Lake Perris is located adjacent to the cities of Moreno Valley and Perris and the Perris Fairgrounds which includes a motor sports complex (DWR 2010a). Lake Perris is located within the Lake Perris State Recreation Area which provides extensive recreational opportunities, as described in Chapter 15, Recreation Resources. The open space areas are characterized by willow and sage scrub, willow and eucalyptus woodland, and nonnative grassland. The scrub areas include California sagebrush, lemonadeberry, sugarbush, yellow bush penstemon, coyote brush, Mexican elderberry, sweetbush, boxthorn, tall prickly-pear, California buckwheat, red brome, bur ragweed, California aster, ripgut brome, sticky monkeyflower, prickly sow thistle, and Russian thistle. The willow woodland includes Goodding's black willow, red willow, narrow leaved willow, Fremont's cottonwood, California sycamore, gooseberry, mulefat, tarragon, curley dock, ragweed, southwestern spinyrush, and bromes. Eucalyptus woodland includes eucalyptus underlain by nonnative grassland. Nonnative grasslands includes soft chess, wild oat, foxtail barley, mustard, sweet fennel, California sagebrush, and California buckwheat. Habitat has been restored within the grasslands to provide habitat for the Stephen's Kangaroo Rat. Mourning Dove, Anna's Hummingbird, raven, California Kingsnake, Raccoon, Black-Tailed Deer, Striped Skunk, coyote, and bobcat use the shoreline. The woodland is used by Ash-Throated Flycatcher, Western Kingbird, Least Bell's Vireo, House Wren, California Towhee, Spotted Towhee, Black-Headed Grosbeak, Blue Grosbeak, Song Sparrow, Bullock's Oriole, House Finch, Lesser Goldfinch, Nuttal's Woodpecker, Red-Tailed Hawk, Red-Shouldered Hawk, Cooper's Hawk, Cottontail Rabbit, Black-Tailed Jackrabbit, raccoon, and Long-Tailed Weasel. The scrub supports California Quail, Greater Roadrunner, White-Throated Swift, Rock Wren, California Towhee, Western Fence Lizard, Gopher Snake, Red Diamond Rattlesnake, Southern Pacific Rattlesnake, Side Blotched Lizard, Granite Spiny Lizard, Coastal Western Whiptail, Black-Tailed Jackrabbit, bobcat, coyote, and rodents.

#### *10.3.6.2 Non-SWP Reservoirs in Riverside County*

Non-SWP reservoirs in Riverside County that store SWP water include Diamond Valley Lake and Lake Skinner that are owned and operated by Metropolitan Water District of Southern California, and Vail Lake that is owned and operated by Rancho California Water District, as described in Chapter 5, Surface Water Resources and Water Supplies.

Diamond Valley Lake is located adjacent to the City of Hemet along the northern boundary, and adjacent to pasture and dairies along the eastern and western boundaries (City of Hemet 2012). Sage scrub and nonnative grasslands occur between the lake and the City of Hemet. Chaparral with sage scrub occur along the southern boundary of the lake. Riversidean sage scrub includes California sagebrush, flat top buckwheat, black sage, and California encelia. Wildlife movement corridors occur around Diamond Valley Lake. Open space around Lake Skinner is also characterized by grassland and sage scrub vegetation (USFWS 2004).

Diamond Valley Lake and Lake Skinner are located within the Southwestern Riverside County Multi-Species Reserve, an area of 11,000 acres surrounding and connecting Diamond Valley Lake and Lake Skinner through the Dr. Roy Shipley Reserve (MWD 2014). At least eight types of habitat are found in the reserve, but coastal sage scrub, nonnative grassland, and chaparral are dominant. There are smaller areas of coast live oak woodland, willow scrub with live oak, and cottonwood-willow riparian forests. The reserve is home to the California Gnatcatcher, Bell's Sage Sparrow, San Diego Horned Lizard, Payson's Jewelflower, and Parry's Spineflower.

Areas around Vail Lake support habitat for Bald Eagle, Golden Eagle, and Great Blue Heron (RCWD 2015).

#### *10.3.6.3 Non-SWP Reservoir in Ventura County*

Lake Piru, located in Ventura County, is used to store SWP water by United Water Conservation District, as described in Chapter 5, Surface Water Resources and Water Supplies (UWCD 1999, 2014). The area surrounding the lake is characterized by chaparral on the hills and coast live oak woodlands along the stream channels.

#### *10.3.6.4 Non-SWP Reservoirs in San Diego County*

Reservoirs in San Diego County that are used to store SWP water include the City of Escondido Dixon Lake; City of San Diego San Vicente, El Capitan, Lower Otay, and Lake Hodges reservoirs; Lake Jennings owned by Helix Water District; and Sweetwater Reservoir owned by Sweetwater Authority.

Dixon Lake is located in the hills above the City of Escondido within the Escondido Multiple Habitat Conservation Plan area (City of Escondido 2012). Habitat around Lake Dixon is characterized by coastal sage scrub and chaparral. The coastal sage scrub includes California sagebrush, flat-top buckwheat, white sage, laurel sumac, black sage, California encelia, San Diego County viguiera, goldenbush, coast prickly-pear, and lemonadeberry and sugarbush. Chaparral includes chamise, scrub oak, toyon, thick-leaf ceanothus, black sage, wild cucumber, morning glory, saw-toothed goldenbush, and nonnative grasses.

The San Vicente Reservoir is characterized by rocky or coarse sand, with occasional willow trees and mulefat (SDCWA and USACE 2008). The constantly fluctuating water levels make it difficult for wetland or riparian vegetation to become established. Much of the shoreline around San Vicente Reservoir, therefore, is a non-vegetated fringe. Outside of the fringe, the area around the reservoir is primarily sage scrub with nonnative grassland and coast live oak woodland. Along the stream channel, vegetation includes southern willow scrub and live oak riparian forest with chaparral. Submerged aquatic vegetation occurs in an intermittent band surrounding almost the entire reservoir. Freshwater marsh vegetation of cattail, bulrush, and sedges occurs between the open water and lakeshore fringe. Birds associated with the open water include grebe, cormorant, heron, egret, ducks and geese, coot, plover, sandpiper, gull, and tern. Other birds associated with open water and riparian habitats include the bald eagle, osprey, and kingfisher. The uplands support rabbit, snakes, lizards, ground squirrel, pocket gopher, raccoon, mule deer, bats, mice, fox, skunk, bobcat, and mountain lion.

El Capitan Reservoir is located within Diegan coastal sage scrub with areas of oak woodlands and chaparral (San Diego County 2011; SDRWWG 2005; SDRP 2015). The Lower Otay Reservoir, Lake Hodges, and Lake Jennings are located within coastal sage scrub. Sweetwater Reservoir is surrounded by coastal sage scrub and chaparral with riparian forest along stream channels.

#### *10.3.6.5 Non-SWP Reservoir in San Bernardino County*

Lake Arrowhead, in San Bernardino County, is used to store SWP water by the Lake Arrowhead Community Services District (County of San Bernardino 2011; LACSD 2014a, 2014b). Lake Arrowhead is located within chaparral, sage scrub, oak woodlands, oak and sycamore woodlands, dogwood tree along the lake, cottonwood and willow forests along stream channels, Ponderosa pine forests, and wetlands. The habitat supports Stellar Jay, blue jay, quail, ducks, western Tanager, Northern Tanager, woodpecker, chickadee, Barn Owl, Bald Eagle, hawks, rattlesnake, coyote, bobcat, Black Bear, Gray Squirrel, Ground Squirrel, chipmunk, raccoon, mountain lion, skunk, and cougar.

## 10.4 Impact Analysis

This section describes the potential mechanisms and analytical methods for change in terrestrial resources; results of the impact analysis; potential mitigation measures; and cumulative effects.

### 10.4.1 Potential Mechanisms for Change and Analytical Methods

As described in Chapter 4, Approach to Environmental Analysis, the impact analysis considers changes in terrestrial resources conditions related to changes in CVP and SWP operations under the alternatives as compared to the No Action Alternative and Second Basis of Comparison.

Changes in CVP and SWP operations under the alternatives as compared to the No Action Alternative and Second Basis of Comparison could change surface water resources affected by CVP and SWP operations.

#### *10.4.1.1 Changes in CVP and SWP Reservoir Elevations*

Changes in surface water elevations at the CVP and SWP reservoirs would influence the extent of the drawdown zone (the area of shoreline between the full inundation elevation and the water level), which can influence the availability and quality of nesting habitat for some ground-nesting birds (e.g., waterfowl) and possibly the prey base for nesting fish-eating raptors (e.g., Bald Eagle and Osprey) in March through June. The creation of barren zones through reservoir drawdown can also affect the ability of wildlife species to access water, which could cause them to be more vulnerable to predation.

As described in Chapter 5, Surface Water Resources and Water Supplies, surface water elevations would be similar in all months and all water year types at Trinity Lake, Shasta Lake, Lake Oroville, Folsom Lake, and New Melones Reservoir under Alternatives 1 through 5 as compared to the No Action Alternative and the Second Basis of Comparison. Surface water elevations would change at San Luis Reservoir under Alternatives 1 through 5 as compared to the No Action Alternative and the Second Basis of Comparison. However, it does not appear that nesting fish-eating raptors or ground-nesting waterfowl use the San Luis Reservoir shoreline during these nesting lifestages (Reclamation 2013). Therefore, changes in CVP and SWP operations under the alternatives would result in similar conditions (within 5 percent change) for terrestrial resources at CVP and SWP reservoirs; and these factors are not analyzed in this EIS.

##### *10.4.1.2 Changes in Rivers Downstream of the CVP and SWP Reservoirs*

Operation of the CVP and SWP would influence flow regimes that renew and support adjacent riparian and wetland plant and wildlife communities. For example, certain riparian plants (e.g., willows) require a specific sequence and timing of flow events to prepare the seedbed and to support germination and seedling growth in March through May. Changes in flow that support or interfere with these processes could influence riparian vegetation and its value as wildlife habitat. The analysis is focused on Trinity, Sacramento, Feather, American, and Stanislaus rivers because these rivers are used to convey water from the reservoirs to CVP and SWP water users. Therefore, changes in CVP and SWP operations could result in substantial changes in flow patterns in these rivers. At other reservoirs that are used to store CVP and SWP water supplies (e.g., San Luis Reservoir), the CVP and SWP water are conveyed from the reservoirs in canals or pipelines. The reservoirs may be operated to provide minimum flows to support habitat in streams adjacent to these reservoirs; however, changes in CVP and SWP operations would not affect the minimum instream flow releases. Therefore, changes in terrestrial resources in these streams is not analyzed in this EIS.

Channel maintenance flows to improve adjacent floodplain habitat conditions would occur along Clear Creek under the No Action Alternative and Alternatives 2 and 5, to the extent possible. The high-flow, short-duration pulse flows would be released, if physically possible, from Whiskeytown Lake to mobilize streambed material in Clear Creek in accordance with the 2009 NMFS Biological Opinion (BO).

##### *10.4.1.3 Changes in Sacramento, American, and Stanislaus Rivers Habitats due to Fish Passage at Dams*

Fish passage would be provided under the No Action Alternative and Alternative 5 around Shasta, Folsom, and New Melones dams. Salmon runs play an important role in the transfer of large quantities of marine-derived nutrients to adjacent forest ecosystems with substantial effects on plant and wildlife production. Spawning salmon contribute to the release of nutrients into streams through normal metabolic processes, release of gametes during spawning, decay of their carcasses following death, and through consumption of their flesh by predators and scavengers (Merz and Moyle 2006). Returning fish to the upper stream segments, fish passage could influence the forest ecosystem and associated wildlife in the upper watersheds and result in less nutrients along the rivers downstream of the dams. This analysis would assume that the objectives of the 2009 NMFS BO were achieved by 2030, including implementation of fish passage at these CVP reservoirs. However, any changes in nutrients in the stream corridors are expected to be minimal based on information in Merz and Moyle (2006). Therefore, habitat conditions related to changes in nutrient loading associated with fish passage actions would be the same under Alternatives 1 through 5 as under the No Action Alternative and the Second Basis of Comparison. Therefore, this potential change is not analyzed in this EIS.

#### *10.4.1.4 Changes in River and Delta Floodplains*

Alternative 4 assumes additional institutional requirements for development within the floodplain and floodways that would require compliance with Endangered Species Act in defining floodplain map revisions, allow for improvements in floodplain management criteria to support natural and beneficial functions, and prohibit new development and substantial improvements to existing development within any designated floodway or within 170 feet of the ordinary high water line of any floodway. However, as described in Chapter 13, Land Use, in 2030, development along major river corridors in the Central Valley would continue to be limited by state regulations implemented by the Central Valley Flood Protection Board and the USACE.

Within the Delta, the floodways are further regulated by the Delta Protection Commission and Delta Stewardship Council to preserve and protect the natural resources of the Delta; and prevent encroachment into Delta floodways. These regulations, as implemented in all alternatives and the Second Basis of Comparison, would prevent development within the Delta floodplains and floodways and in the Sacramento, Feather, American, and San Joaquin rivers corridors upstream of the Delta, as described in Chapter 13. Provisions in Alternative 4 would require additional setbacks along the floodways as compared to other alternatives and the Second Basis of Comparison. The qualitative analysis considers the potential changes in habitat due to these changes in floodplain and floodway development regulations.

Another potential change in Delta habitat would occur under Alternative 4, additional vegetation would remain along the levees in the Delta as compared to conditions under the other alternatives, the No Action Alternative, and the Second Basis of Comparison, as described in Chapter 3, Description of Alternatives. Under Alternatives 1, 2, 3, and 5; the No Action Alternative; and the Second Basis of Comparison existing vegetation would remain along the Delta levees until the levees are repaired. Following repairs, vegetation would be removed along the riparian corridor to improve the structural reliability of the levees in accordance with USACE requirements. It is assumed that by 2030, much of the vegetation would be removed from the levees due to levee repairs.

#### *10.4.1.5 Changes in Flows over Fremont Weir into the Yolo Bypass*

All of the alternatives, including the No Action Alternative and the Second Basis of Comparison, include operations of an operable gate at Fremont Weir, as described in Chapter 3, Description of Alternatives. However, the flow patterns into the Yolo Bypass would change based upon the magnitude of flows in the Sacramento River at Fremont Weir.

#### *10.4.1.6 Changes in Wetlands Habitat*

The No Action Alternative, Alternatives 1 through 5, and Second Basis of Comparison all include implementation of restoration of more than 10,000 acres of intertidal and associated subtidal wetlands in Suisun Marsh and Cache Slough; 17,000 to 20,000 acres of seasonal floodplain restoration in the Yolo Bypass; and continued delivery of refuge water supplies under the Central Valley Project Improvement Act. There would be no changes in wetlands habitat between Alternatives 1 through 5 as compared to the No Action Alternative, and the Second Basis of Comparison. Therefore, changes to wetland habitats are not analyzed in this EIS.

#### *10.4.1.7 Changes in Delta Habitat*

Changes in CVP and SWP operations under the alternatives as compared to the No Action Alternative and Second Basis of Comparison would change the Delta salinity which could affect survival of riparian vegetation. The analysis evaluates changes in salinity by comparing the end of month X2 position.

Another potential change in Delta habitat would occur under Alternative 4, due to additional vegetation along the levees in the Delta as compared to conditions under the other alternatives, the No Action Alternative, and the Second Basis of Comparison, as described in Chapter 3, Description of Alternatives.

#### *10.4.1.8 Changes in Irrigated Agricultural Acreage Habitats in Areas that use CVP and SWP Water*

As described in Section 10.3, Affected Environment, agricultural lands provide considerable value to terrestrial wildlife, which varies with crop type and wildlife species. Generally, rice production provides high habitat value for some species because it supports many of the attributes of wetlands. Most notably, flooded rice fields during the growing season provide foraging and nesting habitat for waterfowl and shorebirds, as well as habitat for the federally listed Giant Garter Snake. In the fall and early winter, flooding for rice straw decomposition plays an important role in providing habitat for migrating waterbirds. Other crops, such as alfalfa and irrigated pasture, also provide habitat value, primarily because of their perennial nature and the application of flood irrigation. These crops provide valuable foraging habitat for species such as the state-listed Swainson’s Hawk. Grain crops provide seasonal value to species such as Greater Sandhill Crane and others, but orchards, vineyards, vegetable, and truck crops generally provide relatively low habitat value for terrestrial species.

Changes in CVP and SWP operations under the alternatives could change the extent of irrigated acreage and associated habitats over the long-term average condition and in dry and critical dry years as compared to the No Action Alternative and Second Basis of Comparison, as described in Chapter 12, Agricultural Resources. However, irrigated acreage under Alternatives 1 through 5 would be similar (within 5 percent change) to irrigated acreage under the No Action Alternative and the Second Basis of Comparison. Therefore, there would be no change in terrestrial habitat at the irrigated acreage; and this factor is not analyzed in this EIS.

#### *10.4.1.9 Effects due to Cross Delta Water Transfers*

Historically water transfer programs have been developed on an annual basis. The demand for water transfers is dependent upon the availability of water supplies to meet water demands. Water transfer transactions have increased over time as CVP and SWP water supply availability has decreased, especially during drier water years.

Parties seeking water transfers generally acquire water from sellers who have available surface water and who can make the water available through releasing previously stored water, pumping groundwater instead of using surface water (groundwater substitution); idling crops; or substituting crops that uses less water in order to reduce normal consumptive use of surface water.

Water transfers using CVP and SWP Delta pumping plants and south of Delta canals generally occur when there is unused capacity in these facilities. These conditions generally occur during drier water year types when the flows from upstream reservoirs plus unregulated flows are adequate to meet the Sacramento Valley water demands and the CVP and SWP export allocations. In non-wet years, the CVP and SWP water allocations would be less than full contract amounts; therefore, capacity may be available in the CVP and SWP conveyance facilities to move water from other sources.

Projecting future terrestrial resources conditions related to water transfer activities is difficult because specific water transfer actions required to make the water available, convey the water, and/or use the water would change each year due to changing hydrological conditions, CVP and SWP water availability, specific local agency operations, and local cropping patterns. Reclamation recently prepared a long-term regional water transfer environmental document which evaluated potential changes in conditions related to water transfer actions (Reclamation 2014d). Results from this analysis were used to inform the impact assessment of potential effects of water transfers under the alternatives as compared to the No Action Alternative and the Second Basis of Comparison.

### 10.4.2 Conditions in Year 2030 without Implementation of Alternatives 1 through 5

This EIS includes two bases of comparison, as described in Chapter 3, Description of Alternatives: the No Action Alternative and the Second Basis of Comparison. Both of these bases are evaluated at 2030 conditions.

Changes that would occur over the next 15 years without implementation of the alternatives are not analyzed in this EIS. However, the changes to terrestrial resources that are assumed to occur by 2030 under the No Action Alternative and the Second Basis of Comparison are summarized in this section. Many of the changed conditions would occur in the same manner under both the No Action Alternative and the Second Basis of Comparison.

#### *10.4.2.1 Common Changes in Conditions under the No Action Alternative and Second Basis of Comparison*

Conditions in 2030 would be different than existing conditions due to:

- Climate change and sea level rise
- General plan development throughout California, including increased water demands in portions of Sacramento Valley.
- Implementation of reasonable and foreseeable water resources management projects to provide water supplies, including general plan development, future water management and supply projects, and river and Delta floodplain development.

##### 10.4.2.1.1 Climate Change and Sea Level Rise

It is anticipated that climate change would result in more short-duration high-rainfall events and less snowpack in the winter and early spring months. The reservoirs would be full more frequently by the end of April or May by 2030 than in recent historical conditions. However, as the water is released in the spring, there would be less snowpack to refill the reservoirs. This condition would reduce reservoir storage and available water supplies to downstream uses in the summer. The reduced end of September storage also would reduce the ability to release stored water to downstream regional reservoirs. These conditions would occur for all reservoirs in the California foothills and mountains, including non-CVP and SWP reservoirs.

These changes would result in a decline of the long-term average CVP and SWP water supply deliveries by 2030 as compared to recent historical long-term average deliveries under the No Action Alternative and the Second Basis of Comparison. However, the CVP and SWP water deliveries would be less under the No Action Alternative as compared to the Second Basis of Comparison, as described in Chapter 5, Surface Water Resources and Water Supplies, which could result in more crop idling.

The Delta estuarine habitat is complex due to the freshwater-saltwater interface that supports numerous terrestrial species that require freshwater conditions primarily in the winter and spring and may withstand periods of higher salinity in the late summer and fall months. Climate change and sea level rise and CVP and SWP operations would change the location of the freshwater-saltwater interface in the Delta which would affect the survivability of vegetation within that area, especially in the western Delta and Suisun Marsh. Operations of the CVP and SWP would continue to maintain freshwater conditions in the spring in accordance with the State Water Resources Control Board Decision 1641. However, higher salinity conditions would occur in the summer months and in the fall of drier years which would affect the types of riparian vegetation in the western Delta and in Suisun Marsh under the No Action Alternative and Second Basis of Comparison in 2030 as compared to recent historical conditions.

#### 10.4.2.1.2 Reasonable and Foreseeable Projects and Programs

Under the No Action Alternative and the Second Basis of Comparison, land uses in 2030 would occur in accordance with adopted general plans. Development under the general plans would change terrestrial resources, especially near municipal areas.

The No Action Alternative and the Second Basis of Comparison assumes completion of water resources management and environmental restoration projects that would have occurred without implementation of Alternatives 1 through 5, including regional and local recycling projects, surface water and groundwater storage projects, conveyance improvement projects, and desalination projects, as described in Chapter 3, Description of Alternatives. The No Action Alternative and the Second Basis of Comparison also assumes implementation of actions included in the 2008 U.S. Fish and Wildlife Service (USFWS) Biological Opinion (BO) and 2009 National Marine Fisheries Service (NMFS) BO that would have been implemented without the BOs by 2030, as described in Chapter 3, Description of Alternatives. These projects would include several projects that would affect terrestrial resources, including:

- Habitat Restoration includes restoration of more than 10,000 acres of intertidal and associated subtidal wetlands in Suisun Marsh and Cache Slough; and at least 17,000 to 20,000 acres of seasonal floodplain restoration in Yolo Bypass.
- Sacramento River, American River, and Clear Creek Spawning Gravel Augmentation.
- Battle Creek Restoration.
- Lower American River Flow Management Standard.

#### 10.4.2.1.3 Changes in River and Delta Floodplains

It is assumed that under the No Action Alternative and the Second Basis of Comparison, the State of California would continue to implement flood management projects to reduce flood risks along the Sacramento and San Joaquin rivers and in the Delta (DWR 2013b). These programs would be implemented in a manner that would be coordinated with opportunities to restore or maintain the function of natural systems with consideration of future conditions with climate change and sea level rise. However, terrestrial resources would be changed by 2030 as compared to recent historical conditions.

Terrestrial resources along Delta levees also would be affected through implementation of USACE policies for vegetation on levees. Historically, the USACE has allowed brush and small trees to be located on the waterside of federal flood management project levees if the vegetation would preserve, protect, and/or enhance natural resources, and/or protect rights of Native Americans, while maintaining the safety, structural integrity, and functionality of the levee (DWR 2011). After Hurricane Katrina in 2005, the USACE issued a policy and draft policy guidance to remove substantial vegetation from these levees throughout the nation (USACE 2009). This policy requires federally authorized levee systems that have maintenance agreements with the USACE (including Delta levees along the Sacramento and San Joaquin rivers) and other levees that are eligible for the federal Rehabilitation and Inspection Program (Public Law 84-99) to remove vegetation in the following manner.

- Removal of all vegetation from the upper third of the waterside slope of the levee, the top of the levee, landside slope of the levee, or within 15 feet of the toe of the levee on the landside ("toe" is where the levee slope meets the ground surfaces).
- Removal of all vegetation over 2 inches in diameter on the lower two-thirds of the waterside slope of the levee and within 15 feet of the toe of the levee on the waterside along benches above the water surface.

In 2010, the USACE issued a draft policy guidance letter, *Draft Process for Requesting a Variance from Vegetation Standards for Levees and Floodwalls—75 Federal Register 6364-68* (USACE 2010) that included procedures for State and local agencies to request variances on a site-specific basis. DWR has been in negotiations with USACE to remove vegetation on the upper third of the waterside slope, top, and landside of the levees, and continue to allow vegetation on the lower two-thirds of the waterside slope of the levee and along benches above the water surface (DSC 2011). By 2030, it is anticipated that much of the existing vegetation on the upper third of the waterside slopes, tops, landside slopes, and within 15 feet of the landside toe of the levees would be removed.

By 2030 under the No Action Alternative and the Second Basis of Comparison, development along major river corridors in the Central Valley would continue to be limited by state regulations implemented by the Central Valley Flood Protection Board and the USACE. Within the Delta, the floodways would continue to be regulated by the Delta Protection Commission and Delta Stewardship Council to preserve and protect the natural resources of the Delta; and prevent encroachment into Delta floodways. These requirements would prevent development within the Delta floodplains and floodways and in the Sacramento, Feather, American, and San Joaquin rivers corridors upstream of the Delta.

### 10.4.3 Evaluation of Alternatives

As described in Chapter 4, Approach to Environmental Analysis, Alternatives 1 through 5 have been compared to the No Action Alternative; and the No Action Alternative and Alternatives 1 through 5 have been compared to the Second Basis of Comparison.

#### *10.4.3.1 No Action Alternative*

As described in Chapter 4, Approach to Environmental Analysis, the No Action Alternative is compared to the Second Basis of Comparison.

##### 10.4.3.1.1 Trinity River Region

*Changes in Rivers Downstream of CVP and SWP Reservoirs*

River flows in Trinity River downstream of Lewiston Dam in the critical period for terrestrial resources of March through May would be similar under the No Action Alternative and the Second Basis of Comparison, as described in Chapter 5, Surface Water Resources and Water Supplies. Therefore, terrestrial resources habitat conditions along the Trinity River and lower Klamath River riparian corridors would be similar under the No Action Alternative and Second Basis of Comparison.

##### 10.4.3.1.2 Central Valley Region

*Changes in Rivers Downstream of CVP and SWP Reservoirs*

Flows in the spring months would be similar in the Sacramento River at Keswick and Freeport and American River downstream of Nimbus Dam; increased flows in the Stanislaus River downstream of Goodwin Dam (over 100 percent); and reduced in the Feather River downstream of Thermalito Complex (25 to 30 percent) under the No Action Alternative as compared to the Second Basis of Comparison. This analysis does not include site specific evaluation of all terrestrial resources along these riparian corridors. However, the changes in flows are indicative of the potential for change in the terrestrial resources. Therefore, under the No Action Alternative as compared to the Second Basis of Comparison, the potential for similar or improved terrestrial resources would occur along the Sacramento, American, and Stanislaus rivers; and the potential for reduced terrestrial resources would occur along the Feather River.

Monthly Clear Creek flows under the No Action Alternative as compared to the Second Basis of Comparison are identical except in May. In May, under the No Action Alternative, flows are up to 40.7 percent higher than under the Second Basis of Comparison in accordance with the 2009 NMFS BO. Terrestrial resources habitat in the floodplains of lower Clear Creek would be slightly improved under the No Action Alternative as compared to the Second Basis of Comparison.

*Potential Effects on Special Status Species*

Habitat changes along the riparian corridors related to changes in spring flows that support riparian vegetation recruitment would affect numerous bird species that use the riparian corridor, including Black Tern, Least Bell's Vireo, Least

Bittern, Swainson's Hawk, Tricolored Blackbird, Western Yellow-billed Cuckoo, White-tailed Kite, Yellow Warbler, Ringtail, Western Pond Turtle, Valley Elderberry Longhorn Beetle, and Delta Button-celery. Potential adverse effects could occur to these species due to reduced flows in the spring months on the Feather River.

*Changes in River and Delta Floodplains*

It is assumed that under the No Action Alternative and the Second Basis of Comparison, the State of California would continue to implement flood management projects to reduce flood risks along the Sacramento and San Joaquin rivers and in the Delta with consideration for opportunities to restore or maintain the function of natural ecosystems. The related terrestrial habitat conditions would be similar under the No Action Alternative and the Second Basis of Comparison.

*Changes in Flows over Fremont Weir into the Yolo Bypass*

Flows from the Sacramento River into the Yolo Bypass at Fremont Weir are similar under the No Action Alternative and the Second Basis of Comparison; therefore, terrestrial habitat could be similar.

*Changes in Delta Habitat due to Changes in Water Quality*

Under the No Action Alternative, the freshwater interface would be similar to conditions under the Second Basis of Comparison in all months in below normal, dry, and critical dry years; and from January through August in wet and above normal years. In the fall months in wet years, the X2 location would be 9 to 14 kilometers towards the west in September through December under the No Action Alternative as compared to the Second Basis of Comparison.

*Potential Effects on Special Status Species*

Lower Delta salinity under the No Action Alternative as compared to the Second Basis of Comparison would improve habitat for Bolander's Water Hemlock, Delta Button-celery, Delta Tule Pea, Mason's Lilaeopsis, Soft Birds-beak, Suisun Marsh Aster, Salt Marsh Harvest Mouse, and Suisun Shrew.

*Effects Related to Cross Delta Water Transfers*

Potential effects to terrestrial resources could be similar to those identified in a recent environmental analysis conducted by Reclamation for long-term water transfers from the Sacramento to San Joaquin valleys (Reclamation 2014d). Potential effects to terrestrial resources were identified as changes in stream flows due declining groundwater levels along streams due to the use of groundwater substitution to provide transfer water. The analysis indicated that these potential impacts would not be substantial due to the inclusion of a monitoring and mitigation program.

Under the No Action Alternative, the timing of cross Delta water transfers would be limited to July through September and include annual volumetric limits, in accordance with the 2008 USFWS BO and 2009 NMFS BO. Under the Second Basis of Comparison, water could be transferred throughout the year without an annual volumetric limit. Overall, the potential for cross Delta water transfers would be less under the No Action Alternative than under the Second Basis of Comparison.

#### ***10.4.3.2 Alternative 1***

Alternative 1 is identical to the Second Basis of Comparison. As described in Chapter 4, Approach to Environmental Analysis, Alternative 1 is compared to the No Action Alternative and the Second Basis of Comparison. However, because water resource conditions under Alternative 1 are identical to water resource conditions under the Second Basis of Comparison; Alternative 1 is only compared to the No Action Alternative.

##### **10.4.3.2.1 Alternative 1 Compared to the No Action Alternative**

*Trinity River Region*

*Changes in Rivers Downstream of CVP and SWP Reservoirs*

River flows in Trinity River downstream of Lewiston Dam in the critical period for terrestrial resources of March through May would be similar under Alternative 1 and the No Action Alternative. Therefore, terrestrial resources habitat conditions along the Trinity River and lower Klamath River riparian corridors would be similar under Alternative 1 as compared to the No Action Alternative.

*Central Valley Region*

*Changes in Rivers Downstream of CVP and SWP Reservoirs*

Flows in the spring months would be similar in the Sacramento River at Keswick and Freeport and American River downstream of Nimbus Dam; increased in the Feather River downstream of Thermalito Complex (35 percent); and reduced flows in the Stanislaus River downstream of Goodwin Dam (60 percent) under Alternative 1 as compared to the No Action Alternative. This analysis does not include site specific evaluation of all terrestrial resources along these riparian corridors. However, the changes in flows are indicative of the potential for change in the terrestrial resources. Therefore, under Alternative 1 as compared to the No Action Alternative, the potential for similar or improved terrestrial resources would occur along the Sacramento, American, and Feather rivers; and the potential for reduced terrestrial resources would occur along the Stanislaus River.

Monthly Clear Creek flows under Alternative 1 as compared to the No Action Alternative are identical except in May. In May, under Alternative 1, flows are up to 29 percent lower as compared to the No Action Alternative. Terrestrial resources habitat in the floodplains of lower Clear Creek could be decreased under Alternative 1 as compared to the No Action Alternative.

*Potential Effects on Special Status Species*

Habitat changes along the riparian corridors related to changes in spring flows that support riparian vegetation recruitment would affect numerous bird species that use the riparian corridor, including Black Tern, Least Bell’s Vireo, Least Bittern, Swainson’s Hawk, Tricolored Blackbird, Western Yellow-billed Cuckoo, White-tailed Kite, Yellow Warbler, Ringtail, Western Pond Turtle, Valley Elderberry Longhorn Beetle, and Delta Button-celery. Potential adverse effects could occur to these species due to reduced flows in the spring months on the Stanislaus River.

*Changes in River and Delta Floodplains*

It is assumed that under Alternative 1 and the No Action Alternative, the State of California would continue to implement flood management projects to reduce flood risks along the Sacramento and San Joaquin rivers and in the Delta with consideration for opportunities to restore or maintain the function of natural ecosystems. The related terrestrial habitat conditions that would occur due to implementation of the flood management projects would be the same under Alternative 1 and the No Action Alternative.

*Changes in Flows over Fremont Weir into the Yolo Bypass*

Flows from the Sacramento River into the Yolo Bypass at Fremont Weir would be similar or higher under Alternative 1 as compared to the No Action Alternative; therefore, terrestrial habitat could be similar or increased depending upon the flow pattern.

*Changes in Delta Habitat due to Changes in Water Quality*

Under Alternative 1, the freshwater interface would be similar to conditions under the No Action Alternative in all months in below normal, dry, and critical dry years; and from January through August in wet and above normal years. In the fall months in wet years, the X2 location would be 9 to 14 kilometers towards the east in September through December under Alternative 1 as compared to the No Action Alternative. This could adversely affect terrestrial species that have acclimated to freshwater conditions.

*Potential Effects on Special Status Species*

Higher Delta salinity under Alternative 1 as compared to the No Action Alternative would reduce habitat conditions for Bolander's Water Hemlock, Delta Button-celery, Delta Tule Pea, Mason's Lilaeopsis, Soft Birds-beak, Suisun Marsh Aster, Salt Marsh Harvest Mouse, and Suisun Shrew.

*Effects Related to Cross Delta Water Transfers*

Potential effects to terrestrial resources could be similar to those identified in a recent environmental analysis conducted by Reclamation for long-term water transfers from the Sacramento to San Joaquin valleys (Reclamation 2014d). Potential effects to terrestrial resources were identified as changes in stream flows due declining groundwater levels along streams due to the use of groundwater substitution to provide transfer water. The analysis indicated that these potential impacts would not be substantial due to the inclusion of a monitoring and mitigation program.

Under Alternative 1, water could be transferred throughout the year without an annual volumetric limit. Under the No Action Alternative, the timing of cross Delta water transfers would be limited to July through September and include annual volumetric limits, in accordance with the 2008 USFWS BO and 2009

NMFS BO. Overall, the potential for cross Delta water transfers would be greater under Alternative 1 as compared to the No Action Alternative.

#### 10.4.3.2.2 Alternative 1 Compared to the Second Basis of Comparison

Alternative 1 is identical to the Second Basis of Comparison.

### *10.4.3.3 Alternative 2*

The CVP and SWP operations under Alternative 2 are identical to the CVP and SWP operations under the No Action Alternative; therefore, Alternative 2 is only compared to the Second Basis of Comparison.

#### 10.4.3.3.1 Alternative 2 Compared to the Second Basis of Comparison

The CVP and SWP operations under Alternative 2 are identical to the CVP and SWP operations under the No Action Alternative. Therefore, changes in terrestrial resources under Alternative 2 as compared to the Second Basis of Comparison would be the same as the impacts described in Section 10.4.3.1, No Action Alternative.

### *10.4.3.4 Alternative 3*

As described in Chapter 3, Description of Alternatives, CVP and SWP operations under Alternative 3 are similar to the Second Basis of Comparison with modified Old and Middle River flow criteria and New Melones Reservoir operations. As described in Chapter 4, Approach to Environmental Analysis, Alternative 3 is compared to the No Action Alternative and the Second Basis of Comparison.

#### 10.4.3.4.1 Alternative 3 Compared to the No Action Alternative

*Trinity River Region*

*Changes in Rivers Downstream of CVP and SWP Reservoirs*

River flows in Trinity River downstream of Lewiston Dam in the critical period for terrestrial resources of March through May would be similar under Alternative conditions along the Trinity River and lower Klamath River riparian corridors would be similar under Alternative 3 as compared to the No Action Alternative.

*Central Valley Region*

*Changes in Rivers Downstream of CVP and SWP Reservoirs*

Flows in the spring months would be similar in the Sacramento River at Keswick and Freeport and American River downstream of Nimbus Dam; increased in the Feather River downstream of Thermalito Complex (25 to 35 percent); and reduced flows in the Stanislaus River downstream of Goodwin Dam (60 percent) under Alternative 3 as compared to the No Action Alternative. This analysis does not include site specific evaluation of all terrestrial resources along these riparian corridors. However, the changes in flows are indicative of the potential for change in the terrestrial resources. Therefore, under Alternative 3 as compared to the No Action Alternative, the potential for similar or improved terrestrial resources would occur along the Sacramento, American, and Feather rivers; and the potential for reduced terrestrial resources would occur along the Stanislaus River.

Monthly Clear Creek flows under Alternative 3 as compared to the No Action Alternative are identical except in May. In May, under Alternative 3, flows are up to 29 percent lower as compared to the No Action Alternative. Terrestrial resources habitat in the floodplains of lower Clear Creek would be decreased under Alternative 3 as compared to the No Action Alternative.

*Potential Effects on Special Status Species*

Habitat changes along the riparian corridors related to changes in spring flows that support riparian vegetation recruitment would affect numerous bird species that use the riparian corridor, including Black Tern, Least Bell's Vireo, Least Bittern, Swainson's Hawk, Tricolored Blackbird, Western Yellow-billed Cuckoo, White-tailed Kite, Yellow Warbler, Ringtail, Western Pond Turtle, Valley Elderberry Longhorn Beetle, and Delta Button-celery. Potential adverse effects could occur to these species due to reduced flows in the spring months on the Stanislaus River.

*Changes in River and Delta Floodplains*

It is assumed that under Alternative 3 and the No Action Alternative, the State of California would continue to implement flood management projects to reduce flood risks along the Sacramento and San Joaquin rivers and in the Delta with consideration for opportunities to restore or maintain the function of natural ecosystems. The related terrestrial habitat that would occur due to implementation of the flood management projects would be the same under Alternative 3 and the No Action Alternative.

*Changes in Flows over Fremont Weir into the Yolo Bypass*

Flows from the Sacramento River into the Yolo Bypass at Fremont Weir would be similar or higher (10 to 30 percent) under Alternative 3 as compared to the No Action Alternative. Terrestrial habitat could be similar or increased due to the flow patterns.

*Changes in Delta Habitat due to Changes in Water Quality*

Under Alternative 3, the freshwater interface would be similar to conditions under the No Action Alternative in all months in below normal, dry, and critical dry years; and from January through August in wet and above normal years. In the fall months in wet years, the X2 location would be 9 to 14 kilometers towards the east in September through December under Alternative 3 as compared to the No Action Alternative.

*Potential Effects on Special Status Species*

Higher Delta salinity under Alternative 3 as compared to the No Action Alternative would reduce habitat conditions for Bolander's Water Hemlock, Delta Button-celery, Delta Tule Pea, Mason's Lilaeopsis, Soft Birds-beak, Suisun Marsh Aster, Salt Marsh Harvest Mouse, and Suisun Shrew.

*Effects Related to Cross Delta Water Transfers*

Potential effects to terrestrial resources could be similar to those identified in a recent environmental analysis conducted by Reclamation for long-term water transfers from the Sacramento to San Joaquin valleys (Reclamation 2014d). Potential effects to terrestrial resources were identified as changes in stream flows due declining groundwater levels along streams due to the use of groundwater substitution to provide transfer water. The analysis indicated that these potential impacts would not be substantial due to the inclusion of a monitoring and mitigation program.

Under Alternative 3, water could be transferred throughout the year without an annual volumetric limit. Under the No Action Alternative, the timing of cross Delta water transfers would be limited to July through September and include annual volumetric limits, in accordance with the 2008 USFWS BO and 2009 NMFS BO. Overall, the potential for cross Delta water transfers would be greater under Alternative 3 as compared to the No Action Alternative.

#### 10.4.3.4.2 Alternative 3 Compared to the Second Basis of Comparison

*Trinity River Region*

*Changes in Rivers Downstream of CVP and SWP Reservoirs*

River flows in Trinity River downstream of Lewiston Dam in the critical period for terrestrial resources of March through May would be similar under Alternative 3 and the Second Basis of Comparison. Therefore, terrestrial resources habitat conditions along the Trinity River and lower Klamath River riparian corridors would be similar under Alternative 3 as compared to the Second Basis of Comparison.

*Central Valley Region*

*Changes in Rivers Downstream of CVP and SWP Reservoirs*

Flows in the spring months would be similar in the Sacramento River at Keswick and Freeport, Feather River downstream of Thermalito Complex, and American River downstream of Nimbus Dam; and reduced flows in the Stanislaus River downstream of Goodwin Dam (6 to 52 percent, depending upon water year type) under Alternative 3 as compared to the Second Basis of Comparison. This analysis does not include site specific evaluation of all terrestrial resources along these riparian corridors. However, the changes in flows are indicative of the potential for change in the terrestrial resources. Therefore, under Alternative 3 as compared to the Second Basis of Comparison, the potential for similar terrestrial resources habitat would occur along the Sacramento, American, and Feather rivers; and the potential for reduced terrestrial resources would occur along the Stanislaus River.

Monthly Clear Creek flows under Alternative 3 as compared to the Second Basis of Comparison are identical under Alternative 3; therefore, terrestrial resources habitat in the floodplains of lower Clear Creek would be similar under Alternative 3 as compared to the Second Basis of Comparison.

*Potential Effects on Special Status Species*

Habitat changes along the riparian corridors related to changes in spring flows that support riparian vegetation recruitment would affect numerous bird species that use the riparian corridor, including Black Tern, Least Bell's Vireo, Least Bittern, Swainson's Hawk, Tricolored Blackbird, Western Yellow-billed Cuckoo, White-tailed Kite, Yellow Warbler, Ringtail, Western Pond Turtle, Valley Elderberry Longhorn Beetle, and Delta Button-celery. Potential adverse effects could occur to these species due to reduced flows in the spring months on the Stanislaus River.

*Changes in River and Delta Floodplains*

It is assumed that under Alternative 3 and the Second Basis of Comparison, the State of California would continue to implement flood management projects to reduce flood risks along the Sacramento and San Joaquin rivers and in the Delta with consideration for opportunities to restore or maintain the function of natural ecosystems. The related terrestrial habitat conditions that would occur due to implementation of the flood management projects would be the same under Alternative 3 and the Second Basis of Comparison.

*Changes in Flows over Fremont Weir into the Yolo Bypass*

Flows from the Sacramento River into the Yolo Bypass at Fremont Weir and associated terrestrial habitat would be similar under Alternative 3 as compared to the Second Basis of Comparison.

*Changes in Delta Habitat due to Changes in Water Quality*

Under Alternative 3, the freshwater-saltwater interface would be similar to conditions under the Second Basis of Comparison in all months and in all water year types.

*Potential Effects on Special Status Species*

Delta salinity under Alternative 3 as compared to the Second Basis of Comparison would result in similar habitat conditions for Bolander's Water Hemlock, Delta Button-celery, Delta Tule Pea, Mason's Lilaeopsis, Soft Birds-beak, Suisun Marsh Aster, Salt Marsh Harvest Mouse, and Suisun Shrew.

*Effects Related to Cross Delta Water Transfers*

Potential effects to terrestrial resources could be similar to those identified in a recent environmental analysis conducted by Reclamation for long-term water transfers from the Sacramento to San Joaquin valleys (Reclamation 2014d). Potential effects to terrestrial resources were identified as changes in stream flows due declining groundwater levels along streams due to the use of groundwater substitution to provide transfer water. The analysis indicated that these potential impacts would not be substantial due to the inclusion of a monitoring and mitigation program.

Under Alternative 3 and the Second Basis of Comparison, water could be transferred throughout the year without an annual volumetric limit. Overall, the potential for cross Delta water transfers would be similar under Alternative 3 as compared to the Second Basis of Comparison.

#### *10.4.3.5 Alternative 4*

The CVP and SWP operations under Alternative 4 are identical to the CVP and SWP operations under the Second Basis of Comparison and Alternative 1. Alternative 4 also includes additional institutional requirements for development within the floodplain and floodways, including the following items.

- Compliance with Endangered Species Act in defining floodplain map revisions.
- Improvements in floodplain management criteria to support natural and beneficial functions.
- Prohibition of new development and substantial improvements to existing development within any designated floodway or within 170 feet of the ordinary high water line of any floodway.
- Modification of USACE requirements to remove vegetation along portions of the waterside of levees, as described in Section 10.4.3.1, No Action Alternative.

Alternative 4 is compared to the No Action Alternative and the Second Basis of Comparison.

##### 10.4.3.5.1 Alternative 4 Compared to the No Action Alternative

These actions would not change CVP and SWP operations; and would only affect the Changes in River and Delta Floodplains. Therefore, changes in terrestrial resources due to changes in CVP and SWP under Alternative 4 as compared to the No Action Alternative would be the same as the impacts described in Section 10.4.3.2.1, Alternative 1 Compared to the No Action Alternative.

*Changes in River and Delta Floodplains*

It is assumed that under the No Action Alternative, the State of California would continue to implement flood management projects to reduce flood risks along the Sacramento and San Joaquin rivers and in the Delta with consideration for opportunities to restore or maintain the function of natural ecosystems. The USACE policies for vegetation on levees would be implemented; and by 2030, much of the vegetation along Delta channels would have been removed.

Under Alternative 4, implementation of institutional provisions would result in development of the floodplains and floodways, especially in the Delta, that would be similar to development under the No Action Alternative. Under the No Action Alternative, as described in Chapter 13, Land Use, development along major river corridors in the Central Valley would be limited by state regulations implemented by the Central Valley Flood Protection Board and the USACE. Within the Delta, the floodways are further regulated by the Delta Protection Commission and Delta Stewardship Council to preserve and protect the natural resources of the Delta; and prevent encroachment into Delta floodways. These regulations would prevent development within the Delta floodplains and floodways and in the Sacramento, Feather, American, and San Joaquin rivers corridors upstream of the Delta. Under Alternative 4, development would be prevented within 170 feet from the ordinary high water line of any floodway. This setback area could provide opportunities to establish vegetative corridors.

Under Alternative 4 and the No Action Alternative, vegetation management along the Delta levees would include removal of all vegetation from the upper third of the waterside slope of the levee, the top of the levee, landside slope of the levee, and within 15 feet on the landside of the toe of the levee ("toe" is where the levee slope meets the ground surfaces). Under Alternative 4, vegetation could be maintained on the lower two-thirds of the waterside slope of the levee and within 15 feet of the toe of the levee on the waterside along benches above the water surface. This would provide shaded riverine aquatic habitat and riparian vegetation along many of the Delta channels as compared to the No Action Alternative.

Overall, Alternative 4 would result in increased vegetation along the riparian corridors related to recruitment of riparian vegetation in the Delta watershed as compared to the No Action Alternative.

#### 10.4.3.5.2 Alternative 4 Compared to the Second Basis of Comparison

The changes in river and Delta floodplain actions would not change CVP and SWP operations which would be identical under Alternative 4 and under the Second Basis of Comparison.

*Changes in River and Delta Floodplains*

It is assumed that under the Second Basis of Comparison, the State of California would continue to implement flood management projects to reduce flood risks along the Sacramento and San Joaquin rivers and in the Delta with consideration for opportunities to restore or maintain the function of natural ecosystems. The USACE policies for vegetation on levees would be implemented; and by 2030, much of the vegetation along Delta channels would have been removed.

Under Alternative 4, implementation of institutional provisions would result in development of the floodplains and floodways, especially in the Delta, that would be similar to development under the Second Basis of Comparison. Under the Second Basis of Comparison, as described in Chapter 13, Land Use, development along major river corridors in the Central Valley would be limited by state regulations implemented by the Central Valley Flood Protection Board and the USACE. Within the Delta, the floodways are further regulated by the Delta Protection Commission and Delta Stewardship Council to preserve and protect the natural resources of the Delta; and prevent encroachment into Delta floodways. These regulations would prevent development within the Delta floodplains and floodways and in the Sacramento, Feather, American, and San Joaquin rivers corridors upstream of the Delta. Under Alternative 4, development would be prevented within 170 feet from the ordinary high water line of any floodway. This setback area could provide opportunities to establish vegetative corridors.

Under Alternative 4 and the Second Basis of Comparison, vegetation management along the Delta levees would include removal of all vegetation from the upper third of the waterside slope of the levee, the top of the levee, landside slope of the levee, and within 15 feet on the landside of the toe of the levee ("toe" is where the levee slope meets the ground surfaces). Under Alternative 4, vegetation could be maintained on the lower two-thirds of the waterside slope of the levee and within 15 feet of the toe of the levee on the waterside along benches above the water surface. This would provide shaded riverine aquatic habitat and riparian vegetation along many of the Delta channels as compared to the Second Basis of Comparison.

Overall, Alternative 4 would result in increased terrestrial resources along the riparian corridors related to recruitment of riparian vegetation in the Delta watershed as compared to the Second Basis of Comparison.

#### *10.4.3.6 Alternative 5*

As described in Chapter 3, Description of Alternatives, CVP and SWP operations under Alternative 5 are similar to the No Action Alternative with modified Old and Middle River flow criteria and New Melones Reservoir operations. As described in Chapter 4, Approach to Environmental Analysis, Alternative 5 is compared to the No Action Alternative and the Second Basis of Comparison.

##### 10.4.3.6.1 Alternative 5 Compared to the No Action Alternative

*Trinity River Region*

*Changes in Rivers Downstream of CVP and SWP Reservoirs*

River flows in Trinity River downstream of Lewiston Dam in the critical period for terrestrial resources of March through May would be similar under Alternative 5 and the No Action Alternative. Therefore, terrestrial resources habitat conditions along the Trinity River and lower Klamath River riparian corridors would be similar under Alternative 5 as compared to the No Action Alternative.

*Central Valley Region*

*Changes in Rivers Downstream of CVP and SWP Reservoirs*

Flows in the spring months would be similar in the Sacramento River at Keswick and Freeport, Feather River downstream of Thermalito Complex, American River downstream of Nimbus Dam; and flows in the Stanislaus River downstream of Goodwin Dam would increase 22 to 40 percent in some spring months and 8 to 18 percent in other spring months, depending upon water year type under Alternative 5 as compared to the No Action Alternative. This analysis does not include site specific evaluation of all terrestrial resources along these riparian corridors. However, the changes in flows are indicative of the potential for change in the terrestrial resources. Therefore, under Alternative 5 as compared to the No Action Alternative, the potential for similar or improved terrestrial resources habitat would occur along the Sacramento, Feather, and American rivers; and the potential for both increased and reduced terrestrial resources habitat would occur along the Stanislaus River.

Monthly Clear Creek flows would be identical under Alternative 5 as compared to the No Action Alternative; therefore, terrestrial resources habitat in the floodplains of lower Clear Creek would be similar under Alternative 5 as compared to the Second Basis of Comparison.

*Potential Effects on Special Status Species*

Habitat changes along the riparian corridors related to changes in spring flows that support riparian vegetation recruitment would affect numerous bird species that use the riparian corridor, including Black Tern, Least Bell's Vireo, Least Bittern, Swainson's Hawk, Tricolored Blackbird, Western Yellow-billed Cuckoo, White-tailed Kite, Yellow Warbler, Ringtail, Western Pond Turtle, Valley Elderberry Longhorn Beetle, and Delta Button-celery. Potential adverse effects could occur to these species due to reduced flows in the spring months on the Stanislaus River.

*Changes in River and Delta Floodplains*

It is assumed that under Alternative 5 and the No Action Alternative, the State of California would continue to implement flood management projects to reduce flood risks along the Sacramento and San Joaquin rivers and in the Delta with consideration for opportunities to restore or maintain the function of natural ecosystems. The related terrestrial habitat conditions that would occur due to implementation of the flood management projects would be the same under Alternative 5 and the No Action Alternative.

*Changes in Flows over Fremont Weir into the Yolo Bypass*

Flows from the Sacramento River into the Yolo Bypass at Fremont Weir and associated terrestrial habitat would be similar under Alternative 5 as compared to the No Action Alternative.

*Changes in Delta Habitat due to Changes in Water Quality*

Under Alternative 5, the freshwater interface would be similar to conditions under the No Action Alternative in all months and in all water year types.

*Potential Effects on Special Status Species*

Similar Delta salinity under Alternative 5 as compared to the No Action Alternative would result in similar habitat conditions for Bolander's Water Hemlock, Delta Button-celery, Delta Tule Pea, Mason's Lilaeopsis, Soft Birds-beak, Suisun Marsh Aster, Salt Marsh Harvest Mouse, and Suisun Shrew.

*Effects Related to Cross Delta Water Transfers*

Potential effects to terrestrial resources could be similar to those identified in a recent environmental analysis conducted by Reclamation for long-term water transfers from the Sacramento to San Joaquin valleys (Reclamation 2014d). Potential effects to terrestrial resources were identified as changes in stream flows due declining groundwater levels along streams due to the use of groundwater substitution to provide transfer water. The analysis indicated that these potential impacts would not be substantial due to the inclusion of a monitoring and mitigation program.

Under Alternative 5 and the No Action Alternative, the timing of cross Delta water transfers would be limited to July through September and include annual volumetric limits, in accordance with the 2008 USFWS BO and 2009 NMFS BO. Overall, the potential for cross Delta water transfers would be similar under Alternative 5 as compared to the No Action Alternative.

#### 10.4.3.6.2 Alternative 5 Compared to the Second Basis of Comparison

*Trinity River Region*

*Changes in Rivers Downstream of CVP and SWP Reservoirs*

River flows in Trinity River downstream of Lewiston Dam in the critical period for terrestrial resources of March through May would be similar under Alternative 5 and the Second Basis of Comparison. Therefore, terrestrial resources habitat conditions along the Trinity River and lower Klamath River riparian corridors would be similar under Alternative 5 as compared to the Second Basis of Comparison.

*Central Valley Region*

*Changes in Rivers Downstream of CVP and SWP Reservoirs*

Flows in the spring months would be similar in the American River downstream of Nimbus Dam; increased flows in the Stanislaus River downstream of Goodwin Dam (over 100 percent); and reduced in the Sacramento River at Keswick and Freeport and Feather River downstream of Thermalito Complex (8 to 13 percent and 25 to 45 percent, respectively) under Alternative 5 as compared to the Second Basis of Comparison. This analysis does not include site specific evaluation of all terrestrial resources along these riparian corridors. However, the changes in flows are indicative of the potential for change in the terrestrial resources. Therefore, under Alternative 5 as compared to the Second Basis of Comparison, the potential for similar or improved terrestrial resources habitat would occur along the American and Stanislaus rivers; and the potential for reduced terrestrial resources habitat would occur along the Sacramento and Feather rivers.

Monthly Clear Creek flows under Alternative 5 as compared to the Second Basis of Comparison are identical except in May. In May, under Alternative 5, flows are up to 40.7 percent higher than under the Second Basis of Comparison in accordance with the 2009 NMFS BO. Terrestrial resources habitat in the floodplains of lower Clear Creek would be improved under Alternative 5 as compared to the Second Basis of Comparison.

*Potential Effects on Special Status Species*

Habitat changes along the riparian corridors related to changes in spring flows that support riparian vegetation recruitment would affect numerous bird species that use the riparian corridor, including Black Tern, Least Bell's Vireo, Least Bittern, Swainson's Hawk, Tricolored Blackbird, Western Yellow-billed Cuckoo, White-tailed Kite, Yellow Warbler, Ringtail, Western Pond Turtle, Valley Elderberry Longhorn Beetle, and Delta Button-celery. Potential adverse effects could occur to these species due to reduced flows in the spring months on the Sacramento and Feather rivers.

*Changes in River and Delta Floodplains*

It is assumed that under Alternative 5 and the Second Basis of Comparison, the State of California would continue to implement flood management projects to reduce flood risks along the Sacramento and San Joaquin rivers and in the Delta with consideration for opportunities to restore or maintain the function of natural ecosystems. The related terrestrial habitat conditions that would occur due to implementation of the flood management projects would be the same under Alternative 5 and the Second Basis of Comparison.

*Changes in Flows over Fremont Weir into the Yolo Bypass*

Flows from the Sacramento River into the Yolo Bypass at Fremont Weir would similar or lower (24 percent) under Alternative 5 as compared to the Second Basis of Comparison. The decrease in the extent of flow inundation in the Yolo Bypass could cause degradation of terrestrial habitat as compared to the Second Basis of Comparison.

*Changes in Delta Habitat due to Changes in Water Quality*

Under Alternative 5, the freshwater interface would be similar to conditions under the Second Basis of Comparison in all months in below normal, dry, and critical dry years; and from January through August in wet and above normal years. In the fall months in wet years, the X2 location would be 9 to 14 kilometers towards the west in September through December under Alternative 5 as compared to the Second Basis of Comparison.

*Potential Effects on Special Status Species*

Lower Delta salinity under Alternative 5 as compared to the Second Basis of Comparison would improve habitat conditions for Bolander's Water Hemlock, Delta Button-celery, Delta Tule Pea, Mason's Lilaeopsis, Soft Birds-beak, Suisun Marsh Aster, Salt Marsh Harvest Mouse, and Suisun Shrew.

*Effects Related to Cross Delta Water Transfers*

Potential effects to terrestrial resources could be similar to those identified in a recent environmental analysis conducted by Reclamation for long-term water transfers from the Sacramento to San Joaquin valleys (Reclamation 2014d). Potential effects to terrestrial resources were identified as changes in stream flows due declining groundwater levels along streams due to the use of groundwater substitution to provide transfer water. The analysis indicated that these potential impacts would not be substantial due to the inclusion of a monitoring and mitigation program.

Under Alternative 5, the timing of cross Delta water transfers would be limited to July through September and include annual volumetric limits, in accordance with the 2008 USFWS BO and 2009 NMFS BO. Under Second Basis of Comparison, water could be transferred throughout the year without an annual volumetric limit. Overall, the potential for cross Delta water transfers would be less under Alternative 5 as compared to the Second Basis of Comparison.

#### 10.4.3.7 Summary of Environmental Consequences

The results of the environmental consequences of implementation of Alternatives 1 through 5 as compared to the No Action Alternative and the Second Basis of Comparison are presented in Tables 10.2 and 10.3.

**Table 10.2 Comparison of Alternatives 1 through 5 to No Action Alternative**

| Alternative | Potential Change | Consideration for Mitigation Measures |
|---|---|---|
| Alternative 1 | Similar or increased flows along Trinity, Sacramento, American, and Feather rivers in the spring to support riparian terrestrial habitat. Reduced flows along the Stanislaus River in the spring; therefore, could be reduced terrestrial habitat conditions.<br>Similar terrestrial conditions in Yolo Bypass related to water that flows from the Sacramento River at the Fremont Weir.<br>Increased salt water habitat in the western Delta in the fall months of wet and above normal water years could adversely affect species that have acclimated to freshwater conditions. | No mitigation measures identified at this time to reduce flow reduction impacts on the Stanislaus River, and adverse impacts due to increased salinity in the western Delta in the fall months of wet and above normal water year types. |
| Alternative 2 | No effects on terrestrial resources. | None needed |
| Alternative 3 | Similar or increased flows along Trinity, Sacramento, American, and Feather rivers in the spring to support riparian terrestrial habitat. Reduced flows along the Stanislaus River in the spring; therefore, could be reduced terrestrial habitat conditions.<br>Similar or improved terrestrial conditions in Yolo Bypass related to water that flows from the Sacramento River at the Fremont Weir.<br>Increased salt water habitat in the western Delta in the fall months of wet and above normal water years could adversely affect species that have acclimated to freshwater conditions. | No mitigation measures identified at this time to reduce flow reduction impacts on the Stanislaus River, and adverse impacts due to increased salinity in the western Delta in the fall months of wet and above normal water year types. |
| Alternative 4 | Same effects as described for Alternative 1 compared to the No Action Alternative; except for increased terrestrial vegetation along the riparian corridors related to recruitment of riparian vegetation. | No mitigation measures identified at this time to reduce flow reduction impacts on the Stanislaus River, and adverse impacts due to increased salinity in the western Delta in the fall months of wet and above normal water year types. |

| Alternative | Potential Change | Consideration for Mitigation Measures |
|---|---|---|
| Alternative 5 | Similar flows along Trinity, Sacramento, American, and Feather rivers in the spring to support riparian terrestrial habitat. Increased flows along the Stanislaus River in the spring; therefore, could be improved terrestrial habitat conditions.<br>Similar terrestrial conditions in Yolo Bypass related to water that flows from the Sacramento River at the Fremont Weir.<br>Similar freshwater and salt water habitats. | None needed. |

Note: Due to the limitations and uncertainty in the CalSim II monthly model and other analytical tools, incremental differences of 5 percent or less between alternatives and the No Action Alternative are considered to be "similar."

**Table 10.3 Comparison of No Action Alternative and Alternatives 1 through 5 to Second Basis of Comparison**

| Alternative | Potential Change | Consideration for Mitigation Measures |
|---|---|---|
| No Action Alternative | Similar or increased flows along Trinity, Sacramento, American, and Stanislaus rivers in the spring to support riparian terrestrial habitat. Reduced flows along the Feather River in the spring; therefore, could be reduced terrestrial habitat conditions.<br>Similar terrestrial conditions in Yolo Bypass related to water that flows from the Sacramento River at the Fremont Weir.<br>Increased freshwater habitat in the western Delta. | Not considered for this comparison. |
| Alternative 1 | No effects on terrestrial resources. | Not considered for this comparison. |
| Alternative 2 | Same effects as described for No Action Alternative as compared to the Second Basis of Comparison. | Not considered for this comparison. |
| Alternative 3 | Similar or increased flows along Trinity, Sacramento, American, and Feather rivers in the spring to support riparian terrestrial habitat. Reduced flows along the Stanislaus River in the spring; therefore, could be reduced terrestrial habitat conditions.<br>Similar terrestrial conditions in Yolo Bypass related to water that flows from the Sacramento River at the Fremont Weir.<br>Similar freshwater and salt water habitats. | Not considered for this comparison. |
| Alternative 4 | Similar effects except for increased terrestrial vegetation along the riparian corridors related to recruitment of riparian vegetation. | Not considered for this comparison. |

| Alternative | Potential Change | Consideration for Mitigation Measures |
|---|---|---|
| Alternative 5 | Similar or increased flows along Trinity, American, and Stanislaus rivers in the spring to support riparian terrestrial habitat. Reduced flows along the Sacramento and Feather rivers in the spring; therefore, could be reduced terrestrial habitat conditions.<br>Similar or decreased terrestrial conditions in Yolo Bypass related to similar or lower water that flows from the Sacramento River at the Fremont Weir.<br>Increased freshwater habitat in the western Delta. | Not considered for this comparison. |

Note: Due to the limitations and uncertainty in the CalSim II monthly model and other analytical tools, incremental differences of 5 percent or less between alternatives and the No Action Alternative are considered to be “similar.”

#### *10.4.3.8 Potential Mitigation Measures*

Mitigation measures are included in EISs to avoid, minimize, rectify, reduce, eliminate, or compensate for adverse environmental effects of alternatives as compared to the No Action Alternative. Mitigation measures are not included in this EIS to address adverse impacts under the alternatives as compared to the Second Basis of Comparison because this analysis was included in this EIS for information purposes only.

Changes in CVP and SWP operations under Alternatives 1, 3, and 4 as compared to the No Action Alternative would result in adverse changes in terrestrial resources along Stanislaus River when spring flows are less than under the No Action Alternative; and when the salinity increases in the western Delta. However, mitigation measures have not been identified at this time to reduce the adverse effects of flow reductions in the spring on the Stanislaus River and of increased salinity in the western Delta in the fall months of wet and above normal water year types under Alternatives 1, 3, and 4.

#### *10.4.3.9 Cumulative Effects Analysis*

As described in Chapter 3, the cumulative effects analysis considers projects, programs, and policies that are not speculative; and are based upon known or reasonably foreseeable long-range plans, regulations, operating agreements, or other information that establishes them as reasonably foreseeable.

The cumulative effects analysis Alternatives 1 through 5 for Terrestrial Resources are summarized in Table 10.4.

**Table 10.4 Summary of Cumulative Effects on Terrestrial Resources of Alternatives 1 through 5 as Compared to the No Action Alternative**

| Scenarios | Actions | Cumulative Effects of Actions |
|---|---|---|
| Past & Present, and Future Actions Included in the No Action Alternative an d in All Alternatives in Year 2030 | Consistent with Affected Environment conditions plus:<br>Actions in the 2008 USFWS BO and 2009 NMFS BO that would have occurred without implementation of the BOs, as described in Section 3.3.1.2 (of Chapter 3, Descriptions of Alternatives) including climate change and sea level rise<br>Actions not included in the 2008 USFWS BO and 2009 NMFS BO that would have occurred without implementation of the BOs, as described in Section 3.3.1.3 (of Chapter 3, Descriptions of Alternatives):<br>- Implementation of Federal and state policies and programs, including Clean Water Act (e.g., Total Maximum Daily Loads); Safe Drinking Water Act; Clean Air Act; and flood management programs<br>- General plans for 2030.<br>- Trinity River Restoration Program.<br>- Central Valley Project Improvement Act programs<br>- Folsom Dam Water Control Manual Update<br>- FERC Relicensing for the Middle Fork of the American River Project<br>- San Joaquin River Restoration Program<br>- Contra Loma Recreation Resource Management Plan<br>- San Luis Reservoir State Recreation Area Resource Management Plan/General Plan | These effects would be the same under all alternatives.<br>Climate change and sea level rise and development under the general plans are anticipated to reduce carryover storage in reservoirs and changes in stream flow patterns in a manner that would change shoreline, riparian, and floodplain habitat.<br>Other actions, including restoration projects, FERC relicensing projects, and some future projects to improve water quality and/or habitat are anticipated to improve shoreline, riparian, and floodplain habitat. |
| Future Actions Considered as Cumulative Effects Actions in All Alternatives in Year 2030 | Actions as described in Section 3.5 (of Chapter 3, Descriptions of Alternatives):<br>- Bay-Delta Water Quality Control Plan Update<br>- FERC Relicensing Projects<br>- Bay Delta Conservation Plan (including the California WaterFix alternative)<br>- Shasta Lake Water Resources, North-of-the-Delta Offstream Storage, Los Vaqueros Reservoir Expansion Phase 2, and Upper San Joaquin River Basin Storage Investigations<br>- El Dorado Water and Power Authority Supplemental Water Rights Project<br>- Semitropic Water Storage District Delta Wetlands<br>- North Bay Aqueduct Alternative Intake<br>- Irrigated Lands Regulatory Program | These effects would be the same under all alternatives.<br>Some of the future reasonably foreseeable actions to improve water quality and FERC Relicensing projects would improve shoreline, riparian, and floodplain habitat.<br>Other future reasonably foreseeable actions, such as expanded or new reservoirs, would reduce some types of terrestrial habitat and increase other types of terrestrial habitat within the reservoir area. |

| Scenarios | Actions | Cumulative Effects of Actions |
|---|---|---|
| No Action Alternative with Associated Cumulative Effects Actions in Year 2030 | Full implementation of the 2008 USFWS BO and 2009 NMFS BO<br>Full implementation of the USACE vegetation standards for levees | Implementation of No Action Alternative with future reasonably foreseeable actions would result in changes in stream flows and levee vegetation policies that would result in changes to related terrestrial resources as compared to conditions prior to the BOs.<br>Reduced riparian habitat along levees within the federally authorized levee systems that have maintenance agreements with the USACE as compared to recent conditions. |
| Alternative 1 with Associated Cumulative Effects Actions in Year 2030 | No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant)<br>Full implementation of the USACE vegetation standards for levees | Implementation of Alternative 1 with future reasonably foreseeable actions would result in changes in stream flows along the Stanislaus River in all water year types, and in salinity in the western Delta fall months of wet and above normal water year types that could result in adverse terrestrial conditions as compared to the No Action Alternative with the added actions.<br>Similar riparian habitat along levees within the federally authorized levee systems that have maintenance agreements with the USACE as compared to the No Action Alternative with the added actions. |
| Alternative 2 with Associated Cumulative Effects Actions in Year 2030 | Full implementation of the 2008 USFWS BO and 2009 NMFS BO CVP and SWP operational actions<br>No implementation of structural improvements or other actions that require further study to develop a more detailed action description.<br>Full implementation of the USACE vegetation standards for levees | Implementation of Alternative 2 with future reasonably foreseeable actions for terrestrial resources would be the same as for the No Action Alternative with the added actions. |

| Scenarios | Actions | Cumulative Effects of Actions |
|---|---|---|
| Alternative 3 with Associated Cumulative Effects Actions in Year 2030 | No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant)<br>Slight increase in positive Old and Middle River flows in the winter and spring months<br>Full implementation of the USACE vegetation standards for levees | Implementation of Alternative 3 with future reasonably foreseeable action would result in changes in stream flows along the Stanislaus River in all water year types, and in salinity in the western Delta fall months of wet and above normal water year types that could result in adverse terrestrial conditions as compared to the No Action Alternative with the added actions.<br>Similar riparian habitat along levees within the federally authorized levee systems that have maintenance agreements with the USACE as compared to the No Action Alternative with the added actions. |
| Alternative 4 with Associated Cumulative Effects Actions in Year 2030 | No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant)<br>No implementation of the USACE vegetation standards for levees | Implementation of Alternative 4 with future reasonably foreseeable actions would result in changes in stream flows along the Stanislaus River in all water year types, and in salinity in the western Delta fall months of wet and above normal water year types that could result in adverse terrestrial conditions as compared to the No Action Alternative with the added actions.<br>Implementation of Alternative 4 also would result in increased riparian habitat along effected levees<br>Increased riparian habitat along levees within the federally authorized levee systems that have maintenance agreements with the USACE as compared to the No Action Alternative with the added actions. |
| Alternative 5 with Associated Cumulative Effects Actions in Year 20530 | Full implementation of the 2008 USFWS BO and 2009 NMFS BO<br>Positive Old and Middle River flows and increased Delta outflow in spring months<br>Full implementation of the USACE vegetation standards for levees | Implementation of Alternative 5 with future reasonably foreseeable actions for terrestrial resources would be similar as under the No Action Alternative with the added actions. |

**Chapter 11**

# Geology and Soils Resources

## 11.1 Introduction

This chapter describes the geology and soils resources in the project area; and potential changes that could occur as a result of implementing the alternatives evaluated in this Environmental Impact Statement (EIS). Implementation of alternatives could affect geology and soils resources through potential changes in operation of the Central Valley Project (CVP) and State Water Project (SWP).

## 11.2 Regulatory Environment and Compliance Requirements

Potential actions that could be implemented under the alternatives evaluated in this EIS could affect reservoirs, streams, and lands served by CVP and SWP water supplies located on lands affected by seismic, landslide, and liquefaction hazards; subsidence; and unstable soils. Actions located on public agency lands; or implemented, funded, or approved by Federal and state agencies would need to be compliant with appropriate Federal and state agency policies and regulations, as summarized in Chapter 4, Approach to Environmental Analysis.

## 11.3 Affected Environment

This section describes the geological, regional seismic, and soils characteristics and subsidence potential that could be potentially affected by the implementation of the alternatives considered in this EIS. Changes in soils characteristics due to changes in CVP and SWP operations may occur in the Trinity River, Central Valley, San Francisco Bay Area, and Central Coast and Southern California regions. Geomorphic provinces in California are shown on Figure 11.1.

### 11.3.1 Trinity River Region

The Trinity River Region includes the area in Trinity County along the Trinity River from Trinity Lake to the confluence with the Klamath River; and in Humboldt and Del Norte counties along the Klamath River from the confluence with the Trinity River to the Pacific Ocean.

#### *11.3.1.1 Geologic Setting*

The Trinity River Region is located within the southwest area of the Klamath Mountains Geomorphic Province and the northwest area of the Coast Ranges Geomorphic Province, as defined by the U.S. Geological Survey (USGS) geomorphic provinces (CGS 2002a). The Klamath Mountains Geomorphic Province covers approximately 12,000 square miles of northwestern California between the Coast Range on the west and the Cascade Range on the east and is considered to be a northern extension of the Sierra Nevada (CGS 2002a, Reclamation 1997).

The Klamath Mountains trend mostly northward. The province is primarily formed by the eastern Klamath Mountain belt, central metamorphic belt, the western Paleozoic and Triassic, and the western Jurassic belt. Rocks in this province include Paleozoic meta-sedimentary and meta-volcanic rocks, Mesozoic igneous rocks, Ordovician to Jurassic aged marine deposits in the Klamath belt, Paleozoic hornblend, mica schists and ultramafic rocks in the central metamorphic belt and slightly metamorphosed sedimentary and volcanic rocks in the western Jurassic, Paleozoic, and Triassic belt (Reclamation 1997).

The Trinity River watershed is located within the Klamath Mountain Geomorphic Province. Although the Trinity River watershed includes portions of both the Coast Ranges Province and the Klamath Mountains Province, the Trinity River riverbed is underlain by rocks of the Klamath Mountains Province (NCRWQCB et al. 2009). The Klamath Mountains Province formations generally dip towards the east and are exposed along the riverbed. Downstream of Lewiston Dam to Deadwood Creek, the area is underlain by the Eastern Klamath Terrane of the Klamath Mountains Province. The rocks in this area are primarily Copley Greenstone, metamorphosed volcanic sequence with intermediate and mafic volcanic rocks; and Bragdon formation, metamorphosed sedimentary formation with gneiss and amphibolite. Along the Trinity River between Lewiston Dam and Douglas City, outcrops of the Weaverville Formation occur. The Weaverville Formation, a series of nonmarine deposits, includes weakly consolidated mudstone, sandstone, and conglomerate of clays matrix and sparse beds of tuff. Downstream of Douglas City, the Trinity River is underlain by the Northfork and Hayfork terranes. The Northfork Terrane near Douglas City includes silicious tuff, chert, mafic volcanic rock, phyllite, and limestone sandstone and pebble conglomerate with serpentine intrusions. As the riverbed extends towards the Klamath River, the geologic formation extends into the Hayfork Terrane that consists of metamorphic and meta-volcanic rock. Terraces of sand and gravel from glacial erosion along the Trinity River flanks near Lewiston Dam contribute sediment into Trinity River.

The Trinity River flows into the Klamath River near Weitchpec. Downstream of the Weitchpec, the Klamath River flows to the Pacific Ocean through the Coast Ranges Geomorphic Province. The geology along the Klamath River in the Coast Ranges Geomorphic Province is characterized by the Eastern Belt of the Franciscan Complex and portions of the Central Belt of this complex. The Franciscan Complex consists of sandstone with some shale, chert, limestone, conglomerate, serpentine, and blueschist. The Eastern Belt is composed of schist and meta-sedimentary rocks with minor amounts of shale, chert, and conglomerate. The Central Belt is primarily composed of an argillite-matrix mélange with slabs of greenstone, serpentinte, graywacke, chert, high-grade metamorphics, and limestone.

#### *11.3.1.2 Regional Seismicity*

The areas along the Trinity River have been categorized as regions that are distant from known, active faults and generally would experience infrequent, low levels of shaking. However, infrequent earthquakes with stronger shaking could occur (CGS 2008). The closest areas to the Trinity River with known seismic active areas capable of producing an earthquake with a magnitude of 8.5 or greater are the northern San Andreas Fault Zone and the Cascadia Subduction Zone which are approximately 62 and 124 miles away, respectively (NCRWQCB et al. 2009).

The areas along the lower Klamath River downstream of the confluence with the Trinity River have a slightly higher potential for greater ground shaking than areas along the Trinity River (CGS 2008). The lower Klamath River is closer than the Trinity River to the offshore Cascadia Subduction Zone, which runs offshore of Humboldt and Del Norte counties and Oregon and Washington states. The Klamath River is approximately 30 to 40 miles from the Trinidad Fault, which extends from the area near Trinidad northwest to the coast near Trinidad State Beach. The Trinidad Fault is potentially capable of generating an earthquake with a moment magnitude of 7.3 (Humboldt County 2012).

The San Andreas Fault, under the Pacific Ocean in a northwestern direction from the Humboldt and Del Norte counties, is where the Pacific Plate moves towards the northwest relative to North America (Humboldt County 2012). The Cascadia Subduction Zone, located under the Pacific Ocean offshore from Cape Mendocino in southwest Humboldt County to Vancouver Island in British Columbia, has produced numerous earthquakes with magnitudes greater than 8. The Cascadia Subduction Zone is where the Gorda Plate and the associated Juan de Fuca Plate descend under the North American Plate.

#### *11.3.1.3 Regional Volcanic Potential*

Active centers of volcanic activity occur in the vicinity of Mount Shasta, located near the northeastern edge of the Trinity River Region. Mount Shasta is located about 45 miles north of Shasta Lake. Over the past 10,000 years, Mount Shasta erupted about once every 800 years. During the past 4,500 years, Mount Shasta erupted about once every 600 years with the most recent eruption in 1786. Lava flows, dome, and mudflows occurred during the eruptions (Reclamation 2013a).

#### *11.3.1.4 Soil Characteristics*

Soils in the southern region of the Klamath Mountain Geomorphic Province, where the Trinity River is located, are generally composed of gravelly loam with some alluvial areas with dredge tailings, river wash, and xerofluvents (NCRWQCB et al. 2009).

Soils along the lower Klamath River are generally composed of gravelly clay loam and gravelly sandy loam with sand and gravels within the alluvial deposits (DOI and DFG 2012). Alluvial deposits (river gravels) and dredge tailings provide important spawning habitat for salmon and steelhead.

#### *11.3.1.5 Subsidence*

Land subsidence is not a major occurrence in the Trinity River Region.

### 11.3.2 Central Valley Region

The Central Valley Region extends from above Shasta Lake to the Tehachapi Mountains, and includes the Sacramento Valley, San Joaquin Valley, Delta, and Suisun Marsh.

#### *11.3.2.1 Geologic Setting*

The Central Valley Region is bounded by the Klamath Mountains, Cascade Range, Great Valley, Coast Ranges, and Sierra Nevada geomorphic provinces (CGS 2002a).

The Klamath Mountains Geomorphic Province was described in subsection 11.3.2, Trinity River Region. The Cascade Range Geomorphic Province consists of volcanic rocks of the Miocene to Pleistocene age. Several volcanoes within the Cascade Range Geomorphic Province and the Central Valley Region include Mount Shasta and Lassen Peak (Reclamation 2013a).

The Great Valley Geomorphic Province is an approximately 400 mile long, 50 mile wide valley that extends from the northwest to the southeast between the Sierra Nevada and Coast Ranges geomorphic provinces. The faulted and folded sediments of the Coast Range extend eastward beneath most of the Central Valley; and the igneous and metamorphic rocks of the Sierra Nevada extend westward beneath the eastern Central Valley (Reclamation 1997). The valley floor is an alluvial plain of sediments that have been deposited since the Jurassic age (CGS 2002a). Below these deposits are Cretaceous Great Valley Sequence shales and sandstones and upper Jurassic bedrock of metamorphic and igneous rocks associated in the east with the Sierra Nevada and in the west with the Coast Ranges (DWR 2007). Sediments deposited along the submarine fans within the Great Valley Geomorphic Province include mudstones, sandstones, and conglomerates from the Klamath Mountains and Sierra Nevada geomorphic provinces.

The valley floor in the Great Valley Geomorphic Province includes dissected uplands, low alluvial fans and plains, river floodplains and channels, and overflow lands and lake bottoms. The dissected uplands include consolidated and unconsolidated Tertiary and Quaternary continental deposits. The alluvial fans along the western boundary include poorly sorted fine sand, silt, and clay. The alluvial fans along the eastern boundary consist of well sorted gravel and sand along major tributaries, and poorly sorted materials along intermittent streams. River and floodplains primarily consist of coarse sands and fine silts. The lake bottoms primarily occur in the in the southern San Joaquin Valley and composed of clay layers (Reclamation 1997).

The Sierra Nevada Geomorphic Province along the eastern boundary of the Great Valley Geomorphic Province is composed of pre-Tertiary igneous and metamorphic rocks. The Sierra Nevada Geomorphic Province is an uplifted fault block nearly 400 miles long with a series of metamorphic rock on the east and deep river cuts on a gentle slope, which disappears under sediments of the Central Valley on the west. Gold-bearing veins are present in the northwest trending

Mother Lode metamorphic bedrock. The province is bordered by the Cascade Range on the north (Placer County 2007).

The Coast Ranges Geomorphic Province is composed of pre-Tertiary and Tertiary semiconsolidated to consolidated marine sedimentary rocks. The Coast Ranges Province is characterized by active uplift related to the San Andreas Fault and plate boundary system tectonics. The province extends westward toward the coastline and eastward toward the Great Valley Geomorphic Province. Rocks in this region include mafic and ultramafic rock associated with the Coast Range ophiolite, and Miocene volcanic rocks (Sonoma Volcanics) and marine and terrestrial sedimentary from the Cretaceous to the Neogene period (Reclamation et al. 2010).

#### 11.3.2.1.1 Sacramento Valley Geological Setting

Major watersheds within the Sacramento Valley that could be affected by CVP and SWP operations include the Sacramento River, Feather River, and the Lower American River watersheds.

*Sacramento River Watershed Geological Setting*

The Sacramento River flows from Shasta Lake to the Delta. The area along the Sacramento River from Shasta Lake to downstream of Red Bluff is characterized by loosely consolidated deposits of Pliocene and or Pleistocene age sandstone, shale, and gravel. Downstream of Red Bluff to the Delta, the river flows through Quaternary age alluvium, lake, playa, and terrace deposits that are unconsolidated or poorly consolidated with outcrops of resistant, cemented alluvial units such as the Modesto and Riverbank formations (CALFED 2000).

The active river channel maintains roughly constant dimensions as it migrates across the floodplain within the limits of the meander belt which is constrained only by outcrops of resistant units or artificial bank protection. Sediment loads in the tributary streams and lower reaches of the Sacramento River occur due to past and current land use practices on the tributary streams.

*Feather River Watershed Geological Setting*

Portions of the Feather River watershed analyzed in this EIS extend from Antelope Lake, Lake Davis, and Frenchman Lake upstream of Lake Oroville, through Lake Oroville and the Thermalito Reservoir complex, and along the Feather River to the confluence with the Sacramento River. The Yuba and Bear rivers are the major tributaries to the Feather River downstream of Thermalito Dam.

The Feather River watershed upstream of Thermalito Dam is located in the Cascade Range Geomorphic Province and the metamorphic belt of the Sierra Nevada Geomorphic Province. The lower watershed downstream of Thermalito Dam is located in the Great Valley Geomorphic Province.

West of Lake Oroville, scattered sedimentary and volcanic deposits cover the older bedrock, including (from oldest to youngest) the marine Chico formation from the upper Cretaceous; the auriferous gravels and mostly non-marine Ione formation of the Eocene Epoch; the extrusive volcanic Lovejoy basalt of the late Oligocene to early Miocene; and volcanic flows and volcaniclastic rocks of the Tuscan formation of the late Pliocene. Late Tertiary and Quaternary units in this area include alluvial terrace and fan deposits of the Plio-Pliestocene Laguna formation, the Riverbank and Modesto formations of the Pleistocene, riverbed sediments of the Holocene, and historical dredge and mine tailings from 20th century mining activities (DWR 2007).

Alluvium deposits occur in active channels of the Feather, Bear, and Yuba rivers and tributary streams. These deposits contain clay, silt, sand, gravel, cobbles, and boulders in various layers and mixtures. Historical upstream hydraulic mining significantly increased the sediment covering the lower Feather River riverbed with a thick deposit of fine clay-rich, light yellow-brown slickens (i.e., powdery matter from a quartz mill or residue from hydraulic mining). More recent floodplain deposits cover these slickens in the banks along most of the Feather River. Cobbles and coarse gravel dredge tailings constitute most of the banks, slowing the bank erosion process between the cities of Oroville and Gridley. The river is wide and shallow, with low sinuosity and a sand bed between Honcut Creek and the mouth of the Feather River.

*American River Watershed Geological Setting*

The Folsom Lake area is located within the Sierra Nevada and the Great Valley Geomorphic Province at the confluence of the North and South Forks of the American River. The Folsom Lake region primarily consists of rolling hills and upland plateaus between major river canyons. Three major geologic divisions within the area include a north-northwest trending belt of metamorphic rocks, granitic plutons that have intruded and obliterated some of the metamorphic belt, and deposits of volcanic ash, debris flows, and alluvial fans that are relatively flat lying. These deposits overlie older rocks (Reclamation et al. 2006).

Igneous, metamorphic, and sedimentary rock types are present within the Folsom Lake area. Major rock divisions are ultramafic intrusive rocks, metamorphic rocks, granodiorite intrusive rocks, and volcanic mud flows and alluvial deposits. Ultramafic rocks are most common on Flagstaff Mountain (Hill) on the Folsom Reservoir Peninsula located on a peninsula between the North Fork American River and South Fork American River. This rock division may contain trace amounts of serpentine minerals, chromite, minor nickel, talc, and naturally occurring asbestos (Reclamation et al. 2006).

Metamorphic rocks are found in a north-northwest trending band primarily on the eastern portions of the Folsom Lake area through most of the peninsula between the North Fork American River and South Fork American River (CGS 2010). The Metamorphic rocks are mainly composed of Copperhill Volcanics (metamorphosed basaltic breccia, pillow lava, and ash) and Ultramafic rocks, two formations that may contain trace amounts of naturally occurring asbestos (Reclamation et al. 2006).

Granodiorite intrusive rocks occur in the Rocklin Pluton on both sides of Folsom Lake extending to Lake Natoma, and the Penryn Pluton upstream of the Rocklin

Pluton. Granodiorite intrusive rocks are composed of a coarse-grained crystalline matrix with slightly more iron and magnesium-bearing minerals and less quartz than granite. Of the granodiorite, the feldspar and hornblend are less resistant than the quartz crystals and easily weathers. When weathering occurs, the remaining feldspars separate from the quartz resulting in decomposed granite (Reclamation et al. 2006).

Volcanic mud flows and alluvial deposits are present downstream of Folsom Lake in the southwest corner of two major formations, the Mehrten and Laguna Formation. The Mehrten Formation contains volcanic conglomerate, sandstone, and siltstone; all derived from andesitic sources and portions are gravels deposited by ancestral streams. The Laguna Formation, deposited predominately as debris flow on the Mehrten Formation, is a sequence of gravel, sand and silt derived from granitic sources (Reclamation et al. 2006).

The area along the American River downstream of Folsom Lake and Nimbus Reservoir is located in the Great Valley Geomorphic Province. The area includes several geomorphic land types including dissected uplands and low foothills, low alluvial fans and plains, and river floodplains and channels. The dissected uplands consist of consolidated and unconsolidated continental deposits of Tertiary and Quaternary that have been slightly folded and faulted (Reclamation 2005).

The alluvial fans and plains consist of unconsolidated continental deposits that extend from the edges of the valleys toward the valley floor (Reclamation 2005). The alluvial plains in the American River watershed include older Quaternary deposits (Sacramento County 2010). River flood plains and channels lay along the American River and smaller streams that flow into the Sacramento River south of the American River. Some floodplains are well-defined, where rivers are incised into their alluvial fans. These deposits tend to be coarse and sandy in the channels and finer and silty in the floodplains (Reclamation 2005; Sacramento County 2010).

#### 11.3.2.1.2 Delta Geological Setting

The Delta is a northwest-trending structural basin, separating the primarily granitic rock of the Sierra Nevada from the primarily Franciscan Formation rock of the California Coast Range (CWDD 1981). The Delta is a basin within the Great Valley Geomorphic Province that is filled with a 3- to 6-mile thick layer of sediment deposited by streams originating in the Sierra Nevada, Coast Ranges, and South Cascade Range. Surficial geologic units throughout the Delta include peat and organic soils, alluvium, levee and channel deposits, dune sand deposits, older alluvium, and bedrock.

The historical delta at the confluence of the Sacramento River and San Joaquin River is referred to as the Sacramento–San Joaquin Delta, or Delta. The Delta is a flat-lying river delta that evolved at the inland margin of the San Francisco Bay Estuary as two overlapping and coalescing geomorphic units: the Sacramento River Delta to the north and the San Joaquin River Delta to the south. During large river-flood events, silts and sands were deposited adjacent to the river channel, formed as a tidal marsh with few natural levees, and was dominated by tidal flows, allowing for landward accumulation of sediment behind the bedrock barrier at the Carquinez Strait. The sediment formed marshlands, which consisted of approximately 100 islands that were surrounded by hundreds of miles of channels. Generally, mineral soils formed near the channels during flood conditions and organic soils formed on marsh island interiors as plant residues accumulated faster than they could decompose (Weir 1949).

In the past, because the San Joaquin River Delta had less well-defined levees than under current conditions, sediments were deposited more uniformly across the floodplain during high water, creating an extensive tule marsh with many small, branching tributary channels. Because of the differential amounts of inorganic sediment supply, the peat of the San Joaquin River Delta grades northward into peaty mud and mud toward the natural levees and flood basins of the Sacramento River Delta (Atwater et al. 1980).

The Delta has experienced several cycles of deposition, nondeposition, and erosion that have resulted in the thick accumulation of poorly consolidated to unconsolidated sediments overlying the Cretaceous and Tertiary formations since late Quaternary time. Shlemon and Begg (1975) calculated that the peat and organic soils in the Delta began to form about 11,000 years ago during an episode of sea level rise. Tule marshes established on peat and organic soils in many portions of the Delta. Additional peat and other organic soils formed from repeated inundation and accumulation of sediment of the tules and other marsh vegetation.

#### 11.3.2.1.3 Suisun Marsh Geological Setting

The Suisun Marsh area is located within the Coast Ranges Geomorphic Province. The Suisun Marsh is bounded by the steep Coast Range on the west and by the rolling Montezuma Hills on the east. The Montezuma Hills consist of uplifted Pleistocene sedimentary layers with active Holocene age alluvium in stream drainages that divide the uplift. Low-lying flat areas of the marshland are covered by Holocene age Bay Mud deposits. The topographically higher central portions of Grizzly Island in the marshlands north of the Suisun Bay are formed by the Potrero Hills. These hills primarily consist of folded and faulted Eocene marine sedimentary rocks and late Pleistocene alluvial fan deposits (Reclamation et al. 2010).

#### 11.3.2.1.4 San Joaquin Valley Geological Setting

The San Joaquin Valley is located within the southern half of the Great Valley Geomorphic Province. The 250-mile-long and 50-to-60-mile-wide valley lies between the Coast Ranges on the west, the Sierra Nevada on the east, and extends northwestward to the Delta near the City of Stockton. The San Joaquin Valley is the southern portion of a large, northwest-to-southeast-trending asymmetric trough filled with up to six vertical miles of Jurassic to Holocene age sediments. The trough is primarily made up of Tertiary and Quaternary continental rocks, and deposits, which become separated by lacustrine, marsh, and floodplain deposits of varying thicknesses. The continental deposits, which include the Mehrten, Kern River, Laguna, San Joaquin, Tulare, Tehama, Turlock, Riverbank, and Modesto formations, form the San Joaquin Valley aquifer (Ferriz 2001, Reclamation et al. 2011, Reclamation 2009).

Dissected uplands, low alluvial fans and plains, river floodplains and channels, and overflow lands and lake bottoms are the several geomorphic land types within the San Joaquin Valley. Dissected uplands consist of slightly folded and faulted, consolidated and unconsolidated, Tertiary and Quaternary age continental deposits. The alluvial fans and plains, which cover most of the valley floor, consist of unconsolidated continental deposits that extend from the edges of the valleys toward the valley floor. In general, alluvial sediments of the western and southern parts of the San Joaquin Valley tend to have lower permeability than deposits on the eastern side. River floodplains and channels lie along the major rivers and are well-defined where rivers incise their alluvial fans. Typically, these deposits are coarse and sandy in the channels and finer and silty in the floodplains (Reclamation et al. 2011).

Lake bottoms of overflow lands in the San Joaquin Valley include historic beds of Tulare Lake, Buena Vista Lake, and Kern Lake as well as other less defined areas in the valley trough. Near the valley trough, fluvial deposits of the east and west sides grade into fine-grained deposits. The largest lake deposits in the Central Valley are found beneath the Tulare Lake bed where up to 3,600 feet of lacustrine and marsh deposits form the Tulare Formation. This formation is composed of widespread clay layers, the most extensive being the Cocoran Clay member which also is found in the western and southern portions of the San Joaquin Valley. The Cocoran Clay member is a confining layer that separates the upper semi-confined to unconfined aquifer from the lower confined aquifer (Reclamation 1997).

The valley floor and foothills portions of the San Joaquin Valley and San Joaquin River area, and the Stanislaus River watershed could be affected by CVP and SWP operations. The Stanislaus River watershed originates in the Sierra Nevada Geomorphic Province, including the area with New Melones Reservoir, and extends into the Great Valley Geomorphic Province. New Melones Reservoir is oriented along a northwest trend that is produced by the Foothill Metamorphic Belt in the Sierra Nevada Geomorphic Province (Reclamation 2010). The area is underlain by Cenozoic sedimentary rocks which dip towards the southwest and overlies the Cretaceous sedimentary rocks of the Great Valley sequence and older metamorphic basement rocks along the edges of the Sierra Nevada. Tertiary sedimentary formations were deposited along the Stanislaus River from an area east of Knights Ferry to Oakdale (CGS 1977). The oldest Tertiary geologic unit, Eocene Ione Formation, primarily consists of quartz, sandstone, and interbedded kaolinitic clays with a maximum thickness of about 200 feet near Knights Ferry. The Oligocene-Miocene Valley Springs Formation of rhyolitic ash, sandy clay, and gravel deposits overlay the Ione Formation. Andestic flows, lahars, and volcanic sediments of the Mehrten Formation were deposited by volcanism, especially from Table Mountain (CGS 1977; Reclamation 2010). Three major alluvial fan deposits occurred along the Stanislaus River after deposition of the

Mehrten Formation, including the Turlock Lake Formation (between Orange Blossom Road and Oakdale) composed of fine sand and silt with some clay, sand, and gravel; Riverbank Formation (between Oakdale and Riverbank) composed of silt and clay; and Modesto Formation (between Riverbank and the confluence with the San Joaquin River) composed of sand, silt, clay, and gravel.

#### *11.3.2.2 Regional Seismicity*

Most of the areas in the Central Valley Region have been categorized as regions that are distant from known, active faults and generally would experience infrequent, low levels of shaking. However, infrequent earthquakes with stronger shaking could occur (CGS 2008). Areas within and adjacent to the Delta Region and along Interstate 5 in the San Joaquin Valley have a higher potential for stronger ground shaking due to their close proximity to the San Andreas Fault Zone.

The San Andreas Fault Zone is located to the west of the Central Valley Region along a 150-mile northwest-trending fault zone (Reclamation 2013a). The fault zone extends from the Gulf of California to Point Reyes where the fault extends under the Pacific Ocean (CGS 2006). The fault zone is the largest active fault in California (Reclamation 2005d).

In the Sacramento Valley, the major fault zones include the Battle Creek Fault Zone located to the east of the Sacramento River, Corning Fault that extends from Red Bluff to Artois parallel to the Corning Canal, Dunnigan Hills Fault located west of Interstate 5 near Dunnigan, Cleveland Fault located near Oroville, and Great Valley Fault system along the west side of the Sacramento Valley (Reclamation 2005a, Reclamation 2013a).

The Delta and Suisun Marsh are located in proximity to several major fault systems, including the San Andreas, Hayward-Rodgers Creek, Calaveras, Concord-Green Valley, and Greenville faults (DWR et al. 2013a). There are also many named and unnamed regional faults in the vicinity. The majority of seismic sources underlying the Delta and Suisun Marsh are “blind” thrusts that are not expected to rupture to the ground surface during an earthquake. The known blind thrusts in the Delta and Suisun Marsh area include the Midland, Montezuma Hills, Thornton Arch, Western Tracy, Midland, and Vernalis faults. Blind thrust faults with discernible geomorphic expression/trace located at the surface occur near the southwestern boundary of the Delta include Black Butte and Midway faults. Two surface crustal fault zones (e.g., areas with localized deformation of geologic features near the surface) are located within the Suisun Marsh, including the Pittsburgh-Kirby Hills fault which occurs along an alignment between Fairfield and Pittsburg, and Concord-Green Valley fault which crosses the western portion of the Suisun Marsh. The Cordelia fault is a surface crustal fault zone that occurs near the western boundary of the Suisun Marsh. Since 1800, no earthquakes with a magnitude greater than 5.0 have been recorded in the Delta or Suisun Marsh.

In the San Joaquin Valley, the eastern foothills are characterized by strike-slip faults that occur because the rock underlying the valley sediment is slowly moving downward relative to the Sierra Nevada Block to the east. An example of this type of faulting is the Kings Canyon lineament which crosses the valley north of Chowchilla and continues nearly to Death Valley in southeastern California (Reclamation et al. 2011). Uplift and tilting of the Sierra Nevada block towards the west and tilting of the Coast Ranges block to the east appear to be causing gradual downward movement of the valley basement rock, in addition to subsidence caused by aquifer compaction and soil compaction discussed below. The San Joaquin Valley is bounded by the Stockton Fault of the Stockton Arch on the north and the Bakersfield Arch on the south. Most of the fault zones in the San Joaquin Valley do not appear to be active. However, numerous faults may not be known until future seismic events, such as the Nunez reverse fault which was not known until the 1983 Coalinga earthquake. In areas adjacent to the San Joaquin Valley, the dominant active fault structure is the Great Valley blind thrust associated with San Andreas Fault. Other active faults occur along the western boundary of the San Joaquin Valley, including the Hayward, Concord-Green Valley, Coast Ranges-Sierra Block boundary thrusts, Mount Diablo, Greenville, Ortigalita, Rinconada, and Hosgri faults (Reclamation 2005d).

#### *11.3.2.3 Regional Volcanic Potential*

Active centers of volcanic activity occur in the vicinity of Mount Shasta and Lassen Peak in the Central Valley Region. Mount Shasta is located about 45 miles north of Shasta Lake. Over the past 10,000 years, Mount Shasta erupted about once every 800 years. During the past 4,500 years, Mount Shasta erupted about once every 600 years with the last eruption in 1786. Lava flows, domes, and mudflows occurred during the eruptions (Reclamation 2013a).

Lassen Peak, located about 50 miles southeast of Shasta Lake, is a cluster of dacitic domes and vents that have formed during eruptions over the past 250,000 years. The last eruptions were relatively small and occurred between 1914 and 1917. The most recent large eruption occurred about 1,100 years ago. Large eruptions appear to occur about once every 10,000 years (USGS 2000a).

#### *11.3.2.4 Soil Characteristics*

The Central Valley Region includes the Sacramento Valley, Delta, Suisun Marsh, and San Joaquin Valley. The soil characteristics are similar in many aspects in the Sacramento and San Joaquin valleys; therefore, the descriptions are combined in the following sections.

##### 11.3.2.4.1 Sacramento Valley and San Joaquin Valley Soil Characteristics

The Sacramento Valley and San Joaquin Valley contain terrace land and upland soils along the foothills; and alluvial, Aeolian, clayey, and saline/alkaline soils in various locations along the valley floors (CALFED 2000, Reclamation 1997).

Foothills soils, located on well-drained, hilly-to-mountainous terrain along the east side of the Central Valley, form through in-place weathering of the underlying rock. Soils in the northern Sacramento Valley near Shasta Lake are different than soils along other foothills in the Sacramento and San Joaquin valleys. The soils near Shasta Lake are related to the geologic formations of the Klamath Mountains, Cascade Ranges, and Sierra Nevada geomorphic provinces.

These soils are formed from weathered metavolcanic and metasedimentary rocks and from intrusions of granitic rocks, serpentine, and basalt. These soils are generally shallow with numerous areas of gravels, cobbles, and stones; therefore, they do not have high water-holding capacity or support topsoil productivity for vegetation (Reclamation 2013a). Soils derived from in-place weathering of granitic rock, referred to as decomposed granite, are coarse-grained, quartz-rich and erodible.

Upland soils along other foothills in the Sacramento and San Joaquin valleys are formed from the Sierra Nevada and Coast ranges geomorphic provinces. Along the western boundary of the Central Valley, the soils primarily are formed from sedimentary rocks. Along the eastern boundary of the Central Valley, the soils primarily are formed from igneous and metamorphic rock. The soils include serpentine soils (which include magnesium, nickel, cobalt, chromium, iron, and asbestos); sedimentary sandstones; shales; conglomerates; and sandy loam, loam, and clay loam soils above bedrock (Reclamation 1997, Reclamation et al. 2011, Reclamation 2013a, DWR 2007). Erosion occurs in the upland soils around reservoirs and rivers especially downgradient of urban development where paving increases the peak flow, volume, and velocity of precipitation runoff (GCI 2003).

Along the western boundary of the Sacramento Valley and the southeastern boundary of the San Joaquin Valley, the terrace lands include brownish loam, silt loam, and/or clayey loam soils. The soils are generally loamy along the Sacramento Valley terraces, and more clayey along the San Joaquin Valley terraces. Along the eastern boundaries of Sacramento and San Joaquin valleys, the terraces are primarily red silica-iron cemented hardpan and clays, sometimes with calcium carbonate (also known as “lime”) (DWR 2007, Reclamation 1997, Reclamation 2005b, Reclamation 2012).

Surface soils of the Central Valley include alluvial and Aeolian soils. The alluvial soils include calcic brown and noncalcic brown alluvial soils on deep alluvial fans and floodplains. The calcic brown soil is primarily made of calcium carbonate and alkaline (also known as “calcerous” soils). The noncalcic brown soils do not contain calcium carbonate and are either slightly acidic or neutral in chemical properties. In the western San Joaquin Valley, light colored calcerous soils occur with less organic matter than the brown soils (Reclamation 1997).

Basin soils occur in the San Joaquin Valley and portions of the Delta. These soils include organic soils, imperfectly drained soils, and saline alkali soils. The organic soils are typically dark, acidic, high in organic matter, and generally include peat. The organic soils occur in the Delta, as discussed below, and along the lower San Joaquin River adjacent to the Delta. The poorly drained soils contain dark clays and occur in areas with high groundwater in the San Joaquin Valley trough and as lake bed deposits (Reclamation et al. 2011). One of the most substantial stratigraphic features of the San Joaquin Valley and a major aquitard is the Corcoran Clay, located in the western and central valley (Galloway et al. 1999). The western boundary of the Corcoran Clay is generally located along the Delta-Mendota Canal and California Aqueduct (as described in Chapter 5, Surface Water Resources and Water Supply). The Corcoran Clay generally extends from Mendota Pool area through the center of the valley to the Tehachapi Mountains. The depth to the Corcoran Clay varies from 160 feet under the Tulare Lake bed to less than a foot near the western edge of the Central Valley. The Corcoran Clay compromised of numerous aquitards and coarser interbeds.

Selenium salts and other salts occur naturally in the western and central San Joaquin Valley soils that are derived from marine sedimentary rocks of the Coast Ranges. Salts are leached from the soils by applied pre-irrigation and irrigation water and collected by a series of drains. The drains also reduce high groundwater elevations in areas with shallow clay soils. Reclamation and other agencies are implementing programs to reduce salinity issues in the San Joaquin Valley that will convey and dispose of drainage water in a manner that would protect the surface water and groundwater resources (Reclamation et al. 2011). As described in Chapter 12, Agricultural Resources, many portions of the western and central San Joaquin Valley are no longer supporting irrigated crops or are experiencing low crop yields due to the saline soils.

Soils in the eastern San Joaquin Valley come from the Sierra Nevada and contain low levels of salt and selenium. Most soils in the western and southern San Joaquin Valley are formed from Coast Range marine sediments, and contain higher concentrations of salts as well as selenium and molybdenum. Soluble selenium moves from soils into drainage water and groundwater, especially during agricultural operations to leach salts from the soils. As described in Chapter 3, Description of Alternatives, Reclamation and other agencies are implementing programs to reduce the discharge of selenium from the San Joaquin Valley into receiving waters (Reclamation 2005d, Reclamation et al. 2011, Reclamation 2009). Additional information related to concerns with salinity and selenium in the San Joaquin Valley is presented in Chapter 6, Surface Water Quality, and Chapter 12, Agricultural Resources.

Soil wind erosion is related to soil erodibility, wind speeds, soil moisture, surface roughness, and vegetative cover. Aeolian soils are more susceptible to wind erosion than alluvial soils. Non-irrigated soils that have been disturbed by cultivation or other activities throughout the Central Valley are more susceptible to wind erosion and subsequent blowing dust than soils with more soil moisture. Dust from eroding soils can create hazards due to soil composition (such as naturally-occurring asbestos), allergic reactions to dust, adverse impacts to plants due to dust, and increased risk of valley fever (as discussed in Chapter 18, Public Health) (Reclamation 2005d).

#### 11.3.2.4.2 Delta Soil Characteristics

Soils in the Delta include organic and/or highly organic mineral soils; deltaic soils along the Sacramento and San Joaquin rivers; basin rim soils; floodplain and stream terrace soils; valley alluvial and low terrace soils; and upland and high terrace soils (Reclamation 1997). Basin, deltaic, and organic soils occupy the lowest elevation ranges and are often protected by levees. In many areas of the western Delta, the soils contain substantial organic matter and are classified as peat or muck.

Basin rim soils are found along the eastern edges (rims) of the Delta, and are generally moderately deep or deep mineral soils that are poorly drained to well-drained and have fine textures in surface horizons. Some areas contain soils with a hardpan layer in the subsurface (SCS 1992, 1993). Floodplain and stream terrace soils are mineral soils adjacent to the Sacramento and San Joaquin rivers and other major tributaries. These soils are typically deep and stratified, with relatively poor drainage and fine textures. Valley fill, alluvial fan, and low terrace soils are typically very deep with variable texture and ability to transmit water ranging from somewhat poorly drained fine sandy loams and silty clay loams to well-drained silt loams and silty clay loams. Upland and high terrace soils are generally well-drained ranging in texture from loams to clays and are primarily formed in material weathered from sandstone, shale, and siltstone, and can occur on dissected terraces or on mountainous uplands.

Soils within the Yolo Bypass area range from clays to silty clay loams and alluvial soils (CALFED 2001, DFG et al. 2008). The higher clay content soils occur in the western portion of the basin north of Interstate 80 and in the eastern portion of the basin south of Interstate 80. The silty clay loams and alluvial soils occur in the western portion of the basin south of Interstate 80, including soils within the Yolo Bypass Wildlife Area.

Soil erosion by rainfall or flowing water occurs when raindrops detach soil particles or when flowing water erodes and transports soil material. Sandy alluvial soils, silty lacustrine soil, and highly organic soil are erodible. Organic soil (peat) in the Delta is also susceptible to wind erosion (deflation). Clay soils are erosion resistant.

#### 11.3.2.4.3 Suisun Marsh Soil Characteristics

Soil within the Suisun Bay include the Joice muck, Suisun peaty muck, and Tamba mucky clay; Reyes silty clay; and Valdez loam (SCS 1977a, Reclamation et al. 2010). The Joice muck generally is poorly drained organic soils in saline water areas interspersed with fine-grain sediment. Suisun peaty muck is formed from dark colored organic soils and plant materials with high permeability. These soils are generally located in areas with shallow surface water and groundwater; therefore, surface water tends to accumulate on the surface. Tamba mucky clay also are poorly drained organic soils formed from alluvial soils and plant materials that overlays mucky clays. Reyes silty clays are poorly drained soils formed from alluvium. The upper layers of the silty clays are acidic and saline. The lower layers are alkaline that become acidic when exposed to air, especially under wetting-drying conditions in tidal areas. Valdez loam soils are poorly drained soils formed on alluvial fans.

Suisun Marsh soils have a low susceptibility to water and wind erosion (SCS 1977a, Reclamation et al. 2010).

#### *11.3.2.5 Subsidence*

Land subsidence occurs for different reasons throughout the Central Valley as described in the following sections.

##### 11.3.2.5.1 Sacramento and San Joaquin Valley Subsidence

Land subsidence in the Sacramento Valley primarily occurs due to aquifer-system compaction as groundwater elevations decline; weathering of underlying of some-types of bedrock, such as limestone; decomposition of organic matter; and natural compaction of soils (Reclamation 2013a). Historic subsidence of the Sacramento Valley has been far less than that observed in the San Joaquin Valley. For example, the range of recent historic subsidence in the Sacramento Valley is generally less than 10 feet. Historical subsidence in the San Joaquin Valley has caused changes in land elevations of more than 30 feet.

In the 1970s, land subsidence exceeded 1 foot near Zamora; however, additional subsidence has not been reported since 1973 (Reclamation 2013a). Subsidence has been reported of two feet near Davis and three to four feet over the last several decades in the areas north of Woodland and east of Davis and Woodland (Davis 2007).

San Joaquin Valley subsidence primarily occurs when groundwater elevations decline which reduces water pressure in the soils and results in compressed clay lenses and subsided land elevations. Other factors that may influence the rate of subsidence in the San Joaquin Valley is the Sierran uplift, sediment loading and compressional down-warping or thrust loading from the Coast Ranges, and near surface compaction (Reclamation et al. 2011). Some of the first reports of land subsidence in the San Joaquin Valley occurred in 1935 in the area near Delano (Galloway et al. 1999). By the late 1960s, San Joaquin Valley subsidence had occurred over 5,212 square miles, or almost 50 percent of the San Joaquin Valley (Reclamation 2005d). During that period, some areas subsided over 33 vertical feet since the late 1880s. The rate of subsidence reduced initially following implementation of CVP and SWP water supplies in the San Joaquin Valley during the 1970s and 1980s. The rate of subsidence for the next twenty years appeared to continue at a rate of 0.008 to 0.016 inches/year in recent years (Reclamation et al. 2011). However, the amount of water available for irrigation from the CVP and SWP has declined more than 20 to 30 percent since the early 1980s due to hydrologic, regulatory, and operational concerns, as described in Chapter 1, Introduction. Due to the reduction in the availability of CVP and SWP water supplies, many water users have increased groundwater withdrawal. A recent study by the USGS of subsidence along the CVP Delta-Mendota Canal (USGS 2013b) reported that in areas where groundwater levels fluctuated consistently on a seasonal basis but were stable on a long-term basis, the land elevations also were relatively stable. Subsidence occurred in portions of the San Joaquin Valley where groundwater elevations below the Corcoran clay and in the shallow groundwater declined on a long-term basis between 2003 and 2010. The highest subsidence rates occurred along the Delta Mendota Canal between Merced and Mendota with subsidence of 0.8 inches to 21 inches between 2003 and 2010.

Shallow subsidence, or hydrocompaction, occurs when low density, relatively dry, fine-grained sediments soften and collapse upon wetting. Historically, hydrocompaction has been most common along the western margin of the San Joaquin Valley (Reclamation 2005c). In the southern San Joaquin Valley, extraction of oil also can result in compaction. Changes in elevation, both subsidence and uplift, occurred near Coalinga following the 1983 Coalinga earthquake with uplift up to 1.6 feet and subsidence of 2 inches.

#### 11.3.2.5.2 Delta and Suisun Marsh Subsidence

Land subsidence on the islands in the central and western Delta and Suisun Marsh may be caused by the elimination of tidal inundation that formed the islands through sediment deposition and transport, and the oxidation and decay of plant materials that would compact to form soils. Following construction of levees, subsidence initially occurred through the mechanical settling of peat as the soil dried; and then, the dried peat and other soils shrunk (Reclamation et al. 2013, Drexler et al. 2009). Agricultural burning of peat (which has been discontinued), wind erosion, oxidation, and leaching of organic material. The rate of subsidence has declined from a maximum of 1.1 to 4.6 inches/year in the 1950s to less than 0.2 to 1.2 inches/year in the western Delta (Drexler et al. 2009, Rojstaczer et al. 1991). Many of the islands in the western and central Delta have subsided to elevations that are 10 to nearly 55 feet below sea level (USGS 2000b, Deverel and Leighton 2010).

Recently, the California Department of Water Resources has implemented several projects to reverse subsidence. The 274-acre Mayberry Farms Duck Club Subsidence Reversal Project on Sherman Island includes creation of emergent wetlands ponds and channels through excavation of peat soils, improving of water movement, and waterfowl habitat. The facility was constructed in 2010 and is being monitored to determine the effectiveness of subsidence reversal, methyl mercury management, and carbon sequestration (DWR 2013). The Department of Water Resources and USGS implemented wetlands restoration for about 15 acres on Twitchell Island in 1997 (DWR et al. 2013b) to encourage tule and cattail growth. After the growing season, the decomposed plant material accumulates and increases the land elevation. Since 1997, elevations have increased at a rate of 1.3 to 2.2 inches/year.

### 11.3.3 San Francisco Bay Area Region

The San Francisco Bay Area Region includes portions of Contra Costa, Alameda, Santa Clara, San Benito, and Napa counties that are within the CVP and SWP service areas. Portions of Napa County are within the SWP service area that use water diverted from Barker Slough in the Sacramento River watershed for portions of Solano and Napa counties. Solano County was discussed under the Delta area of the Central Valley Region. Napa County is described under the San Francisco Bay Area Region.

#### *11.3.3.1 Geologic Setting*

The San Francisco Bay Area Region primarily is located within the Coast Ranges Geomorphic Province. Eastern Contra Costa and Alameda counties are located in the Great Valley Geomorphic Province. The Coast Ranges and Great Valley geomorphic provinces were described in Section 11.3.2, Central Valley Region. San Francisco Bay is a structural trough formed as a gap in the Coast Range down-dropped to allow the Sacramento, San Joaquin, Napa, Guadalupe, and Coyote Rivers to flow into the Pacific Ocean. When the polar ice caps melted 10,000 to 25,000 years ago the ocean filled the inland valleys of the trough and formed San Francisco Bay, San Pablo Bay, and Suisun Bay (CALFED 2000). Initially, alluvial sands, silts, and clays filled the bays to form Bay Mud along the shoreline areas. Sedimentation patterns have changed over the past 150 years due to development of upstream areas of the watersheds which changed sedimentation and hydraulic flow patterns, hydraulic mining, and formation of levees and dams.

The San Francisco Bay Area is formed from the Salinian block located west of the San Andreas Fault; Mesozoic Franciscan complex located between the San Andreas and Hayward faults; and the Great Valley sequence located to the east of Hayward Fault (WTA 2003). The Salinian block generally is composed of granitic plutonic rocks probably from the Sierra Nevada Batholith that was displaced due to movement along the San Andreas Fault. The Franciscan complex includes deep marine sandstone and shale formed from oceanic crust with chert and limestone. The Great Valley sequence primarily includes marine sedimentary rocks.

#### *11.3.3.2 Regional Seismicity*

Large earthquakes have occurred in the San Francisco Bay Area Region along the San Andreas, Hayward, Calaveras, Greenville, Antioch, Concord-Green Valley, Midway, Midland, and Black Butte fault zones over the past 10,000 years. The San Francisco earthquake of 1906 took place as the result of movement along the San Andreas Fault. The San Andreas Fault remains active, as does the Hayward Fault, based on evidence of slippage along both (CALFED 2000).

#### *11.3.3.3 Soil Characteristics*

The San Francisco Bay Area Region soils include basin floor/basin rim, floodplain/valley land, terrace, foothill, and mountain soils (CALFED 2000). Basin floor/basin rim soils are organic-rich saline soils and poorly drained clays, clay loams, silty clay loams, and muck along the San Francisco Bay shoreline (SCS 1977b, 1981a; CALFED 2000). Well-drained sands and loamy sands and poorly-drained silty loams, clay loams, and clays occur on gently sloping alluvial fans of the San Francisco Bay Area Region that surround the floodplain and valley lands. Drained loams, silty loams, silty clay loams, and clay loams interbedded with sedimentary rock and some igneous rock occur in the foothills. Terrace loams are located along the southeastern edge of the San Francisco Bay Area Region above the valley land.

#### *11.3.3.4 Subsidence*

Subsidence in the San Francisco Bay Area Region primarily occurs in the Santa Clara Valley of Santa Clara County. The Santa Clara Valley is characterized by a groundwater aquifer with layers of non-consolidated porous soils interspersed with clay lenses. Historically, when the groundwater aquifer was in overdraft, the water pressure in the soils declined which resulted in compressed clay lenses and subsided land elevations. Between 1940 and 1970, soils near San Francisco Bay declined to elevations below sea level (SCVWD 2000). Under these conditions, salt water intrusion and tidal flooding occurred in the tributary streams of Guadalupe River and Coyote Creek. As of 2000, the land elevation in downtown San Jose subsided 13 feet since 1915. In 1951, water deliveries from San Francisco Water Department were initiated (Ingebritsen et al. 1999). In 1965, SWP deliveries were initiated in Santa Clara County. CVP water deliveries were initiated in 1987. The CVP and SWP water supplies are used to reduce groundwater withdrawals when groundwater elevations are low to allow natural recharge from local surface waters. The CVP and SWP also are used to directly recharge the groundwater through spreading basins in Santa Clara Valley.

#### *11.3.3.5 Central Coast and Southern California Regions*

The Central Coast Region includes portions of San Luis Obispo and Santa Barbara counties served by the SWP. The Southern California Region includes portions of Ventura, Los Angeles, Orange, San Diego, Riverside, and San Bernardino counties served by the SWP.

As described in Chapter 4, Approach to Environmental Analysis, the Southern California Region includes areas affected by operations of the SWP, including the Coachella Valley in Riverside County. The Coachella Valley Water District receives water under a SWP entitlement contract; however, SWP water cannot be conveyed directly to the Coachella Valley due to lack of conveyance facilities. Therefore, Coachella Valley Water District receives water from the Colorado River through an exchange agreement with the Metropolitan Water District of Southern California, as described in Chapter 5, Surface Water Resources and Water Supplies. The Imperial Valley, located to the southeast of the Southern California Region, receives irrigation water from the Colorado River through Reclamation canals; and does not use CVP or SWP water.

#### *11.3.3.6 Geologic Setting*

The Central Coast and Southern California Regions are located in the Coast Ranges, Transverse Ranges, Peninsular Ranges, Colorado Desert, and Mojave Desert geomorphic provinces (CGS 2002a).

The Central Coast Region includes portions of San Luis Obispo and Santa Barbara counties that use SWP water supplies. These areas are located within the Coast Ranges and Transverse Ranges geomorphic provinces. The Coast Ranges Geomorphic Province was described in Section 11.3.2, Central Valley Region. The Transverse Ranges Geomorphic Province consists of deeply folded and faulted sedimentary rocks (CGS 2002a, SBCAG 2013). Bedrock along the stream channels, coastal terraces, and coastal lowlands is overlain by alluvial and terrace deposits; and, in some area, ancient sand dunes. The geomorphic province is being uplifted at the southern border along San Andreas Fault and compressed at the northern border along the Coast Ranges Geomorphic Province. Therefore, the geologic structure of the ridges and valleys are oriented along an east-west orientation, or in a "transverse" orientation, as compared to the north-south orientation of the Coast Range.

The Southern California Region includes portions of Ventura, Los Angeles, Orange, San Diego, Riverside, and San Bernardino counties that use SWP water supplies. These areas are located within the Transverse Ranges, Peninsular Ranges, Mojave Desert, and Colorado Desert geomorphic provinces. The Transverse Ranges Geomorphic Province includes Ventura County and portions of Los Angeles, San Bernardino, and Riverside counties. The Colorado Desert Geomorphic Province is also known as the Salton Trough where the Pacific and North American plants are separating.

The Peninsular Ranges Geomorphic Province is composed of granitic rock with metamorphic rocks (CGS 2002a, SCAG 2011, San Diego County 2011). The geologic structure is similar to the geology of the Sierra Nevada Geomorphic Province. The faulting of this geomorphic province has resulted in northwest trending valleys and ridges that extend into the Pacific Ocean to form the Santa Catalina, Santa Barbara, San Clemente, and San Nicolas islands. The Peninsular Ranges Geomorphic Province includes Orange County and portions of southern Los Angeles County, western San Diego County, northwestern San Bernardino County, and northern Riverside County (including the northern portion of the Coachella Valley).

The Mojave Desert Geomorphic Province is located between the Garlock Fault along the southern boundary of the Sierra Nevada Geomorphic Province and the San Andreas Fault (CGS 2002a, SCAG 2011, RCIP 2000). This geomorphic province includes extensive alluvial basins with non-marine sediments from the surrounding mountains and foothills; and many isolated ephemeral lakebeds (also known as "playas") occur within this region with tributary streams from isolated mountain ranges. The Mojave Desert Geomorphic Province includes portions of Kern, Los Angeles, Riverside, and San Bernardino counties.

The Colorado Desert Geomorphic Province, or Salton Trough, is characterized by a geographically-depressed desert that extends northward from the Gulf of California (located at the mouth of the Colorado River) towards the Mojave Desert Geomorphic Province where the Pacific and North American plants are separating (CGS 2002a, SCAG 2011, RCIP 2000, San Diego County 2011). Large portions of this geomorphic province were formed by the inundation of the ancient Lake Cahuilla and are filled with sediments several miles thick from the historic Colorado River overflows and erosion of the Peninsular Ranges uplands. The Salton Trough is separated from the Gulf of California by a large ridge of sediment. The Salton Sea occurs within the trough along an ancient playa. The Colorado Desert Geomorphic Province includes portions of Riverside County in the Coachella Valley; and portions of San Diego and Imperial counties that are located outside of the study area.

### *11.3.3.7 Regional Seismicity*

Most of the areas in the Central Coast and Southern California regions are characterized by active faults that are capable of producing major earthquakes with substantial ground displacement. The San Andreas Fault Zone extends from the Gulf of California and extends in a northwest direction throughout the Central Coast and Southern California regions (CGS 2006).

Within portions of San Luis Obispo County that use SWP water supplies, the Nacimiento Fault also can result in major seismic events (CGS 2006, San Luis Obispo County 2010a).

The northern portions of Santa Barbara County that use SWP water supplies include Lion's Head Fault along the Pacific Ocean shoreline to the southwest of Santa Maria and along the northern boundary of Vandenberg Air Force Base (CGS 2006, SBCAG 2013). The Big Pine Fault may extend into the Vandenberg Air Force Base area. Areas near the mouth of the Santa Ynez River and Point Arguello could be affected by Lompoc Terrace Fault and Santa Ynez-Pacifico Fault Zone. The Santa Ynez Fault extends across this county and could affect communities near Santa Ynez. Along the southern coast of Santa Barbara County from Goleta to Carpinteria, the area includes many active faults, including More Ranch, Mission Ridge, Arroyo Parida, and Red Mountain faults; and potentially active faults, including Goleta, Mesa-Rincon, and Carpinteria faults.

Portions of Ventura County that use SWP water supplies are located in the southern portion of the county adjacent to Los Angeles County. Major faults in this area include the Oak Ridge Fault that extends into the Oxnard Plain along the south side of the Santa Clara River Valley and may extend into San Fernando Valley in Los Angeles County; Bailey Fault that extends from the Pacific Ocean to the Camarillo Fault; Simi-Santa Rosa, Camarillo, and Springville faults in Simi and Tierra Rejada valleys and near Camarillo; Sycamore Canyon and Boney Mountain faults that extend from the Pacific Ocean towards Thousand Oaks (CGS 2006, Ventura County 2011).

Los Angeles County major fault zones include Northridge Hills, San Gabriel, San Fernando, Verduga, Sierra Madre, Raymond, Hollywood, Santa Monica, and Malibu Coast fault zones; Elysian Park Fold and Thrust Belt in Los Angeles County; and Newport, Inglewood, Whittier, and Palos Verdes fault zones that extend into Los Angeles and Orange counties (CGS 2006, Los Angeles 2005). Recent major seismic events that have occurred in Southern California along faults in Los Angeles include the 1971 San Fernando, 1987 Whittier Narrows, 1991 Sierra Madre, and 1994 Northridge earthquakes.

Riverside and San Bernardino counties are characterized by the San Andreas Fault Zone that extends from the eastern boundaries of these counties and crosses to the western side of San Bernardino County (CGS 2006, RCIP 2000, Riverside County 2000, SCAG 2011, DWR 2009). The San Jacinto Fault Zone also extends through the center of Riverside County and along the western side of San Bernardino County. The Elsinore Fault Zone extends along the western sides of both counties. In San Bernardino County, the Cucamonga Fault extends into

Los Angeles County where it intersects with the Sierra Madre and Raymond faults. The Garlock and Lockhart fault zones extend into both San Bernardino and Kern counties. San Bernardino County also includes several other major fault zones, including North Frontal, and Helendale faults.

Portions of San Diego County that use SWP water supplies include the Rose Canyon Fault Zone located along the Pacific Ocean shoreline and extends into the City of San Diego (San Diego County 2011).

#### *11.3.3.8 Soil Characteristics*

In the Central Coast Region, areas within San Luis Obispo and Santa Barbara counties that use SWP water supplies are located within coastal valleys or along the Pacific Ocean shoreline. In San Luis Obispo County, Morro Bay, Pismo Beach, and Oceano areas are located along the coast with soils that range from sands and loamy sands in areas near the shoreline to shaly loams, clay loams, and clays in the terraces and foothills located along the eastern boundaries of these communities (SBCAG 2010b, NRCS 2014a, NRCS 2014b). In Santa Barbara County, the Santa Maria, Vandenberg Air Force Base, Santa Ynez, Goleta, Santa Barbara, and Carpinteria areas are located in alluvial plains, along stream channels with alluvium deposits, along the shoreline, or along marine terrace deposits above the Pacific Ocean. The soils range from sands, sandy loams, loams, shaly loams, and clay loams in the alluvial soils and along the shoreline. The terrace deposits include silty clays, clay loams, and clays (NRCS 2014c, NRCS 2014d, NRCS 2014e, SCS 1972, SCS 1981b).

Southern California Region soils include gravelly loams and gravelly sands, sands, sandy loams and loamy sands, and silty loams along the Pacific Coast shorelines and on alluvial plains. The mountains and foothills of the region include silty loams, cobbly silty loam, gravelly loam, sandy clay loams, clay loams, silty clays, and clays (SCAG 2011, UCCE 2014, SCS 1978, SCS 1986, SCS 1973). The inland region in Riverside and San Bernardino counties include sand to silty clays to cobbles and boulders on the alluvial fans, valley floor, terraces, and mountains, and dry lake beds (CVWD 2011).

#### *11.3.3.9 Subsidence*

Subsidence in the Central Coast and Southern California regions occur due to soil compaction following groundwater withdrawals at rates greater than groundwater recharge rates, oil and gas withdrawal, seismic activity, and hydroconsolidation of soils along alluvial fans (Los Angeles 2005). The USGS described areas with subsidence related to groundwater overdraft in the Central Coast and Southern California regions in San Luis Obispo, Santa Barbara, Los Angeles, Riverside, and Santa Bernardino counties (USGS 1999, Ventura County 2011, Los Angeles 2005, RCIP 2000). Many of the areas with subsidence have alluvial unconsolidated sands and silty sands with lenses of silt and clayey silt.

A recent study by the USGS in the southern Coachella Valley portion of Riverside described land subsidence of about 0.5 feet between 1930 and 1996 (USGS 2013c). Groundwater elevations in this area had declined since the early

1920s until 1949 when water from the Colorado River was provided to the area. This area is served by Coachella Valley Water District; and as described in Chapter 5, Surface Water Resources and Water Supply, the availability of surface water has not always been available to this area in recent years. The recent USGS study indicated that land subsidence of up to approximately 0.4 feet have occurred at some locations between 1996 and 2005; and possibly greater subsidence at other locations. A Coachella Valley Water District study indicated that up to 13 inches have occurred in parts of the valley between 1996 and 2005 (CVWD 2011).

# 11.4 Impact Analysis

This section describes the potential mechanisms and analytical methods for change in soils resources, results of the impact analysis, potential mitigation measures, and cumulative effects.

## 11.4.1 Potential Mechanisms for Change in Soils Resources

As described in Chapter 4, Approach to Environmental Analysis, the impact analysis considers changes in soils resources conditions related to changes in CVP and SWP operations under the alternatives as compared to the No Action Alternative and Second Basis of Comparison.

Changes in CVP and SWP operations under the alternatives as compared to the No Action Alternative and Second Basis of Comparison could change soil erosion potential due to crop idling on lands irrigated with CVP and SWP water supplies and along rivers downstream of CVP and SWP reservoirs, and potential changes in soils as lands are converted to seasonal floodplain or tidal-influenced wetlands.

### *11.4.1.1 Changes in Soil Erosion*

Changes in CVP and SWP operations under the alternatives could change the extent of irrigated acreage and the potential for soil erosion on crop idled lands over the long-term average condition and in dry and critical dry years as compared to the No Action Alternative and the Second Basis of Comparison.

Changes in CVP and SWP operations under the alternatives also could change peak flows in rivers downstream of CVP and SWP reservoirs in the Trinity River and Central Valley regions as compared to historical conditions which could lead to soil erosion during high peak flow events during storms in wet years along the river banks as compared to the No Action Alternative and the Second Basis of Comparison. However, as described in Chapter 5, Surface Water Resources and Water Supplies, the results of the analysis indicate that peak flows would be within historical range of peak flows in these rivers and would be similar under Alternatives 1 through 5, No Action Alternative, and Second Basis of Comparison. Therefore, changes in CVP and SWP operations would not result in changes to peak flow events that could result in soil erosion along these rivers. Therefore, these changes are not analyzed in this EIS.

#### *11.4.1.2 Changes in Soils at Restored Wetlands*

Restoration of seasonal floodplains and tidally-influenced wetlands would affect soils resources at the restoration locations. However, these actions would occur in a similar manner under the No Action Alternative, Alternatives 1 through 5, and Second Basis of Comparison, as described in Chapter 3, Description of Alternatives; in addition, the conditions of the soils would be the same under all of the alternatives and the Second Basis of Comparison. Therefore, these changes are not analyzed in this EIS.

#### *11.4.1.3 Effects Related to Water Transfers*

Historically water transfer programs have been developed on an annual basis.

The demand for water transfers is dependent upon the availability of water supplies to meet water demands. Water transfer transactions have increased over time as CVP and SWP water supply availability has decreased, especially during drier water years.

Parties seeking water transfers generally acquire water from sellers who have available surface water who can make the water available through releasing previously stored water, pump groundwater instead of using surface water (groundwater substitution), idle crops, or substitute crops that use less water in order to reduce normal consumptive use of surface water.

Water transfers using CVP and SWP Delta pumping plants and south of Delta canals generally occur when there is unused capacity in these facilities. These conditions generally occur during drier water year types when the flows from upstream reservoirs plus unregulated flows are adequate to meet the Sacramento Valley water demands and the CVP and SWP export allocations. In non-wet years, the CVP and SWP water allocations would be less than full contract amounts; therefore, capacity may be available in the CVP and SWP conveyance facilities to move water from other sources.

Projecting future soil conditions related to water transfer activities is difficult because specific water transfer actions required to make the water available, convey the water, and/or use the water would change each year due to changing hydrological conditions, CVP and SWP water availability, specific local agency operations, and local cropping patterns. Reclamation recently prepared a long-term regional water transfer environmental document which evaluated potential changes in surface water conditions related to water transfer actions (Reclamation 2014c). Results from this analysis were used to inform the impact assessment of potential effects of water transfers under the alternatives as compared to the No Action Alternative and the Second Basis of Comparison.

### 11.4.2 Conditions in Year 2030 without Implementation of Alternatives 1 through 5

This EIS includes two bases of comparison, as described in Chapter 3, Description of Alternatives: the No Action Alternative and the Second Basis of Comparison. Both of these bases are evaluated at 2030 conditions. Changes that would occur over the next 15 years without implementation of the alternatives are not analyzed in this EIS. However, the changes to soils resources that are assumed to occur by 2030 under the No Action Alternative and the Second Basis of Comparison are summarized in this section. Many of the changed conditions would occur in the same manner under both the No Action Alternative and the Second Basis of Comparison.

#### *11.4.2.1 Common Changes in Conditions under the No Action Alternative and Second Basis of Comparison*

Conditions in 2030 would be different than existing conditions due to:

- Climate change and sea-level rise
- General plan development throughout California, including increased water demands in portions of Sacramento Valley
- Implementation of reasonable and foreseeable water resources management projects to provide water supplies

It is anticipated that climate change would result in more short-duration high-rainfall events and less snowpack in the winter and early spring months. The reservoirs would be full more frequently by the end of April or May by 2030 than in recent historical conditions. However, as the water is released in the spring, there would be less snowpack to refill the reservoirs. This condition would reduce reservoir storage and available water supplies to downstream uses in the summer. The reduced end-of-September storage would also reduce the ability to release stored water to downstream regional reservoirs. These conditions would occur for all reservoirs in the California foothills and mountains, including non-CVP and SWP reservoirs.

These changes would result in a decline of the long-term average CVP and SWP water supply deliveries by 2030 as compared to recent historical long-term average deliveries under the No Action Alternative and the Second Basis of Comparison. However, the CVP and SWP water deliveries would be less under the No Action Alternative as compared to the Second Basis of Comparison, as described in Chapter 5, Surface Water Resources and Water Supplies, which could result in more crop idling that could be subject to erosion.

Under the No Action Alternative and the Second Basis of Comparison, land uses in 2030 would occur in accordance with adopted general plans. Development under the general plans would result in disruption of soils resources; however, the development of general plans includes preparation of environmental documentation that would identify methods to minimize adverse impacts to soils resources.

Under the No Action Alternative and the Second Basis of Comparison, development of future water resources management projects by 2030 which would result in disruption of soils resources. However, the development of these future programs would include preparation of environmental documentation that would identify methods to minimize adverse impacts to soils resources.

By 2030 under the No Action Alternative and the Second Basis of Comparison, it is assumed that ongoing programs would result in restoration of more than 10,000 acres of intertidal and associated subtidal wetlands in Suisun Marsh and Cache Slough; and 17,000 to 20,000 acres of seasonal floodplain restoration in the Yolo Bypass.

## 11.4.3 Evaluation of Alternatives

Alternatives 1 through 5 have been compared to the No Action Alternative; and the No Action Alternative and Alternatives 1 through 5 have been compared to the Second Basis of Comparison. The evaluation of alternatives is focused on portions of the Central Valley, San Francisco Bay Area, Central Coast, and Southern California regions that use CVP and SWP water for irrigation.

During review of the numerical modeling analyses used in this EIS, an error was determined in the CalSim II model assumptions related to the Stanislaus River operations for the Second Basis of Comparison, Alternative 1, and Alternative 4 model runs. Appendix 5C includes a comparison of the CalSim II model run results presented in this chapter and CalSim II model run results with the error corrected. Appendix 5C also includes a discussion of changes in the comparison of groundwater conditions for the following alternative analyses.

- No Action Alternative compared to the Second Basis of Comparison
- Alternative 1 compared to the No Action Alternative
- Alternative 3 compared to the Second Basis of Comparison
- Alternative 5 compared to the Second Basis of Comparison

### *11.4.3.1 No Action Alternative*

The No Action Alternative is compared to the Second Basis of Comparison.

#### 11.4.3.1.1 Central Valley Region

*Potential Changes in Soil Erosion*

As described in Chapter 12, Agricultural Resources, the extent of irrigated acreage under the No Action Alternative would be similar (within 5 percent) to the conditions under the Second Basis of Comparison over long-term conditions (throughout the 81-year model simulation period) and during dry and critical dry years due to the increased use of groundwater.

*Effects Related to Cross Delta Water Transfers*

Potential effects to soils resources could be similar to those identified in a recent environmental analysis conducted by Reclamation for long-term water transfers from the Sacramento to San Joaquin valleys (Reclamation 2014c). Potential effects to soils resources were identified as increased erosion and shrinking of expansive soils in the seller's service areas if crop idling is used to provide water for transfers; and increased potential for shrinking of expansive soils and soil movement in areas that use the transferred water. The analysis indicated that these potential impacts would not be substantial because farmers manage idle fields as part of normal agricultural operations and they would continue to use the same practices to avoid erosion impacts. The analysis also indicated that shrinking and soil movement occur as part of normal planting and harvesting practices and the changes with the water transfer programs would not result in substantial changes.

Under the No Action Alternative, the timing of cross Delta water transfers would be limited to July through September and include annual volumetric limits, in accordance with the 2008 U.S. Fish and Wildlife Service (USFWS) Biological Opinion (BO) and the 2009 National Marine Fisheries Service (NMFS) BO. Under the Second Basis of Comparison, water could be transferred throughout the year without an annual volumetric limit. Overall, the potential for cross Delta water transfers would be less under the No Action Alternative than under the Second Basis of Comparison.

##### 11.4.3.1.2 San Francisco Bay Area, Central Coast, and Southern California Regions

*Potential Changes in Soil Erosion*

As described in Chapter 12, Agricultural Resources, the extent of irrigated acreage under the No Action Alternative is anticipated to be similar as conditions under the Second Basis of Comparison due to the increased use of groundwater.

#### *11.4.3.2 Alternative 1*

Alternative 1 is identical to the Second Basis of Comparison. Alternative 1 is compared to the No Action Alternative and the Second Basis of Comparison. However, because CVP and SWP operations conditions under Alternative 1 are identical to conditions under the Second Basis of Comparison; Alternative 1 is only compared to the No Action Alternative.

##### 11.4.3.2.1 Alternative 1 Compared to the No Action Alternative

*Central Valley Region*

*Potential Changes in Soil Erosion*

As described in Chapter 12, Agricultural Resources, the extent of irrigated acreage under Alternative 1 would be similar to conditions under the No Action Alternative over long-term conditions and during dry and critical dry years due to the increased availability of CVP and SWP water supplies.

*Effects Related to Cross Delta Water Transfers*

Potential effects to soils resources could be similar to those identified in a recent environmental analysis conducted by Reclamation for long-term water transfers from the Sacramento to San Joaquin valleys (Reclamation 2014c) as described above under the No Action Alternative compared to the Second Basis of Comparison. For the purposes of this EIS, it is anticipated that similar conditions would occur during implementation of cross Delta water transfers under Alternative 1 and the No Action Alternative, and that impacts on soils resources would not be substantial in the seller’s service area due to implementation requirements of the transfer programs.

Under Alternative 1, water could be transferred throughout the year without an annual volumetric limit. Under the No Action Alternative, the timing of cross Delta water transfers would be limited to July through September and include annual volumetric limits, in accordance with the 2008 USFWS BO and 2009 NMFS BO. Overall, the potential for cross Delta water transfers would be increased under Alternative 1 as compared to the No Action Alternative.

*San Francisco Bay Area, Central Coast, and Southern California Regions*

*Potential Changes in Soil Erosion*

As described in Chapter 12, Agricultural Resources, the extent of irrigated acreage under Alternative 1 is anticipated to be similar as conditions under the No Action Alternative due to increased availability of CVP and SWP water supplies.

#### 11.4.3.2.2 Alternative 1 Compared to the Second Basis of Comparison

Alternative 1 is identical to the Second Basis of Comparison.

### *11.4.3.3 Alternative 2*

The CVP and SWP operations under Alternative 2 are identical to the CVP and SWP operations under the No Action Alternative; therefore, the soils resources conditions under Alternative 2 are only compared to the Second Basis of Comparison.

#### 11.4.3.3.1 Alternative 2 Compared to the Second Basis of Comparison

Changes to soils resources under Alternative 2 as compared to the Second Basis of Comparison would be the same as the impacts described in Section 11.4.3.1, No Action Alternative.

### *11.4.3.4 Alternative 3*

The CVP and SWP operations under Alternative 3 are similar to the Second Basis of Comparison and Alternative 1 with modified Old and Middle River flow criteria.

#### 11.4.3.4.1 Alternative 3 Compared to the No Action Alternative

*Central Valley Region*

*Potential Changes in Soil Erosion*

As described in Chapter 12, Agricultural Resources, the extent of irrigated acreage under Alternative 3 would be similar to the conditions under the No Action Alternative over long-term conditions and during dry and critical dry years due to the increased availability of CVP and SWP water supplies.

*Effects Related to Cross Delta Water Transfers*

Potential effects to soils resources could be similar to those identified in a recent environmental analysis conducted by Reclamation for long-term water transfers from the Sacramento to San Joaquin valleys (Reclamation 2014c) as described above under the No Action Alternative compared to the Second Basis of Comparison. For the purposes of this EIS, it is anticipated that similar conditions would occur during implementation of cross Delta water transfers under Alternative 3 and the No Action Alternative, and that impacts on soils resources would not be substantial in the seller's service area due to implementation requirements of the transfer programs.

Under Alternative 3, water could be transferred throughout the year without an annual volumetric limit. Under the No Action Alternative, the timing of cross Delta water transfers would be limited to July through September and include annual volumetric limits, in accordance with the 2008 USFWS BO and 2009 NMFS BO. Overall, the potential for cross Delta water transfers would be increased under Alternative 3 as compared to the No Action Alternative.

*San Francisco Bay Area, Central Coast, and Southern California Regions*

*Potential Changes in Soil Erosion*

As described in Chapter 12, Agricultural Resources, the extent of irrigated acreage under Alternative 3 is anticipated to be similar to conditions under the No Action Alternative due to increased availability of CVP and SWP water supplies.

#### 11.4.3.4.2 Alternative 3 Compared to the Second Basis of Comparison

*Central Valley Region*

*Potential Changes in Soil Erosion*

As described in Chapter 12, Agricultural Resources, the extent of irrigated acreage under Alternative 3 would be similar to the conditions under the Second Basis of Comparison over long-term conditions and during dry and critical dry years due to the increased use of groundwater.

*Effects Related to Cross Delta Water Transfers*

Potential effects to soils resources could be similar to those identified in a recent environmental analysis conducted by Reclamation for long-term water transfers from the Sacramento to San Joaquin valleys (Reclamation 2014c) as described above under the No Action Alternative compared to the Second Basis of Comparison. For the purposes of this EIS, it is anticipated that similar conditions would occur during implementation of cross Delta water transfers under Alternative 3 and the Second Basis of Comparison, and that impacts on soils resources would not be substantial in the seller's service area due to implementation requirements of the transfer programs.

Under Alternative 3 and the Second Basis of Comparison, water could be transferred throughout the year without an annual volumetric limit. Overall, the potential for cross Delta water transfers would be similar under Alternative 3 and the Second Basis of Comparison.

*San Francisco Bay Area, Central Coast, and Southern California Regions*

*Potential Changes in Soil Erosion*

As described in Chapter 12, Agricultural Resources, the extent of irrigated acreage under Alternative 3 is anticipated to be similar to conditions under the Second Basis of Comparison due to the increased use of groundwater.

#### *11.4.3.5 Alternative 4*

Soil resources conditions under Alternative 4 would be identical to the conditions under the Second Basis of Comparison; therefore, Alternative 4 is only compared to the No Action Alternative.

##### 11.4.3.5.1 Alternative 4 Compared to the No Action Alternative

The CVP and SWP operations under Alternative 4 are identical to the CVP and SWP operations under the Second Basis of Comparison and Alternative 1. Therefore, changes in soil resources conditions under Alternative 4 as compared to the No Action Alternative would be the same as the impacts described in Section 11.4.3.2.1, Alternative 1 Compared to the No Action Alternative.

#### *11.4.3.6 Alternative 5*

The CVP and SWP operations under Alternative 5 are similar to the No Action Alternative with modified Old and Middle River flow criteria and New Melones Reservoir operations.

##### 11.4.3.6.1 Alternative 5 Compared to the No Action Alternative

*Central Valley Region*

*Potential Changes in Soil Erosion*

As described in Chapter 12, Agricultural Resources, the extent of irrigated acreage under Alternative 5 would be similar to conditions under the No Action Alternative over long-term conditions and during dry and critical dry years because the availability of CVP and SWP water supplies would be similar.

*Effects Related to Cross Delta Water Transfers*

Potential effects to soils resources could be similar to those identified in a recent environmental analysis conducted by Reclamation for long-term water transfers from the Sacramento to San Joaquin valleys (Reclamation 2014c) as described above under the No Action Alternative compared to the Second Basis of Comparison. For the purposes of this EIS, it is anticipated that similar conditions would occur during implementation of cross Delta water transfers under Alternative 5 and the No Action Alternative, and that impacts on soils resources would not be substantial in the seller's service area due to implementation requirements of the transfer programs.

Under Alternative 5 and the No Action Alternative, the timing of cross Delta water transfers would be limited to July through September and include annual volumetric limits, in accordance with the 2008 USFWS BO and 2009 NMFS BO. Overall, the potential for cross Delta water transfers would be similar under Alternative 5 and the No Action Alternative.

*San Francisco Bay Area, Central Coast, and Southern California Regions*

*Potential Changes in Soil Erosion*

As described in Chapter 12, Agricultural Resources, the extent of irrigated acreage under Alternative 5 is anticipated to be similar as conditions under the No Action Alternative because CVP and SWP water deliveries would be similar.

#### 11.4.3.6.2 Alternative 5 Compared to the Second Basis of Comparison

*Central Valley Region*

*Potential Changes in Soil Erosion*

As described in Chapter 12, Agricultural Resources, the extent of irrigated acreage under Alternative 5 would be similar to the conditions under the Second Basis of Comparison over long-term conditions and during dry and critical dry years due to increased use of groundwater.

*Effects Related to Cross Delta Water Transfers*

Potential effects to soils resources could be similar to those identified in a recent environmental analysis conducted by Reclamation for long-term water transfers from the Sacramento to San Joaquin valleys (Reclamation 2014c) as described above under the No Action Alternative compared to the Second Basis of Comparison. For the purposes of this EIS, it is anticipated that similar conditions would occur during implementation of cross Delta water transfers under Alternative 5 and the Second Basis of Comparison, and that impacts on soils resources would not be substantial in the seller's service area due to implementation requirements of the transfer programs.

Under Alternative 5, the timing of cross Delta water transfers would be limited to July through September and include annual volumetric limits, in accordance with the 2008 USFWS BO and 2009 NMFS BO. Under Second Basis of Comparison, water could be transferred throughout the year without an annual volumetric limit. Overall, the potential for cross Delta water transfers would be less under Alternative 5 as compared to the Second Basis of Comparison.

*San Francisco Bay Area, Central Coast, and Southern California Regions*

*Potential Changes in Soil Erosion*

As described in Chapter 12, Agricultural Resources, the extent of irrigated acreage under Alternative 5 is anticipated to be similar to conditions under the Second Basis of Comparison due to the increased use of groundwater.

