost Summary

Item	Construction Cost[1] ($ Million)
Capital Cost	4,697
Interest During Construction	789
Operation, Maintenance, Repairs, Replacement (Note 2)	554
Ongoing Water Quality and Mitigation Monitoring Costs (Note 2)	175
Allowance for Utility Systems	50
Total Project Cost	6,265

Note: 1. All costs are October 2015 costs
2. Net present value of annual costs for assumed 93-year operating period beginning in 2030

The estimated annual operation and maintenance, repair and replacement costs, and the mitigation costs (totaling approximately $26.6 million annually) were applied over a 100-year operating period beginning in 2030. The net present value was then estimated in October 2015 dollars using the WSIP required discount rate (3.5 percent).

The estimates presented in Table 6-1 and Table 6-2 may not be a complete tabulation of all potential Authority costs to implement the project. An example of other costs might include electric utility owner costs for system improvements to provide power to the project or accept power from project generation. Further PG&E and WAPA system connection studies and discussions with these utilities would be part of future Project design activities that would identify if such costs would be incurred.

7. CONSTRUCTION SCHEDULE

AECOM has developed a preliminary project implementation schedule for Alternative D as part of developing the feasibility-level cost estimate. Figure 7-1 presents the roll-up schedule. Appendix B contains the full schedule that includes approximately 200 linked construction activities. The schedule presents a reasonable approach to construct the project that accounts for the logical sequencing of the work, procurement of equipment, and reasonable durations to complete construction activities. Durations reflect the estimated labor and equipment spreads needed to complete activities, including earthwork, balancing the movement of excavated soil and rock to placement sites, supplying and placing all materials, erecting structures, and installing major equipment. Labor and equipment costs are reflected in the cost estimate.

The schedule presents construction activities with an assumed construction start date in late March 2022. Predecessor activities like design, permitting, packaging the work, and bidding the construction packages are not included because of the uncertainty in scheduling these activities between now and 2022. With hydroelectric generation a part of the project, the FERC permitting process may also affect the actual start date.

As construction progresses, the critical path (or critical remaining work) moves between facilities. Completing the Sacramento River and Sites Pumping/Generating Plants in early 2030 are the final critical activities to achieve project construction completion and begin pumping operations.

Filling the reservoir is not reflected in the schedule due to the uncertainty in hydrological conditions at that time and the operating criteria that would be contained in the regulatory permits required for the project. It may be possible to begin filling the reservoir using natural runoff from Stone Corral and Funks Creek beginning with the 2028 and 2029 wet season. At this point the dams are completed. Adequate storage would be available to accommodate a major storm event (including the PMF) and release facilities would be available at Sites Dam if needed.

8. LIMITATIONS

The construction cost estimate presented in this BOE Report is a feasibility-level cost estimate that reflects a professional opinion of probable project construction costs, total project costs, and escalation to the assumed 2022 start of construction date based on conceptual-level design layouts developed using currently available information on the surface and subsurface site conditions.

Currently available subsurface information and topographic data relied upon by AECOM to prepare designs and cost estimates were developed by others. AECOM does no take responsibility for the accuracy or completeness of this information.

AECOM represents that its services were conducted in a manner consistent with the standard of care ordinarily applied as the state of practice in the profession, within the limits prescribed by our client. No other warranties, either expressed or implied, are included or intended in this technical memorandum.

AECOM assumes that the project will be implemented by the Authority. AECOM further assumes that the estimated cost for the project is based on a conventional design-bid-build approach to the work. Alternative bidding strategies, such as design build, can change the estimated cost.

This document is based on the measurement and pricing of quantities wherever information is provided and/or reasonable assumptions for other work not covered in the drawings. Unit rates have been obtained from historical records and/or discussion with contractors. Contractor costs include mark-ups covering the costs of field overhead, home office overhead and profit and range from 15% to 25% of the cost for a particular item of work.

Cost estimates are an assessment of fair market value for the construction of this project. It is not a prediction of low bid. The construction cost estimate presumes that work packages are established for advertising and bidding such that a minimum of four qualified responsible general contractors bid on the work, and their bids include a minimum of four bidders for subcontracted work. Experience indicates that fewer bidders may result in higher bids. The estimated construction cost is based on industry practice, professional experience and qualifications and represents AECOM's best judgment as a professional construction consultancy familiar with the construction industry.

AECOM does not guarantee that the proposals, bids, or the construction cost will not vary from the estimate prepared. Since AECOM has no control over the cost of labor, material, equipment, the contractor's method of determining prices, the competitive bidding or market conditions at the time of bid, or escalation, the statement of feasibility-level cost is based on industry practice, professional experience and qualifications.

Findings

The benefit-cost analysis (BCA) determined that the Sites Reservoir Project (project) would result in total public benefits with a present value of $3,506 million in 2015 dollars. If it receives its requested $1,662 million in Water Storage Investment Program (WSIP) funding and the entire $730 million of its potential Federal funding**, the Sites Reservoir project would have a public benefit ratio (PBR) of 2.11 and an overall benefit-cost (B/C) ratio of 1.52**. This does not account for the significant non-monetized benefits.

The project's high PBR indicates that WSIP funding of the project would be a highly cost-effective investment. Similarly, the project's B/C ratio indicates that the project is economically feasible and will result in major net benefits from the total expenditures necessary for its construction and future operations.

As discussed extensively in Sites_A5 Documentation under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB and summarized below, the PBR and B/C ratio results are considered highly conservative based on the selected monetization approaches and the assumptions used by the benefit valuation analysis. The project's B/C ratio would increase to more than 2.2 and its PBR to over 3.6 if the alternative cost approach for the project's ecosystem improvements and agricultural supply benefits. Use of WSIP Unit Fish values for the project's anadromous fish benefits are estimated to further increase the project's PBR to over 4.5.

Approach

BCA is a widely used analysis tool for evaluating a project's expected future economic performance. Two key metrics are commonly used to represent and evaluate BCA results: the B/C ratio and the net present value (NPV).

Benefit-Cost Ratio

The B/C ratio is the present (or annualized) value of all project benefits divided by the corresponding value of all costs. The ratio measures the factor by which benefits exceed (or are below) costs. A project with a ratio value greater than 1.0 is considered economically feasible. The B/C ratio is a useful way to compare the relative benefits of projects that may differ in time and/or scale. The overall B/C ratio of a proposed project (considering all costs, benefits, and impacts) is the measure of the project's economic feasibility.

Net Present Valuation

NPV is the present value of all costs subtracted from the present value of all benefits. Projects with values greater than $0.00 are considered economically beneficial. The NPV is a useful way to determine the overall dollar value of a project's expected future net benefits.

Public Benefit Ratio

The WSIP Application requires calculation of a project's PBR. The PBR is the present value of the net monetized public benefits divided by the total requested WSIP cost share.

The BCA data, calculations, and results for Sites Reservoir are provided below. In accordance with WSIP Technical Memorandum guidance, benefits and costs were annualized using a 3.5 percent discount rate applied to the project's operations over the remaining 93 years of the study period (i.e., 2030 to 2122).

Benefits

Table A9-1 shows Sites Reservoir's estimated benefits on an average annual basis for the 93-year study period. As discussed above, the average annual benefits are based on the NPV of the project's future benefits using the WSIP-required 3.5 percent discount rate.

Table A9-1. Annual Benefits Summary (2015$, $Millions/year)

Beneficiary	Benefit Value	Benefit Value Adjusted [a]
WSIP Public Benefits	**$122.0**	**$123.6**
Ecosystem improvement	$110.9	$112.0
Anadromous fish & other aquatic	$57.0	$57.7
Incremental Level 4 refuge	$23.8	$23.8
Oroville coldwater pool	$21.0	$21.0
Yolo Bypass	$9.1	$9.5
Recreation	$6.8	$6.8
Flood control	$4.4	$4.9
Non-Proposition 1 Eligible Benefits	**$194.9**	**$194.9**
Water supply	$175.4	$175.4
M&I water supply	$114.1	$114.1
Agricultural water supply	$50.2	$50.2
Recaptured water supply	$11.1	$11.1
Hydropower (system)	$19.5	$19.5
Total Benefits	**$316.9**	**$318.5**

[a] Adjusted to incorporate the additional $44.7 million (present value) of project benefits obtained during project construction (2026-29).

Overall, Sites Reservoir is estimated to result in $316.9 million in total annual benefits. However, when adjusted for the $44.7 million in ecosystem improvement and flood reduction benefits between 2026 and 2029, Sites Reservoir is estimated to result in $318.5 million in total annual benefits. The project's WSIP public benefits are expected to total $123.6 million (adjusted), which is equivalent to 38.8 percent of the project's $318.5 million in total benefits.

The WSIP Technical Report guidelines require that each benefit category reporting the present value of its expected net monetized benefits over the planning horizon, in 2015 dollars, be discounted to the start of project operations using the required 3.5 percent discount rate. Net monetized benefits are benefits minus any impacts caused by the proposed project or other costs (other than project costs) that are required to realize the benefit. Table A6-1 in Sites_A6 Annual Benefits Table under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB provides the complete benefit estimates on a yearly basis over the full study period.

The Sites Reservoir analysis's use of CALSIM II modeling and its conservative approach in its physical benefit quantification and benefit monetization approach ensure that all necessary costs or impacts were previously incorporated and consequently were "netted out" so that the benefit valuation results (discussed in detail in Sites_A5 Documentation under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB) represent the project's net monetized benefit and do not require any additional adjustment to subtract for any project impacts or other costs.

Costs

Two sets of development costs are shown, and each is used to derive its corresponding BCA results. The first is an unadjusted capital cost that includes the full interest during construction (IDC) that could be expected for the project's 8-year construction schedule. As such, it results in a higher (and therefore financially more conservative) total development cost for the project than if the adjusted (but arguably more realistic) estimate of the development cost discussed below is used.

The adjusted capital cost approach incorporates the IDC reduction that would be gained from expected WSIP and Federal project construction funding. As discussed in Allocation of Total Costs (file name: Sites_A10 Allocation under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB), consistent with the Draft North-of-the-Delta Offstream Storage (NODOS) Feasibility Study, Sites Reservoir could potentially obtain up to $730 million in Federal funding. For the WSIP analysis, WSIP funding of $1,662 million is requested. Assuming that both WSIP and Federal funding would be disbursed as construction expenses are incurred, the project would gain a significant reduction in its IDC because it would carry a much lower amount of capital debt over its 8-year construction period. As such, it results in a lower and arguably more realistic estimate of the project's total development cost than the unadjusted capital cost estimate.

Table A9-2 shows Sites Reservoir's estimated capital cost on an average annual basis for the 93-year study period. As discussed above, the average annual benefits are based on the NPV of the project's future benefits using the WSIP-required 3.5 percent discount rate.

Both the unadjusted (i.e., without WSIP or Federal funding) and the adjusted capital cost (i.e., with WSIP and Federal funding) are shown.

Table A9-2. Annual and Total Capital Cost Summary
(2015$; $Millions/year)

Cost Item	Project (Unadjusted IDC)	Project (with IDC saving)
Construction	$4,747	$4,747
Interest during construction (IDC)	$798	$429 [a]
Total Capital Cost	**$5,545**	**$5,176**
Capital amortization (3.5%; 93 years)	$195.5	$182.5
Operations, maintenance, and replacement	$26.6	$26.6
Total Annual Cost	**$222.1**	**$209.1**

[a] Adjusted for $369 million in expected IDC savings from WSIP and Federal funding during project construction.

The total development cost of Sites Reservoir is estimated to be $5.5 billion without any IDC savings. This cost corresponds to an annualized capital cost of $195.5 million. As a result, the total annual cost is estimated to be $222.1 million when the projected $26.6 million annual operations, maintenance, and replacement (OM&R) cost is added.

If the project's Federal funding and requested WSIP amounts are obtained, its IDC cost is estimated to decrease from $797.6 million to $429.0 million. This decrease would result in $368.5 million in IDC savings, which would be equivalent to a $13.0 million reduction in the project's future annualized cost. As a result, the total development cost for the project with WSIP and Federal construction funding is $5,176 million and its annualized cost would total $209.1 million.