### *11.4.3.7 Summary of Impact Analysis*

The results of the environmental consequences of implementation of Alternatives 1 through 5 as compared to the No Action Alternative and the Second Basis of Comparison are presented in Tables 11.1 and 11.2, respectively.

**Table 11.1 Comparison of Alternatives 1 through 5 to No Action Alternative**

| Alternative | Potential Change | Consideration for Mitigation Measures |
|---|---|---|
| Alternative 1 | No effects on soils resources | None needed |
| Alternative 2 | No effects on soils resources | None needed |
| Alternative 3 | No effects on soils resources | None needed |
| Alternative 4 | No effects on soils resources | None needed |
| Alternative 5 | No effects on soils resources | None needed |

**Table 11.2 Comparison of No Action Alternative and Alternatives 1 through 5 to Second Basis of Comparison**

| Alternative | Potential Change | Consideration for Mitigation Measures |
|---|---|---|
| No Action Alternative | No effects on soils resources | Not considered for this comparison |
| Alternative 1 | No effects on soils resources | Not considered for this comparison |
| Alternative 2 | No effects on soils resources | Not considered for this comparison |
| Alternative 3 | No effects on soils resources | Not considered for this comparison |
| Alternative 4 | No effects on soils resources | Not considered for this comparison |
| Alternative 5 | No effects on soils resources | Not considered for this comparison |

#### *11.4.3.8 Potential Mitigation Measures*

Mitigation measures are presented in this section to avoid, minimize, rectify, reduce, eliminate, or compensate for adverse environmental effects of Alternatives 1 through 5 as compared to the No Action Alternative. Mitigation measures were not included to address adverse impacts under the alternatives as compared to the Second Basis of Comparison because this analysis was included in this EIS for information purposes only.

Changes in CVP and SWP operations under Alternatives 1 through 5 as compared to the No Action Alternative would not result in changes in soils resources. Therefore, there would be no adverse impacts to soils resources as compared to the No Action Alternative; and no mitigation measures are required.

#### *11.4.3.9 Cumulative Effects Analysis*

As described in Chapter 3, the cumulative effects analysis considers projects, programs, and policies that are not speculative; and are based upon known or reasonably foreseeable long-range plans, regulations, operating agreements, or other information that establishes them as reasonably foreseeable.

The cumulative effects analysis for Alternatives 1 through 5 for Geology and Soils Resources are summarized in Table 11.3.

**Table 11.3 Summary of Cumulative Effects on Geology and Soils Resources with Implementation of Alternatives 1 through 5 as Compared to the No Action Alternative**

| Scenarios | Actions | Cumulative Effects of Actions |
|---|---|---|
| Past & Present, and Future Actions | Consistent with Affected Environment conditions plus: | These effects would be the same under all alternatives. |

| Scenarios | Actions | Cumulative Effects of Actions |
|---|---|---|
| included in the No Action Alternative and in All Alternatives in Year 2030 | Actions in the 2008 USFWS BO and 2009 NMFS BO that would have occurred without implementation of the BOs, as described in Section 3.3.1.2 (of Chapter 3, Descriptions of Alternatives) including climate change and sea level rise<br>Actions not included in the 2008 USFWS BO and 2009 NMFS BO that would have occurred without implementation of the BOs, as described in Section 3.3.1.3 (of Chapter 3, Descriptions of Alternatives):<br>- Climate Change and Sea Level Rise<br>- Implementation of Federal and state policies and programs, including Clean Water Act (e.g., Total Maximum Daily Loads); Safe Drinking Water Act; Clean Air Act; and flood management programs<br>- General plans for 2030.<br>- Trinity River Restoration Program.<br>- Central Valley Project Improvement Act programs<br>- Folsom Dam Water Control Manual Update<br>- Dutch Slough Tidal Marsh Restoration<br>- Suisun Marsh Habitat Management, Preservation, and Restoration Plan Implementation<br>- Tidal Wetland Restoration: Yolo Ranch, Northern Liberty Island Fish Restoration Project, Prospect Island Restoration Project, and Calhoun Cut/Lindsey Slough Tidal Habitat Restoration Project<br>- San Joaquin River Restoration Program<br>- Grasslands Bypass Project<br>- Central Valley Salinity Alternatives for Long-Term Sustainability (CV-SALTS)<br>- Future water supply projects, including water recycling, desalination, groundwater banks | Developments under the general plans and future water supply, water quality improvement, and restoration projects could affect soils resources. However, development of these future programs would include preparation of environmental documentation that would identify methods to minimize adverse impacts to soils resources.<br><br>Some of the future actions would reduce the effects of agricultural drainage and/or reduce salinity in the San Joaquin River and the Delta. These programs would result in a beneficial impact to soils resources. |

| Scenarios | Actions | Cumulative Effects of Actions |
|---|---|---|
| | and wellfields, and conveyance facilities (projects with completed environmental documents) | |
| Future Actions considered as Cumulative Effects Actions in All Alternatives in Year 2030 | Actions as described in Section 3.5 (of Chapter 3, Descriptions of Alternatives):<br>- Bay-Delta Water Quality Control Plan Update<br>- FERC Relicensing Projects<br>- Bay Delta Conservation Plan and California WaterFix<br>- Shasta Lake Water Resources, North-of-the-Delta Offstream Storage, Los Vaqueros Reservoir Expansion Phase 2, and Upper San Joaquin River Basin Storage Investigations<br>- El Dorado Water and Power Authority Supplemental Water Rights Project<br>- Semitropic Water Storage District Delta Wetlands<br>- North Bay Aqueduct Alternative Intake<br>- Irrigated Lands Regulatory Program<br>- San Luis Reservoir Low Point Improvement Project<br>- Westlands Water District v. United States Settlement<br>- Future water supply projects, including water recycling, desalination, groundwater banks and wellfields, and conveyance facilities (projects that did not have completed environmental documents during preparation of the EIS) | These effects would be the same in all alternatives.<br>Developments under the future projects are anticipated to potentially effect soils resources. However, development of these future programs would include preparation of environmental documentation that would identify methods to minimize adverse impacts to soils resources.<br>Some of the future cumulative effects actions would reduce the effects of agricultural drainage and/or reduce salinity in the San Joaquin River and the Delta. These programs would result in a beneficial impact to soils resources. |
| No Action Alternative with Associated Cumulative Effects Actions in Year 2030 | Full implementation of the 2008 USFWS BO and 2009 NMFS BO | Implementation of the No Action Alternative with reasonably foreseeable actions would include developments under general plans and future water supply, water quality improvement, and restoration projects are anticipated to potentially affect soils resources. However, |

| Scenarios | Actions | Cumulative Effects of Actions |
|---|---|---|
| | | development of these future programs would include preparation of environmental documentation that would identify methods to minimize adverse impacts to soils resources. |
| Alternative 1 with Associated Cumulative Effects Actions in Year 2030 | No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant) | Implementation of Alternative 1 with reasonably foreseeable actions would result in similar changes as under the No Action Alternative with the added actions. |
| 2 with Associated Cumulative Effects Actions in Year 2030 | Full implementation of the 2008 USFWS BO and 2009 NMFS BO CVP and SWP operational actions<br>No implementation of structural improvements or other actions that require further study to develop a more detailed action description. | Implementation of Alternative 2 with reasonably foreseeable actions would result in similar changes as under the No Action Alternative with the added actions. |
| Alternative 3 with Associated Cumulative Effects Actions in Year 2030 | No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant)<br>Slight increase in positive Old and Middle River flows in the winter and spring months | Implementation of Alternative 3 with reasonably foreseeable actions would result in similar changes as under the No Action Alternative with the added actions. |
| Alternative 4 with Associated Cumulative Effects Actions in Year 2030 | No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant) | Implementation of Alternative 4 with reasonably foreseeable actions would result in similar changes as under the No Action Alternative with the added actions. |
| Alternative 5 with Associated Cumulative Effects Actions in Year 20530 | Full implementation of the 2008 USFWS BO and 2009 NMFS BO<br>Positive Old and Middle River flows and increased Delta outflow in spring months | Implementation of Alternative 5 with reasonably foreseeable actions would result in similar changes as under the No Action Alternative with the added actions. |

**Chapter 12**

# Agricultural Resources

## 12.1 Introduction

This chapter describes agricultural resources in the study area, and potential changes that could occur as a result of implementing the alternatives evaluated in this Environmental Impact Statement (EIS). Implementation of the alternatives could affect land use through potential changes in operation of the Central Valley Project (CVP) and State Water Project (SWP) and ecosystem restoration.

Changes in non-agricultural land use and resources are described in Chapter 13, Land Use.

## 12.2 Regulatory Environment and Compliance Requirements

Potential actions that could be implemented under the alternatives evaluated in this EIS could affect agricultural resources served by CVP and SWP water supplies. Actions located on public agency lands; or implemented, funded, or approved by Federal and state agencies would need to be compliant with appropriate Federal and state agency policies and regulations, as summarized in Chapter 4, Approach to Environmental Analyses.

## 12.3 Affected Environment

This section describes agricultural resources that could be potentially affected by the implementation of the alternatives considered in this EIS. Changes in agricultural resources due to changes in CVP and SWP operations may occur in the Trinity River, Central Valley, San Francisco Bay Area, Central Coast, and Southern California regions. Direct or indirect agricultural resource effects due to implementation of the alternatives analyzed in this EIS are related to changes in agricultural land uses due to the availability and reliability of CVP and SWP water supplies.

Changes in agricultural resources can affect agriculture throughout the state. An overview of California agriculture is presented prior to discussions of agricultural resources in each of the regions.

### 12.3.1 Overview of California Agriculture

California agriculture is an important resource that produces over 400 types of crops. California is the nation’s leading producer of nearly 80 commodities; and produces more than 99 percent of the nation’s almonds, artichokes, dates, figs, raisins, kiwifruit, olives, clingstone peaches, pistachios, prunes, pomegranates, and walnuts (USDA-NASS 2012). In 2011, cultivation of 25.4 million acres of agricultural land contributed about $43.5 billion to California's economy and 11.6 percent of total agricultural revenues in the United States. This section provides:

- Recent trends in California agricultural resources
- Crop production practices
- Cropping pattern changes in response to water supply availability
- Water supply and crop acreage relationships in the San Joaquin Valley

#### *12.3.1.1 Recent Trends in Agricultural Production*

The United States Department of Agriculture (USDA) National Agricultural Statistics Service (NASS) California Field Office publishes annual reports containing data from County Agricultural Commissioners and periodic statewide census of agricultural producers. County Agricultural Commissioners' data covers acres planted, total production, prices, yield per acre, and value of production across crop groups and counties.

From 1960 to 2012, total acreage in production fluctuated between eight and nine million acres, as summarized in Figure 12.1. Over the last fifteen years, total acreage has trended down. Most of the variability over time, and the more recent downward trend, are largely attributable to changes in field and forage crop acreage. The percentage of field and forage acreage decreased from 77 percent of total acreage in 1960 to 48 percent in 2012. The proportion of acreage of permanent crops (e.g. orchards and vine) has steadily increased from 1960 to 2012. Orchard and vine acreage rose from 14 percent of total acreage in 1960 to 38 percent in 2012.

From 1960 to 2012, statewide annual value of production rose from $20 billion (all values are in 2012 US dollars) to $45 billion, as summarized in Figure 12.2. Of the crop categories, orchard and vine values grew the fastest over this period, from around $3 billion in annual value of production in 1960 to over $17 billion in 2012. This increase may be attributable to both the expansion of acreage planted, as shown in Figure 12.1, as well as price and yield increases. Orchard and vine values of production rose from 17 percent of the total statewide value of production in 1960 to 38 percent in 2012. Other crop categories that have also experienced an increase in value of production over this time period are: vegetable, livestock, dairy and poultry, and nursery. Field crops have shown a downward trend. The percentage from field and forage crops decreased from the peak of 28 percent of state value of production in 1980 to 11 percent in 2012. Total value of production is influenced by both the acreage planted each year as well as market prices and yields.

#### *12.3.1.2 Crop Production Practices*

Crop production practices vary by crop and locational differences such as soil, slope, local climate, and water source and reliability. Production practices discussed in this subsection include:

- Crop rotation and fallowing.

- Crop water use.
- Crop irrigation methods.
- Crop responses to water quality.
- Crop drainage methods.
- Crop adaptation to changes in water supply availability.

#### 12.3.1.2.1 Crop Rotation and Fallowing

Crop rotation is the planned variation in the crop grown on a given field. Growers rotate annual crops and some forage crops in order to control plant pests, diseases, and weeds, and to improve soil structure, microbial diversity, and nutrient and mineral availability. Growers select a series of crops that are compatible for rotation that are planned to be grown in a field in a succession of years and plan their operations schedule and build their on-farm infrastructure (e.g., equipment, facilities and staffing) to a scale that meets the production needs of those crop acreage mixes (Baldwin 2006).

Field fallowing is the practice of not planting a crop in a field for one or more growing seasons. Fallowing can be a planned part of the rotation, or may be a consequence of another event like water supply shortage, flooding, land improvement, or poor crop prices. Rotations are not fixed, so changes in market conditions or Federal farm programs can affect crop mix and the pattern and magnitude of fallowing.

Fallowed fields without cover crops can lose topsoil to surface drainage and wind erosion. Loss of topsoil to erosion reduces land productivity, and can reduce nearby crop yields and marketability.

#### 12.3.1.2.2 Crop Water Use

Crop irrigation water use depends on crop type, stage of crop growth, soil moisture profile from winter rains, soil moisture holding capacity (total amount of water in the soil potentially available to plants), management of plant pests and diseases, weather conditions (solar radiation, temperature and humidity) and irrigation water use efficiency. Irrigation water use efficiency can be defined in different ways. The California Department of Water Resources (DWR) defines the agronomic water use fraction as the irrigation water beneficially used for necessary agronomic functions (e.g., transpiration, leaching, frost protection, germination) divided by the total applied water (DWR 2012). Applied irrigation water is transpired by plants (crops and weeds), percolates into the groundwater below the root zone (necessary salt leaching component or over-irrigation loss to groundwater), evaporates directly from water or soil surfaces, or runs off the field as surface drainage (Edinger-Marshall and Letey 1997).

Reuse of water from fields to irrigate other fields, often multiple times, occurs throughout California. As a result, relatively low field-level efficiency (agronomic water use fraction) can result in relatively high efficiency from a regional or basin perspective (DWR 2013a).

#### 12.3.1.2.3 Crop Irrigation

Agricultural irrigation needs vary by season. In the winter, rainfall refills the soil moisture profile that was depleted from the crop root zone the previous summer and fall. If soil moisture is not adequate for planting of annual crops, pre-irrigation water is applied. Pre-irrigation and early growing season irrigations generally occur in the time period from March through May. Peak agricultural irrigation water supply demand generally occurs from the late spring through late summer. Permanent crops are irrigated post-harvest to refill the root zone. Post-harvest irrigation of annual crop land is sometimes used to help break down crop residue and suppress some pests and diseases, especially in rice fields.

Irrigation methods vary by area, soil, crop type, and existing facilities. Annual row crops are often sprinkler irrigated for crop germination and furrow irrigated for the rest of the season. Permanent crops are typically irrigated with drip, sprinkler, furrow, border, or flood irrigation methods. Irrigated pasture and alfalfa are typically irrigated with sprinkler or flood irrigation methods. Rice is generally irrigated with flood irrigation. Irrigation methods utilized in the Central Valley include:

- **Flood and Border Irrigation:** Water is released into a leveled field or block that is segmented into "checks" with a small berm to contain the water. Water applied to the check until it is flooded and the water seeps into the ground or some is allowed to drain off the lower elevation end of the field.
- **Furrow Irrigation:** Water is released into furrows at the higher side of the field and flows down to the lower end of the field. To provide adequate water to the low end of the field, surface irrigation requires that a certain amount of water be spilled or drained off as tailwater. Recycling the tailwater to the head of the field or to an adjacent field can significantly increase overall efficiency. Furrow irrigation is used on annual row crops and on some vineyards.
- **Sprinkler Irrigation:** Sprinkler irrigation uses pressurized water through movable or solid set pipe to a sprinkler. Sprinklers lose some irrigation water to evaporation in the air before the water reaches the ground. Sprinklers also apply water to ground that does not have crop roots, and this applied water goes to surface evaporation, weed transpiration, or percolation to groundwater leaching. Sprinklers are often used during the germination stage of vegetables, and can also be used for frost control on orchards, especially citrus. Sprinkler irrigation can be used on most crops except those for which direct contact with the water drops could cause fruit cracking, fungal growth, or other issues.
- **Surface Drip and Micro-sprinkler Irrigation:** Surface drip and micro-sprinkler irrigation also use pressurized water that is delivered through flexible tubes to drip emitters or micro-sprinkler heads. Surface drip irrigation generally applies water only to the crop root areas. Drip irrigation and micro-sprinklers are used on most orchards and vineyards.

- **Subsurface Drip Irrigation:** Subsurface drip irrigation is similar to the drip irrigation described above, but the tubing or drip tape is buried a few inches to several feet, depending on the crop. Subsurface drip irrigation generally applies water only to crop root areas and reduces surface evaporation. Subsurface drip is used on some row crops and vineyards.

Flood and furrow irrigated acreage has declined over time, especially for trees and vines by drip and micro-sprinkler irrigation (NCWA 2011). Crops that continue to rely upon flood irrigation, such as rice, have improved irrigation efficiency through the use of laser leveling of the fields. The use of furrow and flood irrigation has declined in California from 67 percent of the total irrigated acreage in 1991 to 43 percent in 2010 (DWR 2013a). During this same time period, the use of drip, micro-sprinkler, and subsurface drip irrigation increased from 16 percent of total irrigated acreage in 1991 to 42 percent in 2010.

#### 12.3.1.2.4 Crop Response to Water Quality

Water quality of the surface water streams in the Central Valley is generally very suitable for agricultural production with low salinity, neutral acidity/alkalinity (i.e., pH), minerals, nutrients, and dissolved metal concentrations that are appropriate for agricultural uses. However, groundwater quality varies substantially across California, as described in Chapter 7, Groundwater Resources and Groundwater Quality.

Agricultural production can be affected by high salinity, minerals, and boron in the irrigation water and the soils. In the Sacramento Valley, water temperature can reduce crop yields; cold water is a particular concern for rice production (Roel et al., 2005). Irrigation water can carry debris and biological contaminants that affect agricultural operations and the value of crop production (USDA 2006).

High salinity concerns occur on agricultural lands receiving CVP and SWP water from the Delta. As described in Chapter 6, Surface Water Quality, surface waters in the Delta and lower San Joaquin River water frequently are characterized by high salinity. These waters are used by agricultural water users in the Delta and CVP and SWP water users located within and to the south of the Delta.

Evaporation and transpiration of irrigation water cause salts to accumulate in soils unless adequate leaching and drainage are provided (Reclamation 2005). High water tables with elevated concentrations of salts can draw the salinity vertically through the soil by capillary action into the plant root zone and cause damage to the plant. Excessive irrigation water salinity and accumulated soil salinity can adversely affect soil structure, reduce water infiltration rates, reduce seed germination, increase seedling mortality, impede root growth, impede water uptake by the plant (from increased osmotic pressure), reduce plant growth rate, and reduce yields.

All irrigation water adds soluble salts to the soil, including sodium, calcium, magnesium, potassium, sulfate, and chlorides (Grattan 2002). Salinity is usually measured either in parts per million of total dissolved solids or by electrical conductivity (EC). Water salinity of irrigation water is measured as “$EC_w$.”

Accumulated salts in the soil are measured as "$EC_e$." The strength of the electrical conductivity depends upon the water temperature, types of salts, and salt concentrations.

High salinity can affect the amount of irrigation water applied for crop irrigation and necessary soil leaching component (washing soil salts out of the plant root zone) compared to the total quantity of irrigation water applied (Reclamation 2005). Irrigation in the San Joaquin Valley typically includes a salt leaching component. The leaching water generally conveys the salts into installed drains in the fields or into the groundwater. Therefore, in locations where adequate drainage does not exist, continued irrigation with high salinity water has increased groundwater salinity, as described in Chapter 7, Groundwater Resources and Groundwater Quality.

Table 12.1 presents $EC_e$ and $EC_w$ values for salinity tolerances of a range of crops grown in the Central Valley.

**Table 12.1 Salinity Tolerance of Selected Crops (as percent of maximum yield)**

| | Crop Tolerance based on Soil Salinity (measured as $EC_e$) | | | Crop Tolerance based on Water Salinity (measured as $EC_w$) | | |
|---|---|---|---|---|---|---|
| **Crops[a, b]** | **100%** | **50%** | **0%[c]** | **100%** | **50%** | **0%[c]** |
| Alfalfa | 2.0 | 8.8 | 16 | 1.3 | 5.9 | 10 |
| Almond[d] | 1.5 | 4.1 | 6.8 | 1.0 | 2.8 | 4.5 |
| Apricot[d] | 1.6 | 3.7 | 5.8 | 1.1 | 2.5 | 3.8 |
| Bean | 1.0 | 3.6 | 6.3 | 0.7 | 2.4 | 4.2 |
| Corn, sweet | 1.7 | 5.9 | 10 | 1.1 | 3.9 | 6.7 |
| Cucumber | 2.5 | 6.3 | 10 | 1.7 | 4.2 | 6.8 |
| Grape[e] | 1.5 | 6.7 | 12 | 1.0 | 4.5 | 7.9 |
| Peach | 1.7 | 4.1 | 6.5 | 1.1 | 2.7 | 4.3 |
| Rice (paddy) | 3.0 | 7.2 | 11 | 2.0 | 4.8 | 7.6 |
| Squash, Zucchini | 4.7 | 10 | 15 | 3.1 | 6.7 | 10 |
| Sudan Grass | 2.8 | 14 | 26 | 1.9 | 9.6 | 17 |
| Sugar Beet[e] | 7.0 | 15 | 24 | 4.7 | 10 | 16 |
| Tomato | 2.5 | 7.6 | 13 | 1.7 | 5.0 | 8.4 |

Sources: Ayers and Westcot 1994; Grattan 2002; Maas and Hoffman 1977

Notes:

a. These data should be used as a guide to relative tolerances among crops. Absolute tolerances will change based upon climate, soil conditions, and cultural practices. Plants will tolerate about 2 deciSiemens per meter (dS/m) higher soil salinity ($EC_e$) than indicated if soils have high gypsum, however the water salinity ($EC_w$) tolerances do not change.

b. $EC_e$ is average root zone salinity as measured by electrical conductivity of the saturation extract of the soil, and $EC_w$ is electrical conductivity of the irrigation water, both reported in dS/m) at 25°C. The data is based upon a relationship between soil salinity and water salinity of $EC_e = 1.5\ EC_w$ with a 15 to 20 percent leaching fraction and a 40-30-20-10 percent water use pattern for the upper to lower quarters of the root zone.

c. The zero yield potential or maximum $EC_e$ indicates the theoretical soil salinity ($EC_e$) at which crop growth ceases.

d. Tolerance evaluations are based on tree growth and not on yield.

e. For beets, which are more sensitive during germination, the $EC_e$ should not exceed 3 dS/m in the seeding area for garden beets and sugar beets.

The most sensitive crops are affected when $EC_e$ values exceed 1 dS/m, and include the following crops with threshold values: beans (1.0 dS/m); walnuts 1.1 dS/m), bulb onions (1.2 dS/m); grapes, peppers and almonds (1.5 dS/m); apricots (1.6 dS/m); corn and peaches (1.7 dS/m); alfalfa (2.0 dS/m); and cucumbers and tomatoes (2.5 dS/m).

In addition to salinity, boron is also a concern in some areas. Dry beans are one of the more boron sensitive crops with a threshold value of 0.75 to 1.0 mg/l in the soil water within the crop root zone.

#### 12.3.1.2.5 Crop Drainage Methods

Agricultural crop surface and subsurface drainage is important for the suitability of agricultural production (DWR 2013a; Reclamation 2005; SJVDIP 1998). Drainage of most agricultural fields occurs by a combination of surface drainage and subsurface drainage. Poor drainage can lead to crop loss or damage from lack of soil oxygen availability for plant roots, pest infestations (e.g., pathogenic root fungi, such as *phytothora*), and salt accumulation in the root zone. High water tables, high salinity, and poor drainage can limit crop selection and limit the ability of farmers to use irrigation water to leach excess salts out of the crop root zone.

Surface water drainage from agricultural fields is collected in on-farm drainage ditches which are typically connected to larger drainage facilities. The drainage water either flows by gravity or is pumped into adjacent water bodies. Water quality issues related to disposal of surface water drainage can include high concentrations of sediment; nutrients from fertilizers; or residual organic carbon constituents from herbicides, pesticides, or nematicides. On-farm surface drainage systems sometimes include local methods to remove sediment or nutrients, such as the inclusion of vegetative strips to remove sediment and improve drain water quality (CALFED 2000). During the irrigation season, surface drainage water collected from irrigation can be recirculated for subsequent irrigation; however, this can lead to a long-term increase in soil salinity (DWR 2013a; SJVDIP 1998).

Subsurface drainage is used to control groundwater depth to avoid or limit its encroachment into the root zone of crops (Panuska 2011). For example in the Delta, subsurface and surface drainage is used not only to control groundwater depths related to irrigation practices, but also to control groundwater that seeps into the soils from the surface water that surrounds the islands and tracts. Areas in the western and southern San Joaquin Valley are affected by shallow, saline groundwater that accumulates due to irrigation; and the shallow groundwater is underlain by soils with poor drainage (CALFED 2000; DWR 2013a; SJVDP 1990; SJVDIP 1998; WWD 2013a, 2013b). Some areas of northern San Joaquin, Valley collect and discharge subsurface drainage to the San Joaquin River (Reclamation, 2013). Areas in the central and southern San Joaquin Valley manage poor drainage conditions by careful and integrated management of crop patterns, land retirement, irrigation methods and application rates, and/or drainage water reuse and blending, (USGS 2008; WRCD 2004).

#### 12.3.1.2.6 Crop Adaptation in Response to Changes in Water Supply Availability

Farmers and water suppliers can react to changes in water supply in a range of ways. Some farmers adapt to variability by maintaining a mix of crops that can be shifted or fallowed in response to water supply changes. Some farmers have groundwater wells that can be used to replace surface water in times of shortage. Short term responses can also include reducing irrigation water application below what is needed to maintain full crop yield (water stressing). Over the long term, irrigation systems and management can be changed to apply less water. Decisions that farmers make in response to changes in water supply affect other aspects of their operations, and affect the economy of the surrounding community. For example, crop mix and irrigation methods affect the kinds of tractors and other equipment used on the farm.

Some types of on-farm infrastructure also are specialized for the crops grown including: grain driers and storage, hullers, fruit sorting and packing, fruit driers, cotton gins and cold storage plants. Crop-specific equipment, infrastructure, and marketing agreements may prevent a grower from change crops quickly due to changes in water supply availability.

Input suppliers, equipment dealers, labor force, and processing facilities are also dependent on, and affected by, cropping decisions. As crop types change, the mix of these related economic activities also change. This can happen over a period of time, but is difficult to achieve in the short term.

*Response to Variability in CVP and SWP Water Supplies*

Water availability provided by the CVP and SWP varies each year based upon hydrologic conditions and regulatory requirements, as described in Chapter 5, Surface Water Resources and Water Supplies. The CVP and SWP water supply allocations are initially announced in the late winter. The allocations can be revised throughout the spring months as the hydrologic conditions become more certain. Growers often delay finalizing some of their crop decisions until water supply allocations are announced as late as April or May. Delays in finalizing crop decisions also can result in delays in finalizing crop financing and orders to suppliers (e.g., seed, fertilizer), and contracting with labor suppliers and crop processors. Responses to variations in water allocations depend on many factors, including but not limited to: feasibility of alternative water supplies (availability, suitability of water quality, cost); types of crops grown and need for changes in equipment, processing, and labor; and long-term crop supply contracts and obligations, (WWD 2013a, 2013b). A study of changes that occurred during the 1986 through 1992 drought indicated that implementation of the changes will probably occur over a longer period of time and not necessarily during the water supply shortage, especially if groundwater or other surface water supplies can be obtained within the growing season (Dale et al. 1998).

The effects on the surrounding communities of the variability of CVP and SWP water supplies are discussed in Chapter 19, Socioeconomics, and Chapter 21, Environmental Justice.

Typical responses of a farmer or water supplier to increasing shortage of water supplies include the following actions.

- **Increase the use of groundwater**: Reduction in surface water supplies can induce substitution with groundwater using new or existing wells. Water supplies are used conjunctively in some areas with groundwater storage so that during surface water shortages, water historically used to recharge groundwater can be used for applied irrigation uses.
- **Use alternative/supplemental surface water supplies**: Alternative water supplies may include local exchanges or transfers of surface water, water transfers/purchases from more distant areas, and/or use of water stored in surface water reservoirs or groundwater banks. These all depend on the infrastructure to convey the water and the financial ability to pay for the alternatives water supplies.
- **Increased water use efficiency:** Reduced use of irrigation water may be achieved by on-farm system and irrigation management improvements, water reuse, water source blending, and delivery system improvements. Specific on-farm and delivery system improvements can include irrigation scheduling, field leveling, application system changes, and conveyance system loss reduction such as canal lining, spill reduction, and automation. Some of the changes require only management changes, such as irrigation scheduling, and can occur within the growing season. Other changes, such as conveyance system modifications, require capital investments and generally require several years to implement.
- **Field fallowing or changing to lower-water-use crops:** Fallowing, or temporary idling, reduces gross water use by the entire applied water amount, and reduces net water use by at least the evapotranspiration of the crop not planted. Typically fields with higher water use crops or lower value rotation crops would be the first fields to be fallowed. Farmers generally would avoid or minimize fallowing permanent crops or crops with long-term obligations (e.g., cannery contracts). A farmer receiving a partial allocation of water could decide to reduce irrigated acreage and transfer that acreage’s water allocation to the remaining fields in production or sell the water to other water users. A smaller reduction in water use can be achieved by switching from a crop using more water to one using less water (Dale et al. 1998). Permanent

crops, such as trees and vines, that are the least economically viable or that are approaching the end of their lifespan can be removed or abandoned, and the land fallowed until adequate water is available. In extreme dry periods, such as 2014 when there were no deliveries of CVP water to San Joaquin Valley water supply agencies with CVP water service contracts, permanent crops were removed because the plants would not survive the stress of no water or saline groundwater (Fresno Bee 2014).

- **Stress Irrigation:** Farmers generally try to irrigate to achieve maximum economic yield. For some permanent crops, severe pruning could reduce water use, but could reduce yield over multiple years (AgAlert 2010).

#### *12.3.1.3 Cropping Pattern Changes in Response to Water Supply Availability*

Conversion of farm lands to other land uses has occurred historically and continues to occur. Agricultural lands have been converted to different crop patterns, urban areas, habitat restoration, off-farm infrastructure (e.g., utilities and transportation), and on-farm infrastructure (e.g., storage, maintenance, and processing facilities). Crop conversions occur in response to changes in water supply reliability, changes in market demand for specific crops, and decisions to convert lands to urban or infrastructure land uses.

One method used to indicate changes in California agricultural acreage is related to a loss of the value of production on “Important Farmland” and “Grazing Land” acreages, as reported by the California Department of Conservation since 1988 (CDOC 2004). The comparison of the acreage of lands within each category can be used to identify trends in agricultural land conversions. This information is provided in the following subsections for the years 2000 and 2010 for counties within the study area.

Another factor to be considered prior to crop conversion is the costs related to crop establishment. Costs of irrigated crop production include labor, purchased inputs (e.g., seed, fertilizer, chemicals), custom services, investment in growing stock, other capital (including machinery and structures), and other overhead costs.

Reliability of water supply can be especially important for maintaining substantial investments in growing stock of perennial and multi-year crops. Perennial crops include orchards and vineyards that may have useful lives of 25 years or more. Multiyear forage crops, such as alfalfa and irrigated pasture, also may be in production for years. Investment in growing stock may be expressed as the accumulated costs incurred during the period when the crop is planted and brought to bearing age, called the establishment period. Establishment costs for perennial crops can range up to $15,000 per acre in total costs (including cash outlays plus noncash and allocated overhead costs). The example establishment costs provided in Table 12.2 are for the Central Valley, but are generally representative of establishment costs in other regions.

**Table 12.2 Typical Establishment Costs for Some Perennial Crops in the Central Valley**

| Example Crop | Establishment Period (years) | Assumed Life of Stand (years) | Accumulated Total Cost during Establishment ($ per acre) | University of California Cooperative Extension Cost of Production Study |
|---|---|---|---|---|
| Alfalfa Hay | 1 | 4 | 534 | Sacramento Valley, 2013 |
| Almonds | 4 | 25 | 10,117 | San Joaquin Valley North, 2011 |
| Irrigated Pasture | 1 | 20 | 408 | Sacramento Valley, 2003 |
| Walnuts | 5 | 25 | 14,133 | San Joaquin Valley North, 2013 |
| Wine Grapes | 3 | 25 | 18,495 | Cabernet Sauvignon, SJ Valley North, 2012 |

Sources: UCCE 2003, 2011, 2012a, 2013a

Notes: All costs are converted to 2012 dollar equivalent values using the Gross Domestic Product Implicit Price Deflator (USDOC 2014). Assumed stand life is the financial life used for the cost and budget analysis. Individual growers may decide to keep stands in production longer or to remove them sooner.

Farm expenditures are largely spent in the surrounding community in the form of input purchases, hired labor, rents paid to landlords, well drilling, and custom consulting services. Total labor in the agricultural production sector is discussed in relation to the regional economy in Chapter 19, Socioeconomics. Labor hours and input purchases vary substantially among crops, as shown in Table 12.3.

**Table 12.3 Land Rent, Labor Hours, and Custom Services for Example Crops in the Central Valley**

| Example Crop | Typical Rent ($ per acre) | Typical Annual Labor (hours per acre) | Custom Services Purchased ($ per acre) | University of California Cooperative Extension Cost of Production Study |
|---|---|---|---|---|
| Alfalfa Hay | 284 | 2 | 368 | Sacramento Valley, 2013 |
| Almonds | 763 | 31 | 828 | San Joaquin Valley North, 2011 |
| Corn, Grain | 147 | 3 | 324 | San Joaquin Valley South, 2012 |
| Irrigated Pasture | 63 | 3 | 159 | Sacramento Valley, 2003 |
| Rice | 280 | 5 | 329 | Sacramento Valley, 2012 |
| Walnuts | 690 | 8 | 1,203 | San Joaquin Valley North, 2013 |
| Wheat | 246 | 2 | 57 | San Joaquin Valley South, 2013 |
| Wine Grapes | 633 | 68 | 505 | Cabernet Sauvignon, SJ Valley North, 2012 |

Sources: UCCE 2003, 2011, 2012a, 2012b, 2012c, 2013a, 2013b, 2013c

Notes: All costs are converted to 2012 dollar equivalent values using the Gross Domestic Product Implicit Price Deflator (USDOC 2014).

#### *12.3.1.4 Water Supply and Crop Acreage Relationships in the San Joaquin Valley*

Most publically-available information on irrigated acreage and crop types is compiled at the county level, not the water district level. Water availability for CVP and SWP water is provided at a smaller geographic level, such as a water supply entity or several adjacent entities. Therefore, it is difficult to analyze the correlation of water supply availability, irrigated acreage, and crop types. However, the Westlands Water District does provide more detailed information related to water availability, irrigated acreage, and crop types in their publically-available reports, as summarized in this sub-section of Chapter 12. The purpose of this summary is to describe the relationships between cropping patterns, irrigation methods, and water supply availability. Due to the increased frequency of water supply reductions, especially in drier years (as described in Chapter 5, Surface Water Resources and Water Supplies), the amount of fallowed and non-harvested lands has increased as a percentage of total lands within Westlands Water District. The trend observed in Westlands Water District of using additional groundwater and crop idling land when CVP and SWP water supplies are reduced; and reducing groundwater use and increasing irrigated acreage when CVP and SWP become more available occurs throughout the San Joaquin Valley.

##### 12.3.1.4.1 Water Supplies in Westlands Water District

Formed in 1952, Westlands Water District currently serves over 700 farmers across 604,000 acres located on the west side of Fresno and Kings Counties, as described in Chapter 5, Surface Water Resources and Water Supplies (WWD 2013a, 2013b). There are approximately 568,000 irrigable acres in the district.

Westlands Water District began receiving CVP water in 1968. In the first 10 years of operations, irrigation water conveyance facilities were completed and cropping patterns became established. The CVP water supplies were reduced during the 1976 to 1977 drought. Crop acreage and water supply information are available for Westlands Water District from 1978 through 2013 (WWD 2013a, 2014b, 2014c).

This time period includes several major happenings and/or changes in the CVP water supplies, as described in Chapter 5, Surface Water Resources and Water Supplies, and Chapter 6, Surface Water Quality.

- In 1978, the CVP water supplies were recovering from the 1976 to 1977 drought.
- In the late 1980s, high selenium concentrations were detected in subsurface drainage flows from areas on the west side of the San Joaquin Valley where naturally occurring selenium deposits are located. Subsequently, farmers in these areas changed irrigation practices and in some cases, eliminated irrigation of some lands.
- Between 1987 and 1992, another drought occurred.

- In mid-1990s, the CVP water supplies recovered from a six year drought; however, CVP water supplies available to the district were limited due to initial restrictions on CVP operations to protect winter-run Chinook salmon and delta smelt and to provide refuge water supplies in accordance with the federal Central Valley Project Improvement Act (Public Law 102-575).
- By 2000, the CVP was initially operated under the requirements of State Water Resources Control Board Decision 1641 and the federal Central Valley Project Improvement Act which reduced the long-term availability of CVP water as compared to the 1980s.
- In 2007, the CVP operations were modified in accordance with the Interim Remedial Order issued by the U.S. District Court for the Eastern District of California in *Natural Resources Defense Council, et al. v. Kempthorne*.
- In 2009, the CVP operations were modified in accordance with the 2008 U.S. Fish and Wildlife Service and 2009 National Marine Fisheries Services biological opinions.
- Between 2007 and 2013, six of the seven years were designated as Below Normal, Dry, or Critical Dry water years, which reduced CVP water supplies.

As CVP water supplies have declined over the past 35 years, Westland Water District has needed to implement major conservation programs and purchase water from other CVP and SWP water users and water rights holders. Concurrently, growers have increased groundwater pumping, as illustrated in Figure 12.3. Total supply over this time period ranges from a low of 787,554 acre-feet in 2010 to a high of 1,546,883 acre-feet in 1984 (WWD 2013a, 2014a).

#### 12.3.1.4.2 Cropping Patterns in Westlands Water District

In response to varying water supplies and market factors, farmers in Westlands Water District have changed cropping patterns. In 1978, the predominant crops were cotton and grain crops, including wheat and barley, with some vegetables, including tomatoes and cantaloupe, as summarized in Figure 12.4 (WWD 2013a). Between 1980 and 1996, grain crops were replaced by vegetable crops because other areas in California that traditionally grew crops were experiencing urbanization and groundwater shortages, including southern Santa Clara County and Monterey County (WWD 2008). Planting of permanent crops, including orchards and grapevines, increased between 1978 and 2013 as the markets factors became favorable (WWD 2013a, 2014b, 2014c). Total cotton acreage remained stable between 1978 and 2000, with Acala cotton as the primary crop (WWD No Date-a, No Date-b). After 2000, the total acreage of cotton declined and the primary crop was Pima cotton due to higher market price for this crop; however, cotton prices declined in the early 2000s.

#### 12.3.1.4.3 Irrigation Methods in Westlands Water District

Conversion of the major crops from annual grains to more orchards and vines resulted in Westlands Water District modifying water conveyance facilities because the water demand patterns changed both in quantities and seasonal timing (WWD No Date-c). The change in cropping patterns and the concurrent emphasis on water conservation also resulted in changes in irrigation methods within the district, as summarized in Table 12.4.

**Table 12.4 Irrigation Methods Used in Westlands Water District, as a percentage of total irrigation methods**

| Years | Furrow or Border Strip Irrigation | Sprinkler Irrigation | Drip or Trickle Irrigation | Sprinkler and Furrow Irrigation |
|---|---|---|---|---|
| 1985 | 63% | 21% | 1% | 15% |
| 1990 | 43% | 16% | 3% | 38% |
| 1995 | 36% | 15% | 6% | 43% |
| 2000 | 30% | 13% | 13% | 44% |
| 2005 | 23% | 10% | 33% | 34% |
| 2010 | 11% | 11% | 67% | 22% |
| 2011 | 13% | 12% | 65% | 22% |

Source: WWD 2013a

These changes represent a major investment by the farmers and are considered in the cost of crop establishment costs, a consideration described in above in subsection 12.32.3.1, Crop Establishment Costs. The lower-valued grain and forage crops generally use furrow or border strip irrigation (WWD 2013a). Shallow-rooted vegetables frequently are irrigated with sprinklers or a combination of sprinklers and furrow irrigation. Recently, tomatoes for fresh-pack have been grown with drip irrigation. New orchard and vines have been planted with pressurized drip or trickle irrigation. Other methods, including leveling lands with lasers guided by global positioning satellites and aerated irrigation to introduce air to plant roots, are used to increase irrigation efficiency and improve crop yield (WWD No Date-a).

#### 12.3.1.4.4 Response to Reduced Water Supplies in Westlands Water District

Westlands Water District acquired over 95,000 acres of land with inadequate drainage and the water supplies allocated to these lands are now available for other lands in the district (WWD 2008, 2013a, No Date-c). Much of the purchased land is leased to farmers for non-irrigated crops, or made available for buildings or other economic development, including about 600 acres to the U.S. Bureau of Prisons and about 1,250 acres to Pacific Gas & Electric Company for solar projects.

Frequently, the amount of available surface water is not adequate to meet the irrigation water demand. For example in the drier years of 1991, 1992, 2009, and 2013, groundwater provided more than 50 percent of the irrigation water supply. This extensive reliance on groundwater can substantially reduce groundwater elevations, as described in Chapter 7, Groundwater Resources and Groundwater Quality.

The Westlands Water District *Water Management Handbook* discusses that during droughts, water supplies are reduced and the cost of available water supplies are generally high due to costs of water transfers and/or implementing new or expanded groundwater facilities (WWD 2013b). At the farm level, Westlands' growers use a mix of methods to respond to reduced water supplies: groundwater pumping, land fallowing, and stress irrigation. The decision to fallow land or stress crops by applying less than full irrigation depends upon the crop. Some crops require full irrigation in order to produce a profitable yield, so stress irrigation is not practical – if water is short, acreage of these crops is reduced. Other crops may be able to withstand some stress and produce profitable yield. In the most severe shortage years, such as 2014, even some orchards and vineyards may be stressed or removed from production. From 1978 through the late 1990s when the primary crops were grains and cotton, those crops continued to be grown under stressed conditions and the fallowed and non-harvested land ranged from 3 to 16 percent of the total land in the district, as summarized in Figure 12.5 (WWD 2013a, 2014b, 2014c). However, since 2000, over 40 to 55 percent of the total land in the district is planted in high value orchards, vine, and vegetable crops which cannot sustain stress. Therefore, farmers have increased the amount of fallowed and non-harvested acres to 10 to 34 percent of the total land in the district. When permanent orchards and vines are removed from production, the overall value of production in the district declines for number of years as the permanent crops require several years to become established.

### 12.3.2 Trinity River Region

The Trinity River Region includes the area in Trinity County along the Trinity River from Trinity Lake to the confluence with the Klamath River; and in Humboldt and Del Norte counties along the Klamath River from the confluence with the Trinity River to the Pacific Ocean.

Agriculture in the Trinity River Region is primarily related to timber products and cattle ranching which generally do not rely upon irrigation. Small farms and vineyards are located adjacent to or near the Trinity River rely primarily upon groundwater that is recharged by precipitation and infiltration from local streams, as described in Chapter 7, Groundwater Resources and Groundwater Quality. No lands in Trinity River Region are irrigated with water supplies delivered through the CVP or SWP.

Total value of production and acreage by crop category in the counties that include portions of the Trinity River Region are listed in Table 12.5.

**Table 12.5 Average Annual Agricultural Acreage and Value of Production in Trinity, Humboldt, and Del Norte Counties from 2007 through 2012**

| | Orchards, Vineyards, and Berries | Field and Forage | Livestock, Dairy, Poultry | Nursery, Other | Vegetable | Total |
|---|---|---|---|---|---|---|
| Acreage[a] | 114 | 30,846 | N/A | 231 | – | 31,191 |
| Value[b] | $1.8 | $8.1 | $108.2 | $64.5 | $1.7 | $184 |

Sources: USDA-NASS2008, 2009, 2010, 2011a, 2012a, 2013a

Notes:

a. Not all acreages and/or production values are reported for every crop in every county. Therefore the implied value of production per acre may be misleading for some crop categories.

b. Values in million dollars, 2012 basis.

## 12.3.3 Central Valley Region

The Central Valley Region extends from above Shasta Lake to the Tehachapi Mountains, and includes the Sacramento Valley and San Joaquin Valley. In this chapter, the counties within the Delta and Suisun Marsh area are included in the description of the Sacramento and San Joaquin valleys or the San Francisco Bay Area Region. The Delta counties of Sacramento, Yolo, and Solano counties are included within the Sacramento Valley discussion. Solano County also includes the Suisun Marsh. San Joaquin County is included within the San Joaquin Valley discussion. Contra Costa County is included within the San Francisco Bay Area Region discussion.

Central Valley agriculture is highly productive due to favorable climate, adequate supplies of good quality irrigation water, and deep, fertile soils. Most of the Central Valley receives rainfall in the late fall through the winter months. Very little of the annual rainfall occurs during the peak agricultural irrigation season which extends from early spring through fall. The seasonality of rainfall in the Central Valley is important for agricultural resources, as the timing of precipitation does not reliably support dryland (non-irrigated) farming. Lower value over-winter non-irrigated crops (e.g., winter wheat) can be grown economically in many years but higher value row crops and permanent crops require substantial supplemental irrigation (DWR 2009). Irrigation water provided by the CVP and SWP, local surface water, and groundwater have transformed lands in the Central Valley into some of the most productive and diverse agricultural lands in the United States.

### *12.3.3.1 Sacramento Valley Crop Patterns*

The Sacramento Valley includes the counties of Shasta, Plumas, Tehama, Glenn, Colusa, Butte, Sutter, Yuba, Nevada, Placer, El Dorado, Sacramento, Yolo, and Solano counties. Other counties in Sacramento Valley are not anticipated to be affected by changes in CVP and SWP operations, and are not discussed here, including: Alpine, Sierra, Lassen, and Amador counties.

Field and forage crops dominate the irrigated acreage in Sacramento Valley with over 1.4 million acres irrigated and about 38 percent of crop value produced, as summarized in Table 12.6. Rice, irrigated pasture, and hay are the largest acreages. Second to field and forage are orchard and vine crops, making up roughly 21 percent of total acreage, but providing more than 38 percent crop value produced. Almonds and walnuts are the largest acreages in this category. Crop establishment and production costs are as summarized in Tables 12.2 and 12.3. In total, the Sacramento Valley contains nearly two million agricultural acres generating over four billion dollars per year in value of production.

**Table 12.6 Sacramento Valley Average Annual Agricultural Acreage and Value of Production from 2007 through 2012**

| | Orchards, Vineyards, and Berries | Field and Forage | Livestock, Dairy, Poultry | Nursery, Other | Vegetable | Total |
|---|---|---|---|---|---|---|
| Acreage[a] | 419,263 | 1,435,923 | N/A | 1,658 | 91,684 | 1,948,527 |
| Value[b] | $1,569 | $1,581 | $506 | $135 | $322 | $4,113 |

Sources: USDA-NASS 2008, 2009, 2010, 2011a, 2012a, 2013a

Notes:

a. Not all acreages and/or production values are reported for every crop in every county. Therefore the implied value of production per acre may be misleading for some crop categories.

b. Values in million dollars, 2012 basis

Most of the counties within the Sacramento Valley have experienced losses in Important Farmland between 2000 and 2010, as summarized in Table 12.7.

**Table 12.7 Farmland Mapping and Monitoring Program Acreages in the Sacramento Valley in 2000 and 2010**

| | | Important Farmland[b] | | | Grazing Land | | |
|---|---|---|---|---|---|---|---|
| County | Total[a] | 2000 | 2010 | Change | 2000 | 2010 | Change |

No data was reported by California Department of Conservation for Plumas County.

#### *12.3.3.2 San Joaquin Valley*

The San Joaquin Valley includes the counties of Stanislaus, Merced, Madera, San Joaquin, Fresno, Kings, Tulare, and Kern counties. Other counties in the San Joaquin Valley are not anticipated to be affected by changes in CVP and SWP operations, and are not discussed here, including: Calaveras, Mariposa, and Tuolumne counties.

Field and forage crops are also the largest category in by acreage in this region, as summarized in Table 12.8. Hay, cotton, and silage have the largest acreage in this category. Second to field and forage is orchard and vine crops with almost two million acres, but providing more than three times the value of production. Almonds and grapes are the two largest acreages of orchard and vine crops in the San Joaquin Valley. Crop establishment and production costs are as summarized in Tables 12.2 and 12.3. In total, the San Joaquin Valley contains over 5.5 million irrigated acres, generating over twenty-six billion dollars in value of production.

Important differences exist in water supply mix and reliability within the San Joaquin Valley. The CVP water users that are located on the west side of the valley and the SWP water users in Kings and Kern counties rely primarily on surface water conveyed through the Delta and groundwater, as discussed in Chapter 5, Surface Water Resources and Water Supplies. Agricultural producers within these CVP water service contractors and SWP entitlement holders are especially susceptible to large variation in available surface water supplies. The San Joaquin River Exchange Contractors receive CVP water supplies in exchange for their water rights on the San Joaquin River; and therefore, have much higher water supply reliability than CVP water service contractors or SWP entitlement holders, as described in Chapter 5, Surface Water Resources and Water Supplies.

On the east side of the San Joaquin Valley at the base of the Sierra Nevada, surface water is delivered under senior water rights on streams from the Sierra Nevada, or by the CVP from Millerton Lake at Friant Dam, as described in Chapter 5, Surface Water Resources and Water Supplies. The reliability of CVP water supplies from Friant Dam have generally been similar to or higher than that of CVP water supplies conveyed through the Delta. However, in 2014, the allocations were reduced to zero and available water from Friant Dam was provided to the water rights holders along the San Joaquin River (e.g., San Joaquin River Exchange Contractors).

A number of agricultural areas throughout the valley have no or very low priority surface water rights. Growers in these areas rely on groundwater for irrigation water.

**Table 12.8 San Joaquin Valley Average Annual Agricultural Acreage and Value of Production from 2007 through 2012**

| | Orchards, Vineyards, and Berries | Field and Forage | Livestock, Dairy, Poultry | Nursery, Other | Vegetable | Total |
|---|---|---|---|---|---|---|
| Acreage[a] | 1,943,549 | 3,078,803 | N/A | 3,838 | 510,370 | 5,536,560 |
| Value[b] | $10,915 | $3,049 | $9,429 | $469 | $2,789 | $26,651 |

Sources: USDA-NASS 2008, 2009, 2010, 2011a, 2012a, 2013a

Notes:

a. Not all acreages and/or production values are reported for every crop in every county. Therefore the implied value of production per acre may be misleading for some crop categories.

b. Values in million dollars, 2012 basis.

Most counties within the San Joaquin Valley Region have experienced losses in Important Farmland between 2000 and 2010, as summarized in Table 12.9. The acreage of Important Farmland in Kern County grew substantially due to reclassification of lands in the foothills of the county.

### 12.3.4 San Francisco Bay Area Region

The San Francisco Bay Area Region includes portions of Napa, Contra Costa, Alameda, Santa Clara, and San Benito counties that are within the CVP and SWP service areas.

Crops grown in the San Francisco Bay Area Region include berries, vegetables, orchards, nursery plants, and irrigated and non-irrigated pasture. Permanent crops (orchards, vineyards, and berries) cover the largest acreage in this region with around 60,000 acres planted, as summarized in Table 12.10. Field and forage crops and vegetables also cover substantial acreage. Crop establishment and production costs are generally similar to those shown in Tables 12.2 and 12.3, except that land costs and rent may be substantially higher in this region. In total, the San Francisco Bay Area Region contains about 150,000 acres planted, creating over one billion dollars per year in value of production.

**Table 12.10 San Francisco Bay Area Average Annual Agricultural Acreage and Value from 2007 through 2012**

### 12.3.5 Central Coast Region

The Central Coast Region includes portions of San Luis Obispo and Santa Barbara counties served by the SWP.

Crops grown in this region include orchards and vineyards, berries, vegetables, and irrigated pasture. Permanent crops and vegetables dominate the irrigated acreage in this region, accounting for about eighty percent of both the acres planted and the annual value of production, as summarized in Table 12.12. Crop establishment and production costs are generally similar to those shown in Tables 12.2 and 12.3, except that land costs and rent may be higher in this region. On average, the Central Coast Region contains almost 230,000 acres planted and almost two billion dollars per year in value of production.

**Table 12.12 Central Coast Region Average Annual Agricultural Acreage and Value from 2007 through 2012**

### 12.3.6 Southern California Region

The Southern California Region includes portions of Ventura, Los Angeles, Orange, San Diego, Riverside, and San Bernardino counties served by the SWP.

Two crop categories, orchards, vineyards, and berries; and field and forage, account for more than three quarters of the irrigated acreage and about sixty percent of the annual value of production in the Southern California Region, as summarized in Table 12.14). Vegetables account for about one fifth of the irrigated acreage and production value. Crop establishment and production costs are generally similar to those shown in Tables 12.2 and 12.3, except that land costs and rent may be higher in parts of this region. In total, the Southern California Region contains almost 380,000 acres irrigated and generates over five billion dollars per year in value of production.

**Table 12.14 Southern California Average Annual Agricultural Acreage and Value from 2007 through 2012**

# 12.4 Impact Analysis

This section describes the potential mechanisms and analytical methods for change in agricultural resources; results of the impact analysis; potential mitigation measures; and cumulative effects.

## 12.4.1 Potential Mechanisms for Change in Agricultural Resources

As described in Chapter 4, Approach to Environmental Analysis, the impact analysis considers changes in agricultural resources related to changes in CVP and SWP operations under the alternatives as compared to the No Action Alternative and Second Basis of Comparison.

Changes in CVP and SWP operations under the alternatives as compared to the No Action Alternative and Second Basis of Comparison could change irrigated acreage and total production value in areas that use CVP and SWP water supplies under long-term conditions (based upon the 81-year model simulation period) and dry and critical dry years.

This chapter only includes the analysis of economic changes in agricultural revenues. Chapter 19, Socioeconomics, includes economic changes related to municipal and industrial water supplies and changes in regional economics.

#### *12.4.1.1 Changes in Irrigated Agricultural Acreage and Total Production Value*

Changes in CVP and SWP operations under the alternatives could change the extent of irrigated acreage and total production value over the long-term average condition and in dry and critical dry years as compared to the No Action Alternative and Second Basis of Comparison.

The results of the impact analysis represents comparison of long-term changes that would occur between alternatives by 2030. The impact analysis does not represent short-term responses, especially during one to five years, in response to emergency flood or drought conditions.

Agricultural impacts were evaluated using a regional agricultural production model developed for large-scale analysis of irrigation water supply and cost changes. The Statewide Agricultural Production (SWAP) model is a regional model of irrigated agricultural production and economics that simulates the decisions of producers (farmers) in 27 agricultural subregions in the Central Valley Region, as described in Appendix 12A. The model selects the crops, water supplies, and other inputs that maximize profit subject to constraints on water and land, and subject to economic conditions regarding prices, yields, and costs.

The SWAP model incorporates CVP and SWP water supplies, other local water supplies represented in the CalSim II model, and groundwater. As conditions change within a SWAP subregion (e.g., the quantity of available project water supply declines), the model optimizes production by adjusting the crop mix, water sources and quantities used, and other inputs. The model also fallows land when that appears to be the most cost-effective response to resource conditions.

SWAP was used to compare the long-run agricultural economic responses to potential changes in CVP and SWP irrigation water delivery and to changes in groundwater conditions associated with the alternatives. Results from the surface water analysis that used the CalSim II model, as described in Chapter 5, Surface Water Resources and Water Supplies, were provided as inputs into SWAP through a standardized data linkage procedure. Results from the groundwater analysis that used the CVHM model, as described in Chapter 7, Groundwater Resources and Groundwater Quality, were used to develop changes in pumping lift in SWAP. SWAP produces estimates of the change in value and costs of agricultural production.

The analysis only reduces groundwater withdrawals based upon an optimization of agricultural production costs. The analysis does not restrict groundwater withdrawals based upon groundwater overdraft or groundwater quality conditions. As described in Chapter 7, Groundwater Resources and Groundwater Quality, the Sustainable Groundwater Management Act requires preparation of Groundwater Sustainability Plans (GSPs) by 2020 or 2022 for most of the groundwater basins in the Central Valley Region. The GSPs will identify methods to implement measures that will achieve sustainable groundwater operations by 2040 or 2042. The analysis in this chapter is focused on conditions that would occur in 2030. If local agencies fully implement GSPs prior to the regulatory deadline, increasing groundwater use would be less of an option for agricultural water users. However, to achieve sustainable conditions, some measures could require several years to design and construct new water supply facilities, and sustainable groundwater conditions are not required until the 2040s. Therefore, it was assumed that Central Valley agriculture water users would not reduce groundwater use by 2030, and that groundwater use would change in response to changes in CVP and SWP water supplies.

#### *12.4.1.2 Effects Related to Water Transfers*

Historically water transfer programs have been developed on an annual basis. The demand for water transfers is dependent upon the availability of water supplies to meet water demands. Water transfer transactions have increased over time as CVP and SWP water supply availability has decreased, especially during drier water years.

Parties seeking water transfers generally acquire water from sellers who have available surface water who can make the water available through releasing previously stored water, pump groundwater instead of using surface water (groundwater substitution); idle crops; or substitute crops that uses less water in order to reduce normal consumptive use of surface water.

Water transfers using CVP and SWP Delta pumping plants and south of Delta canals generally occur when there is unused capacity in these facilities. These conditions generally occur in drier water year types when the flows from upstream reservoirs plus unregulated flows are adequate to meet the Sacramento

Valley water demands and the CVP and SWP export allocations. In non-wet years, the CVP and SWP water allocations would be less than full contract amounts; therefore, capacity may be available in the CVP and SWP conveyance facilities to move water from other sources.

Projecting future agricultural resources conditions related to water transfer activities is difficult because specific water transfer actions required to make the water available, convey the water, and/or use the water would change each year due to changing hydrological conditions, CVP and SWP water availability, specific local agency operations, and local cropping patterns. Reclamation recently prepared a long-term regional water transfer environmental document which evaluated potential changes in agricultural resources conditions related to water transfer actions (Reclamation 2014c). Results from this analysis were used to inform the impact assessment of potential effects of water transfers under the alternatives as compared to the No Action Alternative and the Second Basis of Comparison.

### 12.4.2 Conditions in Year 2030 without Implementation of Alternatives 1 through 5

This EIS includes two bases of comparison, as described in Chapter 3, Description of Alternatives: the No Action Alternative and the Second Basis of Comparison. Both of these bases are evaluated at 2030 conditions. Changes that would occur over the next 15 years without implementation of the alternatives are not analyzed in this EIS. However, the changes to agricultural resources that are assumed to occur by 2030 under the No Action Alternative and the Second Basis of Comparison are summarized in this section. Many of the changed conditions would occur in the same manner under both the No Action Alternative and the Second Basis of Comparison.

#### *12.4.2.1 Common Changes in Conditions under the No Action Alternative and Second Basis of Comparison*

Conditions in 2030 would be different than existing conditions due to:

- Climate change and sea level rise
- General plan development throughout California, including increased water demands in portions of Sacramento Valley
- Implementation of reasonable and foreseeable water resources management projects to provide water supplies

It is anticipated that climate change would result in more short-duration high-rainfall events and less snowpack in the winter and early spring months. The reservoirs would be full more frequently by the end of April or May by 2030 than in recent historical conditions. However, as the water is released in the spring, there would be less snowpack to refill the reservoirs. These changes would result in a decline of the long-term average CVP and SWP water supply deliveries by 2030 as compared to recent historical long-term average deliveries under the No Action Alternative and the Second Basis of Comparison. However, the CVP and SWP water deliveries would be less under the No Action Alternative as compared to the Second Basis of Comparison, as described in Chapter 5, Surface Water Resources and Water Supplies, which could result in more crop idling.

Under the No Action Alternative and the Second Basis of Comparison, land uses in 2030 would occur in accordance with adopted general plans. Development under the general plans would result in disruption of agricultural resources; however, the development of general plans includes preparation of environmental documentation that would identify methods to minimize adverse impacts to agricultural resources.

Under the No Action Alternative and the Second Basis of Comparison, development of future water resources management projects by 2030 which would result in improved water supply flexibility and availability, including water supplies for agricultural resources, as described in Chapter 3, Description of Alternatives.

By 2030 under the No Action Alternative and the Second Basis of Comparison, it is assumed that ongoing programs would result in restoration of more than 10,000 acres of intertidal and associated subtidal wetlands in Suisun Marsh and Cache Slough; and 17,000 to 20,000 acres of seasonal floodplain restoration in the Yolo Bypass. The restoration programs could disrupt agricultural resources depending upon the location of the restoration.

### 12.4.3 Evaluation of Alternatives

Alternatives 1 through 5 have been compared to the No Action Alternative; and the No Action Alternative and Alternatives 1 through 5 have been compared to the Second Basis of Comparison.

During review of the numerical modeling analyses used in this EIS, an error was determined in the CalSim II model assumptions related to the Stanislaus River operations for the Second Basis of Comparison, Alternative 1, and Alternative 4 model runs. Appendix 5C, Revised Second Basis of Comparison, includes a comparison of the CalSim II model run results presented in this chapter and CalSim II model run results with the error corrected.

Chapter 7, Groundwater Resources and Groundwater Quality, includes a discussion of changes in the comparison of groundwater conditions for the following alternative analyses.

- No Action Alternative compared to the Second Basis of Comparison
- Alternative 1 compared to the No Action Alternative
- Alternative 3 compared to the Second Basis of Comparison
- Alternative 5 compared to the Second Basis of Comparison.

The results of the impact analysis represents comparison of long-term changes that would occur between alternatives by 2030. The impact analysis does not represent short-term responses, especially during one to five years, in response to emergency flood or drought conditions.

#### *12.4.3.1 No Action Alternative*

The No Action Alternative is compared to the Second Basis of Comparison.

##### 12.4.3.1.1 Trinity River Region

*Potential Changes in Irrigated Agricultural*

There are no agricultural lands irrigated with CVP and SWP water supplies in the Trinity River Region. Therefore, there would be no changes in irrigated lands under the No Action Alternative as compared to the Second Basis of Comparison.

##### 12.4.3.1.2 Central Valley Region

*Potential Changes in Irrigated Agriculture.*

*Sacramento Valley*

Results of the SWAP analysis indicated that agricultural crop patterns in the Sacramento Valley would be similar (less than 5 percent change) under the No Action Alternative and the Second Basis of Comparison over long-term average conditions and in dry and critical dry years, as summarized in Tables 12.16 and 12.17.

**Table 12.16 Changes in Sacramento Valley Irrigated Acreage over the Long-term Average Conditions under the No Action Alternative as Compared to the Second Basis of Comparison**

| Crops | No Action Alternative (1000s acres) | Second Basis of Comparison (1000s acres) | Changes (1000s acres) |
|---|---|---|---|
| **Grain Crops** | 155 | 154 | 1 |
| **Rice** | 548 | 548 | 0 |
| **Field Crops** | 59 | 59 | 0 |
| **Forage Crops** | 199 | 200 | -1 |
| **Vegetables and Truck Crops** | 119 | 119 | 0 |
| **Orchards and Vineyards** | 456 | 457 | 0 |
| **Total** | 1,537 | 1,537 | 0 |

Notes:
Grain crops include corn, dry beans, and grain.
Field crops include cotton, grass, hay, safflower, and sugar beets.
Forage crops include alfalfa and pasture.

**Table 12.17 Changes in Sacramento Valley Irrigated Acreage in Dry and Critical Dry Years under the No Action Alternative as Compared to the Second Basis of Comparison**

| Crops | No Action Alternative (1000s acres) | Second Basis of Comparison (1000s acres) | Changes (1000s acres) |
|---|---|---|---|
| **Grain Crops** | 155 | 155 | 0 |
| **Rice** | 544 | 548 | -4 |
| **Field Crops** | 59 | 59 | 0 |
| **Forage Crops** | 197 | 198 | -1 |

| Crops | No Action Alternative (1000s acres) | Second Basis of Comparison (1000s acres) | Changes (1000s acres) |
|---|---|---|---|
| **Vegetables and Truck Crops** | 119 | 119 | 0 |
| **Orchards and Vineyards** | 456 | 457 | -1 |
| **Total** | 1,529 | 1,536 | -7 |

Notes:
Grain crops include corn, dry beans, and grain.
Field crops include cotton, grass, hay, safflower, and sugar beets.
Forage crops include alfalfa and pasture.

Agricultural production in the Sacramento Valley would be similar (less than 5 percent change) under the No Action Alternative and the Second Basis of Comparison over long-term average conditions and in dry and critical dry years due to increased use of groundwater, as summarized in Tables 12.18 and 12.19.

**Table 12.18 Changes in Sacramento Valley Agricultural Production over the Long-term Average Conditions under the No Action Alternative as Compared to the Second Basis of Comparison**

| Crops | No Action Alternative ($ millions) | Second Basis of Comparison ($ millions) | Changes ($ millions) |
|---|---|---|---|
| **Grain Crops** | 150 | 149 | 0.8 |
| **Rice** | 1,114 | 1,115 | -0.9 |
| **Field Crops** | 77 | 77 | 0.1 |
| **Forage Crops** | 246 | 246 | -0.7 |
| **Vegetables and Truck Crops** | 967 | 967 | 0.0 |
| **Orchards and Vineyards** | 3,192 | 3,193 | -0.9 |
| **Total** | 5,745 | 5,747 | -1.6 |

Notes:
Grain crops include corn, dry beans, and grain.
Field crops include cotton, grass, hay, safflower, and sugar beets.
Forage crops include alfalfa and pasture.
All values of production are in 2012 dollar equivalent values.

**Table 12.19 Changes in Sacramento Valley Agricultural Production in Dry and Critical Dry Years under the No Action Alternative as Compared to the Second Basis of Comparison**

| Crops | No Action Alternative ($ millions) | Second Basis of Comparison ($ millions) | Changes ($ millions) |
|---|---|---|---|
| **Grain Crops** | 150 | 150 | -0.5 |
| **Rice** | 1,107 | 1,114 | -7.3 |

| Crops | No Action Alternative ($ millions) | Second Basis of Comparison ($ millions) | Changes ($ millions) |
|---|---|---|---|
| **Field Crops** | 77 | 77 | -0.1 |
| **Forage Crops** | 243 | 245 | -1.4 |
| **Vegetables and Truck Crops** | 967 | 967 | -0.2 |
| **Orchards and Vineyards** | 3,191 | 3,193 | -1.7 |
| **Total** | 5,735 | 5,746 | -11.3 |

Notes:
Grain crops include corn, dry beans, and grain.
Field crops include cotton, grass, hay, safflower, and sugar beets.
Forage crops include alfalfa and pasture.
All values of production are in 2012 dollar equivalent values.

*San Joaquin Valley*

Results of the SWAP analysis indicated that irrigated acreage in the San Joaquin Valley, including the Tulare Lake area, would be similar under the No Action Alternative as compared to the Second Basis of Comparison over long-term average conditions and in dry and critical dry years, as summarized in Tables 12.20 and 12.21.

**Table 12.20 Changes in San Joaquin Valley Irrigated Acreage over the Long-term Average Conditions under the No Action Alternative as Compared to the Second Basis of Comparison**

| Crops | No Action Alternative (1000s acres) | Second Basis of Comparison (1000s acres) | Changes (1000s acres) |
|---|---|---|---|
| **Grain Crops** | 1,024 | 1,024 | 0 |
| **Rice** | 17 | 17 | 0 |
| **Field Crops** | 828 | 828 | 0 |
| **Forage Crops** | 735 | 735 | 0 |
| **Vegetables and Truck Crops** | 633 | 633 | 0 |
| **Orchards and Vineyards** | 2,156 | 2,156 | 0 |
| **Total** | 5,392 | 5,392 | 0 |

Notes:
Grain crops include corn, dry beans, and grain.
Field crops include cotton, grass, hay, safflower, and sugar beets.
Forage crops include alfalfa and pasture.

**Table 12.21 Changes in San Joaquin Valley Irrigated Acreage in Dry and Critical Dry Years under the No Action Alternative as Compared to the Second Basis of Comparison**

| Crops | No Action Alternative (1000s acres) | Second Basis of Comparison (1000s acres) | Changes (1000s acres) |
|---|---|---|---|
| **Grain Crops** | 1,010 | 1,024 | -14 |
| **Rice** | 17 | 17 | 0 |
| **Field Crops** | 827 | 828 | 0 |
| **Forage Crops** | 735 | 735 | -1 |
| **Vegetables and Truck Crops** | 633 | 633 | 0 |
| **Orchards and Vineyards** | 2,154 | 2,156 | -2 |
| **Total** | 5,375 | 5,392 | -17 |

Notes:
Grain crops include corn, dry beans, and grain.
Field crops include cotton, grass, hay, safflower, and sugar beets.
Forage crops include alfalfa and pasture.

Agricultural production in the Sacramento Valley would be similar under the No Action Alternative and the Second Basis of Comparison over long-term average conditions and in dry and critical dry years due to increased use of groundwater, as summarized in Tables 12.22 and 12.23.

**Table 12.22 Changes in San Joaquin Valley Agricultural Production over the Long-term Average Conditions under the No Action Alternative as Compared to the Second Basis of Comparison**

| Crops | No Action Alternative ($ millions) | Second Basis of Comparison ($ millions) | Changes ($ millions) |
|---|---|---|---|
| **Grain Crops** | 1,373 | 1,373 | -0.2 |
| **Rice** | 31 | 31 | 0.0 |
| **Field Crops** | 1,436 | 1,437 | -0.4 |
| **Forage Crops** | 1,426 | 1,426 | -0.1 |
| **Vegetables and Truck Crops** | 4,623 | 4,623 | 0.1 |
| **Orchards and Vineyards** | 16,547 | 16,547 | 0.0 |
| **Total** | 25,437 | 25,438 | -0.5 |

Notes:
Grain crops include corn, dry beans, and grain.
Field crops include cotton, grass, hay, safflower, and sugar beets.
Forage crops include alfalfa and pasture.
All values of production are in 2012 dollar equivalent values.

**Table 12.23 Changes in San Joaquin Valley Agricultural Production in Dry and Critical Dry Years under the No Action Alternative as Compared to the Second Basis of Comparison**

| Crops | No Action Alternative ($ millions) | Second Basis of Comparison ($ millions) | Changes ($ millions) |
|---|---|---|---|
| **Grain Crops** | 1,359 | 1,373 | -14.4 |
| **Rice** | 31 | 31 | 0.0 |
| **Field Crops** | 1,436 | 1,437 | -0.9 |
| **Forage Crops** | 1,426 | 1,426 | -0.4 |
| **Vegetables and Truck Crops** | 4,623 | 4,623 | -0.2 |
| **Orchards and Vineyards** | 16,542 | 16,547 | -4.4 |
| **Total** | 25,417 | 25,437 | -20.3 |

Notes:
Grain crops include corn, dry beans, and grain.
Field crops include cotton, grass, hay, safflower, and sugar beets.
Forage crops include alfalfa and pasture.
All values of production are in 2012 dollar equivalent values.

*Effects Related to Cross Delta Water Transfers*

Potential effects to agricultural resources could be similar to those identified in a recent environmental analysis conducted by Reclamation for long-term water transfers from the Sacramento to San Joaquin valleys (Reclamation 2014c). Potential effects to agricultural resources were identified as reduced cultivation of agricultural lands over the term of the transfer in the seller's service area. However, the amount of land effected by the water transfers would be relatively small as compared to the total cultivated acreage within a region. Beneficial changes would occur related to agricultural resources in the purchaser's service areas. The analysis indicated that these potential impacts would not be substantial.

Under the No Action Alternative, the timing of cross Delta water transfers would be limited to July through September and include annual volumetric limits, in accordance with the 2008 USFWS BO and 2009 NMFS BO. Under the Second Basis of Comparison, water could be transferred throughout the year without an annual volumetric limit. Overall, the potential for cross Delta water transfers would be less under the No Action Alternative than under the Second Basis of Comparison.

#### 12.4.3.1.3 San Francisco Bay Area, Central Coast, and Southern California Regions

*Potential Changes in Irrigated Agricultural*

It is anticipated that reductions in CVP and SWP water supplies within the San Francisco Bay Area, Central Coast, and Southern California regions would not result in reductions in irrigated acreage or land use changes due to the use of other water supplies in the same manner that is projected to occur in the Central Valley Region.

#### *12.4.3.2 Alternative 1*

Alternative 1 is identical to the Second Basis of Comparison. Alternative 1 is compared to the No Action Alternative and the Second Basis of Comparison. However, because agricultural resource conditions under Alternative 1 are identical to agricultural resource conditions under the Second Basis of Comparison; Alternative 1 is only compared to the No Action Alternative.

##### 12.4.3.2.1 Alternative 1 Compared to the No Action Alternative

*Trinity River Region*

*Potential Changes in Irrigated Agricultural*

There are no agricultural lands irrigated with CVP and SWP water supplies in the Trinity River Region. Therefore, there would be no changes in irrigated lands under Alternative 1 as compared to the No Action Alternative.

*Central Valley Region*

*Potential Changes in Irrigated Agricultural*

*Sacramento Valley*

Results of the SWAP analysis indicated that agricultural crop patterns in the Sacramento Valley would be similar under Alternative 1 as compared to the No Action Alternative over long-term average conditions and in dry and critical dry years, as summarized in Tables 12.24 and 12.25.

**Table 12.24 Changes in Sacramento Valley Irrigated Acreage over the Long-term Average Conditions under Alternative 1 as Compared to the No Action Alternative**

| Crops | Alternative 1 (1000s acres) | No Action Alternative (1000s acres) | Changes (1000s acres) |
|---|---|---|---|
| **Grain Crops** | 154 | 155 | -1 |
| **Rice** | 549 | 548 | 0 |
| **Field Crops** | 59 | 59 | 0 |
| **Forage Crops** | 200 | 199 | 1 |
| **Vegetables and Truck Crops** | 119 | 119 | 0 |
| **Orchards and Vineyards** | 457 | 456 | 0 |
| **Total** | 1,537 | 1,537 | 0 |

Notes:
Grain crops include corn, dry beans, and grain.
Field crops include cotton, grass, hay, safflower, and sugar beets.
Forage crops include alfalfa and pasture.

**Table 12.25 Changes in Sacramento Valley Irrigated Acreage in Dry and Critical Dry Years under Alternative 1 as Compared to the No Action Alternative**

| Crops | Alternative 1 (1000s acres) | No Action Alternative (1000s acres) | Changes (1000s acres) |
|---|---|---|---|
| **Grain Crops** | 155 | 155 | 0 |
| **Rice** | 548 | 544 | 4 |
| **Field Crops** | 59 | 59 | 0 |
| **Forage Crops** | 198 | 197 | 1 |
| **Vegetables and Truck Crops** | 119 | 119 | 0 |
| **Orchards and Vineyards** | 457 | 456 | 1 |
| **Total** | 1,536 | 1,529 | 7 |

Notes:
Grain crops include corn, dry beans, and grain.
Field crops include cotton, grass, hay, safflower, and sugar beets.
Forage crops include alfalfa and pasture.

Agricultural production in the Sacramento Valley would be similar (less than 5 percent change) under Alternative 1 as compared to the No Action Alternative over long-term average conditions and in dry and critical dry years due to reduced use of groundwater, as summarized in Tables 12.26 and 12.27.

**Table 12.26 Changes in Sacramento Valley Agricultural Production over the Long-term Average Conditions under Alternative 1 as Compared to the No Action Alternative**

| Crops | Alternative 1 ($ millions) | No Action Alternative ($ millions) | Changes ($ millions) |
|---|---|---|---|
| **Grain Crops** | 149 | 150 | -0.8 |
| **Rice** | 1,115 | 1,114 | 0.9 |
| **Field Crops** | 77 | 77 | -0.1 |
| **Forage Crops** | 246 | 246 | 0.7 |
| **Vegetables and Truck Crops** | 967 | 967 | 0.0 |
| **Orchards and Vineyards** | 3,193 | 3,192 | 0.9 |
| **Total** | 5,747 | 5,745 | 1.6 |

Notes:
Grain crops include corn, dry beans, and grain.
Field crops include cotton, grass, hay, safflower, and sugar beets.
Forage crops include alfalfa and pasture.
All values of production are in 2012 dollar equivalent values.

**Table 12.27 Changes in Sacramento Valley Agricultural Production in Dry and Critical Dry Years under Alternative 1 as Compared to the No Action Alternative**

| Crops | Alternative 1 ($ millions) | No Action Alternative ($ millions) | Changes ($ millions) |
|---|---|---|---|
| **Grain Crops** | 150 | 150 | 0.5 |
| **Rice** | 1,114 | 1,107 | 7.3 |
| **Field Crops** | 77 | 77 | 0.1 |
| **Forage Crops** | 245 | 243 | 1.4 |
| **Vegetables and Truck Crops** | 967 | 967 | 0.2 |
| **Orchards and Vineyards** | 3,193 | 3,191 | 1.7 |
| **Total** | 5,746 | 5,735 | 11.3 |

Notes:
Grain crops include corn, dry beans, and grain.
Field crops include cotton, grass, hay, safflower, and sugar beets.
Forage crops include alfalfa and pasture.
All values of production are in 2012 dollar equivalent values.

*San Joaquin Valley*

Results of the SWAP analysis indicated that irrigated acreage in the San Joaquin Valley, including the Tulare Lake area, would be similar under Alternative 1 as compared to the No Action Alternative over long-term average conditions and in dry and critical dry years, as summarized in Tables 12.28 and 12.29.

**Table 12.28 Changes in San Joaquin Valley Irrigated Acreage over the Long-term Average Conditions under Alternative 1 as Compared to the No Action Alternative**

| Crops | Alternative 1 (1000s acres) | No Action Alternative (1000s acres) | Changes (1000s acres) |
|---|---|---|---|
| **Grain Crops** | 1,024 | 1,024 | 0 |
| **Rice** | 17 | 17 | 0 |
| **Field Crops** | 828 | 828 | 0 |
| **Forage Crops** | 735 | 735 | 0 |
| **Vegetables and Truck Crops** | 633 | 633 | 0 |
| **Orchards and Vineyards** | 2,156 | 2,156 | 0 |
| **Total** | 5,392 | 5,392 | 0 |

Notes:
Grain crops include corn, dry beans, and grain.
Field crops include cotton, grass, hay, safflower, and sugar beets.
Forage crops include alfalfa and pasture.

**Table 12.29 Changes in San Joaquin Valley Irrigated Acreage in Dry and Critical Dry Years under Alternative 1 as Compared to the No Action Alternative**

| Crops | Alternative 1 (1000s acres) | No Action Alternative (1000s acres) | Changes (1000s acres) |
|---|---|---|---|
| **Grain Crops** | 1,024 | 1,010 | 14 |
| **Rice** | 17 | 17 | 0 |
| **Field Crops** | 828 | 827 | 0 |
| **Forage Crops** | 735 | 735 | 1 |
| **Vegetables and Truck Crops** | 633 | 633 | 0 |
| **Orchards and Vineyards** | 2,156 | 2,154 | 2 |
| **Total** | 5,392 | 5,375 | 17 |

Notes:
Grain crops include corn, dry beans, and grain.
Field crops include cotton, grass, hay, safflower, and sugar beets.
Forage crops include alfalfa and pasture.

Agricultural production in the San Joaquin Valley would be similar under Alternative 1 as compared to the No Action Alternative over long-term average conditions and in dry and critical dry years due to reduced use of groundwater, as summarized in Tables 12.30 and 12.31.

**Table 12.30 Changes in San Joaquin Valley Agricultural Production over the Long-term Average Conditions under Alternative 1 as Compared to the No Action Alternative**

| Crops | Alternative 1 ($ millions) | No Action Alternative ($ millions) | Changes ($ millions) |
|---|---|---|---|
| **Grain Crops** | 1,373 | 1,373 | 0.2 |
| **Rice** | 31 | 31 | 0.0 |
| **Field Crops** | 1,437 | 1,436 | 0.4 |
| **Forage Crops** | 1,426 | 1,426 | 0.1 |
| **Vegetables and Truck Crops** | 4,623 | 4,623 | -0.1 |
| **Orchards and Vineyards** | 16,547 | 16,547 | 0.0 |
| **Total** | 25,438 | 25,437 | 0.5 |

Notes:
Grain crops include corn, dry beans, and grain.
Field crops include cotton, grass, hay, safflower, and sugar beets.
Forage crops include alfalfa and pasture.
All values of production are in 2012 dollar equivalent values.

**Table 12.31 Changes in San Joaquin Valley Agricultural Production in Dry and Critical Dry Years under Alternative 1 as Compared to the No Action Alternative**

| Crops | Alternative 1 ($ millions) | No Action Alternative ($ millions) | Changes ($ millions) |
|---|---|---|---|
| **Grain Crops** | 1,373 | 1,359 | 14.4 |
| **Rice** | 31 | 31 | 0.0 |
| **Field Crops** | 1,437 | 1,436 | 0.9 |
| **Forage Crops** | 1,426 | 1,426 | 0.4 |
| **Vegetables and Truck Crops** | 4,623 | 4,623 | 0.2 |
| **Orchards and Vineyards** | 16,547 | 16,542 | 4.4 |
| **Total** | 25,437 | 25,417 | 20.3 |

Notes:
Grain crops include corn, dry beans, and grain.
Field crops include cotton, grass, hay, safflower, and sugar beets.
Forage crops include alfalfa and pasture.
All values of production are in 2012 dollar equivalent values.

*Effects Related to Water Transfers*

Potential effects to agricultural resources could be similar to those identified in a recent environmental analysis conducted by Reclamation for long-term water transfers from the Sacramento to San Joaquin valleys (Reclamation 2014c) as described above under the No Action Alternative compared to the Second Basis of Comparison. For the purposes of this EIS, it is anticipated that similar conditions would occur during implementation of cross Delta water transfers under Alternative 1 and the No Action Alternative, and that impacts on agricultural resources would not be substantial in the seller's service area due to implementation requirements of the transfer programs.

Under Alternative 1, water could be transferred throughout the year without an annual volumetric limit. Under the No Action Alternative, the timing of cross Delta water transfers would be limited to July through September and include annual volumetric limits, in accordance with the 2008 USFWS BO and 2009 NMFS BO. Overall, the potential for cross Delta water transfers would be increased under Alternative 1 as compared to the No Action Alternative.

*San Francisco Bay Area, Central Coast, and Southern California Regions*

*Potential Changes in Irrigated Agricultural*

It is anticipated that reductions in CVP and SWP water supplies within the San Francisco Bay Area, Central Coast, and Southern California regions would not result in reductions in irrigated acreage or land use changes due to the use of other water supplies in the same manner that is projected to occur in the Central Valley Region.

#### 12.4.3.2.2 Alternative 1 Compared to the Second Basis of Comparison

Alternative 1 is identical to the Second Basis of Comparison.

### *12.4.3.3 Alternative 2*

The agricultural resources under Alternative 2 would identical to the conditions under the No Action Alternative; therefore, Alternative 2 is only compared to the Second Basis of Comparison.

#### 12.4.3.3.1 Alternative 2 Compared to the Second Basis of Comparison

Changes to agricultural resources under Alternatives 2 as compared to the Second Basis of Comparison would be the same as the impacts described in Section 12.4.3.1, No Action Alternative.

### *12.4.3.4 Alternative 3*

The CVP and SWP operations under Alternative 3 are similar to the Second Basis of Comparison with modified Old and Middle River flow criteria and New Melones Reservoir operations.

#### 12.4.3.4.1 Alternative 3 Compared to the No Action Alternative

*Trinity River Region*

*Potential Changes in Irrigated Agricultural*

There are no agricultural lands irrigated with CVP and SWP water supplies in the Trinity River Region. Therefore, there would be no changes in irrigated lands under Alternative 3 as compared to the No Action Alternative.

*Central Valley Region*

*Potential Changes in Irrigated Agricultural*

*Sacramento Valley*

Results of the SWAP analysis indicated that agricultural crop patterns in the Sacramento Valley would be similar under Alternative 3 as compared to the No Action Alternative over long-term average conditions and in dry and critical dry years, as summarized in Tables 12.32 and 12.33.

**Table 12.32 Changes in Sacramento Valley Irrigated Acreage over the Long-term Average Conditions under Alternative 3 as Compared to the No Action Alternative**

| Crops | Alternative 3 (1000s acres) | No Action Alternative (1000s acres) | Changes (1000s acres) |
|---|---|---|---|
| **Grain Crops** | 154 | 155 | -1 |
| **Rice** | 548 | 548 | 0 |
| **Field Crops** | 59 | 59 | 0 |
| **Forage Crops** | 200 | 199 | 1 |
| **Vegetables and Truck Crops** | 119 | 119 | 0 |

| Crops | Alternative 3 (1000s acres) | No Action Alternative (1000s acres) | Changes (1000s acres) |
|---|---|---|---|
| **Orchards and Vineyards** | 457 | 456 | 0 |
| **Total** | 1,537 | 1,537 | 0 |

Notes:
Grain crops include corn, dry beans, and grain.
Field crops include cotton, grass, hay, safflower, and sugar beets.
Forage crops include alfalfa and pasture.

**Table 12.33 Changes in Sacramento Valley Irrigated Acreage in Dry and Critical Dry Years under Alternative 3 as Compared to the No Action Alternative**

| Crops | Alternative 3 (1000s acres) | No Action Alternative (1000s acres) | Changes (1000s acres) |
|---|---|---|---|
| **Grain Crops** | 155 | 155 | 0 |
| **Rice** | 547 | 544 | 3 |
| **Field Crops** | 59 | 59 | 0 |
| **Forage Crops** | 197 | 197 | 1 |
| **Vegetables and Truck Crops** | 119 | 119 | 0 |
| **Orchards and Vineyards** | 456 | 456 | 1 |
| **Total** | 1,533 | 1,529 | 4 |

Notes:
Grain crops include corn, dry beans, and grain.
Field crops include cotton, grass, hay, safflower, and sugar beets.
Forage crops include alfalfa and pasture.

Agricultural production in the Sacramento Valley would be similar under Alternative 3 as compared to the No Action Alternative over long-term average conditions and in dry and critical dry years due to reduced use of groundwater, as summarized in Tables 12.34 and 12.35.

**Table 12.34 Changes in Sacramento Valley Agricultural Production over the Long-term Average Conditions under Alternative 3 as Compared to the No Action Alternative**

| Crops | Alternative 3 ($ millions) | No Action Alternative ($ millions) | Changes ($ millions) |
|---|---|---|---|
| **Grain Crops** | 149 | 150 | -0.7 |
| **Rice** | 1,115 | 1,114 | 0.6 |
| **Field Crops** | 77 | 77 | -0.1 |

| Crops | Alternative 3 ($ millions) | No Action Alternative ($ millions) | Changes ($ millions) |
|---|---|---|---|
| **Forage Crops** | 246 | 246 | 0.5 |
| **Vegetables and Truck Crops** | 967 | 967 | 0.0 |
| **Orchards and Vineyards** | 3,192 | 3,192 | 0.9 |
| **Total** | 5,746 | 5,745 | 1.2 |

Notes:
Grain crops include corn, dry beans, and grain.
Field crops include cotton, grass, hay, safflower, and sugar beets.
Forage crops include alfalfa and pasture.
All values of production are in 2012 dollar equivalent values.

**Table 12.35 Changes in Sacramento Valley Agricultural Production in Dry and Critical Dry Years under Alternative 3 as Compared to the No Action Alternative**

| Crops | Alternative 3 ($ millions) | No Action Alternative ($ millions) | Changes ($ millions) |
|---|---|---|---|
| **Grain Crops** | 150 | 150 | 0.2 |
| **Rice** | 1,112 | 1,107 | 5.8 |
| **Field Crops** | 77 | 77 | 0.1 |
| **Forage Crops** | 244 | 243 | 0.8 |
| **Vegetables and Truck Crops** | 967 | 967 | 0.1 |
| **Orchards and Vineyards** | 3,193 | 3,191 | 2.2 |
| **Total** | 5,744 | 5,735 | 9.2 |

Notes:
Grain crops include corn, dry beans, and grain.
Field crops include cotton, grass, hay, safflower, and sugar beets.
Forage crops include alfalfa and pasture.
All values of production are in 2012 dollar equivalent values.

#### *San Joaquin Valley*

Results of the SWAP analysis indicated that irrigated acreage in the San Joaquin Valley, including the Tulare Lake area, would be similar under Alternative 3 as compared to the No Action Alternative over long-term average conditions and in dry and critical dry years, as summarized in Tables 12.36 and 12.37.

**Table 12.36 Changes in San Joaquin Valley Irrigated Acreage over the Long-term Average Conditions under Alternative 3 as Compared to the No Action Alternative**

| Crops | Alternative 3 (1000s acres) | No Action Alternative (1000s acres) | Changes (1000s acres) |
|---|---|---|---|
| **Grain Crops** | 1,024 | 1,024 | 0 |
| **Rice** | 17 | 17 | 0 |
| **Field Crops** | 828 | 828 | 0 |
| **Forage Crops** | 735 | 735 | 0 |
| **Vegetables and Truck Crops** | 633 | 633 | 0 |
| **Orchards and Vineyards** | 2,156 | 2,156 | 0 |
| **Total** | 5,392 | 5,392 | 0 |

Notes:
Grain crops include corn, dry beans, and grain.
Field crops include cotton, grass, hay, safflower, and sugar beets.
Forage crops include alfalfa and pasture.

**Table 12.37 Changes in San Joaquin Valley Irrigated Acreage in Dry and Critical Dry Years under Alternative 3 as Compared to the No Action Alternative**

| Crops | Alternative 3 (1000s acres) | No Action Alternative (1000s acres) | Changes (1000s acres) |
|---|---|---|---|
| **Grain Crops** | 1,021 | 1,010 | 11 |
| **Rice** | 17 | 17 | 0 |
| **Field Crops** | 828 | 827 | 0 |
| **Forage Crops** | 735 | 735 | 0 |
| **Vegetables and Truck Crops** | 633 | 633 | 0 |
| **Orchards and Vineyards** | 2,154 | 2,154 | 0 |
| **Total** | 5,387 | 5,375 | 12 |

Notes:
Grain crops include corn, dry beans, and grain.
Field crops include cotton, grass, hay, safflower, and sugar beets.
Forage crops include alfalfa and pasture.

Agricultural production in the San Joaquin Valley would be similar under Alternative 3 as compared to the No Action Alternative over long-term average conditions and in dry and critical dry years due to reduced use of groundwater, as summarized in Tables 12.38 and 12.39.

**Table 12.38 Changes in San Joaquin Valley Agricultural Production over the Long-term Average Conditions under Alternative 3 as Compared to the No Action Alternative**

| Crops | Alternative 3 ($ millions) | No Action Alternative ($ millions) | Changes ($ millions) |
|---|---|---|---|
| **Grain Crops** | 1,373 | 1,373 | 0.1 |
| **Rice** | 31 | 31 | 0.0 |
| **Field Crops** | 1,437 | 1,436 | 0.3 |
| **Forage Crops** | 1,426 | 1,426 | 0.1 |
| **Vegetables and Truck Crops** | 4,623 | 4,623 | -0.1 |
| **Orchards and Vineyards** | 16,547 | 16,547 | -0.1 |
| **Total** | 25,437 | 25,437 | 0.3 |

Notes:
Grain crops include corn, dry beans, and grain.
Field crops include cotton, grass, hay, safflower, and sugar beets.
Forage crops include alfalfa and pasture.
All values of production are in 2012 dollar equivalent values.

**Table 12.39 Changes in San Joaquin Valley Agricultural Production in Dry and Critical Dry Years under Alternative 3 as Compared to the No Action Alternative**

| Crops | Alternative 3 ($ millions) | No Action Alternative ($ millions) | Changes ($ millions) |
|---|---|---|---|
| **Grain Crops** | 1,370 | 1,359 | 11.5 |
| **Rice** | 31 | 31 | 0.0 |
| **Field Crops** | 1,436 | 1,436 | 0.4 |
| **Forage Crops** | 1,426 | 1,426 | -0.1 |
| **Vegetables and Truck Crops** | 4,623 | 4,623 | 0.0 |
| **Orchards and Vineyards** | 16,542 | 16,542 | -0.3 |
| **Total** | 25,428 | 25,417 | 11.4 |

Notes:
Grain crops include corn, dry beans, and grain.
Field crops include cotton, grass, hay, safflower, and sugar beets.
Forage crops include alfalfa and pasture.
All values of production are in 2012 dollar equivalent values.

*Effects Related to Water Transfers*

Potential effects to agricultural resources could be similar to those identified in a recent environmental analysis conducted by Reclamation for long-term water transfers from the Sacramento to San Joaquin valleys (Reclamation 2014c) as described above under the No Action Alternative compared to the Second Basis of Comparison. For the purposes of this EIS, it is anticipated that similar conditions would occur during implementation of cross Delta water transfers under Alternative 3 and the No Action Alternative, and that impacts on agricultural resources would not be substantial in the seller's service area due to implementation requirements of the transfer programs.

Under Alternative 3, water could be transferred throughout the year without an annual volumetric limit. Under the No Action Alternative, the timing of cross Delta water transfers would be limited to July through September and include annual volumetric limits, in accordance with the 2008 USFWS BO and 2009 NMFS BO. Overall, the potential for cross Delta water transfers would be increased under Alternative 3 as compared to the No Action Alternative.

*San Francisco Bay Area, Central Coast, and Southern California Regions*

*Potential Changes in Irrigated Agricultural*

It is anticipated that reductions in CVP and SWP water supplies within the San Francisco Bay Area, Central Coast, and Southern California regions would not result in reductions in irrigated acreage or land use changes due to the use of other water supplies in the same manner that is projected to occur in the Central Valley Region.

#### 12.4.3.4.2 Alternative 3 Compared to the Second Basis of Comparison

*Trinity River Region*

*Potential Changes in Irrigated Agricultural*

There are no agricultural lands irrigated with CVP and SWP water supplies in the Trinity River Region. Therefore, there would be no changes in irrigated lands under Alternative 3 as compared to the Second Basis of Comparison.

*Central Valley Region*

*Potential Changes in Irrigated Agricultural*

*Sacramento Valley*

Results of the SWAP analysis indicated that agricultural crop patterns in the Sacramento Valley would be similar under Alternative 3 as compared to the Second Basis of Comparison over long-term average conditions and in dry and critical dry years, as summarized in Tables 12.40 and 12.41.

**Table 12.40 Changes in Sacramento Valley Irrigated Acreage over the Long-term Average Conditions under Alternative 3 as Compared to the Second Basis of Comparison**

| Crops | Alternative 3 (1000s acres) | Second Basis of Comparison (1000s acres) | Changes (1000s acres) |
|---|---|---|---|
| **Grain Crops** | 154 | 154 | 0 |
| **Rice** | 548 | 548 | 0 |
| **Field Crops** | 59 | 59 | 0 |
| **Forage Crops** | 200 | 200 | 0 |
| **Vegetables and Truck Crops** | 119 | 119 | 0 |
| **Orchards and Vineyards** | 457 | 457 | 0 |
| **Total** | 1,537 | 1,537 | 0 |

Notes:
Grain crops include corn, dry beans, and grain.
Field crops include cotton, grass, hay, safflower, and sugar beets.
Forage crops include alfalfa and pasture.

**Table 12.41 Changes in Sacramento Valley Irrigated Acreage in Dry and Critical Dry Years under Alternative 3 as Compared to the Second Basis of Comparison**

| Crops | Alternative 3 (1000s acres) | Second Basis of Comparison (1000s acres) | Changes (1000s acres) |
|---|---|---|---|
| **Grain Crops** | 155 | 155 | 0 |
| **Rice** | 547 | 548 | -1 |
| **Field Crops** | 59 | 59 | 0 |
| **Forage Crops** | 197 | 198 | -1 |
| **Vegetables and Truck Crops** | 119 | 119 | 0 |
| **Orchards and Vineyards** | 456 | 457 | -1 |
| **Total** | 1,533 | 1,536 | -3 |

Notes:
Grain crops include corn, dry beans, and grain.
Field crops include cotton, grass, hay, safflower, and sugar beets.
Forage crops include alfalfa and pasture.

The agricultural production value under long-term average conditions and dry and critical dry conditions would be similar under Alternative 3 and Second Basis of Comparison, as summarized in Tables 12.42 and 12.43, primarily due to a decrease in groundwater pumping.

**Table 12.42 Changes in Sacramento Valley Agricultural Production over the Long-term Average Conditions under Alternative 3 as Compared to the Second Basis of Comparison**

| Crops | Alternative 3 ($ millions) | Second Basis of Comparison ($ millions) | Changes ($ millions) |
|---|---|---|---|
| **Grain Crops** | 149 | 149 | 0.1 |
| **Rice** | 1,115 | 1,115 | -0.3 |
| **Field Crops** | 77 | 77 | 0.0 |
| **Forage Crops** | 246 | 246 | -0.1 |
| **Vegetables and Truck Crops** | 967 | 967 | 0.0 |
| **Orchards and Vineyards** | 3,192 | 3,193 | -0.1 |
| **Total** | 5,746 | 5,747 | -0.3 |

Notes:
Grain crops include corn, dry beans, and grain.
Field crops include cotton, grass, hay, safflower, and sugar beets.
Forage crops include alfalfa and pasture.
All values of production are in 2012 dollar equivalent values.

**Table 12.43 Changes in Sacramento Valley Agricultural Production in Dry and Critical Dry Years under Alternative 3 as Compared to the Second Basis of Comparison**

| Crops | Alternative 3 ($ millions) | Second Basis of Comparison ($ millions) | Changes ($ millions) |
|---|---|---|---|
| **Grain Crops** | 150 | 150 | -0.3 |
| **Rice** | 1,112 | 1,114 | -1.5 |
| **Field Crops** | 77 | 77 | 0.0 |
| **Forage Crops** | 244 | 245 | -0.6 |
| **Vegetables and Truck Crops** | 967 | 967 | -0.1 |
| **Orchards and Vineyards** | 3,193 | 3,193 | 0.4 |
| **Total** | 5,744 | 5,746 | -2.1 |

Notes:
Grain crops include corn, dry beans, and grain.
Field crops include cotton, grass, hay, safflower, and sugar beets.
Forage crops include alfalfa and pasture.
All values of production are in 2012 dollar equivalent values.

### *San Joaquin Valley*

Results of the SWAP analysis indicated that irrigated acreage in the San Joaquin Valley, including the Tulare Lake area, would be similar under Alternative 3 as compared to the Second Basis of Comparison over long-term average conditions and in dry and critical dry years, as summarized in Tables 12.44 and 12.45.

**Table 12.44 Changes in San Joaquin Valley Irrigated Acreage over the Long-term Average Conditions under Alternative 3 as Compared to the Second Basis of Comparison**

| Crops | Alternative 3 (1000s acres) | Second Basis of Comparison (1000s acres) | Changes (1000s acres) |
|---|---|---|---|
| **Grain Crops** | 1,024 | 1,024 | 0 |
| **Rice** | 17 | 17 | 0 |
| **Field Crops** | 828 | 828 | 0 |
| **Forage Crops** | 735 | 735 | 0 |
| **Vegetables and Truck Crops** | 633 | 633 | 0 |
| **Orchards and Vineyards** | 2,156 | 2,156 | 0 |
| **Total** | 5,392 | 5,392 | 0 |

Notes:
Grain crops include corn, dry beans, and grain.
Field crops include cotton, grass, hay, safflower, and sugar beets.
Forage crops include alfalfa and pasture.

**Table 12.45 Changes in San Joaquin Valley Irrigated Acreage in Dry and Critical Dry Years under Alternative 3 as Compared to the Second Basis of Comparison**

| Crops | Alternative 3 (1000s acres) | Second Basis of Comparison (1000s acres) | Changes (1000s acres) |
|---|---|---|---|
| **Grain Crops** | 1,021 | 1,024 | -3 |
| **Rice** | 17 | 17 | 0 |
| **Field Crops** | 828 | 828 | 0 |
| **Forage Crops** | 735 | 735 | -1 |
| **Vegetables and Truck Crops** | 633 | 633 | 0 |
| **Orchards and Vineyards** | 2,154 | 2,156 | -2 |
| **Total** | 5,387 | 5,392 | -5 |

Notes:
Grain crops include corn, dry beans, and grain.
Field crops include cotton, grass, hay, safflower, and sugar beets.
Forage crops include alfalfa and pasture.

The agricultural production value under long-term average conditions would be similar under Alternative 3 and the Second Basis of Comparison, as summarized in Tables 12.46 and 12.47, primarily due to an increase in groundwater pumping.

**Table 12.46 Changes in San Joaquin Valley Agricultural Production over the Long-term Average Conditions under Alternative 3 as Compared to the Second Basis of Comparison**

| Crops | Alternative 3 ($ millions) | Second Basis of Comparison ($ millions) | Changes ($ millions) |
|---|---|---|---|
| **Grain Crops** | 1,373 | 1,373 | -0.1 |
| **Rice** | 31 | 31 | 0.0 |
| **Field Crops** | 1,437 | 1,437 | -0.1 |
| **Forage Crops** | 1,426 | 1,426 | 0.0 |
| **Vegetables and Truck Crops** | 4,623 | 4,623 | 0.0 |
| **Orchards and Vineyards** | 16,547 | 16,547 | -0.1 |
| **Total** | 25,437 | 25,438 | -0.3 |

Notes:
Grain crops include corn, dry beans, and grain.
Field crops include cotton, grass, hay, safflower, and sugar beets.
Forage crops include alfalfa and pasture.
All values of production are in 2012 dollar equivalent values.

**Table 12.47 Changes in San Joaquin Valley Agricultural Production in Dry and Critical Dry Years under Alternative 3 as Compared to the Second Basis of Comparison**

| Crops | Alternative 3 ($ millions) | Second Basis of Comparison ($ millions) | Changes ($ millions) |
|---|---|---|---|
| **Grain Crops** | 1,370 | 1,373 | -2.9 |
| **Rice** | 31 | 31 | 0.0 |
| **Field Crops** | 1,436 | 1,437 | -0.6 |
| **Forage Crops** | 1,426 | 1,426 | -0.5 |
| **Vegetables and Truck Crops** | 4,623 | 4,623 | -0.2 |
| **Orchards and Vineyards** | 16,542 | 16,547 | -4.7 |
| **Total** | 25,428 | 25,437 | -8.9 |

Notes:
Grain crops include corn, dry beans, and grain.
Field crops include cotton, grass, hay, safflower, and sugar beets.
Forage crops include alfalfa and pasture.
All values of production are in 2012 dollar equivalent values.

*Effects Related to Water Transfers*

It is anticipated that water would be transferred between subbasins in the same manner under Alternative 3 as compared to the Second Basis of Comparison. If the water to be transferred is made available through crop idling, there would be a reduction in irrigated acreage. If the water is used to reduce crop idling in dry and critical dry years, there would be an increase in irrigated acreage. Therefore, the changes in agricultural resources would need to be determined for each water transfer program.

Potential effects to agricultural resources could be similar to those identified in a recent environmental analysis conducted by Reclamation for long-term water transfers from the Sacramento to San Joaquin valleys (Reclamation 2014c) as described above under the No Action Alternative compared to the Second Basis of Comparison. For the purposes of this EIS, it is anticipated that similar conditions would occur during implementation of cross Delta water transfers under Alternative 3 as compared to the Second Basis of Comparison, and that impacts on agricultural resources would not be substantial in the seller's service area due to implementation requirements of the transfer programs.

Under Alternative 3 and the Second Basis of Comparison, water could be transferred throughout the year without an annual volumetric limit. Overall, the potential for cross Delta water transfers would be similar under Alternative 3 as compared to the Second Basis of Comparison.

*San Francisco Bay Area, Central Coast, and Southern California Regions*

*Potential Changes in Irrigated Agricultural*

It is anticipated that reductions in CVP and SWP water supplies within the San Francisco Bay Area, Central Coast, and Southern California regions would not result in reductions in irrigated acreage or land use changes due to the use of other water supplies in the same manner that is projected to occur in the Central Valley Region.

#### *12.4.3.5 Alternative 4*

The agricultural resources under Alternative 4 would be identical to the conditions under the Second Basis of Comparison; therefore, Alternative 4 is only compared to the No Action Alternative.

##### 12.4.3.5.1 Alternative 4 Compared to the No Action Alternative

The CVP and SWP operations under Alternative 4 are identical to the CVP and SWP operations under the Second Basis of Comparison and Alternative 1. Therefore, changes in agricultural resources under Alternative 4 as compared to the No Action Alternative would be the same as the impacts described in Section 12.4.3.2.1, Alternative 1 Compared to the No Action Alternative.

#### *12.4.3.6 Alternative 5*

The CVP and SWP operations under Alternative 5 are similar to the No Action Alternative with modified Old and Middle River flow criteria and New Melones Reservoir operations.

##### 12.4.3.6.1 Alternative 5 Compared to the No Action Alternative

*Trinity River Region*

*Potential Changes in Irrigated Agricultural*

There are no agricultural lands irrigated with CVP and SWP water supplies in the Trinity River Region. Therefore, there would be no changes in irrigated lands under Alternative 5 as compared to the No Action Alternative.

*Central Valley Region*

*Potential Changes in Irrigated Agricultural*

*Sacramento Valley*

Results of the SWAP analysis indicated that agricultural crop patterns in the Sacramento Valley would be similar under Alternative 5 as compared to the No Action Alternative over long-term average conditions and in dry and critical dry years, as summarized in Tables 12.48 and 12.49.

**Table 12.48 Changes in Sacramento Valley Irrigated Acreage over the Long-term Average Conditions under Alternative 5 as Compared to the No Action Alternative**

| Crops | Alternative 5 (1000s acres) | No Action Alternative (1000s acres) | Changes (1000s acres) |
|---|---|---|---|
| **Grain Crops** | 155 | 155 | 0 |
| **Rice** | 548 | 548 | 0 |
| **Field Crops** | 59 | 59 | 0 |
| **Forage Crops** | 199 | 199 | 0 |
| **Vegetables and Truck Crops** | 119 | 119 | 0 |
| **Orchards and Vineyards** | 456 | 456 | 0 |
| **Total** | 1,537 | 1,537 | 0 |

Notes:
Grain crops include corn, dry beans, and grain.
Field crops include cotton, grass, hay, safflower, and sugar beets.
Forage crops include alfalfa and pasture.

**Table 12.49 Changes in Sacramento Valley Irrigated Acreage in Dry and Critical Dry Years under Alternative 5 as Compared to the No Action Alternative**

| Crops | Alternative 5 (1000s acres) | No Action Alternative (1000s acres) | Changes (1000s acres) |
|---|---|---|---|
| **Grain Crops** | 155 | 155 | 0 |
| **Rice** | 544 | 544 | 0 |
| **Field Crops** | 59 | 59 | 0 |
| **Forage Crops** | 197 | 197 | 0 |

| Crops | Alternative 5 (1000s acres) | No Action Alternative (1000s acres) | Changes (1000s acres) |
|---|---|---|---|
| **Vegetables and Truck Crops** | 119 | 119 | 0 |
| **Orchards and Vineyards** | 456 | 456 | 0 |
| **Total** | 1,529 | 1,529 | 0 |

Notes:
Grain crops include corn, dry beans, and grain.
Field crops include cotton, grass, hay, safflower, and sugar beets.
Forage crops include alfalfa and pasture.

The agricultural production value under long-term average conditions and dry and critical dry conditions would be similar under Alternative 5 and the No Action Alternative, as summarized in Tables 12.50 and 12.51.

**Table 12.50 Changes in Sacramento Valley Agricultural Production over the Long-term Average Conditions under Alternative 5 as Compared to the No Action Alternative**

| Crops | Alternative 5 ($ millions) | No Action Alternative ($ millions) | Changes ($ millions) |
|---|---|---|---|
| **Grain Crops** | 150 | 150 | 0.0 |
| **Rice** | 1,114 | 1,114 | 0.1 |
| **Field Crops** | 77 | 77 | 0.0 |
| **Forage Crops** | 246 | 246 | 0.0 |
| **Vegetables and Truck Crops** | 967 | 967 | 0.0 |
| **Orchards and Vineyards** | 3,192 | 3,192 | 0.1 |
| **Total** | 5,745 | 5,745 | 0.1 |

Notes:
Grain crops include corn, dry beans, and grain.
Field crops include cotton, grass, hay, safflower, and sugar beets.
Forage crops include alfalfa and pasture.
All values of production are in 2012 dollar equivalent values.

**Table 12.51 Changes in Sacramento Valley Agricultural Production in Dry and Critical Dry Years under Alternative 5 as Compared to the No Action Alternative**

| Crops | Alternative 5 ($ millions) | No Action Alternative ($ millions) | Changes ($ millions) |
|---|---|---|---|
| **Grain Crops** | 150 | 150 | -0.1 |
| **Rice** | 1,107 | 1,107 | 0.2 |
| **Field Crops** | 77 | 77 | 0.0 |
| **Forage Crops** | 243 | 243 | 0.1 |
| **Vegetables and Truck Crops** | 967 | 967 | 0.0 |
| **Orchards and Vineyards** | 3,192 | 3,191 | 0.7 |
| **Total** | 5,736 | 5,735 | 0.8 |

Notes:
Grain crops include corn, dry beans, and grain.
Field crops include cotton, grass, hay, safflower, and sugar beets.
Forage crops include alfalfa and pasture.
All values of production are in 2012 dollar equivalent values.

*San Joaquin Valley*

Results of the SWAP analysis indicated that irrigated acreage in the San Joaquin Valley, including the Tulare Lake area, would be similar under Alternative 5 as compared to the No Action Alternative over long-term average conditions and dry and critical dry years, as summarized in Tables 12.52 and 12.53.

**Table 12.52 Changes in San Joaquin Valley Irrigated Acreage over the Long-term Average Conditions under Alternative 5 as Compared to the No Action Alternative**

| Crops | Alternative 5 (1000s acres) | No Action Alternative (1000s acres) | Changes (1000s acres) |
|---|---|---|---|
| **Grain Crops** | 1,024 | 1,024 | 0 |
| **Rice** | 17 | 17 | 0 |
| **Field Crops** | 828 | 828 | 0 |
| **Forage Crops** | 735 | 735 | 0 |
| **Vegetables and Truck Crops** | 633 | 633 | 0 |
| **Orchards and Vineyards** | 2,156 | 2,156 | 0 |
| **Total** | 5,392 | 5,392 | 0 |

Notes:
Grain crops include corn, dry beans, and grain.
Field crops include cotton, grass, hay, safflower, and sugar beets.
Forage crops include alfalfa and pasture.

**Table 12.53 Changes in San Joaquin Valley Irrigated Acreage in Dry and Critical Dry Years under Alternative 5 as Compared to the No Action Alternative**

| Crops | Alternative 5 (1000s acres) | No Action Alternative (1000s acres) | Changes (1000s acres) |
|---|---|---|---|
| **Grain Crops** | 1,010 | 1,010 | 0 |
| **Rice** | 17 | 17 | 0 |
| **Field Crops** | 827 | 827 | 0 |
| **Forage Crops** | 734 | 735 | 0 |
| **Vegetables and Truck Crops** | 633 | 633 | 0 |
| **Orchards and Vineyards** | 2,153 | 2,154 | -1 |
| **Total** | 5,374 | 5,375 | -1 |

Notes:
Grain crops include corn, dry beans, and grain.
Field crops include cotton, grass, hay, safflower, and sugar beets.
Forage crops include alfalfa and pasture.

The agricultural production value under long-term average conditions and dry and critical dry year conditions would be similar under Alternative 5 and the No Action Alternative, as summarized in Tables 12.54 and 12.55.

**Table 12.54 Changes in San Joaquin Valley Agricultural Production over the Long-term Average Conditions under Alternative 5 as Compared to the No Action Alternative**

| Crops | Alternative 5 ($ millions) | No Action Alternative ($ millions) | Changes ($ millions) |
|---|---|---|---|
| **Grain Crops** | 1,373 | 1,373 | 0.0 |

| **Total** | 25,414 | 25,417 | -2.7 |

Notes:
Grain crops include corn, dry beans, and grain.
Field crops include cotton, grass, hay, safflower, and sugar beets.
Forage crops include alfalfa and pasture.
All values of production are in 2012 dollar equivalent values.

*Effects Related to Water Transfers*

Potential effects to agricultural resources could be similar to those identified in a recent environmental analysis conducted by Reclamation for long-term water transfers from the Sacramento to San Joaquin valleys (Reclamation 2014c) as described above under the No Action Alternative compared to the Second Basis of Comparison. For the purposes of this EIS, it is anticipated that similar conditions would occur during implementation of cross Delta water transfers under Alternative 5 and the No Action Alternative, and that impacts on agricultural resources would not be substantial in the seller's service area due to implementation requirements of the transfer programs.

Under Alternative 5 and the No Action Alternative, the timing of cross Delta water transfers would be limited to July through September and include annual volumetric limits, in accordance with the 2008 USFWS BO and 2009 NMFS BO. Overall, the potential for cross Delta water transfers would be similar under Alternative 5 and the No Action Alternative.

*San Francisco Bay Area, Central Coast, and Southern California Regions*

*Potential Changes in Irrigated Agricultural*

It is anticipated that reductions in CVP and SWP water supplies within the San Francisco Bay Area, Central Coast, and Southern California regions would not result in reductions in irrigated acreage or land use changes due to the use of other water supplies in the same manner that is projected to occur in the Central Valley Region.

#### 12.4.3.6.2 Alternative 5 Compared to the Second Basis of Comparison

*Trinity River Region*

*Potential Changes in Irrigated Agricultural*

There are no agricultural lands irrigated with CVP and SWP water supplies in the Trinity River Region. Therefore, there would be no changes in irrigated lands under Alternative 5 as compared to the Second Basis of Comparison.

*Central Valley Region*

*Potential Changes in Irrigated Agricultural*

*Sacramento Valley*

Results of the SWAP analysis indicated that agricultural crop patterns in the Sacramento Valley would be similar under Alternative 5 as compared to the Second Basis of Comparison over long-term average conditions and in dry and critical dry years, as summarized in Tables 12.56 and 12.57.

**Table 12.56 Changes in Sacramento Valley Irrigated Acreage over the Long-term Average Conditions under Alternative 5 as Compared to the Second Basis of Comparison**

| Crops | Alternative 5 (1000s acres) | Second Basis of Comparison (1000s acres) | Changes (1000s acres) |
|---|---|---|---|
| **Grain Crops** | 155 | 154 | 1 |
| **Rice** | 548 | 549 | 0 |
| **Field Crops** | 59 | 59 | 0 |
| **Forage Crops** | 199 | 200 | -1 |
| **Vegetables and Truck Crops** | 119 | 119 | 0 |
| **Orchards and Vineyards** | 456 | 457 | 0 |
| **Total** | 1,537 | 1,537 | 0 |

Notes:
Grain crops include corn, dry beans, and grain.
Field crops include cotton, grass, hay, safflower, and sugar beets.
Forage crops include alfalfa and pasture.

**Table 12.57 Changes in Sacramento Valley Irrigated Acreage in Dry and Critical Dry Years under Alternative 5 as Compared to the Second Basis of Comparison**

| Crops | Alternative 5 (1000s acres) | Second Basis of Comparison (1000s acres) | Changes (1000s acres) |
|---|---|---|---|
| **Grain Crops** | 155 | 155 | -1 |
| **Rice** | 544 | 548 | -4 |
| **Field Crops** | 59 | 59 | 0 |

| Crops | Alternative 5 (1000s acres) | Second Basis of Comparison (1000s acres) | Changes (1000s acres) |
|---|---|---|---|
| **Forage Crops** | 197 | 198 | -1 |
| **Vegetables and Truck Crops** | 119 | 119 | 0 |
| **Orchards and Vineyards** | 456 | 457 | -1 |
| **Total** | 1,529 | 1,536 | -7 |

Notes:
Grain crops include corn, dry beans, and grain.
Field crops include cotton, grass, hay, safflower, and sugar beets.
Forage crops include alfalfa and pasture.

The agricultural production value under long-term average conditions and in dry and critical dry conditions would be similar under Alternative 5 and Second Basis of Comparison, as summarized in Tables 12.58 and 12.59.

**Table 12.58 Changes in Sacramento Valley Agricultural Production over the Long-term Average Conditions under Alternative 5 as Compared to the Second Basis of Comparison**

| Crops | Alternative 5 ($ millions) | Second Basis of Comparison ($ millions) | Changes ($ millions) |
|---|---|---|---|
| **Grain Crops** | 150 | 149 | 0.8 |
| **Rice** | 1,114 | 1,115 | -0.8 |
| **Field Crops** | 77 | 77 | 0.1 |
| **Forage Crops** | 246 | 246 | -0.6 |
| **Vegetables and Truck Crops** | 967 | 967 | 0.0 |
| **Orchards and Vineyards** | 3,192 | 3,193 | -0.9 |
| **Total** | 5,745 | 5,747 | -1.5 |

Notes:
Grain crops include corn, dry beans, and grain.
Field crops include cotton, grass, hay, safflower, and sugar beets.
Forage crops include alfalfa and pasture.
All values of production are in 2012 dollar equivalent values.

**Table 12.59 Changes in Sacramento Valley Agricultural Production in Dry and Critical Dry Years under Alternative 5 as Compared to the Second Basis of Comparison**

| Crops | Alternative 5 ($ millions) | Second Basis of Comparison ($ millions) | Changes ($ millions) |
|---|---|---|---|
| **Grain Crops** | 150 | 150 | -0.6 |
| **Rice** | 1,107 | 1,114 | -7.1 |
| **Field Crops** | 77 | 77 | -0.1 |
| **Forage Crops** | 243 | 245 | -1.3 |
| **Vegetables and Truck Crops** | 967 | 967 | -0.3 |
| **Orchards and Vineyards** | 3,192 | 3,193 | -1.1 |
| **Total** | 5,736 | 5,746 | -10.5 |

Notes:
Grain crops include corn, dry beans, and grain.
Field crops include cotton, grass, hay, safflower, and sugar beets.
Forage crops include alfalfa and pasture.
All values of production are in 2012 dollar equivalent values.

*San Joaquin Valley*

Results of the SWAP analysis indicated that irrigated acreage in the San Joaquin Valley, including the Tulare Lake area, would be similar under Alternative 5 as compared to the Second Basis of Comparison over long-term average conditions and in dry and critical dry years, as summarized in Tables 12.60 and 12.61.

**Table 12.60 Changes in San Joaquin Valley Irrigated Acreage over the Long-term Average Conditions under Alternative 5 as Compared to the Second Basis of Comparison**

| Crops | Alternative 5 (1000s acres) | Second Basis of Comparison (1000s acres) | Changes (1000s acres) |
|---|---|---|---|
| **Grain Crops** | 1,024 | 1,024 | 0 |
| **Rice** | 17 | 17 | 0 |
| **Field Crops** | 828 | 828 | 0 |
| **Forage Crops** | 735 | 735 | 0 |
| **Vegetables and Truck Crops** | 633 | 633 | 0 |
| **Orchards and Vineyards** | 2,156 | 2,156 | 0 |
| **Total** | 5,392 | 5,392 | -1 |

Notes:
Grain crops include corn, dry beans, and grain.
Field crops include cotton, grass, hay, safflower, and sugar beets.
Forage crops include alfalfa and pasture.

**Table 12.61 Changes in San Joaquin Valley Irrigated Acreage in Dry and Critical Dry Years under Alternative 5 as compared to the Second Basis of Comparison**

| Crops | Alternative 5 (1000s acres) | Second Basis of Comparison (1000s acres) | Changes (1000s acres) |
|---|---|---|---|
| **Grain Crops** | 1,010 | 1,024 | -14 |
| **Rice** | 17 | 17 | 0 |
| **Field Crops** | 827 | 828 | 0 |
| **Forage Crops** | 734 | 735 | -1 |
| **Vegetables and Truck Crops** | 633 | 633 | 0 |
| **Orchards and Vineyards** | 2,153 | 2,156 | -3 |
| **Total** | 5,374 | 5,392 | -18 |

Notes:
Grain crops include corn, dry beans, and grain.
Field crops include cotton, grass, hay, safflower, and sugar beets.
Forage crops include alfalfa and pasture.

The agricultural production value under long-term average conditions and in dry and critical dry conditions would be similar, as summarized in Tables 12.62 and 12.63, primarily due to an increase in groundwater pumping.

**Table 12.62 Changes in San Joaquin Valley Agricultural Production over the Long-term Average Conditions under Alternative 5 as Compared to the Second Basis of Comparison**

| Crops | Alternative 5 ($ millions) | Second Basis of Comparison ($ millions) | Changes ($ millions) |
|---|---|---|---|
| **Grain Crops** | 1,373 | 1,373 | -0.2 |
| **Rice** | 31 | 31 | 0.0 |
| **Field Crops** | 1,436 | 1,437 | -0.5 |
| **Forage Crops** | 1,426 | 1,426 | -0.1 |
| **Vegetables and Truck Crops** | 4,623 | 4,623 | 0.2 |
| **Orchards and Vineyards** | 16,547 | 16,547 | -0.1 |
| **Total** | 25,437 | 25,438 | -0.7 |

Notes:
Grain crops include corn, dry beans, and grain.
Field crops include cotton, grass, hay, safflower, and sugar beets.
Forage crops include alfalfa and pasture.
All values of production are in 2012 dollar equivalent values.

**Table 12.63 Changes in San Joaquin Valley Agricultural Production in Dry and Critical Dry Years under Alternative 5 as Compared to the Second Basis of Comparison**

| Crops | Alternative 5 ($ millions) | Second Basis of Comparison ($ millions) | Changes ($ millions) |
|---|---|---|---|
| **Grain Crops** | 1,359 | 1,373 | -14.5 |
| **Rice** | 31 | 31 | 0.0 |
| **Field Crops** | 1,435 | 1,437 | -1.2 |
| **Forage Crops** | 1,426 | 1,426 | -0.5 |
| **Vegetables and Truck Crops** | 4,622 | 4,623 | -0.5 |
| **Orchards and Vineyards** | 16,540 | 16,547 | -6.4 |
| **Total** | 25,414 | 25,437 | -22.9 |

Notes:
Grain crops include corn, dry beans, and grain.
Field crops include cotton, grass, hay, safflower, and sugar beets.
Forage crops include alfalfa and pasture.
All values of production are in 2012 dollar equivalent values.

*Effects Related to Water Transfers*

Potential effects to agricultural resources could be similar to those identified in a recent environmental analysis conducted by Reclamation for long-term water transfers from the Sacramento to San Joaquin valleys (Reclamation 2014c) as described above under the No Action Alternative compared to the Second Basis of Comparison. For the purposes of this EIS, it is anticipated that similar conditions would occur during implementation of cross Delta water transfers under Alternative 5 and the Second Basis of Comparison, and that impacts on agricultural resources would not be substantial in the seller's service area due to implementation requirements of the transfer programs.

Under Alternative 5, the timing of cross Delta water transfers would be limited to July through September and include annual volumetric limits, in accordance with the 2008 USFWS BO and 2009 NMFS BO. Under Second Basis of Comparison, water could be transferred throughout the year without an annual volumetric limit. Overall, the potential for cross Delta water transfers would be reduced under Alternative 5 as compared to the Second Basis of Comparison.

*San Francisco Bay Area, Central Coast, and Southern California Regions*

*Potential Changes in Irrigated Agricultural*

It is anticipated that reductions in CVP and SWP water supplies within the San Francisco Bay Area, Central Coast, and Southern California regions would not result in reductions in irrigated acreage or land use changes due to the use of other water supplies in the same manner that is projected to occur in the Central Valley Region.

#### *12.4.3.7 Summary of Environmental Consequences*

The results of the environmental consequences of implementation of Alternatives 1 through 5 as compared to the No Action Alternative and the Second Basis of Comparison are presented in Tables 12.64 and 12.65. The results of the impact analysis represents comparison of long-term changes that would occur between alternatives by 2030. The impact analysis does not represent short-term responses, especially during one to five years, in response to emergency flood or drought conditions.

**Table 12.64 Comparison of Alternatives 1 through 5 to No Action Alternative**

| Alternative | Potential Change | Consideration for Mitigation Measures |
|---|---|---|
| Alternative 1 | No effects on agricultural resources. | None needed |
| Alternative 2 | No effects on agricultural resources. | None needed |
| Alternative 3 | No effects on agricultural resources. | None needed |
| Alternative 4 | No effects on agricultural resources. | None needed |
| Alternative 5 | No effects on agricultural resources. | None needed |

**Table 12.65 Comparison of No Action Alternative and Alternatives 1 through 5 to Second Basis of Comparison**

| Alternative | Potential Change | Consideration for Mitigation Measures |
|---|---|---|
| No Action Alternative | No effects on agricultural resources. | Not considered for this comparison. |
| Alternative 1 | No effects on agricultural resources. | Not considered for this comparison. |
| Alternative 2 | No effects on agricultural resources. | Not considered for this comparison. |
| Alternative 3 | No effects on agricultural resources. | Not considered for this comparison. |
| Alternative 4 | No effects on agricultural resources. | Not considered for this comparison. |
| Alternative 5 | No effects on agricultural resources. | Not considered for this comparison. |

#### *12.4.3.8 Potential Mitigation Measures*

Mitigation measures are presented in this section to avoid, minimize, rectify, reduce, eliminate, or compensate for adverse environmental effects of Alternatives 1 through 5 as compared to the No Action Alternative. Mitigation measures were not included to address adverse impacts under the alternatives as compared to the Second Basis of Comparison because this analysis was included in this EIS for information purposes only.

Changes in CVP and SWP operations under Alternatives 1 through 5 as compared to the No Action Alternative, would not result in changes in agricultural resources. Therefore, there would be no adverse impacts to agricultural resources; and no mitigation measures are required.

### *12.4.3.9 Cumulative Effects Analysis*

As described in Chapter 3, the cumulative effects analysis considers projects, programs, and policies that are not speculative; and are based upon known or reasonably foreseeable long-range plans, regulations, operating agreements, or other information that establishes them as reasonably foreseeable.

The cumulative effects analysis Alternatives 1 through 5 for Agricultural Resources are summarized in Table 12.66.

**Table 12.66 Summary of Cumulative Effects on Agricultural Resources of Alternatives 1 through 5 as Compared to the No Action Alternative**

| Scenarios | Actions | Cumulative Effects of Actions |
|---|---|---|
| Past & Present, and Future Actions included in the No Action Alternative and in All Alternatives in Year 2030 | Consistent with Affected Environment conditions plus:<br>Actions in the 2008 USFWS BO and 2009 NMFS BO that would have occurred without implementation of the BOs, as described in Section 3.3.1.2 (of Chapter 3, Descriptions of Alternatives), including climate change and sea level rise<br>Actions not included in the 2008 USFWS BO and 2009 NMFS BO that would have occurred without implementation of the BOs, as described in Section 3.3.1.3 (of Chapter 3, Descriptions of Alternatives):<br>- Implementation of Federal and state policies and programs, including Clean Water Act (e.g., Total Maximum Daily Loads); Safe Drinking Water Act; Clean Air Act; and flood management programs<br>- General plans for 2030.<br>- Trinity River Restoration Program.<br>- Central Valley Project Improvement Act programs<br>- Iron Mountain Mine Superfund Site<br>- Nimbus Fish Hatchery Fish Passage Project<br>- Folsom Dam Water Control Manual Update<br>- FERC Relicensing for the Middle Fork of the American River Project<br>- Lower Mokelumne River Spawning Habitat Improvement Project<br>- Dutch Slough Tidal Marsh Restoration | <u>These effects would be the same under all alternatives.</u><br>Climate change and sea level rise, development under the general plans, FERC relicensing projects, and some future projects to improve water quality and/or habitat are anticipated to reduce availability of CVP and SWP water supplies as compared to past conditions.<br>Some future water quality and habitat projects could modify surface water conditions; however, water supplies are not anticipated to be affected.<br>Future water supply projects are anticipated to both increase water supply reliability due to reduced surface water supplies and to accommodate planned growth in the general plans. Most of these programs were initiated prior to implementation of the 2008 USFWS BO and 2009 NMFS BO which reduced CVP and SWP water supply reliability.<br>Developments under the general plans and future water supply, water quality improvement, and restoration projects are anticipated to potentially affect agricultural resources. However, development of these future programs would include preparation of environmental documentation that would identify methods to minimize adverse impacts to agricultural resources. |

| Scenarios | Actions | Cumulative Effects of Actions |
|---|---|---|
| | - Suisun Marsh Habitat Management, Preservation, and Restoration Plan Implementation<br>- Tidal Wetland Restoration: Yolo Ranch, Northern Liberty Island Fish Restoration Project, Prospect Island Restoration Project, and Calhoun Cut/Lindsey Slough Tidal Habitat Restoration Project<br>- San Joaquin River Restoration Program<br>- Stockton Deep Water Ship Channel Dissolved Oxygen Project<br>- Grasslands Bypass Project<br>- Central Valley Salinity Alternatives for Long-Term Sustainability (CV-SALTS)<br>- Future water supply projects, including water recycling, desalination, groundwater banks and wellfields, and conveyance facilities (projects with completed environmental documents) | Some of the future actions would reduce the effects of agricultural drainage and/or reduce salinity in the San Joaquin River and the Delta. These programs would result in a beneficial impact to remaining agricultural resources. |
| Future Actions considered as Cumulative Effects Actions with All Alternatives in Year 2030 | Actions as described in Section 3.5 (of Chapter 3, Descriptions of Alternatives):<br>- Bay-Delta Water Quality Control Plan Update<br>- FERC Relicensing Projects<br>- Bay Delta Conservation Plan (including the California WaterFix alternative)<br>- Shasta Lake Water Resources, North-of-the-Delta Offstream Storage, Los Vaqueros Reservoir Expansion Phase 2, and Upper San Joaquin River Basin Storage Investigations<br>- El Dorado Water and Power Authority Supplemental Water Rights Project<br>- Sacramento River Water Reliability Project<br>- Semitropic Water Storage District Delta Wetlands<br>- North Bay Aqueduct Alternative Intake<br>- Irrigated Lands Regulatory Program<br>- San Luis Reservoir Low Point Improvement Project<br>- *Westlands Water District v. United States Settlement*<br>- Future water supply projects, including water recycling, | <u>These effects would be the same under all alternatives.</u><br>Most of the reasonably foreseeable actions are anticipated to reduce water supply impacts due to climate change, sea level rise, increased water allocated to improve habitat conditions, and future growth.<br>Some of the reasonably foreseeable actions related to improved water quality and habitat conditions (e.g., Water Quality Control Plan Update and FERC Relicensing Projects), could in further reductions in CVP and SWP water deliveries.<br>Developments under the future projects are anticipated to potentially affect agricultural resources. However, development of these future programs would include preparation of environmental documentation that would identify methods to minimize adverse impacts to agricultural resources.<br>Some of the reasonably foreseeable actions would reduce the effects of agricultural drainage and/or reduce salinity in the San Joaquin River and the Delta. These programs would result in a |

| Scenarios | Actions | Cumulative Effects of Actions |
|---|---|---|
| | desalination, groundwater banks and wellfields, and conveyance facilities (projects that did not have completed environmental documents during preparation of the EIS) | beneficial impact to agricultural resources. |
| No Action Alternative with Associated Cumulative Effects Actions in Year 2030 | Full implementation of the 2008 USFWS BO and 2009 NMFS BO | Climate change and sea level rise, development under the general plans, FERC relicensing projects, and some future projects to improve water quality and/or habitat are anticipated to reduce availability of CVP and SWP water supplies.<br>Future water supply projects are anticipated to both increase water supply reliability due to reduced surface water supplies and to accommodate planned growth in the general plans.<br>Some of the reasonably foreseeable actions would reduce the effects of agricultural drainage and/or reduce salinity in the San Joaquin River and the Delta. |
| Alternative 1 with Associated Cumulative Effects Actions in Year 2030 | No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant) | Implementation of Alternative 1 with reasonably foreseeable actions would result in similar changes as under the No Action Alternative with the added actions. |
| Alternative 2 with Associated Cumulative Effects Actions in Year 2030 | Full implementation of the 2008 USFWS BO and 2009 NMFS BO CVP and SWP operational actions<br>No implementation of structural improvements or other actions that require further study to develop a more detailed action description. | Implementation of Alternative 2 with reasonably foreseeable actions would result in similar changes as under the No Action Alternative with the added actions. |
| Alternative 3 with Associated Cumulative Effects Actions in Year 2030 | No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant)<br>Slight increase in positive Old and Middle River flows in the winter and spring months | Implementation of Alternative 3 with reasonably foreseeable actions would result in similar changes as under the No Action Alternative with the added actions. |
| Alternative 4 with Associated Cumulative Effects Actions in Year 2030 | No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant) | Implementation of Alternative 4 with reasonably foreseeable actions would result in similar changes as under the No Action Alternative with the added actions. |
| Alternative 5 with Associated Cumulative Effects Actions in Year 20530 | Full implementation of the 2008 USFWS BO and 2009 NMFS BO<br>Positive Old and Middle River flows and increased Delta outflow in spring months | Implementation of Alternative 5 with reasonably foreseeable actions would result in similar changes as under the No Action Alternative with the added actions. |

**Chapter 13**

# Land Use

## 13.1 Introduction

This chapter describes non-agricultural land use in the study area, and potential changes that could occur as a result of implementing the alternatives evaluated in this Environmental Impact Statement (EIS). Implementation of the alternatives could affect municipal and industrial land uses through potential changes in the Central Valley Project (CVP) and State Water Project (SWP) operation.

Changes in agricultural land use and resources are described in Chapter 12, Agricultural Resources. Changes to population are described in Chapter 19, Socioeconomics.

## 13.2 Regulatory Environment and Compliance Requirements

Potential actions that could be implemented under the alternatives evaluated in this EIS could affect land uses served by CVP and SWP water supplies. Actions done on public agency lands, or implemented, funded, or approved by Federal and state agencies would need to be compliant with appropriate Federal and state agency policies and regulations (summarized in Chapter 4, Approach to Environmental Analysis).

## 13.3 Affected Environment

This section describes land use conditions potentially affected by the implementation of the alternatives considered in this EIS. Changes in land uses from changes in CVP and SWP operations may occur in the Trinity River, Central Valley, San Francisco Bay Area, Central Coast, and Southern California regions.

An extensive range of land uses are within this study area. However, direct or indirect land use effects from implementing the alternatives analyzed in this EIS are related to changes in agricultural, municipal, and industrial land uses from the availability and reliability of CVP and SWP water supplies. The following description of the affected environment is presented at the county-level for agricultural and municipal and industrial land uses. More detailed agricultural land use information is presented in Chapter 12, Agricultural Resources.

### 13.3.1 Trinity River Region

The Trinity River Region includes the area in Trinity County along the Trinity River from Trinity Lake to the confluence with the Klamath River; and in Humboldt and Del Norte counties along the Klamath River from the confluence with the Trinity River to the Pacific Ocean. Tribal lands are also included for the entire Trinity River Region.

#### *13.3.1.1 Trinity County*

Trinity County encompasses approximately 3,206 square miles in northwestern California. It is bounded on the north by Siskiyou County, on the east by Shasta and Tehama Counties, on the south by Mendocino County, and on the west by Humboldt County. About 76 percent of the land area is within a national forest (Shasta-Trinity, Six Rivers, and Mendocino) and in four wilderness areas (Yolla Bolly-Middle Eel Reserve, Trinity Alps, Chanchellula, and North Fork). Another 14 percent is zoned for timber use or held in agriculture land conservation contracts (Trinity County 2012).

The headwaters of the Trinity River are in the northeastern part of the County at an elevation of 6,200 feet, in the southern Siskiyou Mountains. Trinity Lake and Lewiston Reservoir are located along the middle reach of the mainstem Trinity River. Downstream of Lewiston Dam, the river flows northwest to join the Klamath River in Humboldt County (Trinity County 2012).

Development of communities is relatively limited in Trinity County because much of the land is within national forests and tribal lands or is characterized by steep slopes. The largest communities in Trinity County include Lewiston, Weaverville, and Hayfork (Trinity County 2012).

Trinity County's primary industries are tourism and timber and is the sixth largest timber producer in the state, with substantial acreage in National Forest and private holdings. There is one operating mill in the County. Recreational opportunities are also important in this area, as described in Chapter 15, Recreation Resources (Trinity County 2012).

The portion of Trinity County in the Trinity River Region that could be affected by changes in CVP and/or SWP operations and evaluated in this EIS includes areas in the vicinity of CVP facilities (Trinity Lake and Lewiston Reservoir) and areas along the Trinity River that use the river.

#### *13.3.1.2 Humboldt County*

Humboldt County encompasses approximately 3,570 square miles in northwestern California. It is bounded on the north by Del Norte County, on the east by Siskiyou and Trinity counties, on the south by Mendocino County, and on the west by the Pacific Ocean. About 25 percent of the land area is within the Six Rivers National Forest, Trinity Alps Wilderness Area, Redwood National and State National Park, national wildlife refuges, or other public land. About 3 percent of the land area is within state park lands. The Yurok and Hoopa tribal lands represent about 5.6 percent of the land within Humboldt County boundaries (Humboldt County 2012).

Most of the population and developed areas are located in western Humboldt County along U.S. Highway 101 (Humboldt County 2012). Incorporated cities and residential lands in unincorporated portions of Humboldt County represent less than 1 percent of the county. Development of communities is relatively limited in Humboldt County because much of the land is within national forests and tribal lands, characterized by steep slopes, or within the coastal zone where new large scale developments are minimized. Timber and agricultural lands are located on over 60 percent of unincorporated areas of Humboldt County.

Humboldt County's primary industries are lumber manufacturing, retail, and services (Humboldt County 2012). Humboldt County provides over 25 percent of the lumber in the state.

The portion of Humboldt County in the Trinity River Region evaluated in this EIS is located along the Trinity and Klamath rivers. Most of this area is located within the Hoopa Valley Indian Reservation and Yurok Indian Reservation. This portion of the county includes the communities of Willow Creek and Orleans within Humboldt County; Hoopa in the Hoopa Valley Indian Reservation; and the communities of Weitchpec, Cappell, Pecwan, and Johnson's in the Yurok Tribe Indian Reservation (Humboldt County 2012).

#### *13.3.1.3 Del Norte County*

Del Norte County encompasses 1,070 square miles in northwestern California. It is bounded on the north by the State of Oregon, on the east by Siskiyou County, on the south by Humboldt County, and on the west by the Pacific Ocean. Del Norte County includes lands within national forests (Six Rivers and Rogue River-Siskiyou), Smith River National Recreation Area, Redwood National and State Park, or other federally owned land. State lands include units of the Redwoods State Park and the Lake Earl Wildlife Area. The Yurok tribal lands are located along the lower Klamath River between the Del Norte and Humboldt county boundaries to the Pacific Ocean (Del Norte County 2003).

Del Norte County's primary industries are retail and services (Del Norte County 2003).

The portion of Del Norte County in the Trinity River Region evaluated in this EIS is located along the lower Klamath River. Most of this area is within the Yurok Indian Reservation. This portion of the County includes the communities of Requa and Klamath in the Yurok Tribe Indian Reservation (Del Norte County 2003).

#### *13.3.1.4 Tribal Lands in Trinity River Region*

The major federally recognized tribes and tribal lands in the Trinity River Region include the tribal lands of the Hoopa Valley Tribe, Yurok Tribe of the Yurok Reservation, Resighini Rancheria, and Karuk Tribe. Aquatic and wildlife resources associated with the Trinity and Klamath rivers and the surrounding lands are very important to these tribes (NCRWQCB et al. 2009; Yurok Tribe 2005; Karuk Tribe 2010).

The Hoopa Valley Indian Reservation includes 93,702.73 acres (Hoopa Valley Tribe 2008). The Trinity River flows through the Hoopa Valley Indian Reservation.

The Yurok Indian Reservation includes about 55,890 acres within Tribal trust, Tribal fee, allotment, Tribal member fee, nonmember fee, Federal, state, and county lands (Yurok Tribe 2012). The Tribe employs over 250 in the government agency, as well as seasonal workers for fisheries, forestry, fire prevention, and other programs.

The Resighini Rancheria includes about 435 acres of land along the south bank of the lower Klamath River and extends from an inland area to the U.S. Highway 101 bridge along the western boundary of the Rancheria (Reclamation 2010). The Rancheria is surrounded by the Yurok Indian Reservation (Reclamation 2010; Resighini Rancheria 2014). The community includes tribal offices, a casino, campground, residences, agricultural lands, and open space.

The Karuk Ancestral Territory is located to the north of the Trinity River in the vicinity of Trinity County and east of the Trinity River in the vicinity of Humboldt County (Karuk Tribe 2010). The western boundary of the Karuk Ancestral Territory is relatively concurrent with the western boundary of the Six Rivers National Forest. Therefore, changes in the Trinity River flow or water quality that could be affected by changes in CVP and/or SWP operations considered in the alternatives in this EIS would not occur within the Karuk Ancestral Territory.

## 13.3.2 Central Valley Region

The Central Valley Region extends from above Shasta Lake to the Tehachapi Mountains, and includes the Sacramento Valley, San Joaquin Valley, Delta, and Suisun Marsh.

### *13.3.2.1 Sacramento Valley*

The Sacramento Valley includes the counties of Shasta, Plumas, Tehama, Glenn, Colusa, Butte, Sutter, Yuba, Nevada, Placer, El Dorado, and Sacramento counties. Yolo and Solano counties are also located within the Sacramento Valley; however, these counties are discussed as part of the Delta and Suisun Marsh subsection because potential changes in land use because of changes in CVP and SWP long-term operations would primarily occur within the Delta and Suisun marsh geography. Other counties in this region are not anticipated to be affected by changes in CVP and SWP operations, and are not discussed here, including: Alpine, Sierra, Lassen, and Amador counties. Tribal lands are also described for the entire Sacramento Valley.

#### 13.3.2.1.1 Shasta County

Shasta County encompasses approximately 3,793 square miles in northern California. It is bounded on the north by Siskiyou County, on the east by Lassen County, on the south by Tehama County, and on the west by Trinity County. Shasta County includes lands within national forests (Shasta-Trinity, Whiskeytown-Shasta-Trinity, and Lassen), Lassen Volcanic National Park, or other federally owned land. State lands include state forest and state parks (Shasta County 2004).

The Shasta County General Plan identifies four major categories of land use: urban, rural, agricultural, and timber (Shasta County 2004). Of Shasta County's 2,416,440 acres, 613,495 acres (25 percent) are designated as timber preserve zones pursuant to California's Forest Taxation Reform Act of 1976 (Shasta County 2004). Approximately 169,127 acres (7 percent), are designated as agricultural preserve lands.

Approximately 1.2 percent of the lands in the County are within incorporated areas (Shasta County 2004). Urban development is concentrated in the southern central portion of the county in the cities of Redding, Anderson, and Shasta Lake (Reclamation 2005a).

The portion of the Central Valley Region, Sacramento Valley in Shasta County that could be affected by changes in CVP and/or SWP operations and evaluated in this EIS includes CVP facilities (Shasta Lake, Keswick Reservoir, and Whiskeytown Lake), areas along the Sacramento River and Clear Creek that use the surface waters (including agricultural lands), and CVP water service areas.

#### 13.3.2.1.2 Plumas County

Plumas County encompasses approximately 2,610 square miles in northern California. It is bounded on the north by Shasta County, on the east by Lassen County, on the west by Tehama and Butte counties, and on the south by Sierra County. Plumas County includes lands within national forests (Plumas, Lassen, Toiyabe, and Tahoe), Lassen Volcanic National Park, or other federally owned land. State lands include Plumas-Eureka State Park (Plumas County 2012).

Prominent landscape features in Plumas County are the Sierra Valley, the Lake Almanor Basin, and the Upper Feather River watershed which includes three SWP lakes (Antelope Lake, Lake Davis, and Frenchman Lake). The largest land uses in the county are agricultural and timber resource lands. Rural and semi-rural development is scattered throughout the County, with most growth concentrated in several designated planning areas. The county’s only incorporated area is the City of Portola.

The most recent Plumas County General Plan was adopted in 1984. The county is in the process of updating its General Plan through 2030 (Plumas County 2012). Approximately 76 percent of the land in Plumas County is National Forest land owned and managed by the U.S. Forest Service. The U.S. Forest Service prepared the Plumas National Forest Land and Resource Management Plan in 1988, to guide management and land use planning decisions in the forest. The National Forest Land and Resource Management Plan provides a designation for areas based on established priorities for various resources, including wilderness, recreation, wildlife, timber, and visual resources (Plumas County 2012).

The portion of the Central Valley Region, Sacramento Valley in Plumas County that could be affected by changes in CVP and/or SWP operations and evaluated in this EIS is located at the SWP Antelope Lake, Lake Davis, and Frenchman Lake and along the Feather River downstream of Frenchman Lake.

#### 13.3.2.1.3 Tehama County

Tehama County encompasses approximately 2,951 square miles in northern California. It is bounded on the north by Shasta County, on the east by Plumas County, on the west by Trinity and Mendocino counties, and on the south by Glenn and Butte counties. Tehama County includes lands within national forests (Lassen, Mendocino, and Shasta-Trinity), Lassen Volcanic National Park, or other federally owned land (Tehama County 2008).

Tehama County is predominantly rural, with populations primarily concentrated in the incorporated cities of Corning, Red Bluff, and Tehama or along the major transportation corridors. The incorporated areas include less than 1 percent of the total land area in the county. The primary incorporated and unincorporated developed areas in the county are adjacent to major transportation centers, with most adjacent to Interstate 5 and State Route 99. Clustered commercial land uses are located primarily along the major state and county roadways, most of which are near Red Bluff, Corning, and the unincorporated community of Los Molinos. Residential land uses in the developed portions of the county tend to be located behind or beyond the commercial and service uses adjacent to the major street network (Tehama County 2008).