Benefit-Cost Analysis Results

Table A9-3 shows the BCA results for the project both with and without the expected IDC savings that would be obtained from future WSIP and Federal construction funding.

Table A9-3. Benefit-Cost Analysis Results (2015$, $Millions/year)

Results	Project (Unadjusted IDC)	Project (with IDC saving)
Benefit-cost ratio	1.43	1.52
Net benefit (annual)	$96.4	$109.4
Total net benefit (net present value)	$2,735	$3,104

Sites Reservoir is projected have at least a B/C ratio of 1.43 and result in total net benefits with an NPV of $2,735 million, which would be equivalent to annual net benefits of $96.4 million.

If Sites Reservoir receives its requested $1,662 million in WSIP funding and the full $730 million of its potential Federal funding, the project would have a B/C ratio of 1.52 and result in total net benefits with a net present value of $3,104 million, which would be equivalent to annual net benefits of $109.4 million.

Public Benefit Ratio Results

Sites Reservoir is projected to result in total public benefits with a present value in 2015 dollars of $3,506 million over the 100-year study period. These benefits are equivalent to an annualized average of $123.7 million. Ecosystem improvements account for over 90 percent of the project public benefits and far surpass the 50 percent WSIP funding requirement.

As shown in Table A9-4, based on the project's requested WSIP funding amount of $1,662 million, the PBR for the Sites Reservoir project is 2.11.

Table A9-4. Public Benefit Ratio Results (2015$, $Millions/year)

Results	Project (with IDC Saving)
Total public benefits (annual)	$123.6
Total ecosystem Improvement benefits (annual)	$112.0
Ecosystem improvement as % of public benefit	90.6%
Total public benefits (NPV)	$3,506
WSIP funding request	$1,662
PBR	**2.11**

This value indicates that WSIP funding for the project would be a highly cost-effective investment. As discussed in Sites_A5 Documentation under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB, this result presumes that WSIP funding for the project would encourage Federal funding participation of up to $730 million. The Federal contribution significantly reduces the WSIP funding request necessary to achieve the currently proposed public benefit levels.

As shown in Table A9-5, in the absence of any Federal funding for the project, WSIP funding of $2,392 million would otherwise be necessary to similarly fully fund the project's currently planned public benefits. Under these circumstances, the PBR for the Sites Reservoir project would be reduced to 1.47.

Table A9-5. Public Benefit Ratio Results: No Federal Participation
(2015$, $Millions/year)

Results	Project (with IDC saving)
Total public benefits (annual)	$123.6
Total ecosystem Improvement benefits (annual)	$112.0
Ecosystem improvement as % of public benefit	90.6%
Total public benefits (NPV)	$3,506
WSIP funding request	$2,392
PBR	**1.47**

Evaluation of Results

As discussed extensively in Sites_A3 Physical Monetized under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB, the Sites Reservoir benefit valuation analysis was very conservative in its benefit monetization. This was due to the selected monetization approaches and the assumptions generally applied in the analysis of the project's future ecosystem improvement and agricultural water supply benefits.

Except for the anadromous fish benefits, WSIP unit water values were used to determine the future economic benefits for the other ecosystem improvements and agricultural water supplies. The WSIP unit values were only adjusted to include the estimated conveyance energy costs for the deliveries. It is arguable that other non-energy conveyance costs and carriage water losses might both also be added to further increase the unit values. In any case, no such escalation of the WSIP unit benefit values has been applied by the Sites Reservoir economic benefit analysis.

As shown in Sites_A3 Physical Monetized under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB, the WSIP unit water benefit values were substantially lower than the estimated alternative cost benefits values based on Shasta Lake Expansion. It is arguable that use of the alternative cost valuation is more representative of the project's future benefit since Sites Reservoir would provide new and permanent additional water supplies and net new benefits that otherwise could not be obtain from water transfer from other current water users (as the WSIP unit water values implicitly presume). Furthermore, it is highly unlikely that the water transfers implicit in the WSIP unit water values could actually occur—or be achieved—in a manner that would result in comparable water quantities and reliability as that provided by the project. The significantly higher value reflects the lack of other options for generating a similar large and permanent quantity of benefits.

Third party effects are another important factor contributing to WSIP unit values' under-representation of the benefits for a very large water storage project (such as Sites Reservoir). There are likely major third-party effects (e.g., externalities or related adverse effects on employees and other businesses in related economic sectors) that are not incorporated or represented in the WSIP unit water values, which focus on the compensation to water sellers.

Even the higher benefit values obtained from the alternative cost estimates for Shasta Lake Dam raise are also considered likely to be conservative and under-represent Sites Reservoir's actual benefit values. As discussed in Sites_A3 Physical Monetized under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB, the development cost estimates used from recent USBR feasibility analysis likely do not factor in either the full costs that would be necessary for project development or the schedule delays necessary for it to be completed. Both factors would contribute to higher alternative cost benefit values for Sites due to their increased costs and/or reduced present values of its benefits. It was projected that Sites Reservoir would provide limited anadromous fish beginning in 2026 and its full benefits in 2030. A later completion date for raising Shasta will result in greater fish population and habitat declines during the interim period that would in turn reduced the comparative value of its subsequent ecosystem improvements. Finally, there are also reasons to believe that the 2030 Shasta Lake storage conditions assumed by WSIP in its baseline are overly optimistic and therefore when compared to the project operations, the project's quantified benefits are underestimated.

As a result of the conservative nature of the Sites Reservoir benefit valuations, the PBR and B/C ratio results shown in Tables A9-4 and A9-5 should therefore be recognized as very conservative. The project's B/C ratio would increase to more than 2.2 and its PBR to over 3.6 if the alternative cost approach for the project's ecosystem improvements and agricultural supply benefits is used to monetize those benefits. Use of WSIP Unit Fish values for the project's anadromous fish benefits were estimated to further increase the project's PBR to over 4.5.

Acronyms and Abbreviations

IDC	interest during construction
JPA	Joint Powers Authority
NODOS	North-of-the-Delta Offstream Storage
OM&R	operations, maintenance, and replacement
SCRB	Separable Cost-Remaining Benefits
TR	Technical Report
WSIP	Water Storage Investment Program

A cost allocation was performed to determine the costs to be allocated to the project purposes. Based on its results, a subsequent cost assignment was performed, including beneficiaries and funding sources (accounting for funding sources), to determine the costs to be assigned to the project beneficiaries. The cost assignment also incorporated the requested Water Storage Investment Program (WSIP) grant and potential Federal funding participation (consistent with the Draft North-of-the-Delta Offstream Storage [NODOS] Feasibility Study analysis) to determine the total costs (capital and operations, maintenance, and replacement [OM&R]) that each beneficiary would need to contribute.

The Sites Reservoir Joint Powers Authority (JPA) considers future Federal participation in the project to be likely given both the Federal government's extensive development of the Feasibility Report, other studies, and its current interest in securing incremental Level 4 refuge and anadromous fish benefits from the project. As a result, consistent with Draft NODOS Feasibility Study, Federal funding of up to $730 million was incorporated into the WSIP economic analyses and factored in to determine the $1,662 million in requested WSIP funding.

In addition to securing funding for the project's public benefits, the Federal and WSIP funding would also benefit the project by lowering the cost of development. Assuming that funding would be disbursed as construction expenses are incurred, the project's interest during construction (IDC) expenses would be significantly reduced because it would carry a much less capital debt over the estimated construction period. The future IDC reduction has been included in the total cost used for the cost allocation and assignments.

However, given that Federal participation is not assured, the WSIP economic analyses also performed an alternate cost allocation and assignment to the project beneficiaries without Federal participation.

Analytic Methods

Separable Cost-Remaining Benefits Method

The Federal government's Separable Cost-Remaining Benefits (SCRB) method was used to perform the cost allocation for Sites Reservoir. This approach is recognized as an acceptable cost allocation by the WSIP Technical Reference (TR) guidance (Section 8.2, Tools and Methods).

The SCRB method is based on the justified investment for each project purpose. The maximum justified investment for a purpose is the lesser of either (1) its benefits or (2) the cost of the single purpose project alternative to achieve the same benefits. Quantification of the justifiable expenditures is a means for allocating joint cost in proportion to benefits.

Under SCRB, the project's separable and joint costs are estimated and used as the basis for determining each purpose's designated share of the project's total cost. Separable costs are costs that have be added to the project specifically to serve a given function. Joint costs are the costs for joint use facilities that serve multiple purposes. Each purpose's separable costs are subtracted from its justifiable expense to determine its remaining justifiable expenses.

The project's total joint costs are then allocated proportionally between the purposes based on their remaining justifiable expense. The sum of each purpose's allocated joint cost and its separable costs then determines the total cost allocated to each purpose. The allocated joint costs for the project's OM&R, construction, and IDC expenses were also performed to determine corresponding cost allocation for each cost category.

The SCRB cost allocation for each project purpose was used for cost assignment between beneficiaries and expected future Federal and/or WSIP funding amounts (when applicable). The cost assignment between the ecosystem improvement beneficiaries was based on their benefits because no separable costs were identified for that purpose.

Data and Assumptions

If the project's Federal funding and requested WSIP amounts are obtained, its IDC cost is estimated to decrease from $797.6 million to $429.0 million. This decrease would result in $368.5 million in IDC savings, which would be equivalent to a $13 million reduction in the project's future annualized cost. As a result, the total development cost for the project with WSIP and Federal construction funding is $5,176 million, and its annualized total cost would total $209.1 million. The project's cost allocation was based on this estimated development cost. In addition, an alternate cost allocation using the same SRCB method was also performed for Sites Reservoir assuming no Federal funding contribution for its construction. Single purpose and separable cost estimates for the project purposes were developed based on evaluation of each purpose's physical benefits and modified reservoir designs to meet those results.

It was also assumed that consistent with the Draft NODOS Feasibility Study, Federal funding for the project's OM&R costs would be limited to 50 percent and only applicable for incremental Level 4 refuge water.

Calculations

Table A10-1 shows the estimated annualized total costs allocated to each project purpose. The cost allocation also reports individually each purpose's share of the project's construction, IDC, and OM&R costs. The corresponding nominal amount of each purpose's portion of the project's $5,176 million capital cost is also shown. This includes $429 million of interest during construction, $350 million of future environmental mitigation or compliance and $4,397 million of capital costs.

For all purposes except water supply, the benefits determined their maximum justifiable expense. Separable costs were identified only for Sites Reservoir's hydropower and recreation purposes.

As shown in Table A10-1, water supply was allocated $92.9 million in total annual costs, which represents 44.4 percent of the project's estimated total $209.1 million annual cost. Ecosystem improvement was also allocated a major share (42.3 percent and $88.5 million) of total costs. The annual cost allocations for the other public purposes were $5.4 million (2.6 percent) for recreation and $3.9 million (1.8 percent) for flood protection. In all cases, per WSIP TR requirements, the cost shares for all purposes are less than their monetized benefits (TR, Section 8.2).

The total cost share allocated to the project's public benefit purposes was $97.8 million, which represents nearly half (46.8 percent) of the project's annual total cost. The public benefit purposes' cost share potential eligible for WSIP funding is limited to its capital cost, which is estimated to be $84.3 million per year. This amount would account for $2.4 billion (46.2 percent) of the project's total capital cost of $5.2 billion.

Results

A cost assignment analysis was also performed to determine both the ecosystem beneficiaries' specific cost share and also the WSIP and Federal funding for each public benefit purpose or beneficiary. As required by the application guidelines, Table A10-2 shows the estimated total costs allocated to each project purpose and assigned to the beneficiaries. It also shows the assignment between project purposes and beneficiaries of the requested WSIP funding.

The present value of the project's total cost is estimated to be $5,931 million, of which $755 million would be for future OM&R expenses over the 93-year analysis period. Of the $755 million, $44 million would be replacement costs with the remaining $711 million operations, maintenance and replacement.