Ranches, timber company holdings, and government land dominate the county. Much of the land use is resource-based, such as cropland, rangeland, pasture land, and timber land (Tehama County 2008). The majority of land within the CVP water service area in Tehama County is designated for agricultural use (Tehama County 2008; Reclamation 2005b).

The portion of the Central Valley Region, Sacramento Valley in Tehama County that could be affected by changes in CVP and/or SWP operations and evaluated in this EIS includes CVP facilities, areas along the Sacramento River that use the surface waters (including agricultural lands), and CVP water service areas.

#### 13.3.2.1.4 Glenn County

Glenn County encompasses 1,317 square miles in northern California. It is bounded on the north by Tehama County, on the east by Butte County, on the west by Lake and Mendocino counties, and on the south by Colusa County. Glenn County includes lands within the Mendocino National Forest, Sacramento National Wildlife Refuge, and other federally owned land (Glenn County 1993).

Approximately two-thirds (583,974 acres) are croplands and pasture. The two incorporated towns in the county are Willows, the County seat, and Orland (Reclamation 2004). Intensive agriculture provides a major segment of the county’s economic base (Glenn County 1993; Reclamation 2005b).The portion of the Central Valley Region, Sacramento Valley in Glenn County that could be affected by changes in CVP and/or SWP operations and evaluated in this EIS includes wildlife refuges (described in Chapter 10, Terrestrial Biological Resources), and CVP facilities, areas along the Sacramento River that use the surface waters (including agricultural lands), and CVP water service areas.

#### 13.3.2.1.5 Colusa County

Colusa County encompasses approximately 1,132 square miles in northern California. It is bounded on the north by Glenn County, on the east by Butte and Sutter counties, on the west by Lake County, and on the south by Yolo County. Colusa County includes lands within the Mendocino National Forest, Sacramento National Wildlife Refuge complex (Colusa, Delevan, and Sacramento national wildlife refuges); East Park Reservoir; and other federally owned land (Colusa County 2011). State lands in Colusa County include Willow Creek-Lurline, North Central Valley, Colusa Bypass, and Sacramento River wildlife management areas.

Existing land uses in Colusa County are predominantly agricultural. Approximately 76 percent of the county's total land area is cropland or undeveloped rangeland. Twelve percent is national forest and national wildlife refuge land. Less than 1 percent is covered by urban and rural communities. Colusa and Williams are the only incorporated cities in the county and they encompass about 2,574 acres (Colusa County 2011). Arbuckle is the largest unincorporated town of the unincorporated communities, which includes Arbuckle, College City, Century Ranch, Grimes, Maxwell, Princeton, and Stonyford. Together, these established incorporated and unincorporated towns cover a total area in "urban" uses of about 5,451 acres (Colusa County 2011). The majority of land within the CVP water service area in Colusa County is designated for agricultural use (Colusa County 2011; Reclamation 2005b).

The portion of the Central Valley Region, Sacramento Valley in Colusa County that could be affected by changes in CVP and/or SWP operations and evaluated in this EIS includes wildlife refuges (described in Chapter 10, Terrestrial Biological Resources) and CVP facilities, areas along the Sacramento River that use the surface waters (including agricultural lands), and CVP water service areas.

#### 13.3.2.1.6 Butte County

Butte County encompasses 1,680 square miles in northern California. It is bounded on the north by Tehama County, on the east by Plumas County, on the west by Glenn and Colusa counties, and on the south by Sutter and Yuba counties. Butte County includes lands within national forests (Plumas and Lassen), Sacramento National Wildlife Refuge (Butte County 2010). State lands in Butte County include Big Chico Creek and Butte Creek ecological preserves; Table Mountain Reserve; Gray Lodge, Sacramento River, and Oroville wildlife areas; SWP facilities at Lake Oroville and Thermalito Reservoir; and more than 750 miles of rivers and streams.

The county comprises three general topographical areas: valley region, foothills east of the valley, and mountain region east of the foothills. Each of these regions contains distinct environments with unique wildlife and natural resources.

The U.S. Forest Service manages 135,427 acres (12 percent) within Butte County, including portions of the Plumas and Lassen National Forests. The Bureau of Land Management owns and manages 16,832 acres (1.5 percent) in the county

(Butte County 2010). Agriculture is the dominant land use within unincorporated Butte County, accounting for approximately 599,040 acres (60 percent of the county area) (Butte County 2010).

Butte County contains five incorporated municipalities: Biggs, Chico, Gridley, Oroville, and Paradise. Each has a general plan that guides development within its limits and larger planning area (Butte County 2010).

The portion of the Central Valley Region, Sacramento Valley, in Butte County that could be affected by changes in CVP and/or SWP operations and evaluated in this EIS includes wildlife refuges (described in Chapter 10, Terrestrial Biological Resources), SWP facilities (Lake Oroville and Thermalito Afterbay), CVP facilities, areas along the Feather River that use the surface waters (including agricultural lands), and CVP and SWP water service areas.

#### 13.3.2.1.7 Sutter County

Sutter County encompasses approximately 607 square miles in northern California. It is bounded on the north by Butte County, on the east by Yuba and Placer counties, on the west by Colusa and Yolo counties, and on the south by Sacramento County. Sutter County includes lands within the Sutter National Wildlife Refuge. State lands in Sutter County include Butte Slough, Feather River, Gray Lodge, Sutter Bypass, and Butte Sink wildlife management areas; and Sutter Buttes State Park (Sutter County 2010).

Sutter County's General Plan was updated in 2011. Approximately 98 percent of the land in the County is unincorporated, and approximately 98 percent of the unincorporated land is zoned for agricultural use (Reclamation 2004). The two incorporated cities within the county, Yuba City and Live Oak, encompass approximately 10,600 acres.

Existing land use in Sutter County is rural and dominated by agricultural areas. The county has significant natural and recreational resources, and a relatively low population density. Existing land uses in Yuba City and Live Oak contain the bulk of the county's urban land uses, such as residences, commercial and industrial uses, parks, and public facilities (Sutter County 2010). The county includes several incorporated rural communities: Meridian, Sutter, Robbins, Rio Oso, Trowbridge, Nicolaus, East Nicolaus, and Pleasant Grove (Sutter County 2010).

The portion of the Central Valley Region, Sacramento Valley in Sutter County that could be affected by changes in CVP and/or SWP operations and evaluated in this EIS includes wildlife refuges (described in Chapter 10, Terrestrial Biological Resources), CVP facilities, areas along the Sacramento River that use the surface waters (including agricultural lands), and CVP and SWP water service areas.

#### 13.3.2.1.8 Yuba County

Yuba County encompasses approximately 634 acres in northern California. It is bounded on the north by Butte County, on the east by Sierra and Nevada counties, on the west by Sutter County, and on the south by Placer County. Federally owned lands in Yuba County include Tahoe and Plumas National Forests, and the 22,944-acre Beale Air Force Base (Yuba County 2011). The Department of Fish and Wildlife administers the state Spenceville Wildlife Area.

Yuba County is predominantly rural. Over 189,500 acres (46 percent of the county), are designated for agricultural land uses. Most of the population lives in the two incorporated cities in the county (Marysville and Wheatland); and the major unincorporated communities including Brown's Valley, Brownsville, Camptonville, Dobbins, Linda/Olivehurst, Log Cabin, Loma Rica, Oregon House, Rackerby, and River Highlands (Yuba County 2011).

The portion of the Central Valley Region, Sacramento Valley in Yuba County that could be affected by changes evaluated in this EIS includes areas within Yuba County Water Agency facilities that provide water for environmental and water supply purposes within the Central Valley.

#### 13.3.2.1.9 Nevada County

Nevada County encompasses approximately 634,880 acres in northern California. It is bounded on the north by Sierra County, on the northwest by Yuba County, on and on the south by Placer County. Federally owned lands in Nevada County include 169,686 acres in the Tahoe National Forest; 2,574 acres in the Toiyabe National Forest; and approximately 11,000 acres administered by the Bureau of Land Management (Nevada County 1995). The State Lands Commission manages approximately 4,600 acres; State Parks administers 6,300 acres at several locations, including Malakoff Diggins State Historical Park and Empire Mine State Park; and the Department of Fish and Wildlife administers approximately 11,000 acres at the Spenceville Wildlife Management and Recreation Area.

Nevada County is predominantly rural (Nevada County 2012). Approximately 91 percent of the county is used for agriculture, timber, or open space. Most of the population lives in the three incorporated cities in the county (Grass Valley, Nevada City, and Truckee).

#### 13.3.2.1.10 Placer County

Placer County encompasses approximately 1,506 square miles in northern California. It is bounded on the north by Nevada County, on the east by the California-Nevada boundary, on the west by Yuba and Sutter counties, and on the south by Sacramento and El Dorado counties. Placer County includes lands within the El Dorado and Tahoe National Forests and other federally owned land (Placer County 2011).

Placer County is predominantly rural. Most of the population lives in the area along Interstate 80 from the City of Auburn to the Sutter and Sacramento county boundaries. Incorporated cities and towns include Roseville, Rocklin, Lincoln, Colfax, Loomis, and Auburn (Placer County 2011; Reclamation 2005c; SACOG 2007). Residential land uses range from rural residential areas to medium and high-density dwelling units in urbanized areas. Commercial land uses are primarily located in the urbanized portions of the county; although a large concentration of commercial development occurs outside existing urban areas along Interstate 80. Non-urban land uses include agriculture, resource extraction (timber and mining), and public lands and open space uses. The largest amount of public lands within Placer County is located in the eastern half of the county, and is under the jurisdiction of the Bureau of Land Management, U.S. Forest Service, or the Bureau of Reclamation. The CVP water service area within Placer County primarily includes the communities and agricultural areas in the western portion of the county. The portion of the Central Valley Region, Sacramento Valley in Placer County that could be affected by changes in CVP and/or SWP operations and evaluated in this EIS includes CVP water facilities (Folsom Lake), areas along the American River that use the surface waters (including agricultural lands), and CVP water service areas.

#### 13.3.2.1.11 El Dorado County

El Dorado County encompasses approximately 1,790 square miles in northern California along the American River. It is bounded on the north by Placer County, on the east by California-Nevada boundaries, on the west by Sacramento County, and on the south by Amador and Alpine counties. El Dorado County includes about 521,210 acres (45.5 percent of the total county), under Federal ownership or trust, including lands within the El Dorado and Tahoe national forests. About 9,751 acres (8.5 percent of the county), is under the State jurisdiction (El Dorado County 2003).

The county includes two specific regions: the Lake Tahoe Basin and the western slopes of the Sierra Nevada (El Dorado County 2003). The CVP water service area provides water to a large portion of the communities and some agricultural areas along the western slope. El Dorado County includes two incorporated cities, Placerville and South Lake Tahoe, which cover 621 acres of land. Other major communities include El Dorado Hills, Cameron Park, Shingle Springs, Rescue, Diamond Springs, Camino, Coloma and Gold Hill, Cool and Pilot Hill, Georgetown and Garden Valley, Pollock Pines, Pleasant Valley, Latrobe, Somerset, and Mosquito. The rural land uses in the county include over 259,000 acres of private production forests, 153,472 acres of agricultural lands, and 35,282 acres within the waters of Folsom Lake and Lake Tahoe. The county's two largest crops are wine grapes and apples.

The portion of the Central Valley Region, Sacramento Valley in El Dorado County that could be affected by changes in CVP and/or SWP operations and evaluated in this EIS includes CVP water facilities (Folsom Lake), areas along the American River that use the surface waters, and CVP water service areas.

#### 13.3.2.1.12 Sacramento County

Sacramento County encompasses approximately 1,769 square miles in northern California. It is bounded on the north by Sutter and Placer counties, on the east by El Dorado and Amador counties, on the south by Contra Costa and San Joaquin counties, and on the west by Yolo and Solano counties. Sacramento County includes federally owned lands within Folsom Lake and Lake Natoma.

Residential areas in Sacramento County primarily occur in northern and central Sacramento County. Sacramento County includes areas within the Delta, including the southwestern portion of the City of Sacramento, City of Isleton and the communities of Locke, Ryde, Courtland, Freeport, Hood, and Walnut Grove; and areas located to the east of the Delta (Sacramento County 2011). Sacramento County has seven incorporated cities located in about 56 percent of the county: Sacramento, Elk Grove, Citrus Heights, Folsom, Galt, Isleton, and Rancho Cordova. The County includes several unincorporated communities including Antelope, Arden-Arcade, Carmichael, Cordova, Elverta, Foothill Farms, Fair Oaks, Herold, Natomas, North Highlands, Orangevale, Rancho Murieta, Rio Linda, Sloughhouse, and Wilton.

The leading agricultural crops in Sacramento County include dairy, wine grapes, Bartlett pears, field corn, and turkeys (Sacramento County 2010). Agricultural acreage has declined as urban development has continued. Between 1989 and 2004, the portion of the county designated as agriculture declined from 40 percent to 34 percent. The southeastern portion of the county remains primarily rural with smaller communities, such as Herald (Sacramento County 2011).

The portion of the Central Valley Region, Delta, in Sacramento County that could be affected by changes in CVP and/or SWP operations and evaluated in this EIS includes CVP facilities (Folsom Lake and Lake Natoma), areas along the American and Sacramento rivers and Delta channels that use the surface waters (including agricultural lands), and CVP water service areas.

#### 13.3.2.1.13 Tribal Lands in Sacramento Valley

This section summarizes the tribal lands that could be affected by changes in CVP and/or SWP operations and that are located within the county boundaries.

*Tribal Lands within the Boundaries of Shasta County*

Major federally recognized tribes and tribal lands within the boundaries of Shasta County include the Pit River Tribe and the Redding Rancheria, which is a federal reservation of Wintun, Pit River, and Yana Indians near Redding (SDSU 2013).

*Tribal Lands within the Boundaries of Tehama County*

There are approximately 2,000 acres within the total acreage of Tehama County within tribal trust, including land near Corning owned by the Paskenta Band of Nomlaki Indians of California (Paskenta 2014).

*Tribal Lands within the Boundaries of Glenn County*

Major federally recognized tribes and tribal lands within the boundaries of Glenn County include the Grindstone Indian Reservation near Elk Creek at the Grindstone Indian Rancheria of Wintun-Wailaki Indians of California, and lands of the Paskenta Band of Nomlaki Indians of California.

*Tribal Lands within the Boundaries of Colusa County*

Major federally recognized tribes and tribal lands within the boundaries of Colusa County include the Cachil Dehe Band of Wintun Indians of the Colusa Indian

Community of the Colusa Rancheria, and the Cortina Indian Rancheria of Wintun Indians of California (Colusa County 2011).

*Tribal Lands within the Boundaries of Butte County*

Major federally recognized tribes and tribal lands within the boundaries of Butte County include the Tyme Maidu of Berry-Creek Rancheria on approximately 90 acres, and the Concow Maidu of Mooretown Rancheria on approximately 300 acres (Butte County 2010).

*Tribal Lands within the Boundaries of Nevada County*

Major federally recognized tribes and tribal lands within the boundaries of Nevada County include tribal trust lands of the Shingle Springs Band of Miwok Indians.

*Tribal Lands within the Boundaries of Placer County*

Major federally recognized tribes and tribal lands within the boundaries of Placer County include tribal trust lands of the United Auburn Indian Community of the Auburn Rancheria of California.

*Tribal Lands within the Boundaries of El Dorado County*

Major federally recognized tribes and tribal lands within the boundaries of El Dorado County include the Shingle Springs Band of Miwok Indians.

*Tribal Lands within the Boundaries of Sacramento County*

Major federally recognized tribes and tribal lands within the boundaries of Sacramento County include lands of the Wilton Miwok Indians of the Wilton Rancheria near Elk Grove (SACOG 2007).

#### *13.3.2.2 San Joaquin Valley*

The San Joaquin Valley includes Stanislaus, Merced, Madera, San Joaquin, Fresno, Kings, Tulare, and Kern counties. Other counties in this region are not anticipated to be affected by changes in CVP and SWP operations, and are not discussed here. They include Calaveras, Mariposa, and Tuolumne counties. Tribal lands are also described for the entire San Joaquin Valley.

##### 13.3.2.2.1 Stanislaus County

Stanislaus County encompasses approximately 1,521 square miles in central California. It is bounded on the north by San Joaquin County, on the east by Calaveras and Tuolumne counties, on the west by Santa Clara County, and on the south by Merced County. Stanislaus County includes lands within the San Joaquin River National Wildlife Refuge (Stanislaus Council of Governments 2007).

Land use in the county is primarily agricultural, with nearly 80 percent of the land zoned for general agriculture or in agricultural production (Stanislaus Council of Governments 2007). Over the past 40 years, some portions of the county have been changing from a rural agricultural region to semi-urbanized, especially along major highways and freeways. There are nine incorporated cities in the county, including Ceres, Hughson, Modesto, Newman, Oakdale, Patterson, Riverbank, Turlock, and Waterford. Stanislaus County has adopted community plans for most of its unincorporated towns, including Crows Landing, Del Rio, Denair, Hickman, Keyes, Knights Ferry, La Grange, Westley, and Salida (Stanislaus County 2010, 2012).

The portion of the Central Valley Region, San Joaquin Valley, in Stanislaus County that could be affected by changes in CVP and/or SWP operations and evaluated in this EIS includes wildlife refuges (described in Chapter 10, Terrestrial Biological Resources), CVP water facilities (New Melones Reservoir, Delta-Mendota Canal, and San Luis Canal/California Aqueduct), areas along the Stanislaus and San Joaquin rivers that use the surface waters (including agricultural lands), and CVP water service areas.

**13.3.2.2.2 Merced County**

Merced County encompasses approximately 1,977 square miles in central California. It is bounded on the north by Stanislaus County, on the east by Mariposa County, on the south by Fresno and Madera counties, and on the west by Santa Clara and San Benito counties. Merced County includes federally owned lands within the San Luis National Wildlife Refuge (Merced County 2013). State lands within the county include San Luis Reservoir State Recreation Area; Great Valley Grasslands State Park; and the Los Banos, North Grasslands, and Volta wildlife areas.

Merced County includes the six incorporated cities of Atwater, Dos Palos, Gustine, Livingston, Los Banos, and Merced. The major unincorporated communities include Delhi, Fox Hills, Franklin, Hilmar, LeGrand, Planada, Santa Nella, Laguna San Luis, and Winton (Merced County 2013). Unincorporated land within the county includes approximately 1.2 million acres (98.1 percent of the land in the county). Agriculture is the primary land use, totaling just over 1 million acres (81.2 percent). Public and quasi-public land is the next largest use with 131,582 acres or 10.6 percent of the unincorporated County. Commercial land uses represent 3,025 acres (0.2 percent), industrial uses represent 2,488 acres (0.2 percent), and mining represents 3,375 acres (0.3 percent). Incorporated cities account for 24,138 acres (1.9 percent) (Merced County 2012a, 2013). The Merced County Local Agency Formation Commission policies discourage annexation of prime agricultural land when significant areas of non-prime agricultural land are already available. The policies also encourage development of vacant areas in cities before the annexation and development of outlying areas. Local Agency Formation Commission policies encourage city annexations that reflect a planned, logical, and orderly progression of urban expansion and promote efficient delivery of urban services (Merced County 2012b).

The portion of the Central Valley Region, San Joaquin Valley in Merced County that could be affected by changes in CVP and/or SWP operations and evaluated in this EIS includes wildlife refuges (described in Chapter 10, Terrestrial Biological Resources), CVP and SWP water facilities (San Luis Reservoir, Delta-Mendota Canal, and San Luis Canal/California Aqueduct), areas along the San Joaquin

River that use the surface waters (including agricultural lands), and CVP water service areas.

#### 13.3.2.2.3 Madera County

Madera County encompasses approximately 2,147 square miles in central California. It is bounded on the north by Merced and Mariposa counties, on the east by Mono County, and on the south and west by Fresno County. Madera County includes lands within the Sierra and Inyo national forests (Madera County 1995). State lands within the county include the Millerton Lake State Recreation Area.

Land elevations in Madera County range from 180 feet to over 13,000 feet above mean sea level. Madera County can be divided generally into three regions – the San Joaquin Valley in the west, the foothills between the Madera Canal and the 3,500-foot elevation contour, and the mountains from the 3,500-foot contour to the crest of the Sierra Nevada. The County has two incorporated cities, Madera and Chowchilla (Madera County 1995). Major unincorporated communities in the county include North Fork, South Fork, O'Neals, Oakhurst, Coarsegold, Gunner Ranch, and Rio Mesa.

The portion of the Central Valley Region, San Joaquin Valley, in Madera County that could be affected by changes in CVP and/or SWP operations and evaluated in this EIS includes CVP water facilities (Millerton Lake and the Madera Canal), areas along the San Joaquin River that use the surface waters (including agricultural lands), and CVP water service areas.

#### 13.3.2.2.4 San Joaquin County

San Joaquin County encompasses approximately 1,426 square miles in central California. It is bounded on the north by Sacramento County, on the east by Calaveras and Amador counties, on the south by Stanislaus County, and on the west by Contra Costa and Alameda counties. San Joaquin County includes about 6,000 acres of federally owned lands (San Joaquin County 2009).

San Joaquin County is currently in the process of updating its General Plan. Most of the county's land is in agricultural production. Agriculture, the predominant land use, covers 686,109 acres (75 percent) of the county. Residential land is the second largest use in the unincorporated lands, encompassing 40,410 acres (4.4 percent of the county). Residential development in the county is concentrated in existing cities and in adjacent unincorporated communities. San Joaquin County has seven incorporated cities: Stockton, Tracy, Manteca, Escalon, Ripon, Lodi, and Lathrop. Stockton and Tracy are the largest cities in the county. The major unincorporated areas in the county include French Camp, Linden, Lockeford, Morada, Mountain House, New Jerusalem, Thornton, and Woodbridge (San Joaquin County 2009). The incorporated cities account for 90,191 acres (approximately 10 percent of the county).

The portion of the Central Valley Region, Delta in San Joaquin County that could be affected by changes in CVP and/or SWP operations and evaluated in this EIS includes CVP and SWP facilities (including facilities associated with Rock

Slough Pumping Plant, Jones Pumping Plant, Clifton Court, and Banks Pumping Plant), areas along the Delta channels that use the surface waters (including agricultural lands), and CVP water service areas.

#### 13.3.2.2.5 Fresno County

Fresno County encompasses approximately 6,000 square miles in central California. It is bounded on the north by Merced and Madera counties, on the east by Mono and Inyo counties, on the south by Kings and Tulare counties, and on the west by San Benito and Monterey counties. Fresno County includes lands within Millerton Lake, Pine Flat Lake, the Sierra and Sequoia national forests, Sequoia National Monument, and Kings Canyon National Park (Fresno County 2000). State lands within the county include the Millerton Lake State Recreation Area, San Joaquin River Parkway, and Mendota Wildlife Area.

Fresno County is California's sixth-largest county. Agricultural land uses cover over 48 percent of the county, and resource conservation lands (e.g., forests, parks, and timber preserves) cover approximately 45 percent of the county. The 15 incorporated cities and unincorporated communities cover approximately 5 percent of the county (Fresno County 2000). Development constraints within the county are primarily caused by lack of funding for infrastructure improvement, availability of water supplies, air quality regulations, and physical limitations, especially in the mountains and eastern foothills. The incorporated communities include Clovis, Coalinga, Firebaugh, Fowler, Fresno, Huron, Kerman, Kingsburg, Mendota, Orange Cove, Parlier-West Parlier, Reedley, Sanger, San Joaquin, and Selma (Fresno County 2000). Major unincorporated communities include Biola, Caruthers, Del Rey, Friant, Lanare, Laton, Riverdale, Shaver Lake, and Tranquility.

The portion of the Central Valley Region, San Joaquin Valley in Fresno County that could be affected by changes in CVP and/or SWP operations and evaluated in this EIS includes CVP water facilities (Millerton Lake and the Friant-Kern Canal), areas along the San Joaquin River that use the surface waters, and CVP water service areas (including agricultural lands), and CVP water service areas.

#### 13.3.2.2.6 Kings County

Kings County encompasses approximately 1,280 square miles in south central California. It is bounded on the north by Fresno County, on the east by Tulare County, on the south by Kern County, and on the west by Monterey County. Kings County includes lands within Naval Air Station Lemoore (Kings County 2009).

Land use is predominantly agricultural, with more than 90 percent of the county designated for agricultural uses. Incorporated cities in Kings County include Avenal, Corcoran, Hanford, and Lemoore. Residential land uses in unincorporated areas and special districts cover less than 1 percent of the county's total acreage including for the communities of Armona, Home Garden, Kettleman City, and Stratford (Kings County 2009).

The portion of the Central Valley Region, San Joaquin Valley, in Kings County that could be affected by changes in CVP and/or SWP operations and evaluated in this EIS includes CVP and SWP water service areas.

#### 13.3.2.2.7 Tulare County

Tulare County encompasses approximately 4,840 square miles in south central California. It is bounded on the north by Fresno County, on the east by Inyo County, on the south by Kern County, and on the west by Kings County. Tulare County includes federally owned lands within the Sequoia National Forest, Sequoia and Kings Canyon National Parks, Sequoia National Monument, several wilderness areas, Lake Kaweah, Lake Success, and Pixley National Wildlife Refuge (Tulare County 2010).

Agricultural land uses cover more than 2,150 square miles (approximately 44 percent) of the county. Lands classified as open space (i.e., national forests, monuments, and parks; wilderness areas; and County parks) make up 25 percent of the land use in the county. Less than 3 percent of the county lands are in the incorporated cities of Dinuba, Exeter, Farmersville, Lindsay, Porterville, Tulare, Visalia, and Woodlake (Tulare County 2010). Less than 2 percent of the county is designated for unincorporated residential areas, including the major communities of Alpaugh, Cutler, Ducor, Earlimart, East Oros, Goshen, Ivanhoe, Lemoncove, London, Oros, Pixley, Plainview, Poplar-Cotton Center, Richgrove, Springville, Strathmore, Terra Bella, Three Rivers, Tipton, Traver, and Woodville.

The portion of the Central Valley Region, San Joaquin Valley, in Tulare County that could be affected by changes in CVP and/or SWP operations and evaluated in this EIS includes CVP water service areas.

#### 13.3.2.2.8 Kern County

Kern County encompasses approximately 8,202 square miles in south central California. It is bounded on the north by Kings, Tulare, and Inyo counties; on the east by San Bernardino County, on the south by Ventura and Los Angeles counties; and on the west by San Luis Obispo County. Kern County includes lands within the Sequoia National Forest, Kern and Bitter Creek national wildlife refuges, Lake Isabella, China Lake Naval Air Weapons Station, and Edwards Air Force Base (Kern County 2004). State lands within the county include the Tule Elk State Reserve.

The county's geography includes mountainous regions, agricultural lands, and deserts. There are 11 incorporated cities in the county, including Arvin, Bakersfield, California City, Delano, Maricopa, McFarland, Ridgecrest, Shafter, Taft, Tehachapi, and Wasco (Kern County 2009). The major unincorporated communities include Kernville, Lake Isabella, Inyokern, Mojave, Boron, Rosamond, Golden Hills, Stallion Springs, and Buttonwillow. Agricultural land uses are designated for approximately 85 percent of the unincorporated lands that are under the jurisdiction of the county (not including lands under the jurisdiction of the Federal, state, tribes, or incorporated cities). Less than 6 percent of the unincorporated lands under county jurisdiction are designated for residential uses.

The portion of the Central Valley Region, San Joaquin Valley, in Kern County that could be affected by changes in CVP and/or SWP operations and evaluated in this EIS includes CVP and SWP water service areas.

##### 13.3.2.2.9 Tribal Lands in San Joaquin Valley

This section summarizes the tribal lands that could be affected by changes in CVP and/or SWP operations and that are located within the county boundaries described above.

*Tribal Lands within the Boundaries of Madera County*

Major federally recognized tribes and tribal lands within the boundaries of Madera County include the Picayune Rancheria of the Chuckchansi Indians of California near the community of Coarsegold and the Northfork Rancheria of the Mono Indians of California near Northfork (SDSU 2013).

*Tribal Lands within the Boundaries of Fresno County*

Major federally recognized tribes and tribal lands within the boundaries of Fresno County include the lands of the Big Sandy Rancheria of the Western Mono Indians of California and Table Mountain Rancheria of California.

*Tribal Lands within the Boundaries of Kings County*

Major federally recognized tribes and tribal lands within the boundaries of Kings County includes the lands of the Santa Rosa Indian Community of Santa Rosa Rancheria near the town of Lemoore (SDSU 2013).

*Tribal Lands within the Boundaries of Tulare County*

Major federally recognized tribes and tribal lands within the boundaries of Tulare County includes the Tule River Indian Tribe of the Tule River Reservation of the Yokut Indians about 20 miles east of Porterville and covers 55,356 acres (SDSU 2013).

#### *13.3.2.3 Delta and Suisun Marsh*

The Delta and Suisun Marsh includes Sacramento, Yolo, Solano, San Joaquin, and Contra Costa counties. Sacramento County is discussed in the Sacramento Valley subsection because more of the land that could be affected by changes in CVP and SWP long-term operations is located within the Sacramento Valley than in the Delta and Suisun Marsh geographical areas. San Joaquin County is discussed in the San Joaquin Valley subsection because more of the land that could be affected by changes in CVP and SWP long-term operations is located within the San Joaquin Valley than in the Delta and Suisun Marsh geographical areas. Contra Costa County is discussed as part of the San Francisco Bay Region because more of the land that could be affected by changes in CVP and SWP long-term operations is located within the San Francisco Bay Region than in the Delta and Suisun Marsh geographical areas.

#### 13.3.2.3.1 Yolo County

Yolo County encompasses approximately 1,021 square miles in northern California. It is bounded on the north by Colusa County, on the east by Sutter and Sacramento counties, on the south by Solano County, and on the west by Lake and Napa counties. Yolo County includes federally owned lands in the Yolo Bypass and Cache Creek areas and state lands within the Yolo Bypass.

Residential areas in Yolo County primarily occur in the county's four incorporated cities (Davis, West Sacramento, Winters, and Woodland) that comprise approximately 32,325 acres (5 percent) of county lands (Yolo County 2009). Yolo County includes areas within the Delta, including the City of West Sacramento and the community of Clarksburg. The unincorporated portion of the county encompasses 35 community areas, including Capay, Clarksburg, Dunnigan, Esparto, Guinda, Knights Landing, Madison, Monument Hills, Rumsey, Yolo, and Zamora.

Yolo County adopted its 2030 General Plan in 2011. The general plan designates more than 92 percent of the County area for agricultural and open space uses. The major crops are tomatoes, alfalfa, wine grapes, rice, seed crops, almonds, organic production, walnuts, cattle, and wheat (Yolo County 2009).

The 59,000-acre Yolo Bypass is primarily located within Yolo County and includes a portion of the Sacramento River Flood Control Project, as described in Chapter 5, Surface Water Resources and Water Supplies (CALFED et al. 2001). The upper section of the Yolo Bypass is defined as the area between Fremont Weir and Interstate 80 and is located within Yolo County. The lower section is defined as the area between Interstate 80 and the southern boundary of Egbert Tract at the Sacramento River. The portion of the southern area located to the north of the upper Holland Tract and upper Liberty Island is within Yolo County. In the northern area, agricultural crops include rice, corn, and safflower with melons and tomatoes planted in years when the bypass is not inundated with flood waters. The southern bypass crops include corn, milo, safflower, beans, and sudan grass. Approximately 16,770 acres in the southern Yolo Bypass is within the Yolo Bypass Wildlife Area (Yolo County 2009).

The portion of the Central Valley Region, Delta in Yolo County that could be affected by changes in CVP and/or SWP operations and evaluated in this EIS includes areas in the Yolo Bypass and along the Delta channels that use the surface waters (including agricultural lands), and CVP water service areas.

#### 13.3.2.3.2 Solano County

Solano County encompasses approximately 910 square miles in northern California. It is bounded on the north by Yolo County, on the east by Sutter and Sacramento counties, on the south by Contra Costa County, and on the west by Napa County. Solano County includes federally owned lands within Travis Air Force Base (Solano County 2008). State lands include areas within Suisun Marsh and the Cache Slough area of Yolo Bypass.

Solano County's General Plan was adopted in 2008. Approximately 81,678 acres of the county (14 percent of the total land area), lies within seven incorporated cities: Benicia, Dixon, Fairfield, Rio Vista, Suisun City, Vacaville, and Vallejo. Urban development is generally concentrated within the incorporated cities or surrounding suburban communities. Travis Air Force Base is located on approximately 7,100 acres (1 percent of the land within the county). In 2006, agriculture accounted for 56.5 percent of the total land use in Solano County (Solano County 2008). The southern section of the Yolo Bypass, as described under the Yolo County subsection, is located within Solano County.

The portion of the Central Valley Region, Delta in Solano County that could be affected by changes in CVP and/or SWP operations and evaluated in this EIS includes SWP facilities (North Bay Aqueduct intakes at Barker Slough), areas in the Yolo Bypass and along the Delta channels that use the surface waters (including agricultural lands), and CVP and SWP water service areas.

#### 13.3.2.3.3 Tribal Lands in Delta and Suisun Marsh

This section summarizes the tribal lands that could be affected by changes in CVP and/or SWP operations and that are located within the county boundaries described above.

*Tribal Lands within the Boundaries of Yolo County*

Major federally recognized tribes and tribal lands within the boundaries of Yolo County include lands of the Yocha Dehe Wintun Nation (previously called the Rumsey Indian Rancheria of Wintun Indians of California) (Yolo County 2009).

### 13.3.3 San Francisco Bay Area Region

The San Francisco Bay Area Region includes portions of Napa, Contra Costa, Alameda, Santa Clara, and San Benito counties that are within the CVP and SWP service areas.

#### 13.3.3.1.1 Napa County

Napa County encompasses approximately 793 square miles in northern California. It is bounded on the north by Lake County, on the east by Yolo County, on the south by Solano County, and on the west by Sonoma County. Napa County includes 62,865 acres of federally owned and 40,307 acres of state-owned lands throughout the county, including approximately 28,000 acres related to Lake Berryessa and the State Cedar Rough Wilderness and Wildlife Area (Napa County 2007).

Approximately 479,000 acres (95 percent) of the county, are unincorporated. The five incorporated cities include American Canyon, Calistoga, Napa, and St. Helena, and the town of Yountville. Land use in the county is predominantly agricultural (Napa County 2007, 2008).

The portion of the San Francisco Bay Area Region in Napa County that could be affected by changes in CVP and/or SWP operations and evaluated in this EIS includes SWP water service areas.

#### 13.3.3.1.2 Contra Costa County

Contra Costa County encompasses approximately 805 square miles in northern California. It is bounded on the north by Solano and Sacramento counties, on the east by San Joaquin County, on the south by Alameda County, and on the west by San Francisco Bay. Contra Costa County includes federally owned and state-owned lands throughout the county, including approximately 20,000 acres within Mount Diablo State Park (Contra Costa County 2005).

Over 40 percent of the county's land is in agricultural production, or about 200,370 acres. Residential land is the second largest use in the county, encompassing approximately 122,100 acres (25.4 percent of the county). Approximately 46,700 acres (9 percent of the land within the county), are within surface waters (Contra Costa County 2005).

Residential development is concentrated in existing cities and adjacent unincorporated communities. The Contra Costa County incorporated cities include Antioch, Brentwood, Clayton, Danville, El Cerrito, Hercules, Lafayette, Martinez, Moraga, Oakley, Orinda, Pinole, Pleasant Hill, Pittsburg, Richmond, San Pablo, San Ramon, and Walnut Creek. The major unincorporated areas in the county include Alamo, Bethel Island, Byron, Crockett, Discovery Bay, Kensington, Knightsen, North Richmond, Pacheco, Port Costa, and Rodeo (Contra Costa County 2005). Portions of the cities of Pittsburg, Antioch, Oakley, and Brentwood and eastern Contra Costa County are located within the Delta.

The portion of the San Francisco Bay Area Region in Contra Costa County that could be affected by changes in CVP and/or SWP operations and evaluated in this EIS includes CVP facilities (including facilities associated with Rock Slough), areas along the Delta channels that use the surface waters (including agricultural lands), and CVP water service areas.

#### 13.3.3.1.3 Alameda County

Alameda County encompasses approximately 738 square miles in northern California. It is bounded on the north by Contra Costa County, on the east by San Joaquin County, on the south by Santa Clara County, and on the west by San Francisco Bay. Alameda County includes federally owned and state-owned lands throughout the county (Alameda County 2009).

Western Alameda County and the portions of the Livermore-Amador Valley are heavily urbanized. The incorporated cities include Oakland, which is the County seat; Alameda, Albany, Berkeley, Dublin, Emeryville, Fremont, Hayward, Livermore, Newark, Piedmont, Pleasant, San Leandro, and Union City. The unincorporated area of the County covers approximately 277,760 acres (59 percent) of the total land area, includes the unincorporated areas of Castro Valley, Eden Area, and (Alameda County Community Development Agency 2010; Alameda County 2000, 2009). Large portions of the unincorporated areas located to the east of Castro Valley and within the Livermore-Amador Valley hills include agricultural and open space lands which are not served by the CVP or SWP water supplies.

The portion of the San Francisco Bay Area Region in Alameda County that could be affected by changes in CVP and/or SWP operations and evaluated in this EIS includes CVP and SWP facilities (including the SWP South Bay Aqueduct), reservoirs that store CVP or SWP water, and CVP and SWP water service areas.

#### 13.3.3.1.4 Santa Clara County

Santa Clara County encompasses approximately 1,306 square miles in northern California. It is bounded on the north by Alameda County, on the east by Stanislaus and Merced counties, on the south by San Benito County, and on the west by San Mateo and Santa Cruz counties. Santa Clara County includes federally owned and state-owned lands throughout the county, including approximately 87,000 acres within Henry W. Coe State Park (Santa Clara County 1994, 2012).

Approximately 83 percent of the county's population resides in the 15 incorporated cities. The incorporated cities include Campbell, Cupertino, Gilroy, Los Altos, Los Altos Hills, Los Gatos, Milpitas, Monte Sereno, Morgan Hill, Mountain View, Palo Alto, San Jose, Santa Clara, Saratoga, and Sunnyvale. The southern portion of the county near Gilroy and Morgan Hill is predominantly rural, with low-density residential developments scattered though the valley and foothill areas (Santa Clara County 1994, 2012).

The portion of the San Francisco Bay Area Region in Santa Clara County that could be affected by changes in CVP and/or SWP operations and evaluated in this EIS includes CVP and SWP facilities (including the SWP South Bay Aqueduct and CVP facilities that convey water from San Luis Reservoir) and CVP and SWP water service areas.

#### 13.3.3.1.5 San Benito County

San Benito County encompasses approximately 1,386 square miles in central California. It is bounded on the north by Santa Clara County, on the east by Merced and Fresno counties, and on the south and west by Monterey County. San Benito County includes federally owned and state-owned lands throughout the county, including approximately 26,000 acres within Pinnacles National Monument, over 105,403 acres owned by Bureau of Land Management, and over 8,800 acres associated with the Hollister Hills State Vehicular Recreation Area and San Juan Bautista State Historic Park (San Benito County 2010, 2013).

San Benito County has approximately 882,675 acres of unincorporated lands (nearly 99.5 percent of the total land area). The incorporated cities of Hollister and San Juan Bautista account for approximately 4,044 acres (0.5 percent of the county land area). Agriculture is the predominant land use, totaling 747,409 acres (84 percent of the county) (San Benito County 2010, 2013).

The portion of the San Francisco Bay Area Region in San Benito County that could be affected by changes in CVP and/or SWP operations and evaluated in this EIS includes CVP and SWP facilities (including San Justo Reservoir and other facilities to convey water from San Luis Reservoir) and CVP water service areas.

## 13.3.4 Central Coast Region

The Central Coast Region includes portions of San Luis Obispo and Santa Barbara counties served by the SWP. Tribal lands are also described for the Central Coast Region.

### *13.3.4.1 San Luis Obispo County*

San Luis Obispo County encompasses approximately 3,594 square miles in central California, including over 200,000 acres of surface waters (San Luis Obispo County 2013). It is bounded on the north by Monterey County, on the east by Kern County, on the south by Santa Barbara County, and on the west by the Pacific Ocean. Federally owned land in San Luis Obispo County includes Los Padres National Forest, Carizzo Plain National Monument, several wilderness areas, and Guadalupe-Nipomo Dunes National Wildlife Refuge. State-owned lands include Hearst-San Simeon State Historical Monument, Montano de Oro State Park, and state beaches and marine conservation areas.

Land uses in the County are predominantly rural and agricultural with over 1,672,000 acres in agricultural and rural land uses (83 percent of the total county lands). Incorporated cities include Arroyo Grande, Atascadero, Grover Beach, Morro Bay, Paso Robles, Pismo Beach, and San Luis Obispo. Major unincorporated communities include Avila, California Valley, Creston Village, Edna Village, Heritage Ranch, Los Ranchos, Nipoma, Oak Shores, Oceano, San Miguel, Santa Margarita, and Templeton (San Luis Obispo County 2013).

The portion of the Central Coastal Region in San Luis Obispo County that could be affected by changes in CVP and/or SWP operations and evaluated in this EIS includes SWP facilities (including facilities associated with the Central Coast Water Authority) and SWP water service areas.

### *13.3.4.2 Santa Barbara County*

Santa Barbara County encompasses approximately 2,744 square miles in central California. It is bounded on the north by San Luis Obispo, on the east by Ventura County, and on the south and west by the Pacific Ocean. Federally owned land in Santa Barbara County includes 629,120 acres in the Los Padres National Forest, 98,560 acres in the Vandenberg Air Force Base, Channel Islands National Park, and Guadalupe-Nipomo Dunes National Wildlife Refuge. The state-owned lands include the University of California at Santa Barbara, Sedgwick Reserve, La Purisima Mission State Park and other state parks, and Burton Mesa Ecological Reserve (Santa Barbara County 2009; SBCAG 2013).

Agricultural is the predominant land use in the county with over 1,440,000 acres (82 percent of the land) (Santa Barbara County 2009; SBCAG 2013). Santa Barbara County includes eight incorporated cities, Buellton, Carpinteria, Goleta, Guadalupe, Lompoc, Santa Barbara, Santa Maria, and Solvang. Less than 3 percent of the County is within incorporated cities. The major unincorporated communities include Cuyuama, Los Alamos, Los Olivos, Mission Hills, Montecito, New Cayamu, Orcutt, Summerland, and Vandendberg Village. The portion of the Central Coastal Region, in Santa Barbara County, that could be affected by changes in CVP and/or SWP operations and evaluated in this EIS includes SWP facilities (including facilities associated with the Central Coast Water Authority), recreation facilities at Cachuma Lake that stores SWP water, and SWP water service areas.

#### *13.3.4.3 Tribal Lands in Central Coast Region*

This section summarizes the tribal lands that could be affected by changes in CVP and/or SWP operations and that are located within the county boundaries described above.

*Tribal Lands within the Boundaries of Santa Barbara County*

Major federally recognized tribes and tribal lands within the boundaries of Santa Barbara County include the Santa Ynez Reservation, which is home to the Santa Ynez Band of Chumash Mission Indians of the Santa Ynez Reservation near Santa Barbara (SDSU 2013).

### 13.3.5 Southern California Region

The Southern California Region includes portions of Ventura, Los Angeles, Orange, San Diego, Riverside, and San Bernardino counties served by the SWP. Tribal lands are also described for the Southern California Region.

#### *13.3.5.1 Ventura County*

Ventura County encompasses approximately 1,873 square miles in southern California. It is bounded on the north by Kern County, on the east and south by Los Angeles County, and on the west by Santa Barbara County and the Pacific Ocean. Ventura County includes federally owned and state-owned lands throughout the county, including 550,211 acres in Los Padres National Forest, Chumash and Sespe wilderness area, 4,331 acres at the Point Mugu Naval Air Station, 670 acres at the California State University Channel Islands, and over 410 acres in state beach parks (Ventura County 2013).

Ventura County has 10 incorporated cities, including Camarillo, Fillmore, Moorpark, Ojai, Oxnard, Port Hueneme, Santa Paula, San Buenaventura, Simi Valley, and Thousand Oaks (Ventura County 2013). Major unincorporated communities within the county include Bell Canyon, Box Canyon, Camarillo Heights, Del Norte, El Rio, Hidden Valley, Lake Sherwood, Matilija Canyon, Montalvo, Oak Park, Ojai Valley, Piru, Saticoy, and Somis (Ventura County 2005).

The portion of the Southern California Region in Ventura County that could be affected by changes in CVP and/or SWP operations and evaluated in this EIS includes recreation at Lake Piru that stores SWP water, and SWP water service areas.

#### *13.3.5.2 Los Angeles County*

Los Angeles County encompasses approximately 4,083 square miles in northern California. It is bounded on the north by Kern County, on the east by San Bernardino County, on the south by Orange County, and on the west by Ventura

County and the Pacific Ocean. Los Angeles County includes federally owned and state-owned lands throughout the county, including nearly 650,000 acres in Los Padres and Angeles national forests, portions of Edwards Air Force Base, over 29,000 acres of other federally owned open space (including wilderness areas), and approximately 50,893 acres of state-owned land, including Hungry Valley State Vehicular Recreation Area (Los Angeles County 2011).

More than half of Los Angeles County's 1,698,240 acres of unincorporated land area is designated a natural resources land use category. The next highest land use is rural, which accounts for 39 percent of the unincorporated areas, followed by residential, which accounts for 3 percent of the unincorporated areas. The remaining land area is in the county's 88 incorporated cities, the most populous of which is the City of Los Angeles (Los Angeles County 2012). The County has approximately 140 unincorporated areas (Los Angeles County 2014).

The portion of the Southern California Region in Los Angeles County that could be affected by changes in CVP and/or SWP operations and evaluated in this EIS includes SWP facilities and SWP water service areas.

#### *13.3.5.3 Orange County*

Orange County encompasses 948 square miles in southern California. It is bounded on the north by Los Angeles County, on the east by San Bernardino and Riverside counties, on the south by San Diego County, and on the west by the Pacific Ocean. Orange County includes federally owned lands, including lands in the Cleveland National Forests.

Orange County has 34 incorporated cities in Orange County. The unincorporated lands cover approximately 192,758 acres (Orange County 2005). Land zoned as open space forms the largest land use type (143,313 acres).

The portion of the Southern California Region in Orange County that could be affected by changes in CVP and/or SWP operations and evaluated in this EIS includes SWP facilities and SWP water service areas.

#### *13.3.5.4 San Diego County*

San Diego County encompasses approximately 4,525 square miles in southern California. It is bounded on the north by Orange and Riverside counties, on the east by Imperial County, on the south by Mexico, and on the west by the Pacific Ocean. San Diego County includes federally owned land, including Camp Pendleton Marine Corps Base, Cleveland National Forest, and San Diego and San Diego national wildlife refuges. State-owned lands throughout the county, includes Cuyamaca Rancho State Park, Anza-Borrego Desert State Park, Felipe Wildlife Area, and Ocotillo Wells State Vehicular Recreation Area (San Diego County 2011).

The incorporated cities include Carlsbad, Chula Vista, Coronado, Del Mar, El Cajon, Encinitas, Escondido, Imperial Beach, La Mesa, Lemon Grove, National City, Oceanside, Poway, San Marcos, Santee, Solano Beach, and Vista San Diego (San Diego County 2011). The unincorporated communities include Lakeside, Ramona, San Dieguito, Spring Valley, and Valle de Oro.

The portion of the Southern California Region in San Diego County that could be affected by changes in CVP and/or SWP operations and evaluated in this EIS includes SWP facilities, non-SWP reservoirs that store SWP water (including Dixon Lake; and San Vicente, Lower Otay, and Sweetwater Reservoir), and CVP water service areas.

#### *13.3.5.5 Riverside County*

Riverside County encompasses approximately 7,295 square miles in southern California. It is bounded on the north by San Bernardino County, on the east by the state of Nevada, on the south by San Diego and Imperial counties, and on the west by Orange County. Riverside County includes federally owned lands throughout the county, including March Air Reserve Base, Chocolate Mountains Naval Gunnery Range, Joshua Tree National Park, San Bernardino and Cleveland national forests, numerous wilderness areas, and Coachella Valley National Wildlife Refuge; and state-owned lands including San Jacinto and Santa Rose wildlife areas and Mount San Jacinto State Park (RCIP 2000).

Residential land use accounts for approximately 184,000 acres, nearly 57 percent of which are within incorporated cities. Approximately 1,313,000 acres (28 percent) is in open space, recreation, agriculture, and wildland preservation (RCIP 2000).

Most of the population is concentrated in the 24 incorporated cities of Banning, Beaumont, Calimesa, Canyon Lake, Cathedral City, Coachella, Corona, Desert Hot Springs, Hemet, Indian Wells, Indio, Lake Elsinore, La Quinta, Moreno Valley, Murrieta, Norco, Palm Desert, Palm Springs, Perris, Rancho Mirage, Riverside, San Jacinto, and Temecula. The major unincorporated communities in the county include Banning Bench, Bermuda Dunes, Cabazon, Cherry Valley, Cleveland Ridge, Desert Center, Eagle Mountain, El Cerrito, Lakeview/Nuevo, Meadowbrook, Mecca, Menifee Valley, North Palm Springs, Ripley, Sun City, Temescal Canyon, Tenaja, Thermal, Thousand Palms, Warm Springs, and Wildomar.

The portion of the Southern California Region in Riverside County that could be affected by changes in CVP and/or SWP operations and evaluated in this EIS includes SWP facilities, reservoirs that store SWP water (including Diamond Valley Lake and Lake Skinner), and SWP water service areas.

#### *13.3.5.6 San Bernardino County*

San Bernardino County encompasses approximately 20,106 square miles in southern California. It is bounded on the north by Inyo County, on the east by the state of Nevada, on the south by Riverside County, and on the west by Kern, Los Angeles, and Orange counties. Most of the land in San Bernardino County is federally owned and state-owned lands, including approximately 10,500,000 acres (81 percent of the county) (San Bernardino County 2007, 2012). The federally owned lands include 28 Bureau of Land Management wilderness areas (approximately 47 percent of the total county), San Bernardino and Angeles National Forests (676,666 and 655,387 acres, respectively), Mojave National

Preserve, Joshua Tree and Death Valley National Parks, and four military bases (Edwards Air Force Base, Twentynine Palms Marine Corps Air Ground Combat Training Center, Fort Irwin, and China Lake Naval Weapons Center). State-owned lands include Silverwood Lake State Recreation Area at the SWP reservoir, Wildwood Canyon State Park, and Providence Mountain and Chino Hills state recreation areas.

San Bernardino County includes 24 incorporated cities, including Adelanto, Apple Valley, Barstow, Big Bear Lake, Chino, Chino Hills, Colton, Fontana, Grand Terrace, Hesperia, Highland, Loma Linda, Montclair, Needles, Ontario, Rancho Cucamonga, Redlands, Rialto, San Bernardino, Twentynine Palms, Upland, Victorville, Yucaipa, and Yucca Valley. Major unincorporated communities in the county include Amboy, Baker, Bear Valley, Bloomington, Crest Forest, Earp, Essex, Fontana suburbs, Goffs, Harvard, Havasu Lake, Helendale, Hilltop, Hinckley, Homestead Valley, Joshua Tree, Kelso, Kramer Junction, Lake Arrowhead, Landers, Lucerne Valley, Ludlow, Lytle Creek, Mentone, Moronga Valley, Muscoy, Newberry Springs, Nipton, Oak Glen, Oak Hills, Parker, Phelan/Pinon Hills, Pioneertown, Red Mountain, Rimrock, Silver Lake, Trona, Vidal, and Yerno.

The portion of the Southern California Region in San Bernardino County that could be affected by changes in CVP and/or SWP operations and evaluated in this EIS includes SWP water service areas.

#### 13.3.5.7 Tribal Lands in Southern California Region

This section summarizes the tribal lands that could be affected by changes in CVP and/or SWP operations and that are located within the county boundaries described above.

*Tribal Lands within the Boundaries of San Diego County*

Major federally recognized tribes and tribal lands within the boundaries of San Diego County includes lands of the Capitan Grande Band of Diegueno Mission Indians of California (Barona Reservation and Viejas Reservation), Cahuilla Band of Mission Indians of the Cahuilla Reservation, Campo Band of Diegueno Mission Indians of the Campo Indian Reservation, Ewiiaapaayp Band of Kumeyaay Indians, Inaja Band of Diegueno Mission Indians of the Inaja and Cosmit Reservation, Jamul Indian Village of California, La Jolla Band of Luiseno Indians, La Posta Band of Diegueno Mission Indians of the La Posta Indian Reservation, Los Coyotes Band of Cahuilla and Cupeno Indians, Manzanita Band of Diegueno Mission Indians of the Manzanita Reservation, Mesa Grade Band of Diegueno Mission Indians of the Mesa Grande Reservation, Pala Band of Luiseno Mission Indians of the Pala Reservation, Pauma Band of Luiseno Mission Indians of the Pauma & Yuima Reservation, Rincon Band of Luiseno Indians of the Rincon Reservation, San Pasqual Band of Diegueno Mission Indians of California, Iipay Nation of Santa Ysabel, and Sycuan Band of Kumeyaay Nation.

*Tribal Lands within the Boundaries of Riverside County*

Major federally recognized tribes and tribal lands within the boundaries of Riverside County include lands of the Agua Caliente Band of Cahuilla Indians of the Agua Caliente Reservation, Augustine Band of Cahuilla Indians, Cabazon Band of Mission Indians, Cahuilla Band of Mission Indians of the Cahuilla Reservation, Morango Band of Mission Indians, Pechanga Band of Luiseno Mission Indians of the Pechanga Reservation, Ramona Band of Cahuilla, Santa Rosa Band of Cahuilla Indians, Soboba Band of Luiseno Indians, Torres-Martinez Desert Cahuilla Indians, Twenty-Nine Palms Band of Mission Indians of California, and Colorado River Indian Tribes of the Colorado River Indian Reservation (RCIP 2000).

*Tribal Lands within the Boundaries of San Bernardino County*

Major federally recognized tribes and tribal lands within the boundaries of San Bernardino County include the lands of the San Manual Band of Mission Indians and the Twenty-Nine Palms Band of Mission Indians of California (SDSU 2013). The Chemehuevi Indian Tribe of the Chemehuevi Reservation is also located in San Bernardino County near the Colorado River.

## 13.4 Impact Analysis

This section describes the potential mechanisms for change in non-agricultural land uses and analytical methods; results of the impact analysis; potential mitigation measures; and potential cumulative effects.

### 13.4.1 Potential Mechanisms for Change and Analytical Tools

As described in Chapter 4, Approach to Environmental Analysis, the environmental consequences assessment considers changes in non-agricultural land uses related to changes in CVP and SWP operations under the alternatives as compared to the No Action Alternative and Second Basis of Comparison.

#### *13.4.1.1 Changes in Land Uses*

Land uses in 2030 are assumed to be consistent with the future projections included in existing general plans. The general plans were developed assuming adequate water supplies to support the projected lands uses. Changes in CVP and SWP operations under the No Action Alternative and Alternatives 1 through 5 could change the availability of CVP and SWP water supplies. If the CVP and SWP water supplies were reduced as compared to the No Action Alternative and Second Basis of Comparison to a level that would not support planned municipal and industrial water demands, development of future land uses may not occur. Potential changes to agricultural land uses are described in Chapter 12, Agricultural Resources.

Availability of CVP and SWP water supplies were analyzed using CalSim II model output (see Chapter 5, Surface Water Resources and Water Supplies). Most of the CVP and SWP municipal and industrial water users prepared Urban

Water Management Plans (UWMPs) that project availability of water supplies to support land uses in 2030. That information was used with projected CVP and SWP water supply availability under each of the alternatives to determine if projected municipal and industrial water demands could be met in 2030 using the CWEST model, as described in Chapter 19, Socioeconomics. The results of the CWEST model indicated that municipal and industrial water demands of CVP and SWP water users in the Central Valley, San Francisco Bay Area, Central Coast, and Southern California regions would be met through a combination of water conservation, available CVP and SWP water supplies, local and regional surface water supplies, groundwater, recycled water, and, in some cases, desalination.

Alternative 4 includes provisions for floodway development regulations. It is assumed that under the No Action Alternative and Alternatives 1 through 5, existing programs to protect floodways would continue to be implemented, including Federal and state requirements as implemented by the U.S. Army Corps of Engineers (USACE), Central Valley Flood Protection Board, and Department of Water Resources (DWR). Within the Delta, the floodways are further regulated by the Delta Protection Commission and Delta Stewardship Council to preserve and protect the natural resources of the Delta; and prevent encroachment into Delta floodways, including the Delta Stewardship Council's recently adopted Delta Plan. These regulations would continue to be implemented in the No Action Alternative, Alternatives 1 through 5, and the Second Basis of Comparison. Therefore, future development would be prevented from occurring within the Delta floodplains and floodways; and in the Sacramento, Feather, American, and San Joaquin river corridors upstream of the Delta. Provisions in Alternative 4 would require additional setbacks along the floodways as compared to other alternatives and the Second Basis of Comparison. The potential change in land use is analyzed qualitatively in this chapter.

The No Action Alternative, Alternatives 1 through 5, and Second Basis of Comparison include restoration of more than 10,000 acres of intertidal and associated subtidal wetlands in Suisun Marsh and Cache Slough; 17,000 to 20,000 acres of seasonal floodplain restoration in the Yolo Bypass; and continued delivery of refuge water supplies under the Central Valley Project Improvement Act, as described in Chapter 3, Description of Alternatives. Land uses in 2030 due to implementation of these programs would be consistent between all alternatives and the Second Basis of Comparison. Therefore, this EIS does not analyze changes due to these programs.

##### *13.4.1.2 Effects Related to Cross Delta Water Transfers*

Cross Delta water transfers involving the CVP and SWP facilities or water supplies would be required to be implemented in accordance with all existing regulations and requirements, including not causing adverse impacts to other water users in accordance with the requirements of Reclamation, DWR, and the State Water Resources Control Board. It is anticipated that water transfers would continue under all alternatives to provide water supplies to agricultural, municipal and industrial, and wildlife refuges under all alternatives and the Second Basis of

Comparison in a similar manner. Transfers for municipal and industrial water users would be one of several water supply sources to meet the future water demands in Year 2030. If the availability of transferred water is reduced, it is anticipated that other water supplies (e.g., recycled water and desalination) would be increased, as described in the UWMPs for 2030 water demands.

Reclamation recently prepared a long-term regional water transfer environmental document which evaluated potential changes in surface water conditions related to water transfer actions (Reclamation 2014c). Results from this analysis were used to inform the impact assessment of potential effects of water transfers under the alternatives as compared to the No Action Alternative and the Second Basis of Comparison. The analysis indicated that water transfers would not result in changes to non-agricultural land uses.

Under all of the alternatives and Second Basis of Comparison, it is assumed that these transfers would continue to occur each year to meet the water demands in the existing general plans. It is not anticipated that water transfers would change municipal and industrial land uses as defined in the existing general plans. If a water transfer program was implemented for the purposes of changing existing general plan land uses, separate environmental documentation would be required for the changes to the general plan and the water transfer. Potential effects due to Cross Delta water transfers on in agricultural land uses are described in Chapter 12, Agricultural Resources. Therefore, this chapter does not include separate analyses of changes in municipal and industrial land uses due to cross Delta water transfers.

### 13.4.2 Conditions in Year 2030 without Implementation of Alternatives 1 through 5

This EIS includes two bases of comparison (described in Chapter 3, Description of Alternatives): the No Action Alternative and the Second Basis of Comparison. Both of these bases are evaluated at 2030 conditions.

#### *13.4.2.1 No Action Alternative*

The impact analysis in this EIS is based upon the comparison of the alternatives to the No Action Alternative and the Second Basis of Comparison in the Year 2030. Many of the changed conditions would occur in the same manner under both the No Action Alternative and the Second Basis of Comparison (e.g., climate change, sea level rise, projected development under existing general plans, and implementation of reasonable and foreseeable projects). Due to these changes, especially climate change and sea level rise, it is anticipated that CVP and SWP water supply availability would be less than under recent conditions (described in Chapter 5, Surface Water Resources and Water Supplies). However, it is anticipated that projected land uses would occur by 2030 with implementation of water conservation programs and the development of other water supplies, including ongoing recycled water programs, desalination, and groundwater use.

By 2030 under the No Action Alternative and the Second Basis of Comparison, it is assumed that ongoing programs would result in restoration of more than 10,000 acres of intertidal and associated subtidal wetlands in Suisun Marsh and Cache Slough; and 17,000 to 20,000 acres of seasonal floodplain restoration in the Yolo Bypass.

Under the No Action Alternative and the Second Basis of Comparison, land uses in 2030 would occur in accordance with the general plans for counties and cities within the Central Valley Region; tribal lands; and regulations of state and regional agencies, including Central Valley Flood Protection Board, Delta Protection Commission, and Delta Stewardship Council.

Development along the river corridors in the Central Valley would continue to be limited by the state regulations to protect floodways. The Central Valley Flood Protection Board adopts floodway boundaries and approves uses within those floodways (DWR 2010). Various uses are permitted in the floodways, such as agriculture, canals, low dikes and berms, parks and parkways, golf courses, sand and gravel mining, structures that will not be used for human habitation, and other facilities and activities that will not be substantially damaged by the base flood event and will not cause adverse hydraulic impacts that will raise the water surface in the floodway.

Within the Delta, future development also is subject to the requirements of the Delta Protection Commission and Delta Stewardship Council. The general plans within the Delta are required by state laws to be consistent with the Delta Protection Commission's *Land Use and Resource Management Plan for the Primary Zone of the Delta* (DPC 2010; OAL 2010), which does not allow development within the Primary Zone of the Delta unless proponents can demonstrate that implementing their projects would preserve and protect natural resources of the Delta, promote protection of remnants of riparian and aquatic habitat, not result in loss of wetlands or riparian habitat, would not degrade water quality, would not interfere with migratory birds or public access, would not harm agricultural operations, and would not degrade levees or expose the public to increased flood hazards. Farmers are encouraged to implement management practices to maximize habitat values for migratory birds and wildlife.

The Delta Plan adopted by the Delta Stewardship Council in May 2013 included a policy that protects floodways within the entire Delta that are not regulated by other Federal or state agencies (23 California Code of Regulations Section 5014). This policy prevents encroachment into floodways that would impede the free flow of water in the floodway or jeopardize public safety.

### 13.4.3 Evaluation of Alternatives

As described in Chapter 4, Approach to Environmental Analysis, Alternatives 1 through 5 have been compared to the No Action Alternative; and the No Action Alternative and Alternatives 1 through 5 have been compared to the Second Basis of Comparison.

During review of the numerical modeling analyses used in this EIS, an error was determined in the CalSim II model assumptions related to the Stanislaus River operations for the Second Basis of Comparison, Alternative 1, and Alternative 4 model runs. Appendix 5C includes a comparison of the CalSim II model run results presented in this chapter and CalSim II model run results with the error corrected. Appendix 5C also includes a discussion of changes in the comparison of the following alternative analysis:

- No Action Alternative compared to the Second Basis of Comparison
- Alternative 1 compared to the No Action Alternative
- Alternative 3 compared to the Second Basis of Comparison
- Alternative 5 compared to the Second Basis of Comparison.

### *13.4.3.1 No Action Alternative*

As described in Chapter 4, Approach to Environmental Analysis, the No Action Alternative is compared to the Second Basis of Comparison.

#### 13.4.3.1.1 Changes in Land Use

No municipal and industrial land uses in the Trinity River Region are served by CVP and SWP water supplies. Therefore, the municipal and industrial land uses would be the same under the No Action Alternative and the Second Basis of Comparison in the Trinity River Region.

As described in Chapter 5, Surface Water Resources and Water Supplies, CVP and SWP water deliveries to municipal and industrial Sacramento River Water Rights Settlement Contractors and water rights holders would be similar under the No Action Alternative and the Second Basis of Comparison. CVP water deliveries to water service contractors over the long-term conditions would be 6 percent less for the North of Delta water users and 10 percent less for the South of Delta users under the No Action Alternative, compared to the Second Basis of Comparison. SWP water deliveries to water contractors over the long-term conditions (without Article 21 water) would be reduced by 18 percent throughout the SWP service area under the No Action Alternative, compared to the Second Basis of Comparison. However, as described in Chapter 19, Socioeconomics, 2030 municipal and industrial water demands would be met through a combination of available CVP and SWP water supplies and other water supplies, including water conservation, water transfers, local and regional surface water and groundwater, recycled water, and desalination. Adequate water supplies would be available to support future municipal and industrial land uses projected in existing general plans under the No Action Alternative and the Second Basis of Comparison. Therefore, land use in 2030 would be the same under the No Action Alternative and the Second Basis of Comparison in the Trinity River, Central Valley, San Francisco Bay Area, Central Coast, and Southern California regions.

### *13.4.3.2 Alternative 1*

Alternative 1 is identical to the Second Basis of Comparison. Alternative 1 is compared to the No Action Alternative and the Second Basis of Comparison. However, because land use conditions under Alternative 1 are identical to land use conditions under the Second Basis of Comparison, Alternative 1 is only compared to the No Action Alternative.

##### 13.4.3.2.1 Alternative 1 Compared to the No Action Alternative

*Change in Land Use*

No municipal and industrial land uses in the Trinity River Region are served by CVP and SWP water supplies. Therefore, the municipal and industrial land uses would be the same under Alternative 1 and the No Action Alternative in the Trinity River Region.

As described in Chapter 5, Surface Water Resources and Water Supplies, CVP and SWP water deliveries to municipal and industrial Sacramento River Water Rights Settlement Contractors and water rights holders would be similar under Alternative 1 and the No Action Alternative. CVP water deliveries to water service contractors over the long-term conditions would be 7 percent greater for the North of Delta water users and 11 percent greater for the South of Delta users under Alternative 1 as compared to the No Action Alternative. SWP water deliveries to water contractors over the long-term conditions (without Article 21 water) would be increased by 22 percent under Alternative 1 as compared to the No Action Alternative. The increased CVP and SWP water supply availability would allow water users to reduce other water supplies, including groundwater. It is anticipated that the additional water supplies would not result in changes in the general plan development plans without subsequent environmental documentation. Adequate water supplies would be available to support future municipal and industrial land uses projected in existing general plans under Alternative 1 and the No Action Alternative. Therefore, land use in 2030 would be the same under Alternative 1 and the No Action Alternative in the Trinity River, Central Valley, San Francisco Bay Area, Central Coast, and Southern California regions.

##### 13.4.3.2.2 Alternative 1 Compared to the Second Basis of Comparison

Alternative 1 is identical to the Second Basis of Comparison.

#### *13.4.3.3 Alternative 2*

The land use conditions under Alternative 2 would be identical to the conditions under the No Action Alternative; therefore, Alternative 2 is only compared to the Second Basis of Comparison.

##### 13.4.3.3.1 Alternative 2 Compared to the Second Basis of Comparison

Changes to land use under Alternatives 2 as compared to the Second Basis of Comparison would be the same as the impacts described in Section 13.4.3.1, No Action Alternative.

#### *13.4.3.4 Alternative 3*

The CVP and SWP operations under Alternative 3 are similar to the Second Basis of Comparison with modified Old and Middle River flow criteria and New Melones Reservoir operations.

Alternative 3 would include changed water demands for American River water supplies as compared to the No Action Alternative or Second Basis of Comparison. Alternative 3 would provide water supplies of up to 17 thousand acre feet (TAF)/year under a Warren Act Contract for El Dorado Irrigation District and 15 TAF/year under a CVP water service contract for El Dorado County Water Agency. These demands are not included in the analysis presented in this section of the EIS. A sensitivity analysis comparing the results of the analysis with and without these demands is presented in Appendix 5B of this EIS.

#### 13.4.3.4.1 Alternative 3 Compared to the No Action Alternative

*Changes in Land Use*

No municipal and industrial land uses in the Trinity River Region are served by CVP and SWP water supplies. Therefore, the municipal and industrial land uses would be the same under Alternative 3 and the No Action Alternative in the Trinity River Region.

As described in Chapter 5, Surface Water Resources and Water Supplies, CVP and SWP water deliveries to municipal and industrial Sacramento River Water Rights Settlement Contractors and water rights holders would be similar under Alternative 3 and the No Action Alternative. CVP water deliveries to water service contractors over the long-term conditions would be similar for the North of Delta water users and 9 percent greater for the South of Delta users under Alternative 3, compared to the No Action Alternative. SWP water deliveries to water contractors over the long-term conditions (without Article 21 water) would be increased by 17 percent under Alternative 3, compared to the No Action Alternative. The increased CVP and SWP water supply availability would allow water users to reduce other water supplies, including groundwater. It is anticipated that the additional water supplies would not result in changes in the general plan development plans without subsequent environmental documentation. Adequate water supplies would be available to support future municipal and industrial land uses projected in existing general plans under Alternative 3 and the No Action Alternative. Therefore, land use in 2030 would be the same under Alternative 3 and the No Action Alternative in the Trinity River, Central Valley, San Francisco Bay Area, Central Coast, and Southern California regions.

#### 13.4.3.4.2 Alternative 3 Compared to the Second Basis of Comparison

*Changes in Land Use*

No municipal and industrial land uses in the Trinity River Region are served by CVP and SWP water supplies. Therefore, the municipal and industrial land uses would be the same under Alternative 3 and the Second Basis of Comparison in the Trinity River Region.

As described in Chapter 5, Surface Water Resources and Water Supplies, CVP and SWP water deliveries to municipal and industrial Sacramento River Water Rights Settlement Contractors and water rights holders would be similar under Alternative 3 and the Second Basis of Comparison. CVP water deliveries to water service contractors over the long-term conditions would be similar for the North of Delta water users and South of Delta users under Alternative 3 and the Second Basis of Comparison. SWP water deliveries to water contractors over the long-term conditions (without Article 21 water) would be similar under Alternative 3 and the Second Basis of Comparison. Adequate water supplies would be available to support future municipal and industrial land uses projected in existing general plans under Alternative 3 and the Second Basis of Comparison. Therefore, land use in 2030 would be the same under Alternative 3 and the Second Basis of Comparison in the Trinity River, Central Valley, San Francisco Bay Area, Central Coast, and Southern California regions.

#### *13.4.3.5 Alternative 4*

The CVP and SWP operations under Alternative 4 are identical to the CVP and SWP operations under the Second Basis of Comparison and Alternative 1. Under Alternative 4, new development and substantial improvements would be prohibited within floodways or within 170 feet of the ordinary high water line of any floodway.

##### 13.4.3.5.1 Alternative 4 Compared to the No Action Alternative

*Changes in Land Use*

The CVP and SWP operations under Alternative 4 are identical to the CVP and SWP operations under Alternative 1. Therefore, the land use conditions influenced by availability of CVP and SWP water supplies under Alternative 4 would be the same as conditions under Alternative 1.

Under Alternative 4, new development and substantial improvements would be prohibited within floodways or within 170 feet of the ordinary high water line of any floodway. Development within floodways is currently prohibited in accordance with existing general plans and state and regional plans (e.g., requirements of the Delta Protection Commission and Delta Stewardship Council). Structures that either cannot be moved before flood events or that would reduce the flood management function of the floodway are not allowed. It is anticipated that these requirements would continue to be implemented in 2030, to protect the floodways. However, Alternative 4 would include additional restrictions on new development within 170 feet of the ordinary high water line of any floodway. It is anticipated that the provisions under Alternative 4 could result in site-specific parcel changes as compared to the No Action Alternative. However, the development that would have occurred on these parcels could be incorporated within the general plan development plans and guidelines. Therefore, land use conditions under Alternative 4 would be similar to conditions under the No Action Alternative; and would be the same as the impacts described in Section 13.4.3.2.1, Alternative 1 Compared to the No Action Alternative.

#### 13.4.3.5.2 Alternative 4 Compared to the Second Basis of Comparison

*Changes in Land Use*

The CVP and SWP operations under Alternative 4 are identical to the CVP and SWP operations under Second Basis of Comparison. Therefore, the land use conditions influenced by availability of CVP and SWP water supplies under Alternative 4 would be the same as conditions under the Second Basis of Comparison.

Under Alternative 4, new development and substantial improvements would be prohibited within floodways or within 170 feet of the ordinary high water line of any floodway. Development within floodways is currently prohibited in accordance with existing general plans and state and regional plans (e.g., requirements of the Delta Protection Commission and Delta Stewardship Council). Structures that either cannot be moved prior to flood events or that would reduce the flood management function of the floodway are not allowed. It is anticipated that these requirements would continue to be implemented in 2030 to protect the floodways. However, Alternative 4 would include additional restrictions on new development within 170 feet of the ordinary high water line of any floodway. It is anticipated that the provisions under Alternative 4 could result in site-specific parcel changes as compared to the Second Basis of Comparison. However, the development that would have occurred on these parcels could be incorporated within the general plan development plans and guidelines. Therefore, land use conditions under Alternative 4 would be identical to conditions under the Second Basis of Comparison.

### *13.4.3.6 Alternative 5*

The CVP and SWP operations under Alternative 5 are similar to the No Action Alternative with modified Old and Middle River flow criteria and New Melones Reservoir operations.

Alternative 5 would include changed water demands for American River water supplies as compared to the No Action Alternative or Second Basis of Comparison. Alternative 5 would provide water supplies of up to 17 TAF/year under a Warren Act Contract for El Dorado Irrigation District and 15 TAF/year under a CVP water service contract for El Dorado County Water Agency. These demands are not included in the analysis presented in this section of the EIS. A sensitivity analysis comparing the results of the analysis with and without these demands is presented in Appendix 5B of this EIS.

#### 13.4.3.6.1 Alternative 5 Compared to the No Action Alternative

*Changes in Land Use*

No municipal and industrial land uses in the Trinity River Region are served by CVP and SWP water supplies. Therefore, the municipal and industrial land uses would be the same under Alternative 5 and the No Action Alternative in the Trinity River Region.

As described in Chapter 5, Surface Water Resources and Water Supplies, CVP and SWP water deliveries to municipal and industrial Sacramento River Water Rights Settlement Contractors and water rights holders would be similar under Alternative 5 and the No Action Alternative. CVP water deliveries to water service contractors over the long-term conditions would be similar for the North of Delta and South of Delta water users under Alternative 5, compared to the No Action Alternative. SWP water deliveries to water contractors over the long-term conditions (without Article 21 water) would be similar under Alternative 5, compared to the No Action Alternative. Adequate water supplies would be available to support future municipal and industrial land uses projected in existing general plans under Alternative 5 and the No Action Alternative. Therefore, land use in 2030 would be the same under Alternative 5 and the No Action Alternative in the Trinity River, Central Valley, San Francisco Bay Area, Central Coast, and Southern California regions.

##### 13.4.3.6.2 Alternative 5 Compared to the Second Basis of Comparison

*Changes in Land Use*

No municipal and industrial land uses in the Trinity River Region are served by CVP and SWP water supplies. Therefore, the municipal and industrial land uses would be the same under Alternative 5 and the Second Basis of Comparison in the Trinity River Region.

As described in Chapter 5, Surface Water Resources and Water Supplies, CVP and SWP water deliveries to municipal and industrial Sacramento River Water Rights Settlement Contractors and water rights holders would be similar under the No Action Alternative and the Second Basis of Comparison. CVP water deliveries to water service contractors over the long-term conditions would be similar for the North of Delta water users and 10 percent less for the South of Delta water users under Alternative 5 as compared to the Second Basis of Comparison. SWP water deliveries to water contractors over the long-term conditions (without Article 21 water) would be reduced by 19 percent throughout the SWP service area under the Alternative 5, compared to the Second Basis of Comparison. However, as described in Chapter 19, Socioeconomics, 2030 municipal and industrial water demands would be met through a combination of available CVP and SWP water supplies and other water supplies, including water conservation, water transfers, local and regional surface water and groundwater, recycled water, and desalination. Adequate water supplies would be available to support future municipal and industrial land uses projected in existing general plans under Alternative 5 and the Second Basis of Comparison. Therefore, land use in 2030 would be the same under Alternative 5 and the Second Basis of Comparison in the Trinity River, Central Valley, San Francisco Bay Area, Central Coast, and Southern California regions.

#### *13.4.3.7 Summary of Impact Analysis*

The results of the environmental consequences of implementation of Alternatives 1 through 5, compared to the No Action Alternative and the Second Basis of Comparison are presented in Tables 13.1 and 13.2.

**Table 13.1 Comparison of Alternatives 1 through 5 to No Action Alternative**

| Alternative | Potential Change | Consideration for Mitigation Measures |
|---|---|---|
| Alternative 1 | No effects to municipal and industrial and regional land uses | None needed |
| Alternative 2 | No effects to municipal and industrial and regional land uses | None needed |
| Alternative 3 | No effects to municipal and industrial and regional land uses | None needed |
| Alternative 4 | No effects to municipal and industrial and regional land uses | None needed |
| Alternative 5 | No effects to municipal and industrial and regional land uses | None needed |

**Table 13.2 Comparison of No Action Alternative and Alternatives 1 through 5 to Second Basis of Comparison**

| Alternative | Potential Change | Consideration for Mitigation Measures |
|---|---|---|
| No Action Alternative | No effects to municipal and industrial and regional land uses | None needed |
| Alternative 1 | No effects to municipal and industrial and regional land uses | None needed |
| Alternative 2 | No effects to municipal and industrial and regional land uses | None needed |
| Alternative 3 | No effects to municipal and industrial and regional land uses | None needed |
| Alternative 4 | No effects to municipal and industrial and regional land uses | None needed |
| Alternative 5 | No effects to municipal and industrial and regional land uses | None needed |

#### *13.4.3.8 Potential Mitigation Measures*

Mitigation measures are presented in this section to avoid, minimize, rectify, reduce, eliminate, or compensate for adverse environmental effects of Alternatives 1 through 5, as compared to the No Action Alternative. Mitigation measures were not included to address adverse impacts under the alternatives as compared to the Second Basis of Comparison because this analysis was included in this EIS for information purposes only.

Changes in CVP and SWP operations under Alternatives 1 through 5, compared to the No Action Alternative, would not result in changes in municipal and industrial land uses or regional lands use plans. Therefore, there would be no adverse impacts to land use and no mitigation measures are required.

### *13.4.3.9 Cumulative Effects Analysis*

As described in Chapter 3, Description of Alternatives, the cumulative effects analysis considers projects, programs, and policies that are not speculative; and are based upon known or reasonably foreseeable long-range plans, regulations, operating agreements, or other information that establishes them as reasonably foreseeable.

The cumulative effects analysis for Alternatives 1 through 5 for Land Use are summarized in Table 13.3.

**Table 13.3 Summary of Cumulative Effects on Land Use with Implementation of Alternatives 1 through 5 as Compared to the No Action Alternative**

| Scenarios | Actions | Cumulative Effects of Actions |
|---|---|---|
| Past & Present, and Future Actions included in the No Action Alternative and all Alternatives in Year 2030 | Consistent with Affected Environment conditions plus:<br>Actions in the 2008 USFWS BO and 2009 NMFS BO that would have occurred without implementation of the BOs, as described in Section 3.3.1.2 (of Chapter 3, Descriptions of Alternatives), including climate change and sea level rise<br>Actions not included in the 2008 USFWS BO and 2009 NMFS BO that would have occurred without implementation of the BOs, as described in Section 3.3.1.3 (of Chapter 3, Descriptions of Alternatives):<br>- Implementation of Federal and state policies and programs, including Clean Water Act (e.g., Total Maximum Daily Loads); Safe Drinking Water Act; Clean Air Act; and flood management programs<br>- General plans for 2030.<br>- Trinity River Restoration Program.<br>- Central Valley Project Improvement Act programs<br>- Iron Mountain Mine Superfund Site<br>- Nimbus Fish Hatchery Fish Passage Project<br>- Folsom Dam Water Control Manual Update<br>- FERC Relicensing for the Middle Fork of the American River Project<br>- Lower Mokelumne River Spawning Habitat Improvement Project<br>- Dutch Slough Tidal Marsh Restoration<br>- Suisun Marsh Habitat Management, Preservation, and Restoration Plan Implementation<br>- Tidal Wetland Restoration: Yolo Ranch, Northern Liberty Island Fish | <u>These effects would be the same under all alternatives.</u><br>Community development would occur in accordance with general plan projections for 2030. Development within the Delta would be subject to the requirements of the Delta Protection Commission and Delta Stewardship Council.<br>Restoration plans for the ongoing programs would be completed. Development along river corridors in the Central Valley would continue to be limited by the state regulations to protect floodways.<br>Climate change and sea level rise, development under the general plans, FERC relicensing projects, and some future projects to improve water quality and/or habitat are anticipated to reduce availability of CVP and SWP water supplies as compared to past conditions.<br>Future water supply projects are anticipated to both increase water supply reliability due to reduced surface water supplies and to accommodate planned growth in the general plans. Most of these programs were initiated prior to implementation of the 2008 USFWS BO and 2009 NMFS BO which reduced CVP and SWP water supply reliability. |

| Scenarios | Actions | Cumulative Effects of Actions |
|---|---|---|
| | Restoration Project, Prospect Island Restoration Project, and Calhoun Cut/Lindsey Slough Tidal Habitat Restoration Project<br>- San Joaquin River Restoration Program<br>- Future water supply projects, including water recycling, desalination, groundwater banks and wellfields, and conveyance facilities (projects with completed environmental documents) | |
| Future Actions considered as Cumulative Effects Actions in All Alternatives in Year 2030 | Actions as described in Section 3.5 (of Chapter 3, Descriptions of Alternatives):<br>- Bay-Delta Water Quality Control Plan Update<br>- FERC Relicensing Projects<br>- Bay Delta Conservation Plan(including the California WaterFix alternative)<br>- Shasta Lake Water Resources, North-of-the-Delta Offstream Storage, Los Vaqueros Reservoir Expansion Phase 2, and Upper San Joaquin River Basin Storage Investigations<br>- El Dorado Water and Power Authority Supplemental Water Rights Project<br>- Sacramento River Water Reliability Project<br>- Semitropic Water Storage District Delta Wetlands<br>- North Bay Aqueduct Alternative Intake<br>- San Luis Reservoir Low Point Improvement Project<br>- Future water supply projects, including water recycling, desalination, groundwater banks and wellfields, and conveyance facilities (projects that did not have completed environmental documents during preparation of the EIS) | These effects would be the same under all alternatives.<br>Most of the reasonably foreseeable actions are anticipated to reduce water supply impacts due to climate change, sea level rise, increased water allocated to improve habitat conditions, and future growth.<br>Some of the reasonably foreseeable actions related to improved water quality and habitat conditions (e.g., Water Quality Control Plan Update and FERC Relicensing Projects), could in further reductions in CVP and SWP water deliveries. |

| Scenarios | Actions | Cumulative Effects of Actions |
|---|---|---|
| No Action Alternative with Associated Cumulative Effects Actions in Year 2030 | Full implementation of the 2008 USFWS BO and 2009 NMFS BO | Community development would occur in accordance with general plan projections for 2030. Development within the Delta would be subject to the requirements of the Delta Protection Commission and Delta Stewardship Council.<br>Restoration plans for the ongoing programs would be completed. Development along river corridors in the Central Valley would continue to be limited by the state regulations to protect floodways.<br>Climate change and sea level rise, FERC relicensing projects, and some future projects to improve water quality and/or habitat are anticipated to reduce availability of CVP and SWP water supplies as compared to past conditions.<br>Future water supply projects are anticipated to both increase water supply reliability due to reduced surface water supplies and to accommodate planned growth in the general plans. |
| Alternative 1 reasonably foreseeable actions in Year 2030 | No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant) | Implementation of Alternative 1 with reasonably foreseeable actions would result in similar changes as under the No Action Alternative with the added actions. |
| Alternative 2 reasonably foreseeable actions in Year 2030 | Full implementation of the 2008 USFWS BO and 2009 NMFS BO CVP and SWP operational actions<br>No implementation of structural improvements or other actions that require further study to develop a more detailed action description. | Implementation of Alternative 2 with reasonably foreseeable actions would result in similar changes as under the No Action Alternative with the added actions. |
| Alternative 3 reasonably foreseeable actions in Year 2030 | No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant)<br>Slight increase in positive Old and Middle River flows in the winter and spring months | Implementation of Alternative 3 with reasonably foreseeable actions would result in similar changes as under the No Action Alternative with the added actions. |

| Scenarios | Actions | Cumulative Effects of Actions |
|---|---|---|
| Alternative 4 reasonably foreseeable actions in Year 2030 | No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant)<br>Increased restrictions for development within floodways. | Implementation of Alternative 4 with reasonably foreseeable actions would result in similar changes as under the No Action Alternative with the added actions. |
| Alternative 5 reasonably foreseeable actions in Year 20530 | Full implementation of the 2008 USFWS BO and 2009 NMFS BO<br>Positive Old and Middle River flows and increased Delta outflow in spring months | Implementation of Alternative 5 with reasonably foreseeable actions would result in similar changes as under the No Action Alternative with the added actions. |

**Chapter 14**

# Visual Resources

## 14.1 Introduction

This chapter describes the visual resources in the study area related to natural and artificial landscape features and potential changes that could occur as a result of implementing the alternatives evaluated in this Environmental Impact Statement (EIS). Implementation of the alternatives considered in this EIS could affect visual resources through changes in surface water elevations at Central Valley Project (CVP) and State Water Project (SWP) reservoirs and changes in land use related to potential changes in operation of the CVP and SWP and ecosystem restoration.

Changes in reservoir surface water elevations, agricultural resources, and land use are described in more detail in Chapter 5, Surface Water Resources and Water Supplies; Chapter 12, Agricultural Resources; and Chapter 13, Land Use, respectively.

### 14.1.1 Visual Effects

Natural and artificial landscape features contribute to perceived visual images and aesthetic values of views. The values of views frequently are determined by contrasts of forms and textures related to geology, hydrology, vegetation and wildlife, agricultural crops, and other land uses. For example, a small water feature in a plain may be a significant visual feature; however, a small water feature within an area with vast rivers or larger ponds may be of less significance.

Visual effects are dependent upon the viewpoint of individuals because each person can respond differently to changes in the physical environment depending upon expectations, historical perspective, duration and frequency of the views, and extent of a viewshed. A viewshed is defined by the Federal Highway Administration (DOT 1981) as a surface area visible from a particular location. The character of a viewshed can also vary daily, seasonally, and with changing weather.

Visual effects also are affected by the general activities of the viewers. Passengers in automobiles and trains with relatively short exposure to views may have a different experience than recreationists or residents who view the area for longer periods of time. Residents and recreationists frequently select a location for their activities due to the views. Changes in views could affect the quality of their activities, including housing, camping, hiking, or boating locations. Therefore, changes in visual effects are dependent upon the visual quality of the landscape within the context of the setting (DOT 1981).

Visual quality, or scenic value, has been classified with respect to the lines, forms, colors, textures, and composition of landforms, vegetation, rocks, cultural features, and water features by the U.S. Department of Agriculture (USDA), Forest Service (USDA 1995). The classification system includes Class A, Distinctive; Class B, Typical (or ordinary or common features); and Class C, Indistinctive. This classification system also considers the scenic integrity, or the completeness of the landscape character.

# 14.2 Regulatory Environment and Compliance Requirements

Potential actions that could be implemented under the alternatives evaluated in this EIS could affect visual resources at reservoirs and lands served by CVP and SWP water supplies. Actions located on public agency lands or implemented, funded, or approved by Federal and state agencies, would need to be compliant with appropriate Federal and state agency policies and regulations, as summarized in Chapter 4, Approach to Environmental Analysis.

# 14.3 Affected Environment

This section describes visual resources that could be potentially affected by the implementation of the alternatives considered in this EIS. Changes in visual resources due to changes in CVP and SWP operations may occur in the Trinity River, Central Valley, San Francisco Bay Area, and Central Coast and Southern California regions.

Physical form and visual character are the result of the interaction of natural and engineered elements. Natural elements, including topography, hydrology, vegetation, and climate create the physical context. Engineered elements, such as buildings, roads, infrastructure, and settlement patterns, are secondary elements that act on the natural physical context to establish a visual environment.

Both the natural and engineered landscape features contribute to perceived views and the aesthetic value of those views. In areas considered to have high resource value and scenic character, it is important to evaluate and protect the visual character and aesthetic value of landscapes that may to undergo alteration.

## 14.3.1 Trinity River Region

The Trinity River Region includes the area along the Trinity River from Trinity Lake to the confluence with the Klamath River, and along the Klamath River from the confluence with the Trinity River to the Pacific Ocean.

### *14.3.1.1 Trinity River Watershed*

The Trinity River drains an area of the Coast Range, northwest of the Sacramento Valley. Dams on the river form Trinity Lake and Lewiston Lake, both of which are in the Whiskeytown-Shasta-Trinity National Recreation Area, as described in Chapter 15, Recreation Resources. The Trinity River flows through sparsely populated and heavily forested, mountainous terrain, jagged cliffs that can be viewed during numerous recreational opportunities, including fishing, rafting, kayaking, and canoeing. The forests offer visual resources which include snow-covered peaks, volcanoes, rock outcroppings, mountain creeks, lakes, meadows, and a wide variety of trees and vegetation. Downstream of Lewiston Dam, the Trinity River corridor is characterized by gravel bars, riparian vegetation, and human-built features (NCRWQCB et al. 2009). Artificial lights occur related to passing vehicles and local residential and commercial buildings. Glare related to the water surfaces may occur from some view locations.

##### 14.3.1.1.1 Wild and Scenic Rivers and Scenic Highways in the Trinity River Watershed

On January 19, 1981, the Secretary of the Interior designated portions of the Trinity River watershed as part of the National Wild and Scenic Rivers System, including the Trinity River downstream of Lewiston Dam, and portions of the South Fork, North Fork, and New River (BLM et al. 2012). The State of California adopted similar reaches as wild and scenic under Public Resources Code sections 5093.54 and 5093.545.

The Trinity River Region includes two highways in Trinity County and one highway in Humboldt County that are eligible for State Scenic Highway designations. The two highways in Trinity County are eligible for State Scenic Highway designation and include the Siskiyou-Trinity Scenic Byway (State Route 3, which extends from south of Hayfork to north of Trinity Lake to Interstate 5) and Trinity Scenic Byway (State Route 299, which extends from the Pacific Ocean to Redding) (CalTrans 2014a). In Humboldt County, State Route 96 along the Trinity River from Willow Creek to the confluence with the Klamath River is eligible for State Scenic Highways designation (CalTrans 2014b).

#### *14.3.1.2 Lower Klamath River Watershed*

The Klamath River from the confluence with the Trinity River to the Pacific Ocean is characterized by a forested river canyon with riparian vegetation along the river. Reduced flows in the summer have frequently resulted in algal blooms which has reduced water clarity and visual quality of the river corridor (DOI and DFG 2012).

##### 14.3.1.2.1 Wild and Scenic Rivers and Scenic Highways in the Klamath River Watershed

The portion of the Klamath River watershed within the Trinity River Region considered in this EIS (from the confluence with the Trinity River to the Pacific Ocean) was designated as part of the entire reach of the Klamath River from Iron Gate to the Pacific Ocean by the Secretary of the Interior to be part of the National Wild and Scenic Rivers System on January 19, 1981. The State of California also adopted this reach of Klamath River as wild and scenic under Public Resources Code sections 5093.54 and 5093.545.

Caltrans has not designated highways within the Klamath River watershed in the Trinity River Region as Scenic Highways or identified roadways to be eligible for Scenic Highways status (CalTrans 2014b, 2014c).

## 14.3.2 Central Valley Region

The Central Valley Region extends from above Shasta Lake to the Tehachapi Mountains, and includes the Sacramento Valley, San Joaquin Valley, Delta, and Suisun Marsh.

The Central Valley Region is predominantly made up of lowlands and plains surrounded by foothills and tall mountains of the Coast Range to the west, the Cascade Range to the north, the Sierra Nevada to the east, and the Tehachapi Mountains to the south. Communities and roadways of various sizes are located throughout the valley. Land use outside of the communities is primarily agricultural, with riparian, wetland and oak woodlands along the major waterways.

### *14.3.2.1 Sacramento Valley*

The Sacramento Valley extends from the northern mountainous areas to the less dramatic landscapes of the Central Valley at the lower elevations. The mountainous areas are characterized by rugged and deep river canyons and valleys that extend from jagged peaks to forested areas with pine and deciduous trees. Large rivers flow from the mountain areas through the foothills into the agricultural areas and communities along the valley floor. Oak woodlands are located at middle and lower elevations of the foothills and along riparian corridors on the valley floor.

The Sacramento Valley extends from Shasta Lake and Whiskeytown Lake to the Delta. The Sacramento Valley portion of the Central Valley Region considered in this EIS includes the middle and lower portions of the Feather River and American River watersheds that are influenced by CVP and SWP water supply facilities, respectively.

#### 14.3.2.1.1 Shasta Lake, Keswick Reservoir, and Whiskeytown Lake

Shasta Lake, Keswick Reservoir, and Whiskeytown Lake are in the Whiskeytown-Shasta-Trinity National Recreation Area, as described in Chapter 15, Recreation Resources. These watersheds provide opportunities for high quality visual attractions, such as mountains, forests, waterfalls, streams, open water, and vistas of the sky that can be experienced during numerous recreational activities such as boating, water skiing, swimming, fishing, camping, picnicking, hiking, hunting, and mountain biking. Panoramic views for travelers through the area can be seen from many locations, including State Route 151 vista point, Shasta Dam Visitor Center, and Interstate 5. The contrast between the open water bodies and surrounding mountains provides a wide diversity of views. The quality and diversity of visual resources at the lakes and the surrounding areas is influenced by human-built features such as highways, railroads, resorts, bridges, communities, and electrical transmission facilities. The visual quality of open waters also is influenced by fluctuating water levels. Typically, the water levels decline from an annual maximum in May to a minimum in October. In extremely dry years, exposed bare mineral soils in a “bathtub ring” are in substantial contrast to the open water and the upslope vegetation (Reclamation 2013a).

Between the lakes, pine and oak forests predominate, with intermittent chaparral and rock outcrops. The landscape includes mountain ranges, volcanoes, and waterways, opening below the reservoir to the agricultural vistas and communities of the Central Valley.

#### 14.3.2.1.2 Sacramento River Watershed: Keswick Reservoir to Feather River

The scenic qualities of the upper reaches of the Sacramento River watershed south of Keswick Reservoir are generally considered to be of high quality, especially in areas where little to no development has occurred. Varied topography, geologic formations, and natural and manmade water bodies provide striking vistas. Similar conditions are found in the Sierra Nevada Mountains and foothills near the upper and middle Feather, Yuba, American, Mokelumne, Calaveras, and Stanislaus rivers watersheds.

The foothills provide views of rolling hills, open grasslands, and scattered oak and pine woodlands. In the lower elevations of the Central Valley, the human-built environment becomes more dominant, and detracts from views of the natural landscape. Outside of the urban and suburban areas, land use is rural in character, with agricultural areas that include irrigated row crops, orchards, and grazing lands. Sporadically, flooded agricultural fields, especially rice fields managed for wetlands, are used heavily by migrating birds.

Between the Keswick Reservoir and Feather River confluence with the Sacramento River, the landscape also includes human-built reservoirs and canals. Black Butte Reservoir is operationally integrated with the CVP, and the canal system includes the CVP Corning Canal, Tehama-Colusa Canal, and Glenn-Colusa Irrigation District’s canal. The canals provide visual interest in localized areas with limited viewing opportunities (Reclamation 1997).

Visual resources that could be affected in the Feather River and American River watersheds are described below. The remaining portions of the Sacramento Valley between the Feather River and the San Francisco Bay Area Region includes the Delta (described in following subsections of this chapter) and areas located to the east and west of the Delta. Land uses located to the south of the Feather River and outside of the Delta include agricultural, open space, and major urban centers that all use SWP water supplies. The urban areas include the cities of Vacaville, Fairfield, and Vallejo in Solano County and unincorporated areas of Napa County.

*Scenic Highways in the Sacramento River Area*

In the Sacramento Valley portion of the Central Valley Region, there are several designated State Scenic Highways and several roads that are eligible for this designation, including the following roadways:

- Shasta County: State Route 151 from Shasta Dam to Lake Boulevard is designated as a State Scenic Highway due to views of the Sacramento River, Shasta Lake, and distant hills. State Routes 299, 44, and 89 are eligible for State Scenic Highway designation (CalTrans 2014a, 2014d).

- Tehama County: State Routes 89 and 36 are eligible for State Scenic Highway designation (CalTrans 2014e).
- Yolo County: A portion of State Route 16 is eligible for State Scenic Highways designation (CalTrans 2014f).
- Solano County: A portion of State Route 37 is eligible for State Scenic Highways designation (CalTrans 2014g).
- Napa County: Portions of State Routes 29 and 121 are eligible for State Scenic Highways designation (CalTrans 2014h).

#### 14.3.2.1.3 Feather River Watershed

Antelope Lake, Lake Davis, Frenchman Lake, Lake Oroville, and Thermalito Afterbay on the Feather River are human-built reservoirs providing visual contrast with surrounding terrain.

*Upper Feather River*

Antelope Lake, Lake Davis, and Frenchman Lake are located in the upper Feather River watershed (DWR 2013a; USFS 2006a, 2006b, 2011). Antelope Lake, located on Indian Creek, has the longest dam of the three reservoirs. This remote lake, surrounded by pine and fir trees, can be viewed from Fruit Growers Boulevard and Indian Creek Road. Lake Davis is formed by Grizzly Dam on Big Grizzly Creek, and is the largest of the three dams. It is located in the upper watershed surrounded by many trees, and can be viewed from Beckwourth-Taylorsville Road and Lake Davis Road. Frenchman Lake, located on Last Chance Creek, is formed by the tallest dam of the three dams. This lake also is surrounded by trees to the waterline and can be viewed from Little Last Chance Creek Road and Frenchman Lake Road.

*Lake Oroville and Thermalito Reservoir*

The terrain adjacent to Lake Oroville is generally quite steep with limited vehicular access. Most views of the water are from the bridges on State Route 162, State Route 70, and several county roads. Some residents live in the lands around Lake Oroville and Thermalito Afterbay. The residents can easily view the water and visitors can view the structures. As described above for Shasta Lake and other reservoirs in the upper Sacramento River watershed, Lake Oroville water levels decline as summer progresses, leaving a ring of bare soil along the water's edge. In extremely dry years at Lake Oroville, more than 200 vertical feet of bare mineral soils in a "bathtub ring" may be exposed when the surface water elevation approaches 710 feet above mean sea level (DWR 2007).

The Diversion Pool between Oroville Dam and Thermalito Diversion Dam extends about 4.5 miles along the Feather River and meanders through hillsides with substantial vegetation within widths ranging from 50 to 200 feet (DWR 2007). Vistas of the Diversion Pool are primarily viewed by recreationists on the water or along the adjacent trails. A 1.9-mile-long concrete Thermalito Power Canal appears as a contrast from State Route 70 and county roads to the undeveloped landscape between the Diversion Dam and the Thermalito Forebay.

The Thermalito Forebay is a 630-acre reservoir, approximately 3 miles in length that can be viewed by recreationists along or within the open water and travelers along State Route 70 as the roadway extends from the foothills to the valley floor. Water levels in these human-built features generally vary by 2 to 4 feet during a week. When the water levels are low, exposed bare soils create a "bathtub ring" effect.

Thermalito Afterbay is located in a more flat terrain than Lake Oroville and can be viewed from many locations and residences. The Thermalito Afterbay Dam is located parallel to State Route 99 and rises over 30 feet above the roadway (DWR 2007). The Thermalito Afterbay is approximately 4,300 acres and is visible from State Route 162, several county roads, recreation areas, and neighboring residences. Because the afterbay is located on flat lands with minimal foothills, vistas from the water or lands surrounding the afterbay extend from the Sierra Nevada foothills to the Feather River on the valley floor. Water levels in the afterbay generally vary by 2 to 6 feet during a week, but can decline by as much as 11 feet. When the water levels are low, exposed bare soils create a "bathtub ring" effect.

The low flow channel of the Feather River extends from the Diversion Dam through the community of Oroville (DWR 2007). Urban land uses and other buildings, including the Feather River Fish Hatchery, are located along the channel upstream of the State Route 70 bridge. The Oroville Wildlife Area extends from State Route 70 on the east, downstream of the bridge, and includes the Thermalito Afterbay area. Dredge tailings from hydraulic mining that occurred over 100 years ago occur along the low flow channel with some of the tailings reaching heights of more than 40 feet above the roadway.

*Wild and Scenic Rivers and Scenic Highways in the Feather River Watershed*

Within the Central Valley Region considered in this EIS, the Middle Fork Feather River (from Beckworth to Lake Oroville) was designated as part of Public Law 90-542 (Wild and Scenic Rivers Act) to be part of the National Wild and Scenic Rivers System on October 2, 1968.

In the Feather River watershed and adjacent Bear River watershed of the Central Valley Region, there is one designated State Scenic Highway and several roads that are eligible for this designation, including the following roadways.

- Butte County: State Route70 is eligible for State Scenic Highways designation (CalTrans 2014i).
- Plumas County: State Routes 70 and 89 are eligible for State Scenic Highways designation (CalTrans 2014j).
- Nevada County: State Route 20 from Skillman Flat Campground to half-mile east of Lowell Hill Road is designated as a State Scenic Highway and a U.S. Forest Service (USFS) Scenic Byway due to views of pine forests and results of hydraulic mining. Interstate 80 and State Routes 20, 49, and 174 are eligible for State Scenic Highways designation (CalTrans 2014k).

#### 14.3.2.1.4 Yuba River Watershed

The middle and lower Yuba River watershed extends through Nevada and Yuba counties. Upstream of New Bullards Bar Reservoir, the watershed is characterized by coniferous, mixed conifer/hardwood, and ponderosa pine forests along steep canyons. Most of the upper watershed is undeveloped with rural communities located along State Route 49 (DWR et al. 2007).

New Bullards Bar Reservoir, on the Yuba River and in Yuba County, is a human built reservoir providing visual contrast of the lake surface with mountainous landscape with conifers and mixed hardwood forests (DWR et al. 2007). There are many locations in the watershed to view the lake and the adjacent forests. Recreational developments are located near the marina and campgrounds near the shoreline.

Downstream of New Bullards Bar Reservoir along the Middle Yuba River and to Englebright Reservoir (located in Nevada and Yuba counties), the landscape is characterized by rolling hills with hardwood and coniferous trees and grasslands (DWR et al. 2007, USACE 2012). This portion of the watershed is rural with communities located along State Route 20.

Downstream of Englebright Reservoir, the landscape includes grasslands and agricultural fields with several small communities (USACE 2012). Along the river, the landscape is dominated by remnants of historic gold and gravel mining and ongoing gravel mining activities with minimal riparian vegetation. This portion of the watershed can be viewed from State Route 20.

#### 14.3.2.1.5 Middle and Lower American River Watershed

The middle and lower American River watershed extends through Placer, El Dorado, and Sacramento counties. Upstream of Folsom Dam, much of Placer and El Dorado counties are characterized by undeveloped rolling grasslands and oak woodlands with sporadic agricultural activities related to orchards, vineyards, ornamental flowers, and Christmas tree farms in the wooded foothills. Communities have been developed throughout the counties especially near Interstate 80, U.S. Highway 50, and State Routes 49 and 89.

Folsom Lake, on the American River, is a human built reservoir providing visual contrast with the foothill landscape. Views from the water surface provide panoramic vistas of the foothills with open grasslands, oak woodlands, and pine woodlands. Folsom Lake is generally considered to provide a pleasing visual setting for recreationists, residences, and from roadways along the foothills above the reservoir, especially from the Lake Overlook and the Folsom Dam Observation Point vista points. Increased population in the communities around the lake have provided more scenic view points, including increased vistas of human-built structures such as electric transmission facilities, roadways, dams, and residential subdivisions. Reservoir levels fluctuate and decline as summer progresses, leaving a “bathtub ring” of bare soil along the water’s edge. The visual quality also degrades because visitors drive vehicles onto the exposed soils which cause tire tracks and erosion (Reclamation et al. 2006).

Lake Natoma extends from Folsom Dam along the American River to Nimbus Dam. The land along the river is mostly undeveloped and includes wooded canyon areas, sheer bluffs, and dredge tailings from the gold mining era. Residential and community developments have been constructed along the foothills that overlook the canyon, and these structures can be seen by recreationists from the water or adjacent trails. Lake Natoma can be viewed from U.S. Highway 50 and local roads.

Downstream of Nimbus Dam to Gristmill Recreation Area (downstream of William B. Pond Recreation Area and approximately 2 miles upstream from the Watt Avenue Bridge), the American River flows through a landscape characterized by steep bluffs, terraces, mid-river sand and gravel bars, backwater areas along the edges, and riparian vegetation. This viewshed is seen from the recreational areas on the water and adjoining trails, from the bridge crossings, and from residences along the terraces and foothills. Downstream of the Gristmill Dam Recreation Area, the visual characteristics are less complex with an increased number of bridges, water treatment plant intake, and artificial bank protection. The communities along the American River corridor include the cities of Folsom, Roseville, Rancho Cordova, and Sacramento and unincorporated areas. The communities, transportation infrastructure, and water-river corridor are visible from multiple vantage points.

*Wild and Scenic Rivers and Scenic Highways in the American River Watershed*

Within the American River watershed, the Lower American River from Nimbus Dam to the confluence with the Sacramento River were designated by the Secretary of the Interior to be part of the National Wild and Scenic Rivers System on January 19, 1981. The State of California also designated the Lower American River as wild and scenic under Public Resources Code sections 5093.54 and 5093.545. In addition, the state designated the North Fork American River from the source to Iowa Hill Bridge as wild and scenic.

In the portion of the American River watershed in the study area of this EIS, there is one roadway designated as a State Scenic Highway and one road that is eligible for this designation. In El Dorado County, U.S. Highway 50 from Government Center Interchange in Placerville to South Lake Tahoe is designated as a State Scenic Highway due to vistas of the American River canyon, suburban foothills, granite peaks, and Lake Tahoe. Also in El Dorado County, State Route 49 is eligible for State Scenic Highways designation (CalTrans 2014l).

#### ***14.3.2.2 San Joaquin Valley***

The San Joaquin Valley land cover ranges from high alpine vegetation near the crest of the Sierra Nevada Mountains, through coniferous forest, mixed forest, oak woodlands and oak savanna, to grasslands and agricultural areas at the lower elevations (Reclamation 1997, 2005a, 2005b). Water bodies include reservoirs, natural lakes and ponds, rivers, and tributary streams. The human-built environment is more dominant at lower elevations, and includes roadways, communities, roadside businesses, and transmission lines, detracting from views of the natural environment. On the valley floor, the San Joaquin Valley is characterized by agricultural lands, including many that are irrigated with CVP and/or SWP water supplies. The valley is arid to semi-arid, and there are few natural lakes or streams on the valley floor.

Several wetlands have been established as wildlife refuges in the San Joaquin Valley (as described in Chapter 10, Terrestrial Biological Resources), providing views of water and vegetation, enhanced seasonally by waterfowl and seasonal wildflowers.

The predominant land use is agricultural, with sparse to moderate populations. Interstate 5 and major railroads pass along the western San Joaquin Valley at the base of the Coast Ranges foothills. State Route 99 and other railroads are located along the eastern San Joaquin Valley at the base of the Sierra Nevada foothills. Interstate 580 and State Routes 152, 198, and 46 cross the San Joaquin Valley from east to west between Interstate 5 and State Route 99. Larger cities have been established in the northern San Joaquin Valley, including Lodi, Stockton, Lathrop, Manteca, and Tracy; and along State Route 99, including Merced, Fresno, Visalia, and Bakersfield. Both Interstate 5 and State Route 99 are extensively traveled and provide numerous viewing opportunities.

#### 14.3.2.2.1 Northern San Joaquin Valley

In the northern San Joaquin Valley, the foothills range from rolling hills to mountainous terrain with riparian corridors that range from narrow canyons to alluvial plains. The San Joaquin, Stanislaus, Merced, and Tuolumne rivers are the principal water features that flow from the Sierra Nevada foothills. One or more reservoirs are located along each of these rivers, including the CVP New Melones Reservoir on the Stanislaus River and Millerton Lake on the San Joaquin River. Other reservoirs are owned and operated by local and regional water suppliers, as described in Chapter 5, Surface Water Resources and Water Supplies. Dredge tailings have been deposited along some of the rivers as the streams flow from the mountains into the foothills.

The CVP New Melones Reservoir is located in the western foothills of the Sierra Nevada along the Stanislaus River. The area is characterized by foothills, ridges, and small valleys with vegetated slopes and the open water surface (Reclamation 2010). The vegetation is primarily grasslands and oak woodlands with varying densities, with gray pine and low shrubs along some slopes. Views of the water are primarily from the water surface, adjacent recreation areas, and State Route 49. The surrounding lands are rural and undeveloped except for the infrastructure associated with the dam, canals, and power generation facilities and some minor structures associated with the recreation areas and utility lines. When the reservoir is drawn down, broad bands of bare soil are exposed.

Millerton Lake also is located in the western foothills of the Sierra Nevada along the San Joaquin River in an area that ranges from grasslands and rolling hills near Friant Dam to steep, craggy slopes in the upper reaches of the lake (Reclamation et al. 2011a). The lake, dam infrastructure, and surrounding hills can be viewed from the lake surface and adjacent county roads. Development has occurred along the hillsides that can be viewed from the lake surface and adjacent recreation areas; however; future development will be regulated by Madera and Fresno counties to protect visual and scenic resources. When the reservoir is drawn down, broad bands of bare soil are exposed. The Madera Canal and Friant-Kern Canal extend from Millerton Lake to the north and south, respectively. The canals are located along the Sierra Nevada foothills through mostly agricultural landscapes and limited residences (Reclamation et al. 2011, Reclamation 1997). The canals are only intermittently visible from county roads.

#### 14.3.2.2.2 Western San Joaquin Valley

The Coast Range foothills on the western side of the northern San Joaquin Valley are sparsely populated and characterized by mountainous to hilly terrain with grasslands and scattered oak woodlands along narrow streams. The CVP and SWP San Luis Reservoir complex is located within the western foothills; and the CVP and SWP water supply canals are located at the base of the foothills to the north and south of the San Luis Reservoir.

The CVP and SWP water supply facilities are prominent features in the viewshed of the San Joaquin Valley, including facilities at or near San Luis Reservoir, Delta-Mendota Canal, San Luis Canal-California Aqueduct, Cross Valley Canal, New Melones Reservoir, and Millerton Lake. The San Luis Reservoir, O'Neill Forebay, and Los Banos Creek Reservoir are located in northwestern San Joaquin Valley. State Route 152 is located along the northern and eastern rims of San Luis Reservoir and the western rim of O'Neill Forebay (Reclamation and State Parks 2013). O'Neill Forebay and Los Banos Creek Reservoir can be seen to the west from Interstate 5. The reservoirs are also part of the visual resources for the San Luis Reservoir State Recreation Area, Pacheco State Park, and Upper and Lower Cottonwood Wildlife Areas (which are described in Chapter 10, Terrestrial Biological Resources, and Chapter 15, Recreation Resources). The shorelines of the reservoirs are undeveloped, except for recreational facilities. Views included annual grassland, coastal sage, and riparian woodland. When the reservoirs are drawn down, broad bands of bare soil are exposed. Open water viewing opportunities also occur to the south of the San Luis complex at the Little Panoche Reservoir located to the west of Interstate 5.

The open water and canal infrastructure of the Delta-Mendota Canal, San Luis Canal-California Aqueduct, Cross Valley Canal, and irrigation district canals can be viewed from Interstate 5 and the railroad lines along the western San Joaquin Valley. The open water of Mendota Pool is located at the terminus of the Delta Mendota Canal and can be viewed from county roads.

#### 14.3.2.2.3 Southern San Joaquin Valley

In the southern portion of the San Joaquin Valley, the Kings, Kaweah, Tule, and Kern rivers are the principal water features along the eastern Sierra Nevada foothills. One or more reservoirs are located along each of these rivers. Riparian vegetation and oak woodlands occur along these river corridors. The western Coast Ranges foothills are characterized by distinct, folded foothills with grasslands and infrequent oak woodlands along small drainages. The Tehachapi Mountains rise abruptly along the southern boundary of the valley.

#### 14.3.2.2.4 Wild and Scenic Rivers and Scenic Highways in the San Joaquin Valley

In the San Joaquin Valley within or near the Central Valley Region considered in this EIS, four rivers were designated to be part of the National Wild and Scenic Rivers System. Portions of the Tuolumne River from the source waters to Don Pedro Reservoir were designated through Public Law 98-425 as wild and scenic. Portions of the Merced River were designated through Public Laws 100-149 and 102-432 as wild and scenic, including the entire South Fork and the mainstem from the source waters to Lake McClure. Portions of the Kings River were designated as wild and scenic through Public Law 100-150, including the Middle Fork and South Fork from their respective sources to the confluences with the mainstem; and the mainstem from these confluences to an elevation of 1595 feet above mean sea level (upstream of the confluence with the North Fork and Pine Flat Lake). Portions of the Kern River were designated as wild and scenic through Public Law 100-174, including the North Fork from the source to the Tulare County/Kern County boundary; and the South Fork from the source to the Domeland Wilderness. Most of these reaches are located outside of the Central Valley Region; however, the flows from these reaches could influence the visual resources of downstream reaches in the Central Valley Region.

In the San Joaquin Valley of the Central Valley Region, there are five roadway sections designated as a State Scenic Highway and seven roadway sections that are eligible for this designation.

- San Joaquin County and Alameda County: Interstate 580 from Interstate 5 to State Route 205 is designated as a State Scenic Highway due to vistas of the Coast Ranges and Central Valley. Interstate 5 from the Stanislaus County boundary to Interstate 580 is designated as a State Scenic Highway due to vistas of agricultural lands and the Delta Mendota Canal and California Aqueduct (CalTrans 2014m, 2014n).
- Stanislaus County: Interstate 5 from the San Joaquin County boundary to the Merced County boundary is designated as a State Scenic Highway due to vistas of agricultural lands and the Delta Mendota Canal and California Aqueduct (CalTrans 2014o).
- Merced County: Interstate 5 from State Route 152 to the Stanislaus County boundary is designated as a State Scenic Highway due to vistas of agricultural lands and the Delta Mendota Canal and California Aqueduct (CalTrans 2014p). State Route 152 from Interstate 5 to the Santa Clara County boundary is designated as a State Scenic Highway due to vistas of agricultural lands and the San Luis Reservoir State Recreational Area.
- Fresno County: State Routes 168, 180, and 198 are eligible for State Scenic Highways designation (CalTrans 2014q).

- Tulare County: State Routes 190 and 198 are eligible for State Scenic Highways designation (CalTrans 2014s).
- Kern County: State Routes 14 and 58 are eligible for State Scenic Highways designation (CalTrans 2014t).

#### *14.3.2.3 Delta and Suisun Marsh*

Most of the Delta is used for agricultural purposes with major waterways and sloughs that connect the Sacramento, San Joaquin, Mokelumne, Cosumnes, and Calaveras rivers (CALFED 2000). Flood management and irrigation facilities include levees, impoundments, pumping plants, and control gate structures. Bodies of open water occur where historic levee failures were not repaired, including Franks Tract and Liberty Island. The Sacramento Deep Water Ship Channel is a larger water feature between levees that extends from the Sacramento River near Rio Vista to West Sacramento. Cities within the Delta include the southern portion of Sacramento, Isleton, West Sacramento, Rio Vista, Lathrop, western portions of Stockton and Manteca, Tracy, Brentwood, Oakley, Antioch, and Pittsburg. Small communities to serve the agriculture and recreation users include Freeport, Clarksburg, Hood, Courtland, Locke, Walnut Grove, Ryde, Thornton, Knightsen, and Collinsville. Vistas of the Delta can be seen from residences and agricultural areas in the Delta, open water areas used by recreationists, and from vehicles on roadways and railroads that cross the Delta. Waterfront industries are located along the rivers, especially along the San Joaquin River.

The Suisun Marsh is characterized by tidal and freshwater wetlands and riparian woodlands (Reclamation et al. 2010). The area is bounded by Interstate 80 and State Route 12 on the north; the Montezuma Hills and Sulphur Springs Mountains on the east and west, respectively; and on the south by the open waters of Suisun Bay, Grizzly Bay, and Honker Bay with adjoining wetlands, marshes, and riparian forests. The marsh is relatively flat and comprised primarily of tidal marsh and submerged lands. Upland areas serve as a backdrop with grasslands and nearby rolling foothills. Vistas of Suisun Marsh can be viewed from adjacent roadways railroads; roads and trails within the marsh; a few residences within the marsh; and open water that can be accessed by boats, kayaks, and canoes. Much of Suisun Marsh is managed wetlands and provides habitat for resident and migrating birds and waterfowl.

##### 14.3.2.3.1 Scenic Highways in the Delta

In the Delta and Suisun Marsh portion of the Central Valley Region, there two roadway sections designated as a State Scenic Highway and two roadway sections that are eligible for this designation.

- Sacramento County: State Route 160 between the southern limits of the City of Sacramento to the Contra Costa County boundary is designated as a State Scenic Highway due to the views of historic Delta agriculture and small towns along the Sacramento River (CalTrans 2014u).

- Contra Costa County: State Route 160 from the Antioch Bridge to State Route 4 and State Route 4 continuing on towards Brentwood are eligible for State Scenic Highways designation (CalTrans 2014v).

### 14.3.3 San Francisco Bay Area Region

The San Francisco Bay Area Region includes portions of Contra Costa, Alameda, Santa Clara, and San Benito counties that are within the CVP and SWP service areas. The San Francisco Bay Area Region ranges in topography from sea level to the East Bay and South Bay foothills that reach elevations of 3,500 feet and higher (CALFED 2000; WTA 2003; Reclamation 2005c). It offers a diverse physical and natural environment, and a wide range of visual resources. Typical views and landscapes include urban development, natural and altered open-space areas, major ridgelines, and scenic waterways. The terrain ranges from alluvial plains to gently sloping hills and wooded ravines. Striking views of iconic scenes are available throughout the area, of San Francisco Bay, the San Francisco skyline, Angel Island, Mount Tamalpais, Peninsula foothills, and the East Bay hills. Views to the east are dominated by Mount Diablo and adjacent Diablo Ridge and valleys. Views in the South Bay extend through the baylands that extend along the Contra Costa, San Mateo, Santa Clara, and Alameda counties shorelines; the river floodplains of the Guadalupe River and Coyote Creek in Santa Clara County; and towards the Santa Cruz Mountains (Santa Clara County 1994).

Urban and industrial areas are located throughout the San Francisco Bay Area Region, including along the San Francisco Bay shoreline. Smaller, localized scenic resources include wetlands, isolated hilltops, rock outcroppings, mature stands of trees, lakes, reservoirs, and other natural features. City parks and recreation areas, open-space areas adjacent to ravines, golf courses, and resource preserves provide visual opportunities in urban areas. The reservoirs that store CVP or SWP water or water from other surface water sources are human built reservoirs located in the foothills or at the edge of the foothills. The water can be viewed from roadways located at elevations higher than the reservoirs and by recreationists on the reservoirs. Agricultural areas that use CVP and SWP water are located within coastal valleys especially within the Livermore-Amador valleys of Alameda County, southern Santa Clara County, and northern San Benito County.

#### *14.3.3.1 Scenic Highways in the San Francisco Bay Area Region*

In the San Francisco Bay Area Region, there are four roadway sections designated as a State Scenic Highway and five roadway sections that are eligible for this designation.

- Contra Costa County: State Route 24 from the Alameda County boundary to Interstate 680, and Interstate 680 from State Route 24 to Interstate 580 at the Alameda County boundary are designated as State Scenic Highways due to the views of Mount Diablo and attractive residential and commercial areas (CalTrans 2014v).

- Alameda County: Interstate 580 between Interstate 80 and State Route 92 are designated as a State Scenic Highways (CalTrans 2014n). Portions of Interstate 680 from the Contra Costa County boundary to Mission Boulevard in Fremont and portions of State Route 84 are designated as State Scenic Highways due to vistas of wooded hillsides and valleys. Other portions of Interstate 580 are eligible for State Scenic Highways designation.
- Santa Clara County: Portions of State Routes 152 and 280 within the San Francisco Bay Area Region are eligible for State Scenic Highways designation (CalTrans 2014w).
- San Benito County: Portions of State Routes 156 and 25 within the San Francisco Bay Area Region are eligible for State Scenic Highways designation (CalTrans 2014x).

### 14.3.4 Central Coast and Southern California Regions

The Central Coast and Southern California Regions include portions of San Luis Obispo, Santa Barbara, Ventura, Los Angeles, Orange, San Diego, Riverside, and San Bernardino counties served by the SWP.

Areas along the Pacific Coast in San Luis Obispo, Santa Barbara, Ventura, portions of Los Angeles, portions of Orange, and San Diego counties are characterized by steep, craggy coastal mountains and coastal plains that can be viewed from the roadways, residences, and the Pacific Ocean. The visual resources include beaches, sand dunes, coastal bluffs, headlands, wetlands, estuaries, islands, hillsides, and canyons (Santa Barbara County 2009, SBCAG 2013). The foothills extend from the Pacific Ocean to more than 800 feet above mean sea level; and the mountains extend to more than 3,000 feet above mean sea level. The foothills are generally covered with mature trees and shrubs, including native oaks, deciduous trees, and eucalyptus. The coastal plains gradually slope towards the foothills with streams through the plains. Small to medium size communities occur along the coast and the coastal plains in San Luis Obispo, Santa Barbara, and Ventura counties and within portions of the coastline in Los Angeles, Orange and San Diego counties. Larger communities also are located along the coastline separated by large areas of undeveloped lands.

Inland from the Pacific Ocean, urban areas extend throughout large portions of the foothills and valleys of Los Angeles, Orange, San Diego, Riverside, and San Bernardino counties. Reduced abundance of natural features, vistas, and non-urban land uses may diminish the visual resources for many viewers (SCAG 2010). However, in many inland areas urban areas are separated by areas of undeveloped or agricultural lands, especially in Riverside and San Bernardino counties. Minimal development has occurred within the higher elevations of the Central Coast and Southern California regions, as described in Chapter 13, Land Use. Therefore, the mountainous areas (such as the San Gabriel, Santa Monica, Santa Ana, Santa Rosa, and San Jacinto mountains) provide dramatic viewsheds from the valleys (Los Angeles 2011, RCIP 2000, San Bernardino County 2007). The mountains also are characterized by deep canyons, rock outcroppings, and sparse vegetation. In the Coachella Valley portion of Riverside County, the visual resources are dominated by dramatic vistas of the Santa Rosa, San Jacinto, San Bernardino, Cottonwood, and Chocolate mountains with high desert craggy rock outcroppings and sparse vegetation. The Salton Sea in the southern Coachella Valley provides dramatic vistas from the shoreline and highways that extend around the open water.

The inland areas also include major surface water resources that provide open water vistas, including Twitchell Reservoir, Silverwood Lake, Diamond Valley Lake, Lake Perris, Lake Skinner, Vail Lake, and Lake Mathews; and smaller water supply reservoirs. Many of these reservoirs store CVP and SWP water and are human built reservoirs located in the foothills or at the edge of the foothills. The water can be viewed from highways located at elevations higher than the reservoirs and by recreationists on the reservoirs.

#### *14.3.4.1 Wild and Scenic Rivers and Scenic Highways in the Central Coast and Southern California Regions*

The wild and scenic rivers in the Central Coast and Southern California areas are not located within the study area of this EIS.

In the Central Coast and Southern California regions, there are seven roadway sections designated as State Scenic Highways and several roadway sections that are eligible for this designation.

- San Luis Obispo County: U.S. Highway 1 from the Monterey County boundary to the City of San Luis Obispo is designated as a State Scenic Highway and an All American Road due to dramatic vista along the mountains and rocky headlands of the Pacific Ocean coastline (CalTrans 2014y). Portions of State Route 41 and Interstate 101 are eligible for State Scenic Highways designation.
- Santa Barbara County: U.S. Highway 1 from Interstate 101 near Las Cruces to near Lompoc is designated as a State Scenic Highway due to dramatic vista along the mountains and rocky headlands of the Pacific Ocean coastline (CalTrans 2014z). Portions of Interstate 101 are eligible for State Scenic Highways designation.
- Ventura County: State Route 33 from the Santa Barbara County boundary to the north of the junction with State Route 150 is designated as a State Scenic Highway and a USFS Scenic Byway due to dramatic vista along the mountains between the Coast Ranges and the Central Valley with landscapes that range from pine forests to semi-desert vegetation (CalTrans 2014aa). Portions of Interstate 101 and State Routes 33 and 1 are eligible for State Scenic Highways designation.
- Los Angeles County: State Route 2 from near La Cañada-Flintridge to the San Bernardino County boundary is designated as a State Scenic Highway and a U.S. Forest Service Scenic Byway due to dramatic vista along the San Gabriel Mountains with vistas of the Mojave Desert and the Los Angeles Basin (CalTrans 2014ab). Portions of Interstate 101, 210, and 110 and State

Routes 1, 23, 27, 39, 118, and 126 are eligible for State Scenic Highways designation.

- Orange County: State Route 91 from State Route 55 to the City of Anaheim is designated as a State Scenic Highway due vistas of the Santa Ana River and urban development with intermittent riparian and chaparral vegetation (CalTrans 2014ac). State Routes 1, 57, and 74 and portions of State Route 91 are eligible for State Scenic Highways designation.
- San Diego County: State Route 75 from the City of Imperial Beach to Coronado is designated as a State Scenic Highway due to vistas of the Pacific Ocean, San Diego Harbor, and the Coronado Bridge (CalTrans 2014ad). State Route 125 between State Routes 94 and 8 is designated as a State Scenic Highway due to vistas of Mt. Helix and attractive residential and commercial areas. Interstate 5 and 8 and portions of State Routes 52, 76, and 93 within the Southern California Region are eligible for State Scenic Highways designation.
- Riverside County: State Route 243 from the City of Banning to State Route 74 is designated as a State Scenic Highway and a U.S. Forest Service Scenic Byway due to the vistas of the San Bernardino Mountains and valley (CalTrans 2014ae). Interstate 15 and State Routes 71, 74, 91, and 111 are eligible for State Scenic Highways designation.
- San Bernardino County: State Routes 2, 18, 38, 138, 173, 189, and 247 are eligible for State Scenic Highways designation (CalTrans 2014af).

## 14.4 Impact Analysis

This section describes the potential mechanisms and analytical methods for change in visual resources; results of the impact analysis; potential mitigation measures; and cumulative effects.

### 14.4.1 Potential Mechanisms for Change and Analytical Methods

As described in Chapter 4, Approach to Environmental Analysis, the impact analysis considers changes in visual resources conditions related to changes in CVP and SWP operations under the alternatives as compared to the No Action Alternative and Second Basis of Comparison.

Changes in CVP and SWP operations under the alternatives as compared to the No Action Alternative and Second Basis of Comparison could change the vistas at reservoirs that store CVP and SWP water during dry and critical dry water years and at irrigated agricultural lands during dry and critical dry water years when the crops are idled.

#### *14.4.1.1 Changes in Visual Resources at Reservoirs that Store CVP and SWP Water*

Vistas at reservoirs that store CVP and SWP water provide a wide diversity of visual experiences related to the contrasts between the open water surface and surrounding foothills or mountains. By the end of September, the surface water elevations decline, and a bare "bathtub ring" appears in contrast to the open water and the upslope vegetation. Changes in CVP and SWP operations under the alternatives could change the extent of the "bathtub" ring over the long-term average condition and in dry and critical dry years as compared to the No Action Alternative and Second Basis of Comparison.

The CalSim II model output includes monthly reservoir elevations for CVP and SWP reservoirs in the Central Valley and Trinity Lake. The end-of-September reservoir elevations in dry and critical dry water years generally indicate low reservoir elevations. To assess changes in visual resources, changes in reservoir storage elevations for the end of September in dry and critical dry years were compared between alternatives and the No Action Alternative and Second Basis of Comparison.

Reservoirs in the San Francisco Bay Area, Central Coast, and Southern California regions store water from multiple water supplies including CVP and SWP water; however, these reservoirs are not included in the CalSim II model simulation. For the purposes of this EIS analysis, changes in surface water elevations in these reservoirs were assumed to be related to changes in CVP and SWP water deliveries to the areas located to the south of the Delta.

#### *14.4.1.2 Changes in Vista at Irrigated Agricultural Lands*

Agrarian vistas of irrigated row crops, orchards, and grazing lands intermixed within a landscape of grasslands, large water canals, isolated riparian corridors, and several small communities occur throughout the Central Valley, San Francisco Bay Area, Central Coast, and Southern California regions. Changes in CVP and SWP operations under the alternatives could change the extent of irrigated acreage and the associated vistas over the long-term average condition and in dry and critical dry years as compared to the No Action Alternative and Second Basis of Comparison. However, as described in Chapter 12, Agricultural Resources, the extents of irrigated acreage between Alternatives 1 through 5 are similar to irrigated acreage under the No Action Alternative and the Second Basis of Comparison. Therefore, changes in CVP and SWP operations would not change irrigated acreage and as a result they are not analyzed in this EIS.

#### *14.4.1.3 Effects Related to Water Transfers*

Historically water transfer programs have been developed on an annual basis. The demand for water transfers is dependent upon the availability of water supplies to meet water demands. Water transfer transactions have increased over time as CVP and SWP water supply availability has decreased, especially during drier water years.

Parties seeking water transfers generally acquire water from sellers who have available surface water who can make the water available through releasing previously stored water; pumping groundwater instead of using surface water (groundwater substitution); idle crops; or substitute crops that use less water in order to reduce normal consumptive use of surface water.

Water transfers using CVP and SWP Delta pumping plants and south of Delta canals generally occur when there is unused capacity in these facilities. These conditions generally occur during drier water year types when the flows from upstream reservoirs plus unregulated flows are adequate to meet the Sacramento Valley water demands and the CVP and SWP export allocations. In non-wet years, the CVP and SWP water allocations would be less than full contract amounts; therefore, capacity may be available in the CVP and SWP conveyance facilities to move water from other sources.

Projecting future visual conditions related to water transfer activities is difficult because specific water transfer actions required to make the water available, convey the water, and/or use the water would change each year due to changing hydrological conditions, CVP and SWP water availability, specific local agency operations, and local cropping patterns. Reclamation recently prepared a long-term regional water transfer environmental document which evaluated potential changes in conditions related to water transfer actions (Reclamation 2014c). Results from this analysis were used to inform the impact assessment of potential effects of water transfers under the alternatives as compared to the No Action Alternative and the Second Basis of Comparison.

### 14.4.2 Conditions in Year 2030 without Implementation of Alternatives 1 through 5

This EIS includes two bases of comparison, as described in Chapter 3, Description of Alternatives: the No Action Alternative and the Second Basis of Comparison. Both of these bases are evaluated at 2030 conditions. Changes that would occur over the next 15 years without implementation of the alternatives are not analyzed in this EIS. However, the changes to visual resources that are assumed to occur by 2030 under the No Action Alternative and the Second Basis of Comparison are summarized in this section. Many of the changed conditions would occur in the same manner under both the No Action Alternative and the Second Basis of Comparison.

#### *14.4.2.1 Common Changes in Conditions under the No Action Alternative and Second Basis of Comparison*

Conditions in 2030 would be different than existing conditions due to:

- Climate change and sea-level rise
- General plan development throughout California, including increased water demands in portions of Sacramento Valley
- Implementation of reasonable and foreseeable water resources management projects to provide water supplies

It is anticipated that climate change would result in more short-duration high-rainfall events and less snowpack in the winter and early spring months. The reservoirs would be full more frequently by the end of April or May by 2030 than in recent historical conditions. However, as the water is released in the spring, there would be less snowpack to refill the reservoirs. This condition would reduce reservoir storage and available water supplies to downstream uses in the summer. The reduced end-of-September storage would also reduce the ability to release stored water to downstream regional reservoirs. These conditions would occur for all reservoirs in the California foothills and mountains, including non-CVP and SWP reservoirs.

These changes would result in a decline of the long-term average CVP and SWP water supply deliveries by 2030 as compared to recent historical long-term average deliveries under the No Action Alternative and the Second Basis of Comparison. However, the CVP and SWP water deliveries would be less under the No Action Alternative as compared to the Second Basis of Comparison, as described in Chapter 5, Surface Water Resources and Water Supplies, which could result in more crop-idling.

Under the No Action Alternative and the Second Basis of Comparison, land uses in 2030 would occur in accordance with adopted general plans. Development under the general plans would change visual resources, especially near municipal areas.

The No Action Alternative and the Second Basis of Comparison assumes completion of water resources management and environmental restoration projects that would have occurred without implementation of Alternatives 1 through 5, including regional and local recycling projects, surface water and groundwater storage projects, conveyance improvement projects, and desalination projects, as described in Chapter 3, Description of Alternatives. The No Action Alternative and the Second Basis of Comparison also assumes implementation of actions included in the 2008 U.S. Fish and Wildlife Service (USFWS) Biological Opinion (BO) and 2009 National Marine Fisheries Service (NMFS) BO that would have been implemented without the BOs by 2030, as described in Chapter 3, Description of Alternatives. These projects would include several projects that would affect visual resources, including:

- Restoration of more than 10,000 acres of intertidal and associated subtidal wetlands in Suisun Marsh and Cache Slough; and at least 17,000 to 20,000 acres of seasonal floodplain restoration in Yolo Bypass
- Restoration of Battle Creek
- Implementation of Red Bluff Pumping Plant

### 14.4.3 Evaluation of Alternatives

Alternatives 1 through 5 have been compared to the No Action Alternative; and the No Action Alternative and Alternatives 1 through 5 have been compared to the Second Basis of Comparison.

During review of the numerical modeling analyses used in this EIS, an error was determined in the CalSim II model assumptions related to the Stanislaus River operations for the Second Basis of Comparison, Alternative 1, and Alternative 4 model runs. Appendix 5C includes a comparison of the CalSim II model run results presented in this chapter and CalSim II model run results with the error corrected. Appendix 5C also includes a discussion of changes in the comparison of groundwater conditions for the following alternative analyses.

- No Action Alternative compared to the Second Basis of Comparison
- Alternative 1 compared to the No Action Alternative
- Alternative 3 compared to the Second Basis of Comparison
- Alternative 5 compared to the Second Basis of Comparison

#### *14.4.3.1 No Action Alternative*

The No Action Alternative is compared to the Second Basis of Comparison.

##### 14.4.3.1.1 Trinity River Region

*Potential Changes in Visual Resources at Reservoirs that Store CVP and SWP Water*

Changes in CVP water supplies and operations under the No Action Alternative as compared to the Second Basis of Comparison would result in similar end-of-September reservoir elevations (changes within 5 percent) and related visual resources at Trinity Lake in all water year types, as described in Chapter 5, Surface Water Resources and Water Supplies.

##### 14.4.3.1.2 Central Valley Region

*Potential Changes in Visual Resources at Reservoirs that Store CVP and SWP Water*

Changes in CVP water supplies and operations under the No Action Alternative as compared to the Second Basis of Comparison would result in similar end-of-September reservoir elevations and related visual resources at Shasta Lake, Lake Oroville, Folsom Lake, and New Melones Reservoir in all water year types; and at San Luis Reservoir in above-normal, below-normal, and dry years, as described in Chapter 5, Surface Water Resources and Water Supplies. Changes in visual resources at San Luis Reservoir would be reduced in wet year and critical dry years because the end-of-September surface water elevations would be reduced by 6.2 percent in wet and critical dry years.

*Effects Related to Cross Delta Water Transfers*

Potential effects to visual resources could be similar to those identified in a recent environmental analysis conducted by Reclamation for long-term water transfers from the Sacramento to San Joaquin valleys (Reclamation 2014c). Potential effects to visual resources were identified as changes in reservoir surface water elevations, streams, irrigated acreage, and water elevations in canals that would convey transferred water. The analysis indicated that these potential impacts would not be substantial because the conditions with and without the water transfers would be similar.

Under the No Action Alternative, the timing of cross Delta water transfers would be limited to July through September and include annual volumetric limits, in accordance with the 2008 USFWS BO and 2009 NMFS BO. Under the Second Basis of Comparison, water could be transferred throughout the year without an annual volumetric limit. Overall, the potential for cross Delta water transfers would be less under the No Action Alternative than under the Second Basis of Comparison.

##### 14.4.3.1.3 San Francisco Bay Area, Central Coast, and Southern California Regions

*Potential Changes in Visual Resources at Reservoirs that Store CVP and SWP Water*

Changes in visual resources at reservoirs that store CVP and SWP water supplies are assumed to be related to changes in water deliveries over long-term conditions for this EIS analysis. Monthly deliveries are not necessarily indicative of reservoir storage because all or a portion of the water deliveries could be directly conveyed to water users in any specific month. Therefore, annual deliveries are considered to be relatively proportional to the amount of water that could be stored over all water year types. In the San Francisco Bay Area Region, values for the CVP municipal and industrial water deliveries and the SWP south of the Delta water deliveries (without Article 21 deliveries) were considered; and SWP south of the Delta water deliveries (without Article 21 deliveries) were considered for the Central Coast and Southern California regions. Under the No Action Alternative as compared to the Second Basis of Comparison CVP water deliveries would be reduced by 10 percent and SWP water deliveries would be reduced by 18 percent. Therefore, for this EIS analysis, it is assumed that visual resources related to surface water elevations in reservoirs that store CVP and SWP water supplies would be reduced by 10 to 18 percent in the San Francisco Bay Area Region and 18 percent in the Central Coast and Southern California regions.

#### *14.4.3.2 Alternative 1*

Alternative 1 is identical to the Second Basis of Comparison. Alternative 1 is compared to the No Action Alternative and the Second Basis of Comparison. However, because visual resource conditions under Alternative 1 are identical to visual resource conditions under the Second Basis of Comparison; Alternative 1 is only compared to the No Action Alternative.

##### 14.4.3.2.1 Alternative 1 Compared to the No Action Alternative

*Trinity River Region*

*Potential Changes in Visual Resources at Reservoirs that Store CVP and SWP Water*

Changes in CVP water supplies and operations under Alternative 1 as compared to the No Action Alternative would result in similar end-of-September reservoir elevations and related visual resources at Trinity Lake in all water year types, as described in Chapter 5, Surface Water Resources and Water Supplies.

*Central Valley Region*

*Potential Changes in Visual Resources at Reservoirs that Store CVP and SWP Water*

Changes in CVP water supplies and operations under Alternative 1 as compared to the No Action Alternative would result in similar end-of-September reservoir elevations and related visual resources at Shasta Lake, Lake Oroville, Folsom Lake, and New Melones Reservoir in all water year types; and at San Luis Reservoir in above-normal, below-normal, and dry years, as described in Chapter 5, Surface Water Resources and Water Supplies. Changes in visual resources at San Luis Reservoir would be reduced in wet year and critical dry years because the end-of-September surface water elevations would be increased by 6.6 percent in wet and critical dry years.

*Effects Related to Cross Delta Water Transfers*

Potential effects to visual resources could be similar to those identified in a recent environmental analysis conducted by Reclamation for long-term water transfers from the Sacramento to San Joaquin valleys (Reclamation 2014c) as described above under the No Action Alternative compared to the Second Basis of Comparison. For the purposes of this EIS, it is anticipated that similar conditions would occur during implementation of cross Delta water transfers under Alternative 1 and the No Action Alternative, and that impacts on visual resources would not be substantial in the seller's service area due to implementation requirements of the transfer programs.

Under Alternative 1, water could be transferred throughout the year without an annual volumetric limit. Under the No Action Alternative, the timing of cross Delta water transfers would be limited to July through September and include annual volumetric limits, in accordance with the 2008 USFWS BO and 2009 NMFS BO. Overall, the potential for cross Delta water transfers would be increased under Alternative 1 as compared to the No Action Alternative.

*San Francisco Bay Area, Central Coast, and Southern California Regions*

*Potential Changes in Visual Resources at Reservoirs that Store CVP and SWP Water*

Changes in visual resources at reservoirs that store CVP and SWP water supplies are assumed to be related to changes in water deliveries over long-term conditions for this EIS analysis, as described above under the No Action Alternative as compared to the Second Basis of Comparison. Therefore, under Alternative 1 as compared to the No Action Alternative, visual resources related to surface water elevations in reservoirs that store CVP and SWP water supplies would be increased by 11 to 21 percent in the San Francisco Bay Area Region and 21 percent in the Central Coast and Southern California regions.

#### 14.4.3.2.2 Alternative 1 Compared to the Second Basis of Comparison

Alternative 1 is identical to the Second Basis of Comparison.

#### *14.4.3.3 Alternative 2*

The CVP and SWP operations under Alternative 2 are identical to the CVP and SWP operations under the No Action Alternative; therefore, Alternative 2 is only compared to the Second Basis of Comparison.

##### 14.4.3.3.1 Alternative 2 Compared to the Second Basis of Comparison

The CVP and SWP operations under Alternative 2 are identical to the CVP and SWP operations under the No Action Alternative.  Therefore, changes to visual resources conditions under Alternatives 2 as compared to the Second Basis of Comparison would be the same as the impacts described in Section 14.4.3.1, No Action Alternative.

#### *14.4.3.4 Alternative 3*

As described in Chapter 3, Description of Alternatives, CVP and SWP operations under Alternative 3 are similar to the Second Basis of Comparison with modified Old and Middle River flow criteria and New Melones Reservoir operations.  As described in Chapter 4, Approach to Environmental Analysis, Alternative 3 is compared to the No Action Alternative and the Second Basis of Comparison.

##### 14.4.3.4.1 Alternative 3 Compared to the No Action Alternative

*Trinity River Region*

*Potential Changes in Visual Resources at Reservoirs that Store CVP and SWP Water*

Changes in CVP water supplies and operations under Alternative 3 as compared to the No Action Alternative would result in similar end-of-September reservoir elevations and related visual resources at Trinity Lake in all water year types, as described in Chapter 5, Surface Water Resources and Water Supplies.

*Central Valley Region*

*Potential Changes in Visual Resources at Reservoirs that Store CVP and SWP Water*

Changes in CVP water supplies and operations under Alternative 3 as compared to the No Action Alternative would result in similar end-of-September reservoir elevations and related visual resources at Shasta Lake, Lake Oroville, Folsom Lake, and New Melones Reservoir in all water year types; and at San Luis Reservoir in below-normal, dry, and critical dry years, as described in Chapter 5, Surface Water Resources and Water Supplies.  Changes in visual resources at San Luis Reservoir would be reduced in wet year and critical dry years because the end-of-September surface water elevations would be increased by 7.9 percent in wet years and 5.7 percent in above-normal years.

*Effects Related to Cross Delta Water Transfers*

Potential effects to visual resources could be similar to those identified in a recent environmental analysis conducted by Reclamation for long-term water transfers from the Sacramento to San Joaquin valleys (Reclamation 2014c) as described above under the No Action Alternative compared to the Second Basis of

Comparison. For the purposes of this EIS, it is anticipated that similar conditions would occur during implementation of cross Delta water transfers under Alternative 3 and the No Action Alternative, and that impacts on visual resources would not be substantial in the seller's service area due to implementation requirements of the transfer programs.

Under Alternative 3, water could be transferred throughout the year without an annual volumetric limit. Under the No Action Alternative, the timing of cross Delta water transfers would be limited to July through September and include annual volumetric limits, in accordance with the 2008 USFWS BO and 2009 NMFS BO. Overall, the potential for cross Delta water transfers would be increased under Alternative 3 as compared to the No Action Alternative.

*San Francisco Bay Area, Central Coast, and Southern California Regions*

*Potential Changes in Visual Resources at Reservoirs that Store CVP and SWP Water*

Changes in visual resources at reservoirs that store CVP and SWP water supplies are assumed to be related to changes in water deliveries over long-term conditions for this EIS analysis, as described above under the No Action Alternative as compared to the Second Basis of Comparison. Therefore, under Alternative 3 as compared to the No Action Alternative, visual resources related to surface water elevations in reservoirs that store CVP and SWP water supplies would be increased by 9 to 17 percent in the San Francisco Bay Area Region and 17 percent in the Central Coast and Southern California regions.

#### 14.4.3.4.2 Alternative 3 Compared to the Second Basis of Comparison

*Trinity River Region*

*Potential Changes in Visual Resources at Reservoirs that Store CVP and SWP Water*

Changes in CVP water supplies and operations under Alternative 3 as compared to the Second Basis of Comparison would result in similar end-of-September reservoir elevations and related visual resources at Trinity Lake in all water year types, as described in Chapter 5, Surface Water Resources and Water Supplies.

*Central Valley Region*

*Potential Changes in Visual Resources at Reservoirs that Store CVP and SWP Water*

Changes in CVP water supplies and operations under Alternative 3 as compared to the Second Basis of Comparison would result in similar end-of-September reservoir elevations and related visual resources at Shasta Lake, Lake Oroville, Folsom Lake, New Melones Reservoir, and San Luis Reservoir in all water year types, as described in Chapter 5, Surface Water Resources and Water Supplies.

*Effects Related to Cross Delta Water Transfers*

Potential effects to visual resources could be similar to those identified in a recent environmental analysis conducted by Reclamation for long-term water transfers from the Sacramento to San Joaquin valleys (Reclamation 2014c) as described above under the No Action Alternative compared to the Second Basis of Comparison. For the purposes of this EIS, it is anticipated that similar conditions would occur during implementation of cross Delta water transfers under Alternative 3 and the Second Basis of Comparison, and that impacts on visual resources would not be substantial in the seller's service area due to implementation requirements of the transfer programs.

Under Alternative 3 and the Second Basis of Comparison, water could be transferred throughout the year without an annual volumetric limit. Overall, the potential for cross Delta water transfers would be similar under Alternative 3 and the Second Basis of Comparison.

*San Francisco Bay Area, Central Coast, and Southern California Regions*

*Potential Changes in Visual Resources at Reservoirs that Store CVP and SWP Water*

Changes in visual resources at reservoirs that store CVP and SWP water supplies are assumed to be related to changes in water deliveries over long-term conditions for this EIS analysis, as described above under the No Action Alternative as compared to the Second Basis of Comparison. Therefore, under Alternative 3 as compared to the Second Basis of Comparison, visual resources related to surface water elevations in reservoirs that store CVP and SWP water supplies would be similar (changes within 5 percent).

#### *14.4.3.5 Alternative 4*

The visual resources conditions under Alternative 4 would be identical to the conditions under the Second Basis of Comparison; therefore, Alternative 4 is only compared to the No Action Alternative.