Table A10-3 provides the cost assignment for the project's $5,176 million total capital cost (i.e., construction and IDC). Federal non-reimbursable construction funding of $730 million would be provided as funding for anadromous fish ($488 million), Level 4 refuge ($201 million), and flood reduction ($41 million). The Federal government would also provide $1.3 million per year as its 50 percent cost share for the incremental Level 4 refuge's allocated $2.6 million annual OM&R cost (see Table A10-1).

Table A10-3 also shows the distribution of the requested $1,662 million in WSIP funding between the public purposes and the beneficiaries. If granted, the WSIP funding would provide sufficient matching funds to fully cover the capital cost for all the project's public benefit categories. WSIP would provide 100 percent funding for the capital cost assignments for the Oroville coldwater pool, Yolo Bypass, and recreation. WSIP would also provide the necessary 56 percent remaining capital needed for the other public benefits receiving Federal funding (i.e., Level 4 refuge, anadromous fish, and flood reduction).

Table A10-4 also shows the total cost assignment on an equivalent annualized basis. However, it should be noted that successful WSIP and Federal funding would instead disburse their contributions during the project's construction phase. As a result, their annualized capital cost share would then be eliminated. WSIP provides no OM&R funding and would ensure that the entire capital costs for all the public benefits were fully funded (either solely by WSIP or with Federal assistance). Consequently, the annual costs shown in Table A10-4 for the public benefit categories under the non-Federal partners are the annual OM&R costs that would need to be paid in the future with non-WSIP funding. The results are summarized in Figure A-1.

As discussed in Sites_A5 Documentation under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB, the Sites JPA intends to use future sales of its allocation of recaptured water to cover the OM&R costs assigned for those project public benefit purposes that do not have adequate alternate revenue sources. It is expected that the project would receive Federal funding for 50 percent of the incremental Level 4 refuge supply's annual OM&R. It is also expected that public use fees from the reservoir's recreational visitors would be used to fully fund the $0.9 million in annual OM&R costs that would be assigned to recreation.

Table A10-1. Cost Allocation Summary: WSIP (w/ IDC Savings) and Federal Funding (w/ IDC Savings) (Annualized Values: 2015$; $millions)

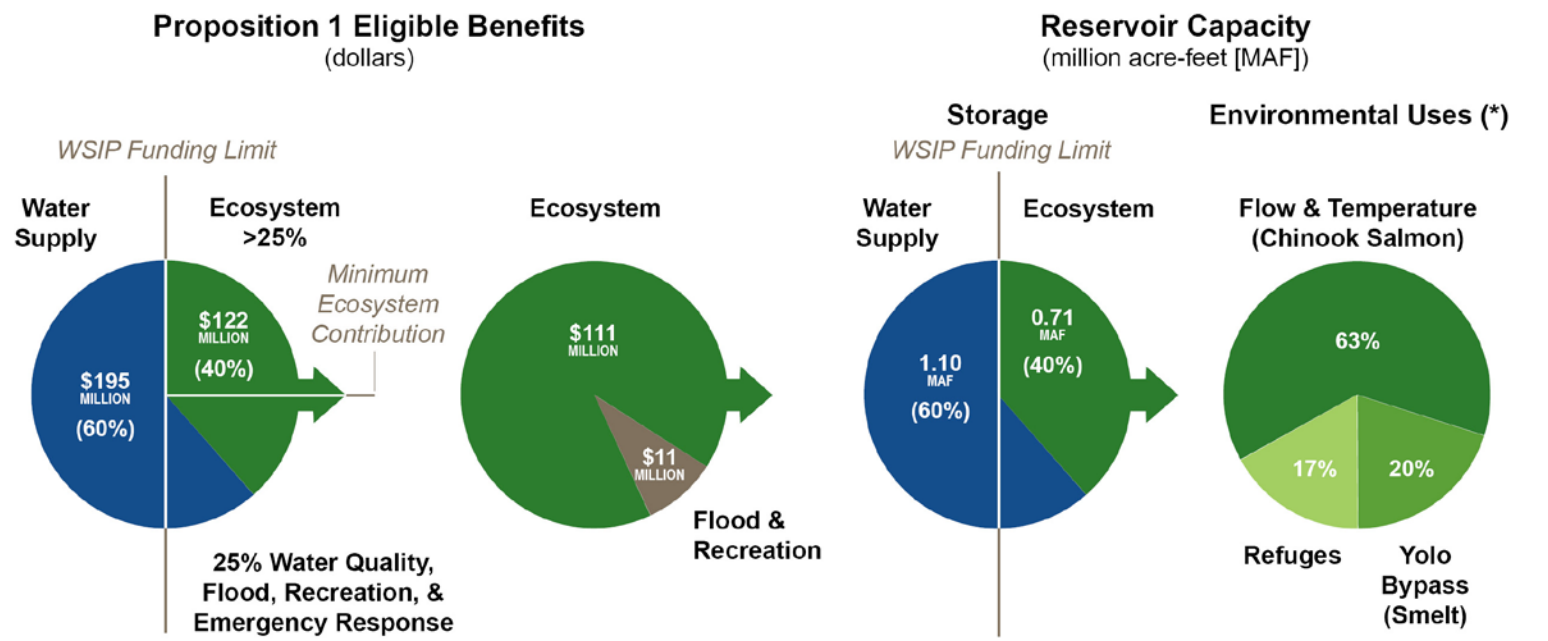
Figure A-1. Eligible Benefits Graph



Prop 1 specified that the State may invest in up to 50% of the project cost for public benefits. Up to half of those benefits could be for non-ecosystem benefits. Based on the values provided by the State, the Sites Project can provide 40% of the annual benefits for Prop 1 categories, 90% of those benefits for the ecosystem.

To accomplish the Prop 1 benefits, the State could acquire the rights to 40% of the storage capacity in Sites Reservoir for the identified benefits. Approximately 63% of those benefits have been allocated to improve habitat for chinook salmon, 20% for food chain improvements for Delta smelt, and 17% for wildlife refuges.

(*) Based on WSIP requirements applied to maximize the State's return on investment. Operations to achieve other benefits will produce different results.

CVP	Central Valley Project
CVPIA	Central Valley Project Improvement Act
CWC	California Water Commission
Delta	Sacramento-San Joaquin River Delta
DEW	Drier/Extreme Warming
DWR	California Department of Water Resources
GCID	Glen Colusa Irrigation District
M&I	municipal and industrial
MAF	million acre-foot (feet)
Operations Plan	Sites Reservoir Project Operations Plan
Reclamation	Bureau of Reclamation
SWP	State Water Project
SWRCB	State Water Resources Control Board
TAF	thousand acre-feet
T-C Canal	Tehama-Colusa Canal
TCCA	Tehama-Colusa Canal Authority
TRR	Terminal Regulating Reservoir
WMW	Wetter/Moderate Warming
WSIP	Water Storage Investment Program

Introduction

Sites Reservoir is able to provide operational flexibility to sustain both public and non Proposition 1 benefits under a range of future uncertain conditions including climate change, potential future projects and water management actions, and severe extended droughts. As an off-stream reservoir located in the Sacramento Valley north of the Sacramento-San Joaquin River Delta, Sites Reservoir provides a unique opportunity to provide public physical benefits and improve the operation and resiliency of the Central Valley water system.

The with-project conditions include a 1.81-million-acre-foot (MAF) reservoir, which would be located in the Sacramento Valley west of the town of Maxwell, and associated conveyance facilities including use of existing Tehama-Colusa Canal (T-C Canal) and Glenn-Colusa Irrigation District (GCID) Main Canal diversion and conveyance facilities, plus a proposed new diversion and discharge pipeline. The proposed reservoir would be filled by diversion of excess Sacramento River water that originates from unregulated tributaries to the Sacramento River downstream from Keswick Dam. These flows are “excess” to those needed to meet current regulatory requirements or other water demands.

Operation of the proposed reservoir would be in cooperation with the operations of existing Central Valley Project (CVP) and State Water Project (SWP) system facilities to facilitate and maximize the potential for a wide range of benefits.

The operation of Sites Reservoir Project would allow for the development and administration of an ecosystem enhancement storage account (EESA) that could be managed by the State to provide water for ecosystem and water quality purposes. Such an account would provide a pool of dedicated storage to manage in cooperation with existing operations to improve coldwater conservation storage, stabilize river flows during critical fisheries periods, increase flows through certain watercourses and/or facilities (such as, Yolo Bypass), improve water quality, and/or enhance habitat restoration.

Sites Reservoir Project would be operated in cooperation with CVP and SWP operations to coordinate releases from Shasta Lake, Lake Oroville, and Folsom Lake. Releases from Sites Reservoir would allow reduced releases from other reservoirs while still meeting requirements for minimum instream flow objectives, Sacramento River temperature requirements, and Delta salinity control assigned to CVP and SWP. Through this reduction in releases, storage could be conserved in Shasta Lake, Lake Oroville, and Folsom Lake to significantly increase operational flexibility to improve river water temperatures for fish survival, Delta water quality, flood control, and recreation.

Sites Reservoir Project EESA operations would achieve multiple public benefits over a wide range of hydrologic conditions. These public benefit objectives include the following actions:

- Increase coldwater pool conservation in Trinity Lake, Shasta Lake, Lake Oroville, and Folsom Lake
- Help regulate Sacramento River summer flows for best use of cold water for control of temperature conditions adverse to anadromous fish
- Provide (via upstream actions) incidental Delta water quality improvements in the summer and fall
- Stabilize Sacramento River fall flows for improving spawning and rearing success of anadromous fish
- Provide water to the Yolo Bypass to support salmon migration and summer food production for delta smelt
- Provide water to increase the quantity and frequency of deliveries to Level 4 refuge deliveries per CVPIA

In dry and critically dry years Sites Reservoir operations as proposed would prioritize improving Shasta Lake storage to preserve coldwater and improve water temperatures in the Sacramento River to protect Chinook salmon.

The following sections describe how the expected public physical benefits would be provided and sustained under the following sources of uncertainty:

- Climate Change
- Future Project and Water Management Actions
- Drought
- Other Sources of Uncertainty

Climate Change

The California Water Commission (CWC) provided three CalSim II models that represent a range of climate scenarios under year 2070 conditions. The primary WSIP 2070 model is required to be used as the basis for the analysis of project operations as part of the WSIP application. The two other models provided by the CWC represent alternative extreme climate scenarios. One is characterized by Wetter/Moderate Warming (WMW) conditions and other by Drier/Extreme Warming (DEW) conditions. Both climate conditions demonstrate more extreme hydrologic scenarios resulting in increased winter precipitation and reduced winter and spring snowpack, which causes higher winter runoff and reduced spring snow melt and decreased inflows to Central Valley rim reservoirs. In the WMW scenario there is increased precipitation and higher reservoir inflows and storage levels, and fewer dry years. In the DEW scenario, there are longer more severe dry periods and decreased reservoir inflows. These scenarios provide a range of uncertainty to allow evaluation of how the benefits of the project can be sustained under potential future extreme climate conditions.

Investigatory level analyses were performed for both the WMW and DEW scenarios with the inclusion of the Sites Reservoir project. These model runs were conducted as a sensitivity analysis and are not refined to a level where their numerical results can be used directly, but the results provide a strong indication of how the project will perform under these extreme future climate conditions.

The public benefits provided by Sites Reservoir are largely dependent on the capability to divert Sacramento River water into the reservoir when all other regulatory and water right requirements are met. In both the WMW and DEW climate scenarios, the average annual diversion to Sites Reservoir illustrates the resiliency of the project, as diversions are only reduced by six percent and three percent, respectively, when compared to the base WSIP 2070 model results. The results of the investigatory model runs for the 2070 WMW and DEW climate scenarios demonstrate that Sites Reservoir operations can be adapted to future conditions and provide sustained public benefits as described below.

Operational Flexibility

Sites Reservoir has the operational flexibility to deliver water to provide public benefits where and when it is needed most, based on changing conditions and ecosystem priorities. In the 2070 WMW climate scenario, less water is needed to preserve the coldwater pool in Shasta Lake, Lake Oroville, and Folsom Lake due to wetter hydrologic conditions, so more water can be prioritized for other public benefits such as late summer deliveries to the Yolo Bypass and increasing the quantity and frequency of deliveries to wildlife refuges.