##### 14.4.3.5.1 Alternative 4 Compared to the No Action Alternative

The CVP and SWP operations under Alternative 4 are identical to the CVP and SWP operations under the Second Basis of Comparison and Alternative 1. Therefore, changes in visual resources conditions under Alternative 4 as compared to the No Action Alternative would be the same as the impacts described in Section 14.4.3.2.1, Alternative 1 Compared to the No Action Alternative.

#### *14.4.3.6 Alternative 5*

As described in Chapter 3, Description of Alternatives, CVP and SWP operations under Alternative 5 are similar to the No Action Alternative with modified Old and Middle Rivers (OMR) flow criteria and New Melones Reservoir operations. As described in Chapter 4, Approach to Environmental Analysis, Alternative 5 is compared to the No Action Alternative and the Second Basis of Comparison.

#### 14.4.3.6.1 Alternative 5 Compared to the No Action Alternative

*Trinity River Region*

*Potential Changes in Visual Resources at Reservoirs that Store CVP and SWP Water*

Changes in CVP water supplies and operations under Alternative 5 as compared to the No Action Alternative would result in similar end-of-September reservoir elevations and related visual resources at Trinity Lake in all water year types, as described in Chapter 5, Surface Water Resources and Water Supplies.

*Central Valley Region*

*Potential Changes in Visual Resources at Reservoirs that Store CVP and SWP Water*

Changes in CVP water supplies and operations under Alternative 5 as compared to the No Action Alternative would result in similar end-of-September reservoir elevations and related visual resources at Shasta Lake, Lake Oroville, Folsom Lake, New Melones Reservoir, and San Luis Reservoir in all water year types, as described in Chapter 5, Surface Water Resources and Water Supplies.

*Effects Related to Cross Delta Water Transfers*

Potential effects to visual resources could be similar to those identified in a recent environmental analysis conducted by Reclamation for long-term water transfers from the Sacramento to San Joaquin valleys (Reclamation 2014c) as described above under the No Action Alternative compared to the Second Basis of Comparison. For the purposes of this EIS, it is anticipated that similar conditions would occur during implementation of cross Delta water transfers under Alternative 5 and the No Action Alternative, and that impacts on visual resources would not be substantial in the seller's service area due to implementation requirements of the transfer programs.

Under Alternative 5 and the No Action Alternative, the timing of cross Delta water transfers would be limited to July through September and include annual volumetric limits, in accordance with the 2008 USFWS BO and 2009 NMFS BO. Overall, the potential for cross Delta water transfers would be similar under Alternative 5 and the No Action Alternative.

*San Francisco Bay Area, Central Coast, and Southern California Region*

*Potential Changes in Visual Resources at Reservoirs that Store CVP and SWP Water*

Changes in visual resources at reservoirs that store CVP and SWP water supplies are assumed to be related to changes in water deliveries over long-term conditions for this EIS analysis, as described above under the No Action Alternative as compared to the Second Basis of Comparison. Therefore, under Alternative 5 as compared to the No Action Alternative, visual resources would be similar.

#### 14.4.3.6.2 Alternative 5 Compared to the Second Basis of Comparison

*Trinity River Region*

*Potential Changes in Visual Resources at Reservoirs that Store CVP and SWP Water*

Changes in CVP water supplies and operations under Alternative 5 as compared to the Second Basis of Comparison would result in similar end-of-September reservoir elevations and related visual resources at Trinity Lake in all water year types, as described in Chapter 5, Surface Water Resources and Water Supplies.

*Central Valley Region*

*Potential Changes in Visual Resources at Reservoirs that Store CVP and SWP Water*

Changes in CVP water supplies and operations under Alternative 5 as compared to the Second Basis of Comparison would result in similar end-of-September reservoir elevations and related visual resources at Shasta Lake, Lake Oroville, Folsom Lake, and New Melones Reservoir in all water year types; and at San Luis Reservoir in wet, above-normal, and below-normal years, as described in Chapter 5, Surface Water Resources and Water Supplies. Changes in visual resources at San Luis Reservoir would be reduced in dry year and critical dry years because the end-of-September surface water elevations would be decreased by 6.2 percent in dry years and 8.5 percent in critical dry years.

*Effects Related to Cross Delta Water Transfers*

Potential effects to visual resources could be similar to those identified in a recent environmental analysis conducted by Reclamation for long-term water transfers from the Sacramento to San Joaquin valleys (Reclamation 2014c) as described above under the No Action Alternative compared to the Second Basis of Comparison. For the purposes of this EIS, it is anticipated that similar conditions would occur during implementation of cross Delta water transfers under Alternative 5 and the Second Basis of Comparison, and that impacts on visual resources would not be substantial in the seller's service area due to implementation requirements of the transfer programs.

Under Alternative 5, the timing of cross Delta water transfers would be limited to July through September and include annual volumetric limits, in accordance with the 2008 USFWS BO and 2009 NMFS BO. Under the Second Basis of Comparison, water could be transferred throughout the year without an annual volumetric limit. Overall, the potential for cross Delta water transfers would be reduced under Alternative 5 as compared to the Second Basis of Comparison.

*San Francisco Bay Area, Central Coast, and Southern California Regions*

*Potential Changes in Visual Resources at Reservoirs that Store CVP and SWP Water*

Changes in visual resources at reservoirs that store CVP and SWP water supplies are assumed to be related to changes in water deliveries over long-term conditions for this EIS analysis, as described above under the No Action Alternative as compared to the Second Basis of Comparison. Therefore, under Alternative 5 as compared to the Second Basis of Comparison, visual resources related to surface water elevations in reservoirs that store CVP and SWP water supplies would be reduced by 10 to 18 percent in the San Francisco Bay Area Region and 18 percent in the Central Coast and Southern California regions.

#### *14.4.3.7 Summary of Impact Assessment*

The results of the impact assessment of implementation of Alternatives 1 through 5 as compared to the No Action Alternative and the Second Basis of Comparison are presented in Tables 14.1 and 14.2.

**Table 14.1 Comparison of Alternatives 1 through 5 to No Action Alternative**

| Alternative | Potential Change | Consideration for Mitigation Measures |
|---|---|---|
| Alternative 1 | Visual resources would be similar at Trinity Lake, Shasta Lake, Lake Oroville, Folsom Lake, and New Melones Reservoir in all water year types; and at San Luis Reservoir in above-normal, below-normal, and dry years. Visual resources would be increased by 6 percent in wet and critical dry years at San Luis Reservoir, by 11 to 21 percent in the San Francisco Bay Area Region, and by 21 percent in the Central Coast and Southern California regions. | None needed. |
| Alternative 2 | No effects on visual resources. | None needed. |
| Alternative 3 | Visual resources would be similar at Trinity Lake, Shasta Lake, Lake Oroville, Folsom Lake, and New Melones Reservoir in all water year types; and at San Luis Reservoir in above-normal, below-normal, and dry years. Visual resources would be increased by 8 percent in wet years and 6 percent in above-normal years at San Luis Reservoir, by 9 to 17 percent in the San Francisco Bay Area Region, and by 17 percent in the Central Coast and Southern California regions. | None needed. |
| Alternative 4 | Same effects as described for Alternative 1 compared to the No Action Alternative. | None needed. |
| Alternative 5 | Visual resources would be similar at Trinity Lake, Shasta Lake, Lake Oroville, Folsom Lake, San Luis Reservoir, and other reservoirs that store CVP and SWP water in the San Francisco Bay Area, Central Coast, and Southern California regions. | None needed. |

Note: Due to the limitations and uncertainty in the CalSim II monthly model and other analytical tools, incremental differences of 5 percent or less between alternatives and the Second Basis of Comparison are considered to be “similar.”

**Table 14.2 Comparison of No Action Alternative and Alternatives 1 through 5 to Second Basis of Comparison**

| Alternative | Potential Change | Consideration for Mitigation Measures |
|---|---|---|
| No Action Alternative | Visual resources would be similar at Trinity Lake, Shasta Lake, Lake Oroville, Folsom Lake, and New Melones Reservoir in all water year types; and at San Luis Reservoir in above-normal, below-normal, and dry years. Visual resources would be reduced by 6 percent in wet and critical dry years at San Luis Reservoir, by 10 to 18 percent in the San Francisco Bay Area Region, and by 18 percent in the Central Coast and Southern California regions. | Not considered for this comparison. |
| Alternative 1 | No effects on visual resources. | Not considered for this comparison. |
| Alternative 2 | Same effects as described for No Action Alternative as compared to the Second Basis of Comparison. | Not considered for this comparison. |
| Alternative 3 | Visual resources would be similar at Trinity Lake, Shasta Lake, Lake Oroville, Folsom Lake, San Luis Reservoir, and other reservoirs that store CVP and SWP water in the San Francisco Bay Area, Central Coast, and Southern California regions. | Not considered for this comparison. |
| Alternative 4 | No effects on visual resources. | Not considered for this comparison. |
| Alternative 5 | Visual resources would be similar at Trinity Lake, Shasta Lake, Lake Oroville, Folsom Lake, and New Melones Reservoir in all water year types; and at San Luis Reservoir in above-normal, below-normal, and dry years. Visual resources would be reduced by 6 percent in dry years and 9 percent in critical dry years at San Luis Reservoir, by 10 to 18 percent in the San Francisco Bay Area Region, and by 18 percent in the Central Coast and Southern California regions. | Not considered for this comparison. |

Note: Due to the limitations and uncertainty in the CalSim II monthly model and other analytical tools, incremental differences of 5 percent or less between alternatives and the Second Basis of Comparison are considered to be “similar.”

#### *14.4.3.8 Potential Mitigation Measures*

Mitigation measures are presented in this section to avoid, minimize, rectify, reduce, eliminate, or compensate for adverse environmental effects of Alternatives 1 through 5 as compared to the No Action Alternative. Mitigation measures were not included to address adverse impacts under the alternatives as compared to the Second Basis of Comparison because this analysis was included in this EIS for information purposes only.

Changes in CVP and SWP operations under Alternatives 1 through 5, as compared to the No Action Alternative, would not result in changes in visual resources. Therefore, there would be no adverse impacts to visual resources and no mitigation measures are required.

#### *14.4.3.9 Cumulative Effects Analysis*

As described in Chapter 3, the cumulative effects analysis considers projects, programs, and policies that are not speculative and are based upon known or reasonably foreseeable long-range plans, regulations, operating agreements, or other information that establishes them as reasonably foreseeable.

The cumulative effects analysis for Alternatives 1 through 5 for Visual Resources are summarized in Table 14.3.

**Table 14.3 Summary of Cumulative Effects on Visual Resources with Implementation of Alternatives 1 through 5 as Compared to the No Action Alternative**

| Scenarios | Actions | Cumulative Effects of Actions |
|---|---|---|
| Past & Present, and Future Actions included in the No Action Alternative in All Alternatives in Year 2030 | Consistent with Affected Environment conditions plus:<br>Actions in the 2008 USFWS BO and 2009 NMFS BO that would have occurred without implementation of the BOs, as described in Section 3.3.1.2 (of Chapter 3, Descriptions of Alternatives), including climate change and sea level rise<br>Actions not included in the 2008 USFWS BO and 2009 NMFS BO that would have occurred without implementation of the BOs, as described in Section 3.3.1.3 (of Chapter 3, Descriptions of Alternatives):<br>- Implementation of Federal and state policies and programs, including Clean Water Act (e.g., Total Maximum Daily Loads); Safe Drinking Water Act; Clean Air Act; and flood management programs<br>- General plans for 2030.<br>- Trinity River Restoration Program.<br>- Central Valley Project Improvement Act programs<br>- Folsom Dam Water Control Manual Update<br>- FERC Relicensing for the Middle Fork of the American River Project<br>- Lower Mokelumne River Spawning Habitat Improvement Project | <u>These effects would be the same under all alternatives.</u><br>Climate change and sea level rise, development under the general plans, FERC relicensing projects, and some future projects to improve water quality and/or habitat are anticipated to reduce end of September storage in CVP and SWP reservoirs compared to past conditions, and to reduce CVP and SWP water supply reliability which could result in less irrigated lands compared to past conditions.<br>General plans would be completed for projected conditions by 2030, as described in Chapter 13, Land Use. Restoration plans for the ongoing programs would be completed which would change visual resources of the restored lands. |

| Scenarios | Actions | Cumulative Effects of Actions |
|---|---|---|
| | - Dutch Slough Tidal Marsh Restoration<br>- Suisun Marsh Habitat Management, Preservation, and Restoration Plan Implementation<br>- Tidal Wetland Restoration: Yolo Ranch, Northern Liberty Island Fish Restoration Project, Prospect Island Restoration Project, and Calhoun Cut/Lindsey Slough Tidal Habitat Restoration Project<br>- San Joaquin River Restoration Program<br>- Future water supply projects, including water recycling, desalination, groundwater banks and wellfields, and conveyance facilities (projects with completed environmental documents) | |
| Future Actions considered as Cumulative Effects Actions in All Alternatives in Year 2030 | Actions as described in Section 3.5 (of Chapter 3, Descriptions of Alternatives):<br>- Bay-Delta Water Quality Control Plan Update<br>- FERC Relicensing Projects<br>- Bay Delta Conservation Plan (including the California WaterFix alternative)<br>- Shasta Lake Water Resources, North-of-the-Delta Offstream Storage, Los Vaqueros Reservoir Expansion Phase 2, and Upper San Joaquin River Basin Storage Investigations<br>- El Dorado Water and Power Authority Supplemental Water Rights Project<br>- Sacramento River Water Reliability Project<br>- Semitropic Water Storage District Delta Wetlands<br>- North Bay Aqueduct Alternative Intake<br>- San Luis Reservoir Low Point Improvement Project<br>- Future water supply projects, including water recycling, desalination, groundwater banks and wellfields, and conveyance facilities (projects that did not have completed environmental documents during preparation of the EIS) | <u>These effects would be the same under all alternatives.</u><br>Most of the future reasonably foreseeable actions are anticipated to reduce water supply impacts due to climate change, sea level rise, increased water allocated to improve habitat conditions, and future growth.<br>Some of the future reasonably foreseeable actions related to improved water quality and habitat conditions (e.g., Water Quality Control Plan Update and FERC Relicensing Projects), could in further reductions in CVP and SWP water deliveries and associated extent of irrigated lands. |

| Scenarios | Actions | Cumulative Effects of Actions |
|---|---|---|
| No Action Alternative with Associated Cumulative Effects Actions in Year 2030 | Full implementation of the 2008 USFWS BO and 2009 NMFS BO | Climate change and sea level rise, FERC relicensing projects, and some future projects to improve water quality and/or habitat are anticipated to reduce end of September CVP and SWP reservoir storage as compared to past conditions.<br>Community development would occur in accordance with general plan projections for 2030. Restoration plans for the ongoing programs would be completed.<br>Future water supply projects are anticipated to both increase water supply reliability due to reduced surface water supplies and to accommodate planned growth in the general plans. |
| Alternative 1 with Associated Cumulative Effects Actions in Year 2030 | No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant) | Implementation of Alternative 1 with future reasonably foreseeable actions would result in similar changes as under the No Action Alternative with the added actions. |
| Alternative 2 with Associated Cumulative Effects Actions in Year 2030 | Full implementation of the 2008 USFWS BO and 2009 NMFS BO CVP and SWP operational actions<br>No implementation of structural improvements or other actions that require further study to develop a more detailed action description. | Implementation of Alternative 2 with future reasonably foreseeable actions would result in similar changes as under the No Action Alternative with the added actions. |
| Alternative 3 with Associated Cumulative Effects Actions in Year 2030 | No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant)<br>Slight increase in positive Old and Middle River flows in the winter and spring months | Implementation of Alternative 3 with future reasonably foreseeable actions would result in similar changes as under the No Action Alternative with the added actions. |
| Alternative 4 with Associated Cumulative Effects Actions in Year 2030 | No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant) | Implementation of Alternative 4 with future reasonably foreseeable actions would result in similar changes as under the No Action Alternative with the added actions. |
| Alternative 5 with Associated Cumulative Effects Actions in Year 20530 | Full implementation of the 2008 USFWS BO and 2009 NMFS BO<br>Positive Old and Middle River flows and increased Delta outflow in spring months | Implementation of Alternative 5 with future reasonably foreseeable actions would result in similar changes as under the No Action Alternative with added actions. |

Chapter 15

# Recreation Resources

## 15.1 Introduction

This chapter describes recreational resources in the study area; and potential changes that could occur as a result of implementing the alternatives evaluated in this Environmental Impact Statement (EIS). Implementation of the alternatives could affect recreation resources through potential changes in operation of the Central Valley Project (CVP) and State Water Project (SWP) and ecosystem restoration.

## 15.2 Regulatory Environment and Compliance Requirements

Potential actions that could be implemented under the alternatives evaluated in this EIS could affect recreational resources at reservoirs and lands served by CVP and SWP water supplies. Actions located on public agency lands; or implemented, funded, or approved by Federal and state agencies would need to be compliant with appropriate Federal and state agency policies and regulations, as summarized in Chapter 4, Approach to Environmental Analyses.

## 15.3 Affected Environment

This section describes recreational resources that could be potentially affected by the implementation of the alternatives considered in this EIS. Changes in recreation opportunities due to changes in CVP and SWP operations may occur in the Trinity River, Central Valley, San Francisco Bay Area, Central Coast, and Southern California regions. Recreational fishing in San Francisco Bay and along the Pacific Coast also may be affected by changes in CVP and SWP operations.

There are extensive recreational opportunities within this study area. However, the recreational opportunities that could be directly or indirectly affected through implementation of the alternatives analyzed in this EIS are related to water-related recreation activities at CVP and SWP reservoirs and in the rivers downstream of those reservoir, fishing opportunities in the Delta and the Pacific Ocean that are affected by the water flows managed by CVP and SWP operations, and bird watching, wildlife viewing, and hunting activities at wildlife refuges that use CVP water supplies. Therefore, the following description of the affected environment is limited to these recreational aspects. The wildlife refuges identified to receive CVP water supplies are shown on Figure 15.1.

### 15.3.1 Trinity River Region

The Trinity River Region includes the area along the Trinity River from Trinity Lake to the confluence with the Klamath River; and along the lower Klamath River from the confluence with the Trinity River to the Pacific Ocean. Major recreational opportunities occur at Trinity Lake, Lewiston Reservoir, along the Trinity River between Lewiston Reservoir and the confluence with the Klamath River, and along the lower Klamath River.

#### *15.3.1.1 Trinity Lake*

Trinity Lake is a CVP facility on the Trinity River that is located approximately 50 miles northwest of Redding, as described in Chapter 5, Surface Water Resources and Water Supplies. Trinity Lake is part of the Whiskeytown-Shasta-Trinity National Recreation Area and part of the Shasta-Trinity National Forest. Recreational facilities and activities at Trinity Lake are administered by the U.S. Forest Service (USFS). When the water storage in the reservoir is at full capacity (water elevation at 2370 feet mean sea level (msl), Trinity Lake has a surface area of 17,222 acres and 147 miles of shoreline (USFS 2014).

Boating, windsurfing, and fishing primarily occur in the northern part of the lake near Trinity Center. Houseboats, motorboats, water skiing primarily occur in the southern part of the lake. There are six public boat ramps on Trinity Lake as summarized in Table 15.1.

**Table 15.1 Trinity Lake Boat Ramps**

| Location | Boat Ramp | Comments | Useable Elevations (feet, msl) |
|---|---|---|---|
| Trinity Lake | Bowerman | – | 2,370 to 2,323 |
| Trinity Lake | Clark Spring | – | 2,370 to 2,313 |
| Trinity Lake | Fairview | – | 2,370 to 2,313 |
| Trinity Lake | Minersville | – | 2,305 to 2,170 |
| Trinity Lake | Stuart Fork | – | 2,370 to 2,338 |
| Trinity Lake | Trinity Center | – | 2,370 to 2,300 |

Source: USFS 2014

Three major marinas are located at Trinity Lake, as summarized in Table 15.2. The USFS can permit up to 1,000 boat slips at the Trinity Lake marinas (USFS 2014). Many commercial houseboats are available for rent at the marinas. Trinity Lake shoreline includes approximately 32 miles of prime houseboating areas and 18.5 miles of secondary houseboating areas. The USFS issues permits for houseboats and privately-owned recreational occupancy vehicles that use the water overnight. At Trinity Lake, up to 99 permits for privately-owned vessels and 85 permits for commercially-owned vessels may be issued each year.

**Table 15.2 Trinity Lake Marinas and Moorage Facilities**

| Location | Marina and Moorage Facility | Number |
|---|---|---|
| Trinity Lake | Cedar Stock Resort & Marina | 31 Commercial and 220 Private Slips, including 10 Commercial Houseboats |
| Trinity Lake | KOA Campground | 15 Commercial and 110 Private Slips |
| Trinity Lake | Pinewood Cove Docks | 52 Private Slips |
| Trinity Lake | Trinity Alps Marina | 31 Commercial and 63 Private Slips, including 25 Commercial Houseboats |
| Trinity Lake | Trinity Center Marina | 80 Private Slips |

Source: USFS 2014

The Trinity Unit of the Whiskeytown-Shasta-Trinity National Recreation Area includes many campground sites, including campgrounds for group camping opportunities (USFS 2014), as summarized in Table 15.3. There are other campgrounds within the upper elevations of the Trinity Lake watershed that are not directly or indirectly affected by changes in surface water elevations.

**Table 15.3 Trinity Lake Major Campgrounds**

| Location | Campground | Comments | Number of Campsites |
|---|---|---|---|
| Trinity Lake | Alpine View | – | 53 |
| Trinity Lake | Bushytail | – | 11 |
| Trinity Lake | Captain’s Point | Boat-In Campground | 3 |
| Trinity Lake | Clark Springs | – | 21 |
| Trinity Lake | Fawn | Group Campground | 60 |
| Trinity Lake | Hayward Flat | – | 98 |
| Trinity Lake | Jackass Springs | – | 10 |
| Trinity Lake | Mariner’s Roost | Boat-In Campground | 7 |
| Trinity Lake | Minersville | – | 14 |
| Trinity Lake | Ridgeville | Boat-In Campground | 10 |
| Trinity Lake | Ridgeville Island | Boat-In Campground | 3 |
| Trinity Lake | Stoney Creek | Group Campground | 10 |
| Trinity Lake | Stoney Point | – | 15 |
| Trinity Lake | Tannery Gulch | – | 82 |

Source: USFS 2014

Trinity Lake recreational areas also include day use areas for picnicking, swimming, and other recreational opportunities, as summarized in Table 15.4. The locations for shoreline day use areas are limited due to the steep and rocky elevations at the shorelines. To develop two swimming beaches at Trinity Lake, the rocky shorelines were covered with sand and/or decomposed granite at a specific elevation. Uses of these locations are less desirable when the water elevations decline.

**Table 15.4 Trinity Lake Major Day Use Areas**

| Location | Day Use Area | Comments | Number |
|---|---|---|---|
| Trinity Lake | Clark Springs Day Use and Beach | Picnic and Swimming | 34 picnic sites |
| Trinity Lake | North Shore Vista | Vistas and Interpretative Site | – |
| Trinity Lake | Osprey Info Site | Vistas and Interpretative Site | – |
| Trinity Lake | Stoney Creek | Picnic and Swimming | 4 picnic sites |
| Trinity Lake | Tanbark Picnic | Picnic and Swimming | 8 picnic sites |
| Trinity Lake | Trail of Trees | Interpretative Trail at Tannery Gulch Campground | 0.5 miles |
| Trinity Lake | Trinity Lakeshore Trail | Trail | 4 miles |
| Trinity Lake | Trinity Vista | Vistas and Interpretative Site | – |

Source: USFS 2014

Trinity Lake fishing opportunities include Smallmouth Bass, Largemouth Bass, Rainbow Trout, Brown Trout, Chinook Salmon, and Kokanee Salmon (USFS 2014). White Catfish, Brown Bullhead, Green Sunfish, Bluegill, Klamath Smallscale Sucker, and Pacific Lamprey also are present but are not generally considered as part of the recreational fishing opportunities. Wildlife viewing opportunities extend throughout the Trinity Lake area, including viewing of Bald Eagles, Black-tailed Deer, Black Bear, Gray Squirrel, rabbit, turkey, and California Quail.

#### *15.3.1.2 Lewiston Reservoir*

Lewiston Reservoir is a CVP facility on the Trinity River that is located immediately downstream of the Trinity Dam, as described in Chapter 5, Surface Water Resources and Water Supplies. Lewiston Reservoir is part of the Whiskeytown-Shasta-Trinity National Recreation Area and part of the Shasta-Trinity National Forest. Recreational facilities and activities are administered by the USFS. When the water storage in the reservoir is at full capacity (water elevation at 1,874 feet msl), the reservoir has a surface area of 759 acres and 15 miles of shoreline (USFS 2014).

The water elevation is generally stable in Lewiston Reservoir because it is used as regulating reservoir for releases to downstream uses. Water is diverted from the lower outlets in Trinity Lake to Lewiston Reservoir to provide cold water to Trinity River and Whiskeytown Lake. Therefore, recreational opportunities in Lewiston Reservoir include boating and fishing; however, there are fewer opportunities for swimming and water skiing. Lewiston Reservoir does not support houseboats. There is one primary boat ramp and two marinas in Lewiston Reservoir, as summarized in Tables 15.5 and 15.6.

**Table 15.5 Lewiston Reservoir Boat Ramps**

| Location | Boat Ramp | Comments | Useable Elevations (feet, msl) |
|---|---|---|---|
| Lewiston Lake | Pine Cove | Open all year | Around 1870 |

Source: USFS 2014

**Table 15.6 Lewiston Lake Marinas and Moorage Facilities**

| Location | Marina and Moorage Facility | Number |
|---|---|---|
| Lewiston Lake | Lakeview Terrace Docks | 14 Commercial and 7 Private Slips |
| Lewiston Lake | Pine Cove Marina | 20 Commercial and 34 Private Slips |

Source: USFS 2014

The Whiskeytown-Shasta-Trinity National Recreation Area includes campground sites near the Lewiston Reservoir shoreline, including campgrounds for group camping opportunities (USFS 2014), as summarized in Table 15.7. Lewiston Reservoir recreational areas also include day use areas for picnicking, swimming, and other recreational opportunities, as summarized in Table 15.8. Because the water surface elevations are more stable in Lewiston Reservoir than Trinity Lake, the day use areas have more vegetation along the shoreline.

**Table 15.7 Lewiston Lake Major Campgrounds**

| Location | Campground | Comments | Number of Campsites |
|---|---|---|---|
| Lewiston Lake | Ackerman | – | 51 |
| Lewiston Lake | Cooper Gulch | – | 5 |
| Lewiston Lake | Mary Smith | – | 17 |
| Lewiston Lake | Tunnel Rock | – | 6 |

Source: USFS 2014

**Table 15.8 Lewiston Major Lake Day Use Areas**

| Location | Day Use Area | Comments | Number |
|---|---|---|---|
| Lewiston Lake | Baker Gulch Trail | Trail | 0,2 miles |
| Lewiston Lake | Lewiston Vista | Vistas and Interpretative Site | – |
| Lewiston Lake | North Lakeshore Trail | Trail | 2 miles |
| Lewiston Lake | Pine Cove | Picnic | 2 picnic sites |
| Lewiston Lake | South Lakeshore Trail | Trail | 1 mile |

Source: USFS 2014

Lewiston Reservoir fishing opportunities include Smallmouth Bass, Rainbow Trout, Brown Trout, Three-spine Stickleback, Golden Shiner, and Kokanee Salmon (USFS 2014). Klamath Smallscale Sucker, and Pacific Lamprey also are present but are not generally considered as part of the recreational fishing opportunities. Wildlife viewing opportunities extend throughout the Lewiston Reservoir area, including viewing of Bald Eagles, Black-tailed Deer, River Otter, ring-tailed cats, raccoon, and California Quail. Waterfowl use Lewiston Reservoir throughout the year with increased populations in the winter.

#### *15.3.1.3 Trinity River from Lewiston Dam to the Klamath River*

The Trinity River flows approximately 112 miles from Lewiston Dam to the Klamath River (NCRWQCB et al. 2009) through Trinity, Humboldt, and Del Norte counties.

The first mile of the river below the Lewiston Dam is located within the Whiskeytown-Shasta-Trinity National Recreation Area. Portions of the Trinity River downstream of Lewiston Dam and Junction City to the confluence with North Fork Trinity River are under the jurisdiction of the Department of the Interior, Bureau of Land Management (BLM) (USFWS et al. 1999). Between the confluence with the North Fork Trinity River and the confluence of New River, the area along the Trinity River is located within the USFS Shasta-Trinity National Forest. Between the confluence with the New River and the Hoopa Indian Reservation, most of the area along the Trinity River is located within the USFS Six Rivers National Forest. The remaining portions of the Trinity River to the confluence with the Klamath River are located within the Hoopa Indian Reservation.

On January 19, 1981, the Secretary of the Interior designated the Trinity River starting 100 yards downstream of the Lewiston Dam to the confluence with the Klamath River as part of the National Wild and Scenic Rivers System. The designation also included portions of the South Fork, North Fork, and New River (BLM et al 2012). However, because the flows in the South Fork, North Fork, and New River are not affected by the alternatives considered in this EIS, these rivers are not evaluated in this EIS.

There are approximately 35 developed recreation sites and more than 200 access points along the Trinity River corridor within a half mile of the river, and numerous river access sites between Lewiston Dam and Weitchpec (NCRWQCB et al. 2009; USFWS et al. 1999).

Recreation occurs year-round in the Trinity River area. Water-related activities include boating, kayaking, canoeing, whitewater rafting, inner tubing, fishing, swimming, wading, gold panning, camping, and picnicking (NCRWQCB et al. 2009). Fishing opportunities include steelhead, Rainbow Trout, Brown Trout, and Chinook Salmon.

#### *15.3.1.4 Lower Klamath River from Trinity River Confluence to the Pacific Ocean*

The Klamath River continues for 43.5 miles from the Trinity River confluence to the Pacific Ocean (NCRWQCB et al. 2009).

Downstream of the Trinity River, the Klamath River flows through the Hoopa Indian Reservation, Yurok Indian Reservation, and Resighini Indian Reservation as well as lands owned by local agencies and private entities (DOI and DFG 2012). Near the confluence with the Pacific Ocean, the Klamath River flows through the Redwood National Park. These reaches are primarily within Humboldt and Del Norte counties.

The portion of the Klamath River from the confluence with the Trinity River to the Pacific Ocean is part of the Klamath River designated by the Secretary of the Interior to be part of the National Wild and Scenic Rivers System on January 19, 1981. The State of California also designated this reach of Klamath River as wild and scenic under Public Resources Code sections 5093.54 and 5093.545.

Recreation along the Klamath River downstream of the Trinity River is limited (DOI and DFG 2012). Canoeing, kayaking, and whitewater boating occurs along this reach. Whitewater rafting generally requires a minimum flow of 1,800 cfs in this portion of the Klamath River. Four campgrounds, picnic areas, and water access at public lands are located along the Klamath River near the confluence with the Pacific Ocean. Fishing opportunities in the lower Klamath River are primarily related to Chinook Salmon. Del Norte County operates two public boat ramps along the Klamath River. The Redwood National and State Parks operate Lagoon Creek near the confluence of the Klamath River and the Pacific Ocean (RNSP 2013; Del Norte County 2003). There are other trails near the Pacific Ocean, including the California Coastal Trail which is generally located along the northern and eastern banks of the Klamath River at the Pacific Ocean (California Coastal Trail 2014).

### 15.3.2 Central Valley Region

The Central Valley Region extends from above Shasta Lake to the Tehachapi Mountains, and includes the Sacramento Valley, San Joaquin Valley, Delta, and Suisun Marsh.

#### *15.3.2.1 Sacramento Valley*

Recreational opportunities in the Sacramento Valley upstream of the Delta that are influenced by CVP and SWP operations occur at Shasta Lake, Keswick Reservoir, Whiskeytown Lake, Clear Creek, Sacramento River between Keswick Dam and the Delta, Lake Oroville and Thermalito Afterbay, Yuba River from between New Bullards Bar and Feather River, Bear River between Camp Far West Reservoir and Feather River, Feather River between Thermalito Dam and the Sacramento River, Folsom Lake and Lake Natoma, American River between Nimbus Dam and the Sacramento River, and refuges that use CVP water supplies.

##### 15.3.2.1.1 Shasta Lake

Shasta Lake is a CVP facility on the Sacramento River that is located near Redding, as described in Chapter 5, Surface Water Resources and Water Supplies. Shasta Lake is part of the Whiskeytown-Shasta-Trinity National Recreation Area and part of the Shasta-Trinity National Forest. Recreational facilities and activities at Shasta Lake are administered by the USFS. When the water storage in the lake is at full capacity (water elevation at 1067 feet msl), Shasta Lake has a surface area of approximately 30,000 acres and 365 miles of shoreline (Reclamation 2013a; USFS 2014).

Boating, water skiing, other water sports, and fishing occur in many locations in the lake. Many types of boats are used, including fishing boats, deck boats, houseboats, cabin cruisers, pontoon boats, personal watercraft, runabouts, and ski boats (Reclamation 2013a; USFS 2014). There are seven public boat ramps on Shasta Lake, as summarized in Table 15.9.

**Table 15.9 Shasta Lake Boat Ramps**

| Location | Boat Ramp | Comments | Useable Elevations (feet, msl) |
|---|---|---|---|
| Shasta Lake | Antlers | – | 1,067 to 992 |
| Shasta Lake | Bailey Cove | – | 1,067 to 1,017 |
| Shasta Lake | Centimudi | – | 1,067 to 857 |
| Shasta Lake | Hirz Bay | – | 1,067 to 972 |
| Shasta Lake | Jones Valley | – | 1,067 to 857 |
| Shasta Lake | Packers Bay | – | 1,067 to 952 |
| Shasta Lake | Sugar Loaf | – | 992 to 907 |

Source: USFS 2014

A boating safety issue that arises with fluctuations in water level is the associated fluctuation of the pattern of submerged obstacles. When the water level decreases, many rocks, shoals, and islands are much closer to the water surface, and can be easily struck by boats. When the water level rises, debris and obstacles that were previously easily visible may be dangerously out of sight and struck by boats (Reclamation 2013a).

Nine major marinas are located at Shasta Lake, as summarized in Table 15.10. The USFS can permit up to 3,000 boat slips at the Shasta Lake marinas (USFS 2014). Many commercial houseboats are available for rent at the marinas. Shasta Lake shoreline includes approximately 109 miles of prime houseboating areas and 153 miles of secondary houseboating areas. The USFS issues permits for houseboats and privately-owned recreational occupancy vehicles that use the water overnight. At Shasta Lake, up to 613 permits for privately-owned vessels and 450 permits for commercially-owned vessels may be issued each year.

**Table 15.10 Shasta Lake Marinas and Moorage Facilities**

| Location | Marina and Moorage Facility | Number |
|---|---|---|
| Shasta Lake | Antlers Resort and Marina | 101 Commercial and 200 Private Slips, including 35 Commercial Houseboats |
| Shasta Lake | Bridge Bay Resort | 140 Commercial and 7,773 Private Slips, including 92 Commercial Houseboats |
| Shasta Lake | Digger Bay Marina | 75 Commercial and 145 Private Slips, including 50 Commercial Houseboats |
| Shasta Lake | Holiday Harbor | 95 Commercial and 330 Private Slips, including 70 Commercial Houseboats |
| Shasta Lake | Jones Valley Marina | 90 Commercial and 99 Private Slips, including 64 Commercial Houseboats |
| Shasta Lake | Packers Bay Marina | 51 Commercial Slips, including 26 Commercial Houseboats |
| Shasta Lake | Shasta Lake RV Resort | 22 Private Slips |
| Shasta Lake | Shasta Marina | 54 Commercial and 139 Private Slips, including 24 Commercial Houseboats |
| Shasta Lake | Silverthorn Resort Marina | 59 Commercial and 113 Private Slips, including 35 Commercial Houseboats |
| Shasta Lake | Sugarloaf Cottages | 16 Private Slips |
| Shasta Lake | Sugarloaf Marina | 41 Commercial and 40 Private Slips, including 21 Commercial Houseboats |
| Shasta Lake | Tsasdi Resort | 30 Private Slips |

Source: USFS 2014

The Shasta Unit of the Whiskeytown-Shasta-Trinity National Recreation Area includes many campground sites, including campgrounds for group camping opportunities (USFS 2014), as summarized in Table 15.11. There are other campgrounds within the upper elevations of the Shasta Lake watershed that are not directly or indirectly affected by changes in surface water elevations.

Campers are also affected by declining water elevations because this increases the distance from the campsites to the shoreline. Drawdown of the reservoir has an aesthetic effect on users because the land exposed during drawdown is generally composed of bare earth and rock.

**Table 15.11 Shasta Lake Major Campgrounds**

| Location | Campground | Comments | Number of Campsites |
|---|---|---|---|
| Shasta Lake | Antlers | – | 59 |
| Shasta Lake | Arbuckle Flat | Boat-In Campground | 11 |
| Shasta Lake | Beehive | Shoreline Campground | No specified number |
| Shasta Lake | Bailey Cove | – | 7 |
| Shasta Lake | Dekkas Rock | Group Campground | 60 |
| Shasta Lake | Ellery Creek | – | 19 |
| Shasta Lake | Gooseneck Cove | Boat-In Campground | 8 |
| Shasta Lake | Green’s Creek | Boat-In Campground | 9 |
| Shasta Lake | Gregory Creek | Shoreline Campground | 18 |
| Shasta Lake | Hirz Bay | Individual and Group Campground | 48 Individual Sites and 200 Group Sites |
| Shasta Lake | Jones Valley (Upper & Lower) | Includes Shoreline Campground at Inlet | 21 |
| Shasta Lake | Lakeshore East | – | 26 |
| Shasta Lake | Lower Salt Creek | Shoreline Campground | No specified number |
| Shasta Lake | Mariners Point | Shoreline Campground | No specified number |
| Shasta Lake | McCloud Bridge | – | 14 |
| Shasta Lake | Moore Creek | Individual and Group Campground | 12 Individual Sites and 90 Group Sites |
| Shasta Lake | Nelson Point | Individual and Group Campground | 8 Individual Sites and 60 Group Sites |
| Shasta Lake | Oak Grove | – | 45 |
| Shasta Lake | Pine Point | Individual and Group Campground | 14 Individual Sites and 100 Group Sites |
| Shasta Lake | Ski Island | Boat-In Campground | 23 |

Source: USFS 2014

Shasta Lake recreational areas also include day use areas for picnicking, swimming, and other recreational opportunities, as summarized in Table 15.12. The locations for shoreline day use areas are limited due to the steep and rocky elevations at the shorelines. Uses of these locations are less desirable when the water elevations decline.

**Table 15.12 Shasta Lake Day Use Areas**

| Location | Day Use Area | Comments | Number |
|---|---|---|---|
| Shasta Lake | Bailey Cove | Picnic and Trail | 9 picnic sites<br>3.1 miles |
| Shasta Lake | Clikapudi | Trail | 8 miles with 1 mile advanced trail |
| Shasta Lake | Dekkas Rock | Picnic | 5 picnic sites |
| Shasta Lake | Dry Fork Creek | Trail | 4.7 miles |
| Shasta Lake | Fisherman's Point | Picnic and Trail | 7 picnic sites<br>0.5 miles |
| Shasta Lake | Hirz Bay | Trail | 1.6 miles |
| Shasta Lake | McCloud Bridge | Picnic | 5 picnic sites |
| Shasta Lake | Packers Bay | Trail | Four Trails: 0.4 to 2.8 miles |
| Shasta Lake | Potem Falls | Trail | 0.3 miles |
| Shasta Lake | Samwel Cave Nature Trail | Interpretative Trail | 1 mile |
| Shasta Lake | Sugarloaf | Trail | 1 mile |

Source: USFS 2014

Additional recreational opportunities are provided at the Shasta Dam Visitors Center.

Fishing is also popular at Shasta Lake, performed mostly by boat as opposed to from the shoreline. Anglers can catch warmwater and coldwater fish species year-round due to the summer stratification of the lake into a warm layer above a coldwater pool (Reclamation 2013a). Shasta Lake warm water fishing opportunities include Black Bass, Smallmouth Bass, Largemouth Bass, Spotted Bass, Black Crappie, Channel Catfish, and Bluegill (USFS 2014). There are many bass tournaments at Shasta Lake each summer. The cooler water strata supports fishing for Rainbow Trout and Chinook Salmon.

#### 15.3.2.1.2 Keswick Reservoir

Keswick Reservoir is a CVP afterbay that extends 9 miles along the Sacramento River from Shasta Dam to Keswick Dam, as described in Chapter 5, Surface Water Resources and Water Supplies. Recreational facilities and activities at Keswick Reservoir are administered by BLM, Shasta County, and U.S. Forest Service for the Department of the Interior, Bureau of Reclamation (Reclamation). The maximum water storage elevation at the top of the Keswick Dam spillway is

587 feet msl (Reclamation 2009). The water level fluctuates frequently in Keswick Reservoir, depending on the operations of Shasta Dam.

Water-related activities include boating, fishing, and water sports. The Keswick Boat Launch, operated by BLM, is located on the western shoreline at the south end of the reservoir (BLM 2005).

There are several trails along Keswick Reservoir and areas for off highway vehicles (OHVs) with camping allowed at one of the locations (BLM 2005; BLM 2011). The Sacramento Rail Trail extends from Moccasin Creek below Shasta Dam to Redding along the western shoreline of Keswick Reservoir and the Sacramento River downstream of Keswick Dam. The Fisherman Trail extends along the shoreline from the lower Sacramento Rail Trail to Keswick Dam. The F.B. Trail extends from the Ribbon Bridge downstream of the Keswick Dam to Walker Mine Road along the eastern side of the Keswick Reservoir. There are several other trails at higher elevations above Keswick Reservoir, including the Hornbeck Tail, Upper and Lower Sacramento Ditch Trails, Flanagan Trail, and Chamise Peak Trail.

The Chappie-Shasta OHV Area provides over 200 miles of roads in approximately 52,000 acres (Reclamation 2013a). The area is accessed at two staging areas. The Chappie-Shasta OHV Staging Area and Shasta Campground includes a staging area for day use activities, including picnics, and 22 campsites (BLM 2005). This site is located along the western shoreline of Keswick Reservoir at the trailhead of the Sacramento Rail Trail at Moccasin Creek. The Copley Mountain OHV Staging Area is located along the western shoreline of Keswick Reservoir about midway between Shasta and Keswick dams. This site also provides a staging area for day use activities, including picnics.

Fishing opportunities are primarily for German Brown Trout and Rainbow Trout.

#### 15.3.2.1.3 Whiskeytown Lake

Whiskeytown Lake is a CVP facility on Clear Creek that is located approximately 8 miles west of Redding on the eastern slope of the Coast Range, as described in Chapter 5, Surface Water Resources and Water Supplies. Whiskeytown Lake is part of the Whiskeytown-Shasta-Trinity National Recreation Area. Recreational facilities and activities administered by the National Park Service (NPS). When the water storage in the reservoir is at full capacity (water elevation at 1210 feet msl), Whiskeytown Lake has a surface area of 3,250 acres and 36 miles of shoreline (Reclamation 1997).

Boating, water skiing, sailing, kayaking, and canoeing, swimming, and fishing occur in many locations in the lake. Boat launches are available at Oak Bottom, Brandy Creek, and Whiskey Creek and at marinas at Oak Bottom and Brandy Creek (NPS 2012), as summarized in Table 15.13.

**Table 15.13 Whiskeytown Lake Boat Ramps**

| Location | Boat Ramp | Comments | Useable Elevations (feet, msl) |
|---|---|---|---|
| Whiskeytown Lake | Brandy Creek | – | 1210 to 1190 |
| Whiskeytown Lake | Oak Bottom | – | 1210 to 1195 |
| Whiskeytown Lake | Oak Bottom Marina | – | 1210 to 1198 |
| Whiskeytown Lake | Whiskey Creek | – | 1210 to 1195 |

Sources: NPS 2012; Reclamation 1997

The lake level is relatively stable and do not reduce the ability for boat launching until late summer or early fall.

The Whiskeytown Unit of the Whiskeytown-Shasta-Trinity National Recreation Area includes many campground sites, including campgrounds for group camping opportunities (NPS 2012), as summarized in Table 15.14.

**Table 15.14 Whiskeytown Lake Major Campgrounds**

| Location | Campground | Comments | Number of Campsites |
|---|---|---|---|
| Whiskeytown Lake | Brandy Creek RV | – | 37 RV Sites |
| Whiskeytown Lake | Brandy Creek | Primitive Campground | 2 Sites |
| Whiskeytown Lake | Coggins Park | Primitive Campground | 1 Site |
| Whiskeytown Lake | Crystal Creek | Primitive Campground near Crystal Creek | 2 Sites |
| Whiskeytown Lake | Dry Creek | Group Campground | 100 people |
| Whiskeytown Lake | Horse Camp | Primitive Campground | 2 Sites |
| Whiskeytown Lake | Oak Bottom Tent and Recreation Vehicle (RV) | – | 98 Tent Sites and 22 RV Sites |
| Whiskeytown Lake | Peltier Bridge | Primitive Campground near Clear Creek | 9 Sites |
| Whiskeytown Lake | Sheep Camp | Primitive Campground | 4 Sites |

Source: NPS 2012

Whiskeytown Lake recreational areas also include day use areas for picnicking, swimming, and other recreational opportunities, as summarized in Table 15.15. Shoreline day use areas are limited at some locations due to the steep and rocky elevations at the shorelines.

**Table 15.15 Whiskeytown Lake Day Use Areas**

| Location | Day Use Area | Comments | Number |
|---|---|---|---|
| Whiskeytown Lake | Boulder Creek Falls | Trail | 1 mile with 2.75-mile advanced trail |
| Whiskeytown Lake | Brandy Creek Beach and Falls | Picnic, Swimming, and Trails | 1.6 and 1.5 miles |
| Whiskeytown Lake | Buck Hollow | Trail | 1 mile |
| Whiskeytown Lake | Camden Water Ditch | Trail | 1.1 miles |
| Whiskeytown Lake | Clear Creek Canal and Vista | Picnic and Trails | 2.4 and 4.5 miles |
| Whiskeytown Lake | Crystal Creek Water Ditch and Falls | Picnic and Trails | 0.75 and 0.3 miles |
| Whiskeytown Lake | Davis Gulch | Trail | 3.3 miles |
| Whiskeytown Lake | East Beach | Swimming | – |
| Whiskeytown Lake | Guardian Rock | Trail | 0.25 miles |
| Whiskeytown Lake | James K. Carr Trail | Trail | 1.7 miles |
| Whiskeytown Lake | Judge Francis Carr Powerhouse | Picnic | – |
| Whiskeytown Lake | Kanaka Peak | Trail | 3.6 miles |
| Whiskeytown Lake | Logging Camp | Trail | 1 mile |
| Whiskeytown Lake | Mill Creek | Trail | 6.1 miles |
| Whiskeytown Lake | Mt. Shasta Mine | Trail | 3.5 miles |
| Whiskeytown Lake | Mule Mountain Pass | Trail | 4.4 miles |
| Whiskeytown Lake | Oak Bottom Beach | Picnic and Swimming | – |
| Whiskeytown Lake | Oak Bottom Ditch | Trail | 2.75 miles |
| Whiskeytown Lake | Papoose Pass | Trail | 5.5 miles |
| Whiskeytown Lake | Peltier | Trail | 1.75 miles |
| Whiskeytown Lake | Rich Gulch | Trail | 1.8 miles |
| Whiskeytown Lake | Salt Creek | Trail | 1.8 miles |
| Whiskeytown Lake | Salt Gulch | Trail | 1.6 miles |
| Whiskeytown Lake | Shasta Divide Nature Trail | Trail | 0.4 miles |
| Whiskeytown Lake | Whiskey Creek | Group Picnic Area and Swimming | – |

Source: NPS 2012

Additional recreational opportunities are provided at the Whiskeytown Visitors Center.

Fishing opportunities at Whiskeytown Lake include Brown Trout and Rainbow Trout; Kokanee Salmon; Smallmouth Bass, Largemouth Bass, and Spotted Bass; Bluegill; crappie; and Sacramento Pikeminnow (NPS No Date).

#### 15.3.2.1.4 Clear Creek from Whiskeytown Dam to the Sacramento River

Whiskeytown Lake is operated to release most of the water through the Spring Creek Power Conduit into Keswick Reservoir, as described in Chapter 5, Surface Water Resources and Water Supplies. Flows are also released from Whiskeytown Lake to Clear Creek to be consistent with federal and state requirements. During high flow events, additional flows may be released into Clear Creek.

The initial reaches of Clear Creek downstream of the Whiskeytown Dam are located within the Whiskeytown-Shasta-Trinity National Recreation Area. The remaining portions of Clear Creek flow to the Sacramento River through lands owned by BLM and private owners. All of these reaches are located within Shasta County and the most eastern reaches are within the City of Redding.

BLM has established the Clear Creek Greenway along a large portion of the lower Clear Creek from within the Whiskeytown-Shasta-Trinity National Recreation Area to the Sacramento River (BLM n.d.). The area also includes the Horsetown-Clear Creek Preserve which is a private-public partnership recreation area.

Hiking, picnicking, kayaking, swimming, fishing, and gold panning occur along the lower Clear Creek (SRWP 2010). The Clear Creek Greenway includes ten trails and eight picnic areas (BLM n.d.). Hunting is allowed in the Swasey and Muletown Road areas of the Clear Creek Greenway. Fishing opportunities include steelhead, Chinook Salmon, carp, suckers, Bluegill, bass, and Sacramento Pikeminnow (SRWP 2010).

#### 15.3.2.1.5 Sacramento River from Keswick Dam to the Delta

The Sacramento River from Keswick Dam to the Sacramento-San Joaquin Delta (Delta) is divided into three reaches for discussion in this section: Keswick Reservoir to Red Bluff, Red Bluff to the Feather River, and Feather River confluence to the Delta (near the City of West Sacramento).

*Sacramento River from Keswick Dam to Red Bluff*

The upper reach of the Sacramento River flows for approximately 60 miles from Keswick Dam to Red Bluff (Reclamation 1997). Water-related recreational activities include boating, picnicking, camping, and wildlife viewing. Boating opportunities include motor-boating, jet-skiing, kayaking, canoeing, and whitewater rafting in some locations (Reclamation 2013a, Reclamation et al. 2002). River flows can increase for short-term periods when water is being released from the CVP facilities and during and following storm events in the upper Sacramento River watershed. Flows in the late fall months may decrease to levels that are not favorable for boating. Water temperatures in this reach are generally cold throughout the year.

Much of the land along the Sacramento River between Balls Ferry and Red Bluff is owned and managed by BLM (Reclamation 2013a). Public access points are provided by the cities of Redding and Anderson and the BLM. Lake Redding Park, Turtle Bay, and the Anderson River Park are some of the prominent access areas. Boat launching can occur at eight public boat ramps and two smaller launch facilities, including at Turtle Bay, Caldwell Park, and South Bonneyview in the City of Redding; Ball Ferry; Battle Creek confluence with the Sacramento River; Bend Bridge; and Red Bluff River Park in the City of Red Bluff.

There are two whitewater river reaches, including between Keswick Dam and the Anderson-Cottonwood Irrigation District Diversion Dam and between Anderson River Park and William B. Ide Adobe State Historic Park.

Camping facilities include public campgrounds along the Sacramento River at Lake Red Bluff Recreation Area (Reclamation 2013a).

There are trails or trail access and picnicking facilities with access to the river in this reach of the Sacramento River (Reclamation 2013a). The trails include the 13-mile Sacramento River Trail between Keswick Dam to Turtle Bay Park in the City of Redding. Many of the picnicking locations are managed by local municipalities, including the cities of Redding, Anderson, and Red Bluff. Coleman National Fish Hatchery, located along Battle Creek near the Sacramento River, provides recreational and educational opportunities.

Fishing opportunities along the upper Sacramento River include Chinook Salmon, steelhead, Rainbow Trout, sunfish, and bass (Reclamation 2013a). Fishing can occur from boats along the Sacramento River and at four public fishing access points, including Turtle Bay East, Kapusta Property, Deschutes Road, Reading Island, Diestlehorst Pasture River Access, Jellys Ferry, and Sacramento River Island.

The Mouth of Cottonwood Creek Wildlife Area is operated by California Department of Fish and Wildlife (DFW). This area provides viewing opportunities for Swainson’s Hawk, Bald Eagle, ringtail cat, River Otter, and other birds and wildlife (Reclamation 2013a). Hunting opportunities on BLM land occur at Inks Creek, Massacre Flat, Perry Rifle, Paynes Creek, Bald Hill and Iron Canyon. Commonly hunted game includes quail, dove, waterfowl, deer, pig, turkey, and bear (Reclamation 2013a).

*Sacramento River from Red Bluff to Feather River*

The middle reach of the Sacramento River flows approximately 160 miles from Red Bluff to the confluence with the Feather River (Reclamation 1997).

Water-dependent activities along the middle reach include boating, swimming, and fishing (Reclamation 2005a). Water-contact activities are popular in this section of the river due to relatively warm water. Public access points are provided along this reach by California Department of Parks and Recreations (State Parks); and Tehama, Glenn, Colusa, and Sutter counties (Reclamation 2005a; Reclamation 1997). River access in this reach is primarily provided at private fishing access points, marinas, and resorts.

The three major State Parks properties along the middle reach include the Woodson Bridge State Recreation Area, the Bidwell-Sacramento River State Park, and the Colusa-Sacramento River State Recreation area (DFG 2004; Reclamation 2013a). Public access for fishing, hunting, and wildlife viewing also is provided at the DFW Fremont Weir Wildlife Area (DFW 2014a).

Fishing opportunities include Chinook Salmon, steelhead, trout, American Shad, sturgeon, catfish, and Striped Bass (Reclamation 2005a).

Seasonal game includes Ring-necked Pheasants, California Quail, various species of ducks and geese, Mourning Doves, and Mule Deer (Reclamation 2013a).

*Sacramento River from Feather River to the Northern Delta Boundary*

The lower reach of the Sacramento River flows for approximately 20 river miles between the confluence with Feather River and immediately downstream of the confluence with the American River (USACE 1991). The major portion of this reach of the Sacramento River flows along private property.

Water-related activities in this reach include boating, swimming and beach use, picnicking, biking, sightseeing, and fishing. Public access is provided by Yolo County at Elkhorn Regional Park (Yolo County ); Sacramento County and the City of Sacramento at Discovery Park and Miller Park, respectively (Sacramento County 2012; Reclamation 2005a); and by the City of West Sacramento at Broderick Boat Ramp (West Sacramento 2000).

Fishing opportunities in this area include Chinook Salmon, steelhead, American Shad, sturgeon, catfish, and Striped Bass (Reclamation 1997, 2005a).

#### 15.3.2.1.6 Sacramento Valley Wildlife Refuges

Wildlife refuges in the Sacramento Valley that rely upon CVP water supplies include the Sacramento National Wildlife Refuge (NWR) Complex include Sacramento, Delevan, Colusa, and Sutter NWRs and Gray Lodge Wildlife Area, as described in Chapter 5, Surface Water Resources and Water Supplies, and Chapter 10, Terrestrial Biological Resources (Reclamation 2012). Water-related activities include wildlife viewing, hiking along the refuge wetlands, and waterfowl hunting. Shoreline fishing opportunities at Gray Lodge Wildlife Area include bass, sunfish, perch, catfish, and carp (DFW 2014b)

#### 15.3.2.1.7 Feather River Watershed

Antelope Lake, Lake Davis, and Frenchman Lake located in the Upper Feather River; Lake Oroville and Thermalito Forebay and Afterbay; and the lower Feather River are located within areas in the Feather River watershed that could be affected by changes in CVP and/or SWP operations.

*Upper Feather River Lakes*

The Upper Feather River Lakes, including Antelope Lake, Lake Davis, and Frenchman Lake, are SWP facilities on the upper Feather River upstream of Lake Oroville. These lakes are part of the Plumas National Forest (DWR 2013a).

Recreational facilities and activities at all three lakes are managed by private concessionaires under contract with the Plumas National Forest.

For Antelope Lake, when the water storage in the lake is at full capacity (water elevation at 5,002 feet), the lake has a surface area of 930 acres and 15 miles of shoreline (DWR 2013a; USFS 2011). Water related activities include boating, water skiing, swimming, fishing, camping, and picnicking. There is a boat launching ramp, three fishing access sites, and a picnic area. There are three campgrounds at Antelope Lake, including Boulder Creek, Lone Rock, and Long Point. There are approximately 194 campsites and 4 group campsites at the three campgrounds for use between May through October. Fishing opportunities in Antelope Lake include Rainbow Trout, Brook Trout, crappie, Channel Catfish, and Smallmouth Bass, Largemouth Bass. Hunting opportunities around Antelope Lake include Mule Deer and Black-tailed Deer.

For Lake Davis, when the water storage in the lake is at full capacity (water elevation at 5,785 feet), the lake has a surface area of 4,030 acres and 32 miles of shoreline (DWR 2013a; USFS 2006a). Water related activities include boating, fishing, camping, and picnicking. There are boat launching ramps at Lightning and Honker Cove, car-top boat ramp at Mallard Cove, a fishing access site, and a picnic area. There are three campgrounds at Lake Davis, including Grizzly, Grasshopper, and Lightning Tree. There are approximately 180 campsites at the three campgrounds for use between May through October. Fishing opportunities in Lake Davis include Rainbow Trout, German Brown Trout, Eagle Lake trout, Brown Bullhead, and Largemouth Bass. Hunting opportunities around Lake Davis include Mule Deer and Black-tailed Deer.

For Frenchman Lake, when the water storage in the lake is at full capacity (water elevation at 5,588 feet), the lake has a surface area of 1,580 acres and 21 miles of shoreline (DWR 2013a; USFS 2006b). Water related activities include boating, water skiing, swimming, fishing, camping, picnicking, and ice fishing. There are two boat launching ramps (Frenchman and Lunker Point), six fishing access sites, and a picnic area. There are five campgrounds at Frenchman Lake, including Chilcoot, Cottonwood Springs, Frenchman, Spring Creek, and Big Cove. There are approximately 209 campsites and 2 group campsites at the five campgrounds for use between May through October. Fishing opportunities in Frenchman Lake include Rainbow Trout, Brown Trout, Eagle Lake trout, and Smallmouth Bass. Hunting opportunities around Frenchman Lake include deer and waterfowl.

*Lake Oroville and Thermalito Forebay and Afterbay*

Lake Oroville and Thermalito Forebay and Afterbay are SWP facilities on the Feather River, as described in Chapter 5, Surface Water Resources and Water Supplies. The upper North Fork arm of Lake Oroville is part of the Lassen National Forest; and the upper Middle Fork and South Fork arms of Lake Oroville are part of Plumas National Forest. The Middle Fork Feather River (from Beckwourth downstream of Lake Davis to Lake Oroville) was designated as part of Public Law 90-542 (Wild and Scenic Rivers Act) to be part of the National Wild and Scenic Rivers System on October 2, 1968. Recreational facilities and activities at the Lake Oroville Complex (including Lake Oroville and Thermalito

Forebay and Afterbay) are managed by State Parks as part of the Lake Oroville State Recreation Area. When the water storage in the lake is at full capacity (water elevation at 900 feet msl), Lake Oroville has a surface area of 15,810 acres and 167 miles of shoreline. Thermalito Forebay has a surface area of 630 acres. Thermalito Afterbay has a surface area of 4,300 acres and 26 miles of shoreline when the water elevation is at 136.5 feet msl (DWR 2007a, 2007c, 2013b).

Water-related activities include boating, whitewater boating, camping, picnicking, and fishing (DWR 2007a). Boating includes kayaking, canoeing, and fishing boats. Whitewater boating occurs on the Big Bend area of the North Fork Feather River when Lake Oroville elevations are sufficiently low to expose several miles of river. This portion of the North Fork Feather River forms the Upper North Fork arm of Lake Oroville. Generally, this area is exposed in the late fall months. Another whitewater area is located in the Bald Rock Canyon on the Middle Fork Feather River. This whitewater area is located upstream of the Middle Fork arm of Lake Oroville.

There are 11 boat ramps on Lake Oroville, as summarized in Table 15.16. Two of the boat ramps are located at marinas (DWR 2007a).

**Table 15.16 Lake Oroville, Thermalito Forebay, and Thermalito Afterbay Boat Ramps**

| Location | Boat Ramp | Comments | Useable Elevations (feet, msl) |
|---|---|---|---|
| Lake Oroville | Bidwell Canyon | Day Use Area<br>Marina with 280 berths and 400 mooring anchors | 900 to 700 |
| Lake Oroville | Dark Canyon | Car-Top Launching | 900 to 765 |
| Lake Oroville | Enterprise | | 900 to 835 |
| Lake Oroville | Foreman Creek | Car-Top Launching | 900 to approximately 800 |
| Lake Oroville | Lime Saddle | Day Use Area<br>Marina, including houseboat rentals | 900 to 702 |
| Lake Oroville | Loafer Creek | Boat-In Campground | 900 to 775 |
| Lake Oroville | Monument Hill | Day Use Area | 900 to approximately 700 |
| Lake Oroville | Nelson Bar | Car-Top Launching | 900 to 825 |
| Lake Oroville | Spillway | Day Use Area | 900 to 695 |
| Lake Oroville | Stringtown Creek | Car-Top Launching | 900 to 866 |
| Lake Oroville | Vinton Gulch | Car-Top Launching | 900 to 825 |

| Location | Boat Ramp | Comments | Useable Elevations (feet, msl) |
|---|---|---|---|
| Thermalito Forebay | North Thermalito Forebay | Day Use Area<br>Also used by California State University, Chico | Water elevation does not vary substantially |
| Thermalito Forebay | South Thermalito Forebay | Day Use Area | Water elevation does not vary substantially |
| Thermalito Afterbay | Larkin Road | Car-Top Launching | Water elevation does not vary substantially |
| Thermalito Afterbay | Oroville Wildlife Area | | Water elevation does not vary substantially |
| Thermalito Afterbay | Thermalito Afterbay Outlet | | Water elevation does not vary substantially |
| Thermalito Afterbay | Wilbur Road | | Water elevation does not vary substantially |

Sources: DWR 2006, 2007a

There are 16 campgrounds at Oroville Lake and Thermalito complex (DWR 2007a), as summarized in Table 15.17. Campers are affected by declining water elevations because this increases the distance from the campsites to the shoreline, and makes it difficult to access shoreline campgrounds at Bidwell Canyon, Lime Saddle, and Loafer Creek when water elevations are lower than 850 feet msl.

**Table 15.17 Lake Oroville, Thermalito Forebay, and Thermalito Afterbay Major Campgrounds**

| Location | Campground | Comments | Number of Campsites |
|---|---|---|---|
| Lake Oroville | Bidwell Canyon | Campground | 75 |
| Lake Oroville | Bloomer Cove | Boat-In Campground | 5 |
| Lake Oroville | Bloomer Group | Boat-In Group Campground | 75 |
| Lake Oroville | Bloomer Knoll | Boat-In Campground | 6 |
| Lake Oroville | Bloomer Point | Boat-In Campground | 25 |
| Lake Oroville | Craig Saddle | Boat-In Campground | 18 |
| Lake Oroville | Floating Campsites | Boat-In Campground | 10 Different Locations with approximately 15 sites per location |

| Thermalito Forebay | North Thermalito Forebay “En Route” | Recreational Vehicle Campground | 15 |
| Thermalito Afterbay | Oroville Wildlife Area | Primitive Campground | Several |

Sources: DWR 2006, 2007a

Lake Oroville recreational areas also include day use areas for picnicking, swimming, and other recreational opportunities, as summarized in Table 15.18. The locations for shoreline day use areas are limited due to the steep and rocky elevations at the shorelines. Uses of these locations are less desirable when the water elevations decline. It is difficult to access shoreline campgrounds at Bidwell Canyon and Loafer Creek when water elevations are lower than 850 feet msl.

**Table 15.18 Lake Oroville, Thermalito Forebay, and Thermalito Afterbay Day Use Areas**

| Location | Day Use Area | Comments | Number |
|---|---|---|---|
| Lake Oroville | Bidwell Canyon<br>With Saddle Dam trailhead | Trail and picnic | 4.9 mile trail (hiking and bicycling)<br>21 picnic sites |

Sources: DWR 2006, 2007a

Fishing is popular at the Lake Oroville complex and is performed by boat and from the shoreline (DWR 2007a). Fishing opportunities in Lake Oroville include Smallmouth Bass, Largemouth Bass, Spotted Bass, red-eye bass, Black Crappie, Bluegill, Green Sunfish, Channel Catfish, and White Catfish, Coho Salmon, Rainbow Trout, and Brown Trout. In Thermalito Forebay, fish species include Brook Trout, Brown Trout, Rainbow Trout, and Chinook Salmon. In Thermalito Afterbay, fishing opportunities include Smallmouth Bass, Largemouth Bass, trout, Channel Catfish, White Catfish, and carp. Downstream in the Feather River, fishing opportunities include steelhead, Chinook Salmon, American Shad, Smallmouth Bass, Largemouth Bass, and White Sturgeon.

Hunting opportunities occur around Thermalito Afterbay and/or Oroville Wildlife Area for turkey (in the spring), dove, quail, waterfowl, pheasant, deer, squirrel, and rabbit.

*Feather River from Thermalito Afterbay/Oroville Wildlife Area to Sacramento River*

The Feather River flows from the Thermalito Dam to approximately 40 miles downstream to the confluence with the Sacramento River (Reclamation 1997). The Feather River Wildlife Area, managed by DFW, is located along the Feather River near the confluence with the Bear River. The Feather River Wildlife Area includes the Abbott Lake, Star Bend, O'Connor Lakes, Lake of the Woods, and Nelson Slough units; and Bobelaine Audubon Ecological Reserve (DFG 2008a). The southern boundary of the wildlife area is located adjacent to the Sutter Bypass. In Sutter County, water-related recreation opportunities along the Feather River also include public access at Donahue Road Park, Tisdale Boat Ramp, Boyd's Pump boat launch, Feather River parkway, Yuba City Boat Ramp, Riverfront Park in Marysville, and Live Oak Park and Recreation Area (Sutter County 2010). There are several private facilities that offer camping, boating, and river access.

**15.3.2.1.8 Yuba River Watershed**

Portions of the Yuba River watershed along the North Yuba River between New Bullards Bar Reservoir and Englebright Lake and along the Lower Yuba River between Englebright Lake and the Feather River could be affected by operation of the Lower Yuba River Water Accord (DWR et al. 2007), as described in Chapter 5, Surface Water Resources and Water Supplies. New Bullards Bar Dam and Reservoir are owned and operated by the Yuba County Water Agency to provide flood control, water storage, and hydroelectric generation. The Harry L. Englebright Dam and Reservoir were constructed by the California Debris Commission downstream of New Bullards Bar Reservoir to trap and store sediment from historical hydraulic mining sites in the upper watershed, and provide recreation and hydroelectric generation opportunities (USACE 2013). Following decommissioning of the California Debris Commission in 1986, administration of Englebright Dam and Reservoir (Lake) was assumed by the U.S. Army Corps of Engineers.

Portions of the watershed along the Middle Yuba River between New Bullards Bar Reservoir and Englebright Reservoir are within the Plumas and Tahoe national forests. There are also lands owned and managed by the Bureau of Land Management and U.S. Army Corps of Engineers along this reach of the river.

This reach also includes the confluence with the South Yuba River. Portions of the Lower South Yuba River are designated as a California Wild and Scenic River (USFS et al. No Date). Portions of the South Yuba River State Park located near the confluence along the South Yuba River and Yuba River provide recreational opportunities for swimming, fishing, bird watching, and gold panning (State Parks 2009).

*New Bullards Bar Reservoir*

The New Bullards Bar Reservoir has a storage capacity of 966,103 acre-feet when the water elevation is at 1,956 feet. When full, the lake has a surface area of 4,790 acres and 71.9 miles of shoreline (YCWA 2012). Recreational facilities and activities are the responsibility of Yuba County Water Agency. Water related activities include boating, fishing, camping from May through September, and picnicking (DWR et al. 2007). There are several campgrounds adjacent to the lake, including Schoolhouse and Dark Day campgrounds along the shoreline and Madrone Cove and Garden Point that are only accessed by boat. Boat access is provided at Emerald Cove Resort and Marina, Cottage Creek, and Dark Day. The Cottage Creek and Dark Day boat ramps are not useable when the lake elevation declines below 1,822 and 1,798 feet, respectively. Fishing opportunities include Rainbow Trout, Brown Trout, Kokanee Salmon, Bluegill, crappie, Bullhead, Smallmouth Bass, and Largemouth Bass.

*Englebright Reservoir*

The Englebright Reservoir has a storage capacity of approximately 70,000 acre-feet when the water elevation is at 527 feet (USACE 2012, 2013, 2014). When full, the lake has a surface area of 815 acres and 24 miles of shoreline. Recreational facilities and activities are the responsibility of U.S. Army Corps of Engineers. Water related activities include boating, water-skiing, fishing, boat-access camping, and picnicking. There are 96 boat-access only camping sites. There are two boat ramps to provide access to the lower part of the lake. The upper portion of the lake is characterized by narrow canyons and sharp bends which limit boat access. Fishing opportunities include Rainbow Trout, Brown Trout, Kokanee Salmon, sunfish, catfish, Smallmouth Bass, and Largemouth Bass.

*Lower Yuba River*

Hiking and boating opportunities occur along the 24 miles of the Lower Yuba River between Englebright Reservoir and the Feather River (DWR et al. 2007). Public river access is provided at several locations to support fishing, picnicking, rafting, kayaking, tubing, and swimming. Fishing opportunities include American Shad, Chinook Salmon, steelhead, Smallmouth Bass, and Striped Bass.

#### 15.3.2.1.9 American River Watershed

Folsom Lake and Lake Natoma on the American River and the lower American River are located within areas in the American River watershed that could be affected by changes in CVP and/or SWP operations.

*Folsom Lake and Lake Natoma*

Folsom Lake is a CVP facility on the American River, as described in Chapter 5, Surface Water Resources and Water Supplies. The El Dorado National Forest is located in the upper American River watershed upstream of Folsom Lake. The State of California designated the North Fork American River from the source to Iowa Hill Bridge upstream of Folsom Lake as wild and scenic. Recreational facilities and activities in the Folsom Lake area are within the Folsom Lake State Recreation Area or the Folsom Powerhouse State Historic Park that are managed by State Parks. Recreational activities upstream of Folsom Lake occur on or adjacent to many lands owned by the Bureau of Land Management, State Parks, and El Dorado County. When the water storage in the lake is at full capacity (466 feet msl), Folsom Lake has a surface area of 11,450 acres and 75 miles of shoreline (State Parks and Reclamation 2003, 2007).

The upper extent of Lake Natoma is located about 1 mile downstream of Folsom Dam. Lake Natoma continues from the Rainbow Bridge to Nimbus Dam, about a 4-mile distance (State Parks and Reclamation 2003, 2007). Recreational facilities and activities at the Lake Natoma area are part of the Folsom Lake State Recreation Area and managed by State Parks. When the water storage in the reservoir is at full capacity (132 feet msl), Lake Natoma has a surface area of 540 acres and 14 miles of shoreline.

Water-related activities at Folsom Lake include boating, jet skiing, water skiing, wind surfing, rafting, sailing, canoeing, kayaking, swimming, and fishing (Reclamation 2005b; State Parks and Recreation 2003, 2007). White water rafting occurs along the South Fork American River upstream of Folsom Lake and at Skunk Hollow and Salmon Falls.

Water-related activities at Lake Natoma generally only includes paddling, rowing, and fishing due to a 5 miles/hour speed limit for motorized watercraft. California State University Sacramento operates an aquatic center at Lake Natoma (Reclamation et al. 2006).

Folsom Lake Marina at Brown's Ravine is the only marina at Folsom Lake. There are six boat launch facilities at Folsom Lake and three boat launch facilities at Lake Natoma, as summarized in Table 15.19.

**Table 15.19 Folsom Lake and Lake Natoma Boat Ramps**

| Location | Boat Ramp | Comments | Useable Elevations (feet, msl) |
|---|---|---|---|
| Folsom Lake | Beal's Point | Day Use Area<br>Informal Boat Ramp | 465 to 420 |
| Folsom Lake | Brown's Ravine | Day Use Area<br>Folsom Lake Marina with 685 wet slips and 175 dry storage slips | 466 to 395 |
| Folsom Lake | Folsom Point | – | 466 to 406 |

| Lake Natoma | Willow Creek | Informal Boat Ramp | 125 to 115 |

Sources: Reclamation et al. 2006; State Parks and Reclamation 2003, 2007

Campgrounds are located at Folsom Lake and Lake Natoma, as summarized in Table 15.20. Campers are also affected by declining water elevations because this increases the distance from the campsites to the shoreline. Drawdown of the reservoir has an aesthetic effect on users because the land exposed during drawdown is generally composed of bare earth and rock.

**Table 15.20 Folsom Lake and Lake Natoma Major Campgrounds**

| Location | Campground | Comments | Number of Campsites |
|---|---|---|---|
| Folsom Lake | Beal's Point | – | 49 Camp Sites<br>20 Recreation Vehicles |
| Folsom Lake | Peninsula | Campground<br>Boat-In Campground | 104 Camp Sites |
| Lake Natoma | Negro Bar | Group Campground | 3 Major Camp Sites |

Note: State Parks and Reclamation 2003, 2007; Reclamation et al. 2006

Folsom Lake and Lake Natoma recreational areas also include day use areas for picnicking, swimming, and other recreational opportunities, as summarized in Table 15.21. The locations for shoreline day use areas are limited due to the steep and rocky elevations at the shorelines. Uses of these locations are less desirable when the water elevations decline. The Jedediah Smith Memorial Trail begins at Beal's Point and extends along Lake Natoma to the confluence of the American River and Sacramento River downstream of Nimbus Dam. The Pioneer Express Trail which extends from the Auburn State Recreation Area to Beal's Point is part of the Western States Pioneer Express Trail (a National Recreation Trail).

**Table 15.21 Folsom Lake and Lake Natoma Day Use Areas**

| Location | Day Use Area | Comments | Number |

Sources: Reclamation et al. 2006; State Parks and Reclamation 2003, 2007

Fishing is also popular at Folsom Lake and Lake Natoma from boats and the shoreline. Anglers can catch warmwater and coldwater fish species due to the summer stratification of the lake into a warm layer above a coldwater pool especially in Folsom Lake (State Parks and Reclamation 2007). Warm water fishing opportunities include Smallmouth Bass, Largemouth Bass, Spotted Bass, and black and White Crappie. The cooler water strata support fishing for Rainbow Trout, Brown Trout, and Chinook Salmon.

*American River from Nimbus Dam to the Confluence with Sacramento River*

The American River flows 14 miles between Nimbus Dam and the confluence with the Sacramento River was designated by the Secretary of the Interior to be part of the National Wild and Scenic Rivers System on January 19, 1981. The State of California also designated the Lower American River as wild and scenic under Public Resources Code sections 5093.54 and 5093.545.

The Jedediah Smith Memorial Trail (also known as the American River Bike Trail) continues along the American River from Beal’s Point at Folsom Lake, along Folsom Lake and Lake Natoma, and along the Lower American River through Discovery Park to the confluence with the Sacramento River (Reclamation 2005b).

The American River Parkway is a 26-mile green space designated and managed by Sacramento County Parks and Recreation along the Lower American River from Nimbus Dam to the confluence with the Sacramento River at Discovery Park. This parkway provides extensive recreational opportunities, including boating rafting, kayaking, canoeing, swimming, and fishing (Reclamation 2005b; Sacramento County 2008). Pedestrian access is provided at 87 locations along the parkway. Bicycle access and equestrian access are provided at 65 and 37 locations, respectively. Boat launch ramps are provided at 7 locations and Car-top Boat Launch opportunities are provided at 17 locations. Picnic locations are located at numerous locations along the American River. Fishing opportunities along the Lower American River include Chinook Salmon, steelhead, trout, Striped Bass, American Shad, Largemouth Bass, Bluegill, crappie, sunfish, and catfish (Sacramento County 2008).

*Sacramento Municipal Utility District – Rancho Seco Park and Lake*

Rancho Seco Park and Lake, operated by Sacramento Municipal Utility District, is used to store CVP water (Reclamation 2005b). The lake has a surface are of 160 acres. Water-related activities include boating, camping, picnicking, bird watching and fishing. Facilities available for these activities are two boat ramps and a fish cleaning facility. Game fish species found at the lake include catfish, Bluegill, crappie, and trout. Birds that use the area include ducks, geese, hawks, Bald Eagles, blue heron, and migratory birds (SMUD 2013).

#### *15.3.2.2 San Joaquin Valley*

Recreational opportunities in the San Joaquin Valley upstream of the Delta that are influenced by CVP and SWP operations occur at Millerton Lake, San Joaquin River between Friant Dam and the Delta, New Melones Reservoir, Stanislaus River between Tulloch Dam and San Joaquin River, San Luis Reservoir complex, recreation areas along Delta Mendota Canal and California Aqueduct, and refuges that use CVP water supplies.

##### 15.3.2.2.1 Millerton Lake

Millerton Lake is a CVP facility on the San Joaquin River, as described in Chapter 5, Surface Water Resources and Water Supplies. Millerton Lake is part of the Millerton State Recreation Area. Recreational facilities and activities at Millerton Lake are administered by State Parks. When the water storage in the lake is at full capacity (water elevation at 580.6 feet msl), Millerton Lake has a surface area of approximately 4,900 acres and 44 miles of shoreline (Reclamation and DWR 2011).

Boating, sailing, water skiing, jetskiing, swimming, tournament and recreational fishing, camping, and picnicking (Reclamation and DWR 2011; Reclamation and State Parks 2010). Whitewater rafting opportunities occur upstream of Millerton Lake. There are six public boat ramps on Millerton Lake, as summarized in Table 15.22.

**Table 15.22 Millerton Lake Boat Ramps**

| Location | Boat Ramp | Comments | Useable Elevations (feet, msl) |
|---|---|---|---|
| Millerton Lake | Crow's Nest | On South Shore | 580 to 487 |
| Millerton Lake | Grange Cove | On South Shore | Several Boat Ramps: 580 to 500 |
| Millerton Lake | McKenzie Point | On South Shore | 580 to 472 |
| Millerton Lake | North Shore | On North Shore | 580 to 470 |
| Millerton Lake | South Bay | On South Shore | 580 to 500 |

Sources: Reclamation and DWR 2011; Reclamation and State Parks 2010

The marina at Millerton Lake is located at Winchell Cove on the South Shore (Reclamation and State Parks 2010). The marina includes 500 boat slips. There are also eight boat slips at Crow's Nest.

Campgrounds are located along the Millerton Lake North Shore, as summarized in Table 15.23. Many of these campsites are located along the shoreline. These campsites are affected by declining water elevations because this increases the distance from the campsites to the shoreline.

**Table 15.23 Millerton Lake Major Campgrounds**

| Location | Campground | Comments | Number of Campsites |
|---|---|---|---|
| Millerton Lake | Dumna Strand | – | 10 |

| Millerton Lake | Rocky Point | – | 21 |
| Millerton Lake | Temperance Flat Boat | Boat-In Campground | 25 |
| Millerton Lake | Valley Oak | – | 6 |

Source: Reclamation and State Parks 2010

Millerton Lake recreational areas also include day use areas for picnicking, swimming, and other recreational opportunities, as summarized in Table 15.24 (Reclamation and State Parks 2010). The locations for shoreline day use areas are less desirable when the water elevations decline.

**Table 15.24 Millerton Lake Day Use Areas**

| Location | Day Use Area | Comments | Number |
|---|---|---|---|
| Millerton Lake | Blue Oak | Picnic and Trail along the South Shore | 3 sites<br>4 miles |
| Millerton Lake | Buzzard's Roost Trail | Picnic and Trail | 2 sites<br>0.5 miles |

| Millerton Lake | South Bay | Picnic | 9 sites |
| Millerton Lake | South Fine Gold | Picnic and Trail | 10 sites<br>11 miles |

Sources: Reclamation and State Parks 2010; State Parks 2008

Fishing is also popular at Millerton Lake from boats and shoreline. Fishing opportunities include Striped Bass, Black Bass, Largemouth Bass, Green Sunfish, and American Shad (Reclamation and State Parks 2010).

#### 15.3.2.2.2 San Joaquin River from Friant Dam to the Delta

The San Joaquin River flows 100 miles from Friant Dam to the Delta. Downstream of Friant Dam, the San Joaquin River flows 23 miles through lands within the San Joaquin River Parkway which includes parks, trails, and ecological reserve areas between Friant Dam and State Route 145 managed by the San Joaquin River Parkway and Conservation Trust (Reclamation and DWR 2011).

Water-related recreational activities include boating, canoeing, kayaking, whitewater rafting, camping, picnicking, fishing, and hunting (Reclamation and DWR 2011). Access and facilities for these activities are available at several locations along and adjacent to the San Joaquin River.

Between Friant Dam and the confluence with the Merced River, whitewater rafting occurs between Friant Dam to Skaggs Bridge Park at State Route 145. Public access locations are generally located within the San Joaquin River

Parkway. Seven boat launching locations along the San Joaquin River Parkway that are managed by the San Joaquin River Parkway and Conservation Trust and/or DFW, Fresno County, or private operators. Lost Lake Park, managed by the San Joaquin River Parkway and Conservation Trust and DFW, provides a non-powered car-top boat launch. Sycamore Island Park, managed by San Joaquin River Parkway and Conservation Trust offers a boat ramp for small boats. River access also is available at Skaggs Bridge Park, managed by Fresno County. Picnicking is provided at most of the public access locations and at several other locations within the parkway. Camping is provided at Scout Island and Lost Lake Park managed by Fresno County and the private Fort Washington Beach. Trails include the 5-mile long Lewis S. Eaton Trail.

Downstream of State Route 145, major recreational areas include the 85-acre Mendota Pool in Mendota; Dunkle and Maldonado parks in the City of Firebaugh; and Las Palmas Fishing Access and Laird Park in Stanislaus County. Public access is provided at all of these sites. A boat ramp is located upstream of Mendota Dam.

The majority of these areas permit fishing. Fishing opportunities in the San Joaquin River include sunfish, crappie, Bluegill, Striped Bass, Largemouth Bass, and catfish (Reclamation and DWR 2011).

**15.3.2.2.3 San Joaquin Valley Refuges**

Wildlife refuges in the San Joaquin Valley that rely upon CVP water supplies include the San Luis NWR (including the San Luis Unit, West Bear Creek Unit, East Bear Creek Unit, Freitas Unit, and Kesterson Unit); Merced NWR; Los Banos Wildlife Area; Volta Wildlife Area; Mendota Wildlife Area; North Grasslands Wildlife Area (including China Island Unit and Salt Slough Unit); and Grasslands Resource Conservation District, as described in Chapter 5, Surface Water Resources and Water Supplies, and Chapter 10, Terrestrial Biological Resources (Reclamation 2012). Water-related activities include wildlife viewing, and hunting. Hunting opportunities include waterfowl, shorebirds, and pheasants (Reclamation and DWR 2011).

Several wildlife areas along the San Joaquin River could be affected by CVP operations of Millerton Lake, including the West Hilmar Wildlife Area downstream of the confluence with the Merced River and the San Joaquin River NWR located between the Tuolumne and Stanislaus rivers (Reclamation and DWR 2011). West Hilmar Wildlife Area includes 340 acres of wildlife area accessible by boat. The San Joaquin River NWR includes over 7,000 acres of riparian woodlands, wetlands, and grasslands for native wildlife with limited access at Pelican Trail.

In the southern San Joaquin Valley, the Kern and Pixley NWRs provide wildlife viewing opportunities.

#### 15.3.2.2.4 Stanislaus River Watershed

New Melones Reservoir and Tulloch Reservoir on the Stanislaus River and the lower Stanislaus River are located within areas in the Stanislaus River watershed that could be affected by changes in CVP operations.

*New Melones Reservoir*

New Melones Reservoir is a CVP facility on the Stanislaus River, as described in Chapter 5, Surface Water Resources and Water Supplies. Recreation activities and facilities at New Melones Reservoir area are managed by Reclamation. When the water storage in the reservoir is at full capacity, New Melones Reservoir has a surface area of approximately 12,500 acres and 105 miles of shoreline at a surface elevation of 1,088 feet msl (Reclamation 1997, 2010a).

Water-related activities include boating, waterskiing, camping, picnicking, wildlife viewing, spelunking, rock climbing, gold panning, and fishing (Reclamation 2010a). Float planes can land within the North, Middle, and South Bays of the reservoir. A model airplane club operates an airstrip near New Melones Dam. Cave exploration occurs in the Stanislaus River Canyon. Rock climbing occurs on Table Mountain. In years when the reservoir elevation is low, whitewater rafters launch at the Old Camp Nine Bridge.

There are five boat ramps at New Melones Reservoir, as summarized in Table 15.25.

**Table 15.25 New Melones Reservoir Boat Ramps**

| Location | Boat Ramp | Comments | Useable Elevations (feet, msl) |
|---|---|---|---|
| New Melones Reservoir | Angels Creek | – | 1,088 to 975 |
| New Melones Reservoir | Glory Hole | Location of New Melones Lake Marina | Several Boat Ramps: 1,088 to 860 |
| New Melones Reservoir | Mark Twain | Unimproved Ramp | 1,088 to 760 |
| New Melones Reservoir | Parrotts Ferry | Unimproved Ramp | Several Boat Ramps: 1,088 to 900 |

Source: Reclamation 2010a

The New Melones Marina is the only location with mooring facilities and houseboat rentals (Reclamation 2010a). Up to 50 private houseboats on mooring balls, 38 private houseboats in slips, and 20 rental houseboats may be maintained on the reservoir.

Campgrounds are located at Glory Hole and Tuttletown, as summarized in Table 15.26 (Reclamation 2010a). Some of the campsites are located along the shoreline. These campsites are affected by declining water elevations because this increases the distance from the campsites to the shoreline.

**Table 15.26 New Melones Reservoir Major Campgrounds**

| Location | Campground | Comments | Number of Campsites |
|---|---|---|---|
| New Melones Reservoir | Glory Hole | Two campgrounds | 144 |
| New Melones Reservoir | Tuttletown | Three campgrounds<br>Two Group campgrounds | 161<br>16 |

Source: Reclamation 2010a

New Melones Reservoir recreational areas also include day use areas for picnicking, swimming, and other recreational opportunities, as summarized in Table 15.27 (Reclamation 2010a). The locations for shoreline day use areas are less desirable when the water elevations decline.

**Table 15.27 New Melones Reservoir Day Use Areas**

| Location | Day Use Area | Comments | Number |
|---|---|---|---|
| New Melones Reservoir | Glory Hole | Picnic and Trails | 61 sites<br>Several trails: 0.25 to 2.5 miles |
| New Melones Reservoir | Mark Twain | Picnic and Norwegian Gulch Trail | 0.5 miles |
| New Melones Reservoir | Natural Bridges | Trail | 0.7 miles |
| New Melones Reservoir | Shoreline | Swimming and Recreational Gold Panning | – |
| New Melones Reservoir | Table Mountain | Trail | Several trails: 1.5 to 4.0 miles |
| New Melones Reservoir | New Melones Lake Visitor | Visitor Center | – |
| New Melones Reservoir | Tuttletown | Picnic and Trail | 52 sites<br>Several trails: 0.4 to 1.7 miles |

Sources: Reclamation 2010a, 2010b, 2014

*Tulloch Reservoir*

Tulloch Reservoir is a reservoir owned and operated by the Oakdale and South San Joaquin Irrigation Districts on the Stanislaus River downstream of New Melones Reservoir, as described in Chapter 5, Surface Water Resources and Water Supplies. When the water storage in the reservoir is at full capacity (water elevation at 510 feet msl), the reservoir has a surface area of 1,260 acres and 55 miles of shoreline (CBC 2013; Tri-Dam Project 2002).

Water-related activities include boating, sailing, windsurfing, jet and water skiing, camping, picnicking, and fishing. Most of the shoreline is privately owned with shoreline access and more than 400 private docks for residents (Tri-Dam Project 2012). Public access is provided at a DFW marina and campground with a boat ramp at South Shore.

*Stanislaus River from Tulloch Dam to the San Joaquin River*

Downstream of Tulloch Dam, the Stanislaus River flows to Goodwin Dam, and then continues approximately 40 miles to the confluence with the San Joaquin River. Water-related activities along the lower portion of the Stanislaus River include whitewater rafting, camping, picnicking, swimming, and fishing. Whitewater rafting begins at Goodwin Dam and continues almost 4 miles to Knights Ferry (Reclamation 1997). Downstream of Knights Ferry, there are seven parks, including Caswell Memorial State Park, a 258-acre park managed by State Parks (Stanislaus County 1987; State Parks 2006a). Fishing opportunities on the lower Stanislaus River include bass, catfish, and crappie.

#### 15.3.2.2.5 San Luis Reservoir State Recreation Area

The San Luis Reservoir complex includes CVP and SWP offstream storage facilities located south of the Delta, as described in Chapter 5, Surface Water Resources and Water Supplies. The San Luis Reservoir complex includes San Luis Reservoir, O'Neill Forebay, and Los Banos Creek Reservoir. The San Luis Reservoir complex is located within the San Luis Reservoir State Recreation Area, and the recreational facilities are operated by State Parks (State Parks 2003). Los Banos Creek Reservoir is a flood detention basin to protect the community of Los Banos and San Luis Canal/California Aqueduct. This reservoir and a similar flood management reservoir that is not within the San Luis Reservoir State Recreation Area (Little Panoche Creek Reservoir) are not affected by CVP and SWP operations. Therefore, Los Banos Creek Reservoir and Little Panoche Creek Reservoir are not considered in detail in this EIS.

When the water storage in the San Luis Reservoir is at full capacity (water elevation at 540 feet msl), the reservoir has a surface area of 12,700 acres and 65 miles of shoreline (Reclamation and State Parks 2013; State Parks 2010).

The O'Neill Forebay is east of the San Luis Reservoir downstream of the San Luis Dam. When the water storage in the forebay is at full capacity (water elevation of 230 feet msl), the reservoir has a surface area of 2,210 acres and 14 miles of shoreline (Reclamation and State Parks 2013; State Parks 2010).

Water-related activities include boating, camping, picnicking, wildlife and scenic viewing, fishing, and hunting occur throughout the San Luis Reservoir State Recreation Area (Reclamation 2005c; State Parks 2010; Reclamation and State Parks 2013). Boat ramps are located at all three reservoirs, as summarized below.

- San Luis Reservoir: Boat ramps at Basalt Area and Dinosaur Point (operational to 340 feet and 360 feet msl, respectively).

- O'Neill Forebay: Boat ramps at Group Campground and Medeiros Campground.
- Los Banos Creek Reservoir: Boat ramp at Los Banos Creek Campground.

Camping occurs at Basalt Area at San Luis Reservoir (79 sites), O'Neill Forebay (50 sites), San Luis Creek Area (53 sites and two group campsites with 90 sites), and Los Banos Creek Area (14 sites) (Reclamation and State Parks 2013). Picnic sites, swimming, and/or trails occur at Basalt Area, Medeiros Area, and Los Banos Creek Area (Reclamation 2005c; State Parks 2010; Reclamation and State Parks 2013).

Fishing opportunities include Striped Bass, American Shad, and catfish (Reclamation and State Parks 2013). Hunting opportunities occur at San Luis Reservoir for waterfowl, deer, and wild pig (Reclamation 2005c; Reclamation and State Parks 2013).

##### 15.3.2.2.6 Delta Mendota Canal

Delta Mendota Canal is a CVP facility, as described in Chapter 5, Surface Water Resources and Water Supplies. The Delta-Mendota Canal includes two fishing sites: one in Stanislaus County and the other in Fresno County (Reclamation 2005c). Fishing opportunities include Striped Bass and catfish (Reclamation 1997).

##### 15.3.2.2.7 California Aqueduct/San Luis Canal

The California Aqueduct is a SWP facility, as described in Chapter 5, Surface Water Resources and Water Supplies. A portion of the canal is also co-located with the CVP San Luis Canal. Fishing is permitted at 12 sites along the California Aqueduct between Bethany Reservoir and Perris Lake in Southern California. Fishing opportunities include Striped Bass, Largemouth Bass, catfish, crappie, Green Sunfish, Bluegill, and starry flounder (Reclamation 1997).

#### *15.3.2.3 Delta*

The Delta is located at the terminus of the Sacramento River and the San Joaquin River. Water-related activities in the Delta include boating, sailing, water skiing, canoeing, kayaking, picnicking, fishing, and hunting. Recreational opportunities exist in many areas of the Delta; however, the analysis in this EIS is related to areas that could be affected by changes in CVP and/or SWP water supply operations and restoration in the Yolo Bypass. The following discussion describes recreation throughout the Delta followed by more specific discussions of recreation within the Yolo Bypass and Cache Slough.

##### 15.3.2.3.1 Delta Recreational Opportunities

The primary recreational activities in the Delta are related to boating and fishing (DPC 2012). Public recreation facilities are limited within the Delta. Most recreational opportunities are provided by private enterprises, including marinas, restaurants, hunting venues, and wineries and farm visits. Public access is provided at DFW and U.S. Fish and Wildlife Service (USFWS) sites.

The most recent survey of boating opportunities in the Delta was completed in 2002 by the California Department of Boating and Waterways (DBW 2014; DPC 2012). The survey indicated that of the 95 marinas surveyed, three were publically-owned and 92 were privately-owned (including 87 that were open to the public and five that were for members). The survey indicated that within the Delta there were over 11,600 boat slips, 55 boat launches, 2,182 campsites, and 324 picnic sites.

Public access sites for boating and wildlife and scenic viewing in the Delta include:

- USFWS: Stone Lakes NWR, Antioch Dunes NWR.
- DFW: Calhoun Cut Ecological Reserve, Decker Island Wildlife Area, Lower Sherman Island Wildlife Area, Miner Slough Wildlife Area, Rhode Island Wildlife Area, White Slough Wildlife Area, Woodbridge Ecological Reserve, Fremont Weir Wildlife Area, Sacramento Bypass Wildlife Area, and Yolo Bypass Wildlife Area.
- State Parks: Brannan Island-Franks Tract State Recreation Areas, Delta Meadows State Recreation Area.
- Department of Water Resources: Clifton Court Forebay.
- The Nature Conservancy/DFW: Cosumnes River Preserve.
- Solano Land Trust: Jepson Prairie Preserve.
- East Bay Regional Park District: Big Break Regional Shoreline, Antioch/Oakley Regional Shoreline, Browns Island Regional Preserve, Bay Point Regional Shoreline, Martinez Regional Shoreline, Carquinez Strait Regional Shoreline-Crockett Hills Regional Park, and Contra Costa Canal Trail.
- Municipal Marinas, Boat Launching, and Fishing Access Facilities: City of Antioch Marina and Municipal Boat Ramp; City of Pittsburg Riverview Park; Sacramento County Cliffhouse, Georgiana Slough Fishing Access, Hogback Island Access, and Sherman Island Public Access Facility; City of Sacramento Garcia Bend Park; several public and private marinas in Sacramento County; 12 public and private marinas with over 900 boat slips and boat access within the City of Stockton; San Joaquin County Dos Reis Regional Park, Mossdale Crossing Regional Park, and Westgate Landing Regional Park; and Yolo County Clarksburg River Access.

Several of these sites include launch sites for boats, canoes, and kayaks and numerous trails (DPC 2012; DSC 2011; DFG 2008b, 2008d, 2009; EBRPD 2013a; Antioch 2003; Pittsburg 2001; Sacramento County 2014; Sacramento 2005; Stockton 2007; Yolo County 2009).

One of the larger bodies of water in the Delta is the SWP Clifton Court Forebay. Fishing is the only recreational opportunity that occurs within the Clifton Court Forebay; and the opportunities are limited (DWR 2013c). Public access is restricted near the radial gate along West Canal. However, boat access occurs at a boat dock along West Canal to the east of the radial gate and by a trail from Clifton Court Road.

Fishing opportunities in the Delta generally include Striped Bass, Smallmouth Bass, Largemouth Bass, Spotted Bass, American Shad, Black Crappie, Chinook Salmon, steelhead, catfish, sunfish, Tule Perch, Warmouth, and White Sturgeon (DPC 2006).

Hunting opportunities for waterfowl, shorebirds, doves, and pheasants occur in many areas of the Delta on privately-owned land. Hunting also occurs at several publically-owned sites within the Delta, including:

- USFWS: Stone Lakes NWR.
- DFW: Decker Island Wildlife Area, Lower Sherman Island Wildlife Area, Miner Slough Wildlife Area, Rhode Island Wildlife Area, White Slough Wildlife Area, Yolo Bypass Wildlife Area; and on some lands owned by DWR (including Sherman and Twitchell islands and Clifton Court Forebay).

The Delta Protection Commission identified several physical constraints to Delta recreational opportunities that could be affected by CVP and SWP operations, including changes in water quality and operation of the CVP or SWP water facilities (Delta Cross Channel, South Delta Temporary Barriers, and Montezuma Slough Salinity Gates) (DPC 2012).

**15.3.2.3.2 Yolo Bypass and Cache Slough Recreational Opportunities**

The primary recreational activities in the Yolo Bypass and Cache Slough areas are related to wildlife viewing and hunting. Many recreational hunting opportunities occur on private lands, including private hunting clubs. Areas within Yolo Bypass and Cache Slough that provide public access for wildlife viewing or hunting within the Yolo Bypass and Cache Slough area, include:

- Fremont Weir Wildlife Area (DFW 2014a).
  - Wildlife viewing and fishing.
  - Hunting for pheasant, waterfowl, Mourning Dove, deer, quail, rabbit, and turkey.
- Sacramento Bypass Wildlife Area (DFW 2014c).
  - Wildlife viewing and fishing, including for White Sturgeon, White Catfish, and Black Crappie in the Tule Canal; and Largemouth Bass, Bluegill, and White Catfish in the borrow pits.
  - Hunting for pheasant and Mourning Dove.
- Yolo Bypass Wildlife Area (DFG 2008c, 2010).
  - Wildlife viewing and hiking.
  - Fishing for sturgeon, Striped Bass, Black Bass, and catfish.

- Hunting for waterfowl, coots, Moorhens, Snipe, pheasants, and Mourning Doves.
- Educational and interpretative programs.

- Calhoun Cut Ecological Reserve (DFG 2008d).
  - Waterfowl hunting and fishing from a boat.

There are other publically-owned lands within the Yolo Bypass and Cache Slough that provide habitat or will be restored to provide habitat. However, these lands are generally not available for public access to protect fragile ecosystems.

#### *15.3.2.4 Suisun Marsh*

Suisun Marsh is 106,511 acres of wetlands located between the Delta and the San Francisco Bay. Water-related activities at Suisun Marsh include waterfowl hunting, boating, kayaking, hiking, wildlife viewing, fishing, and hunting (Reclamation et al. 2011). Water-related recreation occurs within the two major channels, Montezuma and Suisun sloughs; and several moderately sized channels, Cordelia, Denverton, Nurse, and Hill sloughs.

The DFW manages several areas within the Suisun Marsh for public access, as described in Chapter 10, Terrestrial Biological Resources. These areas include (Reclamation et al. 2011):

- Grizzly Island Wildlife Area
  - Wildlife viewing, hiking, and fishing (February through July, and late September).
  - Hunting (August through mid-September, and October through January).
- Hill Slough Wildlife Area
  - Wildlife viewing and fishing.
- Peytonia Slough Ecological Preserve
  - Kayaking.
  - Wildlife viewing and fishing.
- Belden's Landing Water Access Facility
  - Boat launch ramp and fishing pier.

Suisun City Marina and Solano Yacht Club, Suisun City Boat Launch, and McAvoy Yacht Harbor and Club also provide boat launch ramp facilities (Reclamation et al. 2011). Pier fishing opportunities are provided at Suisun City Boat Launch.

The Solano Land Trust's Rush Ranch also provides opportunities for hiking and picnicking in the wetlands and upland areas near Potrero Hills (Reclamation et al. 2010).

Fishing opportunities within Suisun March include Striped Bass, White Sturgeon, catfish, and carp (Reclamation et al. 2011). Occasionally, Chinook Salmon, steelhead, and Largemouth Bass are caught in Suisun Marsh near Grizzly Island.

Duck hunting generates the most frequent recreational visits in Suisun Marsh (Reclamation et al. 2011). About 37,500 acres of Suisun Marsh are owned and operated by private duck clubs. DFW manages about 15,300 acres of public lands in Grizzly Island Wildlife Area for hunting of waterfowl, Snipe, coots, Moorhens, Mourning Doves, pheasants, rabbits, and Tule Elk.

There are other publically-owned lands within Suisun Marsh that provide habitat or will be restored to provide habitat. However, these lands are generally not available for public access to protect fragile ecosystems.

### 15.3.3 San Francisco Bay Area Region

The San Francisco Bay Area Region includes portions of Contra Costa, Alameda, Santa Clara, San Benito, and Napa counties that are within the CVP and SWP service areas. This section describes reservoirs in the San Francisco Bay Area Region that could be affected by CVP and SWP operations, including the CVP Contra Loma and San Justo reservoirs; the SWP Bethany Reservoir and Lake Del Valle; the Contra Costa Water District Los Vaqueros Reservoir; and the East Bay Municipal Utility District Upper San Leandro, San Pablo, Briones, and Lafayette reservoirs and Lake Chabot. CVP and SWP are generally not stored in reservoirs within Santa Clara County (SCVWD 2010).

#### *15.3.3.1 Contra Loma Reservoir*

The Contra Loma Reservoir is a CVP facility in Contra Costa County that provides offstream storage along the Contra Costa Canal, as described in Chapter 5, Surface Water Resources and Water Supplies. The recreation facilities are managed by East Bay Regional Park District. The 80 acre reservoir is part of 661-acre Contra Loma Regional Park and Antioch Community Park (Reclamation 2014a). Water-related activities include boating, wind surfing, kayaking, picnicking, and fishing. No bodily contact is to occur in Contra Loma Reservoir; therefore, a large swimming pool was constructed for the visitors by the East Bay Regional Park District. There is one boat launch at the reservoir. Contra Loma Reservoir accommodates fishing all year-round. Fishing opportunities include catfish, Black Bass, Striped Bass, Largemouth Bass, Bluegill, crappie, trout, and Redear Sunfish (EBRPD 2013c).

#### *15.3.3.2 San Justo Reservoir*

The San Justo Reservoir is a CVP facility in San Benito County that provides offstream storage as part of the San Felipe Division, as described in Chapter 5, Surface Water Resources and Water Supplies. San Justo Reservoir recreation facilities have been closed to the public since 2009 due to an infestation by the zebra mussel. Previously, the recreation facilities were managed by San Benito County Water District (SBCWD 2014).

#### 15.3.3.3 Bethany Reservoir

Bethany Reservoir is a SWP facility located between the California Aqueduct and South Bay Aqueduct in Alameda County, as described in Chapter 5, Surface Water Resources and Water Supplies. The recreation facilities are part of the Bethany Reservoir State Recreation Area and are managed by State Parks. When the water storage in the reservoir is at full capacity (water elevation at 243 feet msl), Bethany Reservoir has 161 acres of surface area and 6 miles of shoreline (DWR 2001). Water-related activities include boating, windsurfing, picnicking, and fishing. There is one boat launch at the reservoir (State Parks 2013a). Fishing opportunities include Striped Bass, Smallmouth Bass, Largemouth Bass, Spotted Bass, White Bass, catfish, crappie, and trout.

#### 15.3.3.4 Lake Del Valle

Lake Del Valle is a SWP facility located along the South Bay Aqueduct in Alameda County, as described in Chapter 5, Surface Water Resources and Water Supplies. The recreation facilities are managed by East Bay Regional Park District as part of the Del Valle Regional Park. When the water storage in the reservoir is at full capacity (water elevation at 703 feet msl), Lake Del Valle has 708 acres of surface area and 16 miles of shoreline (DWR 2001). Water-related activities include boating, windsurfing, camping, swimming, and fishing (DWR 2001). There is a boat launch at the lake (EBRPD 2014). Boating hazards can occur along the variable shoreline when the surface water elevation declines to 678 feet msl. There are seven group campsites for up to 475 and a family campground (DWR 2001; EBRPD 2014). Fishing opportunities include trout, catfish, Largemouth Bass, and Smallmouth Bass, Striped Bass, and Panfish (EBRPD 2014).

#### 15.3.3.5 Los Vaqueros Reservoir

Los Vaqueros Reservoir is a Contra Costa Water District offstream storage facility in Contra Costa County, as described in Chapter 5, Surface Water Resources and Water Supplies. Recreation facilities are managed by Contra Costa Water District. Water-related activities include boating using rented electrical boats, and fishing (CCWD 2014). The Los Vaqueros recreation facilities include a marina, four fishing piers, 55 miles of trails, several individual and group picnic areas, and an interpretative center. Fishing opportunities include Rainbow Trout, Brown Bullhead, White Catfish, Channel Catfish, sunfish, White Crappie, Largemouth Bass, Striped Bass, Chinook Salmon, Kokanee Salmon, Green Sunfish, and Sacramento Perch (EBRPD 2014).

#### 15.3.3.6 San Pablo Reservoir, Lafayette Reservoir, Lake Chabot, and East Bay Municipal Utility District Trails

The East Bay Municipal Utility District reservoirs in Alameda and Contra Costa County are used to store water within and near the East Bay Municipal Utility District service area. Water stored in these reservoirs includes water from local watersheds, the Mokelumne River watershed, and CVP water supplies, as described in Chapter 5, Surface Water Resources and Water Supplies. Recreation is allowed within the waters of San Pablo and Lafayette reservoirs and Lake

Chabot (EBMUD 2011). Recreation is not allowed within the waters of Upper San Leandro and Briones reservoir. East Bay Municipal Utility District maintains trails within the watersheds of the reservoirs.

Recreation facilities at San Pablo Reservoir are managed by East Bay Municipal Utility District. Water-related activities at San Pablo Reservoir include boating, picnicking, and fishing (EBMUD 2014a). There is a boat launch at the reservoir. There are individual sites and nine group picnic areas that can accommodate up to 100 people at each site. Hiking can occur in the San Pablo Reservoir watershed on 8.7 miles of trails which connect to about 13 miles of trails in the Briones Reservoir watershed (EBMUD 2007a). The surface water of the reservoirs can be viewed from many locations along these trails. Fishing opportunities at San Pablo Reservoir include Rainbow Trout, catfish, Black Bass, Bluegill, and crappie (EBMUD 2014a).

Recreation facilities at Lafayette Reservoir are managed by East Bay Municipal Utility District. Water-related activities at Lafayette Reservoir include boating, picnicking, and fishing (EBMUD 2014b). There is a private car-top boat launch at the reservoir. There are 125 picnic sites around the reservoir. Hiking can occur in the Lafayette Reservoir watershed on 7.4 miles of trails. Fishing opportunities at Lafayette Reservoir include Rainbow Trout, catfish, Black Bass, and sunfish.

There are no water-related activities within or adjacent to Upper San Leandro Reservoir. However, East Bay Municipal Utility District maintains over 26 miles of trails within the Upper San Leandro Reservoir watershed. The surface water of the reservoirs can be viewed from many locations along these trails (EBMUD 2007b).

Recreation facilities at Lake Chabot are managed by East Bay Regional Park District as part of the Lake Chabot Regional Park (EBRPD 2011). Water-related activities at Lake Chabot include boating, camping, picnicking, and fishing. There is a boat launch at the reservoir and boat rides are offered on the *Chabot Queen*. Individual campsites and group campsites are located near the southern portion of the park. Picnic sites are located near the Lake Chabot Marina. Hiking can occur along the shoreline on over 9 miles of trails which connect to more than 17 miles of other trails in the watershed (EBRPD 2011, 2013d). Other recreational activities, including equestrian trails and a marksmanship range, are located in the upper Lake Chabot watershed. Fishing opportunities at Lake Chabot include Rainbow Trout, catfish, Black Bass, crappie, Bluegill, and carp.

### 15.3.4 Central Coast Region

The Central Coast Region includes portions of San Luis Obispo and Santa Barbara counties served by the SWP. The SWP water supplies generally are conveyed to Central Coast municipal, industrial, and agricultural water users in pipelines and closed reservoirs. Water is delivered to southern Santa Barbara County communities through Cachuma Lake. Therefore, in the Central Coast Region, the only recreational opportunities that may be affected by changes in SWP operations would be Cachuma Lake in Santa Barbara County (CCWA 2014).

#### *15.3.4.1 Cachuma Lake*

Cachuma Lake is a facility owned and operated by Reclamation in Santa Barbara County, as described in Chapter 5, Surface Water Resources and Water Supplies. Recreation facilities are managed by Santa Barbara County Parks Department. Water-related activities include boating, and fishing within the lake and along the lake shoreline (Reclamation 2010c). Cachuma Lake recreation facilities include a marina with 87 rental boats and a public boat launch, 94 private boat slips, 520 campsites, equestrian campsites, family center, amphitheater, and trails that range from 0.25 to 9 miles in length. Fishing opportunities include trout, catfish, crappie, bass, Redear Perch, and Bluegill.

### 15.3.5 Southern California Region

The Southern California Region includes portions of Ventura, Los Angeles, Orange, San Diego, Riverside, and San Bernardino counties served by the SWP. The SWP water supplies generally are conveyed to Southern California municipal, industrial, and agricultural water users in canals and pipelines. There are six SWP reservoirs along the main canal, West Branch, and East Branch of the California Aqueduct and many other reservoirs owned and operated by regional and local agencies. The Metropolitan Water District of Southern California's Diamond Valley Lake and Lake Skinner primarily store water from the SWP. Other reservoirs that store SWP water, include United Water Conservation District's Lake Piru; City of Escondido's Dixon Lake; City of San Diego's San Vicente, El Capitan, Lower Otay, Hodges, and Murray reservoirs; Helix Water District's Lake Jennings; and Sweetwater Authority's Sweetwater Reservoir.

This section does not include reservoirs that do not provide recreational opportunities, such as Vail Lake in Riverside County or Olivenhain Reservoir in San Diego County, or reservoirs that do not store SWP water supplies, such as Lake Mathews in Riverside County which is used to store Colorado River water (RCWD 2011; SDCWA 2015; Riverside County 2000).

#### *15.3.5.1 Quail Lake*

Quail Lake is a SWP facility in Los Angeles County, as described in Chapter 5, Surface Water Resources and Water Supplies. Recreation facilities are managed by DWR (DWR 2014a). Water-related activities include fishing within the lake and along the shoreline. Fishing opportunities include Channel Catfish, Striped Bass, Blackfish, Tule Perch, Threadfin Shad, and Hitch.

#### *15.3.5.2 Pyramid Lake*

Pyramid Lake is a SWP facility located in Los Angeles County and upstream of Castaic Lake on the West Branch of the California Aqueduct, as described in Chapter 5, Surface Water Resources and Water Supplies. Recreation facilities are managed by the U.S. Forest Service (DWR 2000, 2014b). Water-related activities include boating, camping, water skiing, swimming, and fishing. Boat launch facilities are available at Vaqueros Beach and Emigrant Landing. A marina and picnic sites are available at Emigrant Landing. Four picnic and viewing sites are accessible only by boat. Family and group camping are available at two sites.

Fishing opportunities include largemouth, smallmouth, and Striped Bass; catfish, blue gill; crappie; and trout. Reservoir elevations can vary substantially on a daily basis because the lake provides short-term storage for the downstream Castaic Powerplant.

#### 15.3.5.3 Castaic Lake

Castaic Lake is a SWP facility located in Los Angeles County at the terminal end of the West Branch of the California Aqueduct, as described in Chapter 5, Surface Water Resources and Water Supplies. Recreation facilities are managed by the Los Angeles County Department of Parks (DWR 2007b). Water-related activities include boating, water skiing, jet skiing, wakeboarding, camping, picnicking, swimming at the lagoon/afterbay, and fishing. Fishing opportunities include trout, Largemouth Bass, Striped Bass, catfish, and crappie (DWR 2014c).

#### 15.3.5.4 Silverwood Lake

Silverwood Lake is a SWP facility located in San Bernardino County along the East Branch of the California Aqueduct, as described in Chapter 5, Surface Water Resources and Water Supplies. Recreation facilities are managed by State Parks as part of the Silverwood Lake State Recreational Area (State Parks 2006b). Water-related activities include boating, water skiing, camping, picnicking, swimming, and fishing. Facilities available for boating include a boat ramp, marina, and waterskiing area. Camping facilities include 136 family sites, seven walk-in sites, and several group sites for up to 120 people. The park includes two swimming beaches and 13 miles of trails. Fishing opportunities include Largemouth Bass, Striped Bass, Bluegill, crappie, and catfish.

#### 15.3.5.5 Crafton Hills Reservoir

Crafton Hills Reservoir is a SWP facility located in the City of Yucaipa within San Bernardino County, as described in Chapter 5, Surface Water Resources and Water Supplies. Recreation facilities are managed by DWR (DWR 2009). Recreation activities in vicinity of the reservoir are associated with hiking trails in the open space within the Crafton Hills watershed. The surface water of the reservoirs can be viewed from many locations along these trails.

#### 15.3.5.6 Lake Perris

Lake Perris is a SWP facility located in Riverside County at the terminal end of the East Branch of the California Aqueduct, as described in Chapter 5, Surface Water Resources and Water Supplies. Recreation facilities are managed by State Parks as part of the Lake Perris State Recreational Area (State Parks 2013b; DWR 2010). Water-related activities include boating, camping, swimming, picnicking, and fishing. Boating facilities include a marina and three boat launch ramps. Other recreational facilities include two swimming beaches, family campground, seven equestrian camp sites, boat-in picnic sites on Alessandro Island, and the Ya’i Hek’i Regional Indian Museum. Fishing opportunities include Largemouth Bass, catfish, crappie, carp, Bluegill, and Redear Sunfish.

#### *15.3.5.7 Diamond Valley Lake*

Diamond Valley Lake is an offstream storage facility located in Riverside County owned and operated by Metropolitan Water District of Southern California, as described in Chapter 5, Surface Water Resources and Water Supplies (MWD 2013). The lake is used to store SWP water. Water-related activities include boating, and fishing. Boating facilities include a marina with boat rentals. Other recreational facilities include a visitor center, Western Science Center, and the Valley-Wide Recreation and Park District Regional Aquatic Center and Community Park. Fishing opportunities include Black Bass, Bluegill, redear sunfish, Rainbow Trout, blue catfish, and Channel Catfish (DVM 2014).

#### *15.3.5.8 Lake Skinner*

Lake Skinner is an offstream storage facility located in Riverside County owned and operated by Metropolitan Water District of Southern California, as described in Chapter 5, Surface Water Resources and Water Supplies. Recreation facilities are managed by Riverside County Parks (Riverside County 2014). The lake is used to store SWP water. Water-related activities include boating, camping, and fishing. Other recreational facilities include an amphitheater and Splash Pad. Fishing opportunities include Striped Bass, Largemouth Bass, Bluegill, Rainbow Trout, catfish, and carp.

#### *15.3.5.9 Lake Piru*

Lake Piru is located on Piru Creek, a tributary of the Santa Clara River, in Ventura County (UWCD 2014). The lake is owned and operated by United Water Conservation District, as described in Chapter 5, Surface Water Resources and Water Supplies. Lake Piru is located within Los Padres National Forest (PMC 2014). The lake is used to store SWP water.

Recreation facilities are managed by a private concessionaire for the district (UWCD 2014; PMC 2014). Water-related activities include boating, camping, and picnicking. The marina includes a boat launch and private boat slips. There are over 220 campsites, including several group campsites.

#### *15.3.5.10 Dixon Lake*

Dixon Lake is located in the hills above the City of Escondido in San Diego County (Escondido 2014a). The lake is owned and operated by the City of Escondido, as described in Chapter 5, Surface Water Resources and Water Supplies. The lake is used to store SWP water.

Recreation facilities are managed by the City of Escondido (Escondido 2014b). Water-related activities include camping, picnicking, and fishing. Boats are allowed on the lake for fishing. There are 45 campsites and 22 picnic sites (Escondido 2014 n.d.; Escondido 2014c). Fishing opportunities include trout, bass, Bluegill, carp, catfish, and crappie.

#### *15.3.5.11 San Vicente, El Capitan, Lower Otay, Hodges, and Murray Reservoirs*

San Vicente Reservoir, El Capitan, Lower Otay, Hodges, and Murray reservoirs are located in San Diego County (San Diego 2011). The reservoirs are owned and operated by the City of San Diego, as described in Chapter 5, Surface Water Resources and Water Supplies. The reservoirs are used to store SWP water.

Recreation facilities are managed by the City of San Diego (San Diego 2014a, 2015a, 2015b). Water-related activities at the reservoirs include boating, picnicking, and fishing (San Diego 2014b, 2015a, 2015b). There are 16 picnic sites at Lower Otay Reservoir. Fishing opportunities at Lower Otay Reservoir include Largemouth Bass, Bluegill, black and White Crappie, Channel Catfish, blue catfish, White Catfish, and bullhead. Recreational activities at San Vicente Reservoir are temporarily closed during construction to raise the dam (San Diego 2014c). Fishing opportunities at El Capitan Reservoir include Largemouth Bass, Bluegill, crappie, Channel Catfish, Blue Catfish, Green Sunfish, and carp (San Diego 2014d). Hodges Reservoir provides recreational opportunities including boating, boardsailing, and fishing for bass, catfish, crappie, Bluegill, Bullhead, and carp (San Diego 2015a). Murray Reservoir provides recreational opportunities for boating, floating, swimming, and fishing for Largemouth Bass, Bluegill, Channel Catfish, Black Crappie, and trout (San Diego 2015b).

#### *15.3.5.12 Lake Jennings*

Lake Jennings is located in San Diego County (HWD 2014). The lake is owned and operated by Helix Water District, as described in Chapter 5, Surface Water Resources and Water Supplies. The lake is used to store SWP water.

Recreation facilities are managed by Helix Water District (HWD 2014). Water-related activities include boating, camping, picnicking, and fishing. There are 96 campsites. There are a variety of picnic sites at Lake Jennings including: Cloister Cover, Siesta Point, Hermit Cove, and Eagle Point. Bird watchers at Lake Jennings can see Loons, Grebes, Cormorants, Herons, Swans, Geese, Eagles, Hawks, Thrushes, Warblers, and many others. Hikers at Lake Jennings have access to a variety of different trails near the lake including a 5.5 mile loop around the lake. Fishing opportunities include trout, bass, and catfish.

#### *15.3.5.13 Sweetwater Reservoir*

Sweetwater Reservoir is located in San Diego County (Sweetwater Authority 2014). The lake is owned and operated by Sweetwater Authority, as described in Chapter 5, Surface Water Resources and Water Supplies. The reservoir is used to store SWP water. Recreation facilities are managed by Sweetwater Authority. Water-related activities include fishing.

#### *15.3.5.14 Lake Arrowhead*

Lake Arrowhead is located in San Bernardino County (LACSD 2014). The lake is owned and operated by Arrowhead Lake Association. The Lake Arrowhead Community Services District stores SWP water in the lake, as described in Chapter 5, Surface Water Resources and Water Supplies. Recreation facilities are managed by the Arrowhead Lake Association. Water-related activities include boating, camping, and fishing (Lake Arrowhead 2014).

### 15.3.6 Recreational Fishing in San Pablo and San Francisco Bays

Recreational fishing for sturgeon, Striped Bass, steelhead, trout, and salmon in San Pablo and San Francisco bays could be affected by changes in populations that may occur due to implementation of the alternatives considered in this EIS. Of these species, the majority of recreational fishing in the San Francisco Bay Estuary is related to Striped Bass and sturgeon fishing, especially in San Pablo and Suisun bays.

Recreational fishing for White Sturgeon is limited to three sturgeons per person each year, with a daily bag limit of one fish/day and a size limitation of 40 to 60 inches (from the nose tip to fork in the tail). In addition, White Sturgeon fishing is not allowed in San Francisco Bay from March 16 through December 31. Green sturgeon fishing is not allowed. Striped bass fishing occurs throughout the year with a daily bag limit two fish/day and a minimum size limitation of 18 inches. Salmon sportfishing also occurs within the San Francisco Bay Estuary during periods specified by the National Marine Fisheries Service (NMFS).

### 15.3.7 Recreational Salmon Fishing along Northern California Coast

Chinook Salmon, Coho Salmon, and steelhead are generally the primary species for recreational fishing that could be affected by changes in CVP and SWP operations along the Pacific Coast of Northern California from Pigeon Point to southern Oregon (near Elk River). The Pacific Coast salmon fisheries are managed by the Pacific Fishery Management Council (PFMC) in waters between the United States/Canada border to the United States/Mexico border between 3 and 200 nautical miles offshore (PFMC 2014). The State DFW manages the salmon fisheries within 0 to 3 nautical miles offshore with regulations that are generally similar to the PFMC to the salmon fishing requirements. The PFMC analyzes the a fisheries evaluation each year; and defines the periods of time for the fishing season and minimum size fish to be caught for commercial, recreational, and tribal salmon fishing activities, as described in more detail for recreational and commercial salmon fishing in Chapter 19, Socioeconomics.

## 15.4 Impact Analysis

This section describes the potential mechanisms and analytical methods for change in recreation resources; results of the impact analysis; potential mitigation measures; and cumulative effects.

### 15.4.1 Potential Mechanisms for Change and Analytical Methods

As described in Chapter 4, Approach to Environmental Analysis, the impact analysis considers changes in recreational resources conditions related to changes in CVP and SWP operations under the alternatives as compared to the No Action Alternative and Second Basis of Comparison.

As described in Section 15.3, Affected Environment, there are a wide range of recreational opportunities at the reservoirs and along the downstream rivers. This analysis focuses on the potential changes in these recreational opportunities and not specific recreational actions. For example, this analysis focuses on changes in surface water elevations at reservoirs which could affect boating, shoreline camping and picnicking, and use of trails. The changes in reservoir elevations would occur within the historical range of elevation changes; therefore, none of the recreational opportunities would be permanently reduced or expanded. The changes that would occur within the alternatives would change the potential for enjoyable recreational opportunities based upon changes in reservoir surface water elevations and river flows.

Changes in CVP and SWP operations under the alternatives as compared to the No Action Alternative and Second Basis of Comparison could change recreational opportunities at water bodies affected by CVP and SWP operations.

##### *15.4.1.1 Changes in Recreational Resources at Reservoirs that Store CVP and SWP Water*

Reservoirs that store CVP and SWP water provide a wide diversity of recreational experiences on the water surface, at shoreline campgrounds, and along shoreline trails. By the end of September, the surface water elevations can decline from higher elevations in the spring by up to 100 feet in Shasta Lake and Lake Oroville; and over 50 feet in Trinity and Folsom lakes and New Melones and San Luis reservoirs. As the water elevations declines, boat ramps become unavailable and the water surface recedes along steep slopes from shoreline campgrounds and trails. Changes in CVP and SWP operations under the alternatives could change the surface water elevations, especially in dry and critical dry years as compared to the No Action Alternative and Second Basis of Comparison.

The CalSim II model output includes monthly reservoir elevations for CVP and SWP reservoirs in the Central Valley and Trinity Lake. The end of September reservoir elevations generally indicate low reservoir elevations. To assess changes in recreational resources, changes in reservoir elevations for the end of September were compared between alternatives and the No Action Alternative and Second Basis of Comparison. The reservoir elevations at the end of September were compared to minimum allowable boat ramp elevations as a measure of surface water accessibility.

Reservoirs in the San Francisco Bay Area, Central Coast, and Southern California regions store water from multiple water supplies including CVP and SWP water; however, these reservoirs are not included in the CalSim II model simulation. For the purposes of this EIS analysis, changes in surface water elevations in these reservoirs were assumed to be related to changes in CVP and SWP water deliveries to the areas located to the south of the Delta.

#### 15.4.1.2 Changes in Recreational Resources along Rivers downstream of CVP and SWP Reservoirs

Changes in CVP and SWP operations under the alternatives could change the river flows in Trinity, Sacramento, Feather, American, and Stanislaus rivers in a manner that would affect recreational opportunities including boating and swimming during the spring and summer months, especially in dry and critical dry years.

Results of the CalSim II model were used to assess changes in average monthly flows that could affect recreational opportunities under the alternatives, the No Action Alternative, and the Second Basis of Comparison. This analysis is focused on the Trinity, Sacramento, Feather, American, and Stanislaus rivers. Generally, flow in rivers downstream of San Luis Reservoir and the reservoirs in the San Francisco Bay Area, Central Coast, and Southern California that store CVP and SWP water are based upon minimum instream flow requirements except in high flow events because the reservoirs are operated primarily to provide water into downstream water distribution systems.

#### 15.4.1.3 Changes in Recreational Opportunities at Wildlife Refuges

Changes in CVP and SWP operations under the alternatives would not change water supplies to wildlife refuges that use CVP water for Level 2 water demands, as described in Chapter 5, Surface Water Resources and Water Supplies. Therefore, these changes are not analyzed in this EIS.

#### 15.4.1.4 Effects Related to Water Transfers

Historically water transfer programs have been developed on an annual basis. The demand for water transfers is dependent upon the availability of water supplies to meet water demands. Water transfer transactions have increased over time as CVP and SWP water supply availability has decreased, especially during drier water years.

Water transfers using CVP and SWP Delta pumping plants and south of Delta canals generally occur when there is unused capacity in these facilities. These conditions generally occur during drier water year types when the flows from upstream reservoirs plus unregulated flows are adequate to meet the Sacramento Valley water demands and the CVP and SWP export allocations. In non-wet years, the CVP and SWP water allocations would be less than full contract amounts; therefore, capacity may be available in the CVP and SWP conveyance facilities to move water from other sources.

Projecting future recreational conditions related to water transfer activities is difficult because specific water transfer actions required to make the water available, convey the water, and/or use the water would change each year due to changing hydrological conditions, CVP and SWP water availability, specific local agency operations, and local cropping patterns. Reclamation recently prepared a long-term regional water transfer environmental document which evaluated potential changes in conditions related to water transfer actions (Reclamation 2014f). Results from this analysis were used to inform the impact assessment of potential effects of water transfers under the alternatives as compared to the No Action Alternative and the Second Basis of Comparison.

### 15.4.2 Conditions in Year 2030 without Implementation of Alternatives 1 through 5

This EIS includes two bases of comparison, as described in Chapter 3, Description of Alternatives: the No Action Alternative and the Second Basis of Comparison. Both of these bases are evaluated at 2030 conditions. Changes that would occur over the next 15 years without implementation of the alternatives are not analyzed in this EIS. However, the changes to recreational resources that are assumed to occur by 2030 under the No Action Alternative and the Second Basis of Comparison are summarized in this section. Many of the changed conditions would occur in the same manner under both the No Action Alternative and the Second Basis of Comparison.

#### *15.4.2.1 Common Changes in Conditions under the No Action Alternative and Second Basis of Comparison*

Conditions in 2030 would be different than existing conditions due to:

- Climate change and sea level rise
- General plan development throughout California, including increased water demands in portions of Sacramento Valley
- Implementation of reasonable and foreseeable water resources management projects to provide water supplies

It is anticipated that climate change would result in more short-duration high-rainfall events and less snowpack in the winter and early spring months. The reservoirs would be full more frequently by the end of April or May by 2030 than in recent historical conditions. However, as the water is released in the spring, there would be less snowpack to refill the reservoirs. This condition would reduce reservoir storage and available water supplies to downstream uses in the summer. The reduced end of September storage also would reduce the ability to release stored water to downstream regional reservoirs. These conditions would occur for all reservoirs in the California foothills and mountains, including non-CVP and SWP reservoirs.

Under the No Action Alternative and the Second Basis of Comparison, land uses in 2030 would occur in accordance with adopted general plans. Development under the general plans would could increase demand for recreational resources.

The No Action Alternative and the Second Basis of Comparison assumes completion of water resources management and environmental restoration projects that would have occurred without implementation of Alternatives 1 through 5, including regional and local recycling projects, surface water and groundwater storage projects, conveyance improvement projects, and desalination projects, as described in Chapter 3, Description of Alternatives. The No Action Alternative and the Second Basis of Comparison also assumes implementation of actions included in the 2008 USFWS Biological Opinion (BO) and 2009 NMFS

BO that would have been implemented without the BOs by 2030, as described in Chapter 3, Description of Alternatives. These projects would include several projects that would affect recreational resources, including restoration of more than 10,000 acres of intertidal and associated subtidal wetlands in Suisun Marsh and Cache Slough; and at least 17,000 to 20,000 acres of seasonal floodplain restoration in Yolo Bypass.

### 15.4.3 Evaluation of Alternatives

Alternatives 1 through 5 have been compared to the No Action Alternative; and the No Action Alternative and Alternatives 1 through 5 have been compared to the Second Basis of Comparison.

During review of the numerical modeling analyses used in this EIS, an error was determined in the CalSim II model assumptions related to the Stanislaus River operations for the Second Basis of Comparison, Alternative 1, and Alternative 4 model runs. Appendix 5C includes a comparison of the CalSim II model run results presented in this chapter and CalSim II model run results with the error corrected. Appendix 5C also includes a discussion of changes in the comparison of groundwater conditions for the following alternative analyses.

- No Action Alternative compared to the Second Basis of Comparison
- Alternative 1 compared to the No Action Alternative
- Alternative 3 compared to the Second Basis of Comparison
- Alternative 5 compared to the Second Basis of Comparison

#### *15.4.3.1 No Action Alternative*

The No Action Alternative is compared to the Second Basis of Comparison.

##### 15.4.3.1.1 Trinity River Region

*Potential Changes in Recreational Resources at Reservoirs that Store CVP and SWP Water*

Changes in CVP water supplies and operations under the No Action Alternative as compared to the Second Basis of Comparison would result in similar end of September reservoir elevations (changes within 5 percent) and related recreational resources at Trinity Lake in all water year types, as described in Chapter 5, Surface Water Resources and Water Supplies.

There are several boat ramps at Trinity Lake that provide access at different elevations. Boat ramps at Stuart Fork and Bowerman are not useable when the water elevation is less than 2,323 feet which occurs approximately 80 percent of the time under the No Action Alternative and Second Basis of Comparison. Boat ramps at Clark Springs, Fairview, and Trinity Center are not useable when the water elevation is lower than 2,300 feet which occurs approximately 62 percent of the time under the No Action Alternative and Second Basis of Comparison. The Minersville boat ramp is accessible until the elevation declines below 2,170 feet which occurs approximately 5 percent of the time under the No Action Alternative and Second Basis of Comparison.

*Potential Changes in Recreational Resources along Rivers Downstream of the CVP and SWP Reservoirs*

The following changes would occur on the Trinity River under the No Action Alternative as compared to the Second Basis of Comparison, as summarized in Chapter 5, Surface Water Resources and Water Supplies.

- Over long-term conditions, flows would be similar in March through November; and reduced in December through February (up to 9.5 percent).
- In wet years, flows would be similar in April through November; and reduced in December through March (up to 11.2 percent).
- In dry years, flows would be similar in all months.

Flows in Trinity River would be similar during the recreation season (spring and summer months); therefore, recreational opportunities would be similar.

#### 15.4.3.1.2 Central Valley Region

*Potential Changes in Recreational Resources at Reservoirs that Store CVP and SWP Water*

Changes in CVP water supplies and operations under the No Action Alternative as compared to the Second Basis of Comparison would result in similar end of September reservoir elevations and related recreational resources at Shasta Lake, Lake Oroville, Folsom Lake, and New Melones Reservoir in all water year types; and at San Luis Reservoir in above normal, below normal, and dry years, as described in Chapter 5, Surface Water Resources and Water Supplies. Changes in recreational resources at San Luis Reservoir would be reduced in wet year and critical dry years because the end of September surface water elevations would be reduced by 6.2 percent in wet and critical dry years.

There are several boat ramps at each of the reservoirs that provide access at different elevations. At Shasta Lake, boat ramps at Antlers, Hirz Bay, Packers Bay, Sugar Loaf, and Centimundi and Jones Valley are not accessible approximately 55, 35, 20, 10, and 9 percent of the time, respectively, under the No Action Alternative; and approximately 55, 30, 15, 10, and 7 percent of the time, respectively, under the Second Basis of Comparison.

At Lake Oroville, boat ramps at Enterprise, Vinton Gulch, and Nelson Bar; Foreman Creek; Dark Canyon and Loafer Creek; and Bidwell Canyon, Lime Saddle, and Spillway are not accessible approximately 95, 87, 73, and 35 percent of the time, respectively, under the No Action Alternative; and approximately 85, 75, 62, and 25 percent of the time, respectively, under the Second Basis of Comparison.

At Folsom Lake, boat ramps at Rattlesnake Bar, Beal's Point; Peninsula, Brown's Ravine, and Folsom Point; Hobie Cove; and Granite Bay are not accessible approximately 80, 65, 40, 10, and 7 percent of the time, respectively, under the No Action Alternative; and approximately 65, 40, 10, and 7 percent of the time, respectively, under the Second Basis of Comparison.

At New Melones Reservoir, the boat ramp at Angels Creek, Parrott's Ferry, Glory Hole, and Mark Twain are not accessible approximately 65, 25, 18, and 5 percent of the time, respectively, under the No Action Alternative; and approximately 30, 25, 15, 5 percent of the time, respectively, under the Second Basis of Comparison.

At San Luis Reservoir, the boat ramps at Dinosaur Point and Basalt Area are not useable approximately 50 and 10 percent of the time, respectively, under the No Action Alternative; and approximately 20 and 5 percent of the time, respectively, under the Second Basis of Comparison.

At all reservoirs, boating opportunities would be decreased, and shoreline recreational opportunities would be similar or decreased under the No Action Alternative as compared to the Second Basis of Comparison.

*Potential Changes in Recreational Resources along Rivers Downstream of the CVP and SWP Reservoirs*

The recreational opportunities along the Sacramento, Feather, American, and Stanislaus rivers would be affected by the following changes in river flows, as described in Chapter 5.

- Sacramento River downstream of Keswick Dam
  - Over long-term conditions, similar flows would occur in October, February through May, July, and August; increased flows in September and November (up to 37.7 percent); and reduced flows in December, January, and June (up to 7.8 percent).
  - In wet years, similar flows would occur in January through July; increased flows in September through November (up to 77.7 percent); and reduced flows in December and August (up to 14.6 percent).
  - In dry years, similar flows would occur in July through October, December through March, and May; increased flows in November (33.4 percent).
- Sacramento River at Freeport
  - Over long-term conditions, similar flows would occur in October, December through May, and August; increased flows in September, November, and July (up to 43.3 percent); and reduced flows in June (11.4 percent).
  - In wet years, similar flows would occur in January through June and October; increased flows in July through September and November (up to 90.3 percent); and reduced flows in December (10.7 percent).
  - In dry years, similar flows would occur in August through October and December through April; increased flows in November and July (up to 15.8 percent); and reduced flows in May and June (up to 11.9 percent).

- Feather River downstream of the Thermalito Complex
  - Over long-term conditions, similar flows would occur in November and April; increased flows in July through September (up to 76.1 percent); and reduced flows in October, December through March, May, and June (up to 27.2 percent).
  - In wet years, similar flows would occur in October through November and March through May; increased flows in July through September (up to 184 percent) and reduced flows in December through February (up to 26.0 percent).
  - In dry years, similar flows would occur in November through March; increased flows in April and July (up to 52.4 percent); and reduced flows in August through October and May and June (up to 27.6 percent).
- American River downstream of Nimbus Dam
  - Over long-term conditions, similar flows would occur in November through May and July; increased flows in September and October (up to 44.7 percent); and reduced flows in June and August (up to 6.1 percent).
  - In wet years, similar flows would occur in October through November and January through July; increased flows in September (91.1 percent) and reduced flows in December and August (up to 10.7 percent).
  - In dry years, similar flows would occur in all months except October, February and July; increased flows in October (16.5 percent); and reduced flows in February and July (up to 7.3 percent).
- Stanislaus River downstream of Goodwin Dam
  - Over long-term conditions, similar flows would occur in May and July through September; increased flows in October, March, and April (up to 148.7 percent); and reduced flows in November through February and June (up to 33.8 percent).
  - In wet years, similar flows would occur in February and April; increased flows in October, March, May, July, and August (up to 117.1 percent); and reduced flows in September, November through January, and June (up to 50.8 percent).
  - In dry years, similar flows would occur in July through September; increased flows in October and April (up to 154.3 percent); and reduced flows in November through March, May, and June (up to 35.7 percent).

During the spring and summer months, the changes in flow conditions between the No Action Alternative and the Second Basis of Comparison vary on a monthly basis in the Sacramento, Feather, American, and Stanislaus rivers within a water year type. For example, flows in the Sacramento River at Freeport would increase in several months under the No Action Alternative as compared to the Second Basis of Comparison by up to 90 percent, and decrease in several months up to 11 percent. The overall range of flows is within the historical operational range; therefore, recreational opportunities still exist. However, the value of the recreational opportunities would be both improved and reduced depending upon the timing of the changes.

Overall, under the No Action Alternative and the Second Basis of Comparison, recreational opportunities would be reduced on the Sacramento River downstream of Keswick Dam; and both improved and reduced on the Sacramento River near Freeport, Feather River downstream of Thermalito Complex, American River downstream of Nimbus Dam, and the Stanislaus River downstream of Goodwin Dam depending upon the month.

*Effects Related to Cross Delta Water Transfers*

Potential effects to recreational resources could be similar to those identified in a recent environmental analysis conducted by Reclamation for long-term water transfers from the Sacramento to San Joaquin valleys (Reclamation 2014c). Potential effects to recreational resources were identified as changes in reservoir surface water elevations, streams, and the Delta. The analysis indicated that these potential impacts would not be substantial because the conditions with and without the water transfers would be similar.

Under the No Action Alternative, the timing of cross Delta water transfers would be limited to July through September and include annual volumetric limits, in accordance with the 2008 USFWS BO and 2009 NMFS BO. Under the Second Basis of Comparison, water could be transferred throughout the year without an annual volumetric limit. Overall, the potential for cross Delta water transfers would be less under the No Action Alternative than under the Second Basis of Comparison.

#### 15.4.3.1.3 San Francisco Bay Area, Central Coast, and Southern California Region

*Potential Changes in Recreational Resources at Reservoirs that Store CVP and SWP Water*

Changes in recreational resources at reservoirs that store CVP and SWP water supplies are assumed to be related to changes in water deliveries over long-term conditions for this EIS analysis. Monthly deliveries are not necessarily indicative of reservoir storage because all or a portion of the water deliveries could be directly conveyed to water users in any specific month. Therefore, annual deliveries are considered to be relatively proportional to the amount of water that could be stored over all water year types. In the San Francisco Bay Area Region, values for the CVP municipal and industrial water deliveries and the SWP south of the Delta water deliveries (without Article 21 deliveries) were considered; and SWP south of the Delta water deliveries (without Article 21 deliveries) were considered for the Central Coast and Southern California regions. Under the No Action Alternative as compared to the Second Basis of Comparison CVP water deliveries would be reduced by 10 percent and SWP water deliveries would be reduced by 18 percent. Therefore, for this EIS analysis, it is assumed that recreational resources related to surface water elevations in reservoirs that store CVP and SWP water supplies would be reduced by 10 to 18 percent in the

San Francisco Bay Area Region and 18 percent in the Central Coast and Southern California regions.

#### *15.4.3.2 Alternative 1*

Alternative 1 is identical to the Second Basis of Comparison. As described in Chapter 4, Approach to Environmental Analysis, Alternative 1 is compared to the No Action Alternative and the Second Basis of Comparison. However, because recreational resource conditions under Alternative 1 are identical to recreational resource conditions under the Second Basis of Comparison; Alternative 1 is only compared to the No Action Alternative.

##### 15.4.3.2.1 Alternative 1 Compared to the No Action Alternative

*Trinity River Region*

*Potential Changes in Recreational Resources at Reservoirs that Store CVP and SWP Water*

Changes in CVP water supplies and operations under Alternative 1 as compared to the No Action Alternative would result in similar end of September reservoir elevations and related recreational resources at Trinity Lake in all water year types, as described in Chapter 5, Surface Water Resources and Water Supplies.

There are several boat ramps at Trinity Lake that provide access at different elevations. Boat ramps at Stuart Fork and Bowerman are not useable when the water elevation is less than 2,323 feet which occurs approximately 80 percent of the time under Alternative 1 and the No Action Alternative. Boat ramps at Clark Springs, Fairview, and Trinity Center are not useable when the water elevation is lower than 2,300 feet which occurs approximately 62 percent of the time under Alternative 1 and the No Action Alternative. The Minersville boat ramp is accessible until the elevation declines below 2,170 feet which occurs approximately 5 percent of the time under Alternative 1 and the No Action Alternative.

The potential for reduced recreational resources at Trinity Lake related to shoreline activities would be less under the No Action Alternative as compared to the Second Basis of Comparison.

*Potential Changes in Recreational Resources along Rivers Downstream of the CVP and SWP Reservoirs*

The following changes would occur on the Trinity River under Alternative 1 as compared to the No Action Alternative, as summarized in Chapter 5, Surface Water Resources and Water Supplies.

- Over long-term conditions, flows would be similar in March through November; and increased in December through February (up to 10.5 percent).
- In wet years, flows would be similar in April through November; and increased in December through March (up to 12.6 percent).
- In dry years, flows would be similar all months.

Flows in Trinity River would be similar during the recreation season (spring and summer months); therefore, recreational opportunities would be similar.

*Central Valley Region*

*Potential Changes in Recreational Resources at Reservoirs that Store CVP and SWP Water*

Changes in CVP water supplies and operations under Alternative 1 as compared to the No Action Alternative would result in similar end of September reservoir elevations and related recreational resources at Shasta Lake, Lake Oroville, Folsom Lake, and New Melones Reservoir in all water year types; and at San Luis Reservoir in above normal, below normal, and dry years, as described in Chapter 5, Surface Water Resources and Water Supplies. Changes in recreational resources at San Luis Reservoir would be reduced in wet year and critical dry years because the end of September surface water elevations would be increased by 6.6 percent in wet and critical dry years.

There are several boat ramps at each of the reservoirs that provide access at different elevations. At Shasta Lake, boat ramps at Antlers, Hirz Bay, Packers Bay, Sugar Loaf, and Centimundi and Jones Valley are not accessible approximately 55, 30, 15, 10, and 7 percent of the time, respectively, under Alternative 1; and approximately 55, 35, 20, 10, and 9 percent of the time, respectively, under the No Action Alternative.

At Lake Oroville, boat ramps at Enterprise, Vinton Gulch, and Nelson Bar; Foreman Creek; Dark Canyon and Loafer Creek; and Bidwell Canyon, Lime Saddle, and Spillway are not accessible approximately 85, 75, 62, and 25 percent of the time, respectively, under Alternative 1; and approximately 95, 87, 73, and 35 percent of the time, respectively, under the No Action Alternative.

At Folsom Lake, boat ramps at Rattlesnake Bar, Beal's Point; Peninsula, Brown's Ravine, and Folsom Point; Hobie Cove; and Granite Bay are not accessible approximately 65, 40, 10, and 7 percent of the time, respectively, under Alternative 1; and approximately 80, 65, 40, 10, and 7 percent of the time, respectively, under the No Action Alternative.

At New Melones Reservoir, the boat ramp at Angels Creek, Parrott's Ferry, Glory Hole, and Mark Twain are not accessible approximately 30, 25, 15, 5 percent of the time, respectively, under Alternative 1 as compared to approximately 65, 25, 18, and 5 percent of the time, respectively, under the No Action Alternative.

At San Luis Reservoir, the boat ramps at Dinosaur Point and Basalt Area are not useable approximately 20 and 5 percent of the time, respectively, under Alternative 1; and approximately 50 and 10 percent of the time, respectively, under the No Action Alternative.

At all reservoirs, boating opportunities would be increased, and shoreline recreational opportunities would be similar or increased under Alternative 1 as compared to the No Action Alternative.

*Potential Changes in Recreational Resources along Rivers Downstream of the CVP and SWP Reservoirs*

The recreational opportunities along the Sacramento, Feather, American, and Stanislaus rivers would be affected by the following changes in river flows, as described in Chapter 5.

- Sacramento River downstream of Keswick Dam
  - Over long-term conditions, similar flows would occur in October, February through May, July, and August; reduced flows in September and November (up to 27.4 percent); and increased flows in December, January, and June (up to 8.4 percent).
  - In wet years, similar flows would occur in January through July; reduced flows in September through November (up to 43.7 percent); and increased flows in December and August (up to 17.0 percent).
  - In dry years, similar flows would occur in July through October, December through March, and May; reduced flows in November (25.0 percent); and increased flows in April and June (up to 7.8 percent).
- Sacramento River at Freeport
  - Over long-term conditions, similar flows would occur in October, December through May, and August; reduced flows in September, November, and July (up to 30.2 percent); and increased flows in June (12.8 percent).
  - In wet years, similar flows would occur in January through June and October; reduced flows in July through September and November (up to 47.4 percent); and increased flows in December (6.6 percent).
  - In dry years, similar flows would occur in August through October and December through April; reduced flows in November and July (up to 13.6 percent); and increased flows in May and June (up to 13.5 percent).
- Feather River downstream of the Thermalito Complex
  - Over long-term conditions, similar flows would occur in November and April; reduced flows in July through September (up to 43.2 percent); and increased flows in October, December through March, May, and June (up to 37.4 percent).
  - In wet years, similar flows would occur in October, November, and March through May; reduced flows in July through September (up to 64.9 percent); and increased flows in December through February and June (up to 35.1 percent).
  - In dry years, similar flows would occur in December through April; reduced flows in July (34.4 percent); and increased flows in August through October, May, and June (up to 38.1 percent).

- American River downstream of Nimbus Dam
  - Over long-term conditions, similar flows would occur in November through May and July; reduced flows in September and October (up to 30.9 percent); and increased flows in June (5.4 percent).
  - In wet years, similar flows would occur in October, November, and January through July; reduced flows in September (47.7 percent); and increased flows in August (12.0 percent).
  - In dry years, similar flows would occur in November through January, March through June, August, and September; reduced flows in October (14.1 percent); and increased flows in February and July (up to 7.9 percent).
- Stanislaus River downstream of Goodwin Dam
  - Over long-term conditions, similar flows would occur in July through September; reduced flows in October, March, and April (up to 59.8 percent); and increased flows in November through February and June (up to 51.1 percent).
  - In wet years, similar flows would occur in February and April; reduced flows in October, March, May, July, and August (up to 53.9 percent); and increased flows in September, November through January, and June (up to 103.2 percent).
  - In dry years, similar flows would occur in July through September; reduced flows in October and April (up to 60.7 percent); and increased flows in November through March, May, and June (up to 55.5 percent).