In the 2070 DEW climate scenario, more public benefit water is needed to increase storage in Shasta Lake and other Central Valley reservoirs to preserve coldwater pools and enhance water temperature management for salmonids. Therefore, EESA operations may be adapted to emphasize coldwater pool management and less public benefit water could be allocated to other purposes.

EESA in Sacramento Valley Reservoirs

Increased water storage in Shasta Lake, Lake Oroville, and Folsom Lake would benefit salmonids through the conservation of coldwater pool in each reservoir and improved temperature management downstream. The additional water storage also provides the flexibility to release more water when needed to maintain stable flows for salmon habitat to provide better spawning and rearing conditions.

In the 2070 WMW climate scenario, increased inflows to Sacramento Valley reservoirs lead to higher storage levels. In this scenario, less public benefit water is needed to increase Shasta Lake and Lake Oroville storage since the reservoirs have sufficient water to provide flow stabilization and temperature management. Average annual September storage in Shasta Lake and Lake Oroville is increased slightly compared to the base WSIP 2070 condition. The primary benefit is a significant increase of 12 percent in average annual Folsom Lake storage in September to provide improved coldwater pool and flow management in the American River. This demonstrates the operational flexibility of the Sites Reservoir project to provide water for public benefits in responses to future climate change.

In the 2070 DEW climate scenario, public benefit water from Sites Reservoir can be used to significantly increase storage in central valley reservoirs year-round. During dry periods, there is sufficient EESA water in Sites Reservoir to support increased storage in Shasta Lake, Lake Oroville, and Folsom Lake compared to the without project WSIP 2070 condition. During critical drought periods, the average September storage in Shasta Lake is increased by 19 percent, Lake Oroville is increased by 14 percent, and Folsom Lake is increased by 10 percent, respectively. These storage increases help preserve and maintain coldwater in these reservoirs which provides operational flexibility to improve temperature management and downstream habitat for salmonids.

Yolo Bypass

In both the 2070 WMW and DEW climate scenarios, Sites Reservoir has adequate water stored in the EESA to sustain public benefit flows to the Yolo Bypass in the late summer and early fall through the Colusa Basin Drain and Knights Landing Ridge Cut. In the 2070 WMW scenario, water deliveries to the Yolo Bypass occur in over 90 percent of the years, as compared to 70 percent in the base WSIP 2070 condition.

In the 2070 DEW climate scenario, water is delivered to the Yolo Bypass in over 50 percent of the years, as compared to 70 percent in the base WSIP 2070 condition. In this scenario, Shasta Lake and other reservoir storage levels are lower so more EESA water from Sites Reservoir is dedicated to preserving storage and coldwater in Shasta Lake, Lake Oroville, and Folsom Lake. Therefore, slightly less EESA is delivered to the Yolo Bypass.

Refuge Deliveries

In both the 2070 WMW and DEW climate scenarios, Sites Reservoir has adequate water stored in the EESA to sustain public benefit deliveries to wildlife refuges in the Central Valley to meet CVPIA Level 4 targets. In the 2070 WMW scenario, Level 4 refuge deliveries increase due to more available water in storage. In the 2070 DEW scenario, refuge deliveries would possible decrease as EESA operations shift to support the conservation of coldwater in Shasta Lake, Lake Oroville, and Folsom Lake for dry and critical year temperature management.

Non-Proposition-1 Water Supply Benefits

Water deliveries to project participants would be sustained under potential future extreme climate conditions as diversions of excess Sacramento River flow to storage only decrease slightly as noted previously. CVP and SWP project water deliveries are reduced under these two extreme conditions, as compared to the without project WSIP 2070 condition. Therefore, water deliveries from Sites Reservoir in the 2070 WMW and DEW climate scenarios to supplement existing water sources provides additional water supply reliability under these future extreme climate conditions.

Future Projects and Water Management Actions

This uncertainty analysis of future projects and water management actions is consistent with the list of projects evaluated in the Draft EIR/EIS cumulative impact assessment

The projects and actions identified are organized in the following groups:

- Multi-regional water resources projects and actions
- Water supply projects
- Ecosystem improvement projects and actions

Qualitative descriptions of the potential effects to public physical benefits, as well as potential improvements are provided below. Some of the descriptions are based on rough investigatory analyses or post-processing of WISP 2070 results to attempt to characterize the operational flexibility to sustain public benefits under these potential future conditions.

Multi-region Projects and Actions

The multi-region projects and actions considered in this discussion that may affect the potential public benefits are:

- Bay-Delta Water Quality Control Plan Update
- Bay Delta Conservation Plan/California WaterFix
- Sustainable Groundwater Management Act (SGMA)
- Reclamation and DWR Request for Reinitiation of Section 7 Consultation Addressing the Long-term Operation of the CVP and SWP (also referred to as Reconsultation)
- NMFS Public Draft Recovery Plan for Sacramento River Winter run Chinook Salmon, Central Valley Spring-run Chinook Salmon, and Central Valley Steelhead
- U.S. Fish and Wildlife Service (USFWS) Recovery Plan for the Sacramento-San Joaquin Delta Native Fishes

Bay-Delta Water Quality Control Plan Update

The State Water Board is in the process of developing and implementing updates to 2006 WQCP that protect beneficial uses in the Bay-Delta watershed. This update is broken into four phases, some of which are proceeding concurrently. Phase 1 of this work, currently in progress, involves updating San Joaquin River flow and southern Delta water quality requirements for inclusion in the WQCP. Phase 2 will involve comprehensive changes to the WQCP to protect beneficial uses not addressed in Phase 1, focusing on Sacramento River driven standards. Phase 3 will involve implementation of Phases 1 and 2 through changes to water rights and other measures; this phase requires a hearing to determine the appropriate allocation of responsibility between water rights holders within the scope of the Phase 1 and Phase 2 plans. Phase 4 will involve developing and implementing flow objectives for priority Delta tributaries upstream of the Delta.

There is considerable uncertainty associated with the future development and implementation of flow criteria in the Sacramento River watershed to address tributary-specific public trust needs and other beneficial uses. Water stored in the EESA in Sites Reservoir could be used to enhance public benefit objectives in addition to public trust needs over a wide range of potential future regulatory and operational conditions. The EESA provides the operational flexibility to manage the water associated with the Sites Project to the highest priority needs on an adaptive management basis. Implementation of actions to provide public benefits will be adaptively managed on a continuing basis in response to changing system characteristics (such as reservoir storage), ecological needs, forecasts of future hydrologic conditions, and system operations.

Total average annual diversions of excess Sacramento River flow to Sites Reservoir, based on CalSim II model results, for future 2070 conditions are 588 TAF. The volume of excess flow available for diversion in between December and March allows the seasonal timing of diversions during storm events to be adapted to potential future regulatory requirements. Examples of potential adaption measures include shifting the timing of primary diversion periods (including day-night operations to avoid salmon movements that occur predominantly during dark hours), shifting facility operations and maintenance periods, and shifting diversions between the three intake locations. Therefore, the project has the operational flexibility to adapt diversion, storage, and release operations to provide public physical benefits such as coldwater pool management, refuge deliveries, and Yolo Bypass flow enhancement under a range potential future regulatory regimes.

Bay Delta Conservation Plan/California WaterFix

California Bay Delta Conservation Plan and the California WaterFix are being developed by federal and State agencies and other stakeholders to achieve the dual goals of a reliable water supply for California and a healthy California Bay-Delta ecosystem that supports the State's economy. The program would construct a new diversion and conveyance facility, modify operation of existing CVP and SWP Delta facilities, and reduce ecological stressors that impair the function or the use of the Delta by aquatic and terrestrial resources. The preferred project would convey water under the existing water rights held by DWR and Reclamation; however, DWR and Reclamation have requested changes in the points of diversion for these water rights. The existing 2008 USFWS and 2009 NMFS biological opinions will continue to be implemented until construction of the WaterFix is complete and Reclamation has submitted additional information or a request for reconsultation by the end of construction of the preferred project.

Investigatory level analyses were conducted to assess the interaction between the Sites Reservoir and the proposed WaterFix operations. These investigatory analyses were only developed for sensitivity evaluation purposes, but they do provide an indication of the potential performance of Sites Reservoir in coordination with WaterFix. The results indicate that there is sufficient excess Sacramento River flow available downstream of the Delevan Intake to avoid conflicts between the two projects. The spring outflow criterion for March through May proposed as part of the WaterFix operations would have minimal impacts on diversions to Sites Reservoir as the majority of Sites diversions occur between December and February. The seasonal timing of Sites Project diversions could be shifted to reduce or avoid diversions in March by changing Tehama Colusa Canal Authority (TCCA), Glen Colusa Irrigation District (GCID), and Sites Project facility operations and maintenance periods. Sites Project operations are designed to store water during wet periods and then release water later during periods of critical public benefit need. The investigatory analyses indicate the project has the operational flexibility to shift the timing of diversions, reservoir storage, and release operations to maintain and potential enhance public physical benefits such as coldwater pool management, refuge deliveries, and Yolo Bypass flow enhancement in cooperation with WaterFix facility operations.

Sustainable Groundwater Management Act

The Sustainable Groundwater Management Act of 2014 (SGMA) provides a framework for long-term sustainable groundwater management across California. Under the legislation, local and regional authorities in medium and high priority groundwater basins will form Groundwater Sustainability Agencies (GSAs) that oversee the preparation and implementation of a local Groundwater Sustainability Plan (GSP). Local stakeholders have until 2017 to organize themselves in Groundwater Sustainability Agencies. Groundwater Sustainability Plans will have to be in place and implementation begun sometime between 2020 and 2022. GSAs will have until 2040 to achieve groundwater sustainability.

No groundwater benefits have been monetized; however, the Sites Reservoir project would potentially beneficially affect groundwater basins within service areas of project participants, particularly those within the Sacramento River Hydrologic Region. Some of the participants are designated as a GSA for affected groundwater basins, including but not limited to Colusa County, Colusa County Water District, Santa Clara Valley Water District, and Zone 7 Water Agency. Many other agencies participating in the Sites Project also participate in Groundwater Sustainability Agencies. These member agencies will be involved in the future integration of the Sites Project into their respective Groundwater Sustainability Plans (GSPs)**.** Coachella Valley Water District, Desert Water Agency, Santa Clara Valley Water District, and Zone 7 Water Agency have each submitted prescribed Alternatives to a GSP, consisting of groundwater management plans or an analysis of basin conditions. The Sites Reservoir Project could be incorporated into future updates of these Alternatives.

In addition, Sites participants: Desert Water Agency, California Water Service, San Bernardino Valley Municipal Water District, Metropolitan Water District of Southern California and San Gorgonio Pass Water Agency are affiliated with adjudicated groundwater basins. Antelope Valley - East Kern Water Agency is affiliated with a groundwater basin that is pending adjudication. Water deliveries from the Sites Reservoir Project could be incorporated into the management strategy for these basins. The associated operations by participating agencies with adjudicated basins would be included in annual monitoring and reporting activities. Additional analysis is provided under the ELIGIBILITY TAB in attachment Sites_A6C Groundwater Basins.

Reclamation and DWR Request for Reinitiation of Section 7 Consultation Addressing the Long-term Operation of the CVP and SWP (Reconsultation)

On August 2, 2016, Reclamation and DWR requested the USFWS and NMFS to reinitiate consultation under Section 7 of the Endangered Species Act of the Long-term Coordinated Operation of the CVP and SWP to review the Reasonable and Prudent Alternative presented in the 2008 USFWS Biological Opinion and 2009 NMFS Biological Opinion, respectively. This request for reconsultation was based upon new information collected and analyzed during multiple years of drought, additional data that indicated continued low Delta smelt populations, and new information being developed during ongoing collaborative science processes (e.g., Collaborative Science and Adaptive Management Team and Collaborative Adaptive Management Team processes). Reclamation and DWR also requested that the California Department of Fish and Wildlife participate in this ongoing program.