During the spring and summer months, the changes in flow conditions between Alternative 1 as compared to the No Action Alternative vary on a monthly basis in the Sacramento, Feather, American, and Stanislaus rivers within a water year type. For example, flows in the Sacramento River at Freeport would increase in several months under Alternative 1 as compared to the No Action Alternative by up to 17 percent, and decrease in several months up to 44 percent. The overall range of flows is within the historical operational range; therefore, recreational opportunities still exist. However, the value of the recreational opportunities would be both improved and reduced depending upon the timing of the changes.

Overall, under Alternative 1 as compared to the No Action Alternative, recreational opportunities would be improved on the Sacramento River downstream of Keswick Dam; and both improved and reduced on the Sacramento River near Freeport, Feather River downstream of Thermalito Complex, American River downstream of Nimbus Dam, and the Stanislaus River downstream of Goodwin Dam depending upon the month.

*Effects Related to Cross Delta Water Transfers*

Potential effects to recreational resources could be similar to those identified in a recent environmental analysis conducted by Reclamation for long-term water transfers from the Sacramento to San Joaquin valleys (Reclamation 2014c) as described above under the No Action Alternative compared to the Second Basis of Comparison. For the purposes of this EIS, it is anticipated that similar conditions would occur during implementation of cross Delta water transfers under Alternative 1 and the No Action Alternative, and that impacts on recreational resources would not be substantial in the seller's service area due to implementation requirements of the transfer programs.

Under Alternative 1, water could be transferred throughout the year without an annual volumetric limit. Under the No Action Alternative, the timing of cross Delta water transfers would be limited to July through September and include annual volumetric limits, in accordance with the 2008 USFWS BO and 2009 NMFS BO. Overall, the potential for cross Delta water transfers would be increased under Alternative 1 as compared to the No Action Alternative.

*San Francisco Bay Area, Central Coast, and Southern California Regions*

*Potential Changes in Recreational Resources at Reservoirs that Store CVP and SWP Water*

Changes in recreational resources at reservoirs that store CVP and SWP water supplies are assumed to be related to changes in water deliveries over long-term conditions for this EIS analysis, as described above under the No Action Alternative as compared to the Second Basis of Comparison. Therefore, under Alternative 1 as compared to the No Action Alternative, recreational resources related to surface water elevations in reservoirs that store CVP and SWP water supplies would be increased by 11 to 21 percent in the San Francisco Bay Area Region and 21 percent in the Central Coast and Southern California regions.

#### 15.4.3.2.2 Alternative 1 Compared to the Second Basis of Comparison

Alternative 1 is identical to the Second Basis of Comparison.

### *15.4.3.3 Alternative 2*

The CVP and SWP operations under Alternative 2 are identical to the CVP and SWP operations under the No Action Alternative; therefore, Alternative 2 is only compared to the Second Basis of Comparison.

#### 15.4.3.3.1 Alternative 2 Compared to the Second Basis of Comparison

The CVP and SWP operations under Alternative 2 are identical to the CVP and SWP operations under the No Action Alternative. Therefore, changes to recreational resources conditions under Alternatives 2 as compared to the Second Basis of Comparison would be the same as the impacts described in Section 15.4.3.1, No Action Alternative.

### *15.4.3.4 Alternative 3*

As described in Chapter 3, Description of Alternatives, CVP and SWP operations under Alternative 3 are similar to the Second Basis of Comparison with modified Old and Middle River flow criteria and New Melones Reservoir operations; and additional predation control actions to reduce the populations of striped bass. As described in Chapter 4, Approach to Environmental Analysis, Alternative 3 is compared to the No Action Alternative and the Second Basis of Comparison.

#### 15.4.3.4.1 Alternative 3 Compared to the No Action Alternative

*Trinity River Region*

*Potential Changes in Recreational Resources at Reservoirs that Store CVP and SWP Water*

Changes in CVP water supplies and operations under Alternative 3 as compared to the No Action Alternative would result in similar end of September reservoir elevations and related recreational resources at Trinity Lake in all water year types, as described in Chapter 5, Surface Water Resources and Water Supplies.

There are several boat ramps at Trinity Lake that provide access at different elevations. Boat ramps at Stuart Fork and Bowerman are not useable when the water elevation is less than 2,323 feet which occurs approximately 80 percent of the time under Alternative 3 and the No Action Alternative. Boat ramps at Clark Springs, Fairview, and Trinity Center are not useable when the water elevation is lower than 2,300 feet which occurs approximately 62 percent of the time under Alternative 3 and the No Action Alternative. The Minersville boat ramp is accessible until the elevation declines below 2,170 feet which occurs approximately 5 percent of the time under Alternative 3 and the No Action Alternative.

*Potential Changes in Recreational Resources along Rivers Downstream of the CVP and SWP Reservoirs*

The following changes would occur on the Trinity River under Alternative 3 as compared to the No Action Alternative, as summarized in Chapter 5, Surface Water Resources and Water Supplies.

- Over long-term conditions, flows would be similar in March through November; and increased in December through February (up to 11.8 percent).
- In wet years, flows would be similar in April through October; reduced in November (7.0 percent); and increased in December through March (up to 15.1 percent).
- In dry years, flows would be similar in all months.

Flows in Trinity River would be similar during the recreation season (spring and summer months); therefore, recreational opportunities would be similar.

*Central Valley Region*

*Potential Changes in Recreational Resources at Reservoirs that Store CVP and SWP Water*

Changes in CVP water supplies and operations under Alternative 3 as compared to the No Action Alternative would result in similar end of September reservoir elevations and related recreational resources at Shasta Lake, Lake Oroville, Folsom Lake, and New Melones Reservoir in all water year types; and at San Luis Reservoir in below normal, dry, and critical dry years, as described in Chapter 5, Surface Water Resources and Water Supplies. Changes in recreational resources at San Luis Reservoir would be reduced in wet year and critical dry years because the end of September surface water elevations would be increased by 7.9 percent in wet years and 5.7 percent in above normal years.

There are several boat ramps at each of the reservoirs that provide access at different elevations. At Shasta Lake, boat ramps at Antlers, Hirz Bay, Packers Bay, Sugar Loaf, and Centimundi and Jones Valley are not accessible approximately 55, 30, 15, 10, and 7 percent of the time, respectively, under Alternative 3; and approximately 55, 35, 20, 10, and 9 percent of the time, respectively, under the No Action Alternative.

At Lake Oroville, boat ramps at Enterprise, Vinton Gulch, and Nelson Bar; Foreman Creek; Dark Canyon and Loafer Creek; and Bidwell Canyon, Lime Saddle, and Spillway are not accessible approximately 85, 75, 62, and 25 percent of the time, respectively, under Alternative 3; and approximately 95, 87, 73, and 35 percent of the time, respectively, under the No Action Alternative.

At Folsom Lake, boat ramps at Rattlesnake Bar, Beal's Point; Peninsula, Brown's Ravine, and Folsom Point; Hobie Cove; and Granite Bay are not accessible approximately 65, 40, 10, and 7 percent of the time, respectively, under Alternative 3; and approximately 80, 65, 40, 10, and 7 percent of the time, respectively, under the No Action Alternative.

At New Melones Reservoir, the boat ramp at Angels Creek, Parrott's Ferry, Glory Hole, and Mark Twain are not accessible approximately 22, 18, 10, and 5 percent of the time, respectively, under Alternative 3 as compared to approximately 65, 25, 18, and 5 percent of the time, respectively, under the No Action Alternative.

At San Luis Reservoir, the boat ramps at Dinosaur Point and Basalt Area are not useable approximately 28 and 8 percent of the time, respectively, under Alternative 3; and approximately 50 and 10 percent of the time, respectively, under the No Action Alternative.

At Lake Oroville, Folsom Lake, New Melones Reservoir, and San Luis Reservoir, boating opportunities would be increased, and opportunities would be similar at Shasta Lake under Alternative 3 as compared to the No Action Alternative. At Shasta Lake, Lake Oroville, and New Melones Reservoir shoreline recreational opportunities would be increased, and opportunities would be similar at Folsom Lake and San Luis Reservoir under Alternative 3 as compared to the No Action Alternative.

*Potential Changes in Recreational Resources along Rivers Downstream of the CVP and SWP Reservoirs*

The recreational opportunities along the Sacramento, Feather, American, and Stanislaus rivers would be affected by the following changes in river flows, as described in Chapter 5.

- Sacramento River downstream of Keswick Dam
  - Over long-term conditions, similar flows would occur in October, February through May, July, and August; reduced flows in September and November (up to 20.1 percent); and increased flows in December, January, and June (up to 8.9 percent).
  - In wet years, similar flows would occur in February through August; reduced flows in September through November (up to 42.1 percent); and increased flows in December and January (up to 16.9 percent).
  - In dry years, similar flows would occur in July through September and December through May; reduced flows in November (24.6 percent); and increased flows in January and June (up to 7.3 percent).
- Sacramento River at Freeport
  - Over long-term conditions, similar flows would occur in October, December through May, July, and August; reduced flows in September and November (up to 30.1 percent); and increased flows in June (12.1 percent).
  - In wet years, similar flows would occur in January through May, July, and October; reduced flows in August, September, and November (up to 48.1 percent); and increased flows in December and June (up to 6.6 percent).
  - In dry years, similar flows would occur in July through October and December through April; reduced flows in November (14.2 percent); and increased flows in May and June (up to 15.7 percent).
- Feather River downstream of the Thermalito Complex
  - Over long-term conditions, similar flows would occur in October, November, March, April, and July; reduced flows in August and September (up to 49.4 percent); and increased flows in December through February, May, and June (up to 33.9 percent).
  - In wet years, similar flows would occur in October, November, February through May, and July; reduced flows in August and September (up to 70.0 percent) and increased flows in December, January, and June (up to 28.1 percent).
  - In dry years, similar flows would occur in September and January through April; reduced flows in October through December and July (up to 14.5 percent); and increased flows in May, June, and August (36.9 percent).
- American River downstream of Nimbus Dam
  - Over long-term conditions, similar flows would occur in November, January through May, July, and August; reduced flows in September and October (up to 28.7 percent); and increased flows in June (5.8 percent).

- In wet years, similar flows would occur in October, November, and January through July; reduced flows in September (45.9 percent); and increased flows in August and December (up to 8.5 percent).
- In dry years, similar flows would occur in November through January and March through September; reduced flows in October (11.2 percent); and increased flows in February (6.1 percent).

- Stanislaus River downstream of Goodwin Dam
  - Over long-term conditions, reduced flows would occur in October and March through June (up to 58.3 percent); and increased flows in November through February and July through September (up to 36.81 percent).
  - In wet years, similar flows would occur in April; reduced flows in October, March, and May (up to 52.9 percent); and increased flows in June through September and November through February (up to 67.8 percent).
  - In dry years, similar flows would occur in March and July through September; reduced flows in October and April through June (up to 59.6 percent); and increased flows in November through February (up to 37.0 percent).

During the spring and summer months, the changes in flow conditions between Alternative 3 and the No Action Alternative vary on a monthly basis in the Sacramento, Feather, American, and Stanislaus rivers within a water year type. For example, flows in the Sacramento River at Freeport would increase in several months under Alternative 3 as compared to the No Action Alternative by up to 15 percent, and decrease in several months up to 30 percent. The overall range of flows is within the historical operational range; therefore, recreational opportunities still exist. However, the value of the recreational opportunities would be both improved and reduced depending upon the timing of the changes.

Overall, under Alternative 3 as compared to the No Action Alternative, recreational opportunities would be similar or improved on the Sacramento River downstream of Keswick Dam and American River downstream of Nimbus Dam; and both improved and reduced on the Sacramento River near Freeport, Feather River downstream of Thermalito Complex, and the Stanislaus River downstream of Goodwin Dam depending upon the month.

Recreational opportunities related to Striped Bass fishing would initially be increased when Alternative 3 is implemented. However, by 2030, Striped Bass fishing opportunities would be reduced under Alternative 3 as compared to the No Action Alternative due to actions to reduce predation.

Recreational opportunities related to sport ocean salmon fishing would be reduced under Alternative 3 as compared to the No Action Alternative.

*Effects Related to Cross Delta Water Transfers*

Potential effects to recreational resources could be similar to those identified in a recent environmental analysis conducted by Reclamation for long-term water transfers from the Sacramento to San Joaquin valleys (Reclamation 2014c) as described above under the No Action Alternative compared to the Second Basis of Comparison. For the purposes of this EIS, it is anticipated that similar conditions would occur during implementation of cross Delta water transfers under Alternative 3 and the No Action Alternative, and that impacts on recreational resources would not be substantial in the seller's service area due to implementation requirements of the transfer programs.

Under Alternative 3, water could be transferred throughout the year without an annual volumetric limit. Under the No Action Alternative, the timing of cross Delta water transfers would be limited to July through September and include annual volumetric limits, in accordance with the 2008 USFWS BO and 2009 NMFS BO. Overall, the potential for cross Delta water transfers would be increased under Alternative 3 as compared to the No Action Alternative.

*San Francisco Bay Area, Central Coast, and Southern California Regions*

*Potential Changes in Recreational Resources at Reservoirs that Store CVP and SWP Water*

Changes in recreational resources at reservoirs that store CVP and SWP water supplies are assumed to be related to changes in water deliveries over long-term conditions for this EIS analysis, as described above under the No Action Alternative as compared to the Second Basis of Comparison. Therefore, under Alternative 3 as compared to the No Action Alternative, recreational resources related to surface water elevations in reservoirs that store CVP and SWP water supplies would be increased by 9 to 17 percent in the San Francisco Bay Area Region and 17 percent in the Central Coast and Southern California regions.

#### 15.4.3.4.2 Alternative 3 Compared to the Second Basis of Comparison

*Trinity River Region*

*Potential Changes in Recreational Resources at Reservoirs that Store CVP and SWP Water*

Changes in CVP water supplies and operations under Alternative 3 as compared to the Second Basis of Comparison would result in similar end of September reservoir elevations and related recreational resources at Trinity Lake in all water year types, as described in Chapter 5, Surface Water Resources and Water Supplies.

There are several boat ramps at Trinity Lake that provide access at different elevations. Boat ramps at Stuart Fork and Bowerman are not useable when the water elevation is less than 2,323 feet which occurs approximately 80 percent of the time under Alternative 3 and the Second Basis of Comparison. Boat ramps at Clark Springs, Fairview, and Trinity Center are not useable when the water elevation is lower than 2,300 feet which occurs approximately 62 percent of the time under Alternative 3 and the Second Basis of Comparison. The Minersville boat ramp is accessible until the elevation declines below 2,170 feet which occurs approximately 5 percent of the time under Alternative 3 and the Second Basis of Comparison.

The potential for reduced recreational resources at Trinity Lake related to shoreline activities would be greater in critical dry years and similar in dry years and over the long-term average conditions under the No Action Alternative as compared to the Second Basis of Comparison.

*Potential Changes in Recreational Resources along Rivers Downstream of the CVP and SWP Reservoirs*

Flows in the Trinity River and recreational opportunities under Alternative 3 would be similar to the Second Basis of Comparison, as summarized in Chapter 5, Surface Water Resources and Water Supplies.

*Central Valley Region*

*Potential Changes in Recreational Resources at Reservoirs that Store CVP and SWP Water*

Changes in CVP water supplies and operations under Alternative 3 as compared to the Second Basis of Comparison would result in similar end of September reservoir elevations and related recreational resources at Shasta Lake, Lake Oroville, Folsom Lake, New Melones Reservoir, and San Luis Reservoir in all water year types, as described in Chapter 5, Surface Water Resources and Water Supplies.

There are several boat ramps at each of the reservoirs that provide access at different elevations. At Shasta Lake, boat ramps at Antlers, Hirz Bay, Packers Bay, Sugar Loaf, and Centimundi and Jones Valley are not accessible approximately 55, 30, 15, 10, and 7 percent of the time, respectively, under Alternative 3 and the Second Basis of Comparison.

At Lake Oroville, boat ramps at Enterprise, Vinton Gulch, and Nelson Bar; Foreman Creek; Dark Canyon and Loafer Creek; and Bidwell Canyon, Lime Saddle, and Spillway are not accessible approximately 85, 75, 62, and 35 percent of the time, respectively, under Alternative 3 and the Second Basis of Comparison.

At Folsom Lake, boat ramps at Rattlesnake Bar; Beal's Point; Peninsula, Brown's Ravine, and Folsom Point; Hobie Cove; and Granite Bay are not accessible approximately 70, 65, 40, 10, and 7 percent of the time, respectively, under Alternative 3 and the Second Basis of Comparison.

At New Melones Reservoir, the boat ramp at Angels Creek, Parrott's Ferry, Glory Hole, and Mark Twain are not accessible approximately 22, 18, 10, and 8 percent of the time, respectively, under Alternative 3 as compared to approximately 30, 25, 15, and 3 percent of the time, respectively, under the Second Basis of Comparison.

At San Luis Reservoir, the boat ramps at Dinosaur Point and Basalt Area are not useable approximately 28 and 8 percent of the time, respectively, under

Alternative 3; and approximately 20 and 5 percent of the time, respectively, under the Second Basis of Comparison.

Boating opportunities would be increased at New Melones Reservoir, decreased at San Luis Reservoir, and similar at all other reservoirs under Alternative 3 as compared to the Second Basis of Comparison. Shoreline recreational opportunities would be increased at New Melones Reservoir, decreased at Lake Oroville, and similar at all other reservoirs under Alternative 3 as compared to the Second Basis of Comparison.

*Potential Changes in Recreational Resources along Rivers Downstream of the CVP and SWP Reservoirs*

The recreational opportunities along the Sacramento, Feather, American, and Stanislaus rivers would be affected by the following changes in river flows, as described in Chapter 5.

- Similar or increased flows in the Sacramento River downstream of Keswick Dam and at Freeport.
- Feather River downstream of the Thermalito Complex
  - Over long-term conditions, similar flows would occur in November and January through June; reduced flows in October, December, and September (up to 12.5 percent); and increased flows in July and August (up to 17.0 percent).
  - In wet years, similar flows would occur in November and January through May; reduced flows in October, December, and September (up to 14.6 percent); and increased flows in June through August (up to 10.9 percent).
  - In dry years, similar flows would occur in November and January through June; reduced flows in August through October (up to 21.2 percent); and increased flows in July (37.1 percent).
- Similar flows in American River downstream of Nimbus Dam.
- Stanislaus River downstream of Goodwin Dam
  - Over long-term conditions, similar flows would occur in October, December, January, and March; reduced flows would occur in November, May, and June (up to 52.3 percent); and increased flows in February, April, and July through September (up to 26.8 percent).
  - In wet years, similar flows would occur in October, November, January, and April; reduced flows in May and June (up to 44.8 percent); and increased flows in December, February, March, and July through September (up to 68.6 percent).
  - In dry years, similar flows would occur in July through October; reduced flows in November through March and May through June (up to 36.0 percent); and increased flows in April (40.2 percent).

During the spring and summer months, the changes in flow conditions between Alternative 3 and the Second Basis of Comparison vary on a monthly basis in the Sacramento, Feather, American, and Stanislaus rivers within a water year type. For example, flows in the Stanislaus River downstream of Goodwin Dam would increase in several months under Alternative 3 as compared to the Second Basis of Comparison by up to 90 percent, and decrease in several months up to 11 percent. The overall range of flows is within the historical operational range; therefore, recreational opportunities still exist.

Overall, under Alternative 3 as compared to the Second Basis of Comparison, recreational opportunities would be similar or improved on the Sacramento, Feather, and American rivers; and both improved and reduced on the Stanislaus River depending upon the month.

Recreational opportunities related to Striped Bass fishing would initially be increased when Alternative 3 is implemented. However, by 2030, Striped Bass fishing opportunities would be reduced under Alternative 3 as compared to the Second Basis of Comparison due to actions to reduce predation.

Recreational opportunities related to sport ocean salmon fishing would be reduced under Alternative 3 as compared to the Second Basis of Comparison.

##### *Effects Related to Cross Delta Water Transfers*

Potential effects to recreational resources could be similar to those identified in a recent environmental analysis conducted by Reclamation for long-term water transfers from the Sacramento to San Joaquin valleys (Reclamation 2014c) as described above under the No Action Alternative compared to the Second Basis of Comparison. For the purposes of this EIS, it is anticipated that similar conditions would occur during implementation of cross Delta water transfers under Alternative 3 and the Second Basis of Comparison, and that impacts on recreational resources would not be substantial in the seller's service area due to implementation requirements of the transfer programs.

Under Alternative 3 and the Second Basis of Comparison, water could be transferred throughout the year without an annual volumetric limit. Overall, the potential for cross Delta water transfers would be similar under Alternative 3 and the Second Basis of Comparison.

#### *San Francisco Bay Area, Central Coast, and Southern California Regions*

##### *Potential Changes in Recreational Resources at Reservoirs that Store CVP and SWP Water*

Changes in recreational resources at reservoirs that store CVP and SWP water supplies are assumed to be related to changes in water deliveries over long-term conditions for this EIS analysis, as described above under the No Action Alternative as compared to the Second Basis of Comparison. Therefore, under Alternative 3 as compared to the Second Basis of Comparison, recreational resources related to surface water elevations in reservoirs that store CVP and SWP water supplies would be similar (changes within 5 percent).

#### *15.4.3.5 Alternative 4*

The recreational resources under Alternative 4 would be similar to the conditions under the Second Basis of Comparison with additional predation control actions to reduce the populations of striped bass.

##### 15.4.3.5.1 Alternative 4 Compared to the No Action Alternative

The CVP and SWP operations under Alternative 4 are identical to the CVP and SWP operations under the Second Basis of Comparison and Alternative 1. However, Alternative 4 includes predation controls as compared to the Second Basis. Therefore, reservoir and flow-related changes in recreational resources under Alternative 4 as compared to the No Action Alternative would be the same as the impacts described in Section 15.4.3.2.1, Alternative 1 Compared to the No Action Alternative.

Recreational opportunities related to Striped Bass fishing would initially be increased when Alternative 4 is implemented. However, by 2030, Striped Bass fishing opportunities would be reduced under Alternative 4 as compared to the No Action Alternative due to actions to reduce predation.

Recreational opportunities related to sport ocean salmon fishing would be reduced under Alternative 4 as compared to the No Action Alternative.

##### 15.4.3.5.2 Alternative 4 Compared to the Second Basis of Comparison

The CVP and SWP operations under Alternative 4 are identical to the CVP and SWP operations under the Second Basis of Comparison and Alternative 1. However, Alternative 4 includes predation controls as compared to the Second Basis of Comparison. Therefore, flow-related changes in recreational resources under Alternative 4 are the same as recreational resources under the Second Basis of Comparison.

Recreational opportunities related to Striped Bass fishing would initially be increased when Alternative 4 is implemented. However, by 2030, Striped Bass fishing opportunities would be reduced under Alternative 4 as compared to the Second Basis of Comparison due to actions to reduce predation.

Recreational opportunities related to sport ocean salmon fishing would be reduced under Alternative 4 as compared to the Second Basis of Comparison.

#### *15.4.3.6 Alternative 5*

As described in Chapter 3, Description of Alternatives, CVP and SWP operations under Alternative 5 are similar to the No Action Alternative with modified Old and Middle River flow criteria and New Melones Reservoir operations. As described in Chapter 4, Approach to Environmental Analysis, Alternative 5 is compared to the No Action Alternative and the Second Basis of Comparison.

#### 15.4.3.6.1 Alternative 5 Compared to the No Action Alternative

*Trinity River Region*

*Potential Changes in Recreational Resources at Reservoirs that Store CVP and SWP Water*

Changes in CVP water supplies and operations under Alternative 5 as compared to the No Action Alternative would result in similar end of September reservoir elevations and related recreational resources at Trinity Lake in all water year types, as described in Chapter 5, Surface Water Resources and Water Supplies.

There are several boat ramps at Trinity Lake that provide access at different elevations. Boat ramps at Stuart Fork and Bowerman are not useable when the water elevation is less than 2,323 feet which occurs approximately 80 percent of the time under Alternative 5 and the No Action Alternative. Boat ramps at Clark Springs, Fairview, and Trinity Center are not useable when the water elevation is lower than 2,300 feet which occurs approximately 62 percent of the time under Alternative 5 and the No Action Alternative. The Minersville boat ramp is accessible until the elevation declines below 2,170 feet which occurs approximately 8 percent of the time under Alternative 5 and 5 percent of the time under the No Action Alternative.

The potential for reduced recreational resources at Trinity Lake related to shoreline activities would be slightly less in critical dry years and similar over the long-term average conditions and dry years under Alternative 5 as compared to the No Action Alternative.

*Potential Changes in Recreational Resources along Rivers Downstream of the CVP and SWP Reservoirs*

Flows in the Trinity River and recreational opportunities under Alternative 5 would be similar to the No Action Alternative, as summarized in Chapter 5, Surface Water Resources and Water Supplies.

*Central Valley Region*

*Potential Changes in Recreational Resources at Reservoirs that Store CVP and SWP Water*

Changes in CVP water supplies and operations under Alternative 5 as compared to the No Action Alternative would result in similar end of September reservoir elevations and related recreational resources at Shasta Lake, Lake Oroville, Folsom Lake, New Melones Reservoir, and San Luis Reservoir in all water year types, as described in Chapter 5, Surface Water Resources and Water Supplies.

There are several boat ramps at each of the reservoirs that provide access at different elevations. At Shasta Lake, boat ramps at Antlers, Hirz Bay, Packers Bay, Sugar Loaf, and Centimundi and Jones Valley are not accessible approximately 55, 35, 20, 10, and 9 percent of the time, respectively, under Alternative 5 and the No Action Alternative.

At Lake Oroville, boat ramps at Enterprise, Vinton Gulch, and Nelson Bar; Foreman Creek; Dark Canyon and Loafer Creek; and Bidwell Canyon, Lime Saddle, and Spillway are not accessible approximately 95, 87, 73, and 35 percent of the time, respectively, under Alternative 5 and the Second Basis of Comparison.

At Folsom Lake, boat ramps at Rattlesnake Bar, Beal's Point; Peninsula, Brown's Ravine, and Folsom Point; Hobie Cove; and Granite Bay are not accessible approximately 80, 65, 40, 10, and 7 percent of the time, respectively, under Alternative 5 and the No Action Alternative.

At New Melones Reservoir, the boat ramp at Angels Creek, Parrott's Ferry, Glory Hole, and Mark Twain are not accessible approximately 35, 30, 22, and 8 percent of the time, respectively, under Alternative 5 as compared to approximately 65, 25, 18, and 5 percent of the time, respectively, under the No Action Alternative.

At San Luis Reservoir, the boat ramps at Dinosaur Point and Basalt Area are not useable approximately 50 and 10 percent of the time, respectively, under Alternative 5 and the No Action Alternative.

Increased shoreline recreational opportunities at New Melones Reservoir in long-term average conditions and dry years, decreased opportunities at New Melones Reservoir in critical dry years, and similar opportunities at all times analyzed at all other reservoirs under Alternative 5 as compared to the No Action Alternative. Increased boating opportunities at New Melones Reservoir and similar opportunities at all other reservoirs under Alternative 5 as compared to the No Action Alternative.

*Potential Changes in Recreational Resources along Rivers downstream of the CVP and SWP Reservoirs*

The recreational opportunities along the Sacramento, Feather, American, and Stanislaus rivers would be affected by the following changes in river flows, as described in Chapter 5.

- Flows in the Sacramento River downstream of Keswick Dam and near Freeport would be similar.
- Feather River downstream of the Thermalito Complex
  - Over long-term conditions, similar flows would occur in June through April; and reduced flows in May (6.6 percent).
  - In wet years, similar flows would occur in all months.
  - In dry years, similar flows would occur in September through April and June; reduced flows in May (27.1 percent); and increased flows in July and August (up to 8.9 percent).
- Flows in the American River downstream of Nimbus Dam would be similar.
- Stanislaus River downstream of Goodwin Dam
  - Over long-term conditions, flows would be similar in September through February and June; reduced flows would occur in March, July, and August

(up to 8.0 percent); and increased flows in April and May (up to 22.4 percent).

- In wet years, similar flows would occur in October, November, January, February, and April through June; reduced flows in December, March, and July through September (up to 18.0 percent).
- In dry years, similar flows would occur in June through March; and increased flows in April and May (up to 47.3 percent).

During the spring and summer months, the changes in flow conditions between Alternative 5 and the No Action Alternative vary on a monthly basis in the Sacramento, Feather, American, and Stanislaus rivers within a water year type. For example, flows in the Feather River downstream of Thermalito Complex would increase in several months under Alternative 5 and the No Action Alternative by up to 9 percent, and decrease in several months up to 27 percent. The overall range of flows is within the historical operational range; therefore, recreational opportunities still exist. However, the value of the recreational opportunities would be both improved and reduced depending upon the timing of the changes.

Overall, under Alternative 5 and the No Action Alternative, recreational opportunities would be similar or improved on the Sacramento and American rivers; and both improved and reduced on the Feather and Stanislaus rivers.

*Effects Related to Cross Delta Water Transfers*

Potential effects to recreational resources could be similar to those identified in a recent environmental analysis conducted by Reclamation for long-term water transfers from the Sacramento to San Joaquin valleys (Reclamation 2014c) as described above under the No Action Alternative compared to the Second Basis of Comparison. For the purposes of this EIS, it is anticipated that similar conditions would occur during implementation of cross Delta water transfers under Alternative 5 and the No Action Alternative, and that impacts on recreational resources would not be substantial in the seller's service area due to implementation requirements of the transfer programs.

Under Alternative 5 and the No Action Alternative, the timing of cross Delta water transfers would be limited to July through September and include annual volumetric limits, in accordance with the 2008 USFWS BO and 2009 NMFS BO. Overall, the potential for cross Delta water transfers would be similar under Alternative 5 and the No Action Alternative.

*San Francisco Bay Area, Central Coast, and Southern California Region*

*Potential Changes in Recreational Resources at Reservoirs that Store CVP and SWP Water*

Changes in recreational resources at reservoirs that store CVP and SWP water supplies are assumed to be related to changes in water deliveries over long-term conditions for this EIS analysis, as described above under the No Action Alternative as compared to the Second Basis of Comparison. Therefore, under

Alternative 5 as compared to the No Action Alternative, recreational resources would be similar.

#### 15.4.3.6.2 Alternative 5 Compared to the Second Basis of Comparison

*Trinity River Region*

*Potential Changes in Recreational Resources at Reservoirs that Store CVP and SWP Water*

Changes in CVP water supplies and operations under Alternative 5 as compared to the Second Basis of Comparison would result in similar end of September reservoir elevations and related recreational resources at Trinity Lake in all water year types, as described in Chapter 5, Surface Water Resources and Water Supplies.

There are several boat ramps at Trinity Lake that provide access at different elevations. Boat ramps at Stuart Fork and Bowerman are not useable when the water elevation is less than 2,323 feet which occurs approximately 80 percent of the time under Alternative 5 and the Second Basis of Comparison. Boat ramps at Clark Springs, Fairview, and Trinity Center are not useable when the water elevation is lower than 2,300 feet which occurs approximately 62 percent of the time under Alternative 5 and the Second Basis of Comparison. The Minersville boat ramp is accessible until the elevation declines below 2,170 feet which occurs approximately 8 percent of the time under Alternative 5 and 5 percent of the time under the Second Basis of Comparison.

The potential for reduced recreational resources at Trinity Lake related to shoreline activities would be similar under Alternative 5 as compared to the Second Basis of Comparison.

*Potential Changes in Recreational Resources along Rivers Downstream of the CVP and SWP Reservoirs*

Flows in Trinity River would be similar during the recreation season (spring and summer months); therefore, recreational opportunities would be similar under Alternative 5 as compared to the Second Basis of Comparison.

*Central Valley Region*

*Potential Changes in Recreational Resources at Reservoirs that Store CVP and SWP Water*

Changes in CVP water supplies and operations under Alternative 5 as compared to the Second Basis of Comparison would result in similar end of September reservoir elevations and related recreational resources at Shasta Lake, Lake Oroville, Folsom Lake, and New Melones Reservoir in all water year types; and at San Luis Reservoir in wet, above normal, and below normal years, as described in Chapter 5, Surface Water Resources and Water Supplies. Changes in recreational resources at San Luis Reservoir would be reduced in dry year and critical dry years because the end of September surface water elevations would be decreased by 6.2 percent in dry years and 8.5 percent in critical dry years.

There are several boat ramps at each of the reservoirs that provide access at different elevations. At Shasta Lake, boat ramps at Antlers, Hirz Bay, Packers Bay, Sugar Loaf, and Centimundi and Jones Valley are not accessible approximately 55, 35, 20, 10, and 9 percent of the time, respectively, under Alternative 5; and approximately 55, 30, 15, 10, and 7 percent of the time, respectively, under the Second Basis of Comparison.

At Lake Oroville, boat ramps at Enterprise, Vinton Gulch, and Nelson Bar; Foreman Creek; Dark Canyon and Loafer Creek; and Bidwell Canyon, Lime Saddle, and Spillway are not accessible approximately 95, 87, 73, and 35 percent of the time, respectively, under Alternative 5; and approximately 85, 75, 62, and 25 percent of the time, respectively, under the Second Basis of Comparison.

At Folsom Lake, boat ramps at Rattlesnake Bar are not accessible 80 percent of the time under Alternative 5, and 70 percent of the time, respectively, under the Second Basis of Comparison. Boat ramps at Beal's Point; Peninsula, Brown's Ravine, and Folsom Point; Hobie Cove; and Granite Bay are not accessible approximately 65, 40, 10, and 7 percent of the time, respectively, under Alternative 5 and the Second Basis of Comparison.

At New Melones Reservoir, the boat ramp at Angels Creek, Parrott's Ferry, Glory Hole, and Mark Twain are not accessible approximately 35, 30, 22, and 8 percent of the time, respectively, under Alternative 5 as compared to approximately 30, 25, 15, and 5 percent of the time, respectively, under the Second Basis of Comparison.

At San Luis Reservoir, the boat ramps at Dinosaur Point and Basalt Area are not useable approximately 50 and 10 percent of the time, respectively, under Alternative 5; and approximately 20 and 5 percent of the time, respectively, under the Second Basis of Comparison.

Decreased shoreline recreational opportunities at Shasta Lake, Lake Oroville, and New Melones Reservoir, and similar opportunities at all other reservoirs under Alternative 5 as compared to the Second Basis of Comparison. Decreased boating opportunities at Lake Oroville, New Melones Reservoir, and San Luis Reservoir and similar opportunities at all other reservoirs under Alternative 5 as compared to the Second Basis of Comparison.

*Potential Changes in Recreational Resources along Rivers Downstream of the CVP and SWP Reservoirs*

The recreational opportunities along the Sacramento, Feather, American, and Stanislaus rivers would be affected by the following changes in river flows, as described in Chapter 5.

- Sacramento River downstream of Keswick Dam
  - Over long-term conditions, flows would be similar in July, August, October, and February through April; reduced in December, January, May and June (up to 8.2 percent); and increased in September and November (up to 38.5 percent).

  - In wet years, flows would be similar in January through July; reduced in December and August (up to 15.0 percent); and increased in September through November (up to 77.3 percent).
  - In dry years, similar flows would occur in July through October and December through March; reduced in April through June (up to 10.1 percent); and increased flows in November (32.1 percent).
- Sacramento River at Freeport
  - Over long-term conditions, flows would be similar in October and December through April; reduced in May and June (up to 11.5 percent); and increased in July through September and November (43.4 percent).
  - In wet years, flows would be similar in October and January through June; reduced in December (6.2 percent); and increased in July through September and November (up to 89.0 percent).
  - In dry years, similar flows would occur in August through October and December through April; reduced in May and June (up to 13.6 percent); and increased flows in July and November (up to 19.3 percent).
- Feather River downstream of the Thermalito Complex
  - Over long-term conditions, similar flows would occur in November and April; reduced flows in October, December through March, May, and June (up to 27.7 percent); and increased flows in July through September (up to 76.2 percent).
  - In wet years, similar flows would occur in October, November, March through May; reduced flows in December through February and June (up to 25.6 percent); and increased flows in July through September (up to 181.9 percent).
  - In dry years, similar flows would occur in November through April; reduced flows in October, May, June, August, and September (up to 45.4 percent); and increased flows in July (60.4 percent).
- American River downstream of Nimbus Dam
  - Over long-term conditions, similar flows would occur in November through July; reduced flows in August (5.8 percent); and increased in September and October (42.4 percent).
  - In wet years, similar flows would occur in October, November, and January through July; reduced flows in December and August (up to 13.7 percent); and increased flows in September (88.2 percent).
  - In dry years, similar flows would occur in November through September; and increased flows in October (16.7 percent).
- Stanislaus River downstream of Goodwin Dam
  - Over long-term conditions, similar flows would occur in August; reduced flows would occur in November through February, June, July, August, and

September (up to 35.8 percent); and increased flows in October and March through May (up to 144.8 percent).

- In wet years, similar flows would occur in February and April; reduced flows in November through January and June through September (up to 52.8 percent); and increased flows in October and March (up to 113.1 percent).
- In dry years, similar flows would occur in July through September; reduced flows in November through March and June (up to 35.7 percent); and increased flows in October, April, and May (150.1 percent).

During the spring and summer months, the changes in flow conditions between Alternative 5 and the Second Basis of Comparison vary on a monthly basis in the Sacramento, Feather, American, and Stanislaus rivers within a water year type. For example, flows in the Sacramento River at Freeport would increase in several months under Alternative 5 as compared to the Second Basis of Comparison by up to 89 percent, and decrease in several months up to 13 percent. The overall range of flows is within the historical operational range; therefore, recreational opportunities still exist. However, the value of the recreational opportunities would be both improved and reduced depending upon the timing of the changes.

Overall, under Alternative 5 as compared to the Second Basis of Comparison, recreational opportunities would be similar or improved on the Sacramento River downstream of Keswick Dam and American River downstream of Nimbus Dam; and both improved and reduced on the Sacramento River near Freeport, Feather River downstream of Thermalito Complex, and the Stanislaus River downstream of Goodwin Dam depending upon the month.

*Effects Related to Cross Delta Water Transfers*

Potential effects to recreational resources could be similar to those identified in a recent environmental analysis conducted by Reclamation for long-term water transfers from the Sacramento to San Joaquin valleys (Reclamation 2014c) as described above under the No Action Alternative compared to the Second Basis of Comparison. For the purposes of this EIS, it is anticipated that similar conditions would occur during implementation of cross Delta water transfers under Alternative 5 and the Second Basis of Comparison, and that impacts on recreational resources would not be substantial in the seller's service area due to implementation requirements of the transfer programs.

Under Alternative 5, the timing of cross Delta water transfers would be limited to July through September and include annual volumetric limits, in accordance with the 2008 USFWS BO and 2009 NMFS BO. Under the Second Basis of Comparison, water could be transferred throughout the year without an annual volumetric limit. Overall, the potential for cross Delta water transfers would be reduced under Alternative 5 as compared to the Second Basis of Comparison.

*San Francisco Bay Area, Central Coast, and Southern California Regions*

*Potential Changes in Recreational Resources at Reservoirs that Store CVP and SWP Water*

Changes in recreational resources at reservoirs that store CVP and SWP water supplies are assumed to be related to changes in water deliveries over long-term conditions for this EIS analysis, as described above under the No Action Alternative as compared to the Second Basis of Comparison. Therefore, under Alternative 5 as compared to the Second Basis of Comparison, recreational resources related to surface water elevations in reservoirs that store CVP and SWP water supplies would be reduced by 10 to 18 percent in the San Francisco Bay Area Region and 18 percent in the Central Coast and Southern California regions.

#### ***15.4.3.7 Summary of Impact Assessment***

The results of the impact assessment of implementation of Alternatives 1 through 5 as compared to the No Action Alternative and the Second Basis of Comparison are presented in Tables 15.28 and 15.29.

**Table 15.28 Comparison of Alternatives 1 through 5 to No Action Alternative**

| Alternative | Potential Change | Consideration for Mitigation Measures |
|---|---|---|
| Alternative 1 | Recreational resources would be similar at Trinity Lake, Shasta Lake, Lake Oroville, Folsom Lake, and New Melones Reservoir in all water year types; and at San Luis Reservoir in above normal, below normal, and dry years. Recreational resources would be increased by 6 percent in wet and critical dry years at San Luis Reservoir, by 11 to 21 percent in the San Francisco Bay Area Region, and by 21 percent in the Central Coast and Southern California regions.<br>Recreational opportunities would be similar or improved on Trinity River, Sacramento River downstream of Keswick Dam, and American River downstream of Nimbus Dam. On the Sacramento River near Freeport, Feather River downstream of Thermalito Complex, and the Stanislaus River downstream of Goodwin Dam recreational opportunities would be similar or improved in most spring and summer months; and reduced in July in all years and August in wetter years. | No mitigation measures identified at this time to reduce flow reduction impacts on recreation opportunities. |
| Alternative 2 | No effects on recreational resources. | None needed |

| Alternative | Potential Change | Consideration for Mitigation Measures |
|---|---|---|
| Alternative 3 | Recreational resources would be similar at Trinity Lake, Shasta Lake, Lake Oroville, Folsom Lake, and New Melones Reservoir in all water year types; and at San Luis Reservoir in above normal, below normal, and dry years. Recreational resources would be increased by 8 percent in wet years and 6 percent in above normal years at San Luis Reservoir, by 9 to 17 percent in the San Francisco Bay Area Region, and by 17 percent in the Central Coast and Southern California regions.<br>Recreational opportunities would be similar or improved on Trinity River, Sacramento River downstream of Keswick Dam, and American River downstream of Nimbus Dam. On the Sacramento River near Freeport and Feather River downstream of Thermalito Complex, recreational opportunities would be similar or improved in most spring and summer months; and reduced in August in all years on both rivers and in July on the Feather River in dry years. On the Stanislaus River downstream of Goodwin Dam recreational opportunities would be similar or improved in summer months; and reduced in May and June in all water year types.<br>Recreational opportunities related to Striped Bass fishing and sport ocean salmon fishing would be reduced. | No mitigation measures identified at this time to reduce flow reduction impacts on recreation opportunities.<br>No mitigation measures identified at this time to reduce impacts to reduction in Striped Bass and sport ocean salmon fishing opportunities. |
| Alternative 4 | Reservoir and flow-related recreational opportunities would be as described for Alternative 1 compared to the No Action Alternative.<br>Recreational opportunities related to Striped Bass fishing and sport ocean salmon fishing would be reduced. | No mitigation measures identified at this time to reduce flow reduction impacts on recreation opportunities.<br>No mitigation measures identified at this time to reduce impacts to reduction in Striped Bass and sport ocean salmon fishing opportunities. |
| Alternative 5 | Recreational resources would be similar at Trinity Lake, Shasta Lake, Lake Oroville, Folsom Lake, San Luis Reservoir, and other reservoirs that store CVP and SWP water in the San Francisco Bay Area, Central Coast, and Southern California regions.<br>Recreational opportunities would be similar or improved on Trinity River, Sacramento River downstream of Keswick Dam and near Freeport, and American River downstream of Nimbus Dam. On the Feather River downstream of Thermalito Complex, recreational opportunities would be similar or improved in most spring and summer months; and reduced in May in all years. On the Stanislaus River downstream of Goodwin Dam recreational opportunities would be similar or improved in spring months; and reduced in July and August in most water year types. | No mitigation measures identified at this time to reduce flow reduction impacts on recreation opportunities. |

Note: Due to the limitations and uncertainty in the CalSim II monthly model and other analytical tools, incremental differences of 5 percent or less between alternatives and the No Action Alternative are considered to be “similar.”

**Table 15.29 Comparison of No Action Alternative and Alternatives 1 through 5 to Second Basis of Comparison**

| Alternative | Potential Change | Consideration for Mitigation Measures |
|---|---|---|
| No Action Alternative | Recreational resources would be similar at Trinity Lake, Shasta Lake, Lake Oroville, Folsom Lake, and New Melones Reservoir in all water year types; and at San Luis Reservoir in above normal, below normal, and dry years. Recreational resources would be reduced by 6 percent in wet and critical dry years at San Luis Reservoir, by 10 to 18 percent in the San Francisco Bay Area Region, and by 18 percent in the Central Coast and Southern California regions.<br>Recreational opportunities would be similar or improved on Trinity River. On the Sacramento River downstream of Keswick Dam and near Freeport, Feather River downstream of Thermalito Complex, American River downstream of Nimbus Dam, and the Stanislaus River downstream of Goodwin Dam recreational opportunities would be similar or improved in most spring and summer months; and reduced in June in most years, August in some years on the Feather and American rivers, and in May in some years on Sacramento River near Freeport and on the Feather River. | Not considered for this comparison. |
| Alternative 1 | No effects on recreational resources. | Not considered for this comparison. |
| Alternative 2 | Same effects as described for No Action Alternative as compared to the Second Basis of Comparison. | Not considered for this comparison. |
| Alternative 3 | Recreational resources would be similar at Trinity Lake, Shasta Lake, Lake Oroville, Folsom Lake, San Luis Reservoir, and other reservoirs that store CVP and SWP water in the San Francisco Bay Area, Central Coast, and Southern California regions.<br>Recreational opportunities would be similar or improved on Trinity River, Sacramento River downstream of Keswick Dam and near Freeport, and American River downstream of Nimbus Dam. On the Feather River downstream of Thermalito Complex, recreational opportunities would be similar or improved in most spring and summer months; and reduced in August in dry years. On the Stanislaus River downstream of Goodwin Dam recreational opportunities would be similar or improved in summer months; and reduced in May and June in all water year types.<br>Recreational opportunities related to Striped Bass fishing and sport ocean salmon fishing would be reduced. | Not considered for this comparison. |
| Alternative 4 | Reservoir and flow-related recreational opportunities would be similar.<br>Recreational opportunities related to Striped Bass fishing and sport ocean salmon fishing would be reduced. | Not considered for this comparison. |

| Alternative | Potential Change | Consideration for Mitigation Measures |
|---|---|---|
| Alternative 5 | Recreational resources would be similar at Trinity Lake, Shasta Lake, Lake Oroville, Folsom Lake, and New Melones Reservoir in all water year types; and at San Luis Reservoir in above normal, below normal, and dry years. Recreational resources would be reduced by 6 percent in dry years and 9 percent in critical dry years at San Luis Reservoir, by 10 to 18 percent in the San Francisco Bay Area Region, and by 18 percent in the Central Coast and Southern California regions.<br>Recreational opportunities would be similar or improved on Trinity River. On the Sacramento River downstream of Keswick Dam and near Freeport, Feather River downstream of Thermalito Complex, American River downstream of Nimbus Dam, and the Stanislaus River downstream of Goodwin Dam recreational opportunities would be similar or improved in many spring and summer months. Flows would reduce in May and June in most years on the Sacramento and Feather rivers; in August on the American River; and in June through August on the Stanislaus River. | Not considered for this comparison. |

Note: Due to the limitations and uncertainty in the CalSim II monthly model and other analytical tools, incremental differences of 5 percent or less between alternatives and the No Action Alternative are considered to be "similar."

#### *15.4.3.8 Potential Mitigation Measures*

Mitigation measures are not included in this EIS to address adverse impacts under the alternatives as compared to the Second Basis of Comparison because this analysis was included in this EIS for information purposes only.

Changes in CVP and SWP operations under Alternatives 1 through 5 as compared to the No Action Alternative would not result in adverse changes in recreational resources at reservoirs. However, implementation of Alternatives 1, 3, 4, and 5 would result in adverse changes in recreational opportunities along rivers downstream of CVP and SWP reservoirs. Implementation of Alternatives 3 and 4 would result in adverse changes in recreational Striped Bass and sport ocean salmon fishing opportunities. Mitigation measures have not been identified at this time.

#### *15.4.3.9 Cumulative Effects Analysis*

As described in Chapter 3, the cumulative effects analysis considers projects, programs, and policies that are not speculative; and are based upon known or reasonably foreseeable long-range plans, regulations, operating agreements, or other information that establishes them as reasonably foreseeable.

The cumulative effects analysis for Alternatives 1 through 5 for Recreational Opportunities are summarized in Table 15.30.

**Table 15.30 Summary of Cumulative Effects on Recreational Opportunities with Implementation of Alternatives 1 through 5 as Compared to the No Action Alternative**

| Scenarios | Actions | Cumulative Effects of Actions |
|---|---|---|
| Past & Present, and Future Actions Included and in the No Action Alternative and in All Alternatives in Year 2030 | Consistent with Affected Environment conditions plus:<br>Actions in the 2008 USFWS BO and 2009 NMFS BO that would have occurred without implementation of the BOs, as described in Section 3.3.1.2 (of Chapter 3, Descriptions of Alternatives), including climate change and sea level rise<br>Actions not included in the 2008 USFWS BO and 2009 NMFS BO that would have occurred without implementation of the BOs, as described in Section 3.3.1.3 (of Chapter 3, Descriptions of Alternatives):<br>- Implementation of Federal and state policies and programs, including Clean Water Act (e.g., Total Maximum Daily Loads); Safe Drinking Water Act; Clean Air Act; and flood management programs<br>- General plans for 2030.<br>- Trinity River Restoration Program.<br>- Central Valley Project Improvement Act programs<br>- Folsom Dam Water Control Manual Update<br>- FERC Relicensing for the Middle Fork of the American River Project<br>- San Joaquin River Restoration Program<br>- Contra Loma Recreation Resource Management Plan<br>- San Luis Reservoir State Recreation Area Resource Management Plan/General Plan | <u>These effects would be the same under all alternatives.</u><br>Climate change and sea level rise and development under the general plans are anticipated to reduce carryover storage in reservoirs and changes in stream flow patterns in a manner that would change recreational opportunities, and could reduce the opportunities for sport ocean salmon fishing.<br>Other actions, including restoration projects, FERC relicensing projects, and some future projects to improve water quality and/or habitat are anticipated to improve recreational opportunities. |
| Future Actions Considered as Cumulative Effects Actions in All Alternatives in Year 2030 | Actions as described in Section 3.5 (of Chapter 3, Descriptions of Alternatives):<br>- Bay-Delta Water Quality Control Plan Update<br>- FERC Relicensing Projects<br>- Bay Delta Conservation Plan (including the California WaterFix alternative)<br>- Shasta Lake Water Resources, North-of-the-Delta Offstream Storage, Los Vaqueros Reservoir Expansion Phase 2, and Upper San Joaquin River Basin Storage Investigations<br>- El Dorado Water and Power Authority Supplemental Water Rights Project<br>- Semitropic Water Storage District Delta Wetlands<br>- North Bay Aqueduct Alternative Intake<br>- Irrigated Lands Regulatory Program | <u>These effects would be the same under all alternatives.</u><br>Some of the future reasonably foreseeable actions to improve water quality and FERC Relicensing projects would improve recreational opportunities.<br>Other future reasonably foreseeable actions, such as expanded or new reservoirs would improve recreational opportunities. |
| No Action Alternative with Associated Cumulative Effects Actions in Year 2030 | Full implementation of the 2008 USFWS BO and 2009 NMFS BO | Implementation of No Action Alternative with future reasonably foreseeable actions would result in changes stream flows would result in changes to related recreational opportunities as compared to historical conditions prior to the BOs. |

| Scenarios | Actions | Cumulative Effects of Actions |
|---|---|---|
| Alternative 1 with Associated Cumulative Effects Actions in Year 2030 | No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant) | Implementation of Alternative 1 with future reasonably foreseeable actions would result in reduced stream flows and related recreational opportunities along the Sacramento River near Freeport, Feather River downstream of Thermalito Complex, American River downstream of Nimbus Dam, and the Stanislaus River downstream of Goodwin Dam in July in all years and August in wetter years compared to the No Action Alternative with the added actions. |
| Alternative 2 with Associated Cumulative Effects Actions in Year 2030 | Full implementation of the 2008 USFWS BO and 2009 NMFS BO CVP and SWP operational actions<br>No implementation of structural improvements or other actions that require further study to develop a more detailed action description. | Implementation of Alternative 2 with future reasonably foreseeable actions for recreational opportunities would be the same as for the No Action Alternative with the added actions. |
| Alternative 3 with Associated Cumulative Effects Actions in Year 2030 | No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant)<br>Slight increase in positive Old and Middle River flows in the winter and spring months<br>Increased bag limits for Striped Bass and Pikeminnow<br>Increased sport ocean salmon fishing harvest limitations | Implementation of Alternative 3 with future reasonably foreseeable actions would result in reduced stream flows and related recreational opportunities along the Sacramento River near Freeport, Feather River downstream of Thermalito Complex would be reduced in August in all years on both rivers and in July on the Feather River in dry years. On the Stanislaus River downstream of Goodwin Dam recreational opportunities would be reduced in May and June in all water year types compared to the No Action Alternative with the added actions.<br>Recreational opportunities related to Striped Bass fishing would initially be increased; however by 2030 recreational fishing related to Striped Bass would be reduced.<br>Recreational opportunities related to sport ocean salmon fishing would be reduced. |
| Alternative 4 with Associated Cumulative Effects Actions in Year 2030 | No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant)<br>Increased bag limits for Striped Bass and Pikeminnow<br>Increased sport ocean salmon fishing harvest limitations | Implementation of Alternative 4 with future reasonably foreseeable actions would result in reduced stream flows and related recreational opportunities along the Sacramento River near Freeport, Feather River downstream of Thermalito Complex, American River downstream of Nimbus Dam, and the Stanislaus River downstream of Goodwin Dam in July in all years and August in wetter years compared to the No Action Alternative with the added actions.<br>Recreational opportunities related to Striped Bass fishing would initially be increased; however by 2030 recreational fishing related to Striped Bass would be reduced.<br>Recreational opportunities related to sport ocean salmon fishing would be reduced. |

| Scenarios | Actions | Cumulative Effects of Actions |
|---|---|---|
| Alternative 5 with Associated Cumulative Effects Actions in Year 20530 | Full implementation of the 2008 USFWS BO and 2009 NMFS BO<br>Positive Old and Middle River flows and increased Delta outflow in spring months | Implementation of Alternative 5 with future reasonably foreseeable actions would result in reduced stream flows and related recreational opportunities along the Feather River downstream of Thermalito Complex would be reduced in May in all years compared to the No Action Alternative with the added actions. On the Stanislaus River downstream of Goodwin Dam recreational opportunities would be reduced in July and August in most water year types compared to the No Action Alternative with the added actions. |

Chapter 16

# Air Quality and Greenhouse Gas Emissions

## 16.1 Introduction

This chapter describes existing and future air quality conditions and the potential for greenhouse gas emissions that could occur as a result of implementing the alternatives that could change the long-term operation of the Central Valley Project (CVP) and State Water Project (SWP) as evaluated in this Environmental Impact Statement (EIS). Implementation of the alternatives could affect CVP and SWP water deliveries which could indirectly affect air quality.

## 16.2 Terminology

Important air quality and greenhouse gas emission terminology used in this chapter are defined by the U.S. Environmental Protection Agency (USEPA) and the California Air Resources Board (ARB), as summarized below.

- **Attainment Area:** A geographic area considered to have air quality as good as or better than the national and/or state ambient air quality standards. An area may be an attainment area for one pollutant and a non-attainment area for others (USEPA 2006).
- **California Ambient Air Quality Standard (CAAQS):** A legal limit that specifies the maximum level and time of exposure in the outdoor air for a given air pollutant and which is protective of human health and public welfare (California Health and Safety Code section 39606b). CAAQS are recommended by the California Office of Environmental Health Hazard Assessment and adopted into regulation by the ARB. CAAQS are the standards which must be met per the requirements of the California Clean Air Act (ARB 2010).
- **Criteria Pollutant:** An air pollutant for which acceptable levels of exposure can be determined and for which an ambient air quality standard has been set (ARB 2010). The criteria pollutants are ozone ($O_3$), carbon monoxide (CO), nitrogen oxides ($NO_x$), sulfur dioxide ($SO_2$), particulate matter less than 10 microns in aerodynamic diameter ($PM_{10}$), particulate matter less than 2.5 microns in aerodynamic diameter ($PM_{2.5}$), and lead (Pb).
- **Greenhouse Gases (GHGs):** Atmospheric gases (such as carbon dioxide ($CO_2$), methane ($CH_4$), hydrofluorocarbons (HFC), nitrous oxide ($N_2O$), $O_3$, perfluorocarbons (PFC), sulfur hexafluoride ($SF_6$), and water vapor) that slow the passage of re-radiated heat through the Earth's atmosphere (ARB 2010).

Six of the GHGs are the subject of reductions under the Kyoto Protocol and California Assembly Bill 32 are $CO_2$, $CH_4$, $N_2O$, HFC, PFC, and $SF_6$.

- **National Ambient Air Quality Standard (NAAQS):** Standards established by USEPA that apply for outdoor air throughout the United States (USEPA 2006).
- **Nonattainment Area:** A geographic area identified by the USEPA and/or ARB as not meeting either NAAQS or CAAQS for a given pollutant (ARB 2010).
- **Precursor:** In photochemistry, a compound antecedent to a pollutant. For example, volatile organic compounds (VOC) and $NO_x$ react in sunlight to form the criteria pollutant ozone. As such, VOCs and $NO_x$ are precursors to $O_3$ (USEPA 2006).
- **Reactive Organic Gas (ROG):** A photochemically reactive chemical gas composed of non-methane hydrocarbons (HCs) that may contribute to the formation of smog (ARB 2010). ROG may also be referred to as non-methane organic gases, VOCs, or HCs.
- **State Implementation Plan (SIP):** A plan prepared by states and submitted to USEPA describing how each area will attain and maintain NAAQS. SIPs include the technical foundation for understanding the air quality (e.g., emission inventories and air quality monitoring), control measures and strategies, and enforcement mechanisms (ARB 2010).
- **Toxic Air Contaminant (TAC):** An air pollutant, identified in regulation by the ARB, which may cause or contribute to an increase in deaths or in serious illness, or which may pose a present or potential hazard to human health. Health effects of TACs may occur at extremely low levels and it is typically difficult to identify levels of exposure that do not produce adverse health effects (ARB 2010).

In California, local air districts have been established to oversee the attainment of air quality standards within air basins as defined by the State. Local air districts administer air quality laws and regulations within the air basins. The local air districts have permitting authority over all stationary sources of air pollutants within their district boundaries and provide the primary review of environmental documents prepared for projects with air quality issues.

## 16.3 Regulatory Environment and Compliance Requirements

Potential actions that could be implemented under the alternatives evaluated in this EIS could affect future air quality conditions and the potential for GHG emissions. Implementation of the alternatives could affect CVP and SWP water deliveries which could affect air quality related to agricultural operations and fugitive dust generation. Changes in air quality and GHG emissions are analyzed in this EIS relative to appropriate Federal and state agency policies and regulations, as described in Chapter 4, Approach to Environmental Analyses.

Several of the Federal and state laws and regulations that provide quantitative criteria to determine compliance also are summarized in this subsection of this chapter to provide context for information provided in the remaining sections of this chapter, including:

- Federal Clean Air Act
  - National Ambient Air Quality Standards and Federal Air Quality Designations
  - Federal General Conformity Requirements
- California Clean Air Act
- California Assembly Bill 32, California Global Warming Solutions Act of 2006

### 16.3.1 Federal Clean Air Act

National air quality policies are regulated through the Federal Clean Air Act (FCAA) of 1970 and its 1977 and 1990 amendments. Basic elements of the FCCA include NAAQS for criteria air pollutants, hazardous air pollutants standards, state attainment plans, motor vehicle emissions standards, stationary source emissions standards and permits, acid rain control measures, stratospheric ozone protection, and enforcement provisions.

#### *16.3.1.1 National Ambient Air Quality Standards and Federal Air Quality Designations*

Pursuant to the FCAA, the USEPA established NAAQS for $O_3$, CO, $NO_2$, sulfur dioxide (SOx as $SO_2$), $PM_{10}$, $PM_{2.5}$, and lead. These pollutants are referred to as criteria pollutants because numerical health-based criteria have been established that define acceptable levels of exposure for each pollutant. The NAAQS and the CAAQS are summarized in Table 16.1 (ARB 2013).

**Table 16.1 Federal and State Ambient Air Quality Standards**

| Pollutant | Averaging Time | National Standards[a] Primary[b, i] | National Standards[a] Secondary[c, i] | California Standards[d] |
|---|---|---|---|---|
| Ozone | 8 Hour<br>1 Hour | 0.075 ppm<br>– | 0.075 ppm<br>– | 0.07 ppm<br>0.09 ppm |
| Carbon monoxide | 8 Hour<br>1 Hour | 9 ppm<br>35 ppm | –<br>– | 9.0 ppm<br>20 ppm |

Source: ARB 2012, ARB 2013b.

Notes:

a. National standards, other than ozone, particulate matter, and those based on annual averages or annual arithmetic means, are not to be exceeded more than once a year. The ozone standard is attained when the fourth highest eight hour concentration in a year, averaged over three years, is equal to or less than the standard. For $PM_{10}$, the 24-hour standard is attained when the expected number of days per calendar year with a 24-hour average concentration above 150 $\mu g/m^3$ is equal to or less than one. For $PM_{2.5}$, the 24-hour standard is attained when 98 percent of the daily concentrations, averaged over 3 years, are equal to or less than the standard.

b. National Primary Standards: The levels of air quality necessary, with an adequate margin of safety, to protect the public health.

c. National Secondary Standards: The levels of air quality necessary to protect the public welfare from any known or anticipated adverse effects of a pollutant.

d. California standards for ozone, carbon monoxide, sulfur dioxide (1-hour and 24-hour), nitrogen dioxide, suspended particulate matter ($PM_{10}$, $PM_{2.5}$, and visibility reducing particles), are values that are not to be exceeded. All others are not to be equaled or exceeded. All others are not to be equaled or exceeded. California ambient air quality standards are listed in the Table of Standards in Section 70200 of Title 17 of the California Code of Regulations.

e. On June 2, 2010, a new 1-hour $SO_2$ standard was established and the existing 24-hour and annual primary standards were revoked. To attain the 1-hour national standard, the 3-year average of the annual 99th percentile of the 1-hour daily maximum concentrations at each site must not exceed 75 ppb. The 1971 $SO_2$ national standards (24-hour and annual) remain in effect until one year after an area is designated for the 2010 standard, except for areas designated nonattainment for the 1971 standards, where the 1971 standards remain in effect until implementation plans to attain or maintain the 2010 standards are approved.

f. On December 14, 2012, the national annual $PM_{2.5}$ primary standard was lowered from 15 $\mu g/m^3$ to 12.0 $\mu g/m^3$. The existing national 24-hour $PM_{2.5}$ standards (primary and secondary) were retained at 35 $\mu g/m^3$, as was the annual secondary standard of 15 $\mu g/m^3$. The existing 24-hour $PM_{10}$ standards (primary and secondary) of 150 $\mu g/m^3$ also were retained. The form of the annual primary and secondary standards is the annual mean, averaged over 3 years.

g. The national standard for lead was revised on October 15, 2008, to a rolling 3-month average. The 1978 lead standard (1.5 µg/m3 as a quarterly average) remains in effect until one year after an area is designated for the 2008 standard, except for areas designated nonattainment for the 1978 standard, where the 1978 standard remains in effect until implementation plans to attain or maintain the 2008 standard are approved.

h. In 1989, the ARB converted both the general statewide 10-mile visibility standard and the Lake Tahoe 30-mile visibility standard to instrumental equivalents, which are “extinction of 0.23 per kilometer” and “extinction of 0.07 per kilometer” for the statewide and Lake Tahoe Air Basin standards, respectively.

i. Concentration expressed first in units in which it was promulgated. Equivalent units given in parentheses are based upon a reference temperature of 25°C and a reference pressure of 760 torr. Most measurements of air quality are to be corrected to a reference temperature of 25°C and a reference pressure of 760 torr; ppm in this table refers to ppm by volume, or micromoles of pollutant per mole of gas.

j. To attain the 1-hour national standard, the 3-year average of the annual $98^{th}$ percentile of the 1-hour daily maximum concentrations at each site must not exceed 100 ppb. Note that the national 1-hour standard is in units of parts per billion (ppb). California standards are in units of parts per million (ppm). To directly compare the national 1-hour standard to the California standards the units can be converted from ppb to ppm. In this case, the national standard of 100 ppb is identical to 0.100 ppm.

k. The ARB has identified lead and vinyl chloride as 'toxic air contaminants' with no threshold level of exposure for adverse health effects determined. These actions allow for the implementation of control measures at levels below the ambient concentrations specified for these pollutants.

$\mu g/m^3$ = micrograms per cubic meter.
ppb = parts per billion (by volume).
ppm = parts per million (by volume).

The USEPA designates areas as attainment, nonattainment, or unclassified for individual criteria pollutants depending on whether the areas achieve (i.e., attain) the applicable NAAQS for each pollutant. For some pollutants, there are numerous classifications of the nonattainment designation, depending on the severity of an area's nonattainment status. Areas that lack monitoring data are designated as unclassified areas, and considered as attainment areas for regulatory purposes.

Under the 1977 FCAA amendments, states (or areas within states) with ambient air quality concentrations that do not meet the NAAQS are required to develop and maintain SIPs. These implementation plans constitute a federally enforceable definition of the state's approach and schedule for the attainment of the NAAQS. If a nonattainment area achieves compliance, the area is classified as an attainment maintenance area for 20 years.

#### *16.3.1.2 Federal General Conformity Requirements*

The 1977 FCAA amendments state that the Federal government is prohibited from engaging in, supporting, providing financial assistance for, licensing, permitting, or approving any activity that does not conform to an applicable SIP. In the 1990 FCAA amendments, the USEPA included provisions requiring Federal agencies to ensure that actions undertaken in nonattainment or attainment maintenance areas are consistent with applicable SIPs. The process of determining whether a Federal action is consistent with applicable SIPs is called "conformity" determination. A conformity determination is required only for the project alternative that is ultimately selected and approved. The USEPA general conformity regulation applies only to Federal actions that result in emissions of "nonattainment or maintenance pollutants" or their precursors in federally designated nonattainment or maintenance areas. The emission thresholds that trigger requirements of the general conformity regulation for Federal actions emitting nonattainment or maintenance pollutants, or their precursors, are called *de Minimis* levels, as summarized in Table 16.2.

**Table 16.2 General Conformity *de Minimis* Levels**

| Pollutant | Area Type | Tons/Year |
|---|---|---|
| Ozone (VOC or NOx) | Serious nonattainment | 50 |
| | Severe nonattainment | 25 |
| | Extreme nonattainment | 10 |
| | Other areas outside an ozone transport region | 100 |
| Ozone (NOx) | Marginal and moderate nonattainment inside an ozone transport region | 100 |
| | Maintenance | 100 |
| Ozone (VOC) | Marginal and moderate nonattainment inside an ozone transport region | 50 |
| | Maintenance within an ozone transport region | 50 |
| | Maintenance outside an ozone transport region | 100 |
| Carbon monoxide, $SO_2$ and $NO_2$ | All nonattainment and maintenance | 100 |
| $PM_{10}$ | Serious nonattainment | 70 |
| | Moderate nonattainment and maintenance | 100 |
| $PM_{2.5}$<br>Direct emissions, $SO_2$, NOx (unless determined not to be a significant precursor), VOC or ammonia (if determined to be significant precursors) | All nonattainment and maintenance | 100 |
| Lead (Pb) | All nonattainment and maintenance | 25 |

Source: USEPA 2015b

#### *16.3.1.3 California Clean Air Act*

The California Clean Air Act (CCAA) provides the State with a comprehensive framework for air quality planning regulation. Prior to passage of the CCAA, Federal law contained the only comprehensive planning framework. The CCAA requires attainment of state ambient air quality standards by the earliest practicable date.

The FCAA requires adoption of SIPs for nonattainment areas to describe actions that will be undertaken to achieve the NAAQS. In addition, the CCAA requires local air districts in nonattainment areas to prepare and maintain Air Quality Management Plans (AQMPs) to achieve compliance with CAAQS. These AQMPs also serve as a basis for preparing the SIP for the State of California, which must ultimately be approved by the USEPA and codified in the Code of Federal Register (CFR).

## 16.4 Affected Environment

This section describes the area of analysis, ambient air quality and conditions, and GHG emissions in the study area.

The air basins and air districts in California, including those in the study area, do not specifically align with the study area regions, as noted below and in the description of each air basin (ARB 2011a; ARB 2011b).

The discussion in this chapter area is organized by the study area regions and air basins. The study area regions include the following air basins and counties.

- Trinity River Region is located within portions of the North Coast Air Basin.
  - The Trinity River Region includes the area in Trinity County along the Trinity River from Trinity Lake to the confluence with the Klamath River; and the area in Humboldt and Del Norte counties along the Klamath River from the confluence with the Trinity River to the Pacific Ocean.
- Central Valley Region is located within portions of the Sacramento Valley, Mountain Counties, San Joaquin Valley, San Francisco Bay Area, Mojave Desert air basins.
  - The Central Valley Region includes all or portions the counties of Shasta, Plumas, Tehama, Glenn, Colusa, Butte, Sutter, Yuba, Nevada, Placer, El Dorado, Sacramento, Yolo, Solano, Napa, San Joaquin, Stanislaus, Merced, Madera, Fresno, Kings, Tulare, and Kern that are within the CVP and SWP service areas.
- San Francisco Bay Area Region is located within portions of the San Francisco Bay Area and North Central Coast air basins.
  - The San Francisco Bay Area Region includes portions of Contra Costa, Alameda, Santa Clara, and San Benito counties that are within the CVP and SWP service areas.
- Central Coast Region is located within portions of the South Central Coast Air Basin.
  - The Central Coast Region includes portions of San Luis Obispo and Santa Barbara counties served by the SWP.
- Southern California Region is located within portions of the South Central Coast, South Coast, San Diego, Mojave Desert, and Salton Sea air basins.
  - The Southern California Region includes portions of Ventura, Los Angeles, Orange, San Diego, Riverside, and San Bernardino counties served by the SWP.

### 16.4.1 Ambient Air Quality

Air quality conditions and potential impacts in the project area are evaluated and discussed qualitatively, rather than quantitatively. The following subsections briefly describe the existing air quality environmental setting by air basin for the project area. The counties within each air basin in the project area are presented in Table 16.3, along with non-attainment designations to characterize existing ambient air quality. Non-attainment designations indicate that concentrations of pollutants measured in ambient air exceed the applicable ambient air quality standards. As shown in Table 16.3, many of the counties included in the project area are designated as nonattainment for the Federal and/or State ozone and particulate matter standards. These air quality issues may be exacerbated under dry conditions because when irrigation water supplies are decreased, there is increased potential for the formation and transport of fugitive dust.

**Table 16.3 Pollutants Designated as Nonattainment Pursuant to Federal and State Ambient Air Quality Standards**

| County | Air Basin | Air District | Federal Nonattainment Designations[a] | State Nonattainment Designations[b] |
|---|---|---|---|---|
| **Trinity River Region** | | | | |
| Trinity | North Coast | North Coast Unified | – | – |
| Humboldt | North Coast | North Coast Unified | – | – |
| Del Norte | North Coast | North Coast Unified | – | – |
| **Central Valley Region** | | | | |
| Shasta | Sacramento Valley | Shasta | – | Ozone, $PM_{10}$ |
| Tehama | Sacramento Valley | Tehama | Ozone (Tuscan Buttes area) | Ozone, $PM_{10}$ |
| Butte | Sacramento Valley | Butte | Ozone and $PM_{2.5}$ in Chico | Ozone, $PM_{10}$, $PM_{2.5}$ |
| Glenn | Sacramento Valley | Glenn | – | $PM_{10}$ |
| Colusa | Sacramento Valley | Colusa | – | $PM_{10}$ |
| Yuba | Sacramento Valley | Feather River | – | Ozone, $PM_{10}$ |
| Sutter | Sacramento Valley | Feather River | Ozone | Ozone, $PM_{10}$ |

| **Central Coast Region** | | | | |
| San Luis Obispo | South Central Coast | San Luis Obispo | Ozone (Eastern San Luis Obispo) | Ozone, $PM_{10}$ |
| Santa Barbara | South Central Coast | Santa Barbara | – | Ozone, $PM_{10}$ |
| **Southern California Region** | | | | |
| Ventura | South Central Coast | Ventura | Ozone | Ozone, $PM_{10}$ |
| Los Angeles | South Coast, Mojave Desert | South Coast, Antelope Valley | Ozone, $PM_{2.5}$, Lead | Ozone; $PM_{10}$; $PM_{2.5}$ |
| San Bernardino | South Coast, Mojave Desert | South Coast, Mojave Desert | Ozone, $PM_{10}$, $PM_{2.5}$ | Ozone, $PM_{10}$, $PM_{2.5}$ |
| Riverside | South Coast, Mojave Desert, Salton Sea | South Coast, Mojave Desert | Ozone, $PM_{10}$, $PM_{2.5}$ | Ozone; $PM_{10}$; $PM_{2.5}$ |
| Orange | South Coast | South Coast | Ozone, $PM_{2.5}$ | Ozone, $PM_{10}$, $PM_{2.5}$ |
| San Diego | San Diego County | San Diego | Ozone | Ozone, $PM_{10}$, $PM_{2.5}$ |

Sources: USEPA 2014; ARB 2015

Notes:
a. Areas designated as nonattainment by U.S. Environmental Protection Agency related to National Ambient Air Quality Standards as of January 30, 2015.

b. Areas designated as nonattainment by California Air Resources Board related to California Ambient Air Quality Standards as of April 10, 2014. No changes to the state area designations were proposed for 2014.

#### *16.4.1.1 North Coast Air Basin*

The North Coast Air Basin includes Humboldt, Del Norte, Trinity, Mendocino, and north Sonoma counties (ARB 2013a). This air basin is located within the Trinity River Region of the study area. The basin is sparsely populated, and stretches along the northern coastline through forested mountains. Prevailing winds blow clean air inland from the Pacific Ocean, and air quality is typically good. Humboldt, Del Norte, and Trinity counties are designated attainment for the federal and state air quality standards (USEPA 2015b, ARB 2014).

#### *16.4.1.2 Sacramento Valley Air Basin*

The Sacramento Valley Air Basin encompasses 9 air districts and 11 counties, including: all of Shasta, Tehama, Glenn, Colusa, Butte, Sutter, Yuba, Sacramento, and Yolo counties; the westernmost portion of Placer County; and the northeastern half of Solano County. The air basin is bounded by tall mountains, including the Coast Range to the west, the Cascade Range to the north, and the Sierra Nevada Range to the east. This air basin is located within the northern portion of the Central Valley Region of the study area.

Winters are wet and cool, and summers are hot and dry. When air stagnates, or is trapped by an inversion layer in the valley, ambient pollutant concentrations can reach or exceed threshold levels. On-road vehicles are the largest source of smog-forming pollutants, and particulate matter emissions are primarily from area sources, such as fugitive dust from paved and unpaved roads and vehicle travel (ARB 2013a).

To characterize the existing ambient air quality in the Sacramento Valley Air Basin, data from area monitoring stations were reviewed (ARB 2011d). For the three years from 2007 to 2009, monitoring data indicated the following:

- Concentrations of $O_3$ and 24-hour $PM_{2.5}$ have exceeded the NAAQS and CAAQS.
- Concentrations of $PM_{10}$ have exceeded the CAAQS but are below the NAAQS.
- Measured concentrations of CO and $NO_2$ have complied with the NAAQS and CAAQS.
- Monitored $SO_2$ concentrations are extremely low, and lead concentrations are monitored as part of the air toxics program.

In the time since ARB compiled the 2007 to 2009 air quality monitoring data reported above, Glenn and Colusa counties have been redesignated as attainment for the California ozone standards (ARB 2014). In addition, Sacramento County has been redesignated as attainment for the California $PM_{2.5}$ standards (ARB 2014). No other changes in air quality nonattainment designations have been recorded (USEPA 2014; ARB 2014).

#### *16.4.1.3 Mountain Counties Air Basin*

The Mountain Counties Air Basin includes the mountainous areas of the central and northern Sierra Nevada Mountains, from Plumas County south to Mariposa County, including Plumas, Sierra, Nevada, Central Placer, West El Dorado, Amador, Calaveras, Tuolumne, and Mariposa counties (ARB 2013a). This air basin includes portions of the central-eastern Central Valley Region of the study area; as well as areas located to the east of the study area.

Sparsely populated, motor vehicles are the primary source of emissions in the air basin. Air quality issues often result when eastward surface winds transport pollution from more populated air basins to the west and south. Wood smoke from stoves and fireplaces contribute to elevated ambient $PM_{10}$ concentrations during winter. Nevada, Placer, El Dorado, Amador, Calaveras, Tuolumne, and Mariposa counties are designated as nonattainment for the Federal and State ozone standards (ARB 2014). Plumas, Sierra, Nevada, Placer, El Dorado, and Calaveras counties are designated as nonattainment for the State $PM_{10}$ standards (ARB 2014).

#### *16.4.1.4 San Joaquin Valley Air Basin*

The San Joaquin Valley Air Basin encompasses eight counties, including: all of San Joaquin, Stanislaus, Madera, Merced, Fresno, Kings, Tulare counties; and western Kern County. It is bounded on the west by the Coast Range, on the east by the Sierra Nevada, and in the south by the Tehachapi Mountains. This air basin is located within the central and southern portions of the Central Valley Region of the study area.

Winters are cool and wet and summers are dry and very hot. The area is heavily agricultural, and hosts other localized industries such as forest products, oil and gas production, and oil refining. On-road vehicles are the largest source of smog-forming pollutants, and $PM_{10}$ emissions are primarily from sources such as agricultural operations and fugitive dust from paved and unpaved roads and vehicle travel (ARB 2013a). Air quality issues may be exacerbated under dry conditions. When water supplies and irrigation levels are decreased in urban, rural, and agricultural areas, there is increased potential for the formation and transport of fugitive dust.

To characterize the existing ambient air quality for the San Joaquin Valley Air Basin, data from area monitoring stations were reviewed (ARB 2011d). For the three years from 2007 to 2009, monitoring data indicated the following:

- Concentrations of $O_3$ and 24-hour $PM_{2.5}$ have exceeded the NAAQS and CAAQS.
- Concentrations of $PM_{10}$ have exceeded the CAAQS but are below the NAAQS.
- Measured concentrations of CO and $NO_2$ have complied with the NAAQS and CAAQS.
- Monitored $SO_2$ concentrations are extremely low, and lead concentrations are monitored as part of the air toxics program.

In the time since ARB compiled the 2007 to 2009 air quality monitoring data reported above, no changes in air quality nonattainment designations have been recorded in the San Joaquin Valley Region counties in this study (USEPA 2015; ARB 2014).

##### 16.4.1.4.1 Dust and Particulate Matter in San Joaquin Valley

The San Joaquin Valley Air Pollution Control District (SJVAPCD) is the local regulatory agency with jurisdiction over air quality issues in the San Joaquin Valley area. In response to the area's historical air quality problems with dust and particulate matter, the SJVAPCD was the first agency in the state to regulate emissions from on-field agricultural operations. In 2004, the agency adopted Rule 4550, the Conservation Management Practices rule, and Rule 3190, the Conservation Management Practices Fee rule. To comply with these rules, farmers with 100 acres or more of contiguous land must prepare and implement biennial Conservation Management Plans to reduce dust and particulate matter emissions from on-farm sources, such as unpaved roads and equipment yards, land preparation, harvest activities, and other farming activities. A handbook titled "Agricultural Air Quality Conservation Management Practices for San Joaquin Valley Farms" was published by the agriculture industry in 2004 to provide guidance to farmers on Conservation Management Practices (SJVAPCD 2004a, 2004b). Examples of Conservation Management Practices include activities that reduce or eliminate the need for soil disturbance, activities that protect soil from wind, dust suppressants, alternatives to burning agricultural wastes, and reduced travel speeds on unpaved roads and equipment yards. Lands not currently under cultivation or used for pasture are exempt from Rule 4550, other than recordkeeping to document the exemption. Fees vary depending on the size of the farm, and include an initial application fee, and a biennial renewal fee.

In addition to requirements for on-field agricultural practices, the SJVAPCD rules and regulations address avoidance of nuisance conditions (Rule 4102), prohibitions on opening burning (Rule 4103), and fugitive-dust control (Regulation VIII). Specifically, the SJVAPCD dust-control rules include Rule 8021 for control of $PM_{10}$ from construction, demolition, excavation, extraction, and other earth moving activities; Rule 8031 for control of $PM_{10}$ from handling and storage of bulk materials; Rule 8051 for control of $PM_{10}$ from disturbed open areas; Rule 8061 for control of $PM_{10}$ from travel on paved and unpaved roads; Rule 8071 for control of $PM_{10}$ from unpaved vehicle and equipment traffic areas; and Rule 8081 for off-field agricultural sources, such as bulk materials handling and transport and travel on unpaved roads. Each of these rules requires fugitive dust control, often through application of water, gravel, or chemical dust stabilizers.

#### *16.4.1.5 San Francisco Bay Area Air Basin*

The San Francisco Bay Area Air Basin consists of a single air district and nine counties, including: all of Napa, Marin, San Francisco, Contra Costa, Alameda, San Mateo, and Santa Clara counties; the southern portion of Sonoma County; and the southwestern portion of Solano County (ARB 2013a). The hills of the Coast Range bound the San Francisco and San Pablo bays and the inland valleys of the air basin. This air basin includes the San Francisco Bay Area Region of the study area.

The San Francisco Bay Area Air Basin includes the second largest urban area in California, hosting industry, airports, international ports, freeways, and surface streets. On-road vehicles are the largest source of smog-forming pollutants, and $PM_{10}$ emissions are primarily from area sources, such as fugitive dust from paved and unpaved roads and vehicle travel (ARB 2013a). Air quality in the San Francisco Bay Area is often good as sea breezes blow clean air from the Pacific Ocean into the air basin, but transport of pollutants from the San Francisco Bay

Area can exacerbate air quality problems in the downwind portions of the San Francisco Bay Area Air Basin; as well as in the Sacramento Valley and San Joaquin Valley air basins.

To characterize the existing ambient air quality for the San Francisco Bay Area Air Basin, data from area monitoring stations were reviewed (ARB 2011d). For the three years from 2007 to 2009, monitoring data indicated the following:

- Concentrations of $O_3$ and 24-hour $PM_{2.5}$ have exceeded the NAAQS and CAAQS.
- Concentrations of $PM_{10}$ exceeded the CAAQS in 2008 but were below the CAAQS in 2007 and 2009. Concentrations of $PM_{10}$ were below the NAAQS.
- Measured concentrations of CO and $NO_2$ have complied with the NAAQS and CAAQS.
- Monitored $SO_2$ concentrations are extremely low, and lead concentrations are monitored as part of the air toxics program.

In the time since ARB compiled the 2007 to 2009 air quality monitoring data reported above, no changes in air quality nonattainment designations have been recorded in the San Francisco Bay Region counties in this study (USEPA 2015; ARB 2014).

#### *16.4.1.6 North Central Coast Air Basin*

The North Central Coast Air Basin includes Santa Cruz, San Benito and Monterey counties (ARB 2013a). This air basin includes San Benito County which is located within the San Francisco Bay Area Region of the study area.

The North Central Coast Air Basin is in attainment for all NAAQS, and is designated as nonattainment for the State ozone and $PM_{10}$ standards (ARB 2014). Though separated by the Santa Cruz Mountains and Coast Ranges to the north, wind can transport air pollution from the San Francisco Bay Area Air Basin and contribute to elevated ozone concentrations in the area (ARB 2013a).

#### *16.4.1.7 South Central Coast Air Basin*

The South Central Coast Air Basin includes San Luis Obispo, Santa Barbara and Ventura counties. It is bordered by the Pacific Ocean on the south and west and lies just north of the highly populated South Coast Air Basin. This air basin includes the Central Coast Region and the northern Southern California Region of the study area.

Sources of pollutants in the air basin include power plants, oil production and refining, vehicle travel, and agricultural operations. San Luis Obispo, Santa Barbara, and Ventura counties are designated as nonattainment for the State ozone and $PM_{10}$ standards. Eastern San Luis Obispo and Ventura counties are designated as nonattainment for the Federal ozone standard (USEPA 2015). Wind patterns link Ventura and Santa Barbara counties, resulting in pollutant transport between the South Central Coast and South Coast air basins. San Luis Obispo County is separated from these counties by mountains, and the air quality in San Luis Obispo County is linked more with conditions in the San Francisco Bay Area Air Basin and San Joaquin Valley Air Basin. Additionally, air emissions from the South Coast Air Basin can be blown offshore, and then carried to the coastal cities of the South Central Coast Air Basin. Under some conditions, the reverse air flow can carry pollutants from the South Central Coast Air Basin to the South Coast Air Basin and contribute to ozone violations there (ARB 2013a).

#### *16.4.1.8 South Coast Air Basin*

The South Coast Air Basin is California's largest metropolitan region. The area includes the southern two-thirds of Los Angeles County, all of Orange County, and the western urbanized portions of Riverside and San Bernardino counties. The South Coast Air Basin is bounded by the Pacific Ocean on the west and by mountains on the other three sides. This air basin includes the western-central portion of the Southern California Region of the study area.

The area includes industry, airports, international ports, freeways, and surface streets. On-road vehicles are the largest source of smog-forming pollutants, and $PM_{10}$ emissions are primarily from area sources, such as fugitive dust from paved and unpaved roads and vehicle travel (ARB 2013a). One-third of the state's total criteria pollutant emissions are generated within the basin (ARB 2013a). The pollutant emissions and fugitive dust generated in the South Coast Air Basin affects other air basins. For example, fugitive dust generated in the South Coast Air Basin contributes to poor air quality in the Salton Sea Air Basin and the Coachella Valley portion of Riverside County (USGS 2014).

The persistent high pressure system and frequent low inversion heights caused by the surrounding mountains on three sides of the air basin trap pollutants in the air basin (ARB 2013a). Sunny weather contributes to smog formation. Portions of the South Coast Air Basin are designated as nonattainment for the Federal and State ozone, $PM_{10}$, and $PM_{2.5}$ standards (ARB 2014; USEPA 2015). Wind often transports air pollutants from the South Coast Air Basin to nearby air basins.

#### *16.4.1.9 Mojave Desert Air Basin*

The sparsely populated Mojave Desert Air Basin covers most of California's high desert and is made up of eastern Kern and Riverside counties and northern Los Angeles and San Bernardino counties. The San Gabriel and San Bernardino mountains lie to the south, separating the Mojave Desert Air Basin from the South Coast Air Basin. To the northwest, the Tehachapi Mountains separate the Mojave Desert Air Basin from the San Joaquin Valley Air Basin. This air basin includes the southeastern portion of the Central Valley Region and the northeastern portion of the Southern California Region of the study area.

The primary sources of air pollution in the air basin are military bases, highways, railroads, cement manufacturing, and mineral processing (ARB 2013a). The Mojave Desert Air Basin also is affected by air quality conditions in the San Joaquin Valley and South Coast air basins. Air from the South Coast Air Basin is transported over the San Gabriel Mountains, heavily impacting the areas of the Mojave Desert Air Basin located to the north of the South Coast Air Basin.

The Mojave Desert Air Basin also is located downwind of the San Joaquin Valley Air Basin; and the winds pass through the Tehachapi Mountains carrying air emissions from the San Joaquin Valley Air Basin. Due to the impacts from the South Coast Air Basin, the worst air quality in the Mojave Desert Air Basin is along the southern edge that borders the South Coast Air Basin. This is also where most of the population within the Mojave Desert Air Basin is located (ARB 2013a).

Portions of the Mojave Desert Air Basin are designated as nonattainment for the Federal and State ozone and $PM_{10}$ standards (ARB 2014; USEPA 2015).

#### *16.4.1.10 San Diego Air Basin*

The San Diego Air Basin is in the southwest corner of California and comprises all of San Diego County. This air basin includes the southwestern portion of the Southern California Region of the study area.

The population and emissions are concentrated in the western portion of the air basin, which is bordered on the west by the Pacific Ocean. The climate is relatively mild near the ocean, with higher temperatures and seasonal variations further inland (ARB 2013a).

The air basin includes industrial facilities, airports, an international port, freeways, and surface streets. The San Diego Air Basin is designated as nonattainment for the Federal ozone standard and the State ozone, $PM_{10}$, and $PM_{2.5}$ standards (ARB 2014). Air quality in the San Diego Air Basin is impacted not only by local emission sources, but also from transport of air emissions from the South Coast Air Basin and Mexico.

#### *16.4.1.11 Salton Sea Air Basin*

The Salton Sea Air Basin is in the southeast corner of California and includes all of Imperial County and central Riverside County. The air basin is characterized by flat terrain and the Salton Sea surrounded by high mountains to the west, north, and east. The southern portion of the air basin extends towards the Gulf of California. The flat terrain and strong temperature differentials created by intense heating and cooling patterns produce moderate winds and deep thermal circulation systems which disperse local air emissions (DWR 2006). This air basin includes the northeastern portion of the Southern California Region of the study area.

The primary sources of air pollution are from vehicles and equipment exhaust and particulate matter from disturbed soils and wind erosion. The Salton Sea Air Basin is designated as nonattainment for the Federal and State ozone and $PM_{10}$ standards (ARB 2014; USEPA 2015). Portions of the Salton Sea Air Basin located outside of the study area near Calexico also are in nonattainment for $PM_{2.5}$ standards.

## 16.4.2 Existing Greenhouse Gases and Emissions Sources

This subsection presents an overview of the greenhouse effect and climate change, and potential sources of GHG emissions and information related to climate change and GHG emissions in California. GHG emissions and their climate-related impacts are not limited to specific geographic locations, but occur on global or regional scales. GHG emissions contribute cumulatively to the overall heat-trapping capability of the atmosphere, and the effects of the warming, such as climate change, are manifested in different ways across the planet.

### *16.4.2.1 Greenhouse Gas Emissions Regulations and Analyses*

Global warming is the name given to the increase in the average temperature of the Earth's near-surface air and oceans since the mid-20th century and its projected continuation. Warming of the climate system is now considered to be unequivocal (DWR 2010) with global surface temperature increasing approximately 1.33°F over the last one hundred years. Continued warming is projected to increase global average temperature between 2 and 11 degrees Fahrenheit (°F) over the next one hundred years.

The causes of this warming have been identified as both natural processes and as the result of human actions. The Intergovernmental Panel on Climate Change (IPCC) concludes that variations in natural phenomena such as solar radiation and volcanoes produced most of the warming from pre-industrial times to 1950 and had a small cooling effect afterward. However, after 1950, increasing GHGs concentrations resulting from human activity such as fossil fuel burning and deforestation have been responsible for most of the observed temperature increase. These basic conclusions have been endorsed by more than 45 scientific societies and academies of science, including all of the national academies of science of the major industrialized countries.

Increases in GHG concentrations in the Earth's atmosphere are thought to be the main cause of human-induced climate change. GHGs naturally trap heat by impeding the exit of solar radiation that has hit the Earth and is reflected back into space. Some GHGs occur naturally and are necessary for keeping the Earth's surface inhabitable. However, increases in the concentrations of these gases in the atmosphere during the last hundred years have decreased the amount of solar radiation that is reflected back into space, intensifying the natural greenhouse effect and resulting in the increase of global average temperature (DWR 2010).

The principal GHGs considered in this EIS are $CO_2$, $CH_4$, $N_2O$, $SF_6$, PFC, and HFC, in accordance with the California Health and Safety Code section 38505(g) (DWR 2010). Each of the principal GHGs has a long atmospheric lifetime (one year to several thousand years). In addition, the potential heat-trapping ability of each of these gases varies significantly from one another, and also vary over time. For example, $CH_4$ is 25 times as potent as $CO_2$; while $SF_6$ is 32,800 times more potent than $CO_2$ with a 100-year time horizon (IPCC 2007).

The primary man-made processes that release these gases include: burning of fossil fuels for transportation, heating and electricity generation; agricultural practices that release $CH_4$, such as livestock grazing and crop residue decomposition; and industrial processes that release smaller amounts of high global warming potential gases such as $SF_6$, PFCs, and HFCs (DWR 2010). Deforestation and land cover conversion have also been identified as contributing to global warming by reducing the Earth's capacity to remove $CO_2$ from the air and altering the Earth's albedo or surface reflectance, allowing more solar radiation to be absorbed.

#### *16.4.2.2 An Overview of the Greenhouse Effect*

The greenhouse effect is a natural phenomenon that is essential to keeping the Earth's surface warm (DWR 2010). Like a greenhouse window, GHGs allow sunlight to enter and then prevent heat from leaving the atmosphere. Solar radiation enters the Earth's atmosphere from space. A portion of this radiation is reflected by particles in the atmosphere back into space, and a portion is absorbed by the Earth's surface and emitted back into space. The portion absorbed by the Earth's surface and emitted back into space is emitted as lower-frequency infrared radiation. This infrared radiation is absorbed by various GHGs present in the atmosphere. While these GHGs are transparent to the incoming solar radiation, they are effective at absorbing infrared radiation emitted by the Earth's surface. Therefore, some of the lower-frequency infrared radiation emitted by the Earth's surface is retained in the atmosphere, creating a warming of the atmosphere.

##### 16.4.2.2.1 Global Climate Trends and Associated Impacts

The rate of increase in global average surface temperature over the last hundred years has not been consistent (DWR 2010). The last three decades have warmed at a much faster rate than the previous seven decades – on average 0.32°F per decade. Eleven of the twelve years from 1995 to 2006, rank among the twelve warmest years in the instrumental record of global average surface temperature since 1850.

Increased global warming has occurred concurrent with many other changes have occurred in other natural systems (DWR 2010). Global sea levels have risen on average 1.8 millimeters per year; precipitation patterns throughout the world have shifted, with some areas becoming wetter and other drier; tropical storm activity in the North Atlantic has increased; peak runoff timing of many glacial and snow fed rivers has shifted earlier; as well as numerous other observed conditions. Though it is difficult to prove a definitive cause and effect relationship between global warming and other observed changes to natural systems, there is high confidence in the scientific community that these changes are a direct result of increased global temperatures.

##### 16.4.2.2.2 Overview of Greenhouse Gas Emission Sources

Naturally occurring GHGs include water vapor, $CO_2$, methane, and nitrous oxide. Water vapor is introduced to the atmosphere from oceans and the natural biosphere. Water vapor introduced directly to the atmosphere from agricultural or other activities is not long lived, and thus does not contribute substantially to a warming effect (NAS 2005). Carbon and nitrogen contained in $CO_2$, methane, and nitrous oxide naturally cycle from gaseous forms to organic biomass through processes such as plant and animal respiration and seasonal cycles of plant growth and decay (USEPA 2012). Although naturally occurring, the emissions and sequestration of these gases are also influenced by human activities, and in some cases, are caused by human activities (anthropogenic). In addition to these GHGs, several classes of halogenated substances that contain fluorine, chlorine, or bromine also contribute to the greenhouse effect. However, these compounds are the product of industrial activities for the most part.

Each of the GHGs has a different capacity to trap heat in the atmosphere, with some of these gases being more effective at trapping heat than others. For calculating emissions, ARB (ARB 2007) uses a metric developed by the IPCC to account for these differences and to provide a standard basis for calculations. The metric, called the global warming potential (GWP), is used to compare the future climate impacts of emissions of various long-lived GHGs. The GWP of each GHG is indexed to the heat-trapping capability of $CO_2$, and allows comparison of the global warming influence of each GHG relative to $CO_2$. The GWP is used to translate emissions of each GHG to emissions of carbon dioxide equivalents, or $CO_2e$. In this way, emissions of various GHGs can be summed, and total GHG emissions can be inventoried in common units of metric tons per year of $CO_2e$. Most international inventories, including the United States inventory, use GWP values from the IPCC Fourth Assessment Report, per international consensus (IPCC 2007; USEPA 2012).

$CO_2$ is a byproduct of burning fossil fuels and biomass, as well as land-use changes and other industrial processes (USEPA 2012). It is the principal anthropogenic GHG that contributes to the Earth's radiative balance, and it represents the dominant portion of GHG emissions from activities that result from the combustion of fossil fuels (e.g., construction activities, electrical generation, and transportation).

#### *16.4.2.3 California Climate Trends and Greenhouse Gas Emissions*

Maximum (daytime) and minimum (nighttime) temperatures are increasing almost everywhere in California but at different rates. The annual minimum temperature averaged over all of California has increased 0.33°F per decade during the period 1920 to 2003, while the average annual maximum temperature has increased 0.1°F per decade (DWR 2010).

With respect to California's water resources, the most significant impacts of global warming have been changes to the water cycle and sea level rise. Over the past century, the precipitation mix between snow and rain has shifted in favor of more rainfall and less snow, and snow pack in the Sierra Nevada is melting earlier in the spring (DWR 2010). The average early spring snowpack in the Sierra Nevada has decreased by about 10 percent during the last century, a loss of 1.5 million acre-feet of snowpack storage. These changes have significant implications for water supply, flooding, aquatic ecosystems, energy generation, and recreation throughout the state.

During the same period, sea levels along California's coast have risen. The Fort Point tide gauge in San Francisco was established in 1854 and is the longest continually monitored gauge in the United States. Sea levels measured at this gauge and two other west coast gauges indicate that the sea levels have risen at an average rate of about 7.9 inches/century (0.08 inch/year) over the past 150 years (BCDC 2011). Continued sea level rise associated with global warming may threaten coastal lands and infrastructure, increase flooding at the mouths of rivers, place additional stress on levees in the Sacramento-San Joaquin Delta, and intensify the difficulty of managing the Sacramento-San Joaquin Delta as the heart of the state's water supply system (DWR 2010).

#### 16.4.2.3.1 Potential Effects of Global Climate Change in California

Warming of the atmosphere has broad implications for the environment. In California, one of the effects of climate change could be increases in temperature that could affect the timing and quantity of precipitation. California receives most of its precipitation in the winter months, and a warming environment would raise the elevation of snow pack and result in reduced spring snowmelt and more winter runoff. These effects on precipitation and water storage in the snow pack could have broad implications on the environment in California.

The following are some of the potential effects of a warming climate in California (California Climate Change Portal 2007):

- Loss of snowpack storage will cause increased winter runoff that generally would not be captured and stored because of the need to reserve flood capacity in reservoirs during the winter.
- Less spring runoff would mean lower early summer storage at major reservoirs, which would result in less hydroelectric power production.
- Higher temperatures and reduced snowmelt would compound the problem of providing suitable cold water habitat for salmonid species. Lower reservoir levels would also contribute to this problem, reducing the flexibility of cold water releases.
- Sea level rise would affect the Delta, worsening existing levee problems, causing more saltwater intrusion, and adversely affecting many coastal marshes and wildlife reserves. Release of water to streams to meet water quality requirements could further reduce storage levels.
- Increased temperatures would increase the agricultural demand for water and increase the level of stress on native vegetation, potentially allowing for an increase in pest and insect epidemics and a higher frequency of large, damaging wildfires.

Future climate scenarios have also been evaluated in the U.S. Global Change Research Program National Climate Assessments. The most recent assessment, *Climate Change Impacts in the United States*, was released in May 2014 (USGCRP 2014). For the Southwest Region of the United States, the report projects that water supply availability would be reduced as compared to recent conditions due to reduced snowpack and declining stream flows. Rising temperatures in the future would increase disruptions to electricity generation which could further reduce water availability. The National Climate Assessment also indicates that mitigation policies and other factors have lowered the United States' nationwide GHG emissions in recent years; however, substantial global emissions reductions are needed to avoid many of the predicted consequences. A considerable amount of planning for resilience and adaptation is underway, but implementation of adaptive measures have been limited in scope.

#### 16.4.2.3.2 Current California Emission Sources

The recent California's GHG emission inventory was released on April 6, 2012, with data updated through October 2011. The GHG emissions in California have been estimated for each year from 2000 to 2009, and are reported for several large sectors of emission sources. The estimates for 2009 are summarized in Table 16.4, reported by sector as millions of tons per year of $CO_2$ (ARB 2011e).

**Table 16.4 California Greenhouse Gas Emissions by Sector in 2009**

| Sector | Total Emissions (million tons/year of $CO_2e$) | Percent of Statewide Total Gross Emissions[a] |
|---|---|---|
| Agriculture | 32.1 | 7 |
| Commercial and Residential | 43 | 9.4 |
| Electric Power | 103.6 | 22.7 |
| Forestry (excluding $CO_2$ sinks) | 0.2 | < 1.0 |
| Industrial | 81.4 | 17.8 |
| Recycling and Waste | 7.3 | 1.6 |
| Transportation | 172.9 | 37.9 |
| High Global Warming Potential substance and ozone-depleting substance use[b] | 16.3 | 3.6 |
| **Total** | **456.8** | **100** |
| Forestry Net Emissions | -3.8 | – |

Source: ARB 2011e.

Notes:

a. Based on the 456.8 million tons/year of $CO_2e$ Total Gross Emissions estimate.

b. High Global Warming Potential substance and ozone-depleting substance use are not attributed to an individual sector.

Total gross statewide GHG emissions in 2009 were estimated to be 456.8 million tons per year of $CO_2e$. The two largest sectors contributing to emissions in California are transportation and electric power (the latter sector includes both in-state generation and imported electricity). The agricultural sector represents only 7 percent of the total gross statewide emissions.

The agricultural sector includes manure management, enteric fermentation, agricultural residue burning, and soils management. The forestry sector contributes to overall emissions, but is a net sink of emissions.

The California Global Warming Solutions Act of 2006 (California Assembly Bill 32) requires California to reduce statewide emissions to 1990 levels by 2020.

In December 2007, ARB adopted an emission limit for 2020 of 427 million tons per year of $CO_2$e. Increases in the stateside renewable energy portfolio and reductions in importation of coal-based electrical power will contribute to meeting California's near-term GHG emission reduction goals. The ARB estimates that a reduction of 169 million metric tons net $CO_2$e emissions below business-as-usual would be required by 2020 to meet the 1990 levels (ARB 2007). This amounts to approximately a 30 percent reduction from projected "business-as-usual" levels in 2020.

# 16.5 Impact Analysis

This section describes the potential mechanisms and analytical methods for change in air quality and GHG emissions; results of the impact analysis; potential mitigation measures; and cumulative effects.

## 16.5.1 Potential Mechanisms for Change and Analytical Methods

As described in Chapter 4, Approach to Environmental Analysis, the impact analysis considers changes in air quality and GHG emissions related to changes in CVP and SWP operations under the alternatives as compared to the No Action Alternative and Second Basis of Comparison.

Changes in CVP and SWP operations under the alternatives as compared to the No Action Alternative and Second Basis of Comparison could directly or indirectly change air quality and GHG emissions due to use of engines or electricity that operate groundwater wells, changes in cropping patterns, or odor emissions.

### *16.5.1.1 Changes in Emissions of Criteria Air Pollutants and Precursors, and/or Exposure of Sensitive Receptors to Substantial Concentrations of Air Contaminants*

Changes in CVP and SWP operations under the alternatives could change the use of individual engines to operate groundwater wells. The CVHM model is used to evaluate changes in groundwater conditions in the Central Valley, as described in Chapter 7, Groundwater Resources and Groundwater Quality. To evaluate the potential for changes in emissions of criteria air pollutants and precursors, and/or exposure of sensitive receptors to substantial concentrations of air contaminants, results from the CVHM model that indicate changes in groundwater withdrawals due to changes in CVP and SWP operations. However, it is not known how many of the groundwater pumps use electricity and how many use diesel engines. The diesel engines have the potential to emit criteria air pollutants and precursors, and toxic air contaminants.

Most of the groundwater wells in the Central Valley use electrical pumps. As reported in a recent environmental assessment, approximately 14 to 15 percent of the pumps used diesel fuel in 2003 (Reclamation 2013a). It is assumed for this EIS, that the portion of groundwater pumps that use electricity would remain approximately at 85 percent. Therefore, it is assumed that increases or decreases in groundwater pumping would be indicative of an increase or decrease in the use of diesel engines in the Central Valley as well as in the San Francisco Bay Area, Central Coast, and Southern California regions. Changes in CVP and SWP operations would not result in changes in groundwater pumping in the Trinity River Region; therefore, this analysis does not address Trinity River Region.

#### *16.5.1.2 Changes in Exposure of Sensitive Receptors to Particulate Matter*

Changes in CVP and SWP operations under the alternatives could change the potential for dust generation on irrigated lands that would be idled due to reduced CVP and SWP water supplies. However, as described in Chapter 12, Agricultural Resources, irrigated acreage under Alternatives 1 through 5 would be similar to irrigated acreage under both the No Action Alternative and the Second Basis of Comparison. Therefore, there would be no change in potential for dust generation. Therefore, these changes are not analyzed in this EIS.

#### *16.5.1.3 Changes in Exposure of Sensitive Receptors to Odor Emissions from Wetlands*

Restoration of seasonal floodplains and tidally-influenced wetlands could result in additional odors at surrounding sensitive receptors near the restoration locations. However, these actions would occur in a similar manner under the No Action Alternative, Alternatives 1 through 5, and Second Basis of Comparison, as described in Chapter 3, Description of Alternatives. Therefore, odor emissions would be the same under all of the alternatives and the Second Basis of Comparison. Therefore, this change is not analyzed in this EIS.

#### *16.5.1.4 Changes in GHG Emissions due to Changes in Energy Generation or Use*

Changes in CVP and SWP operations under the alternatives could change CVP and SWP energy generation and use, and the associated GHG emissions. In addition, operational changes could also affect the use of energy by CVP and SWP water users through the implementation of regional and local alternative water supplies, such as recycling or desalination. When CVP and SWP water deliveries decline, CVP and SWP net energy generation changes; and water users are anticipated to increase use of groundwater, recycled water, and/or desalinated water from existing facilities or facilities that are reasonably foreseeable to be constructed by 2030. When CVP and SWP water deliveries increase, CVP and SWP net energy generation would change; and water users are anticipated to reduce use of alternate water supplies either due to economic considerations or to allow the amount of stored water to increase under a conjunctive use pattern. It is not known whether the changes in CVP and SWP net energy generation would be similar to the changes in energy use for alternate regional and local water supplies.

Changes in the timing and magnitude of net CVP and SWP hydropower generation would result in changes in GHG emissions. Increased net CVP and SWP hydropower generation would reduce the need for electricity generated through fossil fuel combustion, and would avoid the GHG emissions that would result from fossil fuel use. In comparison, reduced hydroelectric generation would increase the need for other types of electricity production, including electricity generated from fossil fuels, with the result that GHG emissions would increase.

Potential changes in GHG emissions due to changes in CVP and SWP energy generation or use, and the evaluation of potential for changes in use of energy by CVP and SWP water users to implement alternative water supplies, are analyzed broadly and qualitatively across the overall study area. Some of the changes in energy use and generation will occur across the CVP and SWP system, others may require additional energy resources. Specific locations of the energy sources and users have not been defined.

##### *16.5.1.5 Effects due to Cross Delta Water Transfers*

Historically water transfer programs have been developed on an annual basis. The demand for water transfers is dependent upon the availability of water supplies to meet water demands. Water transfer transactions have increased over time as CVP and SWP water supply availability has decreased, especially during drier water years.

Parties seeking water transfers generally acquire water from sellers who have available surface water who can make the water available through releasing previously stored water, pump groundwater instead of using surface water (groundwater substitution); idle crops; or substitute crops that uses less water in order to reduce normal consumptive use of surface water.

Water transfers using CVP and SWP Delta pumping plants and south of Delta canals generally occur when there is unused capacity in these facilities. These conditions generally occur during drier water year types when the flows from upstream reservoirs plus unregulated flows are adequate to meet the Sacramento Valley water demands and the CVP and SWP export allocations. In non-wet years, the CVP and SWP water allocations would be less than full contract amounts; therefore, capacity may be available in the CVP and SWP conveyance facilities to move water from other sources.

Projecting future air quality conditions related to water transfer activities is difficult because specific water transfer actions required to make the water available, convey the water, and/or use the water would change each year due to changing hydrological conditions, CVP and SWP water availability, specific local agency operations, and local cropping patterns. Reclamation recently prepared a long-term regional water transfer environmental document which evaluated potential changes in conditions related to water transfer actions (Reclamation

2014c). Results from this analysis were used to inform the impact assessment of potential effects of water transfers under the alternatives as compared to the No Action Alternative and the Second Basis of Comparison.

### 16.5.2 Conditions in Year 2030 without Implementation of Alternatives 1 through 5

This EIS includes two bases of comparison, as described in Chapter 3, Description of Alternatives: the No Action Alternative and the Second Basis of Comparison. Both of these bases are evaluated at 2030 conditions. Changes that would occur over the next 15 years without implementation of the alternatives are not analyzed in this EIS. However, the changes to air quality that are assumed to occur by 2030 under the No Action Alternative and the Second Basis of Comparison are summarized in this section. Many of the changed conditions would occur in the same manner under both the No Action Alternative and the Second Basis of Comparison.

#### *16.5.2.1 Common Changes in Conditions under the No Action Alternative and Second Basis of Comparison*

Conditions in 2030 would be different than existing conditions due to:

- Climate change and sea level rise
- General plan development throughout California, including increased water demands in portions of Sacramento Valley
- Implementation of reasonable and foreseeable water resources management projects to provide water supplies

It is anticipated that climate change would result in warmer temperatures, more short-duration high-rainfall events, and less snowpack in the winter and early spring months. The reservoirs would be full more frequently by the end of April or May by 2030 than in recent historical conditions. However, as the water is released in the spring, there would be less snowpack to refill the reservoirs. This condition would reduce reservoir storage and available water supplies to downstream uses in the summer. The reduced end of September storage also would reduce the ability to release stored water to downstream regional reservoirs. These conditions would occur for all reservoirs in the California foothills and mountains, including non-CVP and SWP reservoirs.

These changes would result in a decline of the long-term average CVP and SWP water supply deliveries by 2030 as compared to recent historical long-term average deliveries under the No Action Alternative and the Second Basis of Comparison. However, the CVP and SWP water deliveries would be less under the No Action Alternative as compared to the Second Basis of Comparison, as described in Chapter 5, Surface Water Resources and Water Supplies, which could result in more crop idling which could result in increased dust generation.

Under the No Action Alternative and the Second Basis of Comparison, land uses in 2030 would occur in accordance with adopted general plans. Development under the general plans would be required to be implemented in accordance with adopted air quality management plans.

The No Action Alternative and the Second Basis of Comparison assumes completion of water resources management and environmental restoration projects that would have occurred without implementation of Alternatives 1 through 5, including regional and local recycling projects, surface water and groundwater storage projects, conveyance improvement projects, and desalination projects. These projects would increase energy demand and could be associated with increases in indirect greenhouse gas emissions.

By 2030, more efficient energy use, increases in renewable energy production, and energy conservation are also anticipated to reduce future GHG emissions rates.

Under the No Action Alternative and the Second Basis of Comparison, there are several major variables with varying degrees of uncertainty. These variables include future population growth in the air basins, the extent and emissivity of various emissions sources from existing and future activities, and the success of the local jurisdictions and others in implementing effective air emissions control measures. It is assumed that air quality in 2030 will be similar to the conditions described in the Affected Environment even with population growth because the current air quality management plans were developed with consideration of future growth by at least 2030. It is anticipated that the non-attainment areas will reduce the contaminants to a level of attainment in accordance with adopted air quality management plans. In addition, it is assumed that the California Renewables Portfolio Standard (RPS) will be implemented by 2020. The RPS was established in accordance with California Senate Bill 1078 in 2002, Senate Bill 107 in 2006, and Senate Bill 2 in 2011 to require investor-owned utilities, electric service providers, and community-choice aggregators (e.g., local agencies that purchase or generate electricity for their community) to provide at least 33 percent of their total energy procurement from renewable energy sources by 2020.

Increased groundwater use and related groundwater elevation reductions could occur due to reduction in CVP and SWP water supplies. The increased pumping would increase demand for electricity, and could result indirectly in increases in greenhouse gas emissions. As described above, approximately 15 percent of groundwater pumps rely upon diesel fuels. Increased groundwater pumping could result in increased emissions of criteria air pollutants and precursors, and/or exposure of sensitive receptors to substantial concentrations of air contaminants from increased use of diesel engines.

The No Action Alternative and the Second Basis of Comparison would include restoration of more than 10,000 acres of intertidal and associated subtidal wetlands in Suisun Marsh and Cache Slough; and 17,000 to 20,000 acres of seasonal floodplain restoration in Yolo Bypass. Operation of wetlands restoration projects could result in periodic odors due to anaerobic decomposition of organic matter in portions of the wetlands. As a result, odorous compounds, such as ammonia and hydrogen sulfide, are generated and may be released into the environment. Marshes and wetlands can also be a source of odors during some time periods when ponds or shallow water areas undergo algal or vegetative growth. Marshes, wetlands, shallow water areas, or canals may require periodic maintenance to inhibit algal or vegetative growth, and avoid conditions conducive to anaerobic digestion. The occurrence and severity of odor impacts depend on numerous factors, including the nature, frequency, and intensity of the source; wind speed and direction; and the presence of sensitive receptors. Although odors rarely cause any physical harm, they can still be unpleasant to some individuals.

## 16.5.3 Evaluation of Alternatives

Alternatives 1 through 5 have been compared to the No Action Alternative; and the No Action Alternative and Alternatives 1 through 5 have been compared to the Second Basis of Comparison.

During review of the numerical modeling analyses used in this EIS, an error was determined in the CalSim II model assumptions related to the Stanislaus River operations for the Second Basis of Comparison, Alternative 1, and Alternative 4 model runs. Appendix 5C includes a comparison of the CalSim II model run results presented in this chapter and CalSim II model run results with the error corrected. Appendix 5C also includes a discussion of changes in the comparison of groundwater conditions for the following alternative analyses.

- No Action Alternative compared to the Second Basis of Comparison
- Alternative 1 compared to the No Action Alternative
- Alternative 3 compared to the Second Basis of Comparison
- Alternative 5 compared to the Second Basis of Comparison

### *16.5.3.1 No Action Alternative*

The No Action Alternative is compared to the Second Basis of Comparison.

#### 16.5.3.1.1 Central Valley Region

*Changes in Emissions of Criteria Air Pollutants and Precursors, and/or Exposure of Sensitive Receptors to Substantial Concentrations of Air Contaminants Related to Changes in Groundwater Pumping*

As described in Chapter 7, Groundwater Resources and Groundwater Quality, groundwater pumping in the San Joaquin Valley portion of the Central Valley Region would increase by 8 percent under the No Action Alternative as compared to the Second Basis of Comparison. It is not known if the additional groundwater pumping would rely upon electricity or diesel to drive the pump engines. Under the worst case analysis, it is assumed that the increased use of diesel engines would be proportional to the increased use of groundwater. Therefore, under the No Action Alternative, there would be a potential increase in emissions of criteria air pollutants and precursors, and/or exposure of sensitive receptors to substantial concentrations of air contaminants as compared to the Second Basis of Comparison.

*Effects Related to Cross Delta Water Transfers*

Potential effects to air quality could be similar to those identified in a recent environmental analysis conducted by Reclamation for long-term water transfers from the Sacramento to San Joaquin valleys (Reclamation 2014c). Potential effects to air quality were identified as increased emissions of air pollutants due to the use of diesel engines for groundwater pumps that were used to provide transfer water through groundwater substitution programs. The analysis indicated that the effects could be reduced to avoid substantial impacts through the use of electric engines or reducing the amount of groundwater substitution. Other identified effects were considered to be not substantial or beneficial as related to crop idling to provide transfer water in the seller's service area; and reduction of groundwater pumping that could use diesel engines or dust generation from crop idled lands in the purchaser's service area.

Under the No Action Alternative, the timing of cross Delta water transfers would be limited to July through September and include annual volumetric limits, in accordance with the 2008 USFWS BO and 2009 NMFS BO. Under the Second Basis of Comparison, water could be transferred throughout the year without an annual volumetric limit. Overall, the potential for cross Delta water transfers would be less under the No Action Alternative than under the Second Basis of Comparison.

#### 16.5.3.1.2 San Francisco Bay Area, Central Coast, and Southern California Regions

*Changes in Emissions of Criteria Air Pollutants and Precursors, and/or Exposure of Sensitive Receptors to Substantial Concentrations of Air Contaminants Related to Changes in Groundwater Pumping*

It is anticipated that CVP and SWP water supplies would be decreased by 10 percent and 18 percent, respectively, in the San Francisco Bay Area, Central Coast, and Southern California regions under No Action Alternative as compared to the Second Basis of Comparison. The decrease in surface water supplies could result in additional use of groundwater pumps and emissions of air pollutants and contaminants if the use of diesel engines is also increased.

#### 16.5.3.1.3 Overall Study Area

*Changes in GHG Emissions due to Changes in Energy Generation or Use*

As described in Chapter 8, Energy, changes in CVP and SWP operations under the No Action Alternative as compared to the Second Basis of Comparison would result in a reduction of CVP and SWP water deliveries to areas located south of the Delta; and therefore, annual energy use for conveyance would decline. CVP annual net generation would be similar; and SWP net energy generation would increase which could result indirectly in less GHG emissions if the hydropower generation replaces fossil fuel generation.

In addition to changes in CVP and SWP energy generation and use and the associated GHG emissions, CVP and SWP operations under the No Action Alternative as compared to the Second Basis of Comparison could potentially increase use of energy by CVP and SWP water users to implement regional and local alternate water supplies, such as increased groundwater pumping and use of recycled water treatment plants and desalination water treatment plants. These facilities would require energy which could result in increased GHG emissions.

### *16.5.3.2 Alternative 1*

Alternative 1 is identical to the Second Basis of Comparison. Alternative 1 is compared to the No Action Alternative and the Second Basis of Comparison. However, because CVP and SWP operations conditions under Alternative 1 are identical to conditions under the Second Basis of Comparison; Alternative 1 is only compared to the No Action Alternative.

#### 16.5.3.2.1 Alternative 1 Compared to the No Action Alternative

*Central Valley Region*

*Changes in Emissions of Criteria Air Pollutants and Precursors, and/or Exposure of Sensitive Receptors to Substantial Concentrations of Air Contaminants Related to Changes in Groundwater Pumping*

Groundwater pumping in the San Joaquin Valley portion of the Central Valley Region would decrease by 8 percent under Alternative 1 as compared to the No Action Alternative. It is not known if the reduction in groundwater pumping would result in a reduction of the use of electricity or diesel to drive the pump engines. For this analysis, it is assumed that the decreased use of diesel engines would be proportional to the decreased use of groundwater. Therefore, under Alternative 1, there would be a potential decrease in emissions of criteria air pollutants and precursors, and/or exposure of sensitive receptors to substantial concentrations of air contaminants as compared to the No Action Alternative.

*Effects Related to Cross Delta Water Transfers*

Potential effects to air quality could be similar to those identified in a recent environmental analysis conducted by Reclamation for long-term water transfers from the Sacramento to San Joaquin valleys (Reclamation 2014c) as described above under the No Action Alternative compared to the Second Basis of Comparison. For the purposes of this EIS, it is anticipated that similar conditions would occur during implementation of cross Delta water transfers under Alternative 1 and the No Action Alternative, and that impacts on air quality would not be substantial due to implementation requirements of the transfer programs.

Under Alternative 1, water could be transferred throughout the year without an annual volumetric limit. Under the No Action Alternative, the timing of cross Delta water transfers would be limited to July through September and include annual volumetric limits, in accordance with the 2008 USFWS BO and 2009 NMFS BO. Overall, the potential for cross Delta water transfers would be increased under Alternative 1 as compared to the No Action Alternative.

*San Francisco Bay Area, Central Coast, and Southern California Regions*

*Changes in Emissions of Criteria Air Pollutants and Precursors, and/or Exposure of Sensitive Receptors to Substantial Concentrations of Air Contaminants Related to Changes in Groundwater Pumping*

It is anticipated that CVP and SWP water supplies would be increased by 11 percent and 21 percent, respectively, in the San Francisco Bay Area, Central Coast, and Southern California regions under Alternative 1 as compared to the No Action Alternative. The increase in surface water supplies could result in the reduction in use of groundwater pumps and emissions of air pollutants and contaminants if the use of diesel engines is also decreased.

*Overall Study Area*

*Changes in GHG Emissions due to Changes in Energy Generation or Use*

As described in Chapter 8, Energy, changes CVP and SWP operations under Alternative 1 as compared to the No Action Alternative would result in an increase of CVP and SWP water deliveries to areas located south of the Delta; and therefore, annual energy use for conveyance would increase. CVP annual net generation would be similar, and SWP annual net generation would be decrease over the long-term average conditions. This could result in increased GHG emissions if fossil fuel generation replaces hydropower generation.

In addition to changes in CVP and SWP energy generation and use, and the associated GHG emissions, CVP and SWP operations under Alternative 1 as compared to the No Action Alternative could potentially decrease the use of energy by CVP and SWP water users due to less need to implement regional and local alternative water supplies, such as increased groundwater pumping and use of recycled water treatment plants and desalination water treatment plants. As the need for alternative water supplies is decreased, the associated energy demand and indirect GHG emissions would also be decreased under Alternative 1 as compared to the No Action Alternative.

#### 16.5.3.2.2 Alternative 1 Compared to the Second Basis of Comparison

Alternative 1 is identical to the Second Basis of Comparison.

### *16.5.3.3 Alternative 2*

The CVP and SWP operations under Alternative 2 are identical to the CVP and SWP operations under the No Action Alternative, as described in Chapter 3, Description of Alternatives; therefore, Alternative 2 is only compared to the Second Basis of Comparison.

#### 16.5.3.3.1 Alternative 2 Compared to the Second Basis of Comparison

The CVP and SWP operations under Alternative 2 are identical to the CVP and SWP operations under the No Action Alternative. Therefore, changes to air quality and GHG emission conditions under Alternatives 2 as compared to the Second Basis of Comparison would be the same as the impacts described in Section 16.5.3.1, No Action Alternative.

#### *16.5.3.4 Alternative 3*

As described in Chapter 3, Description of Alternatives, CVP and SWP operations under Alternative 3 are similar to the Second Basis of Comparison with modified Old and Middle River flow criteria and New Melones Reservoir operations. As described in Chapter 4, Approach to Environmental Analysis, Alternative 3 is compared to the No Action Alternative and the Second Basis of Comparison.

##### 16.5.3.4.1 Alternative 3 Compared to the No Action Alternative

*Central Valley Region*

*Changes in Emissions of Criteria Air Pollutants and Precursors, and/or Exposure of Sensitive Receptors to Substantial Concentrations of Air Contaminants Related to Changes in Groundwater Pumping*

Groundwater pumping in the San Joaquin Valley portion of the Central Valley Region would decrease by 6 percent under Alternative 3 as compared to the No Action Alternative. It is not known if the reduction in groundwater pumping would result in a reduction of the use of electricity or diesel to drive the pump engines. For this analysis, it is assumed that the decreased use of diesel engines would be proportional to the decreased use of groundwater. Therefore, under Alternative 3, there would be a potential decrease in emissions of criteria air pollutants and precursors, and/or exposure of sensitive receptors to substantial concentrations of air contaminants as compared to the No Action Alternative.

*Effects Related to Cross Delta Water Transfers*

Potential effects to air quality could be similar to those identified in a recent environmental analysis conducted by Reclamation for long-term water transfers from the Sacramento to San Joaquin valleys (Reclamation 2014c) as described above under the No Action Alternative compared to the Second Basis of Comparison. For the purposes of this EIS, it is anticipated that similar conditions would occur during implementation of cross Delta water transfers under Alternative 3 and the No Action Alternative, and that impacts on air quality would not be substantial due to implementation requirements of the transfer programs.

Under Alternative 3, water could be transferred throughout the year without an annual volumetric limit. Under the No Action Alternative, the timing of cross Delta water transfers would be limited to July through September and include annual volumetric limits, in accordance with the 2008 USFWS BO and 2009 NMFS BO. Overall, the potential for cross Delta water transfers would be increased under Alternative 3 as compared to the No Action Alternative.

*San Francisco Bay Area, Central Coast, and Southern California Regions*

*Changes in Emissions of Criteria Air Pollutants and Precursors, and/or Exposure of Sensitive Receptors to Substantial Concentrations of Air Contaminants Related to Changes in Groundwater Pumping*

It is anticipated that CVP and SWP water supplies would be increased by 9 percent and 17 percent, respectively, in the San Francisco Bay Area, Central Coast, and Southern California regions under Alternative 3 as compared to the No Action Alternative. The increase in surface water supplies could result in the reduction in use of groundwater pumps and emissions of air pollutants and contaminants if the use of diesel engines is also decreased.

*Overall Study Area*

*Changes in GHG Emissions due to Changes in Energy Generation or Use*

As described in Chapter 8, Energy, changes in CVP and SWP operations under Alternative 3 as compared to the No Action Alternative would result in an increase of CVP and SWP water deliveries to areas located south of the Delta; and therefore, annual energy use for conveyance would increase. CVP annual net energy generation would be similar; and SWP annual net energy generation would be less which could result in increased GHG emissions if fossil fuel generation replaces hydropower generation.

In addition to changes in CVP and SWP energy generation and use, and the associated GHG emissions, CVP and SWP operations under Alternative 3 as compared to the No Action Alternative could potentially decrease the use of energy by CVP and SWP water users due to less need to implement regional and local alternative water supplies, such as increased groundwater pumping and use of recycled water treatment plants and desalination water treatment plants. As the need for alternative water supplies is decreased, the associated energy demand and GHG emissions would also be decreased under Alternative 3 as compared to the No Action Alternative.

#### 16.5.3.4.2 Alternative 3 Compared to the Second Basis of Comparison

*Central Valley Region*

*Changes in Emissions of Criteria Air Pollutants and Precursors, and/or Exposure of Sensitive Receptors to Substantial Concentrations of Air Contaminants Related to Changes in Groundwater Pumping*

Groundwater pumping in the San Joaquin Valley portion of the Central Valley Region would be similar (within a 5 percent change) under Alternative 3 as compared to the Second Basis of Comparison. Therefore, the emissions of criteria air pollutants and precursors, and/or exposure of sensitive receptors to substantial concentrations of air contaminants would be similar under Alternative 3 as compared to the Second Basis of Comparison.

*Effects Related to Cross Delta Water Transfers*

Potential effects to air quality could be similar to those identified in a recent environmental analysis conducted by Reclamation for long-term water transfers from the Sacramento to San Joaquin valleys (Reclamation 2014c) as described above under the No Action Alternative compared to the Second Basis of Comparison. For the purposes of this EIS, it is anticipated that similar conditions would occur during implementation of cross Delta water transfers under Alternative 3 and the Second Basis of Comparison, and that impacts on air quality would not be substantial in the seller's service area due to implementation requirements of the transfer programs.

Under Alternative 3 and the Second Basis of Comparison, water could be transferred throughout the year without an annual volumetric limit. Overall, the potential for cross Delta water transfers would be similar under Alternative 3 and the Second Basis of Comparison.

*San Francisco Bay Area, Central Coast, and Southern California Regions*

*Changes in Emissions of Criteria Air Pollutants and Precursors, and/or Exposure of Sensitive Receptors to Substantial Concentrations of Air Contaminants Related to Changes in Groundwater Pumping*

It is anticipated that CVP and SWP water supplies and emissions from diesel engines used for groundwater pumping would be similar in the San Francisco Bay Area, Central Coast, and Southern California regions under Alternative 3 as compared to the Second Basis of Comparison.

*Overall Study Area*

*Changes in GHG Emissions due to Changes in Energy Generation or Use*

As described in Chapter 8, Energy, changes in CVP and SWP operations under Alternative 3 as compared to the Second Basis of Comparison would result in a decrease of CVP and SWP water deliveries to areas located south of the Delta; and therefore, annual energy use for conveyance would decrease. CVP annual net energy generation would be similar; and SWP annual net energy generation would be greater which could result in decreased GHG emissions if hydropower generation replaces fossil fuel generation.

In addition to changes in CVP and SWP energy generation and use, and the associated GHG emissions, CVP and SWP operations under Alternative 3 as compared to the Second Basis of Comparison could potentially increase the use of energy by CVP and SWP water users to implement regional and local alternative water supplies, such as increased groundwater pumping and use of recycled water treatment plants and desalination water treatment plants. These facilities would require energy which could indirectly result in increased GHG emissions.

#### *16.5.3.5 Alternative 4*

The air quality and GHG emissions under Alternative 4 would be identical to the air quality and GHG emissions under the Second Basis of Comparison; therefore, Alternative 4 is only compared to the No Action Alternative.

##### 16.5.3.5.1 Alternative 4 Compared to the No Action Alternative

The CVP and SWP operations under Alternative 4 is identical to the CVP and SWP operations under the Second Basis of Comparison and Alternative 1. Therefore, changes in air quality and GHG emissions under Alternative 4 as compared to the No Action Alternative would be the same as the impacts described in Section 16.5.3.2.1, Alternative 1 Compared to the No Action Alternative.

#### ***16.5.3.6 Alternative 5***

As described in Chapter 3, Description of Alternatives, CVP and SWP operations under Alternative 5 are similar to the No Action Alternative with modified Old and Middle River flow criteria and New Melones Reservoir operations. As described in Chapter 4, Approach to Environmental Analysis, Alternative 5 is compared to the No Action Alternative and the Second Basis of Comparison.

##### **16.5.3.6.1 Alternative 5 Compared to the No Action Alternative**

*Central Valley Region*

*Changes in Emissions of Criteria Air Pollutants and Precursors, and/or Exposure of Sensitive Receptors to Substantial Concentrations of Air Contaminants Related to Changes in Groundwater Pumping*

Groundwater pumping in the San Joaquin Valley portion of the Central Valley Region would be similar under Alternative 5 as compared to the No Action Alternative. Therefore, the emissions of criteria air pollutants and precursors, and/or exposure of sensitive receptors to substantial concentrations of air contaminants would be similar under Alternative 5 as compared to the No Action Alternative.

*Effects Related to Cross Delta Water Transfers*

Potential effects to air quality could be similar to those identified in a recent environmental analysis conducted by Reclamation for long-term water transfers from the Sacramento to San Joaquin valleys (Reclamation 2014c) as described above under the No Action Alternative compared to the Second Basis of Comparison. For the purposes of this EIS, it is anticipated that similar conditions would occur during implementation of cross Delta water transfers under Alternative 5 and the No Action Alternative, and that impacts on air quality would not be substantial in the seller's service area due to implementation requirements of the transfer programs.

Under Alternative 5 and the No Action Alternative, the timing of cross Delta water transfers would be limited to July through September and include annual volumetric limits, in accordance with the 2008 USFWS BO and 2009 NMFS BO. Overall, the potential for cross Delta water transfers would be similar under Alternative 5 and the No Action Alternative.

*San Francisco Bay Area, Central Coast, and Southern California Regions*

*Changes in Emissions of Criteria Air Pollutants and Precursors, and/or Exposure of Sensitive Receptors to Substantial Concentrations of Air Contaminants Related to Changes in Groundwater Pumping*

It is anticipated that CVP and SWP water supplies and emissions from diesel engines used for groundwater pumping would be similar in the San Francisco Bay Area, Central Coast, and Southern California regions under Alternative 5 as compared to the No Action Alternative.

*Overall Study Area*

*Changes in GHG Emissions due to Changes in Energy Generation or Use*

As described in Chapter 8, Energy, changes in CVP and SWP operations under Alternative 5 as compared to the No Action Alternative would result in similar CVP and SWP water deliveries to areas located south of the Delta except in April and May when exports would decline. Overall, annual CVP and SWP net energy generation would be similar under Alternative 5 and the No Action Alternative.

In addition to changes in CVP and SWP energy generation and use, and the associated GHG emissions, CVP and SWP operations under Alternative 5 as compared to the No Action Alternative could potentially increase the use of energy by CVP and SWP water users to implement regional and local alternative water supplies, such as increased groundwater pumping and use of recycled water treatment plants and desalination water treatment plants. These facilities would require energy which could indirectly result in increased GHG emissions.

**16.5.3.6.2 Alternative 5 Compared to the Second Basis of Comparison**

*Central Valley Region*

*Changes in Emissions of Criteria Air Pollutants and Precursors, and/or Exposure of Sensitive Receptors to Substantial Concentrations of Air Contaminants Related to Changes in Groundwater Pumping*

Groundwater pumping in the San Joaquin Valley portion of the Central Valley Region would increase by 8 percent under Alternative 5 as compared to the Second Basis of Comparison. It is not known if the additional groundwater pumping would rely upon electricity or diesel to drive the pump engines. Under the worst case analysis, it is assumed that the increased use of diesel engines would be proportional to the increased use of groundwater. Therefore, under Alternative 5, there would be a potential increase in emissions of criteria air pollutants and precursors, and/or exposure of sensitive receptors to substantial concentrations of air contaminants as compared to the Second Basis of Comparison.

*Effects Related to Cross Delta Water Transfers*

Potential effects to air quality could be similar to those identified in a recent environmental analysis conducted by Reclamation for long-term water transfers from the Sacramento to San Joaquin valleys (Reclamation 2014c) as described above under the No Action Alternative compared to the Second Basis of Comparison. For the purposes of this EIS, it is anticipated that similar conditions would occur during implementation of cross Delta water transfers under Alternative 5 and the Second Basis of Comparison, and that impacts on air quality would not be substantial in the seller's service area due to implementation requirements of the transfer programs.

Under Alternative 5, the timing of cross Delta water transfers would be limited to July through September and include annual volumetric limits, in accordance with the 2008 USFWS BO and 2009 NMFS BO. Under the Second Basis of Comparison, water could be transferred throughout the year without an annual volumetric limit. Overall, the potential for cross Delta water transfers would be reduced under Alternative 5 as compared to the Second Basis of Comparison.

*San Francisco Bay Area, Central Coast, and Southern California Regions*

*Changes in Emissions of Criteria Air Pollutants and Precursors, and/or Exposure of Sensitive Receptors to Substantial Concentrations of Air Contaminants Related to Changes in Groundwater Pumping*

It is anticipated that CVP and SWP water supplies would be decreased by 10 percent and 18 percent, respectively, in the San Francisco Bay Area, Central Coast, and Southern California regions under Alternative 5 as compared to the Second Basis of Comparison. The decrease in surface water supplies could result in increased use of groundwater pumps and emissions of air pollutants and contaminants if the use of diesel engines is also increased.

*Overall Study Area*

*Changes in GHG Emissions due to Changes in Energy Generation or Use*

As described in Chapter 8, Energy, changes in CVP and SWP operations under Alternative 5 as compared to the Second Basis of Comparison would result in a decrease of CVP and SWP water deliveries to areas located south of the Delta; and therefore, annual energy use for conveyance would decrease. CVP annual net generation would be similar; and SWP net energy generation would increase which could result indirectly in less GHG emissions if the hydropower generation replaces fossil fuel generation.

In addition to changes in CVP and SWP energy generation and use, and the associated GHG emissions, CVP and SWP operations under Alternative 5 as compared to the Second Basis of Comparison could potentially increase the use of energy by CVP and SWP water users to implement regional and local alternative water supplies, such as increased groundwater pumping and use of recycled water treatment plants and desalination water treatment plants. These facilities would require energy which could indirectly result in increased GHG emissions.

#### 16.5.3.7 Summary of Environmental Consequences

The results of the environmental consequences of implementation of Alternatives 1 through 5 as compared to the No Action Alternative and the Second Basis of Comparison are presented in Tables 16.5 and 16.6.

**Table 16.5 Comparison of Alternatives 1 through 5 to No Action Alternative**

| Alternative | Potential Change | Consideration for Mitigation Measures |
|---|---|---|
| Alternative 1 | Decrease potential for emissions of criteria air pollutants and precursors, and/or exposure of sensitive receptors to substantial concentrations of air contaminants by 8 percent in the Central Valley, 11 to 21 percent in the San Francisco Bay Area Region, and by 21 percent in the Central Coast and Southern California regions.<br>Potentially, could indirectly result in an increase of GHG emissions due to a decrease in SWP net energy generation; however, GHG emissions could decrease due to a reduced need for additional energy for alternative water supplies. The overall changes in GHG emissions are not known at this time because the need for energy use by alternative water supplies is not known at this time. | None needed |
| Alternative 2 | No effects on air quality. | None needed |
| Alternative 3 | Decrease potential for emissions of criteria air pollutants and precursors, and/or exposure of sensitive receptors to substantial concentrations of air contaminants by 6 percent in the Central Valley, 9 to 17 percent in the San Francisco Bay Area Region, and by 17 percent in the Central Coast and Southern California regions.<br>Potentially, could indirectly result in an increase of GHG emissions due to a decrease in SWP net energy generation; however, GHG emissions could decrease due to a reduced need for additional energy for alternative water supplies. The overall changes in GHG emissions are not known at this time because the need for energy use by alternative water supplies is not known at this time. | None needed |
| Alternative 4 | Same effects as described for Alternative 1 compared to the No Action Alternative. | None needed |

| Alternative | Potential Change | Consideration for Mitigation Measures |
|---|---|---|
| Alternative 5 | Similar potential for emissions of criteria air pollutants and precursors, and/or exposure of sensitive receptors to substantial concentrations of air contaminants in the Central Valley, San Francisco Bay Area, Central Coast, and Southern California regions.<br>Potentially, could indirectly result in an increase of GHG emissions due to the need for additional energy for alternative water supplies. The overall changes in GHG emissions are not known at this time because the need for energy use by alternative water supplies is not known at this time. | None needed |

Note: Due to the limitations and uncertainty in the CalSim II monthly model and other analytical tools, incremental differences of 5 percent or less between alternatives and the No Action Alternative are considered to be "similar."

**Table 16.6 Comparison of Alternatives 1 through 5 to Second Basis of Comparison**

| Alternative | Potential Change | Consideration for Mitigation Measures |
|---|---|---|
| No Action Alternative | Increase potential for emissions of criteria air pollutants and precursors, and/or exposure of sensitive receptors to substantial concentrations of air contaminants by 8 percent in the Central Valley, 10 to 18 percent in the San Francisco Bay Area Region, and by 18 percent in the Central Coast and Southern California regions.<br>Potentially, could indirectly result in a decrease of GHG emissions due to an increase in SWP net energy generation; however, GHG emissions could increase due to the need for additional energy for alternative water supplies. The overall changes in GHG emissions are not known at this time because the need for energy use by alternative water supplies is not known at this time. | Not considered for this comparison. |
| Alternative 1 | No effects on air quality. | Not considered for this comparison. |
| Alternative 2 | Same effects as described for No Action Alternative as compared to the Second Basis of Comparison. | Not considered for this comparison. |

| Alternative | Potential Change | Consideration for Mitigation Measures |
|---|---|---|
| Alternative 3 | Similar potential for emissions of criteria air pollutants and precursors, and/or exposure of sensitive receptors to substantial concentrations of air contaminants in the Central Valley, San Francisco Bay Area, Central Coast, and Southern California regions.<br>Potentially, could indirectly result in a decrease of GHG emissions due to an increase in SWP net energy generation; however, GHG emissions could increase due to the need for additional energy for alternative water supplies. The overall changes in GHG emissions are not known at this time because the need for energy use by alternative water supplies is not known at this time. | Not considered for this comparison. |
| Alternative 4 | No effects on air quality. | Not considered for this comparison. |
| Alternative 5 | Increase potential for emissions of criteria air pollutants and precursors, and/or exposure of sensitive receptors to substantial concentrations of air contaminants by 8 percent in the Central Valley, 10 to 18 percent in the San Francisco Bay Area Region, and by 18 percent in the Central Coast and Southern California regions.<br>Potentially, could indirectly result in a decrease of GHG emissions due to an increase in SWP net energy generation; however, GHG emissions could increase due to the need for additional energy for alternative water supplies. The overall changes in GHG emissions are not known at this time because the need for energy use by alternative water supplies is not known at this time. | Not considered for this comparison. |

Note: Due to the limitations and uncertainty in the CalSim II monthly model and other analytical tools, incremental differences of 5 percent or less between alternatives and the No Action Alternative are considered to be “similar.”

#### *16.5.3.8 Potential Mitigation Measures*

Mitigation measures are presented in this section to avoid, minimize, rectify, reduce, eliminate, or compensate for adverse environmental effects of Alternatives 1 through 5 as compared to the No Action Alternative. Mitigation measures were not included to address adverse impacts under the alternatives as compared to the Second Basis of Comparison because this analysis was included in this EIS for information purposes only.

Changes in CVP and SWP operations under Alternatives 1 through 5 as compared to the No Action Alternative would not result in changes in air quality. Therefore, there would be no adverse impacts to air quality; and no mitigation measures are required.

#### *16.5.3.9 Cumulative Effects Analysis*

As described in Chapter 3, the cumulative effects analysis considers projects, programs, and policies that are not speculative; and are based upon known or reasonably foreseeable long-range plans, regulations, operating agreements, or other information that establishes them as reasonably foreseeable.

The cumulative effects analysis considers potential incremental impacts of the alternatives when added to other past and present actions (as described in the Affected Environment section) and reasonably foreseeable future actions (as described in the No Action Alternative section plus cumulative effects) regardless of what agency (federal or non-federal) or person undertakes such actions (40 CFR 1508.7, 1508.25, and 43 CFR 46.115). The quantitative effects of these items are based upon the quantitative comparisons of Alternatives 1 through 5 to the No Action Alternative presented in previous sections of this chapter; and the qualitative cumulative effects of the alternatives are based upon the qualitative comparisons of Alternatives 1 through 5 to the No Action Alternative presented in previous sections of this chapter and the effects of the cumulative actions that are less certain than future actions under the No Action Alternative.

The cumulative effects analysis for Alternatives 1 through 5 for Air Quality issues are summarized in Table 16.7.

**Table 16.7 Summary of Cumulative Effects on Air Quality with Implementation of Alternatives 1 through 5 as Compared to the No Action Alternative**

| Scenarios | Actions | Cumulative Effects of Actions |
|---|---|---|
| Past & Present, and Future Actions included in the No Action Alternative and in All Alternatives in Year 2030 | Consistent with Affected Environment conditions plus:<br>Actions in the 2008 USFWS BO and 2009 NMFS BO that would have occurred without implementation of the BOs, as described in Section 3.3.1.2 (of Chapter 3, Descriptions of Alternatives), including climate change and sea level rise<br>Actions not included in the 2008 USFWS BO and 2009 NMFS BO that would have occurred without implementation of the BOs, as described in Section 3.3.1.3 (of Chapter 3, Descriptions of Alternatives):<br>• Implementation of Federal and state policies and programs, including Clean Water Act (e.g., Total Maximum Daily Loads); Safe Drinking Water Act; Clean Air Act; and flood management programs<br>• General plans for 2030.<br>• Trinity River Restoration Program.<br>• Central Valley Project Improvement Act programs<br>• Folsom Dam Water Control Manual Update<br>• FERC Relicensing for the Middle Fork of the American River Project<br>• San Joaquin River Restoration Program<br>• Future water supply projects, including water recycling, desalination, groundwater banks and wellfields, and conveyance facilities (projects with completed environmental documents) | These effects would be the same under all alternatives.<br>Climate change and sea level rise, development under the general plans, FERC relicensing projects, and some future projects to improve water quality and/or habitat are anticipated to reduce carryover storage in reservoirs and changes in stream flow patterns in a manner that could reduce hydroelectric generation in the summer and fall months which could result in increased use of fossil fuels and indirectly increase GHG emissions for fossil fuel generation and increased use of diesel engines for additional groundwater use.<br>Reduced CVP and SWP water deliveries south of the Delta would reduce CVP and SWP electricity use for conveyance; and could reduce the need for electricity generation using fossil fuels and indirectly reduce GHG emissions.<br>Future water supply projects are anticipated to both improve water supply reliability due to reduced surface water supplies and to accommodate planned growth in the general plans. It is anticipated that some of these projects could increase energy use, such as implementation of desalination projects. However, other projects, such as water recycling, would not substantially increase energy use because most of the energy use was previously required for wastewater treatment. It is anticipated that energy required for water treatment of alternative water supplies would be similar as treatment for CVP and SWP water supplies. Increased energy use could increase use of electricity generation by fossil fuels; which could increase air quality issues and indirectly increase GHG emissions.<br>Most of these programs were initiated prior to implementation of the 2008 USFWS BO and 2009 NMFS BO which reduced CVP and SWP water supply reliability. |

| Scenarios | Actions | Cumulative Effects of Actions |
|---|---|---|
| Future Actions considered as Cumulative Effects Actions in All Alternatives in Year 2030 | Actions as described in Section 3.5 (of Chapter 3, Descriptions of Alternatives):<br>• Bay-Delta Water Quality Control Plan Update<br>• FERC Relicensing Projects<br>• Bay Delta Conservation Plan (including the California WaterFix alternative)<br>• Shasta Lake Water Resources, North-of-the-Delta Offstream Storage, Los Vaqueros Reservoir Expansion Phase 2, and Upper San Joaquin River Basin Storage Investigations<br>• El Dorado Water and Power Authority Supplemental Water Rights Project<br>• Sacramento River Water Reliability Project<br>• Semitropic Water Storage District Delta Wetlands<br>• North Bay Aqueduct Alternative Intake<br>• Irrigated Lands Regulatory Program<br>• San Luis Reservoir Low Point Improvement Project<br>• *Westlands Water District v. United States Settlement*<br>• Future water supply projects, including water recycling, desalination, groundwater banks and wellfields, and conveyance facilities (projects that did not have completed environmental documents during preparation of the EIS) | <u>These effects would be the same under all alternatives.</u><br>Most of the future reasonably foreseeable actions are anticipated to improve water supplies in California to reduce impacts due to climate change, sea level rise, increased water allocated to improve habitat conditions, and future growth. If CVP and SWP water supply reliability increases, energy use for conveyance of CVP and SWP water supplies also would increase.<br>Some of the future reasonably foreseeable actions are anticipated to potentially reduce CVP and SWP water supply reliability (e.g., Water Quality Control Plan Update and FERC Relicensing Projects).<br>Future water supply projects are anticipated to both improve water supply reliability due to reduced surface water supplies and to accommodate planned growth in the general plans. It is anticipated that some of these projects could increase energy use, such as implementation of desalination projects. However, other projects, such as water recycling, would not substantially increase energy use because most of the energy use was previously required for wastewater treatment. It is anticipated that energy required for water treatment of alternative water supplies would be similar as treatment for CVP and SWP water supplies. Increased use of groundwater pumps would increase energy use. |

| Scenarios | Actions | Cumulative Effects of Actions |
|---|---|---|
| No Action Alternative with Associated Cumulative Effects Actions in Year 2030 | Full implementation of the 2008 USFWS BO and 2009 NMFS BO CVP and SWP | Implementation of No Action Alternative would result in changes stream flows and related changes in hydroelectric generation patterns, and reduced CVP and SWP water supplies as compared to conditions prior to the BOs.<br>If CVP and SWP water supply reliability decreases, energy use for conveyance of CVP and SWP water supplies also would decrease and energy use for alternative water supplies could increase.<br>Increased energy use could increase use of electricity generation by fossil fuels; which could increase air quality issues and indirectly increase GHG emissions. |
| Alternatives 1 and 4 with Associated Cumulative Effects Actions in Year 2030 | No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant) | Implementation of Alternatives 1 and 4 with reasonably foreseeable actions would result in changes in stream flows and related hydroelectric generation patterns, and increased CVP and SWP water supplies as compared to the No Action Alternative with the added actions.<br>Increased CVP and SWP water supply reliability would increase energy use for conveyance of CVP and SWP water supplies; and it is anticipated that energy use for alternative water supplies would decrease as compared to the No Action Alternative with the added actions.<br>Increased energy use for CVP and SWP conveyance could increase use of electricity generation by fossil fuels; which could increase air quality issues and indirectly increase GHG emissions. However, decreased energy use for alternative water supplies could decrease use of electricity generation by fossil fuels; which could decrease air quality issues and indirectly decrease GHG emissions as compared to for the No Action Alternative with the added actions. |
| Alternative 2 with Associated Cumulative Effects Actions in Year 2030 | Full implementation of the 2008 USFWS BO and 2009 NMFS BO CVP and SWP operational actions<br>No implementation of structural improvements or other actions that require further study to develop a more detailed action description. | Implementation of Alternative 2 with reasonably foreseeable actions for energy resources would be the same as for the No Action Alternative with the added actions. |

| Scenarios | Actions | Cumulative Effects of Actions |
|---|---|---|
| Alternative 3 with Associated Cumulative Effects Actions in Year 2030 | No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant)<br>Slight increase in positive Old and Middle River flows in the winter and spring months | Implementation of Alternative 3 with reasonably foreseeable actions would result in changes in stream flows and related hydroelectric generation patterns, and increased CVP and SWP water supplies as compared to the No Action Alternative with the added actions.<br>Increased CVP and SWP water supply reliability would increase energy use for conveyance of CVP and SWP water supplies; and it is anticipated that energy use for alternative water supplies would decrease as compared to the No Action Alternative with the added actions.<br>Increased energy use for CVP and SWP conveyance could increase use of electricity generation by fossil fuels; which could increase air quality issues and indirectly increase GHG emissions. However, decreased energy use for alternative water supplies could decrease use of electricity generation by fossil fuels; which could decrease air quality issues and indirectly decrease GHG emissions as compared to for the No Action Alternative with the added actions. |
| Alternative 5 with Associated Cumulative Effects Actions in Year 20530 | Full implementation of the 2008 USFWS BO and 2009 NMFS BO<br>Positive Old and Middle River flows and increased Delta outflow in spring months | Implementation of Alternative 5 with reasonably foreseeable actions would result in similar net CVP and SWP hydroelectric generation, and reduced CVP and SWP water supplies as compared to the No Action Alternative with the added actions.<br>It is anticipated that energy use for alternative water supplies would increase as compared to the No Action Alternative with cumulative effects which could increase air quality issues and indirectly increase GHG emissions as compared to for the No Action Alternative with the added actions. |

Chapter 17

# Cultural Resources

## 17.1 Introduction

Cultural resources are defined as prehistoric and historic archaeological sites, architectural features (e.g., buildings, bridges, flumes, trestles, railroads), and traditional cultural properties. However, the focus of this chapter is more on cultural resources than historic properties.

This chapter describes the known existing cultural resources conditions in the study area and the potential changes that could occur as a result of implementing the alternatives evaluated in this Environmental Impact Statement (EIS). Implementation of the alternatives could affect cultural and historic resources through potential changes in the operation of the Central Valley Project (CVP) and State Water Project (SWP). Changes in CVP and SWP operations could increase the frequency and duration of low-elevation reservoir conditions that would increase the time of exposure of inundated cultural resources within reservoirs that store CVP and SWP water. Changes in CVP and SWP operations also could reduce water supply availability to agricultural lands, and those lands could be subject to land use changes that could increase disturbances of cultural resources if present.

## 17.2 Regulatory Environment and Compliance Requirements

Potential actions that could be implemented under the alternatives evaluated in this EIS could affect reservoirs, streams, and lands served by CVP and SWP water supplies located on lands with cultural resources. Actions implemented, funded, or approved by Federal and state agencies would need to be compliant with appropriate Federal and state agency policies and regulations, as summarized in Chapter 4, Approach to Environmental Analyses.

## 17.3 Affected Environment

This section describes the types of cultural resources that could be potentially affected by the implementation of the alternatives considered in this EIS. Changes in areas with cultural resources due to changes in CVP and SWP operations may occur at reservoirs that store CVP and SWP water and on lands that use CVP and SWP water supplies in the Trinity River, Central Valley, San Francisco Bay Area, and Central Coast and Southern California regions.

## 17.3.1 Prehistoric Context

### *17.3.1.1 Introduction to the Prehistoric Context*

The study area has a long and complex cultural history with distinct regional patterns that extend back more than 11,000 years (Reclamation 1997). The first generally agreed upon evidence for the presence of prehistoric peoples in the study area is represented by the distinctive fluted spear points called Clovis points. These artifacts have been found on the margins of extinct lakes in the San Joaquin Valley. The Clovis points are found on the same surface with the bones of animals that are now extinct, such as mammoths, sloths, and camels. The subsequent period from about 10000 to 8000 BP (before present) was characterized by a small number of sites with stemmed spear points instead of fluted spear points. Approximately 8,000 years ago, many California cultures shifted the main focus of their subsistence strategies from hunting to seed gathering as evidenced by the increase in food-grinding implements found in archaeological sites dating to this period. In the last 3,000 years, the archaeological record becomes more complex as specialized adaptations to locally available resources were developed and populations expanded. Many sites dated to this time period contain mortars and pestles or are associated with bedrock mortars, implying that the occupants exploited acorns intensively. The range of subsistence resources that were used increased, exchange systems expanded, and social stratification and craft specialization occurred as indicated by well-made artifacts such as charm stones and beads, which were often found with burials.

### *17.3.1.2 Prehistory of the Trinity River Region*

The Trinity River Region includes portions of Trinity County including Trinity Lake, Lewiston Reservoir, and Trinity River from Lewiston Reservoir to the Humboldt County boundary (near the eastern boundary of Hoopa Valley Indian Reservation); portions of Humboldt County including the Hoopa Valley Indian Reservation, Trinity River from the Humboldt County border to the Del Norte County border (near the confluence of the Trinity and Klamath rivers); and Del Norte County including the Lower Klamath River from the confluence with the Trinity River to the Pacific Ocean.

The area surrounding the present Trinity Lake and the Trinity River to its confluence with the Klamath River and along the Klamath River to the Pacific Ocean was inhabited by the Wintu, Chimariko, Yurok, and Hupa Indians at the time of Euroamerican contact.

### *17.3.1.3 Prehistory of the Central Valley Region*

The Central Valley Region extends from above Shasta Lake to the Tehachapi Mountains and includes the Sacramento Valley, San Joaquin Valley, and the Delta and Suisun Marsh areas. The Sacramento Valley and San Joaquin Valley are divided into Eastern and Western subregions.

#### 17.3.1.3.1 Prehistory of the Sacramento Valley

The western Sierra Nevada foothills appear to have been first used by Great Basin people around 8000 BP (Reclamation 1997). By approximately 4000 BP, people possibly from the Great Basin were seasonally hunting and gathering in the Sierra Nevada and the Sacramento Valley.

In the northern western portion of Sacramento Valley, between approximately 12,000 and 150 years ago (12000 to 100 BP), the prehistoric societies of northern California underwent a series of slow but significant changes in subsistence and economic orientation, population densities and distribution, and social organization. These changes are thought to reflect migrations of various peoples into the area and displacement of earlier populations (Jensen and Reed 1980; Farber 1985; Reclamation 1997). Early archaeological investigations within Nomlaki and Wintu ethnographic territory, particularly the present Redding area and adjacent tracts of the southern Klamath Mountains, appear to indicate that human occupation of this area began approximately 1050 to 950 BP.

Little is known of human occupation on the floor of the Sacramento Valley prior to 4500 BP (Reclamation 1997). Because of alluvial and colluvial deposition over the past 10,000 years, ancient cultural deposits have been deeply buried in many areas. Initially, humans appeared to adapt to lakes, marshes, and grasslands environments until approximately 8000 to 7000 BP (Placer County 2007). The earliest evidence of widespread villages and permanent occupation of the lower Sacramento Valley, Delta, and Suisun Marsh areas comes from several sites assigned to the Windmiller Pattern (previously, “Early Horizon”), dated circa 4500 to 2500 BP (Ragir 1972; Reclamation 1997; Reclamation et al. 2010).

From circa 2500 to 1500 BP in the Central Valley area, villages were characterized by deep midden deposits, suggesting intensified occupation and a broadened subsistence base (Reclamation 1997, 2005a; Reclamation et al. 2010; Beardsley 1948; Heizer and Fenenga 1939; Moratto 1984).

During the late prehistoric period from 1500 to 100 BP, development may have been initiated due to the southward expansion of Wintuan populations into the Sacramento Valley (Moratto 1984; Reclamation 1997; Reclamation et al. 2010). The period is characterized by intensified hunting, fishing, and gathering subsistence with larger communities, highly developed trade networks, elaborate ceremonial and mortuary practices, and social stratification.

#### 17.3.1.3.2 Prehistory of the San Joaquin Valley

Evidence of prehistoric occupation of the central and southern Sierra Nevada foothills goes back to 9,500 years ago. The vast majority of investigated sites, however, are less than 500 years old, probably representing a relatively recent proliferation of settlements by Yokut Indians (Moratto 1984; Reclamation 1997). The chronological sequence developed in the south-central Sierra Nevada as a result of the Buchanan Reservoir project in present Madera County is still used as a general framework (Reclamation 1997). Similar findings were identified in major settlement sites along the San Joaquin River and in the present New Melones Reservoir area (Reclamation 2010; Reclamation and DWR 2011).

During the early Holocene period (10,000 to 12,000 years ago), peoples probably inhabited or passed through the San Joaquin Valley; however, few indications of this period have been discovered, probably due to burial beneath accumulated river sediment (Reclamation 1997, 2012). Examples of early Holocene cultural remains are known primarily from the Tulare Basin in the southern San Joaquin Valley. Evidence along the southern shoreline of the ancient Tulare Lake indicates that human presence may have occurred from 11000 BP (Reclamation and State Parks 2013).

From approximately 1650 to 950 BP, there is evidence that the people of the eastern San Joaquin Valley may have interacted with people in the Delta area (Reclamation 1997, 2012).

From approximately 450 to 100 BP, the people of the eastern San Joaquin Valley may have interacted with people in the Central Coast and Southern California areas. Material found in Pacheco to Panoche strata indicates a trade relationship with people of the Delta, Central Coast, and Southern California regions (Moratto 1984; Reclamation 1997, 2012).

#### *17.3.1.4 Prehistory of the San Francisco Bay Area Region*

The San Francisco Bay Area Region only includes portions of the Bay Area that could be affected through implementation of the alternatives considered in this EIS, which includes Contra Costa, Alameda, Santa Clara, and San Benito counties. The prehistory context is different throughout the San Francisco Bay Area Region. Human occupation in the northern valley regions of present San Benito County occurred as described above for the western San Joaquin Valley (San Benito County 2010).

Human occupation in the coastal regions of present Contra Costa and Alameda counties occurred as described above for the southern portion of the Sacramento Valley (Reclamation 1997; DWR 2008; Zone 7 2006). From 5000 to 2500 BP, dense settlements extended from the coastal marshes to interior grasslands and woodlands (Zone 7 2006). From about 2500 to 950 BP, coastal communities relied upon shellfish, and major shellmounds were created near these communities, including near the present Alameda County shorelines and some interior valleys.

Settlement of the interior valleys of the present Contra Costa, Alameda, and Santa Clara counties occurred during the past 12,000 years. From 6000 to 1700 BP, settlements occurred, as there was less emphasis on nomadic hunting for large animals and increased emphasis on the use of plant materials and hunting, fishing, and shellfish collection (Santa Clara County 2012; CCWD et al. 2009). The communities established economies and traded between the communities.

#### 17.3.1.5 Prehistory of the Central Coast Region

The prehistory of the Central Coast Region for this EIS (present day San Luis Obispo and Santa Barbara counties) is poorly known but may have begun around 11000 BP and probably represents mobile hunter-gatherers (Reclamation 1997; San Luis Obispo County 2010; Santa Barbara 2010). Fishing, intensive shellfish collecting, and hunting began around 9000 BP. Use of milling stones and establishment of communities occurred after about 8500 BP. After about 5000 BP, there was greater reliance on hunting of land and sea mammals, gathering of shellfish, and use of mortars and pestles. Subsequently, larger settlements occurred for ethnographically known peoples, including the Chumash.

#### 17.3.1.6 Prehistory of the Southern California Region

The Southern California Region includes the present Ventura, Los Angeles, Orange, San Diego, Riverside, and San Bernardino counties, which have substantially different prehistory characteristics.

In the coastal areas of the Southern California Region (present Ventura, Los Angeles, Orange, and San Diego counties), early habitation extends over 12,000 years ago (Ventura County 2005; Los Angeles 2005; San Diego County 2011b). Between 12000 and 7500 BP, the inhabitants were hunter-gatherer populations that used land and marine resources. The population along the northern coast of Southern California began expanding between 9000 and 8500 BP. Permanent coastal settlements expanded as plants, shellfish, and marine mammals became a large part of the subsistence (Glassow et al. 2007; Los Angeles 2005). From 5000 to 450 BP, the use of plant materials and exploitation of fish and sea mammals increased sedentism and socioeconomic interaction (Glassow 1999; Los Angeles 2005; San Diego County 2011b).

The interior area within the Southern California Region considered in this EIS includes portions of Riverside and San Bernardino counties that use SWP water supplies, including the Mojave Desert and the Peninsular Ranges.

Clovis (circa 12000 to 10000 BP) is the only cultural complex dating from the Pleistocene that can be consistently identified in the Mojave Desert (Sutton et al. 2007). The Clovis culture characteristics appear to be associated with Paleo-Indian groups as big game hunters. More recently, there have been indications that the people had greater cultural and economic diversity than previously recognized (CDFG 2009). Paleo-Indian groups were likely small, highly mobile populations living in small, temporary camps near permanent water sources (Sutton et al. 2007).

From 10000 and 8000 BP, communities were organized around relatively small social units (Sutton et al. 2007; Riverside County 2000). From 7000 to 4000 BP, hunting continued while foraging subsistence transformed during this period to more collection of plant and animal materials within adjacent ecological zones (CDFG 2009; Riverside County 2000; Sutton et al. 2007). Between 4000 and 1750 BP, permanent seasonally occupied settlements occurred in the lower valley with the use of oak woodlands and mesquite groves (Riverside County 2000; Sutton et al. 2007).

From 1750 to 850 BP, communities increased and trade between communities expanded (CDFG 2009; Gardner 2002, 2006; Riverside County 2000; Sutton et al. 2007; Sutton 1988, 1996; Warren and Crabtree 1986). During this period, the lower Coloradan culture became more prevalent along the shoreline of the Lake Cahuilla area (site of the present Salton Sea and Coachella Valley Water District) (Riverside County 2000). The lower Coloradans relied upon shellfish, fish, aquatic birds, marsh and riparian vegetation, and mammals. The culture may have been influenced by the Anasazi settlements of present Southern Nevada, including cultivation of corns, beans, and squash. The Anasazi people also occupied portions of present San Bernardino County where turquoise was mined. Extensive trading occurred between the people in the inland areas and the people along the coast.

After about 850 BP, populations appeared to decline, and several cultural complexes emerged (Sutton et al. 2007). Late Prehistoric occupation sites were based on hunting and gathering, especially of plant foods and small game (Riverside County 2000). Villages in Antelope Valley began to disappear in the later prehistoric times, probably due to the disappearance of lakes that were the headwaters of the Mojave River or changes in trade route locations (DWR 2009). Lake Cahuilla declined around 450 BP and the large populations dispersed to the Colorado River, western Peninsular Ranges in present western Riverside County, and the Pacific Ocean coast (Riverside County 2000).

## 17.3.2 Ethnographic Context

### *17.3.2.1 Introduction to Ethnographic Context*

This section provides brief ethnographic sketches for each native cultural group whose traditional territories are within the study area. Each ethnographic sketch presents the territorial limits of each respective cultural group and then focuses mainly on those aspects of culture that are potentially represented in the archaeological record.

The study area encompasses lands occupied by more than 40 distinct Native American cultural groups. Although most California tribes shared similar elements of social organization and material culture, linguistic affiliation and territorial boundaries primarily distinguish them from each other. Before European settlement of California, an estimated 310,000 native Californians spoke dialects of as many as 80 mutually unintelligible languages representing six major North American language stocks (Cook 1978; Moratto 1984; Reclamation 1997; Shipley 1978).

### *17.3.2.2 Ethnography of the Trinity River Region*

The Trinity River Region includes portions of Shasta, Trinity, Siskiyou, Humboldt, and Del Norte counties. This area is bounded by the Sacramento River on the east, the Pacific Ocean on the west, and the middle and upper Klamath Basin on the north. The ethnography of the Yurok, Hupa, Wintu, and Chimariko is described below.

#### 17.3.2.2.1 Yurok

The Yurok inhabited California's northwestern coastline from Little River to Damnation Creek; along the Klamath River from the confluence with the Pacific Ocean up past the Klamath-Trinity confluence to Slate Creek; and approximately 6 miles along the Trinity River upstream of the confluence with the Klamath River (Pilling 1978; USFWS et al. 1999). The Yurok life, communities, society, and ceremonies are deeply connected with the Klamath River (DOI and CDFG 2012). Yurok culture and traditional stories describe that the Klamath River was created to facilitate the interaction with two neighboring people, the Hupa and the Karuk, and with the salmon that lived in the Klamath River. Both the Hupa and Karuk culture and traditional stories also describe this close interaction of the peoples, salmon, and Klamath River.

Yurok are recognized for their highly stylized art forms and their skills in making redwood canoes, weaving fine baskets, hunting, and especially riverine salmon fishing. The ancient traditions are continued through contemporary times (USFWS et al. 1999). The redwood canoes for ocean conditions can be 30 to 40 feet in length, designed to haul large amounts of fish and seal carcasses, and paddled by 5 to 20 paddlers (DOI and CDFG 2012). The canoes are used to gather food and materials, transport people and materials, and for ceremonial aspects of the Yurok culture. The Jump and Deerskin ceremonies are held in late fall to give thanks for abundant food supplies. The Deerskin Ceremony includes a Boat Ceremony in which the participants travel down the Klamath River to thank the river for continuing to flow and provide resources.

#### 17.3.2.2.2 Hupa

The Hupa inhabited the area surrounding the lower reaches of the Trinity River from approximately Salyer to approximately 6 miles upstream from the confluence with the Klamath River (Wallace 1978a; USFWS et al. 1999). Hupa life is defined by extended families affiliated with villages.

The Hupa believe that the Klamath and Trinity rivers were created to provide interaction with other peoples (Yurok and Karuk) and with the salmon (DOI and CDFG 2012). Many of the Hupa ceremonies highlight their relationship with the rivers, including world renewal ceremonies and ceremonies for bountiful harvests. The world renewal ceremonies include the White Deerskin and Jump ceremonies to honor the earth and the creator for providing food and other resources. The ceremonies for bountiful harvest of fish and acorns include the First Salmon ceremony and the Acorn Feast.

#### 17.3.2.2.3 Wintu

When the Europeans and Americans first explored California, most of the western side of the Sacramento Valley north of about Suisun Bay was inhabited by Wintun-speaking people (USFWS et al. 1999). Early in the anthropological study of the region, a linguistic and cultural distinction was recognized between the Wintun-speaking people in the southwestern Central Valley (the Patwin) and the people occupying the northwestern Central Valley and Trinity River Valley (LaPena 1978; USFWS et al. 1999).

#### 17.3.2.2.4 Chimariko

The Chimariko lived in a 20-mile-long reach of the Trinity River from approximately Big Bar to the confluence with the South Fork (Silver 1978a; USFWS et al. 1999). Although the Chimariko language is now extinct, early ethnographers recorded some words, and the language is thought to be of Hokan stock.

### *17.3.2.3 Ethnography of the Central Valley Region*

#### 17.3.2.3.1 Ethnography of the Sacramento Valley

*Maidu, Konkow, and Nisenan*

Maidu (also known as northeastern Maidu), Konkow (also known as northwestern Maidu), and Nisenan (also known as southern Maidu) inhabited an area of California from Lassen Peak to the Cosumnes River, and from the Sacramento River to Honey Lake (Reclamation 1997; Shipley 1978). Northeastern Maidu territory extended from Lassen Peak on the west to Honey Lake on the east, Sierra Buttes on the south, and Eagle Lake on the north. The Konkow inhabited the region from the Lower Feather River in the north, to the Sutter Buttes in the south, and to the west beyond the Sacramento River. The Nisenan lived in the area east of the Sacramento River and along the Middle Fork Feather River, Bear River, American River, and Cosumnes River from the Sacramento River almost to Lake Tahoe (Riddell 1978; Wilson and Towne 1978; Reclamation 1997, 2005b).

*Yana*

The Yana of north-central California inhabited an area from Lassen Peak and the southern Cascade foothills on the east, Rock Creek on the south, Pit River on the north, and the eastern bank of the Sacramento River on the west. The western boundary is the most uncertain (J. Johnson 1978a; Reclamation 1997).

*Achumawi, Atsugewi, and Shasta*

The Achumawi and Atsugewi of northeastern California are two linguistically and culturally distinct but related groups (Reclamation 1997). The Achumawi and Atsugewi languages belong to the Palaihnihan family, or Hokan stock. The territory of the Achumawi extended generally to Mount Lassen, west to Mount Shasta, northeast to Goose Lake, and east to the Warner Range (Kroeber 1925; Olmsted and Stewart 1978; Garth 1978; Reclamation 1997). Overlapping this area to some extent, the Atsugewi territory ranged from Mount Lassen in the southwest, the Pit River in the north, and Horse Lake to the east.

The Shasta peoples were originally thought to be associated with the Achumawi and Atsugewi but then were considered as a separate group (Kroeber 1925; Reclamation 1997; Shipley 1978). The Shasta peoples inhabited the area from southern Oregon at the Rogue River, south to the present Cecilville, and the area between the Marble and Salmon mountains to Mount Shasta in the west and the

Cascade Range in the east. In California, the core areas of settlement were in Shasta Valley, Scotts Valley, and along the Klamath River from about Scotts River to the town of Hornbrook (Silver 1978b).

*Plains Miwok*

The Plains Miwok established villages along river courses in the foothills located east of Sacramento and the Delta (Reclamation 2005b).

*Nomlaki*

Two major divisions existed among the Nomlaki: the River and Hill Nomlaki (Goldschmidt 1978; DuBois 1935; Reclamation 1997). The River Nomlaki occupied the Sacramento River Valley in present eastern Tehama County. The Hill Nomlaki occupied the eastern side of the Coast Ranges in present Tehama and Glenn counties. The Nomlaki and Wintu conducted trading between the peoples (Goldschmidt 1978; DuBois 1935; Reclamation 1997).

*Patwin*

The Patwin lived along the western side of the Sacramento Valley from the present Princeton to Benicia, including Suisun Marsh (Kroeber 1925; Reclamation 1997; Reclamation et al. 2010). Within this large area, the Patwin have traditionally been divided into River, Hill, and Southern Patwin groups. Settlements generally were located on high ground along the Sacramento River or tributary streams, or in the eastern Coast Range valleys. The ethnographically recorded villages of Aguasto and Suisun were located near San Pablo and Suisun bays (P. Johnson 1978b; Reclamation 1997; Reclamation et al. 2010).

#### 17.3.2.3.2 Ethnography of the San Joaquin Valley

*Eastern Miwok*

The Miwok cultures in present California include the Coast Miwok, Lake Miwok, and Eastern Miwok divisions. The Eastern Miwok included five separate groups (Bay, Plains, Northern Sierra, Central Sierra, and Southern Sierra) that inhabited the area from present Walnut Creek in Contra Costa County and the Delta, along the lower Mokelumne and Cosumnes rivers and along the Sacramento River from present Rio Vista to Freeport, the foothill and mountain areas of the upper Mokelumne River and Calaveras River watersheds, the upper Stanislaus River and Tuolumne River watersheds, and the upper Merced River and Chowchilla River watersheds, respectively (Levy 1978a; Reclamation 1997; Shipley 1978). No one Miwok tribal organization encompassed all the peoples speaking Miwokan languages, nor was there a single tribal organization that encompassed an entire division.

*Yokuts*

Yokuts are a large and diverse number of people in the San Joaquin Valley and Sierra Nevada foothills of central California, including the Southern San Joaquin Valley Yokuts, Northern San Joaquin Valley Yokuts, and Foothill Yokuts (Reclamation 1997; Reclamation et al. 2011a; SJRRP 2011). The three subdivisions of the Yokuts languages belong to the Yokutsan family, or Penutian stock (Shipley 1978).

The Southern Valley Yokuts inhabited the southern San Joaquin Valley from present Fresno to the Tehachapi Mountains (Wallace 1978b). The Northern Valley Yokuts inhabited the northern San Joaquin Valley from Bear Creek to the San Joaquin River near present Mendota, western San Joaquin Valley near present San Luis Reservoir, and eastern present Contra Costa and Alameda counties (ECCCHCPA et al. 2006; Wallace 1978c; Reclamation and State Parks 2012; Reclamation and DWR 2011). The Foothill Yokuts inhabited the western slopes of the Sierra Nevada foothills from the Fresno River to the Kern River (Spier 1978b; Reclamation and State Parks 2013). Yokuts were mobile hunters and gatherers with semipermanent villages and seasonal travel corridors to food sources.

The Yokuts probably traded with the Costanoan people from the coastal areas based upon the abalone and other mussel shells found in settlement sites (Reclamation and State Parks 2012).

*Dumna and Kechayi*

The Dumna and Kechayi lived along the San Joaquin River in the Sierra Nevada foothills near the present Millerton Lake (Reclamation and State Parks 2013).

### *17.3.2.4 Ethnography of the San Francisco Bay Area Region*

Native inhabitants of the San Francisco Bay Area Region include the Miwok, Cholvon Northern Valley Yokuts, and the Costanoan Indians (Reclamation 1997; CCWD et al. 2009; ECCCHCPA et al. 2006; EBMUD 2009; Reclamation 2005b; Santa Clara County 2012; San Benito County 2013).

#### 17.3.2.4.1 Miwok

In the San Francisco Bay Area Region, the Coast Miwok people lived along lower San Joaquin River and San Pablo Bay and in the interior of the present Contra Costa and Alameda counties (Reclamation 1997; ECCCHCPA et al. 2006; Kelly 1978). The Bay Miwok villages were located in the San Ramon Valley with other settlements on the western slopes of the Diablo Range. The Volvons, speakers of the Bay Miwok language, settled along Marsh Creek and Kellogg Creek on the northern side of the Diablo Range and near the present Los Vaqueros Reservoir (CCWD et al. 2009). The Miwok people may have held lands at the peak of Mount Diablo.

#### 17.3.2.4.2 Costanoan

The Costanoans (also known as Ohlone) are a linguistically defined group with several autonomous tribelets that speak related languages (Levy 1978b; Reclamation 1997; EBMUD 2009; Zone 7 2006; Santa Clara County 2012). The Costanoans inhabited coastal shorelines along San Francisco, San Pablo, and Suisun Bay and along the Pacific Ocean Coast from the Golden Gate to Monterey Bay and interior valleys that extended approximately 60 miles inland, including areas within Santa Clara and San Benito counties (Reclamation 1997; ECCCHCPA et al. 2006; San Benito County 2010).

#### *17.3.2.5 Ethnography of the Central Coast Region*

The Central Coast Region considered in this EIS includes the coastal areas of present San Luis Obispo and Ventura counties. This area was home to the Salinan, Chumash, and Tataviam people.

The Salinan territory extends from about the present location of Soledad (Monterey County) to San Luis Obispo (Hester 1978). The Chumash are considered to have been one of the most elaborate cultures in California. The Chumash culture is characterized by large villages with social ranking, intensive trade, craft specialization, and well-developed art styles (Grant 1978b; Greenwood 1978; Kroeber 1925; Moratto 1984; Reclamation 1997; San Luis Obispo County 2010; Santa Barbara 2010; Santa Barbara County 2010). The Chumash inhabited the central coastal area of California from approximately present San Luis Obispo to Malibu Canyon and inland to western San Joaquin Valley.

#### *17.3.2.6 Ethnography of the Southern California Region*

The coastal portion of the Southern California Region considered in this EIS includes the present Ventura, Los Angeles, Orange, and San Diego counties. The interior portion of the Southern California Region includes the present western and central Riverside County and western San Bernardino County.

##### 17.3.2.6.1 Prehistory of Southern California Region, Coastal Portion

The Chumash and Tataviam people lived in the present Ventura County and northern Los Angeles County areas. The ethnography of the Chumash people is similar to that described above for the Central Coast Region. The Tataviam people lived inland of the Chumash and Gabrielino on the upper reaches of the Santa Clara River drainage east of Piru Creek and extending over the Sawmill Mountains to the edge of the southwestern Antelope Valley (King and Blackburn 1978).

The Gabrielino and Juaneño people lived in the present Los Angeles and Orange counties areas. The Gabrielino (also known as Gabrielino Tongva or Gabrieleño) occupied the Southern California coast in the vicinity around Mission San Gabrielal areas. The Juaneño occupied the area around the mission (Bean and Smith 1978; Los Angeles 2005; Riverside County 2000). These people traded with other people in Southern California.

The Luiseño and Tipai-Ipai people lived in the present Orange and San Diego counties areas. The Luiseño occupied most of the San Luis Rey and Santa Margarita River drainages near San Luis Rey Mission (Bean and Shipek 1978). The Luiseño shared many cultural traits with the Gabrielino and Chumas people. The Tipai-Ipai (also known as Kumeyaay) occupied extreme Southern California and Northern Baja California in autonomous, seminomadic bands of patrilineal clans (Luomala 1978; San Diego County 2011b; CDFG 2009). The Ipai occupied the areas north of the San Diego River, and the Tipai occupied the area south of the San Diego River (San Diego County 2011b).

#### 17.3.2.6.2 Prehistory of Southern California Region, Interior Portion

The Cahuilla, Serrano, Tubatalabal, Kawaiisu, and Quechan people lived in present Riverside, eastern Los Angeles, southeastern Kern, and western San Bernardino counties. The Tubatalabal also lived in the southeastern San Joaquin Valley in present southeastern Kern County.

*Cahuilla*

The Cahuilla lived inland within present Riverside County. Villages were located in canyons or on alluvial fans close to food and water sources. The Cahuilla interacted frequently with other people in Southern California (Bean 1978; Riverside County 2000).

*Serrano*

The Serrano lived in the San Bernardino Mountains within present northeastern Los Angeles County and southwestern San Bernardino County and in the northwestern valleys and mountains of Riverside County. Villages were located close to food and water sources along perennial streams and lakes. The Serrano interacted frequently with other people in Southern California (Riverside County 2000; DWR 2009).

*Kawaiisu*

The Kawaiisu occupied a mountainous area between the Mojave Desert and the southern San Joaquin Valley, mostly in Kern County, and the Tehachapi Valley (Zigmond 1986; California State Parks 2014). The Kawaiisu lived in permanent winter villages and traveled during the warmer months into the Mojave Desert and Antelope Valley. They traded and interacted with neighboring groups, including the Chumash, Yokuts, and Tubatalabal people.

*Quechan*

The Quechan were Yuman people that occupied areas along the Colorado River and adjacent valleys, including present Coachella and Imperial valleys (Riverside County 2000). The Quechan had a strong tribal identity and traveled extensively for trade.

## 17.3.3 Historical Context

The historical context presented in this section is focused on historical activities and resources that affected and/or were affected by implementation of water resource actions of CVP and SWP water users. Changes in CVP and SWP operations under implementation of alternatives considered in this EIS could not only affect CVP and SWP facilities. These changes also could affect regional and local water supplies, reservoirs, and associated land uses of those that use CVP and SWP water.

### *17.3.3.1 Introduction to Historical Context*

Initial contact with Europeans and Americans occurred with Spanish missionaries and soldiers, who entered California from the south in 1769, eventually founding 21 missions along the California coast (Reclamation 1997). This period is characterized by the establishment of missions and military presidios, the development of large tracts of land owned by the missions, and subjugation of the local Indian population for labor. This way of life began to change in 1822 when Mexico became independent of Spain. The mission lands were divided by government grants into large ranchos often consisting of tens of thousands of acres. The owners of these large *estancias* built homes, often of adobe, and maintained large herds of cattle and horses.

During the Spanish and Mexican periods, explorers entered the region. Fort Ross on the Sonoma coast was established by the Russians from 1812 until 1841 to support hunting, fishing, and whaling businesses (Reclamation 1997). American explorer Jedediah Smith and Peter Skene Odgen, Chief Trader for the Hudson Bay Company, with other members of the Hudson Bay Company also came to California during this period.

In 1848, the Treaty of Guadalupe Hidalgo transferred the lands of California from the Mexican Republic to the United States and initiated what is called the American Period in California history (Reclamation 1997). During that same year, gold was discovered in the foothills of the Sierra Nevada, and thousands of hopeful miners as well as storekeepers, settlers, and farmers entered the region. Mining in the Trinity River Region was expanded for both gold and copper mines (Placer County 2007).

To support this growth, extensive transportation systems were created to support wagon routes, steamboats on the major rivers, and numerous railroads (Reclamation 1997). Many of the supply centers and shipment points along these transportation corridors developed into cities, towns, and settlements. Logging and ranching also expanded to meet the needs of the new settlers. American ranchers found Central California ideally suited for grazing large herds of stock. During the latter part of the 19th century, American ranchers amassed large tracts of former rancho land, and several great cattle empires were formed. As settlements grew, farming increased. A primary constraint to expansion of crop diversity and areas under cultivation was the lack of water. Irrigation was virtually unknown in California until the 1880s, when large-scale irrigation systems were developed to improve agriculture yields. With the development of irrigation and improved transportation, new crops were added to the grains obtained from dry farming, including vegetables, fruits, and nuts.

Irrigation capabilities further expanded in the 1950s and 1960s with the implementation of multiple water projects. The availability of water also expanded the agricultural and urban water supplies in the Central Valley, San Francisco Bay Area, Central Coast, and Southern California regions.

#### *17.3.3.2 History of the Trinity River Region*

Explorers from the Philippines and Europe may have visited and interacted with the Yurok people as early as the late 1700s. Peter Skene Odgen and Jedediah Smith initially visited the Lower and Middle Klamath River reaches in the 1820s. In 1828, Jedediah Smith and his party of explorers were the first white men known to have visited the Trinity River watershed (USFWS et al. 1999).

Although the area was first used extensively by trappers, gold was discovered on the Trinity River in 1848, and by the late 1840s, gold mining was a major activity along the Trinity River (Hoover et al. 1990; Del Norte County 2003; USFWS et al. 1999). Weaverville was the center of gold mining activity after 1849 with numerous mining camps and settlements along the Trinity River. Mining continued along the Trinity River through the early and mid-1900s with large-scale dragline and bucket dredging operations beginning in 1939. Logging has occurred since the 1880s and continues in the Trinity River Region. These activities resulted in significant changes to rivers and may have caused the destruction of many prehistoric or historic archaeological sites (Hoover et al. 1990).

Increased activities within the Trinity River Region led to conflicts between the new residents and the Yurok and Hupa people. On November 16, 1855, the Klamath Indian Reservation was established by Executive Order for lands from the mouth of the Klamath River to a location upstream of Tectah Creek that extended 1 mile wide on either side of the river for the approximately 20-mile reach (DOI and CDFG 2012). The Hoopa Valley Reservation was established in 1864 and expanded in 1891 to include lands from the mouth of the Klamath River to the Hoopa Valley that extended 1 mile wide on either side of the river including portions of the Klamath Indian Reservation. In 1988, the Hoopa-Yurok Settlement Act (Public Law 100-580) partitioned portions of the previously established reservations into the Yurok Indian Reservation and Hoopa Valley Reservation and established the Resighini Rancheria.

### *17.3.3.3 History of the Central Valley Region*

#### 17.3.3.3.1 History of the Sacramento Valley

Europeans, Americans, and Canadians may have initially entered the Sacramento Valley in the late 1700s and early 1800s as part of missionary or military expeditions (Reclamation 1997, 2005a; Reclamation et al. 2006; Placer County 2007). By 1776, Jose Canizares explored areas located south of the present Sacramento community, and in 1813, there was a major battle between the Spanish and the Miwok people near the confluence of the Cosumnes River along the Sacramento River. Fur trappers moved through this area from the 1820s to 1840s.

The first settlements in this area occurred in the 1830s and 1840s on Mexican Land Grants. The New Helvetica Land Grant, which included more than 40,000 acres in the Sacramento Valley, was awarded to John Sutter in 1841 (DSC 2011).

Following the discovery of gold on the New Helvetica Land Grant in 1848 near present-day Coloma, numerous mining-related settlements were established in areas with the Nisenan, Maidu, Konkow, and Atsugewi people in the eastern portion of the Sacramento Valley and in areas with the Nomlaki and Wintu people in the western Sacramento Valley. Many of the Native Americans died after exposure to diseases from the new settlers, including malaria. Numerous other Native American died during battles against the new settlers.

Mining activities in the northern Sacramento Valley foothills and mountains near present Redding primarily were related to gold and copper (Reclamation 2013a). Mining activities in the central Sierra Nevada foothills primarily were related to gold. In 1848, mining started along the Trinity River and upper Sacramento River tributaries, primarily for copper and gold (Reclamation 2013a; Reclamation et al. 2006). Smelters, mills, and communities grew rapidly near the mining areas, including the town of Keswick, and communities were established within and adjacent to the present day Folsom Lake. The development of hydraulic mining in 1851 required establishment of substantial water diversions, flumes, and ditches to convey the water and displacement of vast amounts of sediment into the streams and along the banks of the waterways.

Logging also was a dominant industry in the western Sacramento Valley since the 1850s (Reclamation 1997, 2013a). The logging industry grew as the railroads were extended. Establishment of logging in the Sierra Nevada foothills and mountains also led to development of water infrastructure to move and/or mill the logs. One of the first water system infrastructures developed for these purposes was the original Folsom Dam constructed in 1893 (Reclamation et al. 2006).

Agricultural activities were successful throughout the Sacramento Valley to serve the mining communities (Reclamation 1997). The completion of the first transcontinental railroad in 1869 increased the number of settlers and allowed transport of crops from the Sacramento Valley to Nevada, Utah, and subsequently to other areas of the nation (Reclamation 2005b). The expanded agricultural markets expanded due to the establishment and development of commercial crops, accessibility to markets, and new farming techniques and irrigation.

Construction of hydroelectric power and water storage facilities in the Sacramento Valley foothills started in the early 1900s to provide hydropower and water supplies to local and regional users, as well as export to other portions of the state using CVP, SWP, City and County of San Francisco, and East Bay Municipal Utility District facilities.

#### 17.3.3.3.2 History of the San Joaquin Valley

The San Joaquin Valley area was not widely settled by Europeans or Mexicans when California lands were under Spanish rule (1769 to 1821) or Mexican rule (1821 to 1848). Numerous expeditions travelled through the San Joaquin Valley during this period but did not establish major settlements (Reclamation 2010). During the Spanish rule, several settlements occurred along Fresno Slough (Reclamation and State Parks 2012; Reclamation and DWR 2011). There were several settlements along the San Joaquin River and along the western boundary of the San Joaquin Valley during Mexican rule when ranches were established in the Coast Range foothills, including in Pacheco Pass and along Los Banos Creek.

In the latter half of the 19th century, agricultural settlements and mining camps were established in the San Joaquin Valley along the railroad corridors

(Reclamation 1997; Reclamation and DWR 2011). The town of Rootville, subsequently renamed Millerton in honor of Major Miller, was established near the present Millerton Lake with a military post, Camp Barbour (later named Fort Miller) to maintain order in the mining camps.

Initially, agricultural activities were related to ranching and dry farming. Livestock ranching expanded in the late 1860s (Reclamation et al. 2011b). With the increased availability of electric pumps, groundwater and surface water irrigation was used throughout the valley. Many irrigation districts were formed after the passage of the Wright Act in 1877 that provided methods to finance major irrigation projects. One of the first irrigation systems constructed in the eastern San Joaquin Valley was the "Main Canal" as part of the Miller and Lux's San Joaquin and Kings River Canal and Irrigation Company (Reclamation and State Parks 2013).

Historic resources are related to the settlement of the valley and include homesteads, transportation infrastructure (such as ship landings, ferry ports, and bridges), food processing and other industrial facilities, residential properties, commercial establishments, mining features (in the eastern portion), and government facilities (Reclamation 1997, 2010; Reclamation and DWR 2011).

#### 17.3.3.3.3 History of the Delta and Suisun Marsh

Communities were not established in the Delta and Suisun Marsh areas until the mid-1800s. There were numerous Spanish expeditions under Spanish rule. In the 1830s and 1840s, Mexico established land grants, including Rancho Suisun located west of present City of Fairfield (Reclamation et al. 2010).

Following the discovery of gold in the Sacramento Valley, settlements occurred in the Delta to provide support services and agricultural products for those traveling to the gold fields and the Sacramento and San Francisco areas. Passage of the Swamp and Overflow Act in 1850 led to the transfer of lands from the U.S. Government in the Delta to the State of California, which subsequently sold the land to individuals. The new settlers in the Delta constructed levees to protect the lands from periodic flooding and drained other lands to reduce the potential for mosquito-borne diseases. By the 1920s, numerous communities were established around food processing and packing houses that supported a wide range of crops such as asparagus, barley, celery, corn, winter grain, sugar beets, onions, and alfalfa for local dairy farms were introduced to the area (DSC 2011; Reclamation et al. 2010). By the 1950s, major food packers and processors moved from the Delta, and many communities became smaller. Recreational opportunities were established in the 1850s with duck hunting opportunities in the Suisun Marsh area.

### *17.3.3.4 History of the San Francisco Bay Area Region*

In 1579, Sir Francis Drake and other Spanish explorers led expeditions into the San Francisco Bay Area. However, in general, the Spanish did not settle Northern California until the 1700s when other Europeans established trading settlements for fur, mining, and other products. Initially, the Spanish confined their settlement to the coastline to establish military bases, or presidios (Hoover et al. 1990). Father Junipero Serra and other Franciscans worked with the Spanish explorers to establish missions along the Alta California coastal areas between present Sonoma County (San Francisco Solano established in 1823) to present Ventura County (San Buenaventura established in 1782), including three missions in areas that use CVP and SWP water (Mission San Jose established in 1797, Mission Santa Clara established in 1777, and Mission San Juan Bautista established in 1797).

San Jose was one the first towns established in Alta California as Pueblo de San José de Guadalupe (Santa Clara County 2012). The Spanish government awarded land grants in the San Francisco Bay Area Region (DWR 2008; EBMUD 2009; Hoover et al. 1990; Reclamation 2005b; San Benito County 2010; Zone 7 2006). In 1821, Mexico won independence from Spain, began to establish more secular communities around the missions, and divided many of the ranchos into smaller pueblos (Santa Clara County 2012). These actions supported growth in the present California coastal areas.

Following California statehood in 1849, ranching and farming communities were established in the interior valleys of the San Francisco Bay Area Region (Santa Clara County 2012; CCWD et al. 2009; ECCCHCPA et al. 2006). Starting in the late 1800s, expansion of the railroads in the area and use of improved irrigation systems led to the expansion of agriculture throughout the area. In mid-1900s, industrial expansion occurred in Contra Costa, Alameda, and Santa Clara counties.

#### *17.3.3.5 History of the Central Coast Region*

In 1542, Portuguese explorer Juan Rodríguez Cabrillo entered Santa Barbara Harbor (Puerto de Santa Bárbara). In 1587, Pedro de Unamuno brought his ship into Morro Bay, explored inland to the present site of the City of San Luis Obispo, and claimed the area for Spain. In 1595, Sebastián Rodríguez Cermeño entered San Luis Obispo Bay (Hoover et al. 1990). The explorations laid the foundation for the founding of five missions in the Central Coast Region considered in this EIS. Ranchos were granted throughout the region in the 1830s and 1840s.

Following the California statehood, ranching and farming continued to be the main economic activity of the Central Coast Region to the present.

#### *17.3.3.6 History of the Southern California Region*

In 1540, Hernando de Alarcón explored the inland areas of the Southern California Region with an expedition that had explored the Colorado River. In 1542, Cabrillo apparently became the first European to sight the coast of Southern California, including the Los Angeles area and Santa Catalina Island, although he did not make landfall (Hoover et al. 1990).

In 1769, Gaspar de Portolá explored a trail by land from present San Diego through present San Diego, Orange, and Los Angeles counties (Hoover et al. 1990). He camped near the Los Angeles River and the Indian Village of Yang-Na (within the present City of Los Angeles). In 1772, Pedro Fages made an inland journey from present San Diego through western Riverside County to San Luis Obispo (Hoover et al. 1990; Riverside County 2000). In 1776, friar Francisco Garcés explored from present San Gabriel Valley to the Antelope Valley. More than 20 missions were established along the Southern California coastline (Los Angeles 2005). Pueblos were established near the missions, including the Pueblo of Los Angeles in 1781.

The first known discovery of gold in California was made between 1775 and 1780 in the Potholes district of southeastern California in present Imperial County (Clark 1970). Other placer deposits were found in 1828 at San Ysidro in present San Diego County, and in 1835 and 1842 at San Francisquito Canyon and Placerita Canyon, respectively, in present Los Angeles County (Clark 1970; Vredenburgh 1991). Some of the mines continued to produce gold through the early 1990s.

Following the end of Spanish Rule, the Mexican Government deeded the extensive land holdings to ranchos to develop ranches and orchards (Riverside County 2000). Oranges and lemons became major agricultural crops between the 1850s and 1880s, and railroads were built to transport the products.

Water supply systems were constructed to provide water to missions and pueblo villages. One of the first systems was the Zanja Madre that was constructed in 1781 to convey water to the pueblo in the present City of Los Angeles (Los Angeles 2005; DWR 2009). The system was expanded in the 1850s and 1860s to convey water to vineyards and fruit orchards. During the late 1800s and early 1900s, numerous dams and conveyance facilities were constructed in the area to support the communities and agriculture.

### 17.3.4 Known Cultural Resources

The following subsections describe known cultural resources in the counties within the study area as determined through review of reports prepared for other projects in the study area. No physical or record surveys were conducted for this EIS because no site-specific construction actions were considered in this EIS. The EIS evaluates alternatives to continue the coordinated long-term operation of the CVP and SWP. The resources described in this subsection indicate the types of resources that occur in areas served by CVP and SWP water and adjacent areas. Therefore, some of the known resources presented in this chapter are located in portions of the counties that are not within the CVP and SWP water service areas.

#### *17.3.4.1 Known Cultural Resources of the Trinity River Region*

Within Trinity County, a cultural resources records search of the Trinity River Region was conducted for the Trinity River Mainstem Fishery Restoration EIS/Environmental Impact Report (EIR) (USFWS et al. 1999). The area covered included 660 feet on either side of the Trinity River from Trinity Lake to the eastern boundary of Hoopa Valley Indian Reservation and the inundation areas of the Trinity Lake and Lewiston Reservoir. More than 150 recorded cultural resources were identified along the mainstem of Trinity River within Trinity County, including 20 types of prehistoric and historic sites. Among these were Native American villages, camps, and lithic scatters; historic Indian sites; mines; ditches; cabins; structures; a school; USFWS stations and campgrounds; cemeteries; a rock wall; trails; a wagon road; and a bridge. Fifty-one sites are inundated within Trinity Lake and Lewiston Reservoir. Few of these sites have been evaluated for eligibility to be included in the National Register of Historic Places (NRHP). With respect to more recent historic sites in Trinity County, none of the sites listed in the NRHP, California State Historical Landmarks, California Register of Historical Resources (CRHR), and/or Points of Interest is located within or along banks of the Trinity River (CSPOHP 2014a).

Within Humboldt County, numerous culturally sensitive areas are located along the Lower Klamath and Lower Trinity rivers. The culturally sensitive areas include the areas along the riverbanks associated with religious and/or resource-producing important sites, in addition to specific known cultural resources. Many cultural resource locations are in the Hoopa Valley Indian Reservation and Yurok Reservation, including villages, cemeteries, ceremonial and gathering areas, and along ridgeline corridors that were used for traveling between villages (Humboldt County 2012). With respect to more recent historic sites in Humboldt County, none of the sites listed in the NRHP, California State Historical Landmarks, CRHR, and/or Points of Interest is located within or along banks of the Trinity or Klamath rivers (CSPOHP 2014b).

Within Del Norte County, numerous culturally sensitive areas are located along the Lower Klamath River, including areas within the Yurok Reservation and the Resighini Rancheria along the southern shoreline of the mouth of the Klamath River at the Pacific Ocean (Del Norte County 2003). The mouth of the Klamath River is of great spiritual significance for the Yurok people (Yurok Tribe 2005). The Yurok Tribe has suggested that the entire Klamath River, including the Lower Klamath River, be designated as a Cultural Riverscape and be submitted for consideration as a NRHP (Yurok Tribe 2005). With respect to more recent historic sites in Del Norte County, none of the sites listed in the NRHP, California State Historical Landmarks, CRHR, and/or Points of Interest is located within or along banks of the Klamath River (CSPOHP 2014c).

#### *17.3.4.2 Previously Recorded Cultural Resources in the Central Valley Region*

The Central Valley Region is rich in both historic- and prehistoric-period resources (Reclamation 1997), including large, deep midden sites (which generally contains waste materials that indicate human inhabitation) that provide information on prehistoric culture extending over thousands of years.

As described above, implementation of the alternatives considered in this EIS could affect cultural resources at CVP and SWP reservoir facilities and in areas that use CVP and SWP water that could experience land uses because of changes in CVP and SWP water supply availability.

#### 17.3.4.2.1 Cultural Resources at CVP and SWP Reservoir Facilities in the Sacramento Valley

Previous cultural resource studies were conducted at and/or near Shasta Lake, Lake Oroville, and Folsom Lake.

The studies near Shasta Lake surveyed approximately 8 percent of the study area and identified 261 cultural resources, including 190 prehistoric properties, 45 historic resources, and 26 properties with prehistoric and historic resources (Reclamation 2013a). The prehistoric sites include habitation sites, artifact and lithic scatters, caves used as shelter, and cemeteries. The historic sites included bridges, railways, a dam, buildings, ranches, orchards, mines, towns, and cemeteries. Several prehistoric and historic cemeteries located within the inundation area were moved prior to completion of the Shasta Lake complex. The Dog Creek Bridge is the only resource in this area that is listed on the NRHP. The Shasta and Keswick dams were determined to be NRHP-eligible.

The studies near Lake Oroville identified 261 cultural resources areas, including 234 prehistoric properties, 462 historic resources, and 91 properties with prehistoric and historic resources (DWR 2004, 2007). Within the Lake Oroville inundation area, 93 prehistoric properties and 19 historic sites were identified prior to the completion of the reservoir. The prehistoric sites include habitation sites, milling sites, quarries, artifact and lithic scatters, caves used as shelter, rock art, fishing and hunting grounds, battle sites, trails, and cemeteries. The historic sites included bridges, railways, a dam, buildings, ranches, orchards, mines, towns, and cemeteries.

Oroville Dam and peripheral dams, Thermalito Diversion Dam, Thermalito Forebay and Afterbay, Fish Barrier Dam, Hyatt Pumping-Generating Plant and Intake Structure, Thermalito Power Plant and Power Canal, Lake Oroville Visitor Center and Visitor Viewing Platform, and Feather River Fish Hatchery were determined to be NRHP-eligible.

The studies near Folsom Lake identified 185 prehistoric properties and 59 historic sites (Reclamation 2005b; Reclamation et al. 2006). The prehistoric sites include habitation sites, middens, groundstones, and artifact and lithic scatters. The historic sites included buildings, mining areas, and refuse dumps. Folsom Dam was determined to be NRHP-eligible.

#### 17.3.4.2.2 Cultural Resources at CVP and SWP Reservoir and Pumping Plant Facilities in the San Joaquin Valley

Previous cultural resource studies were conducted at and/or near New Melones Reservoir, San Luis Reservoir, and Millerton Lake and San Joaquin River downstream of Friant Dam.

The studies near New Melones Reservoir surveyed approximately 78 percent of the study area and identified 725 cultural resources within the New Melones Reservoir area or within 0.25 mile of this area (Reclamation 2010). The prehistoric sites include habitation sites, artifact and lithic scatters, mortars, caves, rock art, and cemeteries. The historic sites included bridges, buildings, ranches, orchards, towns, water and power systems, transportation infrastructure, and cemeteries. Many of the sites are located within the inundation area. However, substantial surveys were conducted prior to construction of New Melones Reservoir in the 1980s.

The studies near San Luis Reservoir identified 51 prehistoric and historic cultural resources (Reclamation and State Parks 2012). The prehistoric sites include habitation sites and artifact and lithic scatters. The historic sites included bridges, water infrastructure, buildings, ranches, orchards, towns, and cemeteries. One of the major historic sites in this area is the remnant locations of Rancho San Luis Gonzaga. Many portions of the ranch are located within the inundation area. However, many of the structures were moved to a site near Pacheco Pass. The remaining portions of the ranch were deeded to the State of California in 1992 to become part of the Pacheco State Park. Rancho San Luis Gonzaga, a historic stock ranch landscape, has been designated by the state to be a Historic District/Cultural Landscape that is potentially NRHP-eligible and CRHR-eligible.

Recent studies along the San Joaquin River identified 19 prehistoric sites within the seasonal inundation area of Millerton Lake (Reclamation and DWR 2011; Reclamation and State Parks 2013). Additional sites are located within the area of the lake that is constantly inundated. Some of the known sites include the remains of Kuyu Illik; the Dumna “head” village; the Kechaye/”Dumna” village of Sanwo Kianu; remains of Fort Miller, Millerton, and Collins Sulphur Springs; and prehistoric sites with housepits, mortars, grinding sticks, and rock alignments (Reclamation and State Parks 2013).

Along the San Joaquin River downstream of Friant Dam (which forms Millerton Lake) to the confluence of the Merced River, 84 prehistoric sites, 18 historic sites, and 7 sites with both prehistoric and historic resources were identified as part of the San Joaquin River Restoration Program. The prehistoric sites include habitation sites, artifact and lithic scatters, and bedrock milling features. The historic sites included bridges, buildings, ranches, orchards, towns, water and power systems, and transportation infrastructure.

The Friant Dam, Friant-Kern Canal, associated features (berms, siphons, control structures, inlets, outlets, and check structures), approximately 40 bridges that cross the canal, and Little Dry Creek Wasteway Facility are considered historic resources (Reclamation and State Parks 2013; Reclamation et al. 2011b). The Friant Dam and Friant-Kern Canal was determined to be NRHP-eligible.

#### 17.3.4.2.3 Cultural Resources in the areas that use CVP and SWP Water Supplies in the Central Valley

Numerous cultural and historical resources are in the Central Valley, as summarized in Table 17.1. Most of the cultural resources are located within areas that would not be affected by land use changes that could result from changes in CVP and SWP water supplies. The resources listed in Table 17.1 also include the sites described above near CVP and SWP facilities.

**Table 17.1 Previously Recorded Cultural and Historical Resources of the Central Valley Region**

| County | Historic Site Types | Prehistoric Site Types |
|---|---|---|
| Butte | 26 NRHP properties, 8 California Historical Landmarks, and 21 California Points of Historical Interest (Reclamation 1997; CSPOHP 2014e). | 1,198 Known Prehistoric Site Types (Reclamation 1997). |
| Colusa | 7 NRHP properties, 3 California Historical Landmarks, and 3 California Points of Historical Interest (Reclamation 1997; CSPOHP 2014g). | 115 Known Prehistoric Site Types (Reclamation 1997). |
| El Dorado | 18 NRHP properties, 30 California Historical Landmarks, 8 California Points of Historical Interest; numerous historic sites, such as mining features, building foundations, trash scatters, and bridges, were inundated by Folsom Lake (Reclamation 1997; CSPOHP 2014h). | 595 Known Prehistoric Site Types (Reclamation 1997). |
| Fresno | 38 NRHP properties, 8 California Historic Landmarks, and 13 of which are California Points of Historical Interest (Reclamation 1997; CSPOHP 2014i). | 2,603 Known Prehistoric Site Types (Reclamation 1997). |
| Glenn | 2 NRHP properties, 2 California Historical Landmarks, and 17 California Points of Historical Interest (Reclamation 1997; CSPOHP 2014j). | 373 Known Prehistoric Site Types (Reclamation 1997). |
| Kern | 20 NRHP properties, 47 California Historic Landmarks, and 11 California Points of Historical Interest (Reclamation 1997; CSPOHP 2014k). | 3,850 Known Prehistoric and Historic Site Types (Reclamation 1997). |
| Kings | 4 NRHP properties, 3 California Historic Landmarks; the San Luis Canal, the only CVP facility in Kings County, has no historic or architectural resources in its vicinity (Reclamation 1997; CSPOHP 2014l). | 56 Known Prehistoric Site Types (Reclamation 1997). |
| Madera | 2 NRHP property, 1 California Historic Landmarks, and 9 California Points of Historical Interest (Reclamation 1997; CSPOHP 2014n). | 2,043 Known Prehistoric Site Types (Reclamation 1997). |
| Merced | 14 NRHP properties, 5 California Historic Landmarks, 1 CRHR properties, and 8 California Points of Historical Interest (Reclamation 1997; CSPOHP 2014p). | 316 Known Prehistoric Site Types (Reclamation 1997). |

| County | Historic Site Types | Prehistoric Site Types |
|---|---|---|
| Napa | 76 NRHP properties, 17 California Historical Landmarks, and 13 California Points of Historical Interest (Reclamation 1997; CSPOHP 2014q). | 700 Known Prehistoric Site Types (Reclamation 1997). |
| Placer | 18 NRHP properties, 20 California Historical Landmarks, 21 California Points of Historical Interest; numerous historic sites, such as mining features, building foundations, trash scatters, and bridges, were inundated by Folsom Lake, which is a CVP facility (Reclamation 1997; CSPOHP 2014s). | 627 Known Prehistoric Site Types (Reclamation 1997). |
| Plumas | 6 NRHP properties, 13 California Historical Landmarks, and 5 California Points of Historical Interest (Reclamation 1997; CSPOHP 2014t). | 1,639 prehistoric sites in Plumas County (Plumas County 2012). |
| Sacramento | 90 NRHP properties, 56 California Historical Landmarks, 4 CRHR properties, 20 California Points of Historical Interest; numerous historic sites, such as mining features, building foundations, trash scatters, and bridges, were inundated by Folsom Lake; the Folsom Mining District surrounds Lake Natoma (Reclamation 1997; CSPOHP 2014u).<br>There are over 40 historic sites along the Sacramento River between Sutter County boundary and Freeport (Reclamation 2005b); including Natomas Main Drainage Canal, Town of Freeport, Sacramento Weir, Yolo Bypass, homes and farms, and a church.<br>There are 14 historic sites along the American River between Folsom Dam and the confluence with the Sacramento River (Reclamation 2005b). | 407 Known Prehistoric Site Types (Reclamation 1997). There are 24 prehistoric sites along the Sacramento River between Sutter County boundary and Freeport (Reclamation 2005b). There are 22 prehistoric sites along the American River between Folsom Dam and the confluence with the Sacramento River (Reclamation 2005b). |
| San Joaquin | 31 NRHP properties, 25 California Historic Landmarks, 3 CRHR properties, and 7 are California Points of Historical Interest (Reclamation 1997; CSPOHP 2014v). | 189 Known Prehistoric Site Types (Reclamation 1997). |

| County | Historic Site Types | Prehistoric Site Types |
|---|---|---|
| Shasta | 26 NRHP properties, 19 California Historical Landmarks, 1 CRHR properties, 15 California Points of Historical Interest (Reclamation 1997; CSPOHP 2014w).<br>The Anderson-Cottonwood Irrigation District Diversion Dam has been determined to be eligible for NRHP listing (Reclamation 2013a). | 1,419 Known Prehistoric Site Types. Many of these sites occur along the Sacramento River near Redding and between Battle Creek and Table Mountain (Reclamation 2013a). |
| Solano | 23 NRHP properties, 14 California Historical Landmarks, and 9 California Points of Historical Interest (Reclamation 1997; CSPOHP 2014x). | 300 Known Prehistoric Site Types (Reclamation 1997). |
| Stanislaus | 21 NRHP properties, 5 California Historic Landmarks, and 7 are California Points of Historical Interest; the former right-of-way for the Patterson and Western Railroad, which was constructed in 1916, bisects the Delta-Mendota Canal (Reclamation 1997; CSPOHP 2014y). | 280 Known Prehistoric Site Types (Reclamation 1997). |
| Sutter | 7 NRHP properties, 2 California Historical Landmarks, and 22 California Points of Historical Interest (Reclamation 1997; CSPOHP 2014z). | 62 Known Prehistoric Site Types (Reclamation 1997). |
| Tehama | 10 NRHP properties, 3 California Historical Landmarks, and 1 California Point of Historical Interest (Reclamation 1997; CSPOHP 2014aa). | 1,415 Known Prehistoric Site Types (Reclamation 1997). |
| Tulare | 34 NRHP properties, 8 California Historic Landmarks, and no California Points of Historical Interest (Reclamation 1997; CSPOHP 2014ab). | 1,857 Known Prehistoric Site Types (Reclamation 1997). |
| Yolo | 21 NRHP properties, 2 California Historical Landmarks, 1 CRHR properties, and 8 California Points of Historical Interest (Reclamation 1997; CSPOHP 2014ad). | 175 Known Prehistoric Site Types (Reclamation 1997). Includes possible fishing stations along Putah and Cache Creeks, the Sacramento, and ephemeral tributaries to these watercourses. |
| Yuba | 10 NRHP properties, 6 California Historical Landmarks, and 14 California Points of Historical Interest (Reclamation 1997; CSPOHP 2014ae). | 1,112 Known Prehistoric Site Types (Reclamation 1997). |

#### 17.3.4.3 Previously Recorded Cultural Resources in the San Francisco Bay Area Region

The San Francisco Bay Area Region includes Alameda, Contra Costa, Santa Clara, and San Benito counties. Much of this region is highly urbanized and that development has affected archaeological resources. Numerous cultural and historical resources are in the San Francisco Bay Area Region, as summarized in Table 17.2. Most of the cultural resources are located within areas that would not be affected by land use changes that could result from changes in CVP and SWP water supplies.

**Table 17.2 Previously Recorded Cultural Resources of the San Francisco Bay Area Region**

| County | Historic Site Types | Prehistoric Site Types |
|---|---|---|
| Alameda | 141 NRHP properties, 34 California Historical Landmarks, 2 CRHR properties, and 4 California Points of Historical Interest (CSPOHP 2014af). | No comprehensive inventory of prehistoric sites in Alameda County (Zone 7 2006). |
| Contra Costa | 40 NRHP properties, 13 California Historical Landmarks, 1 CRHR property, and 12 California Points of Historical Interest (CSPOHP 2014ag). | No comprehensive inventory of prehistoric sites in Contra Costa County (Contra Costa County 2005). Up to 41 sites were identified in the Kellogg Creek Historic District near Los Vaqueros Reservoir (CCWD et al. 2009). |
| San Benito | 12 NRHP properties, 5 California Historic Landmarks, and 2 California Points of Historical Interest (Reclamation 1997; CSPOHP 2014ah). | 180 Known Prehistoric Site Types (Reclamation 1997). |
| Santa Clara | 101 NRHP properties, 41 California Historical Landmarks, and 58 California Points of Historical Interest (CSPOHP 2014ai; Santa Clara County 1994). | Between 1912 and 1960, 43 sites were recorded in the Santa Clara Valley portion of Santa Clara County (Santa Clara 2012). |

#### 17.3.4.4 Previously Recorded Cultural Resources in the Central Coast and Southern California Regions

The Central Coast Region includes San Luis Obispo and Santa Barbara counties. Within the Central Coast Region, the SWP provides water supplies to portions of San Luis Obispo and Santa Barbara counties. Within the Southern California Region, the SWP provides water supplies to portions of Ventura, Los Angeles, Orange, Riverside, San Bernardino, and San Diego counties. Numerous cultural and historical resources are in the Central Coast and Southern California regions, as summarized in Table 17.3. Most of the cultural resources are located within areas that would not be affected by land use changes that could result from changes in SWP water supplies.

**Table 17.3 Previously Recorded Cultural and Historical Resources of the Central Coast and Southern California Regions**

| County | Historic Site Types | Prehistoric Site Types |
|---|---|---|
| San Luis Obispo | 34 NRHP properties, 2 California Historical Landmarks, and 4 California Points of Historical Interest (CSPOHP 2014ao). | The San Luis Obispo County General Plan discusses several hundred prehistoric resources throughout San Luis Obispo County related to the Chumash people (San Luis Obispo County 2010). |
| Santa Barbara | 43 NRHP properties, 16 California Historical Landmarks, and 7 California Points of Historical Interest (CSPOHP 2014ap). | The 2010 Santa Barbara Conservation Element of the Comprehensive Plan noted prehistoric resources throughout Santa Barbara County related to the Chumash people (Santa Barbara County 2010). |
| Los Angeles | 431 NRHP properties, 90 California Historical Landmarks, 6 CRHR property, and 65 California Points of Historical Interest (CSPOHP 2014aj). | Over 4,196 prehistoric sites in Los Angeles County (SCAG 2011). |
| Orange | 108 NRHP properties, 24 California Historical Landmarks, and 20 California Points of Historical Interest (CSPOHP 2014ak). | Over 1,710 prehistoric sites in Orange County (SCAG 2011; Orange County 2005). |
| Riverside | 52 NRHP properties, 23 California Historical Landmarks, and 72 California Points of Historical Interest (CSPOHP 2014al). | Over 19,858 prehistoric sites in Orange County (SCAG 2011). Some of the Cahuilla, Serrano, and Luiseño communities were inundated within Lake Perris (Reclamation and DWR 2003). |
| San Bernardino | 56 NRHP properties, 39 California Historical Landmarks, 2 CRHR property, and 119 California Points of Historical Interest (CSPOHP 2014am). | Over 29,480 prehistoric sites in San Bernardino County, including the Calico “Early Man” Site (SCAG 2011). |
| San Diego | 130 NRHP properties, 63 California Historical Landmarks, 3 CRHR property, and 16 California Points of Historical Interest (CSPOHP 2014an). | The San Diego County General Plan discussed that there are many prehistoric sites within San Diego County; however, the number and locations are not identified to protect the resources (San Diego County 2011a). |

| County | Historic Site Types | Prehistoric Site Types |
|---|---|---|
| Ventura | 34 NRHP properties, 11 California Historical Landmarks, and 4 California Points of Historical Interest (CSPOHP 2014aq). | Over 1,806 prehistoric sites in San Bernardino County (SCAG 2011). |

# 17.4 Impact Analysis

This section describes the potential mechanisms for change in cultural resources and analytical methods, results of the impact analysis, potential mitigation measures, and potential cumulative effects.

## 17.4.1 Potential Mechanisms for Change and Analytical Tools

As described in Chapter 4, Approach to Environmental Analysis, the environmental consequences assessment considers changes in cultural resources conditions related to changes in CVP and SWP operations under the alternatives as compared to the No Action Alternative and Second Basis of Comparison that could result in land disturbance or increased exposure of cultural resources sites.

### *17.4.1.1 Changes in the Potential for Land Disturbance*

Under Alternatives 1 through 5, No Action Alternative, and Second Basis of Comparison, CVP and SWP water supplies would continue to be provided within the currently designated service areas. Implementation of the alternatives does not include expansion of designated service areas or increased water contract amounts. Land use in 2030 would be consistent with existing general plan projections under all alternatives and the Second Basis of Comparison. The CVP and SWP water contract amounts would be the same under all alternatives and the Second Basis of Comparison. The alternatives would not result in expansion of municipal or agricultural lands, or associated disturbances of cultural resources because of expansion of development or cultivated lands in addition to the conditions projected under existing general plans. Therefore, changes in CVP and SWP water supply availability that would result in changes in land use and associated potential for disturbance of cultural resources are not analyzed in this EIS.

### *17.4.1.2 Changes in Potential Exposure of Cultural Resources at Reservoirs that Store CVP and SWP Water*

Changes in CVP and SWP operations under the alternatives as compared to the No Action Alternative and Second Basis of Comparison could result in increased periods of time when low water elevations occur in reservoirs that store CVP and SWP water, including the CVP and SWP reservoirs. The lowest reservoir elevations generally occur in September in dry and critical dry years, as described in Chapter 5, Surface Water Resources and Water Supplies. The minimum and maximum elevations of the reservoir surface water under Alternatives 1 through 5, No Action Alternative, and Second Basis of Comparison would be the same as under current conditions.

#### *17.4.1.3 Effects Related to Cross Delta Water Transfers*

Water transfer programs have been used to provide water to existing agricultural and municipal service areas when other water supplies are not available. It is anticipated that water transfers under all alternatives and the Second Basis of Comparison would continue in this manner to provide water supplies to land uses projected under existing general plans which would not result in expansion of municipal or agricultural lands, or associated disturbances of cultural resources because of expansion of development or cultivated lands in addition to conditions projected under existing general plans. Therefore, effects related to cross Delta water transfers and associated potential for disturbance of cultural resources are not analyzed in this EIS.

### 17.4.2 Conditions in Year 2030 without Implementation of Alternatives 1 through 5

The impact analysis in this EIS is based upon the comparison of the alternatives to the No Action Alternative and the Second Basis of Comparison in the Year 2030. Many of the changed conditions would occur in the same manner under both the No Action Alternative and the Second Basis of Comparison (e.g., climate change, sea level rise, general plan development, and implementation of reasonable and foreseeable projects). Because of these changes, especially climate change and sea level rise, it is anticipated that reservoir elevations at the end of September would be lower, flows patterns in the rivers downstream of the reservoirs would be different than under recent condition, and CVP and SWP water deliveries would be less than under recent condition, as described in Chapter 5, Surface Water Resources and Water Supplies. In all regions, the minimum reservoir elevations under the No Action Alternative and Second Basis of Comparison would be similar to minimum elevations during recent conditions.

### 17.4.3 Evaluation of Alternatives

As described in Chapter 4, Approach to Environmental Analysis, Alternatives 1 through 5 have been compared to the No Action Alternative, and the No Action Alternative and Alternatives 1 through 5 have been compared to the Second Basis of Comparison.

During review of the numerical modeling analyses used in this EIS, an error was determined in the CalSim II model assumptions related to the Stanislaus River operations for the Second Basis of Comparison, Alternative 1, and Alternative 4 model runs. Appendix 5C includes a comparison of the CalSim II model run results presented in this chapter and CalSim II model run results with the error corrected. Appendix 5C also includes a discussion of changes in the comparison of the following alternatives analyses.

- No Action Alternative compared to the Second Basis of Comparison
- Alternative 1 compared to the No Action Alternative

- Alternative 3 compared to the Second Basis of Comparison
- Alternative 5 compared to the Second Basis of Comparison

#### *17.4.3.1 No Action Alternative*

As described in Chapter 4, Approach to Environmental Analysis, the No Action Alternative is compared to the Second Basis of Comparison.

##### 17.4.3.1.1 Potential Exposure of Cultural Resources at Reservoirs that Store CVP and SWP Water

As described above, the minimum reservoir elevations in all regions under the No Action Alternative and the Second Basis of Comparison would be within historic ranges and would not expose lands that are not currently exposed. Therefore, conditions of cultural resources would be similar under the No Action Alternative and Second Basis of Comparison.

#### *17.4.3.2 Alternative 1*

Alternative 1 is identical to the Second Basis of Comparison. Alternative 1 is compared to the No Action Alternative and the Second Basis of Comparison. However, because cultural resource conditions under Alternative 1 are identical to cultural resource conditions under the Second Basis of Comparison, Alternative 1 is only compared to the No Action Alternative.

##### 17.4.3.2.1 Alternative 1 Compared to the No Action Alternative

*Potential Exposure of Cultural Resources at Reservoirs that Store CVP and SWP Water*

As described above, the minimum reservoir elevations in all regions under Alternative 1 as compared to the No Action Alternative would be within historic ranges and would not expose lands that are not currently exposed. Therefore, conditions of cultural resources would be similar under Alternative 1 and the No Action Alternative.

##### 17.4.3.2.2 Alternative 1 Compared to the Second Basis of Comparison

Alternative 1 is identical to the Second Basis of Comparison.

#### *17.4.3.3 Alternative 2*

The cultural resources conditions under Alternative 2 would be identical to the conditions under the No Action Alternative; therefore, Alternative 2 is only compared to the Second Basis of Comparison.

##### 17.4.3.3.1 Alternative 2 Compared to the Second Basis of Comparison

Changes to cultural resources conditions under Alternatives 2 as compared to the Second Basis of Comparison would be the same as the impacts described in Section 17.4.3.1, No Action Alternative.

#### *17.4.3.4 Alternative 3*

CVP and SWP operations under Alternative 3 are similar to the Second Basis of Comparison with modified Old and Middle River flow criteria and New Melones Reservoir operations.

##### 17.4.3.4.1 Alternative 3 Compared to the No Action Alternative

*Potential Exposure of Cultural Resources at Reservoirs that Store CVP and SWP Water*

As described above, the minimum reservoir elevations in all regions under Alternative 3 as compared to the No Action Alternative would be within historic ranges and would not expose lands that are not currently exposed. Therefore, conditions of cultural resources would be similar under Alternative 3 as compared to the No Action Alternative.

##### 17.4.3.4.2 Alternative 3 Compared to the Second Basis of Comparison

*Potential Exposure of Cultural Resources at Reservoirs that Store CVP and SWP Water*

As described above, the minimum reservoir elevations in all regions under Alternative 3 as compared to the Second Basis of Comparison would be within historic ranges and would not expose lands that are not currently exposed. Therefore, conditions of cultural resources would be similar under Alternative 3 and Second Basis of Comparison.

#### *17.4.3.5 Alternative 4*

The cultural resources conditions under Alternative 4 would be identical to the conditions under the Second Basis of Comparison. Therefore, Alternative 4 is only compared to the No Action Alternative.

##### 17.4.3.5.1 Alternative 4 Compared to the No Action Alternative

Changes in cultural resources conditions under Alternative 4 as compared to the No Action Alternative would be the same as the impacts described in Section 17.4.3.2.1, Alternative 1 Compared to the No Action Alternative.

#### *17.4.3.6 Alternative 5*

The CVP and SWP operations under Alternative 5 are similar to the No Action Alternative with modified Old and Middle River flow criteria and New Melones Reservoir operations.

##### 17.4.3.6.1 Alternative 5 Compared to the No Action Alternative

*Potential Exposure of Cultural Resources at Reservoirs that Store CVP and SWP Water*

As described above, the minimum reservoir elevations in all regions under Alternative 5 as compared to the No Action Alternative would be within historic ranges and would not expose lands that are not currently exposed. Therefore, conditions of cultural resources would be similar under Alternative 5 as compared to the No Action Alternative.

#### 17.4.3.6.2 Alternative 5 Compared to the Second Basis of Comparison

*Potential Exposure of Cultural Resources at Reservoirs that Store CVP and SWP Water*

As described above, the minimum reservoir elevations in all regions under Alternative 5 as compared to the Second Basis of Comparison would be within historic ranges and would not expose lands that are not currently exposed. Therefore, conditions of cultural resources would be similar under Alternative 5 and Second Basis of Comparison.

### *17.4.3.7 Summary of Impact Analysis*

The results of the impact analysis of implementation of Alternatives 1 through 5 as compared to the No Action Alternative and the Second Basis of Comparison are presented in Tables 17.4 and 17.5.

**Table 17.4 Comparison of Alternatives 1 through 5 to No Action Alternative**

| Alternative | Potential Change | Consideration for Mitigation Measures |
|---|---|---|
| Alternative 1 | No effects to cultural resources | None needed |
| Alternative 2 | No effects to cultural resources | None needed |
| Alternative 3 | No effects to cultural resources | None needed |
| Alternative 4 | No effects to cultural resources | None needed |
| Alternative 5 | No effects to cultural resources | None needed |

**Table 17.5 Comparison of No Action Alternative and Alternatives 1 through 5 to Second Basis of Comparison**

| Alternative | Potential Change | Consideration for Mitigation Measures |
|---|---|---|
| Alternative 1 | No effects to cultural resources | None needed |
| Alternative 2 | No effects to cultural resources | None needed |
| Alternative 3 | No effects to cultural resources | None needed |
| Alternative 4 | No effects to cultural resources | None needed |
| Alternative 5 | No effects to cultural resources | None needed |

### *17.4.3.8 Potential Mitigation Measures*

Mitigation measures are presented in this section to avoid, minimize, rectify, reduce, eliminate, or compensate for adverse environmental effects of Alternatives 1 through 5, as compared to the No Action Alternative. Mitigation measures were not included to address adverse impacts under the alternatives as compared to the Second Basis of Comparison because this analysis was included in this EIS for information purposes only.

Implementation of Alternatives 1 through 5 as compared to the No Action Alternative would not result in increased potential exposure or disturbance of cultural resources. Therefore, there would be no adverse impacts to cultural resources because of implementation of the alternatives; and no mitigation measures are needed.

#### *17.4.3.9 Cumulative Effects Analysis*

As described in Chapter 3, the cumulative effects analysis considers projects, programs, and policies that are not speculative and are based upon known or reasonably foreseeable long-range plans, regulations, operating agreements, or other information that establishes them as reasonably foreseeable.

The cumulative effects analysis for Alternatives 1 through 5 for Cultural Resources are summarized in Table 17.6.

**Table 17.6 Summary of Cumulative Effects on Cultural Resources with Implementation of Alternatives 1 through 5 as Compared to the No Action Alternative**

| Scenarios | Actions | Cumulative Effects of Actions |
|---|---|---|
| Past & Present, and Future Actions Included in All Alternatives in Year 2030 | Consistent with Affected Environment conditions plus:<br>Actions in the 2008 USFWS BO and 2009 NMFS BO that would have occurred without implementation of the BOs, as described in Section 3.3.1.2 (of Chapter 3, Descriptions of Alternatives), including climate change and sea level rise<br>Actions not included in the 2008 USFWS BO and 2009 NMFS BO that would have occurred without implementation of the BOs, as described in Section 3.3.1.3 (of Chapter 3, Descriptions of Alternatives):<br>- Implementation of Federal and state policies and programs, including Clean Water Act (e.g., Total Maximum Daily Loads); Safe Drinking Water Act; Clean Air Act; and flood management programs<br>- General plans for 2030.<br>- Trinity River Restoration Program.<br>- Central Valley Project Improvement Act programs<br>- Iron Mountain Mine Superfund Site | <u>These effects would be the same under all alternatives.</u><br>Community development would occur in accordance with general plan projections for 2030. Development within the Delta would be subject to the requirements of the Delta Protection Commission and Delta Stewardship Council. Future development projects are anticipated to potentially effect cultural resources. However, development of these future programs would include preparation of environmental documentation that would identify methods to minimize adverse impacts to cultural resources.<br>Restoration plans for the ongoing programs would be completed. Development along river corridors in the Central Valley. Future restoration projects are anticipated to potentially affect cultural resources. However, development of these future programs would include preparation of environmental documentation that would identify methods to |

| Scenarios | Actions | Cumulative Effects of Actions |
|---|---|---|
| | - Nimbus Fish Hatchery Fish Passage Project<br>- Folsom Dam Water Control Manual Update<br>- FERC Relicensing for the Middle Fork of the American River Project<br>- Lower Mokelumne River Spawning Habitat Improvement Project<br>- Dutch Slough Tidal Marsh Restoration<br>- Suisun Marsh Habitat Management, Preservation, and Restoration Plan Implementation<br>- Tidal Wetland Restoration: Yolo Ranch, Northern Liberty Island Fish Restoration Project, Prospect Island Restoration Project, and Calhoun Cut/Lindsey Slough Tidal Habitat Restoration Project<br>- San Joaquin River Restoration Program<br>- Future water supply projects, including water recycling, desalination, groundwater banks and wellfields, and conveyance facilities (projects with completed environmental documents) | minimize adverse impacts to cultural resources.<br>Climate change and sea level rise, development under the general plans, FERC relicensing projects, and some future projects to improve water quality and/or habitat are anticipated to reduce availability of CVP and SWP water supplies as compared to past conditions.<br>Future water supply projects are anticipated to both increase water supply reliability due to reduced surface water supplies and to accommodate planned growth in the general plans. Most of these programs were initiated prior to implementation of the 2008 USFWS BO and 2009 NMFS BO which reduced CVP and SWP water supply reliability. Future water supply projects are anticipated to potentially effect cultural resources. However, development of these future programs would include preparation of environmental documentation that would identify methods to minimize adverse impacts to cultural resources. |
| Future Actions considered as Cumulative Effects Actions in All Alternatives in Year 2030 | Actions as described in Section 3.5 (of Chapter 3, Descriptions of Alternatives):<br>- Bay-Delta Water Quality Control Plan Update<br>- FERC Relicensing Projects<br>- Bay Delta Conservation Plan (including the California WaterFix alternative)<br>- Shasta Lake Water Resources, North-of-the-Delta Offstream Storage, Los Vaqueros Reservoir Expansion Phase 2, and Upper San Joaquin River Basin Storage Investigations | <u>These effects would be the same under all alternatives.</u><br>Most of the future reasonably foreseeable actions are anticipated to reduce water supply impacts due to climate change, sea level rise, increased water allocated to improve habitat conditions, and future growth.<br>Some of the reasonably foreseeable actions related to improved water quality and habitat conditions (e.g., Water Quality Control Plan Update and FERC Relicensing Projects), could in further |

| Scenarios | Actions | Cumulative Effects of Actions |
|---|---|---|
| | - El Dorado Water and Power Authority Supplemental Water Rights Project<br>- Sacramento River Water Reliability Project<br>- Semitropic Water Storage District Delta Wetlands<br>- North Bay Aqueduct Alternative Intake<br>- San Luis Reservoir Low Point Improvement Project<br>- Future water supply projects, including water recycling, desalination, groundwater banks and wellfields, and conveyance facilities (projects that did not have completed environmental documents during preparation of the EIS) | reductions in CVP and SWP water deliveries.<br>Future development of the cumulative projects are anticipated to potentially affect cultural resources. However, development of these future programs would include preparation of environmental documentation that would identify methods to minimize adverse impacts to cultural resources. |
| No Action Alternative with Associated Cumulative Effects Actions in Year 2030 | Full implementation of the 2008 USFWS BO and 2009 NMFS BO | Community development and restoration projects for the ongoing programs would be completed.<br>Climate change and sea level rise, FERC relicensing projects, and some future projects to improve water quality and/or habitat are anticipated to reduce availability of CVP and SWP water supplies as compared to past conditions.<br>Future water supply projects are anticipated to both increase water supply reliability due to reduced surface water supplies and to accommodate planned growth in the general plans.<br>Future development projects are anticipated to potentially affect cultural resources. However, development of these future programs would include preparation of environmental documentation that would identify methods to minimize adverse impacts to cultural resources. |

| Scenarios | Actions | Cumulative Effects of Actions |
|---|---|---|
| Alternative 1 with Associated Cumulative Effects Actions in Year 2030 | No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant) | Implementation of Alternative 1 with reasonably foreseeable actions would result in similar changes as under the No Action Alternative with the added actions. |
| Alternative 2 with Associated Cumulative Effects Actions in Year 2030 | Full implementation of the 2008 USFWS BO and 2009 NMFS BO CVP and SWP operational actions<br>No implementation of structural improvements or other actions that require further study to develop a more detailed action description. | Implementation of Alternative 2 with reasonably foreseeable actions would result in similar changes as under the No Action Alternative with the added actions. |
| Alternative 3 with Associated Cumulative Effects Actions in Year 2030 | No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant)<br>Slight increase in positive Old and Middle River flows in the winter and spring months | Implementation of Alternative 3 with reasonably foreseeable actions would result in similar changes as under the No Action Alternative with the added actions. |
| Alternative 4 with Associated Cumulative Effects Actions in Year 2030 | No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant) | Implementation of Alternative 4 with reasonably foreseeable actions would result in similar changes as under the No Action Alternative with the added actions. |
| Alternative 5 with Associated Cumulative Effects Actions in Year 20530 | Full implementation of the 2008 USFWS BO and 2009 NMFS BO<br>Positive Old and Middle River flows and increased Delta outflow in spring months | Implementation of Alternative 5 with reasonably foreseeable actions would result in similar changes as under the No Action Alternative with the added actions. |

**Chapter 18**

# Public Health

## 18.1 Introduction

This chapter describes public health hazards in the study area related to changes in the environment that could occur as a result of implementing the alternatives evaluated in this Environmental Impact Statement (EIS). Implementation of the alternatives considered in this EIS could affect public health through changes in available water supplies from the Central Valley Project (CVP) and State Water Project (SWP); changes in irrigated crop acreage related to potential changes in operation of the CVP and SWP; changes in wetlands acreage related to potential changes in ecosystem restoration; and changes in water quality related to potential changes in operation of the CVP and SWP.

Changes in available water supplies, agricultural resources, wetlands, and water quality are described in more detail in Chapter 5, Surface Water Resources and Water Supplies; Chapter 12, Agricultural Resources; and Chapter 6, Water Quality, respectively.

## 18.2 Regulatory Environment and Compliance Requirements

Potential actions that could be implemented under the alternatives evaluated in this EIS could affect public health throughout the study area. Some of the actions considered in the alternatives evaluated in this EIS could include facilities located on public agency lands; or actions implemented, funded, or approved by Federal and state agencies. These actions would need to be compliant with appropriate Federal and state agency policies and regulations, as summarized in Chapter 4, Approach to Environmental Analyses.

## 18.3 Affected Environment

This section describes the following public health factors that could be potentially affected by the implementation of the alternatives considered in this EIS.

- Changes in available water supplies.
- Increases in the potential for mosquito-borne diseases due to an increase in wetlands.
- Changes in the potential for Valley Fever from disturbed soils when irrigation water supplies change.
- Changes in the potential for bioaccumulation of mercury in fish and shellfish.

Changes in the potential of direct or indirect exposure to high water quality concentrations of various constituents also may occur due to implementation of the alternatives. These direct changes to water quality and the related changes to drinking water safety and consumption of fish or shellfish exposed to high concentrations of constituents of concern are described in Chapter 6, Water Quality.

Public health effects that could occur due to construction activities are not discussed in this chapter, including increased exposure to naturally occurring asbestos, methane production from disturbance of peat soils, disturbance of oil and gas production fields, use and transport of hazardous wastes, and changes in wastewater or stormwater discharges. Although several of the alternatives include assumptions of constructed facilities, those actions will require subsequent planning and environmental documentation prior to implementation. The subsequent environmental documentation and related permits will evaluate public health effects associated with construction and implementation of those facilities.

### 18.3.1 Public Health Issues Related to Available Water Supplies

Water supply availability can affect public health in several ways. Potential direct effects to public health are related to reduction of municipal water supplies. Potential indirect effects to public health are related to reduction of industrial and irrigation water supplies which could affect the ability to earn an income to fund food, shelter, and other critical factors necessary for public health. Effects related to loss of jobs.

Availability of water supplies substantially decreased for CVP and SWP water users during recent droughts in 1976-1977, 1987-1992, and 2012-2014. In addition, as described in Chapter 5, Surface Water Resources and Water Supplies, the frequency of substantially reduced water supplies provided by the CVP and SWP have increased since the 1976-1977 drought due to changes in regulations and increased water demands by users with higher priorities for water use.

During the 2014 drought, CVP and SWP water supply allocations have been reduced substantially to protect future water supplies and the ability to meet existing regulations, as described in Chapter 5, Surface Water Resources and Water Supplies. The allocations were modified throughout the 2013-2014 winter with the allocations that are the most stringent in the history of the CVP and/or SWP operations, as summarized below (Reclamation 2014a, 2014b; DWR 2013, 2014).

- CVP North of Delta Water Users.
  - Sacramento River Settlement Contractors – allocated 40 percent of total contracted water supply.
  - Sacramento Valley Refuges that use CVP water supplies – allocated 40 percent of total contracted water supply.

  - Agricultural Water Service Contractors – allocated 0 percent of total contracted water supply.
  - Municipal and Industrial Water Service Contractors – allocated 50 percent of historic water use.
- CVP In-Delta Water Service Contractor: Contra Costa Water District – allocated 50 percent of historic water use.
- CVP South of Delta Water Users.
  - San Joaquin River Exchange and Settlement Contractors – allocated 65 percent of total contracted water supply.
  - San Joaquin Valley Refuges that use CVP water supplies – allocated 65 percent of total contracted water supply.
  - Agricultural Water Service Contractors – allocated 0 percent of total contracted water supply.
  - Municipal and Industrial Water Service Contractors – allocated 50 percent of historic water use.
- CVP Friant Division Contractors – allocated 0 percent of total contracted water supply.
- CVP Eastside Water Service Contractors: Water supplies delivered from New Melones Reservoir – allocated 55 percent of total contracted water supply.
- SWP Water Service Contractors – 5 percent of total contracted water supply.

Another potential indirect effect to public health is related to reduction of stored water in the CVP and SWP reservoirs which could affect the ability to provide enough water for firefighting,

#### 18.3.1.1 Public Health and Safety Related to Available Municipal and Industrial Water Supplies

The Department of the Interior, Bureau of Reclamation (Reclamation) current *Draft Municipal and Industrial Shortage Policy* (Reclamation 2005) describes that the CVP water service contractors should develop public health and safety volumes based California’s public health and safety criteria or criteria developed in coordination with Reclamation. Currently, California does not have a uniform set of public health and safety criteria for municipal and industrial water supplies. At this time, most of the urban communities have not adopted specific public health and safety criteria. However, in some of the recently completed Urban Water Management Plans, criteria have been identified to protect public health and safety that range from 25 to 50 percent of the total water demand, as described in Chapter 5, Surface Water Resources and Water Supplies (CCWD 2011; City of Folsom 2011; Metropolitan 2010). The Urban Water Management Plans indicate that during the critical periods with reductions in water supplies, municipal and industrial water uses will be focused on inside water uses with little or no outside irrigation water.

At this time, no specific volumes have been identified for public health and safety quantities for the CVP and/or SWP water users. During the 2014 drought, the Department of Water Resources (DWR) and Reclamation identified 1,500 cubic feet per second as a minimum amount of CVP and SWP Delta exports for public health and safety uses for municipal and industrial water supplies. This amount is also defined by the limitations of the CVP and SWP conveyance facilities, as described in Chapter 5, Surface Water Resources and Water Supplies.

As described above, in 2014, CVP and SWP water supply allocations are at historically low values. However, it is difficult to identify local public health and safety issues, non-agricultural related industrial job losses, and economic losses associated with reductions in CVP and/or SWP water supplies. The potential economic losses, socioeconomic effects, and environmental justice effects are described in Chapter 19, Socioeconomics, and Chapter 21, Environmental Justice.

#### *18.3.1.2 Public Health and Safety Related to Available Agricultural Water Supplies*

Agricultural water suppliers have developed responses to the reductions in agricultural water supplies from the CVP and SWP, as described in Chapter 12, Agricultural Resources. Historically, the number of employment opportunities that rely directly or indirectly on the availability of CVP and/or SWP water supplies for irrigation have declined in the areas where the water supplies have declined, communities within the Central Valley Region and Southern California Region, as described in Chapter 19, Socioeconomics.

#### *18.3.1.3 Public Health and Safety Related to Water Supply Availability for Wildland Firefighting*

Complex terrain, Mediterranean climate, productive natural plant communities, and ample natural and aboriginal ignition sources has caused California to be a complex wildfire-prone and fire-adapted landscape. While natural wildfires support ecosystem health and are critical to maintaining the structure and function of ecosystems, wildfires pose a significant threat to life, public health, infrastructure, properties, and natural resources.

In accordance with Public Resources Code sections 4201 to 4204 and Government Code sections 51175 to 51189, the California Department of Forestry and Fire Prevention (CAL FIRE) has mapped areas of significant fire hazards based on fuels, terrain, weather, and other relevant factors. The zones are referred to as Fire Hazard Severity Zones and represent the risks associated with wildland fires. Under CAL FIRE regulations, areas within very high fire-hazard risk zones must comply with specific building and vegetation requirements intended to reduce property damage and loss of life within these areas.

According to CAL FIRE, there is an increasing trend of acres burned statewide, with particular increase in conifer vegetation types (CAL FIRE FRAP 2010). Statewide, there are 21.3 million acres of land designated as high priority landscape. The high priority landscape areas include locations with high value water supplies and high threats of fire and large communities which should be protected to prevent wildfire threats to maintain ecosystem health, water supplies, and large communities. These areas include the upper Trinity River watershed in the Trinity River Region; the upper Shasta Lake, Lake Oroville, Folsom Lake, New Melones Reservoir, and Millerton Lake watersheds in the Central Valley Region; and communities in throughout the Southern California Region. Areas designated as high priority landscape occur within 46 of 58 counties. Many rural counties have significant numbers of communities and acreage in medium priority landscape, including 508 communities with some high priority landscape areas.

CAL FIRE manages the State Responsibility Areas, and local fire districts manage Local Responsibility Areas. First responders are typically the local fire districts. The U.S. Forest Service provides wildland fire protection both independently and cooperatively with the California Department of Forestry and Fire Protection. In addition, the U.S. Department of the Interior National Park Service and Bureau of Land Management provide resource management and fire protection on portions of Federal lands.

Firefighting actions frequently involve use of water from reservoirs located close to wildland fires in the Trinity River, Central Valley, Central Coast, and Southern California regions, including reservoirs owned by Reclamation and DWR.

### 18.3.2 Public Health Issues Related to Mosquito-Borne Diseases

There are more than 50 species of mosquitos in California, including members of the four major genera: 24 species of *Aedes*, 5 species of *Anopheles*, 11 species of *Culex*, and 4 species of *Culiseta* (CDPH et al. 2012). Not all of these species are known to transmit mosquito-borne viruses, as described below. There are approximately 15 mosquito-borne viruses that occur in California; however, the most significant viruses that cause human disease are St. Louis encephalitis virus (SLEV), western equine encephalomyelitis (WEEV), and West Nile virus (WNV) (CDPH et al. 2014). No cases of SLEV or WEEV have been reported in humans over the past few years in California. Malaria also is a mosquito-borne disease that is caused by a parasite instead of a virus.

The *Culex tarsalis* has been identified as part of transmission of SLEV, WEEV, and WNV, especially in rural areas. The *Culex pipiens* and *Culex quinquefasciatus* have been identified as part of the transmission of WNV and SLEV. The *Culex stigmatosoma* has been identified as part of the transmission of WNV and SLEV, especially among birds. The *Aedes melanimon, Aedes vexans*, and *Culex erythrothorax* have been identified as species involved in transmitting the virus between birds and mammals or between mammals.

Mosquitoes, especially *Culex tarsalis*, live in every area of California, and can be a threat to the health of humans and domestic animals throughout the state. The mosquito life cycle requires water for the egg, larva, and pupa stages. Some of the species are more associated with irrigated agriculture, and others are more associated with urban communities (CDPH et al. 2014). Most of the diseases are not treatable and vaccines are not available for humans. Methods to prevent mosquitoes from becoming adults and methods to prevent mosquitos from biting humans are the only available and practical methods to protect public health.

California Health and Safety Code (Sections 2001 – 4(d); 2002; and 2060(b)) describes that landowners are legally responsible to eliminate public nuisances from their properties, including mosquito breeding habitat (CDPH 2008; CDPH et al. 2012). Federal, state, and local agencies supplement the preventive activities of individual landowners toward protecting humans and domestic animals from mosquito-borne diseases. The California Department of Public Health (CDPH) monitors mosquito populations throughout the state. In 1915, the state legislature enacted the Mosquito Abatement Act to allow local mosquito abatement special districts. The local mosquito and vector control districts monitor mosquito populations and take actions such as eliminating breeding sites, using biological control (predators such as mosquitofish), and using chemical control, to reduce mosquito population size (CDPH 2013a).

#### *18.3.2.1 St. Louis Encephalitis Virus*

The SLEV is a mosquito-borne virus that circulates among birds and is transmitted to humans via mosquito bites CALSURV 2013a; CDPH 2007). Human infection with SLE can cause mild to severe fever and headaches due to inflammation of the brain. In severe cases, the illness can cause disorientation and comas and possibly cause death. Elderly can become more severely ill than young children with SLEV as compared to WEEV.

Since the SLEV was first recognized in 1933 in St. Louis, Missouri, outbreaks have been reported throughout the United States, Canada, and northern Mexico, generally between August and October (CALSURV 2013a). In 1984 and 1989, 29 human cases were reported in the San Joaquin Valley of the Central Valley Region. During the same time periods, 26 human cases were reported in the Los Angeles area of the Southern California Region. The last human case reported in California occurred in 1997 in Los Angeles County.

#### *18.3.2.2 Western Equine Encephalitis*

The WEEV is another mosquito-borne virus that circulates among birds and is transmitted to horses and humans by mosquitoes (CDPH 2007). Symptoms are similar to SLEV. Infants and small children are most severely afflicted with WEEV as compared to SLEV. There is a vaccine for horses, but not for humans. Historically, substantial number of horses died due to this disease as well as humans. Recently, there has not been a recorded case of WEEV in humans in California (CDPH et al. 2014).

#### *18.3.2.3 West Nile Virus*

West Nile virus (WNV) can cause mild to severe illness in human, other mammals, and birds.

The virus circulates among birds and is transmitted to humans primarily by *Culex* mosquitoes (CDPH et al. 2014). The WNV was first detected in North America in New York in 1999, and has subsequently spread to 48 states, Canada, and Mexico.

The WNV first appeared in humans in California in 2002 with the identification of one human case (CALSURV 2013b). In 2003, three human cases and one equine case were reported with numerous verified findings of WNV activity among dead birds and mosquitoes. In 2004, the WNV was reported in 58 counties, with 779 human cases, including 29 WNV-associated deaths (CALSURV 2013b). From 2003 through 2013, there were 4,004 reported human cases of WNV with 145 deaths; 16,299 reported bird deaths; and 1,202 reported cases involving horses (CDPH 2014a). In 2007, 2008, and between 2010 and 2013, the majority of reported human cases occurred in the six counties in Southern California Region, with most of the cases reported in Los Angeles County. Between 2007 and 2013, numerous human cases were reported in Butte, Sutter, Sacramento, Stanislaus, Fresno, Tulare, and Kern counties in the Central Valley Region. During this same period, no human cases were reported in the Trinity River Region; Lassen, Plumas, and Nevada counties in the Central Valley Region; San Benito County in the San Francisco Bay Area Region; and San Luis Obispo County in the Central Coast Region.

In humans, WNV may not result in any symptoms or only mild viral symptoms, including mild fever, headache, body aches, skin rash, and swollen lymph glands. Symptoms in less than 1 percent of people that are infected can include headache, high fever, neck stiffness, stupor, disorientation, coma, tremors, convulsions, muscle weakness, and paralysis that are associated with meningitis or encephalitis.

#### *18.3.2.4 Malaria*

Malaria also is a mosquito-borne disease caused by a parasite that destroys the red blood cells of its host. People with malaria often experience fever, chills, and flu-like illness which can lead to death (CDPH et al. 2012). Malaria is no longer endemic in California, as well as the rest of the United States, due to intense mosquito control efforts and anti-malarial drugs. However, the disease is diagnosed every year, especially in people who have traveled outside the United States. In 2012, 92 human cases were reported in California (CDPH 2013). Of the 92 cases, 90 patients had traveled to countries characterized as endemic with malaria during the previous three years. The *Anopheles* mosquitoes can transmit the parasite to humans and are prevalent in California (CDPH et al. 2012).

### 18.3.3 Public Health Issues Related to Valley Fever

Valley fever is an illness that is caused by inhaling the spores of a fungus *Coccidioides immitis* (CDPH 2013c). This fungus lives in the top layers of some soils within 2 to 12 inches from the ground surface. When the soil is disturbed by digging, vehicles, cultivation, or wind, the fungal spores can be inhaled by persons within the area. Irrigated soils are less likely to contain the fungus than dry, previously undisturbed soils.

In most cases, symptoms in humans include mild cough and flu-like symptoms (CDPH 2013c). However, in about 40 percent of the reported cases, the illness can last for more than a month, make the person susceptible to pneumonia, and include cough, fever, chest pain, headache, muscle ache, rash, joint pain, and/or fatigue. In about 5 percent of the reported cases, the disease becomes "disseminated Valley Fever" and can cause meningitis and/or affect bones, joints, skin, or other organs. There are no vaccines to prevent Valley Fever.

The *Coccidioides immitis* is endemic in many areas of the southwestern United States, Mexico, Central America, and South America. In California, the fungus is found in many areas of the San Joaquin Valley and Southern California (CDPH 2011, 2014b). In California between 2001 and 2012, there were over 35,000 reported cases of Valley Fever. The number of incidences increased from 1,483 cases in 2001 to 4,094 cases in 2012. The highest number of cases reported during this period occurred in Kings, Kern, Fresno, Tulare, and Madera counties in the San Joaquin Valley within the Central Valley Region; San Luis Obispo County in the Central Coast Region; and Los Angeles County in the Southern California Region.

In general, the people who have the highest risk of exposure to the fungus include construction workers, archeologists, geologists, wildland fighters, military personnel, mining or gas/oil extraction workers, and agricultural workers in non-irrigated areas (CDPH 2013c). Other employees also may be at risk. For example, members of the cast and crew of a television film became ill with Valley Fever after working on an outdoor set in Ventura County (CDCP 2014).

In 2011, Fresno, Kern, Kings, San Joaquin, San Luis Obispo, and Tulare counties conducted an analysis of information related to Valley Fever incidences (Fresno County et al. 2011). The observations included:

- More incidences were reported in the western parts of Kern, Kings, Fresno, and San Joaquin counties than in other portions of the counties.
- More incidences were reported in northern San Luis Obispo County and southern Tulare County than other portions of the counties.
- In recent years, there was increased reporting of Valley Fever in the prison populations in Fresno and Kings counties. In Kern County, 8 percent of the reported cases between 2005 and 2008 were prison inmates. In Fresno County, incidences at Pleasant Valley State Prison were 43 percent of the total cases in the county between 2004 and 2010. In Kings County, incidences at state prisons were 58 percent of the total cases in the county between 2007 and 2010.

In 2012, the San Joaquin Valley Air Pollution Control District (SJVAPCD) evaluated causes for Valley Fever and options to reduce social and economic effects of Valley Fever in the San Joaquin Valley (SJVAPCD 2012). The analysis described that Valley Fever appears to be related to a fungus that forms in subsoil strata that are dry through a portion of the year. The analysis referred to other studies that correlated weather patterns with outbreaks of Valley Fever during dry periods following periods of heavy rainfall. The study also indicated that airborne *Coccidioides* spores do not generally come from irrigated agriculture. It appears that it is more likely that the spores are from non-irrigated lands, including undisturbed natural lands, undeveloped land, and grazing areas. The study indicated that additional monitoring or reduction of particulate matter of

10 microns, or $PM_{10}$, did not appear to be useful in reduction of the potential for Valley Fever. The study recommended additional funding to develop a vaccine for Valley Fever.

### 18.3.4 Public Health Issues Related to High Concentrations of Mercury in Fish and Shellfish

As described in Chapter 6, Water Quality, high concentrations of certain substances accumulate in fish and shellfish based upon the water quality. The California Environmental Protection Agency, Office of Environmental Health Hazard Assessment (OEHHA) evaluates concentrations of potentially toxic substances in edible tissues of fish and shellfish harvested in water bodies in California (OEHHA 2014a). Based upon the evaluation, general and specific safe eating guidelines are developed for the fish and shellfish, as summarized in Table 18.1. For the water bodies in the study area, the primary constituents that have triggered the development of safe eating guidelines are mercury, dieldrin, and/or polychlorinated biphenyl (PCB). Other constituents are present, including selenium; however, the concentrations do not exceed thresholds that would trigger safe eating guidelines. The OEHHA develops two separate guidelines: (1) Guidelines for Children from 1 to 17 years and Women from 18 to 45 years; and (2) Guidelines for Women over 45 years old and Men over 17 years old. The guidelines recommend the number of servings per week by fish or shellfish harvested from specific waters. A "serving size" is defined as "about the size and thickness of your hand" (OEHHA 2014a).

**Table 18.1 Summary of Safe Eating Guidelines for Fish and Shellfish from Water Bodies in the Study Area Based on Mercury and PCB (servings per week)**

| Region | Water Body | Fish and Shellfish[a] | Guidelines for Children and Women up to 45 Years Old[b] | Guidelines for Men and Women over 45 Years Old[b] |
|---|---|---|---|---|
| **Trinity River** | Trinity Lake | Rainbow Trout, Brown Trout, White Catfish | 2 | 5 |
| | | Largemouth Bass, Smallmouth Bass | Do not eat | 1 |
| | Lewiston Lake | Trout | 5 | 7 |
| **Central Valley** | Sacramento River and Northern Delta | American Shad, Chinook Salmon, Rainbow Trout, Steelhead Trout | 2 to 3 | 7 |
| | | Clams | 7 | 7 |
| | | Bluegill, other sunfish, carp or goldfish, catfish, crappie, Crayfish, Hardhead, Hitch, sucker | 1 | 3 |

| Region | Water Body | Fish and Shellfisha | Guidelines for Children and Women up to 45 Years Oldb | Guidelines for Men and Women over 45 Years Oldb |
|---|---|---|---|---|
| **Central Valley (continued)** | | Bass, Pikeminnow, White Sturgeon | Do not eat | 1 |
| | | Striped Bass | Do not eat | 2 |
| | Lake Oroville | Bluegill and Green Sunfish | 2 | 5 |
| | | Carp, Coho salmon | 1 | 2 |
| | | Largemouth Bass, Smallmouth Bass, Redeye, or Spotted Bass; Channel Catfish; White Catfish | Do not eat | 1 |
| | Lower Feather River | American Shad, Chinook Salmon, Steelhead Trout | 2 to 3 | 7 |
| | | Carp, sucker | 1 | 2 |
| | | Redear, other sunfish | 1 | 3 |
| | | Black Bass, catfish, Pikeminnow, Striped Bass, White Sturgeon | Do not eat | 1 |
| | Englebright Lake | Rainbow Trout | 2 | 7 |
| | | Bluegill, other sunfish | 1 | 2 |
| | | Largemouth Bass, Smallmouth Bass, Spotted Bass | Do not eat | 1 |
| | Rollins Reservoir | Catfish | 1 | 2 |
| | Camp Far West Reservoir | Bluegill, other sunfish | 1 | 3 |
| | | Largemouth Bass, Smallmouth Bass, Spotted Bass, catfish | Do not eat | 1 |
| | Folsom Lake | Bluegill, Green Sunfish, or other sunfish; Rout: 16 inches or less | 2 | 5 |

| Region | Water Body | Fish and Shellfisha | Guidelines for Children and Women up to 45 Years Oldb | Guidelines for Men and Women over 45 Years Oldb |
|---|---|---|---|---|
| **Central Valley (continued)** | | Catfish; Chinook Salmon; Largemouth Bass, Smallmouth Bass, Spotted Bass, trout: over 16 inches | Do not eat | 1 |
| | Lake Natoma | Bluegill, Green Sunfish, or other sunfish; trout: 16 inches or less | 2 | 5 |
| | | Chinook Salmon; Largemouth Bass, Smallmouth Bass, Spotted Bass, trout: over 16 inches | Do not eat | 1 |
| | | Catfish | Do not eat | Do not eat |
| | Lower American River | American Shad, Chinook Salmon, steelhead trout | 2 to 3 | 7 |
| | | Redear or other sunfish, sucker, white catfish | 1 | 2 |
| | | Striped Bass | Do not eat | 2 |
| | | Bass, Pikeminnow | Do not eat | 1 |
| | Lower Mokelumne River | American Shad, Chinook Salmon, steelhead trout | 2 to 3 | 7 |
| | | Clams | 7 | 7 |
| | | Bluegill or other sunfish, Crayfish, catfish | 1 | 2 |
| | | Striped Bass | Do not eat | 2 |
| | | Bass, Pikeminnow, White Sturgeon | Do not eat | 1 |
| | San Joaquin River (Friant Dam to Port of Stockton) | Chinook Salmon, steelhead trout | 2 | 7 |
| | | Bluegill or other sunfish | 2 | 5 |
| | | American Shad | 3 | 7 |
| | | Carp, catfish, sucker | 1 | 2 |

| Region | Water Body | Fish and Shellfisha | Guidelines for Children and Women up to 45 Years Oldb | Guidelines for Men and Women over 45 Years Oldb |
|---|---|---|---|---|
| **Central Valley (continued)** | | Striped Bass | Do not eat | 2 |
| | | Bass, white sturgeon | Do not eat | 1 |
| | Central and South Delta | American Shad, Chinook Salmon, Bluegill or other sunfish, steelhead trout | 2 | 7 |
| | | Catfish, Crayfish | 2 | 5 |
| | | Clams | 7 | 7 |
| | | Bass, carp, crappie, sucker | 1 | 2 |
| | | Striped Bass | Do not eat | 2 |
| | | White Sturgeon | Do not eat | 1 |
| **San Francisco Bay Area** | San Francisco Bay | Chinook Salmon | 2 | 7 |
| | | Brown Rockfish, Red Rock Crab | 2 | 5 |
| | | Jacksmelt | 2 | 2 |
| | | California Halibut | 1 | 2 |
| | | White Croaker | 1 | 1 |
| | | Sharks, Striped Bass, White Sturgeon | Do not eat | 1 |
| | | Surfperches | Do not eat | Do not eat |
| | San Pablo Reservoir | Crappie | 2 | 5 |
| | | Trout | 5 | 5 |
| | | Largemouth Bass, Smallmouth Bass, Spotted Bass | Do not eat | 1 |
| | | Carp, catfish | Do not eat | Do not eat |
| | Lafayette Reservoir | Crappie | 4 | 7 |
| | | Bass | 1 | 2 |
| | | Carp or Goldfish | Do not eat | 1 |

| Region | Water Body | Fish and Shellfisha | Guidelines for Children and Women up to 45 Years Oldb | Guidelines for Men and Women over 45 Years Oldb |
|---|---|---|---|---|
| **San Francisco Bay Area (continued)** | Lake Chabot | Redear or other sunfish | 2 | 4 |
| | | Channel Catfish | 1 | 1 |
| | | Bass | Do not eat | 1 |
| | | Carp | Do not eat | Do not eat |
| **Southern California Region** | Pyramid Lake | Rainbow Trout | 7 | 7 |
| | | Channel Catfish | 1 | 2 |
| | | Largemouth Bass, Smallmouth Bass | Do not eat | 1 |
| | | Bullhead | Do not eat | Do not eat |
| | Silverwood Lake | Rainbow Trout | 7 | 7 |
| | | Tule Perch | 1 | 1 |
| | | Largemouth Bass, Bluegill, Channel Catfish | Do not eat | 1 |
| | | Striped Bass, Blackfish, Tui Chub | Do not eat | Do not eat |
| **Statewide** | All Lakes and Reservoirs without Site-Specific Advice | Rainbow trout | 2 | 6 |
| | | Bullhead, catfish, Bluegill or other sunfish, Brown Trout: 16 inches or less | 1 | 2 |
| | | Bass, carp, Brown Trout: over 16 inches | Do not eat | 1 |
| | All Rivers, Estuaries, and Coastal Waters without Site-Specific Advice | American Shad, Chinook Salmon, steelhead trout | 2 to 3 | 7 |

| Region | Water Body | Fish and Shellfish[a] | Guidelines for Children and Women up to 45 Years Old[b] | Guidelines for Men and Women over 45 Years Old[b] |
|---|---|---|---|---|
| **Statewide (continued)** | | Striped Bass | Do not eat | 2 |
| | | White Sturgeon | Do not eat | 1 |

Sources: OEHHA 2014b, 2014c, 2014d, 2014e, 2014f, 2014g, 2014h, 2014i, 2014j, 2014k, 2014l, 2014m, 2014n, 2014o, 2014p, 2014q, 2014r, 2014s, 2014t, 2014u, 2014v, 2014w

Notes:
a. All fish and shellfish names are as appears in the OEHHA guidelines.
b. The OEHHA guidelines refer to the total number of servings of fish per week for one water body, not just the total for a specific species. For example, OEHHA guidelines for Men eating fish from Trinity Lake would include no more than 5 servings of Rainbow Trout, Brown Trout, or White Catfish; OR 1 serving of Largemouth Bass or Smallmouth Bass.

Resident Delta fish accumulate mercury primarily through dietary exposure; larger, piscivorous (fish-eating) fish show the greatest levels of tissue mercury. In contrast to anadromous fish (migratory species), the resident fish experience constant exposure to local mercury sources. Resident species include larger fish with human health exposure (such as Largemouth Bass) and smaller, forage fish (such as Inland Silversides). Fish tissues are the ultimate route of exposure to mercury for humans who consume locally caught fish.

Historically, substantial levels of mercury contamination have occurred in fish throughout the Delta. Mercury concentrations in tissue of the larger piscivorous fish are lower in for fish in the central Delta as compared to fish from the Mokelumne, Cosumnes, Sacramento, and San Joaquin rivers (CVRWQCB 2010a, 2010b). Larger, piscivorous resident fish, in general, provide a good record of fish tissue mercury as a baseline condition for the Delta. Largemouth Bass were chosen because they are popular sport fish, top predators, live for several years, and tend to stay in the same area (exhibit high site fidelity). Consequently, they are excellent indicators of long-term average mercury exposure, risk, and spatial pattern for ecological and human health. Mercury in sport fish from the Delta region was reported for Largemouth Bass as a median tissue mercury concentration of 0.53 mg mercury per kilogram (Hg/kg) wet weight (Davis et al. 2003). Current fish tissue concentrations thus exceed both adopted regulatory standards and guidance from the U.S. Environmental Protection Agency (USEPA). In the 2010 Delta TMDL for methylmercury, the Central Valley Regional Water Quality Control Board (Central Valley RWQCB) established a fish tissue threshold (fillet concentrations, wet weight mercury) of 0.24 mg Hg/kg wet weight in trophic level 4 fish (adult, top predatory sport fish, such as Largemouth Bass) (Central Valley Water Board 2010a). These values are slightly lower than USEPA's national recommended water quality criterion for fish tissue of 0.3 mg Hg/kg wet weight for protection of human health and wildlife (USEPA

2001). Therefore, the Delta average for Largemouth Bass fillet concentrations in the study by Davis et al. exceeds both recommended safe consumption guidelines.

# 18.4 Impact Analysis

This section describes the potential mechanisms for change in conditions and analytical methods; results of impact analyses; potential mitigation measures; and cumulative effects.

## 18.4.1 Potential Mechanisms for Change and Analytical Methods

As described in Chapter 4, Approach to Environmental Analysis, the impact analysis considers changes in public health factors related to changes in CVP and SWP operations under the alternatives as compared to the No Action Alternative and Second Basis of Comparison.

Changes in CVP and SWP operations under the alternatives as compared to the No Action Alternative and Second Basis of Comparison could change public health factors affected by CVP and SWP operations.

### *18.4.1.1 Changes in Public Health Factors Related to Available CVP and SWP Agricultural Water Supplies*

Changes in water supply availability to agricultural water users could result in reductions of irrigated acreage and related jobs. The availability of jobs can affect public health, as described in Section 18.3.2, Public Health Issues Related to Available Water Supplies. As described in Chapter 12, Agricultural Resources, agricultural acreage would be similar under Alternatives 1 through 5, No Action Alternative, and Second Basis of Comparison. Therefore, the change in public health conditions would be the same under all of the alternatives and the Second Basis of Comparison; and is not analyzed in this EIS.

### *18.4.1.2 Changes in Public Health Factors Related to Available Municipal Water Supplies*

As described in Section 18.3.2, Public Health Issues Related to Available Water Supplies, water supply availability can affect public health related to direct use within the household and indirect effects related to adequate water supplies for industrial and commercial water users that provide employment. As described in Chapter 5, Surface Water Resources and Water Supplies, and Chapter 18, Socioeconomics, t municipal and industrial water users would rely upon alternate water supplies to meet water demands in 2030. Therefore, public health conditions related to availability of municipal and industrial water supplies would be the same under all of the alternatives and the Second Basis of Comparison; and is not analyzed in this EIS.

### *18.4.1.3 Changes in Public Health Factors Related to Wildland Firefighting and CVP and SWP Reservoir Storage*

Stored water in water supply reservoirs is used for wildland firefighting in the California foothills and mountains, including water stored in CVP and SWP reservoirs. During drier periods, reduced storage levels could affect the availability of water for wildlife firefighting, as indicated in changes in CVP and SWP reservoir at the end of September in critical dry water years, as described in Chapter 5, Surface Water Resources and Water Supplies.

Reservoirs that store water in the San Francisco Bay Area, Central Coast, and Southern California regions are managed to store water supplies as part of short-term conveyance management or storage for regional and local water supplies using water from numerous sources and water for wildland firefighting is not known; and therefore, are not analyzed in this EIS.

#### 18.4.1.4 Changes in Public Health Factors Related to Wetlands Restoration and Mosquito-Borne Diseases

Wetlands provide habitat for mosquito breeding, especially in tidally-influenced wetlands with slow moving water and floodplains after the majority of the water recedes. Management practices (e.g., designing wetlands to provide flushing flows, use of biological controls) can reduce the nuisance and public health aspects of mosquito populations. The extent of seasonal floodplains and tidally-influenced wetlands in Yolo Bypass, Cache Slough, and Suisun Marsh areas would increase in a similar manner under all of the alternatives and the Second Basis of Comparison, as described in Chapter 3, Description of Alternatives. Therefore, the potential for changes in public health conditions related to mosquito populations would be the same under all of the alternatives and the Second Basis of Comparison; and is not analyzed in this EIS.

#### 18.4.1.5 Changes in Public Health Factors Related to Potential Valley Fever

As described above, recent studies have indicated that valley fever exposure appears to be related to cultivated lands, including lands that are idled due to agricultural practices or reduced water supply availability. Changes in CVP and SWP operations under the alternatives and the Second Basis of Comparison would not affect the extent of non-irrigated lands. Therefore, the potential for changes in public health conditions related to Valley Fever would be the same under all of the alternatives and the Second Basis of Comparison; and is not analyzed in this EIS.

#### 18.4.1.6 Changes in Public Health Factors Related to Mercury in Fish used for Human Consumption

As described above, fish used for human consumption in the Delta have mercury levels that exceed OEHHA guidelines. Changes in CVP and SWP operations under the alternatives and the Second Basis of Comparison would change the accumulated mercury concentrations in fish in the Delta. As described in Chapter 6, Surface Water Quality, the bioavailability and toxicity of mercury is enhanced through the natural, bacterial conversion of mercury to methylmercury in marshlands or wetlands. These stagnant locations with reduced oxygen concentrations promote chemical reduction processes that make methylation possible. The methylmercury model is based upon the Total Maximum Daily Load translation equation for mercury developed by the Central Valley Regional

Water Quality Control Board. The model estimates fish tissue concentrations from waterborne concentrations of mercury in the Delta and evaluates the potential to cause exceedances of water quality or tissue benchmarks. The tissue concentrations associated with the Alternatives 1 through 5 were compared to the No Action Alternative and the Second Basis of Comparison.

### 18.4.2 Conditions in Year 2030 without Implementation of Alternatives 1 through 5

This EIS includes two bases of comparison, as described in Chapter 3, Description of Alternatives: the No Action Alternative and the Second Basis of Comparison. Both of these bases are evaluated at 2030 conditions. Changes that would occur over the next 15 years without implementation of the alternatives are not analyzed in this EIS. However, the changes to public health that are assumed to occur by 2030 under the No Action Alternative and the Second Basis of Comparison are summarized in this section. Many of the changed conditions would occur in the same manner under both the No Action Alternative and the Second Basis of Comparison.

#### *18.4.2.1 Common Changes in Conditions under the No Action Alternative and Second Basis of Comparison*

Conditions in 2030 would be different than existing conditions due to:

- Climate change and sea level rise
- General plan development throughout California, including increased water demands in portions of Sacramento Valley
- Implementation of reasonable and foreseeable water resources management projects to provide water supplies

It is anticipated that climate change would result in more short-duration high-rainfall events and less snowpack in the winter and early spring months. The reservoirs would be full more frequently by the end of April or May by 2030 than in recent historical conditions. However, as the water is released in the spring, there would be less snowpack to refill the reservoirs. This condition would reduce reservoir storage and available water supplies to downstream uses in the summer. The reduced end of September storage also would reduce the ability to release stored water to downstream regional reservoirs. These conditions would occur for all reservoirs in the California foothills and mountains, including non-CVP and SWP reservoirs.

These changes would result in a decline of the long-term average CVP and SWP water supply deliveries by 2030 as compared to recent historical long-term average deliveries under the No Action Alternative and the Second Basis of Comparison. However, the CVP and SWP water deliveries would be less under the No Action Alternative as compared to the Second Basis of Comparison, as described in Chapter 5, Surface Water Resources and Water Supplies. Due to climate change and related lower snowfall, end of September low reservoir storage would be lower in critical dry years by 2030 as compared to recent historical conditions in Shasta Lake, Lake Oroville, Folsom Lake, New Melones Reservoir, and San Luis Reservoir. Therefore, the potential for reduced reservoir water supplies for wildland firefighting would be greater under the No Action Alternative and Second Basis of Comparison as compared to recent historical conditions.

Under the No Action Alternative and the Second Basis of Comparison, land uses in 2030 would occur in accordance with adopted general plans.

The No Action Alternative and the Second Basis of Comparison assumes completion of water resources management and environmental restoration projects that would have occurred without implementation of Alternatives 1 through 5, including regional and local recycling projects, surface water and groundwater storage projects, conveyance improvement projects, and desalination projects, as described in Chapter 3, Description of Alternatives. The No Action Alternative and the Second Basis of Comparison also assumes implementation of actions included in the 2008 U.S. Fish and Wildlife Service (USFWS) Biological Opinion (BO) and 2009 National Marine Fisheries Service (NMFS) BO that would have been implemented without the BOs by 2030, as described in Chapter 3, Description of Alternatives.

Under the No Action Alternative and Second Basis of Comparison, it is anticipated that mercury concentrations in fish tissue within the Delta will be either similar or greater than recent historical conditions. Phase 1 of the Delta Mercury Program mandated by the Central Valley RWQCB is currently being completed to protect people eating one meal per week of larger fish from the Delta, including Largemouth Bass. Phase 1 is focused on studies and pilot projects to develop and evaluate management practices to control methylmercury from mercury sources in the Delta and Yolo Bypass; and to reduce total mercury loading to the San Francisco Bay. Following completion of Phase 1 in 2019, Phase 2 will be implemented through 2030. Phase 2 will focus on methylmercury control programs and reduction programs for total inorganic mercury. Due to the extent of these studies, it is not anticipated that changes in methylmercury or total mercury concentrations in fish tissue will be reduced by 2030. Future mercury reduction and control programs will reduce mercury sources and related fish tissue concentrations; however, that will occur after 2030.

### 18.4.3 Evaluation of Alternatives

As described in Chapter 4, Approach to Environmental Analysis, Alternatives 1 through 5 have been compared to the No Action Alternative; and the No Action Alternative and Alternatives 1 through 5 have been compared to the Second Basis of Comparison.

During review of the numerical modeling analyses used in this EIS, an error was determined in the CalSim II model assumptions related to the Stanislaus River operations for the Second Basis of Comparison, Alternative 1, and Alternative 4 model runs. Appendix 5C includes a comparison of the CalSim II model run results presented in this chapter and CalSim II model run results with the error corrected. Appendix 5C also includes a discussion of changes in the comparison of groundwater conditions for the following alternative analyses.

- No Action Alternative compared to the Second Basis of Comparison
- Alternative 1 compared to the No Action Alternative
- Alternative 3 compared to the Second Basis of Comparison
- Alternative 5 compared to the Second Basis of Comparison

### *18.4.3.1 No Action Alternative*

The No Action Alternative is compared to the Second Basis of Comparison.

#### 18.4.3.1.1 Trinity River Region

*Changes in Public Health Factors Related to Wildland Firefighting and CVP and SWP Reservoir Storage*

Changes in CVP water supplies and operations under the No Action Alternative as compared to the Second Basis of Comparison would result in similar end of September reservoir elevations in critical dry years (changes within 5 percent) at Trinity Lake, as described in Chapter 5, Surface Water Resources and Water Supplies. Therefore, the potential for water availability for wildland firefighting would be similar under the No Action Alternative as compared to the Second Basis of Comparison.

#### 18.4.3.1.2 Central Valley Region

*Changes in Public Health Factors Related to Wildland Firefighting and CVP and SWP Reservoir Storage*

Changes in CVP water supplies and operations under the No Action Alternative as compared to the Second Basis of Comparison would result in similar end of September reservoir elevations in critical dry years (changes within 5 percent) at Shasta Lake, Lake Oroville, Folsom Lake, and New Melones Reservoir, as described in Chapter 5, Surface Water Resources and Water Supplies. Therefore, the potential for water availability for wildland firefighting would be similar under the No Action Alternative as compared to the Second Basis of Comparison.

End of September surface water elevations at San Luis Reservoir in critical dry years would be 6 percent lower under the No Action Alternative as compared to the Second Basis of Comparison. Therefore, the potential for water availability for wildland firefighting would be reduced at San Luis Reservoir under the No Action Alternative as compared to the Second Basis of Comparison.

*Changes in Public Health Factors Related to Mercury in Fish used for Human Consumption*

Mercury concentrations in Largemouth Bass would be similar (within 5 percent change) in most locations in the Delta, except for Rock Slough, San Joaquin River near Antioch, and Montezuma Slough in Suisun Marsh. In these areas, the mercury concentrations would increase by 7 percent over long-term conditions under the No Action Alternative as compared to the Second Basis of Comparison.

Under dry and critical dry years, mercury concentrations would increase by 7 to 8 percent at Rock Slough, intakes of the Banks and Jones pumping plants, and Victoria Canal. All values exceed the threshold of 0.24 mg/kg ww for mercury.

#### *18.4.3.2 Alternative 1*

Alternative 1 is identical to the Second Basis of Comparison. Alternative 1 is compared to the No Action Alternative and the Second Basis of Comparison. However, because CVP and SWP operations under Alternative 1 are identical to conditions under the Second Basis of Comparison; Alternative 1 is only compared to the No Action Alternative.

##### 18.4.3.2.1 Alternative 1 Compared to the No Action Alternative

*Trinity River Region*

*Changes in Public Health Factors Related to Wildland Firefighting and CVP and SWP Reservoir Storage*

Changes in CVP water supplies and operations under Alternative 1 as compared to the No Action Alternative would result in similar end of September reservoir elevations in critical dry years at Trinity Lake, as described in Chapter 5, Surface Water Resources and Water Supplies. Therefore, the potential for water availability for wildland firefighting would be similar under Alternative 1 as compared to the No Action Alternative.

*Central Valley Region*

*Changes in Public Health Factors Related to Wildland Firefighting and CVP and SWP Reservoir Storage*

Changes in CVP water supplies and operations under Alternative 1 as compared to the No Action Alternative would result in similar end of September reservoir elevations in critical dry years at Shasta Lake, Lake Oroville, Folsom Lake, and New Melones Reservoir, as described in Chapter 5, Surface Water Resources and Water Supplies. Therefore, the potential for water availability for wildland firefighting would be similar under Alternative 1 as compared to the No Action Alternative.

End of September surface water elevations at San Luis Reservoir in critical dry years would be 7 percent higher under Alternative 1 as compared to the No Action Alternative. Therefore, the potential for water availability for wildland firefighting would be increased at San Luis Reservoir under Alternative 1 as compared to the No Action Alternative.

*Changes in Public Health Factors Related to Mercury in Fish used for Human Consumption*

Mercury concentrations in Largemouth Bass would be similar in most locations in the Delta, except for Rock Slough, San Joaquin River near Antioch, and Montezuma Slough in Suisun Marsh. In these areas, the mercury concentrations would decrease by 6 percent over the long-term conditions under Alternative 1 as compared to the No Action Alternative. Under dry and critical dry years, mercury concentrations would decrease by 6 to 8 percent at Rock Slough, intakes of the

Banks and Jones pumping plants, and Victoria Canal. All values exceed the threshold of 0.24 mg/kg ww for mercury.

##### 18.4.3.2.2 Alternative 1 Compared to the Second Basis of Comparison

Alternative 1 is identical to the Second Basis of Comparison.

#### *18.4.3.3 Alternative 2*

The CVP and SWP operations under Alternative 2 are identical to the CVP and SWP operations under the No Action Alternative; therefore, Alternative 2 is only compared to the Second Basis of Comparison.

##### 18.4.3.3.1 Alternative 2 Compared to the Second Basis of Comparison

The CVP and SWP operations under Alternative 2 are identical to the CVP and SWP operations under the No Action Alternative. Therefore, changes to public health conditions under Alternatives 2 as compared to the Second Basis of Comparison would be the same as the impacts described in Section 18.4.3.1, No Action Alternative.

#### *18.4.3.4 Alternative 3*

As described in Chapter 3, Description of Alternatives, CVP and SWP operations under Alternative 3 are similar to the Second Basis of Comparison with modified Old and Middle River flow criteria and New Melones Reservoir operations. As described in Chapter 4, Approach to Environmental Analysis, Alternative 3 is compared to the No Action Alternative and the Second Basis of Comparison.

##### 18.4.3.4.1 Alternative 3 Compared to the No Action Alternative

*Trinity River Region*

*Changes in Public Health Factors Related to Wildland Firefighting and CVP and SWP Reservoir Storage*

Changes in CVP water supplies and operations under Alternative 3 as compared to the No Action Alternative would result in similar end of September reservoir elevations in critical dry years at Trinity Lake, as described in Chapter 5, Surface Water Resources and Water Supplies. Therefore, the potential for water availability for wildland firefighting would be similar under Alternative 3 as compared to the No Action Alternative.

*Central Valley Region*

*Changes in Public Health Factors Related to Wildland Firefighting and CVP and SWP Reservoir Storage*

Changes in CVP water supplies and operations under Alternative 3 as compared to the No Action Alternative would result in similar end of September reservoir elevations in critical dry years at Shasta Lake, Lake Oroville, Folsom Lake, New Melones Reservoir, and San Luis Reservoir, as described in Chapter 5, Surface Water Resources and Water Supplies. Therefore, the potential for water availability for wildland firefighting would be similar under Alternative 3 as compared to the No Action Alternative.

*Changes in Public Health Factors Related to Mercury in Fish used for Human Consumption*

Mercury concentrations in Largemouth Bass would be similar (within 5 percent change) in most locations in the Delta, except for San Joaquin River near Antioch and Montezuma Slough in Suisun Marsh. In these areas, the mercury concentrations would decrease by 6 percent over the long-term conditions under Alternative 3 as compared to the No Action Alternative. Mercury concentrations under the dry and critical dry years would be similar throughout the Delta. All values exceed the threshold of 0.24 mg/kg ww for mercury.

#### 18.4.3.4.2 Alternative 3 Compared to the Second Basis of Comparison

*Trinity River Region*

*Changes in Public Health Factors Related to Wildland Firefighting and CVP and SWP Reservoir Storage*

Changes in CVP water supplies and operations under Alternative 3 as compared to the Second Basis of Comparison would result in similar end of September reservoir elevations in critical dry years at Trinity Lake, as described in Chapter 5, Surface Water Resources and Water Supplies. Therefore, the potential for water availability for wildland firefighting would be similar under Alternative 3 as compared to the Second Basis of Comparison.

*Central Valley Region*

*Changes in Public Health Factors Related to Wildland Firefighting and CVP and SWP Reservoir Storage*

Changes in CVP water supplies and operations under Alternative 3 as compared to the Second Basis of Comparison would result in similar end of September reservoir elevations in critical dry years at Shasta Lake, Lake Oroville, Folsom Lake, New Melones Reservoir, and San Luis Reservoir, as described in Chapter 5, Surface Water Resources and Water Supplies. Therefore, the potential for water availability for wildland firefighting would be similar under Alternative 3 as compared to the Second Basis of Comparison.

*Changes in Public Health Factors Related to Mercury in Fish used for Human Consumption*

Mercury concentrations in Largemouth Bass would be similar throughout the Delta under Alternative 3 as compared to the Second Basis of Comparison, as summarized in Chapter 6, Surface Water Quality. All values exceed the threshold of 0.24 mg/kg ww for mercury.

### *18.4.3.5 Alternative 4*

The public health conditions under Alternative 4 would be identical to the conditions under the Second Basis of Comparison; therefore, Alternative 4 is only compared to the No Action Alternative.

#### 18.4.3.5.1 Alternative 4 Compared to the No Action Alternative

The CVP and SWP operations under Alternative 4 are identical to the CVP and SWP operations under the Second Basis of Comparison and Alternative 1. Therefore, changes in public health conditions under Alternative 4 as compared to the No Action Alternative would be the same as the impacts described in Section 12.4.4.2.1, Alternative 1 Compared to the No Action Alternative.

### *18.4.3.6 Alternative 5*

As described in Chapter 3, Description of Alternatives, CVP and SWP operations under Alternative 5 are similar to the No Action Alternative with modified Old and Middle River flow criteria and New Melones Reservoir operations. As described in Chapter 4, Approach to Environmental Analysis, Alternative 5 is compared to the No Action Alternative and the Second Basis of Comparison.

#### 18.4.3.6.1 Alternative 5 Compared to the No Action Alternative

*Trinity River Region*

*Changes in Public Health Factors Related to Wildland Firefighting and CVP and SWP Reservoir Storage*

Changes in CVP water supplies and operations under Alternative 5 as compared to the No Action Alternative would result in similar end of September reservoir elevations in critical dry years at Trinity Lake, as described in Chapter 5, Surface Water Resources and Water Supplies. Therefore, the potential for water availability for wildland firefighting would be similar under Alternative 5 as compared to the No Action Alternative.

*Central Valley Region*

*Changes in Public Health Factors Related to Wildland Firefighting and CVP and SWP Reservoir Storage*

Changes in CVP water supplies and operations under Alternative 5 as compared to the No Action Alternative would result in similar end of September reservoir elevations in critical dry years at Shasta Lake, Lake Oroville, Folsom Lake, New Melones Reservoir, and San Luis Reservoir, as described in Chapter 5, Surface Water Resources and Water Supplies. Therefore, the potential for water availability for wildland firefighting would be similar under Alternative 5 as compared to the No Action Alternative.

*Changes in Public Health Factors Related to Mercury in Fish used for Human Consumption*

Mercury concentrations in Largemouth Bass would be similar throughout the Delta under Alternative 5 as compared to the No Action Alternative, as summarized in Chapter 6, Surface Water Quality. All values exceed the threshold of 0.24 mg/kg ww for mercury.

#### 18.4.3.6.2 Alternative 5 Compared to the Second Basis of Comparison

*Trinity River Region*

*Changes in Public Health Factors Related to Wildland Firefighting and CVP and SWP Reservoir Storage*

Changes in CVP water supplies and operations under Alternative 5 as compared to the Second Basis of Comparison would result in similar end of September reservoir elevations in critical dry years at Trinity Lake, as described in Chapter 5, Surface Water Resources and Water Supplies. Therefore, the potential for water availability for wildland firefighting would be similar under Alternative 5 as compared to the Second Basis of Comparison.

*Central Valley Region*

*Changes in Public Health Factors Related to Wildland Firefighting and CVP and SWP Reservoir Storage*

Changes in CVP water supplies and operations under Alternative 5 as compared to the Second Basis of Comparison would result in similar end of September reservoir elevations in critical dry years at Shasta Lake, Lake Oroville, Folsom Lake, and New Melones Reservoir, as described in Chapter 5, Surface Water Resources and Water Supplies. Therefore, the potential for water availability for wildland firefighting would be similar under Alternative 5 as compared to the Second Basis of Comparison.

End of September surface water elevations at San Luis Reservoir in critical dry years would be 9 percent lower under Alternative 5 as compared to the Second Basis of Comparison. Therefore, the potential for water availability for wildland firefighting would be reduced at San Luis Reservoir under Alternative 5 as compared to the Second Basis of Comparison.

*Changes in Public Health Factors Related to Mercury in Fish used for Human Consumption*

Mercury concentrations in Largemouth Bass would be similar in most locations in the Delta, except for Rock Slough, San Joaquin River near Antioch, and Montezuma Slough in Suisun Marsh. In these areas, the mercury concentrations would increase by 7 to 8 percent over long-term conditions under Alternative 5 as compared to the Second Basis of Comparison. During dry and critical dry years, mercury concentrations also would increase by 7 percent at intakes to Banks Pumping Plant and Jones Pumping Plant; and 13 percent at Rock Slough. All values exceed the threshold of 0.24 mg/kg ww for mercury.

### *18.4.3.7 Summary of Environmental Consequences*

The results of the environmental consequences of implementation of Alternatives 1 through 5 as compared to the No Action Alternative and the Second Basis of Comparison are presented in Tables 18.2 and 18.3, respectively.

**Table 18.2 Comparison of Alternatives 1 through 5 to No Action Alternative**

| Alternative | Potential Change | Consideration for Mitigation Measures |
|---|---|---|
| Alternative 1 | Similar water supply availability for wildland firefighting at Trinity Lake, Shasta Lake, Lake Oroville, Folsom Lake, and New Melones Reservoir; and a 7 percent increase at San Luis Reservoir.<br>Similar mercury concentrations in Largemouth Bass in the most of the Delta; and a 6 percent decrease near Rock Slough, San Joaquin River at Antioch, and Montezuma Slough over the long-term conditions. | None needed |
| Alternative 2 | No effects on public health issues. | None needed |
| Alternative 3 | Similar water supply availability for wildland firefighting at Trinity Lake, Shasta Lake, Lake Oroville, Folsom Lake, New Melones Reservoir, and San Luis Reservoir.<br>Similar mercury concentrations in Largemouth Bass in the most of the Delta; and a 6 percent decrease near San Joaquin River at Antioch and Montezuma Slough over the long-term conditions. | None needed |
| Alternative 4 | Same effects as described for Alternative 1 compared to the No Action Alternative. | None needed |
| Alternative 5 | Similar water supply availability for wildland firefighting at Trinity Lake, Shasta Lake, Lake Oroville, Folsom Lake, New Melones Reservoir, and San Luis Reservoir.<br>Similar mercury concentrations in Largemouth Bass throughout the Delta. | None needed |

Note: Due to the limitations and uncertainty in the CalSim II monthly model and other analytical tools, incremental differences of 5 percent or less between alternatives and the Second Basis of Comparison are considered to be “similar.”

**Table 18.3 Comparison of No Action Alternative and Alternatives 1 through 5 to Second Basis of Comparison**

| Alternative | Potential Change | Consideration for Mitigation Measures |
|---|---|---|
| No Action Alternative | Similar water supply availability for wildland firefighting at Trinity Lake, Shasta Lake, Lake Oroville, Folsom Lake, and New Melones Reservoir; and a 6 percent decrease at San Luis Reservoir.<br>Similar mercury concentrations in Largemouth Bass in the most of the Delta; and a 7 percent increase near Rock Slough, San Joaquin River at Antioch, and Montezuma Slough over the long-term conditions. | Not considered for this comparison. |
| Alternative 1 | No effects on public health issues. | Not considered for this comparison. |
| Alternative 2 | Same effects as described for No Action Alternative as compared to the Second Basis of Comparison. | Not considered for this comparison. |
| Alternative 3 | Similar water supply availability for wildland firefighting at Trinity Lake, Shasta Lake, Lake Oroville, Folsom Lake, New Melones Reservoir, and San Luis Reservoir.<br>Similar mercury concentrations in Largemouth Bass throughout the Delta. | Not considered for this comparison. |
| Alternative 4 | No effects on public health issues. | Not considered for this comparison. |
| Alternative 5 | Similar water supply availability for wildland firefighting at Trinity Lake, Shasta Lake, Lake Oroville, Folsom Lake, and New Melones Reservoir; and a 9 percent decrease at San Luis Reservoir.<br>Similar mercury concentrations in Largemouth Bass in the most of the Delta; and a 7 percent increase near Rock Slough, San Joaquin River at Antioch, and Montezuma Slough over the long-term conditions. | Not considered for this comparison. |

Note: Due to the limitations and uncertainty in the CalSim II monthly model and other analytical tools, incremental differences of 5 percent or less between alternatives and the Second Basis of Comparison are considered to be “similar.”

#### *18.4.3.8 Potential Mitigation Measures*

Mitigation measures are presented in this section to avoid, minimize, rectify, reduce, eliminate, or compensate for adverse environmental effects of Alternatives 1 through 5 as compared to the No Action Alternative. Mitigation measures were not included to address adverse impacts under the alternatives as compared to the Second Basis of Comparison because this analysis was included in this EIS for information purposes only.

Changes in CVP and SWP operations under Alternatives 1 through 5 as compared to the No Action Alternative would not result in changes in public health factors. Therefore, there would be no adverse impacts to public health factors; and no mitigation measures are required.

#### *18.4.3.9 Cumulative Effects Analysis*

As described in Chapter 3, the cumulative effects analysis considers projects, programs, and policies that are not speculative; and are based upon known or reasonably foreseeable long-range plans, regulations, operating agreements, or other information that establishes them as reasonably foreseeable.

The cumulative effects analyses for Alternatives 1 through 5 for Public Health are summarized in Table 18.4.

**Table 18.4 Summary of Cumulative Effects on Public Health with Implementation of Alternatives 1 through 5 as Compared to the No Action Alternative**

| Scenarios | Actions | Cumulative Effects of Actions |
|---|---|---|
| Past & Present, and Future Actions included in the No Action Alternative in All Alternatives in Year 2030 | Consistent with Affected Environment conditions plus:<br>Actions in the 2008 USFWS BO and 2009 NMFS BO that would have occurred without implementation of the BOs, as described in Section 3.3.1.2 (of Chapter 3, Descriptions of Alternatives), including climate change and sea level rise<br>Actions not included in the 2008 USFWS BO and 2009 NMFS BO that would have occurred without implementation of the BOs, as described in Section 3.3.1.3 (of Chapter 3, Descriptions of Alternatives):<br>- Implementation of Federal and state policies and programs, including Clean Water Act (e.g., Total Maximum Daily Loads); Safe Drinking Water Act; Clean Air Act; and flood management programs<br>- General plans for 2030.<br>- Trinity River Restoration Program.<br>- Central Valley Project Improvement Act programs | These effects would be the same under all alternatives.<br>Climate change and sea level rise, development under the general plans, FERC relicensing projects, and some future projects to improve water quality and/or habitat are anticipated to reduce end of September storage in CVP and SWP reservoirs.<br>Mercury concentrations in fish tissue within the Delta will be either similar or greater than recent historical conditions because Phases 1 and 2 of the Delta Mercury Program would be completed by 2030, as mandated by the Central Valley RWQCB, including methylmercury control programs and reduction programs for total inorganic mercury. Due to the extent of these programs, it is anticipated that the programs would be initiated; however, future reductions in mercury sources and related reductions of mercury and |

| Scenarios | Actions | Cumulative Effects of Actions |
|---|---|---|
| | - Folsom Dam Water Control Manual Update<br>- FERC Relicensing for the Middle Fork of the American River Project<br>- Lower Mokelumne River Spawning Habitat Improvement Project<br>- Dutch Slough Tidal Marsh Restoration<br>- Suisun Marsh Habitat Management, Preservation, and Restoration Plan Implementation<br>- Tidal Wetland Restoration: Yolo Ranch, Northern Liberty Island Fish Restoration Project, Prospect Island Restoration Project, and Calhoun Cut/Lindsey Slough Tidal Habitat Restoration Project<br>- San Joaquin River Restoration Program<br>- Future water supply projects, including water recycling, desalination, groundwater banks and wellfields, and conveyance facilities (projects with completed environmental documents) | methylmercury concentrations in fish tissue would actually occur after 2030. |
| Future Actions considered as Cumulative Effects Actions in All Alternatives in Year 2030 | Actions as described in Section 3.5 (of Chapter 3, Descriptions of Alternatives):<br>- Bay-Delta Water Quality Control Plan Update<br>- FERC Relicensing Projects<br>- Bay Delta Conservation Plan (including the California WaterFix alternative)<br>- Shasta Lake Water Resources, North-of-the-Delta Offstream Storage, Los Vaqueros Reservoir Expansion Phase 2, and Upper San Joaquin River Basin Storage Investigations<br>- El Dorado Water and Power Authority Supplemental Water Rights Project<br>- Sacramento River Water Reliability Project<br>- Semitropic Water Storage District Delta Wetlands | These effects would be the same under all alternatives.<br>Reasonably foreseeable storage projects would increase reservoir storage at Shasta Lake and Los Vaqueros Reservoir, and provide new reservoir storage at North-of-the-Delta Offstream Storage, Upper San Joaquin River Basin Storage, and Delta Wetlands. |

| Scenarios | Actions | Cumulative Effects of Actions |
|---|---|---|
| | - North Bay Aqueduct Alternative Intake<br>- San Luis Reservoir Low Point Improvement Project<br>- Future water supply projects, including water recycling, desalination, groundwater banks and wellfields, and conveyance facilities (projects that did not have completed environmental documents during preparation of the EIS) | |
| No Action Alternative with Associated Cumulative Effects Actions in Year 2030 | Full implementation of the 2008 USFWS BO and 2009 NMFS BO | Climate change and sea level rise, FERC relicensing projects, and some future projects to improve water quality and/or habitat are anticipated to reduce end of September CVP and SWP reservoir storage as compared to past conditions. Mercury and methylmercury concentrations in fish tissue would be similar or greater than past conditions. |
| Alternative 1 with Associated Cumulative Effects Actions in Year 2030 | No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant) | Implementation of Alternative 1 with future reasonably foreseeable actions would result in similar changes as under the No Action Alternative with the added actions. |
| Alternative 2 with Associated Cumulative Effects Actions in Year 2030 | Full implementation of the 2008 USFWS BO and 2009 NMFS BO CVP and SWP operational actions<br>No implementation of structural improvements or other actions that require further study to develop a more detailed action description. | Implementation of Alternative 2 with reasonably foreseeable actions would result in similar changes as under the No Action Alternative with the added actions. |
| Alternative 3 with Associated Cumulative Effects Actions in Year 2030 | No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant)<br>Slight increase in positive Old and Middle River flows in the winter and spring months | Implementation of Alternative 3 with reasonably foreseeable actions would result in similar changes as under the No Action Alternative with the added actions. |

| Scenarios | Actions | Cumulative Effects of Actions |
|---|---|---|
| Alternative 4 with Associated Cumulative Effects Actions in Year 2030 | No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant) | Implementation of Alternative 4 with reasonably foreseeable actions would result in similar changes as under the No Action Alternative with the added actions. |
| Alternative 5 with Associated Cumulative Effects Actions in Year 20530 | Full implementation of the 2008 USFWS BO and 2009 NMFS BO<br>Positive Old and Middle River flows and increased Delta outflow in spring months | Implementation of Alternative 5 with reasonably foreseeable actions would result in similar changes as under the No Action Alternative with the added actions. |

Chapter 19

# Socioeconomics

## 19.1 Introduction

This Chapter describes socioeconomic conditions in the Study Area; and potential changes that could occur as a result of implementing the alternatives evaluated in this Environmental Impact Statement (EIS). Implementation of the alternatives could affect socioeconomic conditions through potential changes in operation of the Central Valley Project (CVP) and State Water Project (SWP) that would change CVP and SWP water supply availability to agricultural water users and municipal and industrial (M&I) water users. Changes in CVP and SWP operations also would result in changes to recreational resources at reservoirs that store CVP and SWP water.