There is considerable uncertainty associated with the potential outcome of reinitiation of Section 7 consultation for the long-term operations of the CVP and SWP. Water stored in the EESA in Sites

Reservoir could be used in cooperation with CVP/SWP operations to enhance public benefits over a wide range of conditions. The EESA provides the operational flexibility to manage the water associated with the Sites Project to the highest priority needs on an adaptive management basis. Implementation of actions to provide public benefits would be evaluated on a continuing basis in response to changing system parameters, ecological needs, forecasts of future hydrologic conditions, and system operations. For example, as described in the operations plan, water stored the EESA in Sites Reservoir could be exchanged for water normally delivered from other Sacramento Watershed reservoirs and by that exchange Sites EESA water would be “backed” into Lake Shasta, Oroville, or Folsom to increase water storage and thereby help preserve the coldwater pool to enhance fisheries benefit operations.

It is not anticipated that the outcome of the reconsultation will change the ability of the Sites Project to divert excess Sacramento River flows into reservoir storage during major storm events. Results of the CALSIM II future WSIP 2070 condition simulation show an average annual diversion of 588 TAF of excess Sacramento River flow to Sites Reservoir. With an average annual volume of about 2 million acre-feet (MAF) of excess flow available, the seasonal timing of diversions during storm events could be adapted to accommodate potential changes in future CVP/SWP operational and regulatory requirements.

Examples of potential adaption measures include shifting the timing of primary diversion periods, shifting facility operations and maintenance periods, and shifting diversions between the three intake locations. Therefore, the project has the operational flexibility to adapt diversion, storage, and release operations to provide public physical benefits such as coldwater pool management, refuge deliveries, and Yolo Bypass flow enhancement under a range potential future operations and regulatory regimes.

NMFS Public Draft Recovery Plan for Sacramento River Winter-run Chinook Salmon, Central Valley Spring-run Chinook Salmon, and Central Valley Steelhead

The NMFS Draft Recovery Plan provides a roadmap that describes the steps, strategy, and actions that should be taken to return winter-run Chinook salmon, spring-run Chinook salmon, and steelhead to viable status in the Central Valley, California, thereby ensuring their long-term persistence and evolutionary potential.

Excess Sacramento River flow diversions to Sites Reservoir would only take place when flow monitoring indicates that bypass flows are present in the river due to storm event flows. Several existing and additional proposed bypass flow criteria are designed to make certain only excess water would be diverted into Sites Reservoir to maintain and protect existing downstream water uses. As a mitigation measure to more fully avoid and minimize entrainment and impingement of juvenile salmonids and other poor-swimming aquatic species, diversions to Sites Reservoir would also be restricted to protect fish migration during naturally occurring, storm-induced, pulse flow events in the Sacramento River. The proposed pulse protection period would extend from October through May to address outmigration of juvenile winter-, spring-, fall- and late-fall-run Chinook salmon, as well as steelhead.

Due to the combination of operational flexibility and mitigation measures to protect fish during outmigration, it is not anticipated that the NMFS Recovery Plan will change the ability of the Sites Project to provide identified public physical benefits. Water stored in the EESA in Sites Reservoir could be used in cooperation with CVP/SWP operations to enhance public benefits to support chinook salmon, steelhead and sturgeon. The EESA provides the operational flexibility to manage the water associated with the Sites Project to the highest priority needs on an adaptive management basis. As described above, water in stored the EESA in Sites Reservoir could be exchanged and “backed” into Lake Shasta, Oroville, or Folsom to increase water storage and thereby help preserve the coldwater pool to enhance fisheries temperature and flow management operations.

There are number of options being evaluated by the Yolo Bypass-Salmonid Habitat Restoration and Fish Passage Project to modify Fremont Weir to pass a range of flows between 3,000 and 12,000 cfs to provide fish passage and extend periods of inundation. Investigatory level analyses were conducted to provide an indication of the performance of Sites Reservoir operations in coordination with the fish passage project. The results indicate that there is sufficient excess Sacramento River flow available downstream of the Delevan Intake to avoid conflicts with potential future Fremont Weir modifications and operations. Sites Reservoir water could also be released to the Sacramento River or through the Colusa Basin Drain and Knights Landing Ridge Cut to supplement flows into the Yolo Bypass to increase flow levels to promote activation of the flood plain and extend periods of inundation. This concept could also be applied to other isolated floodplains and future weir modifications.

The investigatory analyses indicate the Sites Project has the operational flexibility to shift the timing of diversions, reservoir storage, and release operations to maintain and potentially enhance public physical benefits such as coldwater pool management, refuge deliveries, and Yolo Bypass flow enhancement in cooperation with actions included in the NMFS Public Draft Recovery Plan.

USFWS Recovery Plan for the Sacramento-San Joaquin Delta Native Fishes

The USFWS Recovery Plan addresses the recovery needs for several fish species that occupy the Delta, including delta smelt, Sacramento splittail, longfin smelt, green sturgeon, Chinook salmon (spring-run, late fall-run, and San Joaquin fall-run), and Sacramento perch (believed to be extirpated). The objective of the plan is to establish self-sustaining populations of these species that will persist indefinitely. This would be accomplished by managing the estuary to provide better habitat for aquatic life in general and for the fish addressed by the plan. Recovery actions include tasks such as increasing freshwater flows; reducing entrainment losses to water diversions; reducing the effects of dredging, contaminants, and harvest; developing additional shallow-water habitat, riparian vegetation zones, and tidal marsh; reducing effects of toxic substances from urban non-point sources; reducing the effects of introduced species; and conducting research and monitoring.

Excess Sacramento River flow diversions to Sites Reservoir would only take place when flow monitoring indicates that bypass flows are present in the river due to storm event flows. Several existing and additional proposed bypass flow criteria are designed to make certain only excess water would be diverted into Sites Reservoir to maintain and protect existing downstream water uses. As a mitigation measure to more fully avoid and minimize entrainment and impingement of juvenile salmonids and other poor-swimming aquatic species, diversions to Sites Reservoir would also be restricted to protect fish migration during naturally occurring, storm-induced, pulse flow events in the Sacramento River. The proposed pulse protection period would extend from October through May to address outmigration of juvenile winter-, spring-, fall- and late-fall-run Chinook salmon, as well as steelhead and other anadromous fish.

It is not anticipated that the USFWS Recovery Plan will change the ability of the Sites Project to provide identified public physical benefits. Water stored in the EESA in Sites Reservoir could be used in cooperation with CVP/SWP operations to enhance public benefits to support fish species in the Delta. The EESA provides the operational flexibility to manage the water in Sites Reservoir storage for the highest priority needs on an adaptive management basis. Water stored the EESA in Sites Reservoir could be released through the Colusa Basin Drain and Knights Landing Ridge Cut during summer and fall months (i.e., August through October) to help increase productivity in the Yolo Bypass in the lower Cache Slough and lower Sacramento River areas to increase desirable food sources for Delta smelt and other key fish species.

Water Supply Projects

The water supply projects considered that may affect potential public benefits include:

- Shasta Lake Water Resources Investigation
- North Bay Aqueduct Alternative Intake
- Los Vaqueros Reservoir Expansion Phase II

Shasta Lake Water Resources Investigation

The Shasta Lake Water Resources Investigation is currently being conducted by Reclamation to determine the type and extent of federal interest in a multiple purpose plan to modify Shasta Dam and Reservoir to increase the survival of anadromous fish populations in the upper Sacramento River and increase water supplies and water supply reliability for agricultural, municipal, industrial, and environmental purposes. To the extent possible through meeting these objectives, alternatives include features to benefit other identified water and related resource needs including ecosystem conservation and enhancement, improved hydropower generation capability, flood damage reduction, increased recreation opportunities, and improved water quality conditions in the Sacramento River and the Delta. Anticipated alternatives for expansion of Shasta Lake include, among other features, raising the dam from 6.5 to 18.5 feet above current elevation, which would result in additional storage capacity of 256,000 to 634,000 acre-feet, respectively. The increased capacity is expected to improve water supply reliability and increase the coldwater pool, which would provide improved water temperature conditions for anadromous fish in the Sacramento River downstream of the dam. The final EIS and Feasibility Study for the project were completed in July/August 2015.

Investigatory level analyses were conducted to assess the interaction between Sites Project operations and the proposed increase to Shasta Lake storage capacity. These investigatory analyses provide an indication of potential performance of Sites Project in coordination with an increase in storage in Shasta Lake. Sites Reservoir would be filled through the diversion of excess Sacramento River water that originates from unregulated tributaries to the Sacramento River downstream from Keswick Dam. Less than 1 percent of diversions to Sites Reservoir are assumed to be provided by flood releases or spills that flow through Shasta Lake. Therefore, there is sufficient excess Sacramento River flow available downstream of Keswick Dam so there is no conflict between the two facility operations.

As proposed, the increase in Shasta Lake storage will not change the ability of the Sites Project to provide identified public physical benefits. Water stored in the EESA in Sites Reservoir could be used in cooperation with CVP/SWP operations to enhance public benefits to support chinook salmon and steelhead. The EESA provides the operational flexibility to manage the water in Sites Reservoir storage to the highest priority needs on an adaptive management basis. As described above, water stored in the EESA in Sites Reservoir could be exchanged and “backed” into Shasta Lake to increase water storage and thereby help preserve the coldwater pool to enhance fisheries temperature and flow management. Increased storage capacity in Shasta Lake could provide additional opportunity to exchange water into storage in Shasta Lake and preserve coldwater resources during critical periods.

North Bay Aqueduct Alternative Intake

DWR issued a Notice of Preparation on December 2, 2009 to construct and operate an alternative intake on the Sacramento River, generally upstream of the Sacramento Regional Wastewater Treatment Plant, and connect it to the existing North Bay Aqueduct system by a new segment of pipe. The proposed alternative intake would be operated in conjunction with the existing North Bay Aqueduct intake at Barker Slough. The project would be designed to improve water quality and to provide reliable deliveries of SWP supplies to its contractors, the Solano County Water Agency, and the Napa County Flood Control and Water Conservation District (DWR, 2011).

Based on a review of potential operations, it is not anticipated that the alternative intake project will affect the ability of the Sites Project to provide identified public physical benefits.

Los Vaqueros Reservoir Expansion Phase II

Los Vaqueros Reservoir is an off-stream reservoir in the Kellogg Creek watershed to the west of the Delta. The Los Vaqueros Reservoir initial construction was completed in 1997 as a 100,000 acre-foot off-stream storage reservoir owned and operated by Contra Costa Water District (CCWD) to improve delivered water quality and emergency storage reliability for CCWD's customers. In 2012, the Los Vaqueros Reservoir was expanded to a total storage capacity of 160,000 acre-feet (Phase 1) to provide additional water quality and supply reliability benefits, and to adjust the timing of its Delta water diversions to accommodate the life cycles of Delta aquatic species, thus reducing species impact and providing a net benefit to the Delta environment. An additional expansion up to 275,000 acre-feet (Phase 2) is being evaluated by CCWD.

Preliminary investigatory level analyses conducted to assess the interaction between the Sites Project and the proposed Los Vaqueros expansion indicate that there is sufficient excess Sacramento River flow available downstream of the Delevan Intake to avoid conflicts between the two operations. Los Vaqueros Reservoir is located in the Delta which is the lowest point in the watershed, therefore it is the location with the greatest amount of surplus. The seasonal timing of Sites diversions between December and May could be coordinated with Los Vaqueros operations to maximize public benefits of both projects.

Ecosystem Improvement Projects and Actions

The ecosystem improvement projects and actions considered in the cumulative impact assessment that may affect or be enhanced by potential public benefits include:

- Yolo County HCP/Natural Community Conservation Plan (NCCP)
- Yolo Bypass Wildlife Area Land Management Plan
- Cache Slough Complex Restoration

Yolo County Habitat/Natural Community Conservation Plan

The Yolo County Habitat Joint Powers Authority, consisting of five local public agencies, launched the Yolo Natural Heritage Program in March 2007. This effort includes the continuing preparation of a joint HCP/NCCP. Member agencies include Yolo County and the Cities of Davis, Woodland, West Sacramento, and Winters. The HCP/NCCP describes the measures that local agencies will implement in order to conserve biological resources, obtain permits for urban growth and public infrastructure projects, and continue to maintain the agricultural heritage and productivity of Yolo County.