Changes in agricultural production, including costs to provide Alternative water supplies when CVP and SWP water supplies are not available, are presented in Chapter 12, Agricultural Resources. Changes in reservoir recreational opportunities that would occur due to reduction in reservoir storage elevations are presented in Chapter 15, Recreational Resources. The results of these analyses are summarized in Section 19.4, Environmental Consequences, of this Chapter and considered in the determination of regional socioeconomics effects.

## 19.2 Regulatory Environment and Compliance Requirements

Potential actions that could be implemented under the alternatives evaluated in this EIS could affect socioeconomic conditions in portions of the Study Area affected by or served by CVP and SWP water supplies. Actions located on public agency lands; or implemented, funded, or approved by Federal and state agencies would need to be compliant with appropriate Federal and state agency policies and regulations, as summarized in Chapter 4, Approach to Environmental Analyses.

## 19.3 Affected Environment

This section describes socioeconomic conditions that could be potentially affected by implementation of the alternatives considered in this EIS. The socioeconomic conditions described in this Chapter are related to population, employment, income, and taxes.

Housing information is not described in this Chapter because implementation of the No Action Alternative, Second Basis of Comparison, and Alternatives 1 through 5 would not result in changes to land use that would displace or relocate housing stocks. Land use would be the same under the No Action Alternative, Second Basis of Comparison, and Alternatives 1 through 5, as described in Chapter 13, Land Use. The only changes in land use between recent historical conditions and conditions in 2030 for the No Action Alternative, Second Basis of Comparison, and Alternatives 1 through 5 would occur due to ecosystem restoration on agricultural lands, open space, and public lands that do not support housing units.

### 19.3.1 Characterization of Socioeconomic Conditions

Characterization of the socioeconomic conditions within the Study Area is based upon publically available data sources. The data sources used include the U.S. Census Bureau, U.S. Bureau of Economic Analysis, U.S. Bureau of Labor Statistics, California Department of Finance, California Employment Development Department, and California Board of Equalization. The data were summarized and used to compare historical and current trends in the socioeconomic conditions in the Study Area.

Population and income data used to characterize the socioeconomic conditions are reported from 2000 to 2012 by the California Department of Finance.

The employment data presented in this Chapter are reported from 2001 to 2008 and from 2008 to 2012 (the latest values from consistent data sources). The first period from 2001 to 2008 represents a period of time prior to implementation of the 2008 U.S. Fish and Wildlife Service (USFWS) Biological Opinion (BO) and the 2009 National Marine Fisheries Service (NMFS) BO. The second period from 2008 to 2012 represents a period of time following implementation of the 2008 USFWS BO and 2009 NMFS BO.

There are two estimates of employment that are typically used to describe employment. The civilian labor force employment data compiled by the Bureau of Labor Statistics reflect the employment status of individuals that are covered by unemployment insurance by “place of residence,” and includes the self-employed, employees on unpaid leave of absence, unpaid family workers, and household workers. These data do not include sole proprietors, some self-employed, and some farm workers and domestic workers. Employment by industry data compiled by the Bureau of Economic Analysis, including farm employment, reflect jobs by “place of work” and include sole proprietors and active partners, self-employed, farm workers, and domestic workers. Individuals with more than one job are counted only once in civilian labor force data and counted in each job in the employment by industry data. Therefore, the employment by industry data are greater than the civilian labor force data.

### 19.3.2 Trinity River Region

The Trinity River Region includes the area in Trinity County along the Trinity River from Trinity Lake to the confluence with the Klamath River; and in Humboldt and Del Norte counties along the lower Klamath River from the confluence with the Trinity River to the Pacific Ocean. Tribal lands along the Trinity or lower Klamath River within the Trinity River Region include the

Hoopa Valley Indian Reservation, Yurok Indian Reservation, and Resighini Rancheria.

Trinity County includes extensive trails, lakes, and the Trinity River Scenic Byway, providing several venues for outdoor enthusiasts and travelers. The recreation and tourism industries are major contributors to the local economy of Trinity County (EDD 2013).

Humboldt County is the largest and most populous of the north coast counties. Its 2012 population of 134,728 ranked 35th among the 58 counties in California (EDD 2014a). Humboldt County encompasses 2.3 million acres, 80 percent of which is forestlands, protected redwoods and recreation areas (Humboldt County 2014). Humboldt County is the leading timber producing county in the state (CDFA 2014). As described in Chapter 13, Land Use, the portion of Humboldt County in the Trinity River Region evaluated in this EIS is located along the Trinity and Klamath rivers. This portion of the county includes the communities of Willow Creek and Orleans within Humboldt County; Hoopa in the Hoopa Valley Indian Reservation; and the communities of Weitchpec, Cappell, Pecwan, and Johnson's in the Yurok Tribe Indian Reservation (Humboldt County 2012).

Del Norte County is the northernmost county in California. The county includes Redwood National Park and other state parks making tourism a natural industry in the county (EDD 2014b). As described in Chapter 13, Land Use, the portion of Del Norte County in the Trinity River Region evaluated in this EIS is located along the lower Klamath River. Most of this area is located within the Yurok Indian Reservation, and includes the communities of Requa and Klamath (Del Norte County 2003).

##### *19.3.2.1 Population*

Population in the Trinity River Region, by county and for the region as a whole, is presented in Table 19.1. The population of Trinity River Region has increased, although at a small average annual growth rate for the period shown.

**Table 19.1 Population Characteristics in Trinity River Region**

| Area | Population 2000 | Population 2012 | Average Annual Growth Rate (percent) 2000-2012 |
|---|---|---|---|
| Trinity County | 13,022 | 13,471 | 0.3 |
| Humboldt County | 126,518 | 134,728 | 0.5 |
| Del Norte County | 27,507 | 28,527 | 0.3 |
| Total Trinity River Region | 167,047 | 176,726 | 0.5 |
| **STATE OF CALIFORNIA** | **33,873,086** | **37,427,946** | **0.9** |

Sources: DOF 2013a, 2013b, 2014

Tribal enrollment for the Hoopa Valley Tribe, Yurok Tribe, Karuk Tribe, and Resighini Rancheria as reported by the Bureau of Indian Affairs is presented in Table 19.2. These values do not necessarily include all members that live within the area, and should be considered as representative of trends. Values were only available for the years of 2001, 2003, 2005, and 2013.

**Table 19.2 Tribal Enrollment in Trinity River Region**

| Tribe | 2001 | 2003 | 2005 | 2013 |
|---|---|---|---|---|
| Hoopa Valley Tribe | 1,893 | 1,893 | 1,893 | 1,719[a] |
| Yurok Tribe | 4,466 | 4,466 | 4,912 | Not available |
| Karuk Tribe | 3,165 | 3,165 | 3,427 | Not available |
| Resighini Rancheria | 90 | 175 | 111 | Not available |
| **TOTAL** | **9,614** | **9,699** | **10,343** | **–** |

Sources: BIA 2003, 2006, 2008, 2014
Note:
a. Value is reported as population, not enrollment, for Hoopa Valley Tribe in 2013.

#### *19.3.2.2 Employment*

Civilian labor force characteristics for the Trinity River Region are presented in Table 19.3. The civilian labor force (composed of employment and unemployment) in the Trinity River Region increased between 2001 and 2008 and between 2008 and 2012 (BLS 2014).

**Table 19.3 Civilian Labor Force and Unemployment Rates in Trinity River Region**

| Area | Civilian Labor Force (subject to unemployment insurance) | | | Unemployment Rate (percent) | | |
|---|---|---|---|---|---|---|
| | 2001 | 2008 | 2012 | 2001 | 2008 | 2012 |
| Trinity County | 5,394 | 4,855 | 5,019 | 9.3 | 12.7 | 15.8 |
| Humboldt County | 60,443 | 60,039 | 60,144 | 6.0 | 7.2 | 10.5 |
| Del Norte County | 10,221 | 11,376 | 11,381 | 8.0 | 8.8 | 13.4 |
| Total Trinity River Region | 76,058 | 76,270 | 76,544 | 6.5 | 7.8 | 11.2 |
| **STATE OF CALIFORNIA** | **17,152,106** | **18,392,000** | **18,494,881** | **5.4** | **7.2** | **10.5** |

Source: BLS 2014

Available labor force and unemployment rates for members of the tribes in the Trinity River Region are presented in Table 19.4. These individuals may or may not be included in the values presented in Table 19.3 because different sources are used for each table.

**Table 19.4 Available Labor Force and Unemployment Rates Related to the Tribes in Trinity River Region**

| Area | Civilian Labor Force | | | | Unemployment Rate (percent) | | | |
|---|---|---|---|---|---|---|---|---|
| | 2001 | 2003 | 2005 | 2013 | 2001 | 2003 | 2005 | 2013 |
| Hoopa Valley Tribe | 1,043 | 1,043 | 1,043 | NA | 40 | 40 | 40 | 42 |
| Yurok Tribe | 2,151 | 2,151 | 1,096 | NA | 74 | 74 | 74 | 38 |
| Karuk Tribe | 3,307 | 3,307 | 915 | NA | 14 | 14 | 63 | 29 |
| Resighini Rancheria | 37 | 44 | 45 | NA | 57 | 59 | 60 | NA |

Sources: BIA 2003, 2006, 2008, 2014
Note:
NA = Not Available

Total employment and the farm employment in 2001, 2008 and 2012 in the Trinity River Region counties are presented in Table 19.5. The Trinity River Region farm employment represents less than 1 percent of farm employment in the state and the lowest amount of farm employment in counties within the Study Area, as indicated in Figure 19.1.

**Table 19.5 Employment in Trinity River Region**

| Area | Total Employment | | | Farm Employment[a] | | |
|---|---|---|---|---|---|---|
| | 2001 | 2008 | 2012 | 2001 | 2008 | 2012 |
| Trinity County | 4,878 | 4,930 | 4,788 | 155 | 161 | 165 |
| Humboldt County | 68,596 | 71,552 | 68,861 | 1,662 | 1,383 | 1,227 |
| Del Norte County | 10,266 | 11,531 | 10,720 | 384 | 309 | 231 |
| Total Trinity River Region | 83,740 | 88,013 | 84,369 | 2,201 | 1,853 | 1,623 |
| **STATE OF CALIFORNIA** | **19,411,367** | **20,820,306** | **20,653,860** | **479,283** | **438,013** | **443,764** |

Source: BEA 2014a.

Note:
a. Farm employment includes employment numbers in forestry, fishing, and related activities.

#### *19.3.2.3 Income*

Per capita personal income for the Trinity River Region counties for 2000, 2008, and 2012 is presented in Table 19.6. Humboldt County had the highest per capita income, and Del Norte County had the lowest.

**Table 19.6 Per Capita Personal Income in Trinity River Region**

| Area | Per Capita Personal Income | | | Average Annual Growth Rate (percent) | |
|---|---|---|---|---|---|
| | 2000 | 2008 | 2012 | 2000-2008 | 2008-2012 |
| Trinity County | $20,489 | $28,861 | $34,027 | 4.4 | 4.2 |
| Humboldt County | $23,980 | $32,859 | $35,681 | 4.0 | 2.1 |
| Del Norte County | $18,563 | $26,420 | $30,016 | 4.5 | 3.2 |
| Total Trinity River Region | $22,818 | $31,497 | $34,647 | 4.1 | 2.4 |
| **STATE OF CALIFORNIA** | **$33,404** | **$44,003** | **$43,647** | **3.5** | **1.4** |

Source: BEA 2014e

#### *19.3.2.4 Local Government Finances*

The sales tax rates, as of April 1, 2014, were 7.5 percent in all three counties in the Trinity River Region (BOE 2014). Total annual taxable sales within the Trinity River Region in 2000, 2008, and 2012 are presented in Table 19.7. The region's total taxable sales represents less than one tenth of one percent of total annual state taxable sales.

**Table 19.7 Total Taxable Sales in Trinity River Region**

| Area | Total Taxable Sales (millions) | | | Average Annual Growth Rate (percent) | |
|---|---|---|---|---|---|
| | 2000 | 2008 | 2012 | 2000-2008 | 2008-2012 |
| Trinity County | $61 | $74 | $87 | 2.6 | 3.9 |
| Humboldt County | $1,293 | $1,693 | $1,768 | 3.4 | 1.1 |
| Del Norte County | $176 | $232 | $226 | 3.5 | -0.6 |
| Total Trinity River Region | $1,530 | $1,999 | $2,081 | 3.4 | 1.0 |
| **STATE OF CALIFORNIA** | **$441,854** | **$531,654** | **$407,714** | **2.3** | **-6.4** |

Sources: BOE 2000, 2008, 2012

Total property tax charges (secured and unsecured) within the Trinity River Region in Fiscal Year 2011-2012 were $160.2 million (California State Controller 2012). The Humboldt County share of the total property tax revenues was the largest at $126 million. The Del Norte and Trinity counties contributions to the total were $19 million and $13 million, respectively.

## 19.3.3 Central Valley Region

The Central Valley Region extends from above Shasta Lake to the Tehachapi Mountains, and includes the Sacramento Valley, San Joaquin Valley, and Delta and Suisun Marsh subregions.

### *19.3.3.1 Sacramento Valley*

The Sacramento Valley includes the counties of Shasta, Plumas, Tehama, Glenn, Colusa, Butte, Sutter, Yuba, Nevada, Placer, and El Dorado counties. Sacramento, Yolo, and Solano counties also are located within the Sacramento Valley; however, these counties are discussed below as part of the Delta and Suisun Marsh subsection. Other counties in Sacramento Valley are not anticipated to be affected by changes in CVP and SWP operations, and are not discussed here, including: Alpine, Sierra, Lassen, and Amador counties.

The Sacramento Valley includes major agricultural counties, including Glenn, Colusa, Sutter and Placer counties, as described in Chapter 12, Agricultural Resources. The region also includes some of the leading major timber producing counties of the state. Shasta County is the second and Plumas County is the fifth among the leading timber producing counties in the state.

#### 19.3.3.1.1 Population

Population characteristics in the Sacramento Valley portion of the Central Valley Region are presented in Table 19.8. Among the counties evaluated in the Sacramento Valley portion of the Central Valley Region, Placer County had the highest average annual population growth rate between 2000 and 2012; and Plumas County was the only county with a reduction in population.

**Table 19.8 Population Characteristics in Central Valley Region – Sacramento Valley**

| Area | Population | | Average Annual Growth Rate (percent) |
|---|---|---|---|
| | 2000 | 2012 | 2000-2012 |
| Shasta County | 163,256 | 177,516 | 0.8 |
| Plumas County | 20,824 | 19,901 | -0.4 |
| Tehama County | 56,039 | 62,985 | 1.1 |
| Glenn County | 26,453 | 28,105 | 0.6 |
| Colusa County | 18,804 | 21,552 | 1.2 |
| Butte County | 203,171 | 220,465 | 0.7 |
| Yuba County | 60,219 | 72,642 | 1.6 |
| Nevada County | 92,033 | 97,366 | 0.5 |
| Sutter County | 78,930 | 94,620 | 1.7 |
| Placer County | 248,399 | 351,463 | 3.2 |

| Sacramento Valley Subtotal | 1,124,427 | 1,333,615 | 1.4 |
| Total Central Valley Region | 6,214,316 | 7,408,750 | 1.5 |
| **STATE OF CALIFORNIA** | **33,873,086** | **37,668,804** | **0.9** |

Sources: DOF 2013a, 2013b, 2014

### 19.3.3.1.2 Employment

Civilian labor force characteristics for the counties in the Sacramento Valley portion of the Central Valley Region are presented in Table 19.9. The civilian labor force increased between 2001 and 2012. The data for 2008 represents the employment situation immediately following the recent economic recession that started in 2007. The average unemployment rate in the civilian labor force increased from 2001 to 2012. The average unemployment rate in the Sacramento Valley portion of the Central Valley Region between 2001 and 2012 has been higher than the state unemployment rate; and lower than for the counties in the Central Valley Region.

**Table 19.9 Civilian Labor Force and Unemployment Rates in Central Valley Region – Sacramento Valley**

| Area | Civilian Labor Force (subject to unemployment insurance) | | | Unemployment Rate (percent) | | |
|---|---|---|---|---|---|---|
| | 2001 | 2008 | 2012 | 2001 | 2008 | 2012 |
| Shasta County | 77,647 | 82,675 | 81,245 | 6.3 | 10.0 | 13.4 |
| Plumas County | 9,958 | 9,824 | 9,478 | 7.6 | 10.5 | 14.7 |
| Tehama County | 24,574 | 25,185 | 25,251 | 6.5 | 9.2 | 13.9 |
| Glenn County | 11,239 | 12,196 | 12,841 | 8.8 | 10.4 | 14.7 |
| Colusa County | 9,130 | 10,505 | 11,860 | 12.8 | 13.7 | 20.0 |
| Butte County | 95,216 | 102,952 | 102,063 | 6.6 | 8.4 | 12.2 |
| Yuba County | 24,862 | 27,729 | 27,772 | 8.5 | 11.8 | 16.9 |
| Nevada County | 46,947 | 50,428 | 50,742 | 4.4 | 6.5 | 9.4 |
| Sutter County | 38,457 | 41,100 | 42,810 | 9.7 | 12.3 | 17.6 |
| Placer County | 139,106 | 177,243 | 178,818 | 4.0 | 6.4 | 9.4 |
| El Dorado County | 84,064 | 90,732 | 90,525 | 4.3 | 6.9 | 10.4 |
| Sacramento Valley Subtotal | 561,200 | 630,569 | 633,405 | 5.8 | 8.3 | 12.0 |
| Total Central Valley Region | 3,519,870 | 3,885,435 | 3,990,083 | 6.8 | 8.7 | 12.6 |
| **STATE OF CALIFORNIA** | **17,152,106** | **18,392,000** | **18,494,881** | **4.9** | **7.2** | **10.5** |

Source: BLS 2014

Total employment and farm employment in 2001, 2008, and 2012 in the Sacramento Valley portion of the Central Valley Region are presented in Table 19.10. The contribution of farm employment to the total employment in the Sacramento Valley portion of the Central Valley Region declined between 2001 and 2008 and increased slightly by 2012.

**Table 19.10 Employment in Central Valley Region – Sacramento Valley**

| Area | Total Employment | | | Farm Employment | | |
|---|---|---|---|---|---|---|
| | 2001 | 2008 | 2012 | 2001 | 2008 | 2012 |
| Shasta County | 85,937 | 91,883 | 86,696 | 1,821 | 1,781 | 1,751 |

Source: BEA 2014a

Note:

Farm employment includes employment numbers in forestry, fishing, and related activities.

The annual farm employment for the Sacramento Valley portion of the Central Valley Region declined in 2004 and remained relatively stable through 2012, as shown in Figure 19.2. The overall trend in farm employment is influenced by the farm employment trends in Butte, Sutter, Tehama, Colusa, and Glenn counties, as shown in Figure 19.3. The decrease in farm employment is related to the reduction in cultivated acreage during this period, as described in Chapter 12, Agricultural Resources.

The farm employment numbers presented in Table 19.10 include only workers directly involved in farming, forestry, and fishing activities. However, farming is one of the most important basic industries in the Central Valley Region; and supports many other businesses including farm inputs (e.g., fertilizer, seed, machinery, and fuel) and processing of food and fiber grown on farms. As a result, employment both directly on farm and indirectly dependent on farming is higher than the values displayed in Table 19.10.

#### 19.3.3.1.3 Income

The average per capita personal incomes for the counties in the Sacramento Valley portion of the Central Valley Region are presented in Table 19.11. Per capita personal incomes increased by an average annual rate of between 3 and 6 percent from 2000 to 2008. Following the economic downturn that started in 2007, the average annual growth in per capita personal income slowed between 2008 and 2012, except in Tehama County.

**Table 19.11 Per Capita Personal Income in Central Valley Region – Sacramento Valley**

| Area | Per Capita Personal Income | | | Average Annual Growth Rate (percent) | |
|---|---|---|---|---|---|
| | 2000 | 2008 | 2012 | 2000-2008 | 2008-2012 |
| Shasta County | $25,385 | $34,995 | $37,593 | 4.1 | 1.8 |
| Plumas County | $26,415 | $38,401 | $43,085 | 4.8 | 2.9 |
| Tehama County | $19,461 | $25,805 | $30,094 | 3.6 | 3.9 |
| Glenn County | $20,210 | $32,054 | $38,568 | 5.9 | 4.7 |
| Colusa County | $24,656 | $39,568 | $45,800 | 6.1 | 3.7 |
| Butte County | $23,143 | $32,379 | $35,696 | 4.3 | 2.5 |
| Yuba County | $19,537 | $27,655 | $32,835 | 4.4 | 4.4 |
| Nevada County | $32,253 | $44,960 | $47,924 | 4.2 | 1.6 |
| Sutter County | $25,581 | $33,117 | $36,243 | 3.3 | 2.3 |
| Placer County | $38,034 | $49,436 | $52,544 | 3.3 | 1.5 |
| El Dorado County | $37,397 | $50,052 | $54,533 | 3.7 | 2.2 |
| Average in Sacramento Valley Counties | $29,317 | $40,177 | $43,873 | 4.0 | 2.2 |
| Central Valley Region | $28,163 | $37,207 | $40,619 | 3.5 | 2.2 |
| **STATE OF CALIFORNIA** | **$33,404** | **$44,003** | **$46,477** | **3.5** | **1.4** |

Source: BEA 2014e

#### 19.3.3.1.4 Local Government Finances

As of April 1, 2014, the county sales tax rates in the counties within the Sacramento Valley portion of the Central Valley Region was 7.5 percent for all counties except Nevada County (BOE 2014). The Nevada County sales tax rate was 7.625 percent. These rates include the state, county, local and district taxes.

The total annual taxable sales in the Sacramento Valley portion of the Central Valley Region in 2000, 2008, and 2012 are presented in Table 19.12. The total taxable sales represent about 3 percent of total annual state taxable sales. The lower rates of growth for the period 2008 to 2012 may be attributable to the effects of the recession that started in 2007 and a decline in employment, as discussed above.

**Table 19.12 Total Taxable Sales in Central Valley Region – Sacramento Valley**

| Area | Total Taxable Sales (millions) | | | Average Annual Growth Rate | |
|---|---|---|---|---|---|

Combined (secured and unsecured) property tax revenues in each of the counties in the Sacramento Valley portion of the Central Valley Region for Fiscal Year 2011-2012 are presented in Table 19.13. Total property tax revenues from these counties accounted for about 3 percent of the total state property tax revenues.

**Table 19.13 Property Tax Revenues, Fiscal Year 2011-2012, in Central Valley Region – Sacramento Valley**

| Area | Property Tax Revenues (millions) |
|---|---|
| Shasta County | $168 |
| Plumas County | $41 |

#### *19.3.3.2 San Joaquin Valley*

The San Joaquin Valley includes the counties of Stanislaus, Merced, Madera, Fresno, Kings, Tulare, and Kern counties. San Joaquin County also is located within the San Joaquin Valley; however, this county is discussed below as part of the Delta and Suisun Marsh subsection. Other counties in the San Joaquin Valley are not anticipated to be affected by changes in CVP and SWP operations, and are not discussed here, including: Calaveras, Mariposa, and Tuolumne counties.

The San Joaquin Valley includes the major agricultural counties, of Fresno, Kern, Kings and Tulare, as described in Chapter 12, Agricultural Resources.

##### 19.3.3.2.1 Population

Population characteristics in the San Joaquin Valley portion of the Central Valley Region are presented in Table 19.14. Among the counties in the San Joaquin Valley portion of the Central Valley Region, Kern County had the highest average annual population growth rate between 2000 and 2012; and Stanislaus and Kings counties had the lowest growth rate.

**Table 19.14 Population Characteristics in Central Valley – San Joaquin Valley**

| Area | Population | | Average Annual Growth Rate (percent) |
|---|---|---|---|
| | 2000 | 2012 | 2000-2012 |
| Stanislaus County | 446,997 | 519,339 | 1.3 |
| Madera County | 123,109 | 152,325 | 1.8 |
| Merced County | 210,554 | 260,029 | 1.8 |
| Fresno County | 799,407 | 943,493 | 1.4 |
| Tulare County | 368,021 | 451,540 | 1.7 |
| Kings County | 129,461 | 151,774 | 1.3 |
| Kern County | 661,653 | 849,977 | 2.1 |
| San Joaquin Valley Subtotal | 2,739,202 | 3,328,477 | 1.6 |
| Total Central Valley Region | 6,062,064 | 7,238,742 | 1.5 |
| **STATE OF CALIFORNIA** | **33,873,086** | **37,668,804** | **0.9** |

##### 19.3.3.2.2 Employment

Civilian labor force characteristics for the counties in the San Joaquin Valley portion of the Central Valley Region are presented in Table 19.15. The civilian labor force increased between 2001 and 2012. The data for 2008 represents the employment situation immediately following the recession that started in 2007. The average unemployment rate in the civilian labor force increased from 2001 to 2012. The average unemployment rates for the San Joaquin Valley portion of the Central Valley Region between 2001 and 2012 have been higher than for the entire Central Valley Region and the state.

**Table 19.15 Civilian Labor Force and Unemployment Rates in Central Valley Region – San Joaquin Valley**

| Area | Civilian Labor Force (subject to unemployment insurance) | | | Unemployment Rate (percent) | | |
|---|---|---|---|---|---|---|
| | 2001 | 2008 | 2012 | 2001 | 2008 | 2012 |
| Stanislaus County | 214,292 | 231,965 | 239,461 | 8.3 | 11.0 | 15.2 |
| Madera County | 53,956 | 65,100 | 68,167 | 9.6 | 9.4 | 13.6 |
| Merced County | 91,825 | 102,251 | 111,322 | 10.1 | 12.5 | 17.0 |
| Fresno County | 389,805 | 430,163 | 442,453 | 10.7 | 10.5 | 15.2 |
| Tulare County | 175,357 | 199,124 | 207,634 | 11.4 | 10.8 | 15.8 |
| Kings County | 50,233 | 58,801 | 60,886 | 10.7 | 10.5 | 15.3 |
| Kern County | 297,982 | 359,573 | 396,657 | 8.6 | 9.8 | 13.3 |
| San Joaquin Valley Subtotal | 1,273,450 | 1,446,977 | 1,526,580 | 9.8 | 10.5 | 14.9 |

| **STATE OF CALIFORNIA** | **17,152,106** | **18,392,000** | **18,494,881** | **4.9** | **7.2** | **10.5** |

Source: BLS 2014

Total employment and farm employment in 2001, 2008 and 2012 in the San Joaquin Valley portion of the Central Valley Region are presented in Table 19.16. The contribution of farm employment to the total employment declined between 2001 and 2008, and then increased slightly in 2012, except in Tulare County. In Tulare County, farm employment increased between 2001 and 2008 and decreased between 2008 and 2012.

**Table 19.16 Employment in Central Valley Region – San Joaquin Valley**

| Area | Total Employment | | | Farm Employment | | |
|---|---|---|---|---|---|---|
| | 2001 | 2008 | 2012 | 2001 | 2008 | 2012 |
| Stanislaus County | 208,016 | 221,632 | 214,446 | 18,708 | 16,000 | 15,784 |
| Madera County | 50,975 | 59,354 | 59,027 | 6,296 | 4,750 | 5,186 |
| Merced County | 82,803 | 92,891 | 93,766 | 14,147 | 12,029 | 8,075 |
| Fresno County | 401,025 | 446,939 | 437,934 | 56,655 | 50,798 | 51,277 |
| Tulare County | 168,523 | 191,195 | 186,875 | 42,851 | 38,080 | 36,369 |
| Kings County | 48,960 | 57,513 | 55,008 | 4,705 | 4,061 | 6,620 |

Source: BEA 2014a

Note:
Farm employment includes employment numbers in forestry, fishing, and related activities.

Annual farm employment for the San Joaquin Valley portion of the Central Valley Region declined in 2004 and continued to fluctuate through 2012, as shown in Figure 19.2. Farm employment in the San Joaquin Valley portion of the Central Valley Region represents a major portion of the overall farm employment in the Central Valley.

Within the counties in the San Joaquin Valley portion of the Central Valley Region, farm employment declined between 2003 and 2006 and remained about the same between 2007 and 2012. The overall trend in farm employment is influenced by the farm employment trends in Fresno, Kern, and Tulare counties, as shown in Figure 19.4. The decrease in farm employment is related to the reduction in cultivated acreage during this period, as described in Chapter 12, Agricultural Resources.

The farm employment numbers presented in Table 19.16 include only workers directly involved in farming, forestry, and fishing activities. However, farming is one of the most important basic industries in the Central Valley; and supports many other businesses including farm inputs (e.g., fertilizer, seed, machinery, and fuel) and processing of food and fiber grown on farms. As a result, employment both directly on farm and indirectly dependent on farming is higher than the values displayed in Table 19.16.

Total farm-dependent employment is not reported in the U.S. Bureau of Economic Analysis or the U.S. Bureau of Labor Statistics; however, the employment values can be estimated by studies of local economies. A study of the local economy in four counties of the San Joaquin Valley found that, for every on-farm job, about two and one-half additional jobs are supported because of inputs purchased for farming operations (NEA 1997). This estimate includes the associated effects of workers on those farms and businesses spending their incomes on other purchases; however, the estimated values do not include employment in the processing sector. Another study indicated that the employment multiplier of the agricultural production and processing industry is 1.92, or that for every 100 agricultural production and processing jobs in the San Joaquin Valley, 92 other jobs were created in the San Joaquin Valley (UCAIC 2009).

San Joaquin Valley employment also includes employment associated with adult prison facilities. The San Joaquin Valley portion of the Central Valley Region includes eight (or about 24 percent) of the 33 adult prison facilities operated by the California Department of Corrections and Rehabilitation. These prisons are home to about a quarter of the total prison population in the state and employ about a quarter of the total prison staff in the state. Employment for these prisons is summarized in Table 19.17.

**Table 19.17 California State Prisons in Central Valley Region - San Joaquin Valley**

| Prison Facility | Location | Staff |
|---|---|---|
| Central California Women's Facility | Chowchilla, Madera County | 1,064 |
| Valley State Prison | Chowchilla, Madera County | 1,021 |
| Pleasant Valley State Prison | Coalinga, Fresno County | 1,357 |
| Avenal State Prison | Avenal, Kings County | 1,475 |
| California State Prison | Corcoran, Kings County | 2,003 |
| Wasco State Prison | Wasco, Kern County | 1,523 |
| North Kern State Prison | Delano, Kern County | 1,393 |
| Kern Valley State Prison | Delano, Kern County | 1,545 |

Sources: CDCR 2014a, 2014b, 2014c, 2014d, 2014e, 2014f, 2014g, 2014h

Federal prisons are located at Atwater in Merced County, Mendota in Fresno County, and Taft in Kern County within the San Joaquin Valley portion of the Central Valley Region (BOP 2014).

### 19.3.3.2.3 Income

The average per capita personal income in the San Joaquin Valley portion of the Central Valley Region was lower than that for the entire Central Valley Region, as presented in Table 19.18. The average per capita personal income in the San Joaquin Valley portion of the Central Valley Region was a little more than two-thirds of the average per capita personal income in the Central Valley Region and the state. With the exception of Stanislaus County, most counties in the San Joaquin Valley portion of the Central Valley Region had higher annual average growth in per capita personal income between 2000 and 2008 than the entire Central Valley Region and the state.

**Table 19.18 Per Capita Personal Income in Central Valley Region – San Joaquin Valley**

| Area | Per Capita Personal Income | | | Average Annual Growth Rate (percent) | |
|---|---|---|---|---|---|
| | 2000 | 2008 | 2012 | 2000-2008 | 2008-2012 |
| Stanislaus County | $24,284 | $31,093 | $34,138 | 3.1 | 2.4 |
| Madera County | $18,983 | $26,693 | $31,169 | 4.4 | 4.0 |
| Merced County | $19,976 | $26,963 | $30,630 | 3.8 | 3.2 |
| Fresno County | $23,001 | $30,977 | $34,074 | 3.8 | 2.4 |
| Tulare County | $20,070 | $28,035 | $31,307 | 4.3 | 2.8 |
| Kings County | $16,912 | $26,339 | $31,835 | 5.7 | 4.9 |
| Kern County | $21,507 | $29,527 | $34,453 | 4.0 | 3.9 |
| Average in San Joaquin Valley Counties | $21,755 | $29,505 | $33,303 | 3.9 | 3.1 |
| Central Valley Region | $28,183 | $37,198 | $40,601 | 3.5 | 2.2 |
| **STATE OF CALIFORNIA** | **$33,404** | **$44,003** | **$46,477** | **3.5** | **1.4** |

#### 19.3.3.2.4 Local Government Finances

As of April 1, 2014, the county sales tax rates in the counties within the San Joaquin Valley portion of the Central Valley ranged from 7.5 percent in Merced, Kern, and Kings counties to 8.225 percent in Fresno County (BOE 2014).

The total annual taxable sales for the counties in the San Joaquin Valley portion of the Central Valley Region in 2000, 2008, and 2012 are presented in Table 19.19. The contribution of the area to California total annual taxable sales increased between 2000 and 2012. The lower rates of growth for the period 2008 to 2012 may be attributable to the effects of the recession that started in 2007 and a decline in employment, as discussed above.

**Table 19.19 Total Taxable Sales in Central Valley Region – San Joaquin Valley**

| Area | Total Taxable Sales (millions) | | | Average Annual Growth Rate (percent) | |
|---|---|---|---|---|---|
| | 2000 | 2008 | 2012 | 2000-2008 | 2008-2012 |
| Stanislaus County | $5,195 | $6,729 | $7,178 | 3.3 | 1.6 |
| Madera County | $881 | $1,327 | $1,356 | 5.2 | 0.5 |
| Merced County | $1,740 | $2,388 | $2,512 | 4.0 | 1.3 |
| Fresno County | $8,472 | $11,729 | $12,021 | 4.2 | 0.6 |
| Tulare County | $3,222 | $4,755 | $5,499 | 5.0 | 3.7 |
| Kings County | $888 | $1,389 | $1,386 | 5.8 | -0.1 |
| Kern County | $6,938 | $12,086 | $14,666 | 7.2 | 5.0 |
| Total San Joaquin Valley | $27,337 | $40,403 | $44,619 | 5.0 | 2.5 |
| Central Valley Region | $81,975 | $107,699 | $113,368 | 3.5 | 1.3 |
| **STATE OF CALIFORNIA** | **$441,854** | **$531,654** | **$407,714** | **2.3** | **-6.4** |

Sources: BOE 2000, 2008, 2012

The combined (secured and unsecured) property tax revenues in each of the counties in the San Joaquin Valley portion of the Central Valley Region for Fiscal Year 2011-2012 are presented in Table 19.20. Total property tax revenues from these counties accounted for about 6 percent of the total state property tax revenues.

**Table 19.20 Property Tax Revenues, Fiscal Year 2011-2012, in Central Valley Region – San Joaquin Valley**

| Area | Property Tax Revenues (millions) |
|---|---|
| Stanislaus County | $426 |
| Madera County | $128 |
| Merced County | $197 |
| Fresno County | $755 |
| Tulare County | $327 |
| Kings County | $104 |
| Kern County | $1,102 |
| San Joaquin Valley Subtotal | $3,039 |
| Central Valley Region | $9,874 |
| **STATE OF CALIFORNIA** | **$55,459** |

Source: California State Controller 2012

#### *19.3.3.3 Delta and Suisun Marsh*

The Delta and Suisun Marsh portion of the Central Valley Region includes Sacramento, Yolo, Solano, San Joaquin, and Contra Costa counties. These counties include some of the leading agricultural areas in the state. In addition to agriculture, this area includes important transportation infrastructures including inland shipping ports (Port of West Sacramento and Port of Stockton); major employment centers (cities of Sacramento, West Sacramento, Fairfield, Stockton, and Concord); and water-based recreation activities (e.g., boating, fishing, and water skiing).

##### 19.3.3.3.1 Population

Population characteristics in the counties of the Delta and Suisun Marsh portion of the Central Valley Region are presented in Table 19.21. San Joaquin County had the highest average annual population growth rate between 2000 and 2012, and Solano County had the lowest growth rate.

**Table 19.21 Population Characteristics in Central Valley Region – Delta and Suisun Marsh**

| Area | Population | | Average Annual Growth Rate (percent) |
|---|---|---|---|
| | 2000 | 2012 | 2000-2012 |
| Sacramento County | 1,223,499 | 1,433,525 | 1.3 |
| Yolo County | 168,660 | 204,349 | 1.6 |
| Solano County | 394,930 | 415,787 | 0.4 |
| San Joaquin County | 563,598 | 692,997 | 1.7 |
| Contra Costa County | 948,816 | 1,066,602 | 1.0 |
| Delta and Suisun Marsh Subtotal | 3,299,503 | 3,813,260 | 1.2 |
| Total Central Valley Region | 6,062,064 | 7,238,742 | 1.5 |
| **STATE OF CALIFORNIA** | **33,873,086** | **37,668,804** | **0.9** |

### 19.3.3.3.2 Employment

Civilian labor force characteristics for the Sacramento, Yolo, Solano, San Joaquin, and Contra Costa counties are presented in Table 19.22. The civilian labor force in these counties increased between 2001 and 2012. The data for 2008 represents the employment situation immediately following the recession in 2007.

**Table 19.22 Civilian Labor Force and Unemployment Rates in Central Valley Region – Delta and Suisun Marsh**

| Area | Civilian Labor Force (subject to unemployment insurance) | | | Unemployment Rate (percent) | | |
|---|---|---|---|---|---|---|
| | 2001 | 2008 | 2012 | 2001 | 2008 | 2012 |
| Sacramento County | 624,693 | 680,373 | 680,349 | 4.5 | 7.2 | 10.6 |
| Yolo County | 88,331 | 98,438 | 98,475 | 5.1 | 7.4 | 11.5 |
| Solano County | 197,178 | 211,369 | 217,024 | 4.6 | 6.8 | 10.1 |
| San Joaquin County | 266,288 | 293,190 | 298,468 | 7.5 | 10.4 | 15.2 |

| **STATE OF CALIFORNIA** | **17,152,106** | **18,392,000** | **18,494,881** | **4.9** | **7.2** | **10.5** |

Source: BLS 2014

Total employment and farm employment in 2001, 2008, and 2012 in the Sacramento, Yolo, Solano, San Joaquin, and Contra Costa counties are presented in Table 19.23. The contribution of farm employment to the total employment declined slightly between 2001 and 2008, and then increased slightly between 2008 and 2012.

**Table 19.23 Employment in Central Valley Region – Delta and Suisun Marsh**

| Area | Total Employment | | | Farm Employment | | |
|---|---|---|---|---|---|---|
| | 2001 | 2008 | 2012 | 2001 | 2008 | 2012 |
| Sacramento County | 739,256 | 806,976 | 784,386 | 5,176 | 4,019 | 3,924 |
| Yolo County | 110,902 | 122,054 | 117,609 | 5,244 | 5,364 | 5,745 |
| Solano County | 162,874 | 174,565 | 169,096 | 3,321 | 2,144 | 2,116 |
| San Joaquin County | 260,809 | 286,171 | 277,260 | 21,088 | 16,939 | 17,496 |
| Contra Costa County | 475,493 | 497,887 | 492,144 | 3,130 | 910 | 1,599 |
| Delta and Suisun Marsh Subtotal | 1,749,334 | 1,887,653 | 1,840,495 | 37,959 | 29,376 | 30,880 |
| Total Central Valley Region | 3,616,241 | 3,997,557 | 3,923,230 | 256,672 | 226,321 | 230,832 |

Source: BEA 2014a

Note:

Farm employment includes employment numbers in forestry, fishing, and related activities.

Annual farm employment for the Sacramento, Yolo, Solano, San Joaquin, and Contra Costa counties declined in 2004, slightly increased in 2006, and continued to fluctuate through 2012, as shown in Figure 19.5. Within these counties, farm employment started to decline in 2004 and began to increase slightly in 2006, as shown in Figure 19.5. The overall trend in farm employment in the Delta and Suisun Marsh portion of the Central Valley Region is influenced by the farm employment trends in San Joaquin County. The decrease in farm employment is related to the reduction in cultivated acreage during this period, as described in Chapter 12, Agricultural Resources.

The farm employment numbers presented in Table 19.23 include only workers directly involved in farming, forestry, and fishing activities. However, farming is one of the most important basic industries in many counties in the Central Valley Region; and supports many other businesses including farm inputs (e.g., fertilizer, seed, machinery, and fuel) and processing of food and fiber grown on farms. As a result, employment both directly on farm and indirectly dependent on farming is higher than the values displayed in Table 19.23.

#### 19.3.3.3.3 Income

The average per capita personal income in the Sacramento, Yolo, Solano, San Joaquin, and Contra Costa counties was about 15 percent higher than the average per capita personal income in the entire Central Valley Region, as presented in Table 19.24. San Joaquin and Contra Costa counties experienced the lowest average annual growth rates in per capita personal income between 2000 and 2008. Between 2008 and 2012, Yolo County was the only county with a slightly higher average annual growth rate as compared to the entire Central Valley Region.

**Table 19.24 Per Capita Personal Income in Central Valley Region – Delta and Suisun Marsh**

| Area | Per Capita Personal Income | | | Average Annual Growth Rate (percent) | |
|---|---|---|---|---|---|

#### 19.3.3.3.4 Local Government Finances

As of April 1, 2014, the county sales tax rates in the Sacramento, Yolo, Solano, San Joaquin, and Contra Costa counties ranged between 7.5 percent in Yolo to 8 percent in San Joaquin (BOE 2014).

Total annual taxable sales for Sacramento, Yolo, Solano, San Joaquin, and Contra Costa counties in 2000, 2008, and 2012 are presented in Table 19.25. Between 2000 and 2008 Yolo, Solano, and San Joaquin counties experienced average annual growth in total taxable sales that were higher than the entire Central Valley Region and the state. Between 2008 and 2012, Sacramento County experienced negative average annual growth in total taxable sales.

**Table 19.25 Total Taxable Sales in Central Valley Region – Delta and Suisun Marsh**

| Area | Total Taxable Sales (millions) | | | Average Annual Growth Rate (percent) | |
|---|---|---|---|---|---|
| | 2000 | 2008 | 2012 | 2000-2008 | 2008-2012 |
| Sacramento County | $16,594 | $19,332 | $19,090 | 1.9 | -0.3 |
| Yolo County | $2,416 | $3,347 | $3,475 | 4.2 | 0.9 |
| Solano County | $4,424 | $6,033 | $6,038 | 4.0 | 0.0 |
| San Joaquin County | $6,582 | $8,696 | $9,011 | 3.5 | 0.9 |
| Contra Costa County | $12,331 | $13,308 | $13,997 | 1.0 | 1.3 |
| Delta and Suisun Marsh Counties | $42,347 | $50,715 | $51,611 | 2.3 | 0.4 |
| Central Valley Region | $81,975 | $107,699 | $113,368 | 3.5 | 1.3 |
| **STATE OF CALIFORNIA** | **$441,854** | **$531,654** | **$407,714** | **2.3** | **-6.4** |

Sources: BOE 2000, 2008, 2012

The combined (secured and unsecured) property tax revenues in Sacramento, Yolo, Solano, San Joaquin, and Contra Costa counties for Fiscal Year 2011-2012 are presented in Table 19.26. Total property tax revenues from these counties accounted for about 9 percent of the total state property tax revenues.

**Table 19.26 Property Tax Revenues, Fiscal Year 2011-2012, in Central Valley Region – Delta and Suisun Marsh**

| Area | Property Tax Revenues (millions) |
|---|---|
| Sacramento County | $1,539 |
| Yolo County | $270 |
| Solano County | $497 |
| San Joaquin County | $684 |
| Contra Costa County | $1,979 |
| Delta and Suisun Marsh Counties | $4,969 |
| Central Valley Region | $9,874 |
| **STATE OF CALIFORNIA** | **$55,459** |

## 19.3.4 San Francisco Bay Area Region

The San Francisco Bay Area Region includes portions of Napa, Alameda, Santa Clara, and San Benito counties that are within the CVP and SWP service areas. Contra Costa County also is part of the San Francisco Bay Area Region. However, for this chapter, Contra Costa County is discussed under Section 19.3.4.3, Delta and Suisun Marsh.

### *19.3.4.1 Population*

Population characteristics in the San Francisco Bay Area Region are presented in Table 19.27. The population of the San Francisco Bay Area Region grew slightly less than a quarter million, or at an average annual growth rate of less than one half of one percent between 2000 and 2012.

**Table 19.27 Population Characteristics in San Francisco Bay Area Region**

| Area | Population | | Average Annual Growth Rate (percent) |
|---|---|---|---|
| | 2000 | 2012 | 2000-2012 |
| Alameda County | 1,443,939 | 1,530,176 | 0.5 |
| Santa Clara County | 1,682,585 | 1,813,696 | 0.6 |
| San Benito County | 53,234 | 56,137 | 0.4 |
| Napa County | 124,279 | 137,731 | 0.9 |
| Total San Francisco Bay Area Region | 3,304,037 | 3,537,740 | 0.6 |
| **STATE OF CALIFORNIA** | **33,873,086** | **37,668,804** | **0.9** |

Sources: DOF 2013a, 2013b, 2014

#### 19.3.4.2 Employment

Civilian labor force characteristics for the counties in the San Francisco Bay Area Region are presented in Table 19.28. The civilian labor force in the counties within the San Francisco Bay Area Region declined between 2001 and 2008, and then increased between 2008 and 2012. The data for 2008 represents the employment situation immediately following the onset of the recession in 2007.

**Table 19.28 Civilian Labor Force and Unemployment Rates in San Francisco Bay Area Region**

| Area | Civilian Labor Force (subject to unemployment insurance) | | | Unemployment Rate (percent) | | |
|---|---|---|---|---|---|---|
| | 2001 | 2008 | 2012 | 2001 | 2008 | 2012 |
| Alameda County | 778,472 | 757,566 | 775,855 | 4.8 | 6.2 | 9.0 |
| Santa Clara County | 939,501 | 870,251 | 910,983 | 5.1 | 6.0 | 8.4 |
| San Benito County | 27,461 | 24,870 | 26,611 | 6.3 | 9.6 | 13.9 |
| Napa County | 70,447 | 75,670 | 77,843 | 3.6 | 5.1 | 7.8 |
| Total San Francisco Bay Area Region | 1,815,881 | 1,728,357 | 1,791,292 | 4.9 | 6.1 | 8.7 |

Source: BLS 2014

Total employment and farm employment in 2001, 2008 and 2012 in the San Francisco Bay Area Region are presented in Table 19.29. The contribution of farm employment to total employment in the San Francisco Bay Area Region declined slightly between 2001 and 2008, and remained relatively stable between 2008 and 2012.

**Table 19.29 Employment in San Francisco Bay Area Region**

| Area | Total Employment | | | Farm Employment | | |
|---|---|---|---|---|---|---|
| | 2001 | 2008 | 2012 | 2001 | 2008 | 2012 |
| Alameda County | 886,316 | 906,403 | 894,625 | 1,704 | 1,475 | 1,291 |
| Santa Clara County | 1,226,987 | 1,176,129 | 1,187,799 | 5,969 | 4,436 | 2,643 |
| San Benito County | 21,722 | 21,827 | 21,116 | 1,969 | 1,244 | 1,073 |
| Napa County | 84,369 | 91,837 | 93,050 | 4,835 | 5,730 | 3,148 |
| Total San Francisco Bay Area Region | 2,219,394 | 2,196,196 | 2,196,590 | 14,477 | 12,885 | 8,155 |
| **STATE OF CALIFORNIA** | **19,411,367** | **20,820,306** | **20,653,860** | **479,283** | **438,013** | **443,764** |

Source: BEA 2014a

Note:
Farm employment includes employment numbers in forestry, fishing, and related activities.

As shown in Table 19.29, overall farm employment has declined by 45 percent between 2001 and 2012, as presented in Figure 19.1. The decrease in farm employment is related to the reduction in cultivated acreage during this period, as described in Chapter 12, Agricultural Resources.

#### *19.3.4.3 Income*

The average per capita personal incomes for the counties in the San Francisco Bay Area Region are presented in Table 19.30. Among the four counties in this region, San Benito County had the lowest per capita personal income. Santa Clara County had the lowest average annual per capita growth rate between 2000 and 2008. All counties experienced smaller average annual per capita growth rates between 2008 and 2012 compared to the 2000 to 2008 period.

**Table 19.30 Per Capita Personal Income in San Francisco Bay Area Region**

| Area | Per Capita Personal Income | | | Average Annual Growth Rate (percent) | |
|---|---|---|---|---|---|
| | 2000 | 2008 | 2012 | 2000-2008 | 2008-2012 |
| Alameda County | $39,613 | $50,302 | $54,683 | 3.0 | 2.1 |
| Santa Clara County | $55,588 | $59,927 | $66,535 | 0.9 | 2.6 |
| San Benito County | $29,608 | $36,100 | $38,030 | 2.5 | 1.3 |
| Napa County | $38,854 | $51,712 | $54,807 | 3.6 | 1.5 |
| Total San Francisco Bay Area Region | $47,546 | $55,050 | $60,493 | 1.8 | 2.4 |
| **STATE OF CALIFORNIA** | **$33,404** | **$44,003** | **$46,477** | **3.5** | **1.4** |

#### *19.3.4.4 Local Government Finances*

As of April 1, 2014, the county sales tax rates in the San Francisco Bay Area region ranged between 7.5 percent in San Benito and 9.0 percent in Alameda (BOE 2014).

Total annual taxable sales for the counties in the San Francisco Bay Area Region in 2000, 2008, and 2012 are presented in Table 19.31. Between 2000 and 2008 all counties in the region, except Santa Clara County, experienced small increases in average annual growth in total taxable sales. All counties experienced increasing growth rates between 2008 and 2012. Santa Clara County had the highest annual average growth rate in total taxable sales among all the counties in the region during this period.

**Table 19.31 Total Taxable Sales in San Francisco Bay Area Region**

| Area | Total Taxable Sales (Millions) | | | Average Annual Growth Rate (percent) | |
|---|---|---|---|---|---|
| | 2000 | 2008 | 2012 | 2000-2008 | 2008-2012 |
| Alameda County | $23,764 | $23,863 | $25,182 | 0.1 | 1.4 |
| Santa Clara County | $37,304 | $32,274 | $36,220 | -1.8 | 2.9 |
| San Benito County | $476 | $505 | $530 | 0.7 | 1.2 |
| Napa County | $1,908 | $2,549 | $2,719 | 3.7 | 1.6 |
| Total San Francisco Bay Area Region | $63,451 | $59,191 | $64,651 | -0.9 | 2.2 |
| **STATE OF CALIFORNIA** | **$441,854** | **$531,654** | **$407,714** | **2.3** | **-6.4** |

Sources: BOE 2000, 2008, 2012

The combined (secured and unsecured) property tax revenues in each of the counties in the San Francisco Bay Area Region for Fiscal Year 2011-2012 are presented in Table 19.32. Total property tax revenues in the four counties accounted for about 13 percent of the total state property tax revenues.

**Table 19.32 Property Tax Revenues, Fiscal Year 2011-2012, in San Francisco Bay Area Region**

| Area | Property Tax Revenues (millions) |
|---|---|
| Alameda County | $2,830 |
| Santa Clara County | $3,973 |
| San Benito County | $68 |
| Napa County | $327 |
| Total San Francisco Bay Area Region | $7,198 |
| **STATE OF CALIFORNIA** | **$55,459** |

Source: California State Controller 2014

## 19.3.5 Central Coast Region

The Central Coast Region includes portions of San Luis Obispo and Santa Barbara counties served by the SWP. San Luis Obispo and Santa Barbara counties are among the top 15 counties in total agricultural production in the state.

### *19.3.5.1 Population*

Population characteristics in the Central Coast Region are presented in Table 19.33. The population of the Central Coast Region grew by an average annual growth rate of about one half of one percent between 2000 and 2012.

**Table 19.33 Population Characteristics in Central Coast Region**

| Area | Population | | Average Annual Growth Rate (percent) |
|---|---|---|---|
| | 2000 | 2012 | 2000-2012 |
| San Luis Obispo County | 246,681 | 271,502 | 0.8 |
| Santa Barbara County | 399,347 | 426,351 | 0.5 |
| Total Central Coast Region | 646,028 | 697,853 | 0.6 |
| **STATE OF CALIFORNIA** | **33,873,086** | **37,668,804** | **0.9** |

Sources: DOF 2013a, 2013b, 2014

### *19.3.5.2 Employment*

Civilian labor force characteristics for the counties in the Central Coast Region are presented in Table 19.34. The civilian labor force in the Central Coast Region increased between 2000 and 2012.

**Table 19.34 Civilian Labor Force and Unemployment Rates in Central Coast Region**

| Area | Civilian Labor Force (subject to unemployment insurance) | | | Unemployment Rate (percent) | | |
|---|---|---|---|---|---|---|
| | 2001 | 2008 | 2012 | 2001 | 2008 | 2012 |
| San Luis Obispo County | 126,176 | 136,615 | 138,650 | 4.0 | 5.7 | 9.3 |
| Santa Barbara County | 203,039 | 218,429 | 225,635 | 4.4 | 5.4 | 8.8 |
| Total Central Coast Region | 329,215 | 355,044 | 364,285 | 4.3 | 5.6 | 5.9 |
| **STATE OF CALIFORNIA** | **17,152,106** | **18,392,000** | **18,494,881** | **4.9** | **7.2** | **10.5** |

Source: BLS 2014

Total employment and farm employment in 2001, 2008, and 2012 in the Central Coast Region are presented in Table 19.35. Farm employment accounted for less than ten percent of total employment during this period.

**Table 19.35 Employment in Central Coast Region**

| Area | Total Employment | | | Farm Employment | | |
|---|---|---|---|---|---|---|
| | 2001 | 2008 | 2012 | 2001 | 2008 | 2012 |
| San Luis Obispo County | 140,320 | 155,093 | 156,757 | 7,775 | 6,866 | 7,374 |
| Santa Barbara County | 243,955 | 260,056 | 257,841 | 15,228 | 16,483 | 18,075 |
| Total Central Coast Region | 384,275 | 415,149 | 414,598 | 23,003 | 23,349 | 25,449 |
| **STATE OF CALIFORNIA** | **19,411,367** | **20,820,306** | **20,653,860** | **479,283** | **438,013** | **443,764** |

Source: BEA 2014a
Note: Farm employment includes employment numbers in forestry, fishing, and related activities.

The farm employment numbers presented in Table 19.35 include only workers directly involved in farming, forestry, and fishing activities. However, farming is one of the most important basic industries in many counties in the Central Coast Region; and supports many other businesses including farm inputs (e.g., fertilizer, seed, machinery, and fuel) and processing of food and fiber grown on farms. As a result, employment both directly on farm and indirectly dependent on farming is higher than the values displayed in Table 19.35.

#### *19.3.5.3 Income*

Per capita personal incomes for the counties in the Central Coast Region are lower than those for the state. Both San Luis Obispo and Santa Barbara had average annual per capita personal income growth rates between 2000 and 2008 that were among the highest in the state. Per capita personal income for each of the two counties in the Central Coast Region in 2000, 2008 and 2012 are presented in Table 19.36.

**Table 19.36 Per Capita Personal Income in Central Coast Region**

| | Per Capita Personal Income | | | Average Annual Growth Rate (percent) | |
|---|---|---|---|---|---|
| **Area** | **2000** | **2008** | **2012** | **2000-2008** | **2008-2012** |
| San Luis Obispo County | $28,671 | $40,204 | $43,698 | 4.3 | 2.1 |
| Santa Barbara County | $33,317 | $45,997 | $47,862 | 4.1 | 1.0 |
| Central Coast Region | $31,540 | $43,735 | $46,241 | 4.2 | 1.4 |
| **STATE OF CALIFORNIA** | **$33,404** | **$44,003** | **$46,477** | **3.5** | **1.4** |

Source: BEA 2014e

#### *19.3.5.4 Local Government Finances*

As of April 1, 2014, the county sales tax rates in the San Luis Obispo and Santa Barbara counties were 7.5 percent and 8.0 percent, respectively (BOE 2014).

Total annual taxable sales for San Luis Obispo and Santa Barbara counties in the Central Coast Region in 2000, 2008, and 2012 are presented in Table 19.37. The Central Coast Region's average annual growth in total taxable sales were higher than for the state.

**Table 19.37 Total Taxable Sales in Central Coast Region**

| | Total Taxable Sales (Millions) | | | Average Annual Growth Rate (percent) | |
|---|---|---|---|---|---|
| **Area** | **2000** | **2008** | **2012** | **2000-2008** | **2008-2012** |
| San Luis Obispo County | $2,925 | $3,974 | $5,026 | 3.9 | 6.0 |
| Santa Barbara County | $4,823 | $5,884 | $6,051 | 2.5 | 0.7 |
| Central Coast Region | $7,748 | $9,858 | $11,077 | 3.1 | 3.0 |

## 19.3.6 Southern California Region

The Southern California Region includes portions of Ventura, Los Angeles, Orange, San Diego, Riverside, and San Bernardino counties served by the SWP.

### *19.3.6.1 Population*

Population characteristics in Southern California Region are presented in Table 19.39. Among the counties in the Southern California Region, Riverside County had the highest average annual population growth rate, and Los Angeles County had the lowest average annual population growth rate between 2000 and 2012.

**Table 19.39 Population Characteristics in Southern California Region**

| Area | Population | | Average Annual Growth Rate (percent) |
|---|---|---|---|
| | 2000 | 2012 | 2000-2012 |
| Ventura County | 753,197 | 829,065 | 0.8 |
| Los Angeles County | 9,519,330 | 9,889,520 | 0.3 |
| Orange County | 2,846,289 | 3,057,879 | 0.6 |
| San Diego County | 2,813,833 | 3,128,734 | 0.9 |
| Riverside County | 1,545,387 | 2,234,193 | 3.1 |
| San Bernardino County | 1,710,139 | 2,059,699 | 1.6 |

### *19.3.6.2 Employment*

Civilian labor force characteristics for the counties in the Southern California Region are presented in Table 19.40. The civilian labor force in the Southern California Region increased between 2001 and 2012. The average unemployment rates for the Southern California Region have been lower than for the state.

**Table 19.40 Civilian Labor Force and Unemployment Rates in Southern California Region**

| Area | Civilian Labor Force (subject to unemployment insurance) | | | Unemployment Rate (percent) | | |
|---|---|---|---|---|---|---|
| | 2001 | 2008 | 2012 | 2001 | 2008 | 2012 |
| Ventura County | 399,325 | 429,444 | 440,649 | 4.8 | 6.3 | 9.0 |
| Los Angeles County | 4,752,839 | 4,934,756 | 4,879,674 | 5.7 | 7.5 | 10.9 |
| Orange County | 1,513,234 | 1,618,079 | 1,618,677 | 4.0 | 5.3 | 7.6 |

Note:

Farm employment includes employment numbers in forestry, fishing, and related activities.

#### *19.3.6.3 Income*

Among the six counties in this region, San Bernardino County had the lowest per capita personal income in 2000 and 2008, as presented in Table 19.42. In 2012, Riverside County had the lowest per capita personal income.

**Table 19.42 Per Capita Personal Income in Southern California Region**

| Area | Per Capita Personal Income | | | Average Annual Growth Rate (percent) | |
|---|---|---|---|---|---|
| | 2000 | 2008 | 2012 | 2000-2008 | 2008-2012 |
| Ventura County | $34,296 | $46,634 | $48,837 | 3.9 | 1.2 |
| Los Angeles County | $29,878 | $42,881 | $44,474 | 4.6 | 0.9 |
| Orange County | $38,357 | $49,436 | $52,342 | 3.2 | 1.4 |
| San Diego County | $33,779 | $47,197 | $49,719 | 4.3 | 1.3 |
| Riverside County | $24,528 | $30,842 | $31,742 | 2.9 | 0.7 |

### *19.3.6.4 Local Government Finances*

As of April 1, 2014, the county sales tax rates in the Southern California Region ranged from 7.5 percent in Ventura County to 9.0 percent in Los Angeles County (BOE 2014).

Total annual taxable sales for the counties in the Southern California Region in 2000, 2008, and 2012 are presented in Table 19.43. The counties in this region have had higher average annual growth rates in total taxable retail sales compared to the state. Between 2000 and 2008, Riverside and San Bernardino led the region with higher average annual growth rates. However, between 2008 and 2012, the two counties experienced declining growth rates.

**Table 19.43 Total Taxable Sales in Southern California Region**

| Area | Total Taxable Sales (millions) | | | Average Annual Growth Rate (percent) | |
|---|---|---|---|---|---|
| | 2000 | 2008 | 2012 | 2000-2008 | 2008-2012 |
| Ventura County | $9,096 | $11,322 | $11,958 | 2.8 | 1.4 |
| Los Angeles County | $106,674 | $131,882 | $135,296 | 2.7 | 0.6 |
| Orange County | $44,462 | $53,607 | $55,231 | 2.4 | 0.7 |
| San Diego County | $36,245 | $45,329 | $47,947 | 2.8 | 1.4 |
| Riverside County | $16,979 | $26,004 | $28,096 | 5.5 | 2.0 |
| San Bernardino County | $18,885 | $27,778 | $29,532 | 4.9 | 1.5 |
| Total Southern California Region | $232,342 | $295,921 | $308,059 | 3.1 | 1.0 |

### 19.3.7 Ocean Salmon Fishery

The ocean salmon fishery along the southern Oregon and northern California coast are affected by the population of salmon that rely upon the northern California rivers, including the Sacramento and San Joaquin rivers. Changes in CVP and SWP water operations would affect the flow patterns and water quality of the Sacramento and San Joaquin rivers; and the survivability of the salmon that use those rivers for habitat, as described in Chapter 9, Fish and Aquatic Resources. This section discusses the economic contributions of the Pacific Coast salmon fishery.

Management of the California ocean salmon fishery is a combined effort of the California Department of Fish and Wildlife (CDFW) and the Pacific Fishery Management Council (PFMC), a regional council of the National Oceanic and Atmospheric Administration. The California Department of Fish and Wildlife manages salmon harvest from the shoreline to three nautical miles off the California coast. From three nautical miles to two hundred nautical miles offshore is managed by the PFMC. The PFMC is responsible for developing the Pacific Coast Salmon Fishery Management Plan (FMP) that guides management of the ocean commercial and recreational fishery in California, Oregon, and Washington (PFMC 2014a). The annual ocean salmon fishery regulations promote the maximum amount of harvest while ensuring that suitable population levels are maintained (NOAA 2014).

#### *19.3.7.1 Commercial Ocean Fisheries for Salmon along the Southern Oregon and Northern California Coasts*

The commercial ocean salmon fishery plays a large role in the overall California commercial ocean industry, as shown in Table 19.45. The total harvest value for Chinook salmon ranked fourth among all commercially harvested ocean species in 2012. The harvest value rank of Chinook salmon in California between 2001 and 2012 as compared to the other commercially harvested ocean species are presented in Table 19.46.

**Table 19.45 Top Ten Species by Total Value for Commercially Harvested Ocean Species in California in 2012**

| Rank | Species | Total Value |
|---|---|---|
| 1 | Dungeness Crab | $85,643,530 |
| 2 | California Market Squid | $63,883,456 |
| 3 | California Spiny Lobster | $13,706,721 |
| **4** | **Chinook Salmon** | **$12,841,853** |
| 5 | Sablefish | $8,987,599 |
| 6 | Pacific Oyster | $8,736,923 |
| 7 | Sea Urchins | $8,320,111 |
| 8 | Spot Shrimp | $4,462,204 |
| 9 | Pacific Sardine | $4,248,504 |
| 10 | Kumamoto Oyster | $3,170,760 |

Annual revenues from commercial ocean salmon fishery in California have fluctuated with changes in salmon prices and total landings. The dollar per dressed pound for Chinook salmon paid to the commercial operator can change within a season, across seasons, and at different ports, as presented in Table 19.47. Prices for Chinook salmon have increased over the past years; however, the costs for fuel, labor, and equipment maintenance also have increased.

**Table 19.47 Average Annual Commercial Chinook Salmon Prices**

| Year | Average Annual California Price (dollar per dressed pound) | Average Annual Oregon Price (dollar per dressed pound) |
|---|---|---|
| 2001 | $1.98 | $1.61 |
| 2002 | $1.55 | $1.54 |
| 2003 | $1.91 | $1.97 |
| 2004 | $2.87 | $3.45 |
| 2005 | $2.97 | $3.17 |
| 2006 | $5.13 | $5.48 |
| 2007 | $5.18 | $5.66 |
| 2008 | Season Closed | $7.31 |
| 2009 | Season Closed | Season Closed |
| 2010 | $5.46 | $5.49 |
| 2011 | $5.17 | $5.96 |
| 2012 | $5.34 | $5.75 |

The economic contribution of the California commercial ocean salmon fishery extends beyond the revenues received by fishermen. Supporting industries include fish processors, boat manufacturers, repair and maintenance. The economic contribution of the commercial ocean salmon fishery can be estimated through the use of Input-Output models. Economic contributions are estimated by PFMC using an Input-Output model, the Fishery Economic Assessment Model (FEAM), as summarized in Table 19.49 for the commercial ocean salmon fishery by management area.

**Table 19.49 Estimated Total Economic Impact for the Commercial Fishery by PFMC**

| Year | Economic Values by Management Areas ($1,000) | | | | | |
|---|---|---|---|---|---|---|
| | KMZ – Oregon | KMZ – California | Fort Bragg | San Francisco | Monterey | Total |
| 2001 | $635 | $328 | $1,033 | $10,857 | $2,297 | $15,150 |
| 2002 | $806 | $797 | $3,730 | $15,516 | $4,179 | $25,028 |
| 2003 | $699 | $259 | $15,160 | $15,795 | $2,491 | $34,404 |
| 2004 | $1,502 | $2,373 | $7,434 | $23,356 | $5,257 | $39,922 |
| 2005 | $1,259 | $582 | $5,420 | $13,496 | $7,083 | $27,840 |
| 2006 | $378 | $0 | $2,471 | $6,389 | $985 | $10,223 |
| 2007 | $780 | $1,156 | $3,407 | $8,131 | $1,658 | $15,132 |
| 2008 | $72 | $0 | $0 | $0 | $0 | $72 |
| 2009 | $42 | $0 | $0 | $0 | $0 | $42 |

Notes:

All values estimated using the Fishery Economic Assessment Model, and presented as 2013 dollars.

Southern Oregon values include data for Brookings, Oregon which may include values from landings outside of the KMZ.

a. KMZ –Oregon represents the area from Humbug Mountain to the Oregon-California Border, and includes landings at the Brookings port and season length and quota values for the entire area including Chetco River Ocean Terminal Area between Twin Rocks and the Oregon-California border.

b. KMZ –California represents the area from Oregon-California Border to Humboldt South Jetty, and includes landings at the Crescent City and Eureka ports.

Fisherman and industries that rely on the commercial ocean salmon fishery have access to financial assistance from the federal government in years of low revenue or closure. The fishery can be declared a failure by the Department of Commerce after requests are sent by state or local officials and certain criteria have been met. After a fishery failure is declared, disaster relief can be provided in the form of monetary compensation, community grants, low-interest loans, habitat restoration, or fishery capacity reduction. Disaster relief related to the California commercial ocean salmon fishery has occurred six times between 1994 and 2009, as summarized in Table 19.50 (CRS 2013). Direct payments may involve a minimum amount to any permit holder and additional amounts based upon past landing values (Hackett and Hansen 2008). Disaster relief funds distribution is conducted by the PFMC and the California Salmon Council.

**Table 19.50 Disaster Relief Monies and Programs for the Commercial Ocean Salmon Fishery in California**

| Year | Programs | Dollar Value |
|---|---|---|
| 1994 | Fishery capacity reduction, habitat restoration jobs, and data collection jobs | $12 Million |
| 1995 | Similar programs as in 1994 | $13 Million |
| 1998 | Fishery capacity reduction | $3.5 Million |
| 2007 | Direct payments to fisherman and businesses dependent on the Klamath River salmon | $60.4 Million |
| 2008 | Direct payments to fisherman and businesses dependent on the Sacramento River salmon | $170 Million |
| 2009-2010 | Continuation of 2008 programs | Remainder of the 2008 $170 Million |

### *19.3.7.2 Ocean Sport Fisheries for Salmon along the Southern Oregon and Northern California Coasts*

The PFMC and CDFW also manages the ocean sport fishery. The economic contribution of the ocean sport salmon fishery can be estimated through the use of Input-Output models. Economic contributions are estimated by PFMC using an Input-Output model, the Fishery Economic Assessment Model (FEAM), as summarized in Table 19.51.

**Table 19.51 Estimated Total Economic Impact for the Recreational Fishery by PFMC**

| Year | Economic Values by Management Areas ($1,000) | | | | | |
|---|---|---|---|---|---|---|
| | KMZ – Oregon | KMZ-California | Fort Bragg | San Francisco | Monterey | Total |

### 19.3.8 Ocean Salmon Fisheries for the Yurok and Hoopa Valley Tribes

The salmon populations are extremely important to the Yurok Tribe and Hoopa Valley Tribe as part of their lives, cultural traditions, ceremonies, and community health (Reclamation 2012). Fifty percent of the total available salmon in the Trinity River is the federally protected harvest for the Yurok and Hoopa Valley tribes (DOI 1993). Each tribe determines the use of the harvest. Historical landing data for the Yurok and Hoopa Valley tribes are presented in Table 19.52 (Reclamation 2012).

**Table 19.52 Salmon Landings by the Yurok Tribe and Hoopa Valley Tribe**

| Year | Spring Run Chinook Salmon | Fall Run Chinook Salmon | Total |
|---|---|---|---|
| 2001 | 19,640 | 39,044 | 58,684 |
| 2002 | 15,136 | 24,700 | 39,836 |
| 2003 | 9,065 | 30,078 | 39,143 |

| 2012 | 6,477 | 101,662 | 108,139 |
| 2013[a] | 4,972 | 63,030 | 68,002 |

Source: PFMC 2014b (Table B-5)
Note:
a. 2013 data are preliminary.
Includes landings at the Klamath River estuary, along the Klamath River from the estuary to Weitchpec (at the confluence of the Klamath and Trinity rivers), and along the Trinity River.

## 19.4 Impact Analysis

This section describes the potential mechanisms and analytical methods for change in socioeconomic factors; results of the impact analysis; potential mitigation measures; and cumulative effects.

This Chapter includes the analysis of overall regional economic changes and economic changes related to changes in CVP and SWP water supplies for M&I water users. More detailed discussions of changes in agricultural production are presented in Chapter 12, Agricultural Resources.

### 19.4.1 Potential Mechanisms and Analytical Methods

As described in Chapter 4, Approach to Environmental Analysis, the impact assessment considers changes in socioeconomic factors related to changes in CVP and SWP operations under the alternatives as compared to the No Action Alternative and Second Basis of Comparison.

Changes in CVP and SWP operations under the alternatives as compared to the No Action Alternative and Second Basis of Comparison could change water supply availability for CVP and SWP water users, recreational opportunities at reservoirs that store CVP and SWP water, and salmon from the Delta watershed that are relied upon by commercial, sport, and tribal fisherman.

#### *19.4.1.1 Regional Changes in Irrigated Agricultural Production Value*

Changes in CVP and SWP operations could change the extent of total agricultural production value as compared to the No Action Alternative and the Second Basis of Comparison. As described in Chapter 12, Agricultural Resources, there was no changes in agricultural production in the Central Valley under long-term conditions (over the 81-year model simulation period). Therefore, this analysis only addresses regional economic changes during dry and critical dry years.

This analysis uses model output from the Statewide Agricultural Production (SWAP) model and the IMPLAN model. The SWAP model, **a**s described in Chapter 12, is a regional model of irrigated agricultural production and economics that simulates the decisions of producers (farmers) in the Central Valley Region. The model selects the crops, water supplies, and other inputs that maximize profit subject to constraints on water and land, and subject to economic conditions regarding prices, yields, and costs. The SWAP model incorporates CVP and SWP water supplies, other local water supplies represented in the CalSim II model, and groundwater. As conditions change within a SWAP subregion (e.g., the quantity of available project water supply declines), the model optimizes production by adjusting the crop mix, water sources and quantities used, and other inputs. The model also fallows land when that appears to be the most cost-effective response to resource conditions. The analysis only reduces groundwater withdrawals based upon an optimization of agricultural production costs. The analysis does not restrict groundwater withdrawals based upon groundwater overdraft or groundwater quality conditions.

As described in Chapter 7, Groundwater Resources and Groundwater Quality, The Sustainable Groundwater Management Act (SGMA) requires preparation of Groundwater Sustainability Plans (GSPs) by 2020 or 2022 for most of the groundwater basins. The GSPs will identify methods to implement measures that will achieve sustainable groundwater operations by 2040 or 2042. The analysis in this Chapter is focused on conditions that would occur in 2030. If local agencies fully implement GSPs prior to the regulatory deadline, increasing groundwater use would be less of an option for agricultural water users. However, to achieve sustainable conditions, some measures could require several years to design and construct new water supply facilities, and sustainable groundwater conditions are not required until the 2040s. Therefore, it was assumed that Central Valley agriculture water users would not reduce groundwater use by 2030, and that groundwater use would increase in response to reduced CVP and SWP water supplies.

As described in Chapter 12, the impact to irrigated acreage and agricultural production is relatively small. Most of the change in CVP or SWP irrigation supplies would be offset by changes in groundwater pumping, with only small changes in crop acreage in production. However, this is an aggregate result for the Central Valley. Individual growers that rely on CVP or SWP supply and have no access to groundwater would have their irrigated acreage affected by larger amounts. Some of their change in production can and would be offset by changes on other farms that have access to groundwater or other surface supplies. Over time, growers without the buffer of access to groundwater could be driven to sell to or merge with other farming operations. From the larger, regional perspective, total value of production is estimated to change relatively little.

The regional economic analysis was conducted using the results of the impact analysis on agricultural production and M&I water use. The incremental impact results, estimated by the SWAP and CWEST economic models, were input into the regional IMPLAN models as the direct change caused by each of Alternative as compared to the No Action Alternative and the Second Basis of Comparison. Changes in economic effects depend upon loss of production or expenditures for water supplies, interactions within the regional economy, and “leakage” of economic activity between regions. Economic linkages create multiplier effects in a regional economy in the IMPLAN input-output model based upon estimates of county-level final demands and final payments developed from published data, national average matrix of technical coefficients, and mathematical relationships. IMPLAN uses information from the U.S. Department of Commerce’s Bureau of Economic Analysis, U.S. Department of Labor’s Bureau of Labor Statistics, and other federal and state government agencies. Data is collected for 440 different industrial sectors of the national economy per the North American Industry Classification System based on the primary commodity or service produced. Data sets are provided for the IMPLAN model for each county in the United States. In this analysis counties were grouped into the Central Valley Region (does not include Contra Costa County), San Francisco Bay Area Region (does include Contra Costa County), Central Coast Region, and Southern California Region.

IMPLAN is a static model that estimates impacts for a snapshot in time when the impacts are expected to occur, based on the makeup of the economy at the time of the underlying IMPLAN data. IMPLAN measures the initial impact to the economy based on average expenditure patterns, but does not consider long-term adjustments if labor and capital move into alternative uses.

Irrigated acreage occurs in the San Francisco Bay Area, Central Coast, and Southern California regions that use CVP and SWP water. This irrigated acreage is not included in the SWAP model simulation; and therefore, is not evaluated quantitatively in this EIS. However, changes in irrigated acreage in response to reductions in CVP and SWP water deliveries are assumed to occur in a similar manner as projected for the Central Valley Region.

As described in this chapter, the SWAP and IMPLAN models are annual-time step models that use information from the monthly-time step model. The model results represent long-term responses and must be used in a comparative manner to reduce the effects of use of monthly assumptions and other assumptions that are indicative of real-time operations, but do not specific match real-time observations. The CalSim II model output includes minor fluctuations of up to 5 percent due to model assumptions and approaches. Therefore, if the quantitative changes between a specific alternative and the No Action Alternative and/or Second Basis of Comparison are 5 percent or less, the conditions under the specific alternative would be considered to be "similar" to conditions under the No Action Alternative and/or Second Basis of Comparison.

#### *19.4.1.2 Regional Changes in Municipal and Industrial Water Supplies and Water Supply Costs*

Changes in CVP and SWP operations could change availability of water supplies for M&I water in the study area, related costs of additional supplies or shortages, and changes in regional economics as compared to the No Action Alternative and the Second Basis of Comparison. The quantitative analyses of regional changes related to changes in M&I water supplies and associated costs, employment, and economic output are analyzed using the California Water Economics Spreadsheet Tool (CWEST) model and the IMPLAN model.

Changes in M&I water supplies were evaluated using a regional economic model that was specifically modified to address water supply and cost changes to CVP and SWP M&I water users. The CWEST is a regional model that considers the economic costs to M&I water users including the cost of CVP and SWP water supplies, regional surface water supplies (including recycled water), conveyance costs, shortage costs, and changes in groundwater pumping costs. The model operations on an annual time step. Annual supplies are calculated for each water user based upon annual CVP and/or SWP water supplies, local surface water and groundwater supplies, surface water and groundwater storage, wastewater effluent and stormwater recycling water treatment, and desalination water treatment.

CVP and SWP water supply inputs are provided for the 81-year hydrologic period from the CalSim II model. The CWEST model analyzes the changes in annual conditions over the 81-long-term condition, and averages the overall costs for each Alternative over the 81-long-term condition. The CWEST model evaluates responses to changes in CVP and SWP water supplies differently for wet, above normal, and below normal water year types as compared to dry and critical dry water year types.

The goal of the CWEST model is to minimize the cost for the water providers and end-users to meet 2030 water demand. In years when the combination of average existing water supplies (either for the wetter or drier conditions) are greater than the 2030 water demand, the CWEST model assumes any overage water amount would be placed into surface water or groundwater storage, if available. If storage is not available, groundwater pumping would be reduced so that the other available supplies can be utilized. The CWEST model assumes that local surface water, other imported water supplies, recycled water use, and desalinated water use would not be reduced. However, during wet years, total CVP and SWP water deliveries may not be delivered if groundwater pumping is reduced to zero and local storage facilities are full.

In years when annual supplies are less than the 2030 water demand, the model assumes that water users with local surface water and groundwater storage would first fully utilize those supplies, and participate in temporary water transfers or a similar annual option if necessary. If shortage and transfer costs occur frequently, the model can select to purchase additional fixed-yield supplies, such as additional recycled water, desalination water treatment, or groundwater capacity. The model optimizes these long-term supply decisions to provide the lowest-cost water supply portfolio to meet 2030 demands throughout the 81-year hydrologic period.

The CWEST model local supply amounts and costs for this EIS are primarily based upon information presented in 2010 Urban Water Management Plans (UWMPs) developed by the CVP and SWP contractors (see Appendix 5D, Municipal and Industrial Water Demands and Supplies). The assumptions related to future water supplies presented in the UWMPs were evaluated to determine if the projects were reasonable and certain to occur by 2030. Projects that had undergone environmental review, were under design, or under construction were considered to exist in 2030 water supply assumptions in the CWEST model. Projects described in the UWMPs were considered as options to increase fixed-yield supplies. Existing and future water supplies considered for municipalities by 2030 are presented in Appendix 5B, Future Municipal Water Supplies for CVP and SWP Water Users. For smaller water users that are not addressed in an UWMP, information was obtained from water master plans and integrated regional water management plans.

CWEST calculates the change in the cost of water supplies plus end-user shortage costs. It does not calculate the total cost of water supplies. To provide a basis for understanding the relative importance of a change in costs, annual operating expenses were obtained from the fiscal year 2011-12 reports for special districts, counties, and cities published by the State Controllers' office (2013, 2014, 2014a). These operating expenses were updated to 2014 dollars using the California urban consumer price index. The cost change from CWEST, divided by the operating expense, provides a reasonable indication of the relative importance of cost changes for urban water providers.

The level of 2014 operating expense for each region includes:

- Central Valley Region
  - Sacramento Valley - $257 million
  - San Joaquin Valley - $297 million
- San Francisco Bay Area Region - $415 million
- Central Coast Region - $38 million

- Southern California Region (also known as “South Coast”) - $1,613 million

The CWEST model assumes that groundwater pumping would occur up to the amounts included in the UWMPs for wetter and drier conditions. As described above for agricultural production, it is assumed that full implementation of SGMA would not occur by 2030. Therefore, it was assumed that water users that are not currently operating groundwater resources in accordance with adjudication or other types of agreements, would not reduce groundwater use by 2030.

The IMPLAN model, described above, also is used to analyze changes in regional economics related to M&I water supplies. Increased costs of water supply are estimated from CWEST results. It is assumed that these costs must be passed on to regional water users. Regional water users are assumed to reduce their spending by an amount equal to the water supply cost increase. This reduced spending is distributed over regional industries according to coefficients provided by IMPLAN.

As described in this chapter, the CWEST and IMPLAN models are annual-time step models that use information from the monthly-time step model. The model results represent long-term responses and must be used in a comparative manner to reduce the effects of use of monthly assumptions and other assumptions that are indicative of real-time operations, but do not specific match real-time observations. The CalSim II model output includes minor fluctuations of up to 5 percent due to model assumptions and approaches. Therefore, if the quantitative changes between a specific alternative and the No Action Alternative and/or Second Basis of Comparison are 5 percent or less, the conditions under the specific alternative would be considered to be “similar” to conditions under the No Action Alternative and/or Second Basis of Comparison.

#### *19.4.1.3 Changes in Local Government Finances*

Changes in CVP and SWP operations would not result in major changes in land use, as described in Chapter 13, Land Use. Therefore, changes to collection of local taxes and fees are not anticipated under the alternatives as compared to the No Action Alternative and the Second Basis of Comparison. Therefore, changes in local government finances are not evaluated in this EIS.

#### *19.4.1.4 Changes in Recreational Economics*

Reservoirs that store CVP and SWP water provide a wide diversity of recreational experiences on the water surface, as described in Chapter 15, Recreational Resources. However, changes to recreational economic opportunities under the alternatives primarily would occur due to changes in surface water elevations at San Luis Reservoir and reduced Striped Bass fishing opportunities under Alternatives 3 and 4.

This EIS does not quantitatively analyze potential changes in recreation user days or recreation spending because specific projects or responses to the changes in reservoir elevations are not considered under the purpose and need of this EIS. The qualitative analysis presented in this Chapter is based upon potential changes in recreational use related to changes under the alternatives as compared to the No

Action Alternative and the Second Basis of Comparison, as described in Chapter 15, Recreational Resources.

#### *19.4.1.5 Changes in Commercial, Sport, and Tribal Salmon Fishing Opportunities*

Changes in CVP and SWP operations under the alternatives could change the salmon population as compared to the No Action Alternative and the Second Basis of Comparison. Commercial, sport, and tribal fishing primarily relies upon Fall-run Chinook Salmon because the populations of other runs of salmon are substantially lower. Specific population changes for Fall-run Chinook Salmon are not projected in this EIS. Therefore, this Chapter presents a qualitative analysis of potential changes in socioeconomic factors under the alternatives as compared to the No Action Alternative and the Second Basis of Comparison.

#### *19.4.1.6 Effects of Cross Delta Water Transfers*

Historically water transfer programs have been developed on an annual basis. The demand for water transfers is dependent upon the availability of water supplies to meet water demands. Water transfer transactions have increased over time as CVP and SWP water supply availability has decreased, especially during drier water years.

Parties seeking water transfers generally acquire water from sellers who have available surface water who can make the water available through releasing previously stored water, pump groundwater instead of using surface water (groundwater substitution); idle crops; or substitute crops that uses less water in order to reduce normal consumptive use of surface water.

Water transfers using CVP and SWP Delta pumping plants and south of Delta canals generally occur when there is unused capacity in these facilities. These conditions generally occur drier water year types when the flows from upstream reservoirs plus unregulated flows are adequate to meet the Sacramento Valley water demands and the CVP and SWP export allocations. In non-wet years, the CVP and SWP water allocations would be less than full contract amounts; therefore, capacity may be available in the CVP and SWP conveyance facilities to move water from other sources.

Projecting future socioeconomic conditions related to water transfer activities is difficult because specific water transfer actions required to make the water available, convey the water, and/or use the water would change each year due to changing hydrological conditions, CVP and SWP water availability, specific local agency operations, and local cropping patterns. Reclamation recently prepared a long-term regional water transfer environmental document which evaluated potential changes in conditions related to water transfer actions (Reclamation 2014c). Results from this analysis were used to inform the impact assessment of potential effects of water transfers under the alternatives as compared to the No Action Alternative and the Second Basis of Comparison.

### 19.4.2 Conditions in Year 2030 without Implementation of Alternatives 1 through 5

This EIS includes two bases of comparison, as described in Chapter 3, Description of Alternatives: the No Action Alternative and the Second Basis of Comparison. Both of these bases are evaluated at 2030 conditions. Changes that would occur over the next 15 years without implementation of the alternatives are not analyzed in this EIS. However, the changes to socioeconomics that are assumed to occur by 2030 under the No Action Alternative and the Second Basis of Comparison are summarized in this section. Many of the changed conditions would occur in the same manner under both the No Action Alternative and the Second Basis of Comparison.

#### *19.4.2.1 Common Changes in Conditions under the No Action Alternative and Second Basis of Comparison*

Conditions in 2030 would be different than existing conditions due to:

- Climate change and sea level rise
- General plan development throughout California, including increased water demands in portions of Sacramento Valley
- Implementation of reasonable and foreseeable water resources management projects to provide water supplies

It is anticipated that climate change would result in more short-duration high-rainfall events and less snowpack in the winter and early spring months. The reservoirs would be full more frequently by the end of April or May by 2030 than in recent historical conditions. However, as the water is released in the spring, there would be less snowpack to refill the reservoirs. This condition would reduce reservoir storage and available water supplies to downstream uses in the summer. The reduced end of September storage also would reduce the ability to release stored water to downstream regional reservoirs. These conditions would occur for all reservoirs in the California foothills and mountains, including non-CVP and SWP reservoirs.

These changes would result in a decline of the long-term average CVP and SWP water supply deliveries by 2030 as compared to recent historical long-term average deliveries under the No Action Alternative and the Second Basis of Comparison. However, the CVP and SWP water deliveries would be less under the No Action Alternative as compared to the Second Basis of Comparison, as described in Chapter 5, Surface Water Resources and Water Supplies, which could result in more crop idling.

Under the No Action Alternative and the Second Basis of Comparison, land uses in 2030 would occur in accordance with adopted general plans.

The No Action Alternative and the Second Basis of Comparison assumes completion of water resources management and environmental restoration projects that would have occurred without implementation of Alternatives 1 through 5, including regional and local recycling projects, surface water and groundwater storage projects, conveyance improvement projects, and desalination projects, as described in Chapter 3, Description of Alternatives. The No Action Alternative and the Second Basis of Comparison also assumes implementation of actions included in the 2008 U.S. Fish and Wildlife Service (USFWS) Biological Opinion (BO) and 2009 National Marine Fisheries Service (NMFS) BO that would have been implemented without the BOs by 2030, as described in Chapter 3, Description of Alternatives.

#### *19.4.2.2 Population Projections under the No Action Alternative and Second Basis of Comparison*

The 2030 population projections for each region addressed in this EIS are presented in Tables 19.53 through 19.59.

**Table 19.53 Population Projections in Trinity River Region**

| Area | Population | | Average Annual Growth Rate (percent) |
|---|---|---|---|
| | 2012 | 2030 | 2012-2030 |
| Trinity County | 13,471 | 15,309 | 0.7 |
| Humboldt County | 134,728 | 143,811 | 0.4 |
| Del Norte County | 28,527 | 31,252 | 0.5 |
| Total Trinity River Region | 176,726 | 190,373 | 0.4 |

### 19.4.3 Evaluation of Alternatives

Alternatives 1 through 5 have been compared to the No Action Alternative; and the No Action Alternative and Alternatives 1 through 5 have been compared to the Second Basis of Comparison.

During review of the numerical modeling analyses used in this EIS, an error was determined in the CalSim II model assumptions related to the Stanislaus River operations for the Second Basis of Comparison, Alternative 1, and Alternative 4 model runs. Appendix 5C includes a comparison of the CalSim II model run results presented in this Chapter and CalSim II model run results with the error corrected. Appendix 5C also includes a discussion of changes in the comparison of groundwater conditions for the following Alternative analyses.

- No Action Alternative compared to the Second Basis of Comparison
- Alternative 1 compared to the No Action Alternative
- Alternative 3 compared to the Second Basis of Comparison
- Alternative 5 compared to the Second Basis of Comparison.

#### *19.4.3.1 No Action Alternative*

The No Action Alternative is compared to the Second Basis of Comparison.

##### 19.4.3.1.1 Trinity River Region

*Regional Changes to Irrigated Agriculture*

There are no agricultural lands irrigated with CVP and SWP water supplies in the Trinity River Region. Therefore, there would be no changes in irrigated lands under the No Action Alternative as compared to the Second Basis of Comparison.

*Regional Changes to Municipal and Industrial Water Supplies*

The CVP would continue to release water in Trinity River for downstream beneficial uses, including water supplies under the No Action Alternative and the Second Basis of Comparison. There are no municipal and industrial CVP or SWP water service contractors in the Trinity River Region.

*Regional Changes to Recreational Opportunities*

Recreational opportunities would be similar in the Trinity River Region under the No Action Alternative as compared to the Second Basis of Comparison as described in Chapter 15, Recreational Resources.

*Regional Changes related to Changes in Salmon Fishing*

Trinity River flows would be similar under the No Action Alternative as compared to the Second Basis of Comparison. This could result in similar salmon harvest conditions by the Yurok and Hoopa Valley tribes.

##### 19.4.3.1.2 Central Valley Region

*Regional Changes to Irrigated Agriculture*

As described in Chapter 5, Surface Water Resources and Water Supplies, CVP and SWP water supplies would be less under the No Action Alternative than under the Second Basis of Comparison. It is anticipated that groundwater use would increase in response to reduced CVP and SWP water supplies in 2030 because sustainable groundwater management plans would not be fully implemented until the 2040s, as discussed in Chapter 12, Agricultural Resources.

The agricultural production value under long-term average conditions would be reduced by less than 1 percent ($1.6 million/year in the Sacramento Valley and $0.5 million/year in the San Joaquin Valley) primarily due to an increase in groundwater pumping of approximately 6 percent. The agricultural production value under dry and critical dry conditions also would be reduced by less than 1 percent ($11.3 million/year in the Sacramento Valley and $20.3 million/year in the San Joaquin Valley) primarily due to an increase in groundwater pumping.

The overall reduction in agricultural production values are less than 0.05 percent under long-term conditions; and, changes in employment and regional economic output would be minimal. Therefore, the analysis of employment and regional economic output is focused on dry and critical dry years.

The direct changes in agricultural production would result in changes to employment and regional economic output in the Sacramento and San Joaquin valleys, as summarized in Tables 19.60 and 19.61, respectively.

**Table 19.60 Changes in Agricultural-Related Employment and Regional Economic Output for the Sacramento Valley under the No Action Alternative as Compared to the Second Basis of Comparison in Dry and Critical Dry Years**

| Economic Sectors | Employment | | | | Economic Output ($ millions) | | | |

| Government | 0 | -1 | 0 | -1 | 0.0 | -0.2 | -0.1 | -0.3 |
| **Total** | **-139** | **-79** | **-35** | **-254** | **-20.3** | **-9.2** | **-4.9** | **-34.4** |

As described in Chapter 11, Geology and Soils Resources, increased groundwater pumping under the long-term average conditions may result in an additional increment of subsidence in those areas within the Central Valley. The additional amount of subsidence and the economic costs associated with it have not been quantified in this EIS. However, total subsidence-related costs have been shown to be substantial, as reported by Borchers et al. (2014) who estimated that the cost of subsidence in San Joaquin Valley between 1955 and 1972 was more than $1.3 billion (in 2013 dollars). These estimates are based on the impacts to major infrastructure in the region including the San Joaquin River, Delta Mendota Canal, Friant-Kern Canal and San Luis Canal in addition to privately owned infrastructure. The incremental subsidence-related costs, expressed on an annual basis, could be an unknown fraction of that cumulative cost.

*Regional Changes to Municipal and Industrial Water Supplies*

As described in Chapter 5, Surface Water Resources and Water Supplies, CVP and SWP water supplies would be less under the No Action Alternative than under the Second Basis of Comparison. The analysis assumed CVP and SWP water deliveries, as described in Chapter 5, and determined the need for new water supplies, changes in water storage and groundwater pumping, water transfers, water shortage costs, and excess water savings. The factors and basis of the analysis are described in detail in Appendix 19A, CWEST Model. The analysis assumes that no new annual transfer supplies would be implemented until shortages were greater than 5 percent. The costs of these shortages are included in the analysis. It is assumed that some communities that do not have alternative water supplies (e.g., cities of Huron and Coalinga) and would utilize water transfers.

The average annual water supply costs over the 81-year hydrologic period for M&I water supplies are presented in Tables 19.62 and 19.63 for the Sacramento and San Joaquin Valley, respectively.

**Table 19.62 Changes in Municipal and Industrial Water Supply Costs for the Sacramento Valley under the No Action Alternative as Compared to the Second Basis of Comparison**

| Differences in Total | No Action Alternative | Second Basis of Comparison | Changes |
|---|---|---|---|
| Average Annual CVP/SWP Deliveries (TAF) | 447 | 463 | -16 |
| Delivery Cost ($1,000) | $8,031 | $8,317 | -$287 |
| Assumed New Supply Deliveries (TAF) | 0 | 0 | 0 |
| Annualized New Supply Costs ($1,000) | $0 | $0 | $0 |
| Water Storage Costs ($1,000) | $0 | $0 | $0 |
| Lost Water Sales Revenues ($1,000) | $213 | $207 | $6 |
| Transfer Costs ($1,000) | $739 | $517 | $222 |
| Shortage Costs ($1,000) | $69 | $68 | $1 |
| Groundwater Pumping Savings (due to reductions in Groundwater Pumping) ($1,000) | -$3,858 | -$3,916 | $58 |
| Excess Water Savings ($1,000) | -$2,275 | -$2,563 | $288 |
| **Average Annual Changes in Water Supply Costs ($1,000)** | **$2,919** | **$2,630** | **$288** |

Note: In 2012 dollars

**Table 19.63 Changes in Municipal and Industrial Water Supply Costs for the San Joaquin Valley under the No Action Alternative as Compared to the Second Basis of Comparison**

| Differences in Total | No Action Alternative | Second Basis of Comparison | Changes |
|---|---|---|---|
| Average Annual CVP/SWP Deliveries (TAF) | 214 | 237 | -23 |
| Delivery Cost ($1,000) | $3,460 | $3,854 | -$394 |
| Assumed New Supply Deliveries (TAF) | 2 | 0 | 2 |
| Annualized New Supply Costs ($1,000) | $429 | $15 | $414 |
| Water Storage Costs ($1,000) | $942 | $820 | $122 |
| Lost Water Sales Revenues ($1,000) | $361 | $322 | $39 |
| Transfer Costs ($1,000) | $2,673 | $2,623 | $50 |
| Shortage Costs ($1,000) | $115 | $102 | $13 |
| Groundwater Pumping Savings (due to reductions in Groundwater Pumping) ($1,000) | -$15,377 | -$16,011 | $634 |
| Excess Water Savings ($1,000) | -$1,029 | -$1,318 | $289 |
| **Average Annual Changes in Water Supply Costs ($1,000)** | **-$8,427** | **-$9,593** | **$1,166** |

Note: In 2012 dollars

The changes in M&I water supply costs would result in changes to employment and regional economic output in the Sacramento and San Joaquin valleys, as summarized in Tables 19.64 and 19.65, respectively. The M&I average annual water supply operating expenses would increase by 0.11 and 0.39 percent in the Sacramento Valley and the San Joaquin Valley, respectively; and therefore, the results would be similar.

**Table 19.64 Changes in Municipal and Industrial Water Supply Related Employment and Regional Economic Output for the Sacramento Valley under the No Action Alternative as Compared to the Second Basis of Comparison**

| Economic Sectors | Employment | | | | Economic Output ($ thousands) | | | |

*Regional Changes to Recreational Opportunities*

Recreational opportunities would decrease at San Luis Reservoir by 6 percent under the No Action Alternative as compared to the Second Basis of Comparison, as described in Chapter 15, Recreation Resources. Therefore, it is anticipated that recreational economic factors would be reduced under the No Action Alternative as compared to the Second Basis of Comparison.

*Effects Related to Cross Delta Water Transfers*

Potential effects to socioeconomic factors could be similar to those identified in a recent environmental analysis conducted by Reclamation for long-term water transfers from the Sacramento to San Joaquin valleys (Reclamation 2014c). Potential effects to socioeconomic factors were identified as adverse in the seller's service area related to loss of income to farm workers and the associated agriculturally-related businesses and retail enterprises if crop idling methods were used to provide transfer water. The analysis also identified that local sales taxes could decline due to the loss of household income. If groundwater substitution was used to provide transfer water, agricultural production values could decline due to additional cost of pumping. However, income from the water transfer could increase operating income for the sellers. The regional impact would depend upon the extent of lands involved in the water transfer program in any specific year.

Under the No Action Alternative, the timing of cross Delta water transfers would be limited to July through September and include annual volumetric limits, in accordance with the 2008 USFWS BO and 2009 NMFS BO. Under the Second Basis of Comparison, water could be transferred throughout the year without an annual volumetric limit. Overall, the potential for cross Delta water transfers would be less under the No Action Alternative than under the Second Basis of Comparison.

#### 19.4.3.1.3 San Francisco Bay Area Region

*Regional Changes to Irrigated Agriculture*

It is anticipated that as in the Central Valley Region, reductions in CVP and SWP water supplies within the San Francisco Bay Area Region would not result in reductions in long-term irrigated acreage or land use changes due to the use of other water supplies. However, there could be a reduction in irrigated acreage in dry and critical dry years under the No Action Alternative as compared to the Second Basis of Comparison.

*Regional Changes to Municipal and Industrial Water Supplies*

As described in Chapter 5, Surface Water Resources and Water Supplies, CVP and SWP water supplies would be less under the No Action Alternative than under the Second Basis of Comparison. The analysis assumed CVP and SWP water deliveries, as described in Chapter 5, and determined the need for new water supplies, changes in water storage and groundwater pumping, water transfers, water shortage costs, and excess water savings. The factors and basis of the analysis is described in detail in Appendix 19A, CWEST Model. The analysis assumes that no new annual transfer supplies would be implemented until shortages were greater than 5 percent. The costs of these shortages are included in the analysis.

The average annual water supply operating expenses over the 81-year hydrologic period for M&I water supplies would increase by $7.276 million, or 1.75 percent, as presented in Table 19.66; and therefore, the results would be similar under the No Action Alternative and Second Basis of Comparison.

**Table 19.66 Changes in Municipal and Industrial Water Supply Costs for the San Francisco Bay Area Region under the No Action Alternative as Compared to the Second Basis of Comparison**

| Differences in Total | No Action Alternative | Second Basis of Comparison | Changes |
|---|---|---|---|
| Average Annual CVP/SWP Deliveries (TAF) | 396 | 445 | -48 |
| Delivery Cost ($1,000) | $11,044 | $12,515 | -$1,471 |
| Assumed New Supply Deliveries (TAF) | 18 | 16 | 2 |
| Annualized New Supply Costs ($1,000) | $599 | $234 | $365 |
| Water Storage Costs ($1,000) | $1,577 | $1,963 | -$386 |
| Lost Water Sales Revenues ($1,000) | $4,286 | $1,595 | $2,691 |
| Transfer Costs ($1,000) | $5,722 | $1,154 | $4,568 |
| Shortage Costs ($1,000) | $1,410 | $523 | $887 |
| Groundwater Pumping Savings (due to reductions in Groundwater Pumping) ($1,000) | -$493 | -$792 | $298 |
| Excess Water Savings ($1,000) | -$225 | -$549 | $324 |
| **Average Annual Changes in Water Supply Costs ($1,000)** | **$23,919** | **$16,643** | **$7,276** |

Note: In 2012 dollars

The changes in M&I water supply costs would result in changes to employment and regional economic output, as summarized in Table 19.67.

**Table 19.67 Changes in Municipal and Industrial Water Supply Related Employment and Regional Economic Output for the San Francisco Bay Area Region under the No Action Alternative as Compared to the Second Basis of Comparison**

| Economic Sectors | Employment | | | | Economic Output ($ thousands) | | | |
|---|---|---|---|---|---|---|---|---|
| | Direct | Indirect | Induced | Total | Direct | Indirect | Induced | Total |
| Agriculture | 0 | 0 | 0 | 0 | 0.0 | 0.1 | -7.9 | -7.8 |
| Mining & Logging | 0 | 0 | 0 | 0 | 0.0 | 1.6 | -5.0 | -3.4 |
| Construction | 0 | 1 | 0 | 1 | 0.0 | 158.8 | -37.1 | 121.7 |
| Manufacturing | 0 | 0 | 0 | 0 | 0.0 | 28.8 | -478.0 | -449.1 |
| Transportation, Warehousing & Utilities | 5 | 0 | -1 | 4 | 1,492.4 | 11.2 | -183.5 | 1,320.1 |
| Wholesale Trade | 0 | 0 | -1 | -1 | 0.0 | 5.0 | -350.6 | -345.7 |
| Retail Trade | 0 | 0 | -6 | -6 | 0.0 | 4.2 | -567.2 | -563.0 |
| Information | 0 | 0 | -1 | -1 | 0.0 | 16.8 | -306.6 | -289.8 |
| Financial Activities | 0 | 0 | -5 | -4 | 0.0 | 55.8 | -1,740.5 | -1,684.7 |
| Services | 0 | 1 | -20 | -19 | 0.0 | 133.7 | -2,162.8 | -2,029.1 |
| Government | 0 | 0 | 0 | 0 | 0.0 | 0.7 | -55.1 | -54.4 |
| **Total** | **5** | **3** | **-35** | **-27** | **1,492.4** | **416.7** | **-5,894.3** | **-3,985.2** |

Note: In 2012 dollars

*Regional Changes to Recreational Opportunities*

Changes in CVP and SWP water supplies and operations under the No Action Alternative as compared to the Second Basis of Comparison generally would result in lower reservoir elevations in reservoirs (up to 10 to 18 percent) that store CVP and SWP water; and would result in reduced recreational economic factors under the No Action Alternative as compared to the Second Basis of Comparison.

*Regional Changes to Salmon Fishing*

Changes in commercial and sport ocean salmon fishing primarily would be related to the presence of fall-run Chinook Salmon from Central Valley hatcheries. It is assumed that the production of hatchery fish would be similar under the No Action Alternative and the Second Basis of Comparison. However, survival of the fall-run Chinook Salmon hatchery fish to the Pacific Ocean could be related to changes in CVP and SWP operations. As described in Chapter 9, Fish and Aquatic Resources, there would be little change in through-Delta survival by emigrating natural juvenile fall-run Chinook Salmon under the No Action Alternative as compared to the Second Basis of Comparison. It is assumed that the survival of the hatchery juvenile fall-run Chinook Salmon would be similar to the survival of the natural juvenile fall-run Chinook Salmon. Therefore, the availability of fish for commercial and sport ocean salmon fishing and the associated economic conditions for the fishing industry would be similar under the No Action Alternative and the Second Basis of Comparison.

#### 19.4.3.1.4 Central Coast Region

*Regional Changes to Irrigated Agriculture*

It is anticipated that as in the Central Valley Region, reductions in CVP and SWP water supplies within the Central Coast Region would not result in reductions in long-term irrigated acreage or land use changes due to the use of other water supplies. However, there could be a reduction in irrigated acreage in dry and critical dry years under the No Action Alternative as compared to the Second Basis of Comparison.

*Regional Changes to Municipal and Industrial Water Supplies*

As described in Chapter 5, Surface Water Resources and Water Supplies, CVP and SWP water supplies would be less under the No Action Alternative than under the Second Basis of Comparison. The analysis assumed CVP and SWP water deliveries, as described in Chapter 5, and determined the need for new water supplies, changes in water storage and groundwater pumping, water transfers, water shortage costs, and excess water savings. The factors and basis of the analysis is described in detail in Appendix 19A, CWEST Model. The analysis assumes that no new annual transfer supplies would be implemented until shortages were greater than 5 percent. The costs of these shortages are included in the analysis. It is assumed that some communities that do not have alternative water supplies would utilize water transfers.

The average annual water supply operating expenses over the 81-year hydrologic period for M&I water supplies would increase by 0.7 percent, as presented in Table 19.68; and therefore, the results would be similar under the No Action Alternative and Second Basis of Comparison.

**Table 19.68 Changes in Municipal and Industrial Water Supply Costs for the Central Coast Region under the No Action Alternative as Compared to the Second Basis of Comparison**

| Differences in Total | No Action Alternative | Second Basis of Comparison | Changes |
|---|---|---|---|
| Average Annual CVP/SWP Deliveries (TAF) | 44 | 54 | -10 |
| Delivery Cost ($1,000) | $6,663 | $8,174 | -$1,510 |
| Assumed New Supply Deliveries (TAF) | 0 | 0 | 0 |
| Annualized New Supply Costs ($1,000) | $0 | $0 | $0 |
| Water Storage Costs ($1,000) | $0 | $0 | $0 |
| Lost Water Sales Revenues ($1,000) | $0 | $0 | $0 |
| Transfer Costs ($1,000) | $0 | $0 | $0 |
| Shortage Costs ($1,000) | $0 | $0 | $0 |
| Groundwater Pumping Savings (due to reductions in Groundwater Pumping) ($1,000) | -$8,068 | -$8,643 | $575 |
| Excess Water Savings ($1,000) | -$2,970 | -$4,176 | $1,206 |
| **Average Annual Changes in Water Supply Costs ($1,000)** | **-$4,374** | **-$4,645** | **$271** |

Note: In 2012 dollars

The changes in M&I water supply costs would result in changes to employment and regional economic output, as summarized in Table 19.69.

**Table 19.69 Changes in Municipal and Industrial Water Supply Related Employment and Regional Economic Output for the Central Coast Region under the No Action Alternative as Compared to the Second Basis of Comparison**

| Economic Sectors | Employment | | | | Economic Output ($ thousands) | | | |
|---|---|---|---|---|---|---|---|---|
| | Direct | Indirect | Induced | Total | Direct | Indirect | Induced | Total |

| Information | 0 | 0 | 0 | 0 | 0.0 | 12.0 | -39.0 | -27.0 |
| Financial Activities | 0 | 0 | -1 | -1 | 0.0 | 68.9 | -352.0 | -283.2 |
| Services | 0 | 2 | -5 | -3 | 0.0 | 167.1 | -447.4 | -280.3 |
| Government | 0 | 0 | 0 | 0 | 0.0 | 0.9 | -13.2 | -12.3 |
| **Total** | **6** | **4** | **-8** | **2** | **1,510.8** | **512.7** | **-1,159.9** | **863.6** |

Note: In 2012 dollars

*Regional Changes to Recreational Opportunities*

Changes in CVP and SWP water supplies and operations under the No Action Alternative as compared to the Second Basis of Comparison generally would result in lower reservoir elevations in reservoirs that store CVP and SWP water (up to 10 to 18 percent) that store CVP and SWP water; and would result in reduced recreational economic factors under the No Action Alternative as compared to the Second Basis of Comparison..

### 19.4.3.1.5 Southern California Region

*Regional Changes to Irrigated Agriculture*

It is anticipated that as in the Central Valley Region, reductions in CVP and SWP water supplies within the Southern California Region would not result in reductions in long-term irrigated acreage or land use changes due to the use of other water supplies. However, there could be a reduction in irrigated acreage in dry and critical dry years under the No Action Alternative as compared to the Second Basis of Comparison.

*Regional Changes to Municipal and Industrial Water Supplies*

As described in Chapter 5, Surface Water Resources and Water Supplies, CVP and SWP water supplies would be less under the No Action Alternative than under the Second Basis of Comparison. The analysis assumed CVP and SWP water deliveries, as described in Chapter 5, and determined the need for new water supplies, changes in water storage and groundwater pumping, water transfers, water shortage costs, and excess water savings. The factors and basis of the analysis is described in detail in Appendix 19A, CWEST Model. The analysis assumes that no new annual transfer supplies would be implemented until shortages were greater than 5 percent. The costs of these shortages are included in the analysis. It is assumed that some communities that do not have alternative water supplies would utilize water transfers.

The average annual water supply costs over the 81-year hydrologic period for M&I water supplies would increase by 2.14 percent, as presented in Table 19.70; and therefore, the results would be similar under the No Action Alternative and Second Basis of Comparison.

**Table 19.70 Changes in Municipal and Industrial Water Supply Costs for the Southern California Region under the No Action Alternative as Compared to the Second Basis of Comparison**

| Differences in Total | No Action Alternative | Second Basis of Comparison | Changes |
|---|---|---|---|
| Average Annual CVP/SWP Deliveries (TAF) | 1,932 | 2,394 | -461 |
| Delivery Cost ($1,000) | $239,692 | $296,795 | -$57,103 |
| Assumed New Supply Deliveries (TAF) | 47 | 11 | 35 |
| Annualized New Supply Costs ($1,000) | $12,688 | $4,032 | $8,656 |
| Water Storage Costs ($1,000) | $7,598 | $2,824 | $4,774 |
| Lost Water Sales Revenues ($1,000) | $14,614 | $1,119 | $13,495 |
| Transfer Costs ($1,000) | $11,484 | $3,705 | $7,779 |
| Shortage Costs ($1,000) | $17,319 | $353 | $16,966 |
| Groundwater Pumping Savings (due to reductions in Groundwater Pumping) ($1,000) | -$57,474 | -$91,507 | $34,033 |
| Excess Water Savings ($1,000) | -$4,629 | -$10,573 | $5,944 |
| **Average Annual Changes in Water Supply Costs ($1,000)** | **$241,291** | **$206,749** | **$34,542** |

Note: In 2012 dollars

The changes in M&I water supply costs would result in changes to employment and regional economic output, as summarized in Table 19.71.

**Table 19.71 Changes in Municipal and Industrial Water Supply Related Employment and Regional Economic Output for the Southern California Region under the No Action Alternative as Compared to the Second Basis of Comparison**

| Economic Sectors | Employment | | | | Economic Output ($ thousands) | | | |
|---|---|---|---|---|---|---|---|---|
| | Direct | Indirect | Induced | Total | Direct | Indirect | Induced | Total |
| Agriculture | 0 | 0 | 2 | 0 | 0.0 | -12.5 | 272.7 | 260.2 |
| Mining & Logging | 0 | -1 | 1 | 0 | 0.0 | -164.2 | 369.0 | 204.8 |
| Construction | 0 | -43 | 3 | 0 | 0.0 | -5,205.5 | 395.5 | -4,810.0 |
| Manufacturing | 0 | -2 | 10 | 0 | 0.0 | -1,452.6 | 6,814.5 | 5,361.9 |
| Transportation, Warehousing & Utilities | -175 | -2 | 12 | -175 | -43,673.4 | -592.0 | 2,602.9 | -41,662.5 |
| Wholesale Trade | 0 | -1 | 20 | 0 | 0.0 | -275.3 | 4,339.0 | 4,063.8 |

| Information | 0 | -1 | 6 | 0 | 0.0 | -637.5 | 2,962.1 | 2,324.6 |
| Financial Activities | 0 | -9 | 52 | 0 | 0.0 | -2,528.7 | 17,797.9 | 15,269.1 |
| Services | 0 | -46 | 212 | 0 | 0.0 | -5,542.2 | 20,430.6 | 14,888.4 |
| Government | 0 | 0 | 3 | 0 | 0.0 | -29.8 | 587.3 | 557.5 |
| **Total** | **-175** | **-108** | **378** | **-175** | **-43,673.4** | **-16,611.0** | **61,677.8** | **1,393.5** |

Note: In 2012 dollars

*Regional Changes to Recreational Opportunities*

Changes in CVP and SWP water supplies and operations under the No Action Alternative as compared to the Second Basis of Comparison generally would result in lower reservoir elevations in reservoirs that store CVP and SWP water, (up to 10 to 18 percent) that store CVP and SWP water; and would result in reduced recreational economic factors under the No Action Alternative as compared to the Second Basis of Comparison..

### *19.4.3.2 Alternative 1*

As described in Chapter 3, Description of Alternatives, Alternative 1 is identical to the Second Basis of Comparison. As described in Chapter 4, Approach to Environmental Analysis, Alternative 1 as compared to the No Action Alternative and the Second Basis of Comparison. However, because socioeconomic factors under Alternative 1 are identical to socioeconomic factors under the Second Basis of Comparison; Alternative 1 is only compared to the No Action Alternative.

#### 19.4.3.2.1 Alternative 1 Compared to the No Action Alternative

*Trinity River Region*

*Regional Changes to Irrigated Agriculture*

There are no agricultural lands irrigated with CVP and SWP water supplies in the Trinity River Region. Therefore, there would be no changes in irrigated lands under Alternative 1 as compared to the No Action Alternative.

#### *Regional Changes to Municipal and Industrial Water Supplies*

The CVP would continue to release water in Trinity River for downstream beneficial uses, including water supplies under Alternative 1 as compared to the No Action Alternative. There are no CVP or SWP water contractors in the Trinity River Region.

#### *Regional Changes to Recreational Opportunities*

Recreational opportunities would be similar in the Trinity River Region under Alternative 1 as compared to the No Action Alternative as described in Chapter 15, Recreational Resources.

#### *Regional Changes to Salmon Fishing*

Trinity River flows would be similar under Alternative 1 as compared to the No Action Alternative. This could result in similar salmon harvest conditions by the Yurok and Hoopa Valley tribes.

### *Central Valley Region*

#### *Regional Changes to Irrigated Agriculture*

As described in Chapter 5, Surface Water Resources and Water Supplies, CVP and SWP water supplies would be greater under Alternative 1 as compared to the No Action Alternative. It is anticipated that groundwater use would decrease in response to increased CVP and SWP water supplies in 2030; and sustainable groundwater management plans would not be fully implemented until the 2040s, as discussed in Chapter 12, Agricultural Resources.

The agricultural production value under long-term average conditions would be increased by less than 1 percent ($1.6 million/year in the Sacramento Valley and $0.5 million/year in the San Joaquin Valley) primarily due to a decrease in groundwater pumping of approximately 7 percent. The agricultural production value under dry and critical dry conditions also would be increased by less than 1 percent ($11.3 million/year in the Sacramento Valley and $20.3 million/year in the San Joaquin Valley) primarily due to a decrease in groundwater pumping.

The overall increase in agricultural production values are less than 0.05 percent under long-term conditions; and, changes in employment and regional economic output would be minimal. Therefore, the analysis of employment and regional economic output is focused on dry and critical dry years.

The direct changes in agricultural production would result in changes to employment and regional economic output in the Sacramento and San Joaquin valleys, as summarized in Tables 19.72 and 19.73, respectively.

**Table 19.72 Changes in Agricultural-Related Employment and Regional Economic Output for the Sacramento Valley under Alternative 1 as compared to the No Action Alternative in Dry and Critical Dry Years**

| Economic Sectors | Employment | | | | Economic Output ($ millions) | | | |
|---|---|---|---|---|---|---|---|---|
| | Direct | Indirect | Induced | Total | Direct | Indirect | Induced | Total |
| Agriculture | 87 | 21 | 0 | 108 | 11.3 | 1.3 | 0 | 12.7 |
| Mining & Logging | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Construction | 0 | 1 | 0 | 1 | 0 | 0.1 | 0 | 0.2 |

| **Total** | **139** | **79** | **35** | **254** | **20.3** | **9.2** | **4.9** | **34.4** |

Note: In 2012 dollars.

As described in Chapter 11, Geology and Soils Resources, increased groundwater pumping under the long-term average conditions may result in an additional increment of subsidence in those areas within the Central Valley. The additional amount of subsidence and the economic costs associated with it have not been quantified in this EIS. However, total subsidence-related costs have been shown to be substantial, as reported by Borchers et al. (2014) who estimated that the cost of subsidence in San Joaquin Valley between 1955 and 1972 was more than $1.3 billion (in 2013 dollars). These estimates are based on the impacts to major infrastructure in the region including the San Joaquin River, Delta Mendota Canal, Friant-Kern Canal and San Luis Canal in addition to privately owned infrastructure. The incremental subsidence-related costs, expressed on an annual basis, could be an unknown fraction of that cumulative cost.

*Regional Changes to Municipal and Industrial Water Supplies*

As described in Chapter 5, Surface Water Resources and Water Supplies, CVP and SWP water supplies would increase under Alternative 1 as compared to the No Action Alternative. The analysis assumed CVP and SWP water deliveries, as described in Chapter 5, and determined the need for new water supplies, changes in water storage and groundwater pumping, water transfers, water shortage costs, and excess water savings. The factors and basis of the analysis are described in detail in Appendix 19A, CWEST Model. The analysis assumes that no new annual transfer supplies would be implemented until shortages were greater than 5 percent. The costs of these shortages are included in the analysis. It is assumed that some communities that do not have alternative water supplies would utilize water transfers.

The average annual water supply costs over the 81-year hydrologic period for M&I water supplies are presented in Tables 19.74 and 19.75 for the Sacramento and San Joaquin Valley, respectively. The average annual water supply operating expenses would decrease by 0.11 and 0.39 percent in the Sacramento Valley and the San Joaquin Valley, respectively; and therefore, the results would be similar under Alternative 1 and the No Action Alternative.

**Table 19.74 Changes in Municipal and Industrial Water Supply Costs for the Sacramento Valley under Alternative 1 as compared to the No Action Alternative**

| Differences in Total | Alternative 1 | No Action Alternative | Changes |
|---|---|---|---|
| Average Annual CVP/SWP Deliveries (TAF) | 463 | 447 | 16 |
| Delivery Cost ($1,000) | $8,317 | $8,031 | $287 |
| Assumed New Supply Deliveries (TAF) | 0 | 0 | 0 |
| Annualized New Supply Costs ($1,000) | $0 | $0 | $0 |
| Water Storage Costs ($1,000) | $0 | $0 | $0 |
| Lost Water Sales Revenues ($1,000) | $207 | $213 | -$6 |
| Transfer Costs ($1,000) | $517 | $739 | -$222 |
| Shortage Costs ($1,000) | $68 | $69 | -$1 |
| Groundwater Pumping Savings (due to reductions in Groundwater Pumping) ($1,000) | -$3,916 | -$3,858 | -$58 |
| Excess Water Savings ($1,000) | -$2,563 | -$2,275 | -$288 |
| **Average Annual Changes in Water Supply Costs ($1,000)** | **$2,630** | **$2,919** | **-$288** |

Note: In 2012 dollars

**Table 19.75 Changes in Municipal and Industrial Water Supply Costs for the San Joaquin Valley under Alternative 1 as compared to the No Action Alternative**

| Differences in Total | Alternative 1 | No Action Alternative | Changes |
|---|---|---|---|
| Average Annual CVP/SWP Deliveries (TAF) | 237 | 214 | 23 |
| Delivery Cost ($1,000) | $3,854 | $3,460 | $394 |
| Assumed New Supply Deliveries (TAF) | 0 | 2 | -2 |
| Annualized New Supply Costs ($1,000) | $15 | $429 | -$414 |
| Water Storage Costs ($1,000) | $820 | $942 | -$122 |
| Lost Water Sales Revenues ($1,000) | $322 | $361 | -$39 |
| Transfer Costs ($1,000) | $2,623 | $2,673 | -$50 |
| Shortage Costs ($1,000) | $102 | $115 | -$13 |
| Groundwater Pumping Savings (due to reductions in Groundwater Pumping) ($1,000) | -$16,011 | -$15,377 | -$634 |
| Excess Water Savings ($1,000) | -$1,318 | -$1,029 | -$289 |
| **Average Annual Changes in Water Supply Costs ($1,000)** | **-$9,593** | **-$8,427** | **-$1,166** |

The changes in M&I water supply costs would result in changes to employment and regional economic output in the Sacramento and San Joaquin valleys, as summarized in Tables 19.76 and 19.77, respectively.

**Table 19.76 Changes in Municipal and Industrial Water Supply Related Employment and Regional Economic Output for the Sacramento Valley under Alternative 1 as compared to the No Action Alternative**

#### *Regional Changes to Recreational Opportunities*

Recreational opportunities would increase at San Luis Reservoir by 6 percent under Alternative 1 as compared to the No Action Alternative, as described in Chapter 15, Recreation Resources. Therefore, it is anticipated that recreational economic factors would be increased under Alternative 1 as compared to the No Action Alternative.

#### *Effects Related to Cross Delta Water Transfers*

Potential effects to socioeconomic factors could be similar to those identified in a recent environmental analysis conducted by Reclamation for long-term water transfers from the Sacramento to San Joaquin valleys (Reclamation 2014c) as described above under the No Action Alternative compared to the Second Basis of Comparison. For the purposes of this EIS, it is anticipated that similar conditions would occur during implementation of cross Delta water transfers under Alternative 1 and the No Action Alternative, and that impacts on socioeconomic factors could be adverse in the seller's service area.

Under Alternative 1, water could be transferred throughout the year without an annual volumetric limit. Under the No Action Alternative, the timing of cross Delta water transfers would be limited to July through September and include annual volumetric limits, in accordance with the 2008 USFWS BO and 2009 NMFS BO. Overall, the potential for cross Delta water transfers would be increased under Alternative 1 as compared to the No Action Alternative.

### *San Francisco Bay Area Region*

#### *Regional Changes to Irrigated Agriculture*

It is anticipated that as in the Central Valley Region, increases in CVP and SWP water supplies within the San Francisco Bay Area Region would not result in changes in long-term irrigated acreage or land use changes due to the use of other water supplies. However, there could be an increase in irrigated acreage in dry and critical dry years under Alternative 1 as compared to the No Action Alternative.

#### *Regional Changes to Municipal and Industrial Water Supplies*

As described in Chapter 5, Surface Water Resources and Water Supplies, CVP and SWP water supplies would increase under Alternative 1 as compared to the No Action Alternative. The analysis assumed CVP and SWP water deliveries, as described in Chapter 5, and determined the need for new water supplies, changes in water storage and groundwater pumping, water transfers, water shortage costs, and excess water savings. The factors and basis of the analysis is described in detail in Appendix 19A, CWEST Model. The analysis assumes that no new annual transfer supplies would be implemented until shortages were greater than 5 percent. The costs of these shortages are included in the analysis.

The average annual water supply operating expenses over the 81-year hydrologic period for M&I water supplies would decrease by 1.75 percent, as presented in Table 19.78; and therefore, the results would be similar under Alternative 1 and the No Action Alternative.

**Table 19.78 Changes in Municipal and Industrial Water Supply Costs for the San Francisco Bay Area Region under Alternative 1 as compared to the No Action Alternative**

| Differences in Total | Alternative 1 | No Action Alternative | Changes |
|---|---|---|---|
| Average Annual CVP/SWP Deliveries (TAF) | 445 | 396 | 48 |
| Delivery Cost ($1,000) | $12,515 | $11,044 | $1,471 |
| Assumed New Supply Deliveries (TAF) | 16 | 18 | -2 |
| Annualized New Supply Costs ($1,000) | $234 | $599 | -$365 |
| Water Storage Costs ($1,000) | $1,963 | $1,577 | $386 |
| Lost Water Sales Revenues ($1,000) | $1,595 | $4,286 | -$2,691 |
| Transfer Costs ($1,000) | $1,154 | $5,722 | -$4,568 |
| Shortage Costs ($1,000) | $523 | $1,410 | -$887 |
| Groundwater Pumping Savings (due to reductions in Groundwater Pumping) ($1,000) | -$792 | -$493 | -$298 |
| Excess Water Savings ($1,000) | -$549 | -$225 | -$324 |
| **Average Annual Changes in Water Supply Costs ($1,000)** | **$16,643** | **$23,919** | **-$7,276** |

Note: In 2012 dollars

The changes in M&I water supply costs would result in changes to employment and regional economic output, as summarized in Table 19.79.

**Table 19.79 Changes in Municipal and Industrial Water Supply Related Employment and Regional Economic Output for the San Francisco Bay Area Region under Alternative 1 as compared to the No Action Alternative**

| Economic Sectors | Employment | | | | Economic Output ($ thousands) | | | |
|---|---|---|---|---|---|---|---|---|
| | Direct | Indirect | Induced | Total | Direct | Indirect | Induced | Total |
| Agriculture | 0 | 0 | 0 | 0 | 0.0 | -0.1 | 7.9 | 7.8 |
| Mining & Logging | 0 | 0 | 0 | 0 | 0.0 | -1.6 | 5.0 | 3.4 |
| Construction | 0 | -1 | 0 | -1 | 0.0 | -158.8 | 37.1 | -121.7 |
| Manufacturing | 0 | 0 | 0 | 0 | 0.0 | -28.8 | 478.0 | 449.1 |
| Transportation, Warehousing & Utilities | -5 | 0 | 1 | -4 | -1,492.4 | -11.2 | 183.5 | -1,320.1 |
| Wholesale Trade | 0 | 0 | 1 | 1 | 0.0 | -5.0 | 350.6 | 345.7 |
| Retail Trade | 0 | 0 | 6 | 6 | 0.0 | -4.2 | 567.2 | 563.0 |
| Information | 0 | 0 | 1 | 1 | 0.0 | -16.8 | 306.6 | 289.8 |
| Financial Activities | 0 | 0 | 5 | 4 | 0.0 | -55.8 | 1,740.5 | 1,684.7 |
| Services | 0 | -1 | 20 | 19 | 0.0 | -133.7 | 2,162.8 | 2,029.1 |
| Government | 0 | 0 | 0 | 0 | 0.0 | -0.7 | 55.1 | 54.4 |
| **Total** | **-5** | **-3** | **35** | **27** | **-1,492.4** | **-416.7** | **5,894.3** | **3,985.2** |

Note: In 2012 dollars

#### *Regional Changes to Recreational Opportunities*

Changes in CVP and SWP water supplies and operations under Alternative 1 as compared to the No Action Alternative generally would result in higher reservoir elevations in reservoirs that store CVP and SWP water (up to 11 to 21 percent); and would result in increased recreational economic factors under Alternative 1 as compared to the No Action Alternative.

#### *Regional Changes to Salmon Fishing*

Changes in commercial and sport ocean salmon fishing primarily would be related to the presence of fall-run Chinook Salmon from Central Valley hatcheries. It is assumed that the production of hatchery fish would be similar under Alternative 1 and the No Action Alternative. However, survival of the fall-run Chinook Salmon hatchery fish to the Pacific Ocean could be related to changes in CVP and SWP operations. As described in Chapter 9, Fish and Aquatic Resources, there would be little change in through-Delta survival by emigrating natural juvenile fall-run Chinook Salmon under Alternative 1 and the No Action Alternative. It is assumed that the survival of the hatchery juvenile fall-run Chinook Salmon would be similar to the survival of the natural juvenile fall-run Chinook Salmon. Therefore, the availability of fish for commercial and sport ocean salmon fishing and the associated economic conditions for the fishing industry would be similar under Alternative 1 and the No Action Alternative.

### *Central Coast Region*

#### *Regional Changes to Irrigated Agriculture*

It is anticipated that as in the Central Valley Region, increases in CVP and SWP water supplies within the Central Coast Region would not result in increases in long-term irrigated acreage or land use changes due to the use of other water supplies. However, there could be increased irrigated acreage in dry and critical dry years under Alternative 1 as compared to the No Action Alternative.

#### *Regional Changes to Municipal and Industrial Water Supplies*

As described in Chapter 5, Surface Water Resources and Water Supplies, CVP and SWP water supplies would be higher under Alternative 1 as compared to the No Action Alternative. The analysis assumed CVP and SWP water deliveries, as described in Chapter 5, and determined the need for new water supplies, changes in water storage and groundwater pumping, water transfers, water shortage costs, and excess water savings. The factors and basis of the analysis is described in detail in Appendix 19A, CWEST Model. The analysis assumes that no new annual transfer supplies would be implemented until shortages were greater than 5 percent. The costs of these shortages are included in the analysis. It is assumed that some communities that do not have alternative water supplies would utilize water transfers.

The average annual water supply operating expenses over the 81-year hydrologic period for M&I water supplies would increase 0.7 percent, as presented in Table 19.80; and therefore, the results would be similar under Alternative 1 and the No Action Alternative.

**Table 19.80 Changes in Municipal and Industrial Water Supply Costs for the Central Coast Region under Alternative 1 as compared to the No Action Alternative**

| Differences in Total | Alternative 1 | No Action Alternative | Changes |
|---|---|---|---|
| Average Annual CVP/SWP Deliveries (TAF) | 54 | 44 | 10 |

| **Total** | **-6** | **-4** | **8** | **-2** | **-1,510.8** | **-512.7** | **1,159.9** | **-863.6** |

Note: In 2012 dollars

*Regional Changes to Recreational Opportunities*

Changes in CVP and SWP water supplies and operations under Alternative 1 as compared to the No Action Alternative generally would result in higher reservoir elevations in reservoirs that store CVP and SWP water (up to 11 to 21 percent); and would result in increased recreational economic factors under Alternative 1 as compared to the No Action Alternative.

*Southern California Region*

*Regional Changes to Irrigated Agriculture*

It is anticipated that as in the Central Valley Region, increases in CVP and SWP water supplies within the Southern California Region would not result in increases in long-term irrigated acreage or land use changes due to the use of other water supplies. However, there could be increased irrigated acreage in dry and critical dry years under Alternative 1 as compared to the No Action Alternative.

*Regional Changes to Municipal and Industrial Water Supplies*

As described in Chapter 5, Surface Water Resources and Water Supplies, CVP and SWP water supplies would be higher under Alternative 1 as compared to the No Action Alternative. The analysis assumed CVP and SWP water deliveries, as described in Chapter 5, and determined the need for new water supplies, changes in water storage and groundwater pumping, water transfers, water shortage costs, and excess water savings. The factors and basis of the analysis is described in detail in Appendix 19A, CWEST Model. The analysis assumes that no new annual transfer supplies would be implemented until shortages were greater than 5 percent. The costs of these shortages are included in the analysis. It is assumed that some communities that do not have alternative water supplies would utilize water transfers.

The average annual water supply operating expenses over the 81-year hydrologic period for M&I water supplies would decrease 2.14 percent, as presented in Table 19.82; and therefore, the results would be similar under Alternative 1 and the No Action Alternative.

**Table 19.82 Changes in Municipal and Industrial Water Supply Costs for the Southern California Region under Alternative 1 as compared to the No Action Alternative**

| Differences in Total | Alternative 1 | No Action Alternative | Changes |
|---|---|---|---|
| Average Annual CVP/SWP Deliveries (TAF) | 2,394 | 1,932 | 461 |
| Delivery Cost ($1,000) | $296,795 | $239,692 | $57,103 |
| Assumed New Supply Deliveries (TAF) | 11 | 47 | -35 |
| Annualized New Supply Costs ($1,000) | $4,032 | $12,688 | -$8,656 |
| Water Storage Costs ($1,000) | $2,824 | $7,598 | -$4,774 |

Note: In 2012 dollars

*Regional Changes to Recreational Opportunities*

Changes in CVP and SWP water supplies and operations under Alternative 1 as compared to the No Action Alternative generally would result in higher reservoir elevations in reservoirs that store CVP and SWP water (up to 11 to 21 percent); and would result in increased recreational economic factors under Alternative 1 as compared to the No Action Alternative.

##### 19.4.3.2.2 Alternative 1 Compared to the Second Basis of Comparison

As described in Chapter 3, Description of Alternatives, Alternative 1 is identical to the Second Basis of Comparison.

#### *19.4.3.3 Alternative 2*

The CVP and SWP operations under Alternative 2 are identical to the CVP and SWP operations under the No Action Alternative, therefore, Alternative 2 is only compared to the Second Basis of Comparison.

##### 19.4.3.3.1 Alternative 2 Compared to the Second Basis of Comparison

The CVP and SWP operations under Alternative 2 are identical to the CVP and SWP operations under the No Action Alternative. Therefore, changes to socioeconomic factors under Alternatives 2 as compared to the Second Basis of Comparison would be the same as the impacts described in Section 12.4.3.1, No Action Alternative.

#### *19.4.3.4 Alternative 3*

As described in Chapter 3, Description of Alternatives, CVP and SWP operations under Alternative 3 are similar to the Second Basis of Comparison with modified Old and Middle River flow criteria and New Melones Reservoir operations and reductions in Striped Bass fishing opportunities. As described in Chapter 4, Approach to Environmental Analysis, Alternative 3 is compared to the No Action Alternative and the Second Basis of Comparison.

##### 19.4.3.4.1 Alternative 3 Compared to the No Action Alternative

*Trinity River Region*

*Regional Changes to Irrigated Agriculture*

There are no agricultural lands irrigated with CVP and SWP water supplies in the Trinity River Region. Therefore, there would be no changes in irrigated lands under Alternative 3 as compared to the No Action Alternative.

*Regional Changes to Municipal and Industrial Water Supplies*

The CVP would continue to release water in Trinity River for downstream beneficial uses, including water supplies under Alternative 3 as compared to the No Action Alternative. There are no CVP or SWP water contractors in the Trinity River Region.

*Regional Changes to Recreational Opportunities*

Recreational opportunities would be similar in the Trinity River Region under Alternative 3 as compared to the No Action Alternative as described in Chapter 15, Recreational Resources.

*Regional Changes to Salmon Fishing*

Trinity River flows would be similar under Alternative 3 as compared to the No Action Alternative. This could result in similar salmon harvest conditions by the Yurok and Hoopa Valley tribes.

*Central Valley Region*

*Regional Changes to Irrigated Agriculture*

As described in Chapter 5, Surface Water Resources and Water Supplies, CVP and SWP water supplies would be greater under Alternative 3 as compared to the No Action Alternative. It is anticipated that groundwater use would decrease in response to increased CVP and SWP water supplies in 2030; and sustainable groundwater management plans would not be fully implemented until the 2040s, as discussed in Chapter 12, Agricultural Resources.

The agricultural production value under long-term average conditions would be increased by less than 1 percent ($1.2 million/year in the Sacramento Valley and $0.3 million/year in the San Joaquin Valley) primarily due to a decrease in groundwater pumping of approximately 4 percent. The agricultural production value under dry and critical dry conditions also would be increased by less than 1 percent ($9.2 million/year in the Sacramento Valley and $11.4 million/year in the San Joaquin Valley), primarily due to a decrease in groundwater pumping.

The overall increase in agricultural production values are less than 0.05 percent under long-term conditions; and, changes in employment and regional economic output would be minimal. Therefore, the analysis of employment and regional economic output is focused on dry and critical dry years.

The direct changes in agricultural production would result in changes to employment and regional economic output in the Sacramento and San Joaquin valleys, as summarized in Tables 19.84 and 19.85, respectively.

**Table 19.84 Changes in Agricultural-Related Employment and Regional Economic Output for the Sacramento Valley under Alternative 3 as compared to the No Action Alternative in Dry and Critical Dry Years**

| Economic Sectors | Employment | | | | Economic Output ($ millions) | | | |
|---|---|---|---|---|---|---|---|---|

Note: In 2012 dollars

**Table 19.85 Changes in Agricultural-Related Employment and Regional Economic Output for the San Joaquin Valley under Alternative 3 as compared to the No Action Alternative in Dry and Critical Dry Years**

| Economic Sectors | Employment | | | | Economic Output ($ millions) | | | |
|---|---|---|---|---|---|---|---|---|
| | Direct | Indirect | Induced | Total | Direct | Indirect | Induced | Total |
| Agriculture | 103 | 26 | 0 | 130 | 11.4 | 1.2 | 0.0 | 12.7 |
| Mining & Logging | 0 | 1 | 0 | 1 | 0.0 | 0.2 | 0.0 | 0.2 |
| Construction | 0 | 1 | 0 | 1 | 0.0 | 0.1 | 0.0 | 0.1 |
| Manufacturing | 0 | 1 | 0 | 1 | 0.0 | 1.2 | 0.1 | 1.3 |
| Transportation, Warehousing & Utilities | 0 | 2 | 0 | 2 | 0.0 | 0.5 | 0.1 | 0.6 |
| Wholesale Trade | 0 | 1 | 0 | 1 | 0.0 | 0.2 | 0.1 | 0.3 |
| Retail Trade | 0 | 0 | 3 | 3 | 0.0 | 0.0 | 0.3 | 0.3 |
| Information | 0 | 0 | 0 | 0 | 0.0 | 0.0 | 0.1 | 0.1 |
| Financial Activities | 0 | 8 | 1 | 10 | 0.0 | 1.8 | 0.6 | 2.5 |
| Services | 0 | 3 | 9 | 12 | 0.0 | 0.3 | 0.7 | 1.0 |
| Government | 0 | 0 | 0 | 1 | 0.0 | 0.1 | 0.0 | 0.1 |
| **Total** | 103 | 44 | 15 | 161 | 11.4 | 5.7 | 2.1 | 19.1 |

Note: In 2012 dollars

As described in Chapter 11, Geology and Soils Resources, increased groundwater pumping under the long-term average conditions may result in an additional increment of subsidence in those areas within the Central Valley. The additional amount of subsidence and the economic costs associated with it have not been quantified in this EIS. However, total subsidence-related costs have been shown to be substantial, as reported by Borchers et al. (2014) who estimated that the cost of subsidence in San Joaquin Valley between 1955 and 1972 was more than $1.3 billion (in 2013 dollars). These estimates are based on the impacts to major infrastructure in the region including the San Joaquin River, Delta Mendota Canal, Friant-Kern Canal and San Luis Canal in addition to privately owned infrastructure. The incremental subsidence-related costs, expressed on an annual basis, could be an unknown fraction of that cumulative cost.

*Regional Changes to Municipal and Industrial Water Supplies*

As described in Chapter 5, Surface Water Resources and Water Supplies, CVP and SWP water supplies would increase under Alternative 3 as compared to the No Action Alternative. The analysis assumed CVP and SWP water deliveries, as described in Chapter 5, and determined the need for new water supplies, changes in water storage and groundwater pumping, water transfers, water shortage costs, and excess water savings. The factors and basis of the analysis is described in detail in Appendix 19A, CWEST Model. The analysis assumes that no new annual transfer supplies would be implemented until shortages were greater than 5 percent. The costs of these shortages are included in the analysis. It is assumed that some communities that do not have alternative water supplies would utilize water transfers.

The average annual water supply costs over the 81-year hydrologic period for M&I water supplies are presented in Tables 19.86 and 19.87 for the Sacramento and San Joaquin Valley, respectively. Average annual water supply operating expenses would decrease by 0.07 and 0.5 percent in the Sacramento Valley and the San Joaquin Valley, respectively; and therefore, the results would be similar under Alternative 3 and the No Action Alternative.

**Table 19.86 Changes in Municipal and Industrial Water Supply Costs for the Sacramento Valley under Alternative 3 as compared to the No Action Alternative**

| Differences in Total | Alternative 3 | No Action Alternative | Changes |
|---|---|---|---|
| Average Annual CVP/SWP Deliveries (TAF) | 461 | 447 | 13 |
| Delivery Cost ($1,000) | $8,285 | $8,031 | $255 |
| Assumed New Supply Deliveries (TAF) | 0 | 0 | 0 |
| Annualized New Supply Costs ($1,000) | $0 | $0 | $0 |
| Water Storage Costs ($1,000) | $0 | $0 | $0 |
| Lost Water Sales Revenues ($1,000) | $243 | $213 | $30 |
| Transfer Costs ($1,000) | $601 | $739 | -$138 |
| Shortage Costs ($1,000) | $77 | $69 | $8 |
| Groundwater Pumping Savings (due to reductions in Groundwater Pumping) ($1,000) | -$3,938 | -$3,858 | -$81 |
| Excess Water Savings ($1,000) | -$2,517 | -$2,275 | -$241 |
| **Average Annual Changes in Water Supply Costs ($1,000)** | **$2,750** | **$2,919** | **-$169** |

Note: In 2012 dollars

**Table 19.87 Changes in Municipal and Industrial Water Supply Costs for the San Joaquin Valley under Alternative 3 as compared to the No Action Alternative**

| Differences in Total | Alternative 3 | No Action Alternative | Changes |
|---|---|---|---|
| Average Annual CVP/SWP Deliveries (TAF) | 241 | 214 | 27 |
| Delivery Cost ($1,000) | $3,896 | $3,460 | $436 |

Note: In 2012 dollars

*Regional Changes to Recreational Opportunities*

Recreational opportunities would be similar at San Luis Reservoir under Alternative 3 as compared to the No Action Alternative, as described in Chapter 15, Recreation Resources. Recreational opportunities related to Striped Bass fishing would initially be increased when Alternative 3 is implemented.

However, by 2030, Striped Bass fishing opportunities would be reduced under Alternative 3 as compared to the Second Basis of Comparison due to actions to reduce predation. Therefore, it is anticipated that recreational economic factors would be reduced under Alternative 3 as compared to the No Action Alternative.

*Effects Related to Cross Delta Water Transfers*

Potential effects to socioeconomic factors could be similar to those identified in a recent environmental analysis conducted by Reclamation for long-term water transfers from the Sacramento to San Joaquin valleys (Reclamation 2014c) as described above under the No Action Alternative compared to the Second Basis of Comparison. For the purposes of this EIS, it is anticipated that similar conditions would occur during implementation of cross Delta water transfers under Alternative 3 and the No Action Alternative, and that impacts on socioeconomic factors could be adverse in the seller's service area.

Under Alternative 3, water could be transferred throughout the year without an annual volumetric limit. Under the No Action Alternative, the timing of cross Delta water transfers would be limited to July through September and include annual volumetric limits, in accordance with the 2008 USFWS BO and 2009 NMFS BO. Overall, the potential for cross Delta water transfers would be increased under Alternative 3 as compared to the No Action Alternative.

*San Francisco Bay Area Region*

*Regional Changes to Irrigated Agriculture*

It is anticipated that as in the Central Valley Region, increases in CVP and SWP water supplies within the San Francisco Bay Area Region would not result in changes in long-term irrigated acreage or land use changes due to the use of other water supplies. However, there could be an increase in irrigated acreage in dry and critical dry years under Alternative 3 as compared to the No Action Alternative.

*Regional Changes to Municipal and Industrial Water Supplies*

As described in Chapter 5, Surface Water Resources and Water Supplies, CVP and SWP water supplies would increase under Alternative 3 as compared to the No Action Alternative. The analysis assumed CVP and SWP water deliveries, as described in Chapter 5, and determined the need for new water supplies, changes in water storage and groundwater pumping, water transfers, water shortage costs, and excess water savings. The factors and basis of the analysis is described in detail in Appendix 19A, CWEST Model. The analysis assumes that no new annual transfer supplies would be implemented until shortages were greater than 5 percent. The costs of these shortages are included in the analysis.

The average annual water supply operating expenses over the 81-year hydrologic period for M&I water supplies would decrease by 1.23 percent, as presented in Table 19.90; and therefore, the results would be similar under Alternative 3 and the No Action Alternative.

**Table 19.90 Changes in Municipal and Industrial Water Supply Costs for the San Francisco Bay Area Region under Alternative 3 as compared to the No Action Alternative**

| Differences in Total | Alternative 3 | No Action Alternative | Changes |
|---|---|---|---|
| Average Annual CVP/SWP Deliveries (TAF) | 431 | 396 | 34 |
| Delivery Cost ($1,000) | $12,096 | $11,044 | $1,052 |
| Assumed New Supply Deliveries (TAF) | 18 | 18 | 0 |
| Annualized New Supply Costs ($1,000) | $575 | $599 | -$24 |
| Water Storage Costs ($1,000) | $2,303 | $1,577 | $726 |
| Lost Water Sales Revenues ($1,000) | $2,381 | $4,286 | -$1,905 |
| Transfer Costs ($1,000) | $1,826 | $5,722 | -$3,896 |
| Shortage Costs ($1,000) | $743 | $1,410 | -$667 |
| Groundwater Pumping Savings (due to reductions in Groundwater Pumping) ($1,000) | -$726 | -$493 | -$232 |
| Excess Water Savings ($1,000) | -$393 | -$225 | -$167 |
| **Average Annual Changes in Water Supply Costs ($1,000)** | **$18,806** | **$23,919** | **-$5,113** |

Note: In 2012 dollars

The changes in M&I water supply costs would result in changes to employment and regional economic output, as summarized in Table 19.91.