The Sites Reservoir Project has the ability to enhance public physical benefits in the Yolo bypass through the release water through the Colusa Basin Drain and Knights Landing Ridge Cut during summer and fall months (i.e., generally August through October when adequate capacity of the Colusa Basin Drain is available) to help increase fish productivity in the Yolo Bypass in the lower Cache Slough and lower Sacramento River areas. Building on what was learned in the 2016 pilot project, these enhancement flows will increase desirable food sources for Delta smelt and other key fish species in the late summer and early fall. In addition, releases of Sites EESA water into the bypass could be timed to provide water flows, depths, and durations to benefit other aquatic and terrestrial wildlife.

Other Sites Project water release patterns to augment other environmental programs would be reasonable to consider in cooperation with future unrelated actions (e.g.; the new operational notching of the Fremont weir to support riparian and wetland habitat restoration in the Yolo Bypass) associated with the HCP/NCCP measures or the Central Valley Flood Protection Program.

Yolo Bypass Wildlife Area Land Management Plan

The Yolo Bypass Wildlife Area consists of approximately 16,770 acres of managed wildlife habitat and agricultural land within the Yolo Bypass. The bypass conveys seasonal high flows from the Sacramento River to help control river stage and protect the cities of Sacramento, West Sacramento, and Davis, as well as other local communities, farms, and lands from flooding. Substantial environmental, social, and economic benefits are provided by the Yolo Bypass, benefiting the people of the State of California.

As noted previously, releases of Sites EESA water into the Yolo Bypass could provide water flows, depths, and durations to benefit aquatic species and terrestrial wildlife.

Cache Slough Complex Restoration

The Cache Slough Complex is located in the northern Delta where Cache Slough and the southern Yolo Bypass meet. It currently includes Liberty Island, Little Holland Tract, Prospect Island, Little Egbert Tract and the surrounding waterways. Levee height on these tracts is restricted and designed to allow overtopping in large flow events to convey water from the upper Yolo Bypass. Since 1983 and 1998 respectively, Little Holland Tract and Liberty Island have remained breached. Restoration is occurring naturally on the islands. Restoration in the Cache Slough Complex was identified as an Interim Delta Action by Governor Schwarzenegger in July 2007.

As noted previously, releases of Sites EESA water into the Yolo Bypass could provide water flows, depths, and durations to benefit aquatic species and terrestrial wildlife.

Drought Performance

To evaluate project performance during a five-year drought period, the results of the WSIP 2070 with Sites Reservoir simulation were compared to the base without project WSIP 2070 results for the period 1930 through 1934. During extended drought periods, the public benefit operations of Sites Reservoir prioritize increasing storage in Shasta Lake, Lake Oroville, and Folsom Lake to help preserve the coldwater pools and provide releases to maintain appropriate river water temperatures downstream. Public benefit water would also be used for other high priority needs on an adaptive management basis. Implementation of actions to provide public benefits would be evaluated on a continuing basis in response to changing system parameters (such as reservoir storage), ecological needs, forecasts of future hydrologic conditions, and system operations.

Table 1 presents the volume of water in system storage and in the Sites Reservoir EESA that could be used for public benefit over the course of the 5-year drought period. System reservoir storage is typically highest in May and lowest in September after releases have been made over the summer and before the first fall storm events. Sites Reservoir operations increase system storage for public benefits creating operational flexibility to provide manage cold water storage and temperature flows to benefit salmonids. As shown in Table 1, total system storage that could be used for public benefits in the first year of the drought (May of 1930) is 900 TAF declining to 300 TAF in end of the fourth consecutive year of drought (September of 1934).

Table 1. Sites Reservoir Project Performance During Drought

Increase in Reservoir System Storage with Sites Reservoir over the 5-Year Drought Period From 1930 to 1934						
Year	System Storage for Public Benefits (TAF) (Shasta, Oroville, and Folsom)		Sites EESA for Public Benefits (TAF)		Total Public Storage Benefit (TAF)	
	May	Sep	May	Sep	May	Sep
1930	489	182	416	398	905	581
1931	668	623	253	0	921	623
1932	562	201	165	128	727	329
1933	507	475	103	0	611	475
1934	454	302	172	0	626	302

Other Sources of Uncertainty

The preceding sections adequately cover the range of potential uncertain future conditions that may affect the public physical benefits identified. As discussed previously, the operation of Sites Reservoir Project would allow for the development and administration of an ecosystem enhancement storage account (EESA) that could be managed by the State to provide water for ecosystem and water quality purposes. The EESA provides the operational flexibility for the State's resource managers delegated the responsibility to manage the water stored in Sites Reservoir to sustain public benefits to meet future needs on an adaptive management basis.

The volume of excess flow in the Sacramento River available for diversion primarily between December and March allows the seasonal timing of diversions during storm events to be adapted to potential future uncertain conditions. Examples of potential adaption measures include shifting the timing of primary diversion periods, shifting facility operations and maintenance periods, and shifting diversions between the three intake locations. Therefore, the project has the operational flexibility to adapt diversion, storage, and release operations to provide public benefits such as coldwater pool management, refuge deliveries, and Yolo Bypass flow enhancement over a range potential uncertain future conditions.

APPLICANT INFORMATION

Sites Project Authority *	Sites Project
Tax ID	900635251
Point Of Contact *	**Division/Address List:** General Manager **Address1:** 122 Old Highway 99 West · **Address2:** P. O. Box 517 **City:** Maxwell · **State:** CA **Zip:** 95955 **First Name:** Jim · **Last Name:** Watson **Email:** jwatson@sitesproject.org · **Phone (Direct):** 5304108250
Point Of Contact Position Title *	General Manager, Sites Project Authority
Proposal Name *	Sites Project
Proposal Objective*	This application is submitted by the Sites Project Authority to secure investment funding as authorized under voter approved Proposition 1 in exchange for providing the State of California with eligible public benefits. The Sites Project will be an offstream reservoir independently owned, constructed, governed, and operated by the Authority under its own water rights and other regulatory requirements; but in cooperation with the U.S. Bureau of Reclamation and California Department of Water Resources in their operation of the Central Valley Project (CVP) and State Water Project (SWP), respectively. The summary objective of the Sites Project is to make California's water system more efficient, flexible, and reliable, which will provide local, statewide, and national benefits. The project helps to achieve the objectives of the California Water Action Plan by providing a substantial supply of high-quality water to support the economy and enhance the environment, particularly in the face of climate change. The public benefits for the Sites Project are to improve the survival of anadromous fish and other aquatic species, provide incremental Level 4 refuge water supply, provide opportunities for recreation, and reduce flood damage reduction. Non-Proposition 1 eligible benefits include water supply and hydropower generation. The Authority offers the State of California the first right of refusal for 710,000 AF (40% capacity) for public benefits provided by

	the project. If the State accepts full responsibility for the public benefits, this would provide a long-term average of 195 TAF of water for public benefits. The submittals in this application assume the State would instead prefer federal participation with shared investment in public benefits at a level that reduces capital costs for the Water Storage Investment Program (WSIP) program. This anticipates future federal funding under the Water Infrastructure for Improvements to the Nation (WIIN) Act.

BUDGET

Other Contribution	0
Local Contribution	2720000000

Section : ELIGIBILITY AND GENERAL PROJECT INFORMATION

ELIGIBILITY AND GENERAL PROJECT INFORMATION TAB

Q.1 Applicant Type:

Specify which of the following describes the applicant:

Joint powers authority

Q.2 Project Type:

Please identify the appropriate project type for the application:

Surface Storage Projects Identified in the CALFED

Q.3 Public Benefits:

Please identify the public benefit categories for which Program funding is requested:

a) ☑ Ecosystem Improvements (must be included)
b) ☑ Water Quality Improvements
c) ☑ Flood Control Benefit
d) ☑ Emergency Response
e) ☑ Recreational Purposes

Q.4:

Explain why the proposed project does not adversely affect any river afforded protection pursuant to the California or Federal Wild and Scenic Rivers Act. See section 6003(a)(1)(I) of the regulations.

The dams for Sites Reservoir would be constructed on Funks and Stone Corral Creeks. Neither watercourse is protected by the California or Federal Wild and Scenic Rivers Act. No protected rivers would be impacted. See Chapter 6 (Section 6.3) in the Draft EIR/S (http://sitesproject.org/information/DraftEIR-EIS)for a detailed analysis of impacts to surface water.

Q.5:

Is the applicant an agricultural or urban water supplier as defined in section 6001 of the Program regulations? If not, enter "Not Applicable"; if so, has the applicant submitted complete Agricultural or Urban Water Management Plans to DWR? Have those plans been verified as complete by DWR? If not, explain how the applicant is working towards compliance with the requirements of Water Code section 10608.56. See section 6003(a)(1)(J) of the regulations.

The Sites Project Authority is composed of representatives of the potentially affected counties, and water management agencies within the Sacramento River watershed. The Sites Project Reservoir Committee participants include both urban and agricultural water suppliers. All participants that are required to submit plans have submitted plans to DWR. Some of the Urban Water Management Plans have already been approved. The remaining plans are currently under review by DWR. All applicants will work with DWR to resolve any future comments on their plans. The status for the plans of each individual agency participating in Sites Reservoir is provided in the Water Management Plan Summary in Attachment Sites_A6B WMPs.xls of this tab.

Q.6:

Does the proposed project affect groundwater basins, as defined by Water Code section 10722 *et seq*.? If not, enter "Not Applicable"; if so, identify the affected groundwater basins and describe how the project would be integrated with future GSP(s). Explain how the project would reduce, eliminate, or have an effect on undesirable results (as defined in regulations section 6001(a)(85)) within the affected groundwater basin(s). Describe how the applicant would work with GSA(s) or adjudicated participants of the basin. See regulations section 6003(a)(1)(K).

Sites Reservoir would help alleviate undesirable conditions in the Colusa Groundwater Basin. Desert Water Agency and the Coachella Valley Water Agency would use water from Sites for groundwater replenishment to address undesirable results in their basins. An attachment on Groundwater Management is provided in Attachment Sites_A6C Groundwater Basins of this tab.

A.1 Executive Summary:

Attach the executive summary (max 20 pages). See regulation section 6003(a)(1)(A).

Last Uploaded Attachments: Sites_A1 ExecSum.pdf

A.2 Resolution:

Attach the Resolution, as required by regulations section 6003(a)(1)(C). See Program website for an example resolution.

Last Uploaded Attachments: Sites_A2 Resolution.pdf

A.3 Project Description:

Project Description. Attach a description of the project that meets the requirements of section 3.3 of the TR. If a full project description is included in another attachment, identify the attachment name and beginning page number in this attachment.

Last Uploaded Attachments: Sites_A3 Project Description.pdf

A.4 Project Description Support:

Attach maps, schematics and engineering design drawings that support the project description, if not already available in other attached documents. See section 6003(a)(1)(B) of the regulations.

Last Uploaded Attachments: Sites_A4 Drawings.pdf

A.5 Attestation:

Attach a statement, under penalty of perjury pursuant to the laws of the State of California, attesting that the information provided in the full application is true and correct to the best of the applicant's knowledge. Scanned uploaded documents containing a scanned signature are sufficient. See section 6003(a)(1)(Y) of the regulations.

Last Uploaded Attachments: Sites_A2 Resolution.pdf

A.6 Other Application Information:

OPTIONAL: Attach any other information that would support the application which does not fit easily in another category: for example, other studies or an index of the submitted application documents.

Last Uploaded Attachments: Sites_A6A Application Index.xlsx,Sites_A6B WMPs.docx,Sites_A6C Groundwater Basins.docx,Sites_A6D Modeling Results Compendium.pdf,Sites_A6E Letters.pdf

Section : PHYSICAL PUBLIC BENEFITS

PHYSICAL PUBLIC BENEFITS

A.1 Ecosystem Benefits:

Attach completed Ecosystem Priorities worksheets. Be sure to include the general information worksheet as well as worksheets for each priority being claimed for which funds are being requested. Identify at least one Program ecosystem priority for any ecosystem public benefit quantified. See section 6003(a)(1)(Q) of the regulations.

Last Uploaded Attachments: Sites_A1 Ecosystem Priorities.docx

A.2 Ecosystem Benefits:

Attach supporting documentation requested in Ecosystem Priorities worksheets such as maps or other information not already provided elsewhere in the application.

Last Uploaded Attachments: Sites_A2 Ecosystem Documentation.docx

A.1 Water Quality Benefits:

Attach completed Water Quality Priorities table(s). If the project is claiming water quality benefits that meet the water quality priorities, be sure to include the general application questions table as well as tables for each priority being claimed for which funds are being requested. Identify at least one Program water quality priority for any water quality public benefit quantified See section 6003(a)(1)(Q) of the regulations.

Last Uploaded Attachments: Sites_A1 WQ General Questions.docx,Sites_A1 WQ Priority 1.docx,Sites_A1 WQ Priority 6.docx,Sites_A1 WQ Priority 7.docx,Sites_A1 WQ Priority 9.docx

A.2 Water Quality Benefits:

Attach supporting documentation requested in Water Quality Priorities tables such as maps or other information not already provided elsewhere in the application.

Last Uploaded Attachments: Sites_A2 WQ Maps.docx,Sites_A2 Documentation WQ Priority 1.docx,Sites_A2 Documentation WQ Priority 6.docx,Sites_A2 Documentation WQ Priority 9.docx

Q.1 Flood Control Benefits: If the proposed project is not claiming flood control benefits, leave the following questions blank.

If applicable, how will the project provide flood control benefits? If some project operations will be for flood control purposes, explain. Are the flood control benefits realized locally and/or throughout the larger flood control system? (TR section 4.9.2.1) Describe any negative impacts of providing the flood control benefit. (TR section 4.9.2.4)

The proposed project is located in the Colusa Basin watershed in Colusa and Glenn counties. It consists of constructing two main dams, Golden State Dam on Funks Creek and Sites Dam on Stone Corral Creek, and nine saddle dams on the northern end of the reservoir between the Funks Creek and Hunter Creek watersheds along the Glenn-Colusa county line. The existing Funks Dam is located on Funks Creek would be replaced with a new, larger Holthouse Reservoir. As an offstream reservoir, Sites Reservoir does not have a large, upstream watershed. Sites Reservoir can, nevertheless, be operated to provide local flood control benefits by capturing and attenuating flood flows associated with Stone Corral and Funks Creeks and the other local ephemeral watersheds. By capturing flows from extreme storm events, the project will reduce flood damages, such as the February 18, 2017 event that flooded the community of Maxwell and temporarily closed Interstate 5.

Q.2 Flood Control Benefits: If the proposed project is not claiming flood control benefits, leave the following questions blank.

What methods were used to calculate flood damage reduction? Identify which of the following methods was used to quantify physical flood control benefits:

1. Modeling provided with feasibility study
2. New modeling using historical flood events or historical hydrology
3. New modeling using the climate change hydrology data set provided

If 1 or 2 is used, explain how benefits might be different under the provided future climate and sea levels projections. Provide justification for any methods not identified in section 5.4.3 of the TR. See also regulations section 6004(a)(1)(F).

New modeling using historical flood events or historical hydrology was used to determine physical flood damage reduction benefits. Flooding in the watershed currently occurs between October and April due to rainfall-runoff. If rainfall run-off timing and duration are affected by climate change, it is anticipated that the project will provide additional flood damage reduction benefits. Additional information is provided in Attachment A1 (Sites_A1 Flood Control under the PHYSICAL PUBLIC BENEFITS TAB).

A.1 Flood Control Benefits: If the proposed project is not claiming flood control benefits, leave the following questions blank.

Attach any relevant flood damage reduction supporting documentation, such as hydraulic and hydrologic modeling studies, and property flood damage analysis (TR section 4.9.4). If information to support this question is located in another attachment, provide the location.

Last Uploaded Attachments: Sites_A1 Flood Control.docx

Q.1 Emergency Response Benefits: If the proposed project is not claiming emergency response benefits, leave the following questions blank.

If applicable, how will the project be operated to provide emergency response benefits? Identify the types of emergency benefits the proposed project could provide. (TR section 4.11.1). If additional information to support this question is located in another attachment, provide the location.

The Authority is committed to working with the state and federal water managers and emergency personnel to provide water to support emergency events such as, but not limited to, firefighting, drought relief, and Delta levee failures. Instead of dedicating a volume of water that may not be called upon by the state until at least a one-in-ten year event (or longer) occurs, the Authority proposes that should water from Sites Reservoir be used to aid in responding to or recovery from an emergency, that repayment would occur through a mutually-acceptable exchange or transfer of water. As such, this benefit was not monetized and the Authority is not requesting Proposition 1 funding for this purpose. Should the Water Commission be interested in acquiring water to reserve storage for a qualifying Proposition-1 emergency event, the Sites Project Authority will work with the Water Commission to evaluate the concept and, if appropriate, prepare an amendment to this application for the Water Commission?s consideration.

A.1 Emergency Response Benefits: If the proposed project is not claiming emergency response benefits, leave the following questions blank.

Attach a description of the amount or share of stored water to be provided for the emergency benefits and define the conditions under which water would be made available. Describe how the applicant can commit to the conditions under which the emergency benefits would be made available. (TR section 4.11.2)

Q.1 Recreation Benefits: If the proposed project is not claiming recreation benefits, leave the following questions blank.

If applicable, how will the project be operated to provide recreation benefits? If additional information to support this question is located in another attachment, provide the location.

Sites Reservoir will provide new opportunities for surface-water recreation, such as boating, fishing, and swimming. New shoreline facilities at the reservoir will be constructed to support camping, hiking, horseback riding, mountain biking, picnicking, and sightseeing. The project includes two new recreation areas, Stone Corral and Peninsula Hills. Two boat ramps would provide access to the reservoir. Day-use and overnight camping facilities would be constructed on the shore. Sites Reservoir operations would also support the maintenance of higher water levels at Shasta and Folsom Lakes. Beneficial effects were noted in some instances where additional storage in existing facilities resulting from the operation of Sites Reservoir would provide more frequent access to boat ramps at these facilities. Additional recreational benefits will be provided for fishermen in the Sacramento and American River watersheds as a result of increased populations of Chinook salmon and steelhead. Additional information is provided in Sites_A2 Recreation under the PHYSICAL PUBLIC BENEFITS TAB.

Q.2 Recreation Benefits: If the proposed project is not claiming recreation benefits, leave the following questions blank.

By providing new recreation benefits, does the proposed project negatively affect any existing recreation activities either at the proposed project site, at another facility, or nearby recreation area? (TR section 4.10.1.1)

Recreational impacts are evaluated in Chapter 21 of the Draft EIR/EIS (Posted at http://sitesproject.org/information/DraftEIR-EIS). No potentially significant impacts were identified. There are no existing recreational activities in the project footprint. Beneficial effects were noted in some instances where additional storage at nearby recreation areas (e.g., Shasta Lake) will result from the operation of Sites Reservoir, providing more frequent access to boat ramps at these facilities.

Q.3 Recreation Benefits: If the proposed project is not claiming recreation benefits, leave the following questions blank.

Describe the proposed recreation physical benefits including the size of the facility, recreation activities allowed, recreation facilities associated with these activities, and their capacities and seasonal closures and conditions in which facilities are not usable or activities cannot occur. Any supporting analysis should be attached in A.1 below. (TR section 4.10.1.2)

Sites_A2 Recreation under the PHYSICAL PUBLIC BENEFITS TAB contains a description of the proposed recreation facilities.

A.1 Recreation Benefits: If the proposed project is not claiming recreation benefits, leave the following questions blank.

Attach recreation visitation estimates including documentation of estimation methodology.

Last Uploaded Attachments: Sites_A1 Recreation Visitation.docx

A.2 Recreation Benefits: If the proposed project is not claiming recreation benefits, leave the following questions blank.

Attach or provide links to any relevant recreation studies associated with the proposed project.

Last Uploaded Attachments: Sites_A2 Recreation.docx

Section : FEASIBILITY & IMPLEMENTATION RISK

FEASIBILITY & IMPLEMENTATION RISK

A.1 Feasibility Documentation:

Attach feasibility studies or documentation that demonstrates the proposed project's technical, environmental, economic, and financial feasibility as described in TR section 3.5. See also regulations section 6003(a)(1)(O).

Last Uploaded Attachments: Sites_A1 Feasibility.docx

A.2 Permit List:

Provide a listing and status of all local, state, and federal permits, certifications, and other approval necessary for the construction and operation of the project. See section 6003(a)(1)(W) of the regulations.

Last Uploaded Attachments: Sites_A2 Permits.docx

A.3 Schedule:

Attach an estimated schedule for the proposed project until the first year of operation. If the schedule is included in another attachment, identify the location. See section 6003(a)(1)(G) of the regulations.

Last Uploaded Attachments: Sites_A3 Schedule.pdf

A.4 Environmental Document:

Attach the most recent publicly available environmental document for the proposed project. If the document is available on a website, provide a link to the document(s). See section 6003(a)(1)(S) of the regulations.

Last Uploaded Attachments: Sites_A4 Environmental.pdf

A.5 Impacts and Consultation:

Summarize the project's impacts on environmental or cultural resources and how the project will mitigate or minimize impacts to those resources, or identify where in the CEQA document this information can be found. If any environmental or cultural impacts will not be fully mitigated, explain. See regulations section 6003(a)(1)(T).

If applicable, identify whether Tribal consultation has been initiated for the project. If it has, provide supporting documentation, or identify the location in the CEQA document. If consultation has not been initiated, state whether consultation is expected and when consultation is expected to be initiated. See regulations section 6003(a)(1)(U).

Last Uploaded Attachments: Sites_A5 Impacts and Tribal.docx

Section : BENEFIT CALCULATION, MONETIZATION, and RESILIENCY

BENEFIT CALCULATION, MONETIZATION, and RESILIENCY

Q.1:

Did the applicant use the model products and assumptions described in section 6004(a)(1) of the regulations? See regulations section 6003(a)(1)(CC). If no, provide a description of the models and assumptions used to determine the without-project future conditions for years 2030 and 2070.

The analyses conducted for the Sites Reservoir Project utilized the model products and assumptions described in section 6004(a)(1). This includes the 2030 and 2070 future conditions CalSim II and DSM2 models provided by the California Water Commission on November 2, 2016. The models provided by the commission were modified to include the facilities and operation of the Sites Project as described in the Project Description and Assumptions section. The with- and without-project current conditions analyses were based on the DWR State Water Project Delivery Capability Report 2015 (DCR 2015) - CalSim II base scenario. The DCR 2015 base scenario, provided by DWR, was modified to include the facilities and operation of the Sites Project. The project description and assumptions for the with-project current condition are the same as for the 2030 and 2070 with-project conditions. The analyses also included the use of other analytical tools that were updated for future 2030 and 2070 conditions. These tools include: - USRDOM - Upper Sacramento River Daily Operations Model - Sacramento River HEC5Q model - SALMOD - American River CE-QUAL-W2 Model - CWEST - SWAP - LTGEN - SWP Power - NODOS Power

A.1 Project Conditions:

Attach description and assumptions of with-project conditions for years 2030 and 2070, as defined in section 6004(a)(2) of the regulations, as well as a description of the with- and without-project current conditions. See also regulations section 6003(a)(1)(BB).

Last Uploaded Attachments: Sites_A1 Modeling.docx

A.2 Preliminary Operations Plan:

Attach the preliminary operations plan for the proposed project. See regulations section 6003(a)(1)(H) for details. If the preliminary operations plan is located in another attachment, identify the attachment and provide the location.

Last Uploaded Attachments: Sites_A2 Operations.docx

A.3 Monetized Benefits Analysis:

Attach the analysis of all public and non-public monetized benefits. Identify at least one Program ecosystem or water quality priority for any ecosystem or water quality public benefit quantified. For each public and non-public benefit, describe the methods used to derive the physical and economic benefits and impacts at a level of detail that allows reviewers to verify your analysis.

Description must include:

- The physical changes that are being monetized, consistent with information requested in the Physical Public Benefits Tab, and describing linkages between physical benefits and monetized benefits. See regulations sections 6004(a)(3) and 6004(a)(4); and
- The monetization method and sources for data used. See regulations section 6004(a)(4).

Last Uploaded Attachments: Sites_A3 Physical Monetized.docx

A.4 Mitigation and Compliance Obligation:

For each net public benefit claimed, where applicable, identify any existing environmental mitigation or compliance obligations that are accounted for in each net public benefit as of the date of the CalSim-II model product in section 6004 (a)(1).

- Applicants that use the CalSim-II and DSM2 models to analyze their projects can indicate "within models" for any existing environmental mitigation and compliance obligations contained in those models.
- If applicable to their claimed net public benefit such projects shall also list and account for the non-flow related mitigation and compliance obligations of the State Water Project and Central Valley Project.

Last Uploaded Attachments: Sites_A4 Mitigation.docx

A.5 Quantification Support:

Provide additional information that supports the physical and monetary quantification of the public and non-public benefits and impacts of the project as required by subsection 6004(a)(4) of the regulations. This includes data, assumptions, analytical methods and modeling results, calculations and relevant sources of information. For reference documents or studies relied upon, applicants may provide links to an existing website in lieu of attaching those documents to the application.

Last Uploaded Attachments: Sites_A5 Documentation.docx

A.6 Monetization Table:

Attach a table displaying each future economic benefit in 2015 dollars for each year of the planning horizon as required by section 6004(a)(4)(A) of the regulations.

Last Uploaded Attachments: Sites_A6 Annual Benefits Table.docx

A.7 Non-Monetized Benefits:

If applicable, provide a summary of public benefits that cannot be monetized. Provide the following information for each non-monetized benefit.

- Justification why benefit cannot be monetized,
- Qualitative description of importance of benefit (who is affected, how and how often),
- Evidence to show how the physical change is beneficial and important to Californians.

Last Uploaded Attachments: Sites_A7 Non_Monetized.docx

A.8 Total Project Cost Estimate:

Attach an estimate of the total project costs that includes construction cost, interest during construction, land acquisition, monitoring, environmental mitigation or compliance obligations, operations and maintenance, repair, and replacement costs during the planning horizon using methods described in TR section 6. If the project costs are located in another attachment, identify the location.

The project cost estimates must be reviewed, approved and signed by an engineer licensed by the California Board for Professional Engineers, Land Surveyors, and Geologists.

Last Uploaded Attachments: Sites_A8 Estimate.pdf

A.9 Benefit and Cost Analysis:

Attach the benefit and cost analysis for the proposed project. If the analysis is located in another document, identify the location. See regulations section 6004(a)(6).

Last Uploaded Attachments: Sites_A9 BCA Results.docx

A.10 Cost Allocation:

Provide a proposed allocation of total project costs to all project beneficiaries, including the Program, and an explanation of how the allocation was calculated, consistent with TR section 8 and section 6004(a)(7) of the regulations. If this information is included in another attachment, identify the location.

Last Uploaded Attachments: Sites_A10 Allocation.docx

A.11 Physical and Economic Summary Table:

Attach the Physical and Economic Benefits Summary tables. These tables can be downloaded from the Commission website and uploaded with the application. See regulations section 6003(a)(1)(N).

Last Uploaded Attachments: Sites_A11 Physical and Economic Benefits Summary Tables.xlsx

A.12 Uncertainty Analysis:

Attach the uncertainty analysis. See regulations section 6004(a)(8).

Last Uploaded Attachments: Sites_A12 Uncertainty.docx

Section : PROGRAM REQUIREMENTS

PROGRAM REQUIREMENTS

Q.1:

Describe how the project improves the operation of the state water system. See regulations section 6003(a)(1)(M).

Sites Reservoir would improve operational flexibility and reliability of the state water system, especially within the service areas of both the SWP and CVP, in addition to allowing California resource agencies to purposely allocate water for the benefit of environmental uses. CALSIM modeling results indicate that average long-term end of May storage in Lake Oroville would increase by 26 TAF in 2030 and further increase by an additional 31 TAF in 2070 through exchanges with Sites Reservoir. This demonstrates the resiliency of the improvement in the SWP. Likewise, long-term average storage in CVP reservoirs would also increase. End-of-May storage in Shasta Lake would increase by 59 TAF in 2030 and then increase by an additional 80 TAF in 2070. Storage in existing reservoirs that are cooperatively managed with the Sites Project would increase in all year types. This additional storage would provide the state water system greater flexibility in operating the overall system without negative impacts to water supplies and providing California resource agencies with a water supply dedicated to the environment. Sites Reservoir would be operated collaboratively with the SWP and CVP. The SWP and CVP would make their annual allocations and deliveries as normal. Exchanges with water stored in Sites Reservoir would help to maintain supplies in the existing reservoirs and produce the public benefits described for the project. Sites Reservoir would provide supplemental water that is much needed when allocations are low. Sites Reservoir Project would augment deliveries for both water supply and public benefits, especially during drought years. Sites Reservoir is beneficially located where it can support the operations of existing reservoirs north of the Delta, provide water to the Yolo Bypass for ecosystem restoration, deliver water to be picked up at the North Bay Aqueduct, and export water to the San Joaquin Valley and Southern California. In addition to preserving water in existing SWP and CVP reservoirs through exchange, Sites Reservoir would facilitate water transfers, one of the initiatives in the California Water Action Plan. Water from Sites could be moved south of the Delta to fill Diamond Valley Reservoir or provided for groundwater recharge to Coachella Valley Water District and Desert Water Agency. This topic is further discussed in the Executive Summary (Sites_A1 ExecSum under the ELIGIBILITY AND GENERAL PROJECT INFORMATION TAB).

Q.2:

Describe how the project provides a net improvement in ecosystem and water quality conditions required by Water Code section 79750.

Sites Reservoir would deliver an average of 125 TAF/yr from 2030 to 2070 for improving ecosystem and water quality conditions. This is an unprecedented amount of water that the State resources agencies will be able to directly manage for environmental benefit. Furthermore, cooperatively managing the operation of Sites Reservoir with State and Federal facilities will preserve higher water levels in the existing reservoirs and thereby protect the coldwater pools, improve temperature conditions downstream for existing reservoirs, and provide flows to support the migration of aquatic species in a variety of life stages. The potential benefits of the project for fish were modeled using SALMOD. Modeling results predict net improvements in fish populations for Chinook salmon (including endangered winter-run) under 2015, 2030, and 2070 conditions. By providing releases to the Yolo Bypass, Sites Reservoir Project can also benefit Delta smelt, however, there are insufficient studies to characterize the magnitude of this benefit at this time. Sites Reservoir Project would excel in providing opportunities for in lieu use of surface water, thereby reducing the chronic lowering of groundwater levels, an undesirable result under SGMA. Sites Reservoir will also support the delivery of water for basic human needs to disadvantaged communities. See Sites_A4 Mitigation under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB and Sites_A5 Documentation under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB for further analysis.

Q.3:

If applicable, summarize how the applicant is coordinating with the owners and operators of water system facilities not owned or operated by the applicant or project partners that may be affected by the project. See regulations section 6003 (a)(1)(P).

The Authority is coordinating the development of operations with the Department of Water Resources and the U.S. Bureau of Reclamation. This coordination includes the future development of Principles of Agreement governing operations. See Sites_A6 Annual Benefits Table under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB. A list of project partners is provided in Sites_A1 Feasibility under the FEASIBILITY AND IMPLEMENTATION RISK TAB.

Q.4:

Describe how the project advances the long-term objectives of restoring the ecological health and improving water management for beneficial uses of the Delta. See regulations section 6003(a)(1)(R).

The operations proposed for Sites Reservoir Project were developed with the intent of contributing to the attainment of the co-equal goals for the Delta of ecological health and improving water management for beneficial use. As a result, the annual yield from the Sites Project is divided between environmental and water supply purposes. The Sites Project would provide a unique opportunity to allocate reservoir storage and establish the first firm asset Ecosystem Enhancement Account in California. Based on the operations assumptions included in this application, the allocated storage would deliver approximately 125 TAF/yr (in 2030 through 2070 (with deliveries of up to 200 TAF/yr in critically dry years) that would be managed by the State (CDFW, SWRCB, and DWR) and Federal government to perform restoration actions beyond existing regulatory requirements. Conceptually, this account would use Sites Reservoir project assets to support modified operations that facilitate habitat enhancement actions. A Sites Reservoir Ecosystem Enhancement Governance Board would be created to manage the water account. The water account would be managed to adaptively support operational actions and respond to changing future conditions throughout the Sacramento River watershed and Delta. Sites Reservoir would also provide water for beneficial uses throughout the State, including water for agriculture and M&I purposes, and State and Federal wildlife refuges. Project participants include agencies in the Sacramento River Valley, Bay Area, San Joaquin Valley, Southern Desert, and South Coast regions of California.

Q.5:

Describe how the applicant will ensure that the proposed project will comply with and be consistent with all applicable local, state, and federal laws and regulations, including existing environmental mitigation or compliance obligation requirements. See regulations section 6003(a)(1)(V).

The Authority has initiated pre-applications discussions with several of the critical resource management and regulatory agencies in order to expedite compliance with all required laws and regulations. This early and diligent effort to understand the evolving concerns for regulatory compliance will reduce the overall compliance schedule and help ensure compliance with all applicable local, state, and federal laws in the planning, construction, and operation of Sites Reservoir, including mitigation requirements. The EIR/EIS (attached at http://sitesproject.org/information/DraftEIR-EIS) describes the impacts and mitigation measures that when implemented would reduce or avoid impacts and support compliance with all applicable laws, regulations, and statutes. This includes all applicable regulations regarding water operations on the Sacramento River. Regulations are identified in Sites_A2 Permits under the FEASIBILITY AND IMPLEMENTATION RISK TAB. The Authority's commitment to mitigation is further described under Sites_A4 Mitigation under the BENEFIT CALCULATION, MONETIZATION, AND RESILIENCY TAB.

A.1 Delta or Tributary Measurable Improvement:

What measurable improvements to the Delta ecosystem or tributary to the Delta does the project provide? Where is the location of the improvement? If the project is not within the watershed of the Delta, what specific water rights or water contracts would be created or amended to ensure public benefits to the Delta ecosystem? Provide supporting documentation of the willingness of these water right or water contract holders to enter into such contracts or amendments. Explain how these changes would assure measurable improvements to the Delta ecosystem. See regulations section 6003(a)(1)(L).

Last Uploaded Attachments: Sites_A1 Measureable Benefits.docx

A.2 Cost Effectiveness:

Provide documentation indicating the proposed project is cost-effective. If there is at least one feasible alternative means of providing the same amount or more of the total public and non-public physical benefits as provided by the proposed project, calculate, display and document the least-cost of these alternative means and justify the proposed project by comparison.

Section : EARLY FUNDING REQUEST

EARLY FUNDING REQUEST

Q.1:

Is early funding for completing environmental documentation and/or permits requested? If yes, answer the following question and provide the requested information. See regulations section 6003(a)(1)(X).

Yes.

Q.2:

What is the requested amount?

Requesting 50% of $91,851,000 or $45,925,500.

A.1 Early Funding Scope, Schedule, Budget:

Attach a schedule, scope of work, and budget.

- Keep in mind that the applicant must provide a 50 percent cost share and reimbursable costs can only go back to November 4, 2014.
- Scope of work must include an explanation of why early funding is critical to the project, the viability of the project in the absence of this funding and how the project will proceed once early funding is expended.
- The scope of work cannot include work performed prior to submittal of the application.
- The tasks in the schedule, scope of work and budget should match.