**Table 19.91 Changes in Municipal and Industrial Water Supply Related Employment and Regional Economic Output for the San Francisco Bay Area Region under Alternative 3 as compared to the No Action Alternative**

| Economic Sectors | Employment | | | | Economic Output ($ thousands) | | | |
|---|---|---|---|---|---|---|---|---|
| | Direct | Indirect | Induced | Total | Direct | Indirect | Induced | Total |
| Agriculture | 0 | 0 | 0 | 0 | 0.0 | 0.1 | -6.0 | -5.9 |
| Mining & Logging | 0 | 0 | 0 | 0 | 0.0 | 1.9 | -3.8 | -1.9 |
| Construction | 0 | 1 | 0 | 1 | 0.0 | 186.7 | -28.2 | 158.6 |
| Manufacturing | 0 | 0 | 0 | 0 | 0.0 | 33.9 | -363.5 | -329.6 |

| **Total** | **6** | **3** | **-26** | **-17** | **1,754.5** | **489.9** | **-4,472.7** | **-2,228.3** |

Note: In 2012 dollars

*Regional Changes to Recreational Opportunities*

Changes in CVP and SWP water supplies and operations under Alternative 3 as compared to the No Action Alternative generally would result in higher reservoir elevations in reservoirs that store CVP and SWP water (up to 9 to 17 percent);

and would result in increased recreational economic factors under Alternative 3 as compared to the No Action Alternative.

*Regional Changes to Salmon Fishing*

Commercial and sport ocean salmon fishing would be reduced under Alternative 3 and the No Action Alternative due to increased commercial and sport ocean salmon harvests limits.

*Central Coast Region*

*Regional Changes to Irrigated Agriculture*

It is anticipated that as in the Central Valley Region, increases in CVP and SWP water supplies within the Central Coast Region would not result in increases in long-term irrigated acreage or land use changes due to the use of other water supplies. However, there could be increased irrigated acreage in dry and critical dry years under Alternative 3 as compared to the No Action Alternative.

*Regional Changes to Municipal and Industrial Water Supplies*

As described in Chapter 5, Surface Water Resources and Water Supplies, CVP and SWP water supplies would be higher under Alternative 3 as compared to the No Action Alternative. The analysis assumed CVP and SWP water deliveries, as described in Chapter 5, and determined the need for new water supplies, changes in water storage and groundwater pumping, water transfers, water shortage costs, and excess water savings. The factors and basis of the analysis is described in detail in Appendix 19A, CWEST Model. The analysis assumes that no new annual transfer supplies would be implemented until shortages were greater than 5 percent. The costs of these shortages are included in the analysis. It is assumed that some communities that do not have alternative water supplies would utilize water transfers.

The average annual water supply operating expenses over the 81-year hydrologic period for M&I water supplies would decrease by $125,000, or 0.33 percent, as presented in Table 19.92; and therefore, the results would be similar under Alternative 3 and the No Action Alternative.

**Table 19.92 Changes in Municipal and Industrial Water Supply Costs for the Central Coast Region under Alternative 3 as compared to the No Action Alternative**

| Differences in Total | Alternative 3 | No Action Alternative | Changes |
|---|---|---|---|
| Average Annual CVP/SWP Deliveries (TAF) | 51 | 44 | 8 |
| Delivery Cost ($1,000) | $7,814 | $6,663 | $1,151 |
| Assumed New Supply Deliveries (TAF) | 0 | 0 | 0 |
| Annualized New Supply Costs ($1,000) | $0 | $0 | $0 |

*Regional Changes to Recreational Opportunities*

Changes in CVP and SWP water supplies and operations under Alternative 3 as compared to the No Action Alternative generally would result in higher reservoir elevations in reservoirs that store CVP and SWP water (up to 9 to 17 percent); and would result in increased recreational economic factors under Alternative 3 as compared to the No Action Alternative.

*Southern California Region*

*Regional Changes to Irrigated Agriculture*

It is anticipated that as in the Central Valley Region, increases in CVP and SWP water supplies within the Southern California Region would not result in increases in long-term irrigated acreage or land use changes due to the use of other water supplies. However, there could be increased irrigated acreage in dry and critical dry years under Alternative 3 as compared to the No Action Alternative.

*Regional Changes to Municipal and Industrial Water Supplies*

As described in Chapter 5, Surface Water Resources and Water Supplies, CVP and SWP water supplies would be higher under Alternative 3 as compared to the No Action Alternative. The analysis assumed CVP and SWP water deliveries, as described in Chapter 5, and determined the need for new water supplies, changes in water storage and groundwater pumping, water transfers, water shortage costs, and excess water savings. The factors and basis of the analysis is described in detail in Appendix 19A, CWEST Model. The analysis assumes that no new annual transfer supplies would be implemented until shortages were greater than 5 percent. The costs of these shortages are included in the analysis. It is assumed that some communities that do not have alternative water supplies would utilize water transfers.

The average annual water supply costs over the 81-year hydrologic period for M&I water supplies would be $4.94 million, or 0.31 percent, as presented in Table 19.94; and therefore, the results would be similar under Alternative 3 and the No Action Alternative.

**Table 19.94 Changes in Municipal and Industrial Water Supply Costs for the Southern California Region under Alternative 3 as compared to the No Action Alternative**

| Differences in Total | Alternative 3 | No Action Alternative | Changes |
|---|---|---|---|
| Average Annual CVP/SWP Deliveries (TAF) | 2,241 | 1,932 | 308 |
| Delivery Cost ($1,000) | $278,085 | $239,692 | $38,393 |
| Assumed New Supply Deliveries (TAF) | 40 | 47 | -7 |
| Annualized New Supply Costs ($1,000) | $10,584 | $12,688 | -$2,104 |
| Water Storage Costs ($1,000) | $8,154 | $7,598 | $556 |
| Lost Water Sales Revenues ($1,000) | $11,409 | $14,614 | -$3,205 |
| Transfer Costs ($1,000) | $6,181 | $11,484 | -$5,303 |
| Shortage Costs ($1,000) | $12,632 | $17,319 | -$4,687 |
| Groundwater Pumping Savings (due to reductions in Groundwater Pumping) ($1,000) | -$81,693 | -$57,474 | -$24,218 |
| Excess Water Savings ($1,000) | -$9,005 | -$4,629 | -$4,376 |
| **Average Annual Changes in Water Supply Costs ($1,000)** | **$236,347** | **$241,291** | **-$4,944** |

Note: In 2012 dollars

The changes in M&I water supply costs would result in changes to employment and regional economic output, as summarized in Table 19.95.

**Table 19.95 Changes in Municipal and Industrial Water Supply Related Employment and Regional Economic Output for the Southern California under Alternative 3 as compared to the No Action Alternative**

| Economic Sectors | Employment | | | | Economic Output ($ thousands) | | | |
|---|---|---|---|---|---|---|---|---|

| **Total** | 148 | 91 | -202 | 37 | 36,845.0 | **14,013.9** | **-33,002.7** | **17,856.2** |

Note: In 2012 dollars

*Regional Changes to Recreational Opportunities*

Changes in CVP and SWP water supplies and operations under Alternative 3 as compared to the No Action Alternative generally would result in higher reservoir elevations in reservoirs that store CVP and SWP water (up to 9 to 17 percent); and would result in increased recreational economic factors under Alternative 3 as compared to the No Action Alternative.

#### 19.4.3.4.2 Alternative 3 Compared to the Second Basis of Comparison

*Trinity River Region*

*Regional Changes to Irrigated Agriculture*

There are no agricultural lands irrigated with CVP and SWP water supplies in the Trinity River Region. Therefore, there would be no changes in irrigated lands under Alternative 3 as compared to the Second Basis of Comparison.

*Regional Changes to Municipal and Industrial Water Supplies*

The CVP would continue to release water in Trinity River for downstream beneficial uses, including water supplies under Alternative 3 and the Second Basis of Comparison. There are no CVP or SWP water contractors in the Trinity River Region.

*Regional Changes to Recreational Opportunities*

Recreational opportunities would be similar in the Trinity River Region under Alternative 3 as compared to the Second Basis of Comparison as described in Chapter 15, Recreational Resources.

*Regional Changes to Salmon Fishing*

Trinity River flows would be similar under Alternative 3 as compared to the Second Basis of Comparison. This could result in similar salmon harvest conditions by the Yurok and Hoopa Valley tribes.

*Central Valley Region*

*Regional Changes to Irrigated Agriculture*

As described in Chapter 5, Surface Water Resources and Water Supplies, CVP and SWP water supplies would be less under Alternative 3 than under the Second Basis of Comparison. It is anticipated that groundwater use would increase in response to reduced CVP and SWP water supplies in 2030 because sustainable groundwater management plans would not be fully implemented until the 2040s, as discussed in Chapter 12, Agricultural Resources.

The agricultural production value under long-term average conditions would be reduced by less than 1 percent ($0.3 million/year in the Sacramento Valley and $0.3 million/year in the San Joaquin Valley) primarily due to an increase in groundwater pumping of approximately 2 percent. The agricultural production value under dry and critical dry conditions also would be reduced by less than 1 percent ($2.1 million/year in the Sacramento Valley and $8.9 million/year in the San Joaquin Valley) primarily due to an increase in groundwater pumping.

The overall reduction in agricultural production values are less than 0.05 percent under long-term conditions; and, changes in employment and regional economic output would be minimal. Therefore, the analysis of employment and regional economic output is focused on dry and critical dry years.

The direct changes in agricultural production would result in changes to employment and regional economic output in the Sacramento and San Joaquin valleys, as summarized in Tables 19.96 and 19.97, respectively.

**Table 19.96 Changes in Agricultural-Related Employment and Regional Economic Output for the Sacramento Valley under Alternative 3 as Compared to the Second Basis of Comparison in Dry and Critical Dry Years**

| Economic Sectors | Employment | | | | Economic Output ($ millions) | | | |
|---|---|---|---|---|---|---|---|---|
| | Direct | Indirect | Induced | Total | Direct | Indirect | Induced | Total |

| Services | 0 | -2 | -12 | -14 | 0.0 | -0.2 | -1.0 | -1.2 |
| Government | 0 | 0 | 0 | 0 | 0.0 | -0.1 | 0.0 | -0.1 |
| **Total** | **-36** | **-36** | **-20** | **-92** | **-8.9** | **-3.5** | **-2.8** | **-15.3** |

Note: In 2012 dollars

As described in Chapter 11, Geology and Soils Resources, increased groundwater pumping under the long-term average conditions may result in an additional increment of subsidence in those areas within the Central Valley. The additional amount of subsidence and the economic costs associated with it have not been quantified in this EIS. However, total subsidence-related costs have been shown to be substantial, as reported by Borchers et al. (2014) who estimated that the cost of subsidence in San Joaquin Valley between 1955 and 1972 was more than $1.3 billion (in 2013 dollars). These estimates are based on the impacts to major infrastructure in the region including the San Joaquin River, Delta Mendota Canal, Friant-Kern Canal and San Luis Canal in addition to privately owned infrastructure. The incremental subsidence-related costs, expressed on an annual basis, could be an unknown fraction of that cumulative cost.

*Regional Changes to Municipal and Industrial Water Supplies*

As described in Chapter 5, Surface Water Resources and Water Supplies, CVP and SWP water supplies would be similar in the Sacramento Valley and greater in the San Joaquin Valley under Alternative 3 than under the Second Basis of Comparison. The analysis assumed CVP and SWP water deliveries, as described in Chapter 5, and determined the need for new water supplies, changes in water storage and groundwater pumping, water transfers, water shortage costs, and excess water savings. The factors and basis of the analysis is described in detail in Appendix 19A, CWEST Model. The analysis assumes that no new annual transfer supplies would be implemented until shortages were greater than 5 percent. The costs of these shortages are included in the analysis. It is assumed that some communities that do not have alternative water supplies would utilize water transfers.

The average annual water supply operating expenses over the 81-year hydrologic period for M&I water supplies are presented in Tables 19.98 and 19.99 for the Sacramento and San Joaquin Valley, respectively. Average annual water supply operating costs would increase in the Sacramento Valley by 0.05 percent, decrease in the San Joaquin Valley by 0.2 percent; and therefore, the results would be similar under Alternative 3 and the Second Basis of Comparison.

**Table 19.98 Changes in Municipal and Industrial Water Supply Costs for the Sacramento Valley under Alternative 3 as Compared to the Second Basis of Comparison**

| Differences in Total | Alternative 3 | Second Basis of Comparison | Changes |
|---|---|---|---|
| Average Annual CVP/SWP Deliveries (TAF) | 461 | 463 | -2 |
| Delivery Cost ($1,000) | $8,285 | $8,317 | -$32 |
| Assumed New Supply Deliveries (TAF) | 0 | 0 | 0 |
| Annualized New Supply Costs ($1,000) | $0 | $0 | $0 |

*Regional Changes to Recreational Opportunities*

Recreational opportunities would be similar at San Luis Reservoir under Alternative 3 as compared to the Second Basis of Comparison, as described in Chapter 15, Recreation Resources. Recreational opportunities related to Striped Bass fishing would initially be increased when Alternative 3 is implemented. However, by 2030, Striped Bass fishing opportunities would be reduced under Alternative 3 as compared to the Second Basis of Comparison due to actions to reduce predation. Therefore, it is anticipated that recreational economic factors would be reduced under Alternative 3 as compared to the Second Basis of Comparison.

*Effects Related to Cross Delta Water Transfers*

Potential effects to socioeconomic factors could be similar to those identified in a recent environmental analysis conducted by Reclamation for long-term water transfers from the Sacramento to San Joaquin valleys (Reclamation 2014c) as described above under the No Action Alternative compared to the Second Basis of Comparison. For the purposes of this EIS, it is anticipated that similar conditions would occur during implementation of cross Delta water transfers under Alternative 3 and the Second Basis of Comparison, and that impacts on socioeconomic factors could be adverse in the seller's service area.

Under Alternative 3 and Second Basis of Comparison, water could be transferred throughout the year without an annual volumetric limit. Overall, the potential for cross Delta water transfers would be similar under Alternative 3 as compared to the Second Basis of Comparison.

*San Francisco Bay Area Region*

*Regional Changes to Irrigated Agriculture*

It is anticipated that as in the Central Valley Region, reductions in CVP and SWP water supplies within the San Francisco Bay Area Region would not result in reductions in long-term irrigated acreage or land use changes due to the use of other water supplies. However, there could be a reduction in irrigated acreage in dry and critical dry years under Alternative 3 as compared to the Second Basis of Comparison.

*Regional Changes to Municipal and Industrial Water Supplies*

As described in Chapter 5, Surface Water Resources and Water Supplies, CVP and SWP water supplies would be less under Alternative 3 than under the Second Basis of Comparison. The analysis assumed CVP and SWP water deliveries, as described in Chapter 5, and determined the need for new water supplies, changes in water storage and groundwater pumping, water transfers, water shortage costs, and excess water savings. The factors and basis of the analysis is described in detail in Appendix 19A, CWEST Model. The analysis assumes that no new annual transfer supplies would be implemented until shortages were greater than 5 percent. The costs of these shortages are included in the analysis.

The average annual water supply operating expenses over the 81-year hydrologic period for M&I water supplies would increase by $2.16 million, or 0.52 percent, as presented in Table 19.102; and therefore, the results would be similar under Alternative 3 and the Second Basis of Comparison.

**Table 19.102 Changes in Municipal and Industrial Water Supply Costs for the San Francisco Bay Area Region under Alternative 3 as Compared to the Second Basis of Comparison**

| Differences in Total | Alternative 3 | Second Basis of Comparison | Changes |
|---|---|---|---|
| Average Annual CVP/SWP Deliveries (TAF) | 431 | 445 | -14 |
| Delivery Cost ($1,000) | $12,096 | $12,515 | -$419 |
| Assumed New Supply Deliveries (TAF) | 18 | 16 | 2 |
| Annualized New Supply Costs ($1,000) | $575 | $234 | $342 |
| Water Storage Costs ($1,000) | $2,303 | $1,963 | $340 |
| Lost Water Sales Revenues ($1,000) | $2,381 | $1,595 | $786 |
| Transfer Costs ($1,000) | $1,826 | $1,154 | $672 |
| Shortage Costs ($1,000) | $743 | $523 | $221 |
| Groundwater Pumping Savings (due to reductions in Groundwater Pumping) ($1,000) | -$726 | -$792 | $66 |
| Excess Water Savings ($1,000) | -$393 | -$549 | $156 |
| **Average Annual Changes in Water Supply Costs ($1,000)** | **$18,806** | **$16,643** | **$2,163** |

Note: In 2012 dollars

The changes in M&I water supply costs would result in changes to employment and regional economic output, as summarized in Table 19.103.

**Table 19.103 Changes in Municipal and Industrial Water Supply Related Employment and Regional Economic Output for the San Francisco Bay Area Region under Alternative 3 as Compared to the Second Basis of Comparison**

| Economic Sectors | Employment | | | | Economic Output ($ thousands) | | | |

Note: In 2012 dollars

*Regional Changes to Recreational Opportunities*

Changes in CVP and SWP water supplies and operations under Alternative 3 as compared to the Second Basis of Comparison generally would result in similar reservoir elevations in reservoirs that store CVP and SWP water and similar recreational economic factors under Alternative 3 as compared to the Second Basis of Comparison.

*Regional Changes to Salmon Fishing*

Commercial and sport ocean salmon fishing would be reduced under Alternative 3 and the Second Basis of Comparison due to increased commercial and sport ocean salmon harvests limits.

*Central Coast Region*

*Regional Changes to Irrigated Agriculture*

It is anticipated that as in the Central Valley Region, reductions in CVP and SWP water supplies within the Central Coast Region would not result in reductions in long-term irrigated acreage or land use changes due to the use of other water supplies. However, there could be a reduction in irrigated acreage in dry and critical dry years under Alternative 3 as compared to the Second Basis of Comparison.

*Regional Changes to Municipal and Industrial Water Supplies*

As described in Chapter 5, Surface Water Resources and Water Supplies, CVP and SWP water supplies would be less under Alternative 3 than under the Second Basis of Comparison. The analysis assumed CVP and SWP water deliveries, as described in Chapter 5, and determined the need for new water supplies, changes in water storage and groundwater pumping, water transfers, water shortage costs, and excess water savings. The factors and basis of the analysis is described in detail in Appendix 19A, CWEST Model. The analysis assumes that no new annual transfer supplies would be implemented until shortages were greater than 5 percent. The costs of these shortages are included in the analysis. It is assumed that some communities that do not have alternative water supplies would utilize water transfers.

The average annual water supply operating expenses over the 81-year hydrologic period for M&I water supplies would increase by $146,000, or 0.38 percent, as presented in Table 19.104; and therefore, the results would be similar under Alternative 3 and the Second Basis of Comparison.

**Table 19.104 Changes in Municipal and Industrial Water Supply Costs for the Central Coast Region under Alternative 3 as Compared to the Second Basis of Comparison**

| Differences in Total | Alternative 3 | Second Basis of Comparison | Changes |
|---|---|---|---|
| Average Annual CVP/SWP Deliveries (TAF) | 51 | 54 | -2 |
| Delivery Cost ($1,000) | $7,814 | $8,174 | -$360 |
| Assumed New Supply Deliveries (TAF) | 0 | 0 | 0 |
| Annualized New Supply Costs ($1,000) | $0 | $0 | $0 |
| Water Storage Costs ($1,000) | $0 | $0 | $0 |
| Lost Water Sales Revenues ($1,000) | $0 | $0 | $0 |
| Transfer Costs ($1,000) | $0 | $0 | $0 |
| Shortage Costs ($1,000) | $0 | $0 | $0 |
| Groundwater Pumping Savings (due to reductions in Groundwater Pumping) ($1,000) | -$8,333 | -$8,643 | $310 |
| Excess Water Savings ($1,000) | -$3,980 | -$4,176 | $196 |
| **Average Annual Changes in Water Supply Costs ($1,000)** | **-$4,499** | **-$4,645** | **$146** |

Note: In 2012 dollars

The changes in M&I water supply costs would result in changes to employment and regional economic output, as summarized in Table 19.105.

**Table 19.105 Changes in Municipal and Industrial Water Supply Related Employment and Regional Economic Output for the Central Coast Region under Alternative 3 as Compared to the Second Basis of Comparison**

| Economic Sectors | Employment | | | | Economic Output ($ thousands) | | | |
|---|---|---|---|---|---|---|---|---|
| | Direct | Indirect | Induced | Total | Direct | Indirect | Induced | Total |

| **Total** | **-2** | **-1** | **2** | **0** | **-359.9** | **-122.1** | **345.5** | **-136.5** |

Note: In 2012 dollars

### *Regional Changes to Recreational Opportunities*

Changes in CVP and SWP water supplies and operations under Alternative 3 as compared to the Second Basis of Comparison generally would result in similar reservoir elevations in reservoirs that store CVP and SWP water and similar recreational economic factors under Alternative 3 as compared to the Second Basis of Comparison.

*Southern California Region*

*Regional Changes to Irrigated Agriculture*

It is anticipated that as in the Central Valley Region, reductions in CVP and SWP water supplies within the Southern California Region would not result in reductions in long-term irrigated acreage or land use changes due to the use of other water supplies. However, there could be a reduction in irrigated acreage in dry and critical dry years under Alternative 3 as compared to the Second Basis of Comparison.

*Regional Changes to Municipal and Industrial Water Supplies*

As described in Chapter 5, Surface Water Resources and Water Supplies, CVP and SWP water supplies would be less under Alternative 3 than under the Second Basis of Comparison. The analysis assumed CVP and SWP water deliveries, as described in Chapter 5, and determined the need for new water supplies, changes in water storage and groundwater pumping, water transfers, water shortage costs, and excess water savings. The factors and basis of the analysis is described in detail in Appendix 19A, CWEST Model. The analysis assumes that no new annual transfer supplies would be implemented until shortages were greater than 5 percent. The costs of these shortages are included in the analysis. It is assumed that some communities that do not have alternative water supplies would utilize water transfers.

The average annual water supply costs over the 81-year hydrologic period for M&I water supplies would increase by 1.83 percent, as presented in Table 19.106; and therefore, the results would be similar under Alternative 3 and the Second Basis of Comparison.

**Table 19.106 Changes in Municipal and Industrial Water Supply Costs for the Southern California Region under Alternative 3 as Compared to the Second Basis of Comparison**

| Differences in Total | Alternative 3 | Second Basis of Comparison | Changes |
|---|---|---|---|
| Average Annual CVP/SWP Deliveries (TAF) | 2,241 | 2,394 | -153 |
| Delivery Cost ($1,000) | $278,085 | $296,795 | -$18,710 |
| Assumed New Supply Deliveries (TAF) | 40 | 11 | 28 |
| Annualized New Supply Costs ($1,000) | $10,584 | $4,032 | $6,552 |
| Water Storage Costs ($1,000) | $8,154 | $2,824 | $5,330 |
| Lost Water Sales Revenues ($1,000) | $11,409 | $1,119 | $10,289 |
| Transfer Costs ($1,000) | $6,181 | $3,705 | $2,476 |
| Shortage Costs ($1,000) | $12,632 | $353 | $12,279 |
| Groundwater Pumping Savings (due to reductions in Groundwater Pumping) ($1,000) | -$81,693 | -$91,507 | $9,814 |
| Excess Water Savings ($1,000) | -$9,005 | -$10,573 | $1,568 |
| **Average Annual Changes in Water Supply Costs ($1,000)** | **$236,347** | **$206,749** | **$29,598** |

Note: In 2012 dollars

The changes in M&I water supply costs would result in changes to employment and regional economic output, as summarized in Table 19.107.

**Table 19.107 Changes in Municipal and Industrial Water Supply Related Employment and Regional Economic Output for the Southern California Region under Alternative 3 as Compared to the Second Basis of Comparison**

| Economic Sectors | Employment | | | | Economic Output ($ thousands) | | | |
|---|---|---|---|---|---|---|---|---|
| | Direct | Indirect | Induced | Total | Direct | Indirect | Induced | Total |
| Agriculture | 0 | 0 | 1 | 1 | 0.0 | -2.0 | 126.3 | 124.4 |
| Mining & Logging | 0 | 0 | 1 | 0 | 0.0 | -25.7 | 169.2 | 143.5 |
| Construction | 0 | -7 | 1 | -5 | 0.0 | -813.9 | 183.7 | -630.2 |

Note: In 2012 dollars

*Regional Changes to Recreational Opportunities*

Changes in CVP and SWP water supplies and operations under Alternative 3 as compared to the Second Basis of Comparison generally would result in similar reservoir elevations in reservoirs that store CVP and SWP water and similar recreational economic factors under Alternative 3 as compared to the Second Basis of Comparison.

### *19.4.3.5 Alternative 4*

The CVP and SWP operations under Alternative 4 are identical to the CVP and SWP operations under the Second Basis of Comparison and Alternative 1, as described in Chapter 3, Description of Alternatives. In addition, Alternative 4 includes Striped Bass predation control which would reduce recreational opportunities. The non-recreational socioeconomic factors under Alternative 4 would be identical to the conditions under the Second Basis of Comparison. Alternative 4 is compared to the No Action Alternative and the Second Basis of Comparison.

#### 19.4.3.5.1 Alternative 4 Compared to the No Action Alternative

The CVP and SWP operations under Alternative 4 are identical to the CVP and SWP operations under the Second Basis of Comparison and Alternative 1. Therefore, changes in non-recreational socioeconomic factors under Alternative 4 as compared to the No Action Alternative would be the similar to impacts described in Section 12.4.3.2.1, Alternative 1 Compared to the No Action

Alternative. Recreational opportunities related to Striped Bass fishing would initially be increased when Alternative 4 is implemented. However, by 2030, Striped Bass fishing opportunities would be reduced under Alternative 4 as compared to the No Action Alternative due to actions to reduce predation. Commercial and sport ocean salmon fishing opportunities would be reduced under Alternative 4 as compared to the No Action Alternative due to increased harvest limitations.

#### 19.4.3.5.2 Alternative 4 Compared to the Second Basis of Comparison

As described in Chapter 3, Description of Alternatives, socioeconomic factors under Alternative 4 are the same as non-recreational socioeconomic factors under the Second Basis of Comparison. Recreational opportunities related to Striped Bass fishing would initially be increased when Alternative 4 is implemented. However, by 2030, Striped Bass fishing opportunities would be reduced under Alternative 4 as compared to the Second Basis of Comparison due to actions to reduce predation. Commercial and sport ocean salmon fishing opportunities would be reduced under Alternative 4 as compared to the Second Basis of Comparison due to increased harvest limitations.

### *19.4.3.6 Alternative 5*

As described in Chapter 3, Description of Alternatives, CVP and SWP operations under Alternative 5 are similar to the No Action Alternative with modified Old and Middle River flow criteria and New Melones Reservoir operations. As described in Chapter 4, Approach to Environmental Analysis, Alternative 5 is compared to the No Action Alternative and the Second Basis of Comparison.

#### 19.4.3.6.1 Alternative 5 Compared to the No Action Alternative

*Trinity River Region*

*Regional Changes to Irrigated Agriculture*

There are no agricultural lands irrigated with CVP and SWP water supplies in the Trinity River Region. Therefore, there would be no changes in irrigated lands under Alternative 5 as compared to the No Action Alternative.

*Regional Changes to Municipal and Industrial Water Supplies*

The CVP would continue to release water in Trinity River for downstream beneficial uses, including water supplies under Alternative 5 as compared to the No Action Alternative. There are no CVP or SWP water contractors in the Trinity River Region.

*Regional Changes to Recreational Opportunities*

Recreational opportunities would be similar in the Trinity River Region under Alternative 5 as compared to the No Action Alternative as described in Chapter 15, Recreational Resources.

*Regional Changes to Salmon Fishing*

Trinity River flows would be similar under Alternative 5 as compared to the No Action Alternative. This could result in similar salmon harvest conditions by the Yurok and Hoopa Valley tribes.

*Central Valley Region*

*Regional Changes to Irrigated Agriculture*

As described in Chapter 5, Surface Water Resources and Water Supplies, CVP and SWP water supplies would be similar under Alternative 5 and the No Action Alternative. It is anticipated that groundwater use would be similar and sustainable groundwater management plans would not be fully implemented until the 2040s, as discussed in Chapter 12, Agricultural Resources.

The agricultural production value under long-term average conditions would be the same under Alternative 5 as the No Action Alternative. The agricultural production value under dry and critical dry conditions also would be reduced by less than 1 percent ($0.8 million/year increase in the Sacramento Valley and $2.7 million/year decrease in the San Joaquin Valley), although groundwater pumping is not anticipated to change.

The overall decrease in agricultural production values are less than 0.05 percent under long-term conditions; and, changes in employment and regional economic output would be minimal. Therefore, the analysis of employment and regional economic output is focused on dry and critical dry years.

The direct changes in agricultural production would result in changes to employment and regional economic output in the Sacramento and San Joaquin valleys, as summarized in Tables 19.108 and 19.109, respectively.

**Table 19.108 Changes in Agricultural-Related Employment and Regional Economic Output for the Sacramento Valley under Alternative 5 as compared to the No Action Alternative in Dry and Critical Dry Years**

| Economic Sectors | Employment | | | | Economic Output ($ millions) | | | |
|---|---|---|---|---|---|---|---|---|
| | Direct | Indirect | Induced | Total | Direct | Indirect | Induced | Total |
| Agriculture | 3 | 2 | 0 | 4 | 0.8 | 0.1 | 0.0 | 0.9 |
| Mining & Logging | 0 | 0 | 0 | 0 | 0.0 | 0.0 | 0.0 | 0.0 |
| Construction | 0 | 0 | 0 | 0 | 0.0 | 0.0 | 0.0 | 0.0 |
| Manufacturing | 0 | 0 | 0 | 0 | 0.0 | 0.0 | 0.0 | 0.0 |
| Transportation, Warehousing & Utilities | 0 | 0 | 0 | 0 | 0.0 | 0.0 | 0.0 | 0.0 |
| Wholesale Trade | 0 | 0 | 0 | 0 | 0.0 | 0.0 | 0.0 | 0.0 |

| **Total** | **3** | **2** | **2** | **7** | **0.8** | **0.2** | **0.3** | **1.3** |

Note: In 2012 dollars

**Table 19.109 Changes in Agricultural-Related Employment and Regional Economic Output for the San Joaquin Valley under Alternative 5 as compared to the No Action Alternative in Dry and Critical Dry Years**

| Economic Sectors | Employment | | | | Economic Output ($ millions) | | | |
|---|---|---|---|---|---|---|---|---|
| | Direct | Indirect | Induced | Total | Direct | Indirect | Induced | Total |
| Agriculture | -5 | -9 | 0 | -14 | -2.7 | -0.4 | 0.0 | -3.0 |
| Mining & Logging | 0 | 0 | 0 | 0 | 0.0 | 0.0 | 0.0 | 0.0 |
| Construction | 0 | 0 | 0 | 0 | 0.0 | 0.0 | 0.0 | 0.0 |
| Manufacturing | 0 | 0 | 0 | 0 | 0.0 | -0.2 | -0.1 | -0.2 |
| Transportation, Warehousing & Utilities | 0 | 0 | 0 | -1 | 0.0 | -0.1 | 0.0 | -0.1 |
| Wholesale Trade | 0 | 0 | 0 | 0 | 0.0 | 0.0 | 0.0 | -0.1 |
| Retail Trade | 0 | 0 | -2 | -2 | 0.0 | 0.0 | -0.1 | -0.1 |
| Information | 0 | 0 | 0 | 0 | 0.0 | 0.0 | 0.0 | 0.0 |
| Financial Activities | 0 | -1 | -1 | -1 | 0.0 | -0.2 | -0.3 | -0.5 |
| Services | 0 | -1 | -4 | -5 | 0.0 | -0.1 | -0.4 | -0.4 |
| Government | 0 | 0 | 0 | 0 | 0.0 | 0.0 | 0.0 | 0.0 |
| **Total** | **-5** | **-11** | **-7** | **-24** | **-2.7** | **-0.9** | **-1.0** | **-4.6** |

Note: In 2012 dollars

As described in Chapter 11, Geology and Soils Resources, increased groundwater pumping under the long-term average conditions may result in an additional increment of subsidence in those areas within the Central Valley. The additional amount of subsidence and the economic costs associated with it have not been quantified in this EIS. However, total subsidence-related costs have been shown to be substantial, as reported by Borchers et al. (2014) who estimated that the cost of subsidence in San Joaquin Valley between 1955 and 1972 was more than $1.3 billion (in 2013 dollars). These estimates are based on the impacts to major infrastructure in the region including the San Joaquin River, Delta Mendota Canal, Friant-Kern Canal and San Luis Canal in addition to privately owned infrastructure. The incremental subsidence-related costs, expressed on an annual basis, could be an unknown fraction of that cumulative cost.

*Regional Changes to Municipal and Industrial Water Supplies*

As described in Chapter 5, Surface Water Resources and Water Supplies, CVP and SWP water supplies would be similar in the Sacramento Valley and lower in the San Joaquin Valley under Alternative 5 and the No Action Alternative. The analysis assumed CVP and SWP water deliveries, as described in Chapter 5, and determined the need for new water supplies, changes in water storage and groundwater pumping, water transfers, water shortage costs, and excess water savings. The factors and basis of the analysis is described in detail in Appendix 19A, CWEST Model. The analysis assumes that no new annual transfer supplies would be implemented until shortages were greater than 5 percent. The costs of these shortages are included in the analysis. It is assumed that some communities that do not have alternative water supplies would utilize water transfers.

The average annual water supply costs over the 81-year hydrologic period for M&I water supplies are presented in Tables 19.110 and 19.111 for the Sacramento and San Joaquin Valley, respectively. Average annual water supply operating expenses would be similar (within 0.05 percent change) for the Sacramento Valley, and increase by 0.07 percent in the San Joaquin Valley; and therefore, the results would be similar under Alternative 5 and the No Action Alternative.

**Table 19.110 Changes in Municipal and Industrial Water Supply Costs for the Sacramento Valley under Alternative 5 as compared to the No Action Alternative**

| Differences in Total | Alternative 5 | No Action Alternative | Changes |
|---|---|---|---|
| Average Annual CVP/SWP Deliveries (TAF) | 447 | 447 | -1 |
| Delivery Cost ($1,000) | $8,022 | $8,031 | -$8 |
| Assumed New Supply Deliveries (TAF) | 0 | 0 | 0 |
| Annualized New Supply Costs ($1,000) | $0 | $0 | $0 |
| Water Storage Costs ($1,000) | $0 | $0 | $0 |
| Lost Water Sales Revenues ($1,000) | $204 | $213 | -$9 |
| Transfer Costs ($1,000) | $752 | $739 | $12 |
| Shortage Costs ($1,000) | $68 | $69 | -$2 |
| Groundwater Pumping Savings (due to reductions in Groundwater Pumping) ($1,000) | -$3,856 | -$3,858 | $1 |
| Excess Water Savings ($1,000) | -$2,266 | -$2,275 | $10 |
| **Average Annual Changes in Water Supply Costs ($1,000)** | **$2,924** | **$2,919** | **$5** |

Note: In 2012 dollars

**Table 19.111 Changes in Municipal and Industrial Water Supply Costs for the San Joaquin Valley under Alternative 5 as compared to the No Action Alternative**

| Differences in Total | Alternative 5 | No Action Alternative | Changes |
|---|---|---|---|
| Average Annual CVP/SWP Deliveries (TAF) | 211 | 214 | -3 |
| Delivery Cost ($1,000) | $3,411 | $3,460 | -$49 |
| Assumed New Supply Deliveries (TAF) | 2 | 2 | 1 |
| Annualized New Supply Costs ($1,000) | $601 | $429 | $171 |

Note: In 2012 dollars

*Regional Changes to Recreational Opportunities*

Recreational opportunities at San Luis Reservoir would be similar under Alternative 5 as compared to the No Action Alternative, as described in Chapter 15, Recreation Resources. Therefore, it is anticipated that recreational economic factors would be similar under Alternative 5 as compared to the No Action Alternative.

*Effects Related to Cross Delta Water Transfers*

Potential effects to socioeconomic factors could be similar to those identified in a recent environmental analysis conducted by Reclamation for long-term water transfers from the Sacramento to San Joaquin valleys (Reclamation 2014c) as described above under the No Action Alternative compared to the Second Basis of Comparison. For the purposes of this EIS, it is anticipated that similar conditions would occur during implementation of cross Delta water transfers under Alternative 5 and the No Action Alternative, and that impacts on socioeconomic factors could be adverse in the seller's service area.

Under Alternative 5 and the No Action Alternative, the timing of cross Delta water transfers would be limited to July through September and include annual volumetric limits, in accordance with the 2008 USFWS BO and 2009 NMFS BO. Overall, the potential for cross Delta water transfers would be similar under Alternative 5 and the No Action Alternative.

*San Francisco Bay Area Region*

*Regional Changes to Irrigated Agriculture*

It is anticipated that as in the Central Valley Region, CVP and SWP water supplies within the San Francisco Bay Area Region would be similar under Alternative 5 and the No Action Alternative, and would not result in changes in irrigated acreage or land use changes due to the use of other water supplies.

*Regional Changes to Municipal and Industrial Water Supplies*

As described in Chapter 5, Surface Water Resources and Water Supplies, CVP and SWP water supplies would be lower under Alternative 5 and the No Action Alternative. The analysis assumed CVP and SWP water deliveries, as described in Chapter 5, and determined the need for new water supplies, changes in water storage and groundwater pumping, water transfers, water shortage costs, and excess water savings. The factors and basis of the analysis is described in detail in Appendix 19A, CWEST Model. The analysis assumes that no new annual transfer supplies would be implemented until shortages were greater than 5 percent. The costs of these shortages are included in the analysis.

The average annual water supply operating expenses over the 81-year hydrologic period for M&I water supplies would be increase by 0.1 percent, as presented in Table 19.114; and therefore, the results would be similar under Alternative 5 and the No Action Alternative.

**Table 19.114 Changes in Municipal and Industrial Water Supply Costs for the San Francisco Bay Area Region under Alternative 5 as compared to the No Action Alternative**

| Differences in Total | Alternative 5 | No Action Alternative | Changes |
|---|---|---|---|
| Average Annual CVP/SWP Deliveries (TAF) | 394 | 396 | -3 |
| Delivery Cost ($1,000) | $10,962 | $11,044 | -$82 |
| Assumed New Supply Deliveries (TAF) | 18 | 18 | 0 |
| Annualized New Supply Costs ($1,000) | $599 | $599 | $0 |
| Water Storage Costs ($1,000) | $1,495 | $1,577 | -$81 |
| Lost Water Sales Revenues ($1,000) | $4,360 | $4,286 | $74 |
| Transfer Costs ($1,000) | $6,156 | $5,722 | $434 |
| Shortage Costs ($1,000) | $1,450 | $1,410 | $40 |
| Groundwater Pumping Savings (due to reductions in Groundwater Pumping) ($1,000) | -$470 | -$493 | $24 |
| Excess Water Savings ($1,000) | -$225 | -$225 | $0 |
| **Average Annual Changes in Water Supply Costs ($1,000)** | **$24,328** | **$23,919** | **$409** |

Note: In 2012 dollars

The changes in M&I water supply costs would result in changes to employment and regional economic output, as summarized in Table 19.115.

**Table 19.115 Changes in Municipal and Industrial Water Supply Related Employment and Regional Economic Output for the San Francisco Bay Area Region under Alternative 5 as compared to the No Action Alternative**

#### *Regional Changes to Recreational Opportunities*

Changes in CVP and SWP water supplies and operations under Alternative 5 as compared to the No Action Alternative generally would result in similar reservoir elevations in reservoirs that store CVP and SWP water and similar recreational economic factors under Alternative 5 as compared o the No Action Alternative.

#### *Regional Changes to Salmon Fishing*

Changes in commercial and sport ocean salmon fishing primarily would be related to the presence of fall-run Chinook Salmon from Central Valley hatcheries. It is assumed that the production of hatchery fish would be similar under Alternative 15 and the No Action Alternative. However, survival of the fall-run Chinook Salmon hatchery fish to the Pacific Ocean could be related to changes in CVP and SWP operations. As described in Chapter 9, Fish and Aquatic Resources, there would be little change in through-Delta survival by emigrating natural juvenile fall-run Chinook Salmon under Alternative 5 and the No Action Alternative. It is assumed that the survival of the hatchery juvenile fall-run Chinook Salmon would be similar to the survival of the natural juvenile fall-run Chinook Salmon. Therefore, the availability of fish for commercial and sport ocean salmon fishing and the associated economic conditions for the fishing industry would be similar under Alternative 5 and the No Action Alternative.

### *Central Coast Region*

#### *Regional Changes to Irrigated Agriculture*

It is anticipated that as in the Central Valley Region, increases in CVP and SWP water supplies within the Central Coast Region would be lower under Alternative 5 and the No Action Alternative, and would not result in changes in irrigated acreage or land use changes due to the use of other water supplies.

#### *Regional Changes to Municipal and Industrial Water Supplies*

As described in Chapter 5, Surface Water Resources and Water Supplies, CVP and SWP water supplies would be similar under Alternative 5 and the No Action Alternative. The analysis assumed CVP and SWP water deliveries, as described in Chapter 5, and determined the need for new water supplies, changes in water storage and groundwater pumping, water transfers, water shortage costs, and excess water savings. The factors and basis of the analysis is described in detail in Appendix 19A, CWEST Model. The analysis assumes that no new annual transfer supplies would be implemented until shortages were greater than 5 percent. The costs of these shortages are included in the analysis. It is assumed that some communities that do not have alternative water supplies would utilize water transfers.

The average annual water supply operating expenses over the 81-year hydrologic period for M&I water supplies would increase by 0.06 percent, as presented in Table 19.116; and therefore, the results would be similar under Alternative 5 and the No Action Alternative.

**Table 19.116 Changes in Municipal and Industrial Water Supply Costs for the Central Coast Region under Alternative 5 as compared to the No Action Alternative**

| Differences in Total | Alternative 5 | No Action Alternative | Changes |
|---|---|---|---|
| Average Annual CVP/SWP Deliveries (TAF) | 43 | 44 | -1 |
| Delivery Cost ($1,000) | $6,567 | $6,663 | -$97 |
| Assumed New Supply Deliveries (TAF) | 0 | 0 | 0 |
| Annualized New Supply Costs ($1,000) | $0 | $0 | $0 |
| Water Storage Costs ($1,000) | $0 | $0 | $0 |
| Lost Water Sales Revenues ($1,000) | $0 | $0 | $0 |
| Transfer Costs ($1,000) | $0 | $0 | $0 |
| Shortage Costs ($1,000) | $0 | $0 | $0 |
| Groundwater Pumping Savings (due to reductions in Groundwater Pumping) ($1,000) | -$8,018 | -$8,068 | $50 |
| Excess Water Savings ($1,000) | -$2,899 | -$2,970 | $70 |
| **Average Annual Changes in Water Supply Costs ($1,000)** | **-$4,350** | **-$4,374** | **$23** |

Note: In 2012 dollars

The changes in M&I water supply costs would result in changes to employment and regional economic output, as summarized in Table 19.117.

**Table 19.117 Changes in Municipal and Industrial Water Supply Related Employment and Regional Economic Output for the Central Coast Region under Alternative 5 as compared to the No Action Alternative**

| Economic Sectors | Employment | | | | Economic Output ($ thousands) | | | |

Note: In 2012 dollars

*Regional Changes to Recreational Opportunities*

Changes in CVP and SWP water supplies and operations under Alternative 5 as compared to the No Action Alternative generally would result in similar reservoir elevations in reservoirs that store CVP and SWP water and similar recreational economic factors under Alternative 5 as compared to the No Action Alternative.

*Southern California Region*

*Regional Changes to Irrigated Agriculture*

It is anticipated that as in the Central Valley Region, increases in CVP and SWP water supplies within the Southern California Region would be similar under Alternative 5 and the No Action Alternative, and would not result in changes in irrigated acreage or land use changes due to the use of other water supplies.

*Regional Changes to Municipal and Industrial Water Supplies*

As described in Chapter 5, Surface Water Resources and Water Supplies, CVP and SWP water supplies would be lower under Alternative 5 and the No Action Alternative. The analysis assumed CVP and SWP water deliveries, as described in Chapter 5, and determined the need for new water supplies, changes in water storage and groundwater pumping, water transfers, water shortage costs, and excess water savings. The factors and basis of the analysis is described in detail in Appendix 19A, CWEST Model. The analysis assumes that no new annual transfer supplies would be implemented until shortages were greater than 5 percent. The costs of these shortages are included in the analysis. It is assumed that some communities that do not have alternative water supplies would utilize water transfers.

The average annual water supply operating expenses over the 81-year hydrologic period for M&I water supplies would be increase by 0.37 percent, as presented in Table 19.118; and therefore, the results would be similar under Alternative 5 and the No Action Alternative.

**Table 19.118 Changes in Municipal and Industrial Water Supply Costs for the Southern California Region under Alternative 5 as compared to the No Action Alternative**

| Differences in Total | Alternative 5 | No Action Alternative | Changes |
|---|---|---|---|
| Average Annual CVP/SWP Deliveries (TAF) | 1,912 | 1,932 | -20 |
| Delivery Cost ($1,000) | $237,118 | $239,692 | -$2,575 |
| Assumed New Supply Deliveries (TAF) | 81 | 47 | 34 |
| Annualized New Supply Costs ($1,000) | $24,191 | $12,688 | $11,503 |
| Water Storage Costs ($1,000) | $7,474 | $7,598 | -$124 |
| Lost Water Sales Revenues ($1,000) | $14,206 | $14,614 | -$408 |
| Transfer Costs ($1,000) | $10,505 | $11,484 | -$979 |
| Shortage Costs ($1,000) | $16,662 | $17,319 | -$657 |
| Groundwater Pumping Savings (due to reductions in Groundwater Pumping) ($1,000) | -$58,323 | -$57,474 | -$849 |
| Excess Water Savings ($1,000) | -$4,588 | -$4,629 | $41 |
| **Average Annual Changes in Water Supply Costs ($1,000)** | **$247,243** | **$241,291** | **$5,952** |

Note: In 2012 dollars

The changes in M&I water supply costs would result in changes t9o employment and regional economic output, as summarized in Table 19.119.

**Table 19.119 Changes in Municipal and Industrial Water Supply Related Employment and Regional Economic Output for the Southern California under Alternative 5 as compared to the No Action Alternative**

| **Total** | **35** | **22** | **6** | **63** | **8,804.2** | **3,348.6** | **827.3** | **12,980.1** |

Note: In 2012 dollars

*Regional Changes to Recreational Opportunities*

Changes in CVP and SWP water supplies and operations under Alternative 5 as compared to the No Action Alternative generally would result in similar reservoir elevations in reservoirs that store CVP and SWP water and similar recreational economic factors under Alternative 5 as compared to the No Action Alternative.

#### 19.4.3.6.2 Alternative 5 Compared to the Second Basis of Comparison

*Trinity River Region*

*Regional Changes to Irrigated Agriculture*

There are no agricultural lands irrigated with CVP and SWP water supplies in the Trinity River Region. Therefore, there would be no changes in irrigated lands under Alternative 5 as compared to the Second Basis of Comparison.

*Regional Changes to Municipal and Industrial Water Supplies*

The CVP would continue to release water in Trinity River for downstream beneficial uses, including water supplies under Alternative 5 and the Second Basis of Comparison. There are no CVP or SWP water contractors in the Trinity River Region.

*Regional Changes to Recreational Opportunities*

Recreational opportunities would be similar in the Trinity River Region under Alternative 5 as compared to the Second Basis of Comparison as described in Chapter 15, Recreational Resources.

#### *Regional Changes to Salmon Fishing*

Trinity River flows would be similar under Alternative 5 as compared to the Second Basis of Comparison. This could result in similar salmon harvest conditions by the Yurok and Hoopa Valley tribes.

### *Central Valley Region*

#### *Regional Changes to Irrigated Agriculture*

As described in Chapter 5, Surface Water Resources and Water Supplies, CVP and SWP water supplies would be less under Alternative 5 than under the Second Basis of Comparison. It is anticipated that groundwater use would increase in response to reduced CVP and SWP water supplies in 2030 because sustainable groundwater management plans would not be fully implemented until the 2040s, as discussed in Chapter 12, Agricultural Resources.

The agricultural production value under long-term average conditions would be reduced by less than 1 percent ($1.5 million/year in the Sacramento Valley and $0.7 million/year in the San Joaquin Valley) primarily due to an increase in groundwater pumping of approximately 6 percent. The agricultural production value under dry and critical dry conditions also would be reduced by less than 1 percent ($10.5 million/year in the Sacramento Valley and $22.9 million/year in the San Joaquin Valley) primarily due to an increase in groundwater pumping.

The overall reduction in agricultural production values are less than 0.05 percent under long-term conditions; and, changes in employment and regional economic output would be minimal. Therefore, the analysis of employment and regional economic output is focused on dry and critical dry years.

The direct changes in agricultural production would result in changes to employment and regional economic output in the Sacramento and San Joaquin valleys, as summarized in Tables 19.120 and 19.121, respectively.

**Table 19.120 Changes in Agricultural-Related Employment and Regional Economic Output for the Sacramento Valley under Alternative 5 as Compared to the Second Basis of Comparison in Dry and Critical Dry Years**

| Economic Sectors | Employment | | | | Economic Output ($ millions) | | | |
|---|---|---|---|---|---|---|---|---|
| | Direct | Indirect | Induced | Total | Direct | Indirect | Induced | Total |

| Retail Trade | 0 | 0 | -9 | -9 | 0.0 | 0.0 | -0.7 | -0.8 |
| Information | 0 | 0 | 0 | -1 | 0.0 | -0.1 | -0.2 | -0.2 |
| Financial Activities | 0 | -13 | -4 | -16 | 0.0 | -2.8 | -1.8 | -4.6 |
| Services | 0 | -6 | -25 | -31 | 0.0 | -0.6 | -2.1 | -2.7 |
| Government | 0 | -1 | 0 | -1 | 0.0 | -0.2 | -0.1 | -0.3 |
| **Total** | **-145** | **-90** | **-42** | **-277** | **-22.9** | **-10.2** | **-5.9** | **-39.0** |

Note: In 2012 dollars

As described in Chapter 11, Geology and Soils Resources, increased groundwater pumping under the long-term average conditions may result in an additional increment of subsidence in those areas within the Central Valley.  The additional amount of subsidence and the economic costs associated with it have not been quantified in this EIS. However, total subsidence-related costs have been shown to be substantial, as reported by Borchers et al. (2014) who estimated that the cost of subsidence in San Joaquin Valley between 1955 and 1972 was more than $1.3 billion (in 2013 dollars). These estimates are based on the impacts to major infrastructure in the region including the San Joaquin River, Delta Mendota Canal, Friant-Kern Canal and San Luis Canal in addition to privately owned infrastructure. The incremental subsidence-related costs, expressed on an annual basis, could be an unknown fraction of that cumulative cost.

*Regional Changes to Municipal and Industrial Water Supplies*

As described in Chapter 5, Surface Water Resources and Water Supplies, CVP and SWP water supplies would be less under Alternative 5 than under the Second Basis of Comparison. The analysis assumed CVP and SWP water deliveries, as described in Chapter 5, and determined the need for new water supplies, changes in water storage and groundwater pumping, water transfers, water shortage costs, and excess water savings. The factors and basis of the analysis is described in detail in Appendix 19A, CWEST Model. The analysis assumes that no new annual transfer supplies would be implemented until shortages were greater than 5 percent. The costs of these shortages are included in the analysis. It is assumed that some communities that do not have alternative water supplies would utilize water transfers.

The average annual water supply costs over the 81-year hydrologic period for M&I water supplies are presented in Tables 19.122 and 19.123 for the Sacramento and San Joaquin Valley, respectively. Average annual water supply operating expenses would increase by 0.11 and 0.47 percent in the Sacramento Valley and the San Joaquin Valley, respectively; and therefore, the results would be similar under Alternative 5 and the Second Basis of Comparison.

**Table 19.122 Changes in Municipal and Industrial Water Supply Costs for the Sacramento Valley under Alternative 5 as Compared to the Second Basis of Comparison**

| Differences in Total | Alternative 5 | Second Basis of Comparison | Changes |
|---|---|---|---|
| Average Annual CVP/SWP Deliveries (TAF) | 447 | 463 | -16 |
| Delivery Cost ($1,000) | $8,022 | $8,317 | -$295 |
| Assumed New Supply Deliveries (TAF) | 0 | 0 | 0 |

*Regional Changes to Recreational Opportunities*

Recreational opportunities would decrease by 6 to 9 percent under Alternative 5 as compared to the Second Basis of Comparison, depending upon water year type, , as described in Chapter 15, Recreation Resources. Therefore, it is anticipated that recreational economic factors would be reduced under Alternative 5 as compared to the Second Basis of Comparison.

*Effects Related to Cross Delta Water Transfers*

Potential effects to socioeconomic factors could be similar to those identified in a recent environmental analysis conducted by Reclamation for long-term water transfers from the Sacramento to San Joaquin valleys (Reclamation 2014c) as described above under the No Action Alternative compared to the Second Basis of Comparison. For the purposes of this EIS, it is anticipated that similar conditions would occur during implementation of cross Delta water transfers under Alternative 5 and the Second Basis of Comparison, and that impacts on socioeconomic factors could be adverse in the seller's service area.

Under Alternative 5, the timing of cross Delta water transfers would be limited to July through September and include annual volumetric limits, in accordance with the 2008 USFWS BO and 2009 NMFS BO. Under Second Basis of Comparison, water could be transferred throughout the year without an annual volumetric limit. Overall, the potential for cross Delta water transfers would be decreased under Alternative 5 as compared to the Second Basis of Comparison.

*San Francisco Bay Area Region*

*Regional Changes to Irrigated Agriculture*

It is anticipated that as in the Central Valley Region, reductions in CVP and SWP water supplies within the San Francisco Bay Area Region would not result in reductions in long-term irrigated acreage or land use changes due to the use of other water supplies. However, there could be a reduction in irrigated acreage in dry and critical dry years under Alternative 5 as compared to the Second Basis of Comparison.

*Regional Changes to Municipal and Industrial Water Supplies*

As described in Chapter 5, Surface Water Resources and Water Supplies, CVP and SWP water supplies would be less under Alternative 5 than under the Second Basis of Comparison. The analysis assumed CVP and SWP water deliveries, as described in Chapter 5, and determined the need for new water supplies, changes in water storage and groundwater pumping, water transfers, water shortage costs, and excess water savings. The factors and basis of the analysis is described in detail in Appendix 19A, CWEST Model. The analysis assumes that no new annual transfer supplies would be implemented until shortages were greater than 5 percent. The costs of these shortages are included in the analysis.

The average annual water supply costs over the 81-year hydrologic period for M&I water supplies would increase by 1.85 percent, as presented in Table 19.126; and therefore, the results would be similar under Alternative 5 and the Second Basis of Comparison.

**Table 19.126 Changes in Municipal and Industrial Water Supply Costs for the San Francisco Bay Area Region under Alternative 5 as Compared to the Second Basis of Comparison**

| Differences in Total | Alternative 5 | Second Basis of Comparison | Changes |
|---|---|---|---|
| Average Annual CVP/SWP Deliveries (TAF) | 394 | 445 | -51 |
| Delivery Cost ($1,000) | $10,962 | $12,515 | -$1,553 |
| Assumed New Supply Deliveries (TAF) | 18 | 16 | 2 |
| Annualized New Supply Costs ($1,000) | $599 | $234 | $365 |
| Water Storage Costs ($1,000) | $1,495 | $1,963 | -$467 |
| Lost Water Sales Revenues ($1,000) | $4,360 | $1,595 | $2,765 |
| Transfer Costs ($1,000) | $6,156 | $1,154 | $5,002 |
| Shortage Costs ($1,000) | $1,450 | $523 | $927 |
| Groundwater Pumping Savings (due to reductions in Groundwater Pumping) ($1,000) | -$470 | -$792 | $322 |
| Excess Water Savings ($1,000) | -$225 | -$549 | $324 |
| **Average Annual Changes in Water Supply Costs ($1,000)** | **$24,328** | **$16,643** | **$7,686** |

Note: In 2012 dollars

The changes in M&I water supply costs would result in changes to employment and regional economic output, as summarized in Table 19.127.

**Table 19.127 Changes in Municipal and Industrial Water Supply Related Employment and Regional Economic Output for the San Francisco Bay Area Region under Alternative 5 as Compared to the Second Basis of Comparison**

| Economic Sectors | Employment | | | | Economic Output ($ thousands) | | | |
|---|---|---|---|---|---|---|---|---|
| | Direct | Indirect | Induced | Total | Direct | Indirect | Induced | Total |
| Agriculture | 0 | 0 | 0 | 0 | 0.0 | -0.1 | 8.4 | 8.3 |
| Mining & Logging | 0 | 0 | 0 | 0 | 0.0 | -1.7 | 5.3 | 3.5 |
| Construction | 0 | -1 | 0 | -1 | 0.0 | -176.1 | 39.5 | -136.6 |
| Manufacturing | 0 | 0 | 1 | 0 | 0.0 | -32.0 | 509.0 | 477.0 |
| Transportation, Warehousing & Utilities | -6 | 0 | 1 | -5 | -1,654.5 | -12.4 | 195.3 | -1,471.6 |
| Wholesale Trade | 0 | 0 | 2 | 1 | 0.0 | -5.5 | 373.6 | 368.1 |
| Retail Trade | 0 | 0 | 7 | 7 | 0.0 | -4.7 | 603.7 | 599.0 |
| Information | 0 | 0 | 1 | 1 | 0.0 | -18.6 | 326.5 | 307.9 |
| Financial Activities | 0 | 0 | 5 | 5 | 0.0 | -61.9 | 1,853.1 | 1,791.2 |
| Services | 0 | -1 | 22 | 20 | 0.0 | -148.2 | 2,302.6 | 2,154.4 |
| Government | 0 | 0 | 0 | 0 | 0.0 | -0.7 | 58.7 | 57.9 |
| **Total** | **-6** | **-3** | **37** | **29** | **-1,654.5** | **-462.0** | **6,275.6** | **4,159.1** |

Note: In 2012 dollars

*Regional Changes to Recreational Opportunities*

Changes in CVP and SWP water supplies and operations under Alternative 5 as compared to the Second Basis of Comparison generally would result in lower reservoir elevations in reservoirs that store CVP and SWP water (up to 10 to 18 percent); and would result in decreased recreational economic factors under Alternative 5 as compared to the Second Basis of Comparison.

*Regional Changes to Salmon Fishing*

Changes in commercial and sport ocean salmon fishing primarily would be related to the presence of fall-run Chinook Salmon from Central Valley hatcheries. It is assumed that the production of hatchery fish would be similar under Alternative 5 and the Second Basis of Comparison. However, survival of the fall-run Chinook Salmon hatchery fish to the Pacific Ocean could be related to changes in CVP and SWP operations. As described in Chapter 9, Fish and Aquatic Resources, there would be little change in through-Delta survival by emigrating natural juvenile fall-run Chinook Salmon under Alternative 5 as compared to the Second Basis of Comparison. It is assumed that the survival of the hatchery juvenile fall-run Chinook Salmon would be similar to the survival of the natural juvenile fall-run Chinook Salmon. Therefore, the availability of fish for commercial and sport ocean salmon fishing and the associated economic conditions for the fishing industry would be similar under Alternative 5 and the Second Basis of Comparison.

*Central Coast Region*

*Regional Changes to Irrigated Agriculture*

It is anticipated that as in the Central Valley Region, reductions in CVP and SWP water supplies within the Central Coast Region would not result in reductions in long-term irrigated acreage or land use changes due to the use of other water supplies. However, there could be a reduction in irrigated acreage in dry and critical dry years under Alternative 5 as compared to the Second Basis of Comparison.

*Regional Changes to Municipal and Industrial Water Supplies*

As described in Chapter 5, Surface Water Resources and Water Supplies, CVP and SWP water supplies would be less under Alternative 5 than under the Second Basis of Comparison. The analysis assumed CVP and SWP water deliveries, as described in Chapter 5, and determined the need for new water supplies, changes in water storage and groundwater pumping, water transfers, water shortage costs, and excess water savings. The factors and basis of the analysis is described in detail in Appendix 19A, CWEST Model. The analysis assumes that no new annual transfer supplies would be implemented until shortages were greater than 5 percent. The costs of these shortages are included in the analysis. It is assumed that some communities that do not have alternative water supplies would utilize water transfers.

The average annual water supply operating expenses over the 81-year hydrologic period for M&I water supplies would increase by 0.77 percent, as presented in Table 19.128; and therefore, the results would be similar under Alternative 5 and the Second Basis of Comparison.

**Table 19.128 Changes in Municipal and Industrial Water Supply Costs for the Central Coast Region under Alternative 5 as Compared to the Second Basis of Comparison**

| Differences in Total | Alternative 5 | Second Basis of Comparison | Changes |
|---|---|---|---|
| Average Annual CVP/SWP Deliveries (TAF) | 43 | 54 | -11 |
| Delivery Cost ($1,000) | $6,567 | $8,174 | -$1,607 |
| Assumed New Supply Deliveries (TAF) | 0 | 0 | 0 |
| Annualized New Supply Costs ($1,000) | $0 | $0 | $0 |
| Water Storage Costs ($1,000) | $0 | $0 | $0 |
| Lost Water Sales Revenues ($1,000) | $0 | $0 | $0 |
| Transfer Costs ($1,000) | $0 | $0 | $0 |
| Shortage Costs ($1,000) | $0 | $0 | $0 |
| Groundwater Pumping Savings (due to reductions in Groundwater Pumping) ($1,000) | -$8,018 | -$8,643 | $625 |
| Excess Water Savings ($1,000) | -$2,899 | -$4,176 | $1,277 |
| **Average Annual Changes in Water Supply Costs ($1,000)** | **-$4,350** | **-$4,645** | **$295** |

Note: In 2012 dollars

The changes in M&I water supply costs would result in changes to employment and regional economic output, as summarized in Table 19.129.

**Table 19.129 Changes in Municipal and Industrial Water Supply Related Employment and Regional Economic Output for the Central Coast Region under Alternative 5 as Compared to the Second Basis of Comparison**

| Economic Sectors | Employment | | | | Economic Output ($ thousands) | | | |
|---|---|---|---|---|---|---|---|---|
| | Direct | Indirect | Induced | Total | Direct | Indirect | Induced | Total |

Note: In 2012 dollars

*Regional Changes to Recreational Opportunities*

Changes in CVP and SWP water supplies and operations under Alternative 5 as compared to the Second Basis of Comparison generally would result in lower reservoir elevations in reservoirs that store CVP and SWP water (up to 10 to 18 percent); and would result in decreased recreational economic factors under Alternative 5 as compared to the Second Basis of Comparison.

*Southern California Region*

*Regional Changes to Irrigated Agriculture*

It is anticipated that as in the Central Valley Region, reductions in CVP and SWP water supplies within the Southern California Region would not result in reductions in long-term irrigated acreage or land use changes due to the use of other water supplies. However, there could be a reduction in irrigated acreage in dry and critical dry years under Alternative 5 as compared to the Second Basis of Comparison.

*Regional Changes to Municipal and Industrial Water Supplies*

As described in Chapter 5, Surface Water Resources and Water Supplies, CVP and SWP water supplies would be less under Alternative 5 than under the Second Basis of Comparison. The analysis assumed CVP and SWP water deliveries, as described in Chapter 5, and determined the need for new water supplies, changes in water storage and groundwater pumping, water transfers, water shortage costs, and excess water savings. The factors and basis of the analysis is described in detail in Appendix 19A, CWEST Model. The analysis assumes that no new annual transfer supplies would be implemented until shortages were greater than 5 percent. The costs of these shortages are included in the analysis. It is assumed that some communities that do not have alternative water supplies would utilize water transfers.

The average annual water supply operating expenses over the 81-year hydrologic period for M&I water supplies would increase by 2.5 percent, as presented in Table 19.130; and therefore, the results would be similar under Alternative 5 and the Second Basis of Comparison.

**Table 19.130 Changes in Municipal and Industrial Water Supply Costs for the Southern California Region under Alternative 5 as Compared to the Second Basis of Comparison**

| Differences in Total | Alternative 5 | Second Basis of Comparison | Changes |
|---|---|---|---|
| Average Annual CVP/SWP Deliveries (TAF) | 1,912 | 2,394 | -482 |
| Delivery Cost ($1,000) | $237,118 | $296,795 | -$59,677 |
| Assumed New Supply Deliveries (TAF) | 81 | 11 | 70 |
| Annualized New Supply Costs ($1,000) | $24,191 | $4,032 | $20,159 |
| Water Storage Costs ($1,000) | $7,474 | $2,824 | $4,649 |
| Lost Water Sales Revenues ($1,000) | $14,206 | $1,119 | $13,087 |
| Transfer Costs ($1,000) | $10,505 | $3,705 | $6,800 |
| Shortage Costs ($1,000) | $16,662 | $353 | $16,309 |
| Groundwater Pumping Savings (due to reductions in Groundwater Pumping) ($1,000) | -$58,323 | -$91,507 | $33,183 |
| Excess Water Savings ($1,000) | -$4,588 | -$10,573 | $5,985 |
| **Average Annual Changes in Water Supply Costs ($1,000)** | **$247,243** | **$206,749** | **$40,495** |

Note: In 2012 dollars

The changes in M&I water supply costs would result in changes to employment and regional economic output, as summarized in Table 19.131.

**Table 19.131 Changes in Municipal and Industrial Water Supply Related Employment and Regional Economic Output for the Southern California Region under Alternative 5 as Compared to the Second Basis of Comparison**

| Economic Sectors | Employment | | | | Economic Output ($ thousands) | | | |
|---|---|---|---|---|---|---|---|---|
| | Direct | Indirect | Induced | Total | Direct | Indirect | Induced | Total |
| Agriculture | 0 | 0 | 2 | 1 | 0.0 | -10.0 | 276.1 | 266.1 |
| Mining & Logging | 0 | 0 | 1 | 1 | 0.0 | -131.1 | 372.3 | 241.2 |

| Government | 0 | 0 | 3 | 3 | 0.0 | -23.8 | 594.9 | 571.1 |
| **Total** | **-140** | **-86** | **384** | **158** | **-34,869.2** | **-13,262.4** | **62,505.2** | **14,373.6** |

Note: In 2012 dollars

*Regional Changes to Recreational Opportunities*

Changes in CVP and SWP water supplies and operations under Alternative 5 as compared to the Second Basis of Comparison generally would result in lower reservoir elevations in reservoirs that store CVP and SWP water (up to 10 to 18 percent); and would result in decreased recreational economic factors under Alternative 5 as compared to the Second Basis of Comparison.

#### *19.4.3.7 Summary of Environmental Consequences*

The results of the environmental consequences of implementation of Alternatives 1 through 5 as compared to the No Action Alternative and the Second Basis of Comparison are presented in Tables 19.132 and 19.133.

**Table 19.132 Comparison of Alternatives 1 through 5 to No Action Alternative**

| Alternative | Potential Change | Consideration for Mitigation Measures |
|---|---|---|
| Alternative 1 | Agricultural and M&I water-related employment would be similar.<br>M&I water supply operating expenses would be similar.<br>Recreational economic factors would increase or be similar related to use of reservoirs that store CVP and SWP water. | None needed |
| Alternative 2 | No effects on socioeconomic factors. | None needed |
| Alternative 3 | Agricultural and M&I water-related employment would be similar.<br>M&I water supply operating expenses would be similar.<br>Recreational economic factors would increase or be similar related to use of reservoirs that store CVP and SWP water.<br>Reduced recreational economic factors related to Striped Bass fishing.<br>Reduced commercial and sport ocean salmon fishing due to increased harvest limitations. | None identified at this time to reduce economic effects of reduced Striped Bass fishing and ocean salmon. |
| Alternative 4 | Same effects as described for Alternative 1 compared to the No Action Alternative for non-recreational economic factors.<br>Reduced recreational economic factors related to Striped Bass fishing.<br>Reduced commercial and sport ocean salmon fishing due to increased harvest limitations. | None identified at this time to reduce economic effects of reduced Striped Bass fishing or ocean salmon fishing. |
| Alternative 5 | Agricultural and M&I water-related employment would be similar.<br>M&I water supply operating expenses would be similar.<br>Recreational economic factors would be similar related to use of reservoirs that store CVP and SWP water. | None needed |

Note: Due to the limitations and uncertainty in the CalSim II monthly model and other analytical tools, incremental differences of 5 percent or less between alternatives and the No Action Alternative are considered to be “similar.”

**Table 19.133 Comparison of No Action Alternative and Alternatives 1 through 5 to Second Basis of Comparison**

| Alternative | Potential Change | Consideration for Mitigation Measures |
|---|---|---|
| No Action Alternative | Agricultural and M&I water-related employment would be similar.<br>M&I water supply operating expenses would be similar.<br>Recreational economic factors would decrease at San Luis Reservoir and at of reservoirs that store CVP and SWP water in the San Francisco Bay Area and Central Coast regions. | Not considered for this comparison. |
| Alternative 1 | No effects on socioeconomic factors. | Not considered for this comparison. |
| Alternative 2 | Same effects as described for No Action Alternative as compared to the Second Basis of Comparison. | Not considered for this comparison. |
| Alternative 3 | Agricultural and M&I water-related employment would be similar.<br>M&I water supply operating expenses would be similar.<br>Recreational economic factors would be similar related to use of reservoirs that store CVP and SWP water.<br>Reduced recreational economic factors related to Striped Bass fishing.<br>Reduced commercial and sport ocean salmon fishing due to increased harvest limitations.<br>Recreational economic factors would be similar. | Not considered for this comparison. |
| Alternative 4 | No effects on non-recreational socioeconomic factors.<br>Reduced recreational economic factors related to Striped Bass fishing.<br>Reduced commercial and sport ocean salmon fishing due to increased harvest limitations. | Not considered for this comparison. |
| Alternative 5 | Agricultural and M&I water-related employment would be similar.<br>M&I water supply operating expenses would be similar.<br>Recreational economic factors would decrease at San Luis Reservoir and at of reservoirs that store CVP and SWP water in the San Francisco Bay Area, Central Coast, and Southern California regions.<br>Reduced recreational economic factors related to Striped Bass fishing.<br>Reduced commercial and sport ocean salmon fishing due to increased harvest limitations. | Not considered for this comparison. |

Note: Due to the limitations and uncertainty in the CalSim II monthly model and other analytical tools, incremental differences of 5 percent or less between alternatives and the No Action Alternative are considered to be “similar.”

#### *19.4.3.8 Potential Mitigation Measures*

Mitigation measures are presented in this section to avoid, minimize, rectify, reduce, eliminate, or compensate for adverse environmental effects of Alternatives 1 through 5 as compared to the No Action Alternative. Mitigation measures were not included to address adverse impacts under the alternatives as compared to the Second Basis of Comparison because this analysis was included in this EIS for information purposes only.

Changes in CVP and SWP operations under Alternatives 1 through 5 as compared to the No Action Alternative would not result in adverse changes in socioeconomic factors related to the average annual agricultural production or M&I water supply operating expenses as compared to the No Action Alternative. However, implementation of Alternatives 3 and 4 would result in adverse changes in recreational Striped Bass and sport ocean salmon fishing opportunities.

##### 19.4.3.8.1 Recreational Fishing Opportunities

Under Alternatives 3 and 4, fishing opportunities for Striped Bass and commercial and sport ocean salmon fishing would be reduced as compared to the No Action Alternative. Mitigation measures are not identified at this time to reduce the impact to the Striped Bass and ocean salmon fishing opportunities.

#### *19.4.3.9 Cumulative Effects Analysis*

As described in Chapter 3, the cumulative effects analysis considers projects, programs, and policies that are not speculative; and are based upon known or reasonably foreseeable long-range plans, regulations, operating agreements, or other information that establishes them as reasonably foreseeable.

The cumulative effects analysis Alternatives 1 through 5 for Socioeconomics are summarized in Table 19.134.

**Table 19.134 Summary of Cumulative Effects on Socioeconomics of Alternatives 1 through 5 as Compared to the No Action Alternative**

| Scenarios | Actions | Cumulative Effects of Actions |
|---|---|---|
| Past & Present, and Future Actions included in the No Action Alternative and in all Alternatives in Year 2030 | Consistent with Affected Environment conditions plus:<br>Actions in the 2008 USFWS BO and 2009 NMFS BO that would have occurred without implementation of the Biological Opinions, as described in Section 3.3.1.2 (of Chapter 3, Descriptions of Alternatives), including climate change and sea level rise<br>Actions not included in the 2008 USFWS BO and 2009 NMFS BO that would have occurred without implementation of the Biological Opinions, as described in Section 3.3.1.3 (of Chapter 3, Descriptions of Alternatives):<br>• Implementation of Federal and state policies and programs, including Clean Water Act (e.g., Total Maximum Daily Loads); Safe Drinking Water Act; Clean Air Act; and flood management programs<br>• General plans for 2030.<br>• Trinity River Restoration Program.<br>• Central Valley Project Improvement Act programs<br>• Folsom Dam Water Control Manual Update<br>• FERC Relicensing for the Middle Fork of the American River Project<br>• San Joaquin River Restoration Program<br>• Contra Loma Recreation Resource Management Plan<br>• San Luis Reservoir State Recreation Area Resource Management Plan/General Plan | <u>These effects would be the same in all alternatives.</u><br>Climate change and sea level rise and development under the general plans are anticipated to reduce carryover storage in reservoirs in a manner that would reduce CVP and SWP water supply availability and recreational opportunities at some reservoirs that store CVP and SWP water, and could reduce the opportunities for ocean salmon fishing.<br>Other actions, including restoration projects, FERC relicensing projects, and some future projects to improve water quality and/or habitat are anticipated to improve recreational opportunities and salmon populations that could improve ocean salmon fishing. |
| Future Actions considered as Cumulative Effects Actions in all Alternatives in Year 2030 | Actions as described in Section 3.5 (of Chapter 3, Descriptions of Alternatives):<br>• Bay-Delta Water Quality Control Plan Update<br>• FERC Relicensing Projects<br>• Bay Delta Conservation Plan (including the California WaterFix alternative)<br>• Shasta Lake Water Resources, North-of-the-Delta Offstream Storage, Los Vaqueros Reservoir Expansion Phase 2, and Upper San Joaquin River Basin Storage Investigations | <u>These effects would be the same in all alternatives.</u><br>Some of the future reasonably foreseeable actions to improve water quality and FERC Relicensing projects could improve recreational opportunities and salmon populations that could improve ocean salmon fishing.<br>Other actions, such as expanded or new reservoirs would improve water supply availability and recreational opportunities. |

| Scenarios | Actions | Cumulative Effects of Actions |
|---|---|---|
| | • El Dorado Water and Power Authority Supplemental Water Rights Project<br>• Semitropic Water Storage District Delta Wetlands<br>• North Bay Aqueduct Alternative Intake<br>• Irrigated Lands Regulatory Program | |
| No Action Alternative with Associated Cumulative Effects Actions in Year 2030 | Full implementation of the 2008 USFWS BO and 2009 NMFS BO | Implementation of No Action Alternative would result in changes stream flows. Changes in stream flows would in turn in changes in water supply availability, recreational opportunities, and salmon populations. Changes in salmon populations would affect ocean salmon fishing as compared to historical conditions prior to the BOs. |
| Alternative 1 with Associated Cumulative Effects Actions in Year 2030 | No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant) | Implementation of Alternative 1 with reasonably foreseeable actions would result in similar agricultural and M&I water supply economics, and similar or improved reservoir recreational opportunities compared to the No Action Alternative with these added actions. |
| Alternative 2 with Associated Cumulative Effects Actions in Year 2030 | Full implementation of the 2008 USFWS BO and 2009 NMFS BO CVP and SWP operational actions<br>No implementation of structural improvements or other actions that require further study to develop a more detailed action description. | Implementation of Alternative 2 with reasonably foreseeable actions for recreational opportunities would be the same as for the No Action Alternative with these added actions. |
| Alternative 3 with Associated Cumulative Effects Actions in Year 2030 | No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant)<br>Slight increase in positive Old and Middle River flows in the winter and spring months<br>Increased bag limits for Striped Bass and Pikeminnow<br>Increased ocean salmon fishing harvest limitations | Implementation of Alternative 3 with reasonably foreseeable actions would result in similar agricultural and M&I water supply economics, and similar or improved reservoir recreational opportunities as for the No Action Alternative with tjese added actions.<br>Recreational opportunities related to Striped Bass fishing would initially be increased; however by 2030 recreational fishing related to Striped Bass would be reduced.<br>Opportunities related to commercial and sport ocean salmon fishing would be reduced. |

| Scenarios | Actions | Cumulative Effects of Actions |
|---|---|---|
| Alternative 4 with Associated Cumulative Effects in Year 2030 | No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant)<br>Increased bag limits for Striped Bass and Pikeminnow<br>Increased ocean salmon fishing harvest limitations | Implementation of Alternative with these reasonably foreseeable actions would result in similar agricultural and M&I water supply economics, and similar or improved reservoir recreational opportunities as for the No Action Alternative with these added actions.<br>Recreational opportunities related to Striped Bass fishing would initially be increased; however by 2030 recreational fishing related to Striped Bass would be reduced.<br>Opportunities related to commercial and sport ocean salmon fishing would be reduced. |
| Alternative 5 with Associated Cumulative Effects in Year 2030 | Full implementation of the 2008 USFWS BO and 2009 NMFS BO<br>Positive Old and Middle River flows and increased Delta outflow in spring months | Implementation of Alternative 5 with reasonably foreseeable actions would result in similar agricultural and M&I water supply economics, and similar reservoir recreational opportunities as for the No Action Alternative with these added actions. |

Chapter 20

# Indian Trust Assets

## 20.1 Introduction

This chapter describes Indian Trust Assets (ITAs) in the study area and potential changes that could occur as a result of implementing the alternatives evaluated in this Environmental Impact Statement (EIS). Implementation of the alternatives could affect ITAs through potential changes to the operation of the Central Valley Project (CVP) and State Water Project (SWP) and ecosystem restoration.

## 20.2 Regulatory Environment and Compliance Requirements

Potential actions that could be implemented under the alternatives evaluated in this EIS could affect ITAs in the areas along the rivers and reservoirs directly impacted by changes in the operation of CVP or SWP reservoirs and in the vicinity of lands served by CVP and SWP water supplies. Actions located on public agency lands, or implemented, funded, or approved by Federal and state agencies, would need to be compliant with appropriate Federal and state agency policies and regulations, as summarized in Chapter 4, Approach to Environmental Analyses.

The Federal Indian Trust Asset policies, summarized below and in Chapter 4, have been used to identify potential areas of change to ITAs that could occur due to changes in long-term operation of the CVP and/or SWP facilities.

The ITAs are legal interests in property held in trust by the U.S. for federally-recognized Indian tribes or individual Indians. An Indian trust has three components: (1) the trustee, (2) the beneficiary, and (3) the trust asset. ITAs can include land, minerals, federally-reserved hunting and fishing rights, federally-reserved water rights, and in-stream flows associated with trust land. Beneficiaries of the Indian trust relationship are federally-recognized Indian tribes with trust land; the U.S. is the trustee. By definition, ITAs cannot be sold, leased, or otherwise encumbered without approval of the U.S. The characterization and application of the U.S. trust relationship have been defined by case law that interprets Congressional acts, executive orders, and historic treaty provisions.

The federal government, through treaty, statute or regulation, may take on specific, enforceable fiduciary obligations that give rise to a trust responsibility to federally recognized tribes and individual Indians possessing trust assets. Courts have recognized an enforceable federal fiduciary duty with respect to federal supervision of Indian money or natural resources, held in trust by the federal government, where specific treaties, statutes or regulations create such a fiduciary duty.

Consistent with President William J. Clinton's 1994 memorandum, "Government-to-Government Relations with Native American Tribal Governments," Bureau of Reclamation (Reclamation) assesses the effect of its programs on tribal trust resources and federally-recognized tribal governments. Reclamation is tasked to actively engage federally-recognized tribal governments and consult with such tribes on government-to-government level when its actions affect ITAs (Federal Register, Vol. 59, No. 85, May 4, 1994, pages 22951-22952). The U.S. Department of the Interior (DOI) Departmental Manual Part 512.2 ascribes the responsibility for ensuring protection of ITAs to the heads of bureaus and offices. DOI is required to carry out activities in a manner that protects ITAs and avoids adverse effects whenever possible.

## 20.3 Affected Environment

The U.S. Government's trust responsibility for Indian resources requires Reclamation and other agencies to take measures to protect and maintain trust resources. These responsibilities include taking reasonable actions to preserve and restore tribal resources.

In compliance with 36 Code of Federal Register 800.4(a) (4), Reclamation sent letters to the federally-recognized Indian tribes in the study area, including most of the tribes listed in Table 20.1, to request their input regarding the identification of any properties to which they might attach religious and cultural significance to within the area of potential effect.

**Table 20.1 Federally Recognized Tribes in the Vicinity of the Study Area**

| Federally Recognized Tribe | EIS Geographical Region | County | In the Vicinity of this Community |
|---|---|---|---|
| Hoopa Valley Tribal Council | Trinity River | Trinity and Humboldt | Hoopa |
| Resighini Rancheria Tribe | Trinity River | Del Norte | Klamath |
| Yurok Tribe of the Yurok Reservation | Trinity River | Trinity, Humboldt, and Del Norte | Klamath |
| Pit River Tribe | Central Valley | Shasta | Burney |
| Redding Rancheria Tribe | Central Valley | Shasta | Redding |
| Paskenta Band of Nomlaki Indians of California | Central Valley | Tehama and Glenn | Corning and Orland |
| Grindstone Indian Rancheria of Wintun-Wailaki Indians of California | Central Valley | Glenn | Elk Creek |

| Federally Recognized Tribe | EIS Geographical Region | County | In the Vicinity of this Community |
|---|---|---|---|
| Cachil Dehe Band of Wintun Indians of the Colusa Indian Community of the Colusa Rancheria | Central Valley | Colusa | Colusa |
| Cortina Indian Rancheria of Wintun Indians of California | Central Valley | Colusa | Williams |
| Tyme Maidu of Berry Creek Rancheria | Central Valley | Butte | Oroville |
| Konkow Maidu of Mooretown Rancheria | Central Valley | Butte | Oroville |
| Enterprise Rancheria of Maidu Indians of California | Central Valley | Butte | Oroville |
| Mechoopda Indian Tribe of Chico Rancheria | Central Valley | Butte | Chico |
| Miwok Maidu United Auburn Indian Community of the Auburn Rancheria | Central Valley | Placer | Placer |
| United Auburn Indian Community of the Auburn Rancheria of California | Central Valley | Placer | Rocklin |
| Shingle Springs Band of Miwok Indians, including Shingle Springs Rancheria | Central Valley | El Dorado and Nevada County | Shingle Springs |
| Buena Vista Rancheria of Me-Wuk | Central Valley | Sacramento | Sacramento |
| Wilton Miwok Indians of the Wilton Rancheria | Central Valley | Sacramento | Elk Grove |
| Yocha Dehe Wintun Nation | Central Valley | Yolo | Brooks |
| Northfork Rancheria of Mono Indians of California | Central Valley | Madera | North Fork |
| Picayune Rancheria of Chukchansi Indians of California | Central Valley | Madera | Coarsegold |
| California Valley Miwok Tribe | Central Valley | San Joaquin | Stockton |
| Big Sandy Rancheria of Mono Indians of California | Central Valley | Fresno | Auberry |

| Federally Recognized Tribe | EIS Geographical Region | County | In the Vicinity of this Community |
|---|---|---|---|
| Table Mountain Rancheria | Central Valley | Fresno | Friant |
| Santa Rosa Indian Community of Santa Rosa Rancheria | Central Valley | Kings | Lemoore |
| Tule River Indian Tribe of the Tule River Reservation of the Yokut Indians | Central Valley | Tulare | Porterville |
| Santa Ynez Band of Chumash Mission Indians of Santa Ynez Reservation | Central Coast | Santa Barbara | Santa Ynez |
| Cahuilla Band of Mission Indians of the Cahuilla Reservation | Southern California | San Diego | Anza |
| Campo Band of Diegueno Mission Indians of the Campo Indian Reservation | Southern California | San Diego | Campo |
| Capitan Grande Band of Diegueno Mission Indians of California (Barona Reservation and Viejas Reservation) | Southern California | San Diego | Alpine |
| Ewiiaapaayp Band of Kumeyaay Indians | Southern California | San Diego | Alpine |
| Iipay Nation of Santa Ysabel | Southern California | San Diego | Santa Ysabel |
| Inaja Band of Diegueno Mission Indians of the Inaja and Cosmit Reservation | Southern California | San Diego | Escondido |
| Jamul Indian Village of California | Southern California | San Diego | Jamul |
| La Jolla Band of Luiseño Indians | Southern California | San Diego | Pauma Valley |
| La Posta Band of Diegueno Mission Indians of the La Posta Indian Reservation | Southern California | San Diego | Boulevard |
| Los Coyotes Band of Cahuilla and Cupeno Indians | Southern California | San Diego | Warner Springs |

| Federally Recognized Tribe | EIS Geographical Region | County | In the Vicinity of this Community |
|---|---|---|---|
| Manzanita Band of Diegueno Mission Indians of the Manzanita Reservation | Southern California | San Diego | Boulevard |
| Mesa Grande Band of Diegueno Mission Indians of the Mesa Grande Reservation | Southern California | San Diego | Santa Ysabel |
| Pala Band of Luiseño Mission Indians of the Pala Reservation | Southern California | San Diego | Pala |
| Pauma Band of Luiseño Mission Indians of the Pauma & Yuima Reservation | Southern California | San Diego | Pauma Valley |
| Rincon Band of Luiseño Mission Indians of the Rincon Reservation | Southern California | San Diego | Valley Center |
| San Pasqual Band of Diegueno Mission Indians of California | Southern California | San Diego | Valley Center |
| Sycuan Band of the Kumeyaay Nation | Southern California | San Diego | El Cajon |
| Agua Caliente Band of Cahuilla Indians of the Agua Caliente Indian Reservation | Southern California | Riverside | Palm Springs |
| Augustine Band of Cahuilla Indians | Southern California | Riverside | Coachella |
| Cabazon Band of Mission Indians | Southern California | Riverside | Indio |
| Morongo Band of Mission Indians | Southern California | Riverside | Banning |
| Pechanga Band of Luiseño Mission Indians of the Pechanga Reservation | Southern California | Riverside | Temecula |
| Ramona Band of Cahuilla | Southern California | Riverside | Anza |
| Santa Rosa Band of Cahuilla Indians | Southern California | Riverside | Mountain Center |
| Soboba Band of Luiseño Indians | Southern California | Riverside | San Jacinto |

| Federally Recognized Tribe | EIS Geographical Region | County | In the Vicinity of this Community |
|---|---|---|---|
| Torres-Martinez Desert Cahuilla Indians | Southern California | Riverside | Thermal |
| Twenty-Nine Palms Band of Mission Indians of California | Southern California | Riverside and San Bernardino | Coachella |
| Chemehuevi Indian Tribe of the Chemehuevi Reservation | Southern California | San Bernardino | Needles |
| San Manuel Band of Mission Indians | Southern California | San Bernardino | Highland |
| Big Lagoon Rancheria | Not within study area | Humboldt | Arcata |
| Blue Lake Rancheria | Not within study area | Humboldt | Blue Lake |
| Karuk Tribe | Not within study area | Siskiyou | Happy Camp |
| Greenville Rancheria of Maidu Indians | Not within study area | Plumas and Tehama | Greenville |
| Susanville Indian Rancheria | Not within study area | Lassen | Susanville |
| Lytton Rancheria | Not within study area | Sonoma | Santa Rosa |
| Chicken Ranch Rancheria of Me-Wuk Indians of California | Not within study area | Tuolumne | Jamestown |
| Cold Springs Rancheria of Mono Indians | Not within study area | Fresno | Tollhouse |
| Colorado River Indian Tribes of the Colorado River Indian Reservation | Not within study area | Riverside | Parker, Arizona |

## 20.4 Impact Analysis

This section describes the potential mechanisms for change to ITAs, quantitative and qualitative analytical methods, effects of the analyses, potential mitigation measures, and cumulative effects.

### 20.4.1 Potential Mechanisms for Change and Analytical Tools

As described in Chapter 4, Approach to Environmental Analysis, the environmental consequences assessment considers changes in conditions related to changes in CVP and SWP operation under the alternatives as compared to the No Action Alternative and Second Basis of Comparison.

Changes in CVP and SWP operation under the alternatives as compared to the No Action Alternative and Second Basis of Comparison could change water elevations within the CVP and SWP reservoirs, flow patterns in the rivers downstream of CVP and SWP reservoirs, and CVP and SWP water deliveries. Impacts to existing ITAs would be considered adverse if the action:

- Interfered with the exercise of a federally reserved water right, or degrade water quality where there is a federally reserved water right
- Interfered with the use, value, occupancy, character or enjoyment of an ITA
- Failed to protect ITAs from loss, damage, waste, depletion, or other negative effects

#### *20.4.1.1 Changes in CVP and SWP Reservoir Elevation*

There are no ITAs within any of the reservoir inundation areas (DWR 2005; Reclamation 2010, 2012, 2013a, 2014a; Reclamation et al. 2011; USACE et al. 2012). Therefore, the changes in reservoir elevations would not affect ITAs and are not analyzed in this EIS.

#### *20.4.1.2 Changes in Rivers Downstream of CVP and SWP Reservoirs*

There are no ITAs within the rivers downstream of CVP and SWP reservoirs (DWR 2005; Reclamation 2010, 2012, 2013a, 2014a; Reclamation et al. 2011; USACE et al. 2012). Therefore, changes in river flow patterns would not directly affect any ITAs. However, changes in river flow patterns in the Trinity River could indirectly affect several ITAs, including the Hoopa Valley Tribe, Resighini Rancheria Tribe, and Yurok Tribe of the Yurok Reservation. Changes in the river flow patterns could affect use of the Trinity River for boats, access to adjacent lands, and fish in the Trinity River that are important to the tribes.

As described in Chapter 5, Surface Water Resources and Water Supplies, implementation of Alternatives 1 through 5 as compared to the No Action Alternative and the Second Basis of Comparison, and the No Action Alternative as compared to the Second Basis of Comparison could affect change river flow patterns in the Trinity River.

#### *20.4.1.3 Changes due to CVP and SWP Water Deliveries*

There are no ITAs that directly receive CVP or SWP water. As described in Chapter 19, Socioeconomics, municipalities that use CVP or SWP water supplies, including agencies that serve ITAs, would continue to meet water demands in 2030 if CVP and SWP water supplies are reduced through the increased use of non-CVP and SWP water supplies. Therefore, changes in CVP and SWP water deliveries would not affect water supplies to ITAs and are not analyzed in this EIS.

#### *20.4.1.4 Effects Related to Cross Delta Water Transfers*

Cross Delta water transfers involving the CVP and SWP facilities or water supplies would be required to be implemented in accordance with all existing regulations and requirements, including not causing adverse impacts to other water users in accordance with the requirements of Reclamation, California Department of Water Resources (DWR), and the State Water Resources Control Board (SWRCB).

Reclamation recently prepared a long-term regional water transfer environmental document which evaluated potential changes in surface water conditions related to water transfer actions (Reclamation 2014d). Results from this analysis were used to inform the impact assessment of potential effects of water transfers under the alternatives as compared to the No Action Alternative and the Second Basis of Comparison.

The transfers could change flow patterns in rivers downstream of CVP and SWP reservoirs. Surface water elevations in CVP and SWP reservoirs due to transfer programs under the alternatives and Second Basis of Comparison could be affected for a short-time during a water year; however, because the transferred water would have been released for the seller's use, the end of September storage elevations would be similar with or without the transfer.

### 20.4.2 Conditions in Year 2030 without Implementation of Alternatives 1 through 5

The impact analysis in this EIS is based upon the comparison of the alternatives to the No Action Alternative and the Second Basis of Comparison in the Year 2030. Many of the changed conditions would occur in the same manner under both the No Action Alternative and the Second Basis of Comparison (e.g., climate change, sea-level rise, general plan development, and implementation of reasonable and foreseeable projects). Due to these changes, especially climate change and sea-level rise, it is anticipated that reservoir elevations at the end of September would be lower and flows patterns in the rivers downstream of the reservoirs would be different than under recent condition, as described in Chapter 5, Surface Water Resources and Water Supplies.

### 20.4.3 Evaluation of Alternatives

As described in Chapter 4, Approach to Environmental Analysis, Alternatives 1 through 5 have been compared to the No Action Alternative, and the No Action Alternative and Alternatives 1 through 5 have been compared to the Second Basis of Comparison. The evaluation of alternatives is focused on the Trinity River Region because, as discussed above, potential changes that could affect ITAs are located along the Trinity River.

During review of the numerical modeling analyses used in this EIS, an error was determined in the CalSim II model assumptions related to the Stanislaus River operation for the Second Basis of Comparison, Alternative 1, and Alternative 4 model runs. Appendix 5C includes a comparison of the CalSim II model run results presented in this chapter and CalSim II model run results with the error corrected. Appendix 5C also includes a discussion of changes in the comparison of four alternative analyses:

- No Action Alternative compared to the Second Basis of Comparison
- Alternative 1 compared to the No Action Alternative
- Alternative 3 compared to the Second Basis of Comparison
- Alternative 5 compared to the Second Basis of Comparison

#### *20.4.3.1 No Action Alternative*

As described in Chapter 4, Approach to Environmental Analysis, the No Action Alternative is compared to the Second Basis of Comparison.

##### 20.4.3.1.1 Potential Changes in Trinity River downstream of Lewiston Dam

As described in Chapter 5, Surface Water Resources and Water Supplies, the following changes would occur on the Trinity River under the No Action Alternative as compared to the Second Basis of Comparison.

- Over long-term conditions (over the 82-year analysis period), flows would be similar (within 5 percent) from March through November, and reduced from December through February (up to 9.5 percent; 70 cubic feet per second [cfs]).
- In wet years, flows would be similar from April through November, and reduced from December through March (up to 11.2 percent; 160 cfs).
- In above normal years, flows would be similar from March through November, and reduced in January and February (up to 19.9 percent; 74 cfs).
- In below normal years, flows would be similar from March through January, and reduced in February (30.4 percent, 192 cfs).
- In dry and Critical dry years, flows would be similar all months.

The changes in river flows would occur in the winter months of wetter years when potential use of the rivers would be less for transportation and ceremonies (USFWS et al. 1999). As described in Chapter 9, Fish and Aquatic Resources, these changes in river flows would result in similar conditions for salmonids using Trinity River. Therefore, there would be no effect the ITAs.

##### 20.4.3.1.2 Effects Related to Cross Delta Water Transfers

As described in Chapter 5, Surface Water Resources and Water Supplies, and Chapter 7, Groundwater Resources and Groundwater Quality, potential effects on surface water resources could be similar to those identified in a recent environmental analysis conducted by Reclamation for long-term water transfers from the Sacramento Valley to San Joaquin Valley (Reclamation 2014d). Potential effects were identified as reduced surface water storage in upstream reservoirs; changes in flow patterns in rivers downstream of the reservoirs if water was released from the reservoirs in patterns that were different than would have been used by the sellers; and groundwater elevation reductions if groundwater substitution was used to provide the water for the transfers. All water transfers would be required to avoid adverse impacts on other water users and biological resources; and water transfer programs would include groundwater mitigation and monitoring plans (see Section 3.A.6.3, Transfers). Therefore, water transfer programs would need to be implemented in a manner that would avoid impacts associated with changes in Trinity Lake storage, Trinity River flow patterns, and groundwater elevation reductions in the Central Valley that could affect ITAs. For the purposes of this EIS, it is anticipated that similar conditions would occur due to cross Delta water transfers under the No Action Alternative as compared to the Second Basis of Comparison, and there would be no effect on the ITAs due to cross Delta water transfers.

### *20.4.3.2 Alternative 1*

Alternative 1 is identical to the Second Basis of Comparison. Alternative 1 is compared to the No Action Alternative and the Second Basis of Comparison. However, because conditions under Alternative 1 are identical to conditions under the Second Basis of Comparison, Alternative 1 is only compared to the No Action Alternative.

#### 20.4.3.2.1 Alternative 1 Compared to the No Action Alternative

*Potential Changes in Trinity River downstream of Lewiston Dam*

As described in Chapter 5, Surface Water Resources and Water Supplies, the following changes would occur on the Trinity River under Alternative 1 and the No Action Alternative.

- Over long-term conditions, flows would be similar from March through November, and increased from December through February (up to 10.5 percent, 86 cfs).
- In wet years, flows would be similar from April through November, and increased from December through March (up to 12.6 percent, 160 cfs).
- In above normal years, flows would be similar from March through November, and increased in January and February (up to 24.8 percent; 74 cfs).
- In below normal years, flows would be similar from March through January, and increased in February (30.4 percent, 192 cfs).
- In dry and critical dry years, flows would be similar all months.

The changes in river flows would increase flows in the Trinity River under Alternative 1 as compared to the No Action Alternative. As described in Chapter 9, Fish and Aquatic Resources, these changes in river flows would result in similar conditions for salmonids using Trinity River. Therefore, there would be no effect on the ITAs.

*Effects Related to Cross Delta Water Transfers*

As described in Chapter 5, Surface Water Resources and Water Supplies, and Chapter 7, Groundwater Resources and Groundwater Quality, potential effects on surface water resources could be similar to those identified in a recent environmental analysis conducted by Reclamation for long-term water transfers from the Sacramento to San Joaquin valleys (Reclamation 2014d). Potential effects were identified as reduced surface water storage in upstream reservoirs; changes in flow patterns in rivers downstream of the reservoirs if water was released from the reservoirs in patterns that were different than would have been used by the seller; and groundwater elevation reductions if groundwater substitution was used to provide the water for the transfers. All water transfers would be required to avoid adverse impacts on other water users and biological resources; and water transfer programs would include groundwater mitigation and monitoring plans (see Section 3.A.6.3, Transfers). Therefore, water transfer programs would need to be implemented in a manner that would avoid impacts associated with changes in Trinity Lake storage, Trinity River flow patterns, and groundwater elevation reductions in the Central Valley that could affect ITAs. For the purposes of this EIS, it is anticipated that similar conditions would occur due to cross Delta water transfers under Alternative 1 as compared to the No Action Alternative, and there would be no effect on the ITAs due to cross Delta water transfers.

#### 20.4.3.2.2 Alternative 1 Compared to the Second Basis of Comparison

Alternative 1 is identical to the Second Basis of Comparison.

### *20.4.3.3 Alternative 2*

The ITA conditions under Alternative 2 would be identical to the conditions under the No Action Alternative; therefore, Alternative 2 is only compared to the Second Basis of Comparison.

#### 20.4.3.3.1 Alternative 2 Compared to the Second Basis of Comparison

Changes to ITAs under Alternative 2 as compared to the Second Basis of Comparison would be the same as the impacts described in Section 20.4.3.1, No Action Alternative.

### *20.4.3.4 Alternative 3*

CVP and SWP operation under Alternative 3 are similar to the Second Basis of Comparison with modified Old and Middle River flow criteria and New Melones Reservoir operation.

Alternative 3 would include changed water demands for American River water supplies as compared to the No Action Alternative and Second Basis of Comparison. Alternative 3 would provide water supplies of up to 17 thousand acre feet (TAF)/year under a Warren Act Contract for El Dorado Irrigation District and 15 TAF/year under a CVP water service contract for El Dorado County Water Agency. These demands are not included in the analysis presented in this section of the EIS. A sensitivity analysis comparing the results of the analysis with and without these demands is presented in Appendix 5B of this EIS.

#### 20.4.3.4.1 Alternative 3 Compared to the No Action Alternative

*Potential Changes in Trinity River downstream of Lewiston Dam*

As described in Chapter 5, Surface Water Resources and Water Supplies, the following changes would occur on the Trinity River under Alternative 3 as compared to the No Action Alternative.

- Over long-term conditions, flows would be similar from March through November, and increased from December through February (up to 11.8 percent, 79 cfs).
- In wet years, flows would be similar from April through October, reduced in November (7.0 percent, 36 cfs), and increased from December through March (up to 15.0 percent, 193 cfs).
- In above normal years, flows would be similar from March through November, and increased in January and February (up to 24.8 percent; 74 cfs).
- In dry years, flows would be similar in all months.

However, as described in Chapter 9, Fish and Aquatic Resources, these changes in river flows would result in similar conditions for salmonids using Trinity River, and there would be no effect on the ITAs.

- In above normal years, flows would be similar from March through December, and increased in January and February (up to 22.5 percent; 67 cfs).
- In below normal years, flows would be similar from March through January, and increased in February (43.3 percent, 192 cfs).
- In dry years, flows would be similar all months.
- In Critical dry years, flows would be similar from December through October, and increased in November (20.0 percent, 50 cfs).

The changes in river flows would increase flows in the Trinity River under Alternative 3 as compared to the No Action Alternative. As described in Chapter 9, Fish and Aquatic Resources, these changes in river flows would result in similar conditions for salmonids using Trinity River. Therefore, there would be no effect on the ITAs.

*Effects Related to Cross Delta Water Transfers*

As described in Chapter 5, Surface Water Resources and Water Supplies, and Chapter 7, Groundwater Resources and Groundwater Quality, potential effects on surface water resources could be similar to those identified in a recent environmental analysis conducted by Reclamation for long-term water transfers from the Sacramento to San Joaquin valleys (Reclamation 2014d). Potential effects were identified as: reduced surface water storage in upstream reservoirs; changes in flow patterns in river downstream of the reservoirs if water was released from the reservoirs in patterns that were different than would have been used by the sellers; and groundwater elevation reductions if groundwater substitution was used to provide the water for the transfers. All water transfers would be required to avoid adverse impacts on other water users and biological resources; and water transfer programs would include groundwater mitigation and monitoring plans (see Section 3.A.6.3, Transfers). Therefore, water transfer programs would need to be implemented in a manner that would avoid impacts associated with changes in Trinity Lake storage, Trinity River flow patterns, and groundwater elevation reductions in the Central Valley that could affect ITAs. For the purposes of this EIS, it is anticipated that similar conditions would occur due to cross Delta water transfers under Alternative 3 as compared to the No Action Alternative, and there would be no effect on the ITAs due to cross Delta water transfers.

##### 20.4.3.4.2 Alternative 3 Compared to the Second Basis of Comparison

*Potential Changes in Trinity River downstream of Lewiston Dam*

As described in Chapter 5, Surface Water Resources and Water Supplies, under Alternative 3 as compared to the Second Basis of Comparison, flows would be similar under long-term conditions and all water year types. As described in Chapter 9, Fish and Aquatic Resources, there would be similar conditions for salmonids using Trinity River. Therefore, there would be no effect on the ITAs.

*Effects Related to Cross Delta Water Transfers*

As described in Chapter 5, Surface Water Resources and Water Supplies, and Chapter 7, Groundwater Resources and Groundwater Quality, potential effects on surface water resources could be similar to those identified in a recent environmental analysis conducted by Reclamation for long-term water transfers from the Sacramento to San Joaquin valleys (Reclamation 2014d). Potential effects were identified as: reduced surface water storage in upstream reservoirs; changes in flow patterns in river downstream of the reservoirs if water was released from the reservoirs in patterns that were different than would have been used by the sellers; and groundwater elevation reductions if groundwater substitution was used to provide the water for the transfers. All water transfers would be required to avoid adverse impacts on other water users and biological resources; and water transfer programs would include groundwater mitigation and monitoring plans (see Section 3.A.6.3, Transfers). Therefore, water transfer programs would need to be implemented in a manner that would avoid impacts associated with changes in Trinity Lake storage, Trinity River flow patterns, and groundwater elevation reductions in the Central Valley that could affect ITAs. For the purposes of this EIS, it is anticipated that similar conditions would occur due to cross Delta water transfers under Alternative 3 as compared to the Second Basis of Comparison, and there would be no effect on the ITAs due to cross Delta water transfers.

#### *20.4.3.5 Alternative 4*

The ITA conditions under Alternative 4 would be identical to the ITA conditions under the Second Basis of Comparison; therefore, Alternative 4 is only compared to the No Action Alternative.

#### 20.4.3.5.1 Alternative 4 Compared to the No Action Alternative

Changes in ITA conditions under Alternative 4 as compared to the No Action Alternative would be the same as the impacts described in Section 20.4.3.2.1, Alternative 1 Compared to the No Action Alternative.

### *20.4.3.6 Alternative 5*

The CVP and SWP operation under Alternative 5 are similar to the No Action Alternative with modified Old and Middle River flow criteria and New Melones Reservoir operation. Alternative 5 would include changed water demands for American River water supplies as compared to the No Action Alternative or Second Basis of Comparison. Alternative 5 would provide water supplies of up to 17 TAF/year under a Warren Act Contract for El Dorado Irrigation District and 15 TAF/year under a CVP water service contract for El Dorado County Water Agency. These demands are not included in the analysis presented in this section of the EIS. A sensitivity analysis comparing the results of the analysis with and without these demands is presented in Appendix 5B of this EIS.

#### 20.4.3.6.1 Alternative 5 Compared to the No Action Alternative

*Potential Changes in Trinity River downstream of Lewiston Dam*

As described in Chapter 5, Surface Water Resources and Water Supplies, flows under Alternative 5 and the No Action Alternative would be similar under long-term conditions and all water year types. As described in Chapter 9, Fish and Aquatic Resources, there would be similar conditions for salmonids using Trinity River. Therefore, there would be no effect on the ITAs.

*Effects Related to Cross Delta Water Transfers*

As described in Chapter 5, Surface Water Resources and Water Supplies, and Chapter 7, Groundwater Resources and Groundwater Quality, potential effects on surface water resources could be similar to those identified in a recent environmental analysis conducted by Reclamation for long-term water transfers from the Sacramento to San Joaquin valleys (Reclamation 2014d). Potential effects were identified as: reduced surface water storage in upstream reservoirs; changes in flow patterns in river downstream of the reservoirs if water was released from the reservoirs in patterns that were different than would have been used by the sellers; and groundwater elevation reductions if groundwater substitution was used to provide the water for the transfers. All water transfers would be required to avoid adverse impacts on other water users and biological resources; and water transfer programs would include groundwater mitigation and monitoring plans (see Section 3.A.6.3, Transfers). Therefore, water transfer programs would need to be implemented in a manner that would avoid impacts associated with changes in Trinity Lake storage, Trinity River flow patterns, and groundwater elevation reductions in the Central Valley that could affect ITAs. For the purposes of this EIS, it is anticipated that similar conditions would occur due to cross Delta water transfers under Alternative 5 as compared to the No Action Alternative, and there would be no effect on the ITAs due to cross Delta water transfers.

#### 20.4.3.6.2 Alternative 5 Compared to the Second Basis of Comparison

*Potential Changes in Trinity River downstream of Lewiston Dam*

As described in Chapter 5, Surface Water Resources and Water Supplies, the following changes would occur on the Trinity River flows under Alternative 5 and Second Basis of Comparison

- Over long-term conditions, flows would be similar from March through November and January, and reduced in December and February (up to 9.6 percent, 200 cfs).
- In wet years, flows would be similar from April through November, and reduced in December through March (up to 13.9 percent).
- In above normal years, flows would be similar from April through December, and reduced in January and February (up to 19.9 percent, 74 cfs).
- In below normal years, flows would be similar from March through January, and reduced in February (up to 21.5 percent, 135 cfs).
- In dry and critical dry years, flows would be similar in all months.

However, as described in Chapter 9, Fish and Aquatic Resources, these changes in river flows would result in similar conditions for salmonids using Trinity River; and there would be no effect the ITAs.

*Effects Related to Cross Delta Water Transfers*

As described in Chapter 5, Surface Water Resources and Water Supplies, and Chapter 7, Groundwater Resources and Groundwater Quality, potential effects on surface water resources could be similar to those identified in a recent environmental analysis conducted by Reclamation for long-term water transfers from the Sacramento to San Joaquin valleys (Reclamation 2014d). Potential effects were identified as reduced surface water storage in upstream reservoirs and changes in flow patterns in river downstream of the reservoirs if water was released from the reservoirs in patterns that were different than would have been used by the water seller's; and groundwater elevation reductions if groundwater substitution was used to provide the water for the transfers. All water transfers would be required to avoid adverse impacts on other water users and biological resources; and water transfer programs would include groundwater mitigation and monitoring plans (see Section 3.A.6.3, Transfers). Therefore, water transfer programs would need to be implemented in a manner that would avoid impacts associated with changes in Trinity Lake storage, Trinity River flow patterns, and groundwater elevation reductions in the Central Valley that could affect ITAs. For the purposes of this EIS, it is anticipated that similar conditions would occur due to cross Delta water transfers under Alternative 5 as compared to the Second Basis of Comparison, and there would be no effect on the ITAs due to cross Delta water transfers.

#### 20.4.3.7 Summary of Impact Analysis

The results of the impact analysis of implementation of Alternatives 1 through 5 as compared to the No Action Alternative and the Second Basis of Comparison are presented in Tables 20.2 and 20.3.

**Table 20.2 Comparison of Alternatives 1 through 5 to No Action Alternative**

| Alternative | Potential Change | Consideration for Mitigation Measures |
|---|---|---|
| Alternative 1 | No effects to ITAs | None needed |
| Alternative 2 | No effects to ITAs | None needed |
| Alternative 3 | No effects to ITAs | None needed |
| Alternative 4 | No effects to ITAs | None needed |
| Alternative 5 | No effects to ITAs | None needed |

**Table 20.3 Comparison of No Action Alternative and Alternatives 1 through 5 to Second Basis of Comparison**

| Alternative | Potential Change | Consideration for Mitigation Measures |
|---|---|---|
| No Action Alternative | No effects to ITAs | None needed |
| Alternative 1 | No effects to ITAs | None needed |
| Alternative 2 | No effects to ITAs | None needed |
| Alternative 3 | No effects to ITAs | None needed |
| Alternative 4 | No effects to ITAs | None needed |
| Alternative 5 | No effects to ITAs | None needed |

#### 20.4.3.8 Potential Mitigation Measures

Mitigation measures are presented in this section to avoid, minimize, rectify, reduce, eliminate, or compensate for adverse environmental effects of Alternatives 1 through 5 as compared to the No Action Alternative. Mitigation measures were not included to address adverse impacts under the alternatives as compared to the Second Basis of Comparison because this analysis was included in this EIS for information purposes only.

Changes under Alternatives 1 through 5 as compared to the No Action Alternative would result in similar or increased flows in the Trinity River, and implementation of cross Delta water transfers would not result in adverse impacts to ITAs. Therefore, there would be no adverse impacts to ITAs, and no mitigation measures are needed.

#### 20.4.3.9 Cumulative Effects Analysis

As described in Chapter 3, the cumulative effects analysis considers projects, programs, and policies that are not speculative, and are based upon known or reasonably foreseeable long-range plans, regulations, operating agreements, or other information that establishes them as reasonably foreseeable.

The cumulative effects analysis for Alternatives 1 through 5 to Indian Trust Assets are summarized in Table 20.4. As described in this chapter, potential changes to Indian Trust Assets would be associated with changes in flows in the Trinity River.

**Table 20.4 Summary of Cumulative Effects on Indian Trust Assets with Implementation of Alternatives 1 through 5 as Compared to the No Action Alternative**

| Scenarios | Actions | Cumulative Effects of Actions |
|---|---|---|
| Past & Present, and Future Actions included in the No Action Alternative and All Alternatives in Year 2030 | Consistent with Affected Environment conditions plus:<br>Actions in the 2008 USFWS BO and 2009 NMFS BO that would have occurred without implementation of the BOs, as described in Section 3.3.1.2 (of Chapter 3, Descriptions of Alternatives), including climate change and sea level rise<br>Actions not included in the 2008 USFWS BO and 2009 NMFS BO that would have occurred without implementation of the BOs, as described in Section 3.3.1.3 (of Chapter 3, Descriptions of Alternatives):<br>- Trinity River Restoration Program.<br>- Central Valley Project Improvement Act programs | <u>These effects would be the same under all alternatives.</u><br>Climate change and sea level rise are anticipated to reduce carryover storage in reservoirs, including Trinity Lake, and changes in stream flow patterns, including Trinity River, in a manner that would change beneficial use of the Trinity River, including salmon fishing.<br>Other ongoing actions, including Trinity River Restoration Program, would improve water quality and/or habitat along the Trinity River. |
| Future Actions considered as Cumulative Effects Actions in All Alternatives in Year 2030 | Actions as described in Section 3.5 (of Chapter 3, Descriptions of Alternatives):<br>- Bay-Delta Water Quality Control Plan Update<br>- FERC Relicensing Projects<br>- Bay Delta Conservation Plan (including the California WaterFix alternative)<br>- Shasta Lake Water Resources, North-of-the-Delta Offstream Storage, Los Vaqueros Reservoir Expansion Phase 2, and Upper San Joaquin River Basin Storage Investigations<br>- El Dorado Water and Power Authority Supplemental Water Rights Project<br>- Semitropic Water Storage District Delta Wetlands<br>- North Bay Aqueduct Alternative Intake | <u>These effects would be the same under all alternatives.</u><br>Based upon environmental documents prepared for these programs, changes to the Trinity River flows are not anticipated due to implementation of these programs. |

| Scenarios | Actions | Cumulative Effects of Actions |
|---|---|---|
| No Action Alternative with Associated Cumulative Effects Actions in Year 2030 | Full implementation of the 2008 USFWS BO and 2009 NMFS BO | Implementation of No Action Alternative with reasonably foreseeable actions would result in changes Trinity Lake carryover storage and Trinity River flows which would result in changes to beneficial use opportunities for Indian Trust Assets as compared to historical conditions prior to the BOs. |
| Alternative 1 with Associated Cumulative Effects Actions in Year 2030 | No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant) | Implementation of Alternative 1 with reasonably foreseeable actions would result in similar conditions for Indian Trust Assets as for the No Action Alternative with the added actions. |
| Alternative 2 with Associated Cumulative Effects Actions in Year 2030 | Full implementation of the 2008 USFWS BO and 2009 NMFS BO CVP and SWP operational actions<br>No implementation of structural improvements or other actions that require further study to develop a more detailed action description. | Implementation of Alternative 2 with reasonably foreseeable actions would result in similar conditions for Indian Trust Assets as for the No Action Alternative with the added actions. |
| Alternative 3 with Associated Cumulative Effects Actions in Year 2030 | No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant)<br>Slight increase in positive Old and Middle River flows in the winter and spring months | Implementation of Alternative 3 with reasonably foreseeable actions would result in similar conditions for Indian Trust Assets as for the No Action Alternative with the added actions. |
| Alternative 4 with Associated Cumulative Effects Actions in Year 2030 | No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant) | Implementation of Alternative 4 with reasonably foreseeable actions would result in similar conditions for Indian Trust Assets as for the No Action Alternative with the added actions. |
| Alternative 5 with Associated Cumulative Effects Actions in Year 20530 | Full implementation of the 2008 USFWS BO and 2009 NMFS BO<br>Positive Old and Middle River flows and increased Delta outflow in spring months | Implementation of Alternative 5 with reasonably foreseeable actions would result in similar conditions for Indian Trust Assets as for the No Action Alternative with the added actions. |

# Environmental Justice

## 21.1 Introduction

This chapter describes the presence of environmental justice populations in the study area and potential changes that could have disproportionately high and adverse human health or environmental effects on minority and/or low-income populations as a result of implementing the alternatives evaluated in this Environmental Impact Statement (EIS). Implementation of the alternatives could affect conditions through potential changes in operation of the Central Valley Project (CVP) and State Water Project (SWP) and ecosystem restoration.

## 21.2 Regulatory Environment and Compliance Requirements

This chapter was prepared in compliance with Presidential Executive Order 12898, *Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations*, dated February 11, 1994 and Title VI of the Civil Rights Act of 1964.

Potential actions that could be implemented under the alternatives evaluated in this EIS could have disproportionately high and adverse human health or environmental effects on minority and/or low-income populations. Actions located on public agency lands; or implemented, funded, or approved by Federal and state agencies would need to be compliant with appropriate Federal and state agency policies and regulations, as summarized in Chapter 4, Approach to Environmental Analyses.

## 21.3 Affected Environment

This section describes changes that could result in disproportionately high and adverse human health or environmental effects on minority and/or low-income populations due to changes in CVP and SWP operations. The conditions described in this chapter are related to the distribution of minority populations and populations below poverty levels.

### 21.3.1 Area of Analysis

A summary of conditions are described in this section of the EIS for the following regions that could be affected by implementation of alternatives analyzed in this EIS, as described in Chapter 4, Approach to Environmental Analysis.

- Trinity River Region
- Central Valley Region

- San Francisco Bay Area Region
- Central Coast Region
- Southern California Region

### 21.3.2 Characterization of Conditions Considered in the Environmental Justice Analysis

Characterization of the conditions within the Study Area is based upon publically available data from government websites and other data sources. The data sources used include the 2010 U.S. Census Bureau data on minority populations and the 2010 American Community Survey (ACS) 5-year population estimates on populations below the poverty level.

#### *21.3.2.1 Determination of Minority Populations*

The U.S. Census Bureau provides a total population value for each county, which are also used by the State Department of Finance, as presented in Chapter 14, Socioeconomics. The U.S. Census Bureau also provides a definition of minority and low income populations. Minority populations are defined by the U.S. Census as racial and ethnic minorities. Racial minorities, as defined by the U.S. Census, include people who identified themselves in the census as belonging to one of the following categories:

- Single Race
  - Black/African American
  - American Indian and Alaskan Native
  - Asian
  - Native Hawaiian and Other Pacific Islander
  - Some Other Race
- Two or More Races (inclusive the races listed above and White).

Ethnic minorities, as defined by the U.S. Census, include individuals who identified themselves as being of Hispanic or Latino origin by responding to one of the following categories in the census:

- Mexican
- Mexican American
- Chicano
- Puerto Rican
- Cuban
- Other Spanish/Hispanic/Latino

Individuals who identified themselves of Hispanic or Latino origin maybe of one or more races according to the U.S. Census.

#### *21.3.2.2 Determination of Populations below the Poverty Level*

Populations below the Federal poverty level can be identified using several methodologies. The information presented in this chapter has been developed in ACS reports by the U.S. Census Bureau based upon 48 different sets of dollar value thresholds related to family size and ages. The poverty level is assigned at the family-level and affects every member of the family. The thresholds are consistent throughout the United States and do not consider geographic differentials. The thresholds are updated each year based on the Consumer Price Index. For the five-year ACS reporting period used in this chapter, separate thresholds are applied to each year in this continuous survey. Other federal agencies rely upon different poverty statistics including the Current Population Survey Annual Social and Economic Supplement and the U.S. Department of Health and Human Services poverty guidelines.

The population for whom poverty level is estimated by ACS is smaller value than the total population values presented in Chapter 14, Socioeconomics, for each county and the equivalent population values used for the distribution of the population by race and ethnicity. The population values to determine poverty rates do not include institutionalized individuals (e.g., military personnel that live in group quarters, students that live in college dormitories, and prison inmates. The U.S. Census Bureau designates geographical areas with poverty rates at and above 20 percent as “poverty areas.”

#### *21.3.2.3 Social Services*

The need for and delivery of social services within each county is another indication of social conditions, including Federal grants to the state and local agencies for Medicaid, other health related activities, and nutrition and family welfare; and Federal direct payments made to individuals under the CalFresh (previously referred to as “Food Stamps”) and supplemental social security income.

#### *21.3.2.4 Limited English Proficiency*

Another consideration related to environmental justice is the ability of the Federal government to provide access to federally conducted and assisted programs and activities to all people who, as a result of their national origin, are limited in their English proficiency (LEP). These individuals are not able to speak, read, write, or understand the English language at a level that permits them to interact effectively with Federal employees who provide Federal services. Therefore, these individuals are often excluded from Federal programs, do not receive all available Federal services, and/or experience delays when interacting with Federal programs. The Executive Order 13166 became effective on August 11, 2000 to ensure meaningful participation by individuals who have limited English proficiency in federally conducted and federally assisted programs and activities. This information is compiled and reported by the U.S. Census Bureau.

### 21.3.3 Trinity River Region

The Trinity River Region includes the area in Trinity County along the Trinity River from Trinity Lake to the confluence with the Klamath River; and in Humboldt and Del Norte counties along the Lower Klamath River from the confluence with the Trinity River to the Pacific Ocean. Tribal lands along the Trinity or Lower Klamath River within the Trinity River Region include the

Hoopa Valley Indian Reservation, Yurok Indian Reservation, and Resighini Rancheria.

#### 21.3.3.1 Minority Populations

As recorded in the 2010 Census, the Trinity River Region had a total population of 177,019 (U.S. Census 2014a). About 24.3 percent of this population identified themselves as a racial minority and/or of Hispanic or Latino origin, regardless of race, as presented in Table 21.1 (U.S. Census 2014a, 2014b, 2014c, 2014d). There are fewer minorities in the Trinity River Region than in the entire State of California.

#### 21.3.3.2 Poverty Levels

Poverty levels presented in Table 21.2 are calculated on a subset of the total population of a county, as described above in section 21.3.2, Characterization of Conditions Considered in the Environmental Justice Analysis. Of the total population for whom poverty is determined in the Trinity River Region, 167,987 individuals (or 18.2 percent) were below the poverty level based on the 2006–2010 ACS 5-year dataset (U.S. Census 2014e). The U.S. Census Bureau defines geographical areas with more than 20 percent of the population below the poverty level as a “poverty areas.” Both Humboldt and Del Norte counties are defined as poverty areas.

Poverty rates based upon the 2000 census were reported as 40 percent for Indians on the Yurok Indian Reservation, 34 percent of the Indians on the Hoopa Valley Indian Reservation, and 54 percent of the Indians on and off Karuk Reservation trust lands (NMFS 2012a, 2012b, 2012c). The Yurok Tribe has reported an average poverty rate of 80 percent of the Indians on the Yurok Indian Reservation (Yurok Tribe 2014a). Average per capita income of residents on the Resighini Rancheria (not limited to Resighini Rancheria members) in 1999 was reported to be approximately 46 percent of the average per capita income in Del Norte County (NMFS 2012d).

#### 21.3.3.3 Social Services

Federal grants to the state and local agencies for Medicaid, other health related activities, and nutrition and family welfare; and Federal direct payments made to individuals under the CalFresh (previously referred to as “Food Stamps”) and supplemental social security income within counties in the Trinity River Region are summarized in Table 21.3.

Social services to tribal members are funded by the tribe and/or the federal government (DOI and DFG 2012). The Hoopa Valley Tribe provides food distribution and other social services, including Temporary Assistance for Needy Families (TANF) which receives some assistance from Humboldt County social services to provide cash assistance, utility billing assistance, childcare, educational assistance, job development, substance abuse assistance, and family assistance (Hoopa Tribe 2014 a, 2014b). The Yurok Tribe provides a wide range of services, including general assistance, food distribution, Indian Child welfare, low income energy assistance, Yurok Youth Program, emergency and temporary assistance, and Yurok Domestic Violence/Sexual Assault Project (Yurok Tribe 2014b).

#### *21.3.3.4 Limited English Proficiency*

The percent of the population that speaks English and other languages at home and the percent of the population that speak English “less than very well” based on the language they speak at home are presented in Tables 21.4 and 21.5.

### 21.3.4 Central Valley Region

The Central Valley Region includes the Sacramento Valley, San Joaquin Valley, and Delta and Suisun Marsh subregions.

#### *21.3.4.1 Sacramento Valley*

The Sacramento Valley includes the counties of Shasta, Plumas, Tehama, Glenn, Colusa, Butte, Sutter, Yuba, Nevada, Placer, and El Dorado counties. Sacramento, Yolo, and Solano counties also are located within the Sacramento Valley; however, these counties are discussed below as part of the Delta and Suisun Marsh subsection. Other counties in this region are not anticipated to be affected by changes in CVP and SWP operations, and are not discussed here, including: Alpine, Sierra, Lassen, and Amador counties.

##### 21.3.4.1.1 Minority Populations

As recorded in the 2010 U.S. Census, the Sacramento Valley portion of the Central Valley Region had a total population of 1,325,380 in 2010. About 25.8 percent of this population identified themselves as a racial minority and/or of Hispanic or Latino origin, regardless of race, as presented in Table 21.6. The table also shows the minority population distribution for the entire Central Valley Region and the State of California.

**Table 21.1 Minority Population Distribution in Trinity River Region in 2010**

| Areas | Total Population | Races | | | | | | | Hispanic or Latino Origin | Total Minority[a] |
|---|---|---|---|---|---|---|---|---|---|---|

Sources: U.S. Census 2014a, 2014g, 2014h, 2014i, 2014j, 2014k, 2014l, 2014m, 2014n, 2014o, 2014p, 2014q

Note:

a. Total Minority is an aggregation of all non-white racial groups and includes all individuals of Hispanic or Latino origin, regardless of race.

#### 21.3.4.1.2 Poverty Levels

Poverty levels presented in Table 21.7 are calculated on a subset of the total population of a county, as described above in section 21.3.2, Characterization of Conditions Considered in the Environmental Justice Analysis. Of the total population for whom poverty status is determined within the Sacramento Valley portion of the Central Valley Region, 1,288,594 individuals, 12.6 percent were below the poverty level based on the 2006–2010 ACS 5-year dataset (U.S. Census 2014e).

The U.S. Census Bureau defines geographical areas with more than 20 percent of the population below the poverty level as a "poverty areas." There are no counties in this area defined as poverty areas; although, 20 percent of the populations in Tehama and Yuba counties are below the poverty level.

#### 21.3.4.1.3 Social Services

Federal grants to the state and local agencies for Medicaid, other health related activities, and nutrition and family welfare; and Federal direct payments made to individuals under the CalFresh and supplemental social security income within counties in the Sacramento Valley portion of the Central Valley Region are summarized in Table 21.8.

#### 21.3.4.1.4 Limited English Proficiency

The percent of the population that speaks English and other languages at home and the percent of the population that speak English "less than very well" based on the language they speak at home are presented in Tables 21.9 and 21.10.

### *21.3.4.2 San Joaquin Valley*

The San Joaquin Valley includes the counties of Stanislaus, Merced, Madera, Fresno, Kings, Tulare, and Kern counties. San Joaquin County also is located within the San Joaquin Valley; however, this county is discussed below as part of the Delta and Suisun Marsh subsection. Other counties in this region are not anticipated to be affected by changes in CVP and SWP operations, and are not discussed here, including: Calaveras, Mariposa, and Tuolumne counties.

#### 21.3.4.2.1 Minority Populations

As recorded in the 2010 U.S. Census, the San Joaquin Valley portion of the Central Valley Region had a total population of 3,286,353 in 2010. About 63.3 percent of this population identified themselves as a racial minority and/or of Hispanic or Latino origin, regardless of race, as presented in Table 21.11. The table also shows the minority population distribution for the entire Central Valley Region and the State of California.

**Table 21.7 Population below Poverty Level in the Central Valley Region–Sacramento Valley, 2006–2010**

| Areas | Total Population[a] | Population Below Poverty Level | Percent of Population Below Poverty Level |

Sources: U.S. Census 2014a, 2014r, 2014s, 2014t, 2014u, 2014v, 2014w, 2014x

Note:

a. Total Minority is an aggregation of all non-white racial groups and includes all individuals of Hispanic or Latino origin, regardless of race.

#### 21.3.4.2.2 Poverty Levels

Poverty levels presented in Table 21.12 are calculated on a subset of the total population of a county, as described above in section 21.3.2, Characterization of Conditions Considered in the Environmental Justice Analysis. Of the total population for whom poverty status is determined within the San Joaquin Valley portion of the Central Valley Region, 3,111,943 individuals, 20.8 percent, were below the poverty level based on the 2006–2010 ACS 5-year dataset (U.S. Census 2014e). The U.S. Census Bureau defines geographical areas with more than 20 percent of the population below the poverty level as a “poverty areas.” Merced, Fresno, Tulare, and Kern counties are defined as poverty areas because more than 20 percent of the populations in these counties are below the poverty level.

#### 21.3.4.2.3 Social Services

Distribution of social services varies for each county. Federal grants to the state and local agencies for Medicaid, other health related activities, and nutrition and family welfare; and Federal direct payments made to individuals under the CalFresh and supplemental social security income within counties in the San Joaquin Valley portion of the Central Valley Region are summarized in Table 21.13.

#### 21.3.4.2.4 Limited English Proficiency

The percent of the population that speaks English and other languages at home and the percent of the population that speak English “less than very well” based on the language they speak at home are presented in Tables 21.14 and 21.15.

#### 21.3.4.2.5 Effects of Recent Drought in Two San Joaquin Valley Communities

The San Joaquin Valley portion of the Central Valley Region includes about 8.8 percent of the state’s total population, 9.3 percent of the state’s population that identified themselves as a racial minority and/or of Hispanic or Latino origin, and about 13.1 percent of the state’s population below the poverty level. Merced, Fresno, and Tulare counties had the highest concentration of total minority populations and the highest concentration of individuals living below the poverty level. There are communities within these counties that have higher concentrations of minority populations and/or populations below the poverty level. These communities are mainly farming communities that have been impacted by loss in agricultural employment, as described in Chapter 12, Agricultural Resources, and Chapter 19, Socioeconomics. The impacts have increased recently during the current drought.

Source: U.S. Census 2014f

Conditions in this geographic area have been the focus of recent newspaper articles describing conditions in these communities. According to AgAlert (2014), a weekly newspaper for California agriculture, increased levels of land fallowing on irrigated cropland in the San Joaquin Valley has resulted in significant economic losses in small farming communities. Higher than typical unemployment rates has resulted in increased food insecurity. As a result, food banks are facing increased demand. Another article in the Fresno Bee Newspaper (2014) described the food insecurity issue in the City of Mendota, a community in Fresno County.

Although there are emergency programs such as those administered through the U.S. Department of Agriculture (USDA), many of these programs are specific in their targets, require a long time to implement, or are of limited duration. For example, the 2014 Farm Bill includes $100 million in livestock disaster assistance; $15 million in assistance to farmers and ranchers to implement water conservation practices; and $60 million for food banks in the State of California (USDA 2014a). The USDA February 14, 2014 news release announcing these programs acknowledges that previous implementation of assistance programs were hampered by long processing times and emphasizes that the USDA is committed to reduce the response times by more than 80 percent. The USDA also is working with California Department of Education to expand the number of Summer Food Service Program meal sites. The U.S. Department of Homeland Security also provides assistance with food and related expenses through the Emergency Food and Shelter National Board Program (USDHS 2014); however this assistance is limited to one month. There also are many California-based programs, including the California Department of Social Services that provided in 2014 up to $25 million in food assistance for counties affected by employment losses due to the drought that has reduced agriculturally-related jobs (CDSS 2014). This program is specifically targeted for counties where the unemployment rate in 2013 was higher than the statewide average, including Fresno, Merced, and Tulare counties. This aid includes pre-packaged food boxes to be delivered to local food banks. Families and individuals that expected to experience long-term impacts due to the drought also were provided assistance to apply for the CalFresh Program to supplement funding for the food budget.

*Huron and Mendota*

The cities of Huron and Mendota are both located in Fresno County. Economic activities in both cities and surrounding communities are based on agriculture. Of the 25 major employers in Fresno County, only one, Stamoules Produce Company, is located in the City of Mendota (CEDD 2013). None of the 25 major employers in Fresno County are located in Huron. Another major employer in the City of Mendota is a medium security Federal prison for men (BOP 2014).

In 2010, the number of people that identified themselves as a racial minority and/or of Hispanic or Latino origin and the portion of the population below the poverty level in these two cities were significantly higher than the distribution of these populations in Fresno County and the State of California, as presented in Tables 21.16 and 21.17. Although the two communities became more racially diverse in 2010 than they were in the 2000 Census, both communities became poorer. While Huron and Mendota have experienced increases in poverty levels, the proportion of the population below the poverty level has been relatively stable in Fresno County.

**Table 21.16 Racial and Ethnic Minority Population in Huron and Mendota in 2010**

| Areas | Total Population | Racial Minority | Hispanic or Latino Origin | Below Poverty Level |
|---|---|---|---|---|
| Huron City | 6,754 | 65.9% | 96.6% | 54.5% |
| Mendota City | 11,014 | 47.1% | 96.6% | 44.6% |
| Fresno County | 930,450 | 44.6% | 50.3% | 22.5% |
| **State of California** | **37,253,956** | **42.4%** | **37.6%** | **13.7%** |

Source: U.S. Census Bureau, 2013a, 2013b, 2014e, 2014u

**Table 21.17 Racial and Ethnic Minority Population in Huron and Mendota in 2000**

| Areas | Total Population | Racial Minority | Hispanic or Latino Origin | Below Poverty Level |
|---|---|---|---|---|
| Huron City | 6,306 | 79.6% | 98.3% | 39.4% |
| Mendota City | 7,890 | 72.7% | 94.7% | 41.9% |
| Fresno County | 799,407 | 45.7% | 44.0% | 22.9% |
| **State of California** | **33,871,648** | **40.5%** | **32.4%** | **14.2%** |

Sources: U.S. Census Bureau, 2013c, 2013d, 2013e, 2013f

*Other Indicators of Economic Conditions*

Other indicators of economic struggles within these communities are the number of individuals who are on poverty alleviation programs, including CalFresh, the Federal Supplemental Nutrition Assistance Program administered by the State of California, California Work Opportunity and Responsibility to Kids (CalWORKs), and National School Lunch Program (NSLP).

Both CalFresh and CalWORKs are administered by the California Department of Social Services. The CalFresh Program issues monthly electronic benefits that can be used to buy most foods. The program's purpose is to help improve the health and well-being of qualified households and individuals. CalWORKs is a social welfare program that provides cash aid and services to eligible needy California families. Figure 21.1 shows the trend in the average annual population on public assistance (both the CalFresh Program and CalWORKs program) between 2006 and 2012, the years for which electronic data were available for the cities of Huron and Mendota. The populations in Huron and Mendota have higher levels of participations in the two public assistance programs compared to the levels in Fresno County and the state. Additionally, the rates of participation in the two communities have been growing at a faster rate than growth in these programs in Fresno County and the state. Eligibility in the CalFresh Program is based upon several factors, including a poverty threshold requirement and citizenship/immigration status. Eligibility for CalWORKs is determined on the basis of citizenship, age, income, resources, assets and other factors (CDSS 2013j).

The NSLP program includes students that are eligible for assistance under CalFresh and other federal assistance programs, such as the Temporary Assistance for Needy Families and the Food Distribution Program on Indian Reservations; and students who are eligible under the Other Source Categorically Eligible Programs. A student is eligible under the Other Source Categorically Eligible Programs if that student is: (1) homeless, runaway or migrant; (2) a foster child; or (3) enrolled in a Federally-funded Head Start Program or a comparable State-funded Head Start Program or pre-kindergarten programs, or in an Even Start Program (USDA 2014b). Students enrolled in the NSLP are eligible for either free or reduced price meals (FRPM). Figure 21.2 shows the proportion of students enrolled in the FRPM program in the two communities, Fresno County, and the state. Participation on FRPM in Fresno County is higher than in the entire state; and lower than within Huron and Mendota.

Relatively large participation in the social services programs is related to low employment in Huron and Mendota. Annual unemployment rates in Huron and Mendota between 2006 and 2012 have consistently remained higher than for Fresno County and the state, as presented in Figure 21.3. The pattern of unemployment has been similar to unemployment patterns in Fresno County, and increased following the economic recession that started in 2007. The increase in unemployment also occurred at a time when both agricultural cultivated acreage and farm employment in the area declined; and included five consecutive years with reduced water availability, as described in Chapter 12, Agricultural Resources, and Chapter 19, Socioeconomics.

#### *21.3.4.3 Delta and Suisun Marsh*

The Delta and Suisun Marsh portion of the Central Valley Region includes Sacramento, Yolo, Solano, San Joaquin, and Contra Costa counties.

##### 21.3.4.3.1 Minority Populations

As recorded in the 2010 U.S. Census, the Delta and Suisun Marsh portion of the Central Valley Region had a total population of 2,718,287 in 2010. About 54.8 percent of this population identified themselves as a racial minority and/or of Hispanic or Latino origin, regardless of race, as presented in Table 21.18. The table also shows the minority population distribution for the entire Central Valley Region and the State of California.

##### 21.3.4.3.2 Poverty Levels

Poverty levels presented in Table 21.19 are calculated on a subset of the total population of a county, as described above in section 21.3.2, Characterization of Conditions Considered in the Environmental Justice Analysis.

**Table 21.18 Minority Population Distribution in the Central Valley Region – Delta and Suisun Marsh in 2010**

| Areas | Total Population | Races | | | | | | | Hispanic or Latino Origin | Total Minority[a] |
|---|---|---|---|---|---|---|---|---|---|---|
| | | White | Black/ African American | American Indian and Native Alaskan | Asian | Native Hawaiian and Other Pacific Islander | Some Other Race | Two or More Races | | |
| Sacramento County | 1,418,788 | 57.5% | 10.4% | 1.0% | 14.3% | 1.0% | 9.3% | 6.6% | 21.6% | 51.6% |
| Yolo County | 200,849 | 63.2% | 2.6% | 1.1% | 13.0% | 0.5% | 13.9% | 5.8% | 30.3% | 50.1% |
| Solano County | 413,344 | 51.0% | 14.7% | 0.8% | 14.6% | 0.9% | 10.5% | 7.6% | 24.0% | 59.2% |
| San Joaquin County | 685,306 | 51.0% | 7.6% | 1.1% | 14.4% | 0.5% | 19.1% | 6.4% | 38.9% | 64.1% |
| Contra Costa County | 1,049,025 | 58.6% | 9.3% | 0.6% | 14.4% | 0.5% | 10.7% | 5.9% | 24.4% | 52.2% |
| Total Delta and Suisun Marsh Valley | 3,767,312 | 56.2% | 9.6% | 0.9% | 14.3% | 0.7% | 11.9% | 6.4% | 26.2% | 54.8% |
| Central Valley Region | 8,379,045 | 61.4% | 6.3% | 1.3% | 9.5% | 0.4% | 15.7% | 5.4% | 42.6% | 53.5% |
| STATE OF CALIFORNIA | 37,253,956 | 57.6% | 6.2% | 1.0% | 13.0% | 0.4% | 17.0% | 4.9% | 37.6% | 59.9% |

Sources: U.S. Census 2014a, 2014y, 2014z, 2014aa, 2014ab, 2014ac

Note:

a. Total Minority is an aggregation of all non-white racial groups and includes all individuals of Hispanic or Latino origin, regardless of race.

**Table 21.19 Population below Poverty Level in the Central Valley Region – Delta and Suisun Marsh, 2006–2010**

| Areas | Total Population[a] | Population Below Poverty Level | Percent of Population Below Poverty Level |
|---|---|---|---|
| Sacramento County | 1,368,693 | 190,768 | 13.9% |
| Yolo County | 186,800 | 31,895 | 17.1% |
| Solano County | 397,576 | 41,158 | 10.4% |
| San Joaquin County | 657,594 | 105,502 | 16.0% |
| Contra Costa County | 1,013,854 | 91,142 | 9.0% |
| Total Delta and Suisun Marsh Valley | 3,624,517 | 460,465 | 12.7% |
| Central Valley Region | 8,025,054 | 1,268,984 | 15.8% |
| **STATE OF CALIFORNIA** | **35,877,036** | **4,919,945** | **13.7%** |

Source: U.S. Census 2014e

Note:

a. Population numbers are only those for whom poverty status was determined and exclude institutionalized individuals

Of the total population for whom poverty status is determined within the Delta and Suisun Marsh portion of the Central Valley Region, 3,624,517 individuals, 12.7 percent were below the poverty level based on the 2006–2010 ACS 5-year dataset (U.S. Census 2014e). The U.S. Census Bureau defines geographical areas with more than 20 percent of the population below the poverty level as a "poverty areas." None of the counties in this area are defined as poverty areas.

#### 21.3.4.3.3 Social Services

Distribution of social services varies for each county. Federal grants to the state and local agencies for Medicaid, other health related activities, and nutrition and family welfare; and Federal direct payments made to individuals under the CalFresh and supplemental social security income within counties in the Delta and Suisun Marsh portion of the Central Valley Region are summarized in Table 21.20.

#### 21.3.4.3.4 Limited English Proficiency

The percent of the population that speaks English and other languages at home and the percent of the population that speak English "less than very well" based on the language they speak at home are presented in Tables 21.21 and 21.22.

### 21.3.5 San Francisco Bay Area Region

The San Francisco Bay Area Region includes portions of Napa, Alameda, Santa Clara, and San Benito counties that are within the CVP and SWP service areas. Contra Costa County also is part of the San Francisco Bay Area Region. However, for this chapter, Contra Costa County is discussed under Section 14.3.4.3, Delta Suisun Marsh.

#### *21.3.5.1 Minority Populations*

As recorded in the 2010 U.S. Census, the San Francisco Bay Area Region had a total population of 3,483,666 in 2010. About 64.4 percent of this population identified themselves as a racial minority and/or of Hispanic or Latino origin, regardless of race, as presented in Table 21.23. The table also shows the minority population distribution for the State of California.

#### *21.3.5.2 Poverty Levels*

Poverty levels presented in Table 21.24 are calculated on a subset of the total population of a county, as described above in section 21.3.2, Characterization of Conditions Considered in the Environmental Justice Analysis. Of the total population for whom poverty status is determined within the San Francisco Bay Area Region, 3,344,994 individuals, 10.1 percent were below the poverty level based on the 2006–2010 ACS 5-year dataset (U.S. Census 2014e). The U.S. Census Bureau defines geographical areas with more than 20 percent of the population below the poverty level as a "poverty areas." None of the counties in the San Francisco Bay Area Region are defined as poverty areas.

**Table 21.20 Federal Funds Distributed for Social Programs in the Central Valley Region – Delta and Suisun Marsh in 2010**

| Areas | Grants (millions of dollars) | | Distributed to Individuals (millions of dollars) |
|---|---|---|---|
| | Medicaid and Other Health-Related Items | Nutrition and Family Welfare | CalFresh Benefits and Supplemental Security Income |
| Sacramento County | $2,115.5 | $2,695.9 | $659.1 |
| Yolo County | $504.8 | $39.7 | $55.2 |

Note:

a. Population numbers are only those for whom poverty status was determined and exclude institutionalized individuals

#### *21.3.5.3 Social Services*

Distribution of social services varies for each county. Federal grants to the state and local agencies for Medicaid, other health related activities, and nutrition and family welfare; and Federal direct payments made to individuals under the CalFresh and supplemental social security income within counties in the San Francisco Bay Area Region are summarized in Table 21.25.

#### *21.3.5.4 Limited English Proficiency*

The percent of the population that speaks English and other languages at home and the percent of the population that speak English "less than very well" based on the language they speak at home are presented in Tables 21.26 and 21.27.

### 21.3.6 Central Coast Region

The Central Coast Region includes portions of San Luis Obispo and Santa Barbara counties served by the SWP. SWP water supplies are used directly by municipal and industrial water users, and as part of groundwater replenishment plans to meet municipal, industrial, and agricultural water demands.

#### *21.3.6.1 Minority Populations*

As recorded in the 2010 U.S. Census, the Central Coast Region had a total population of 693,532 in 2010. About 43.1 percent of this population identified themselves as a racial minority and/or of Hispanic or Latino origin, regardless of race, as presented in Table 21.28. The table also shows the minority population distribution for the State of California.

#### *21.3.6.2 Poverty Levels*

Poverty levels presented in Table 21.29 are calculated on a subset of the total population of a county, as described above in section 21.3.2, Characterization of Conditions Considered in the Environmental Justice Analysis. Of the total population for whom poverty status is determined within the Central Coast

Region, 649,348 individuals, 13.8 percent were below the poverty level based on the 2006–2010 ACS 5-year dataset (U.S. Census 2014e). The U.S. Census Bureau defines geographical areas with more than 20 percent of the population below the poverty level as a "poverty areas." None of the counties in the Central Coast Region are defined as poverty areas.

#### *21.3.6.3 Social Services*

Distribution of social services varies for each county. Federal grants to the state and local agencies for Medicaid, other health related activities, and nutrition and family welfare; and Federal direct payments made to individuals under the CalFresh and supplemental social security income within counties in the Central Coast Region are summarized in Table 21.30.

**Table 21.25 Federal Funds Distributed for Social Programs in the San Francisco Bay Area Region in 2010**

| Areas | Grants (millions of dollars) | | Distributed to Individuals (millions of dollars) |
|---|---|---|---|
| | Medicaid and Other Health-Related Items | Nutrition and Family Welfare | CalFresh Benefits and Supplemental Security Income |
| Alameda County | $2,556.4 | $318.6 | $529.6 |
| Santa Clara County | $2,000.2 | $334.3 | $466.3 |
| San Benito County | $27.1 | $12.5 | $8.2 |
| Napa County | $102.5 | $32.0 | $21.3 |
| San Francisco Bay Area Region | $4,686.2 | $697.4 | $1,025.4 |
| **STATE OF CALIFORNIA** | **$41,931.1** | **$11,743.7** | **$12,469.4** |

#### *21.3.6.4 Limited English Proficiency*

The percent of the population that speaks English and other languages at home and the percent of the population that speak English “less than very well” based on the language they speak at home are presented in Tables 21.31 and 21.32.

### 21.3.7 Southern California Region

The Southern California Region includes portions of Ventura, Los Angeles, Orange, San Diego, Riverside, and San Bernardino counties served by the SWP.

#### *21.3.7.1 Minority Populations*

As recorded in the 2010 U.S. Census, the Southern California Region had a total population of 20,972,319 in 2010. About 64.2 percent of this population identified themselves as a racial minority and/or of Hispanic or Latino origin, regardless of race, as presented in Table 21.33. The table also shows the minority population distribution for the State of California.

#### 21.3.7.2 Poverty Levels

Poverty levels presented in Table 21.34 are calculated on a subset of the total population of a county, as described above in section 21.3.2, Characterization of Conditions Considered in the Environmental Justice Analysis. Of the total population for whom poverty status is determined within the Southern California Region, 20,296,879 individuals, 13.8 percent, were below the poverty level based on the 2006–2010 ACS 5-year dataset (U.S. Census 2014e). The U.S. Census Bureau defines geographical areas with more than 20 percent of the population below the poverty level as a "poverty areas." None of the counties in the Southern California Region are defined as poverty areas.

#### 21.3.7.3 Social Services

Distribution of social services varies for each county. Federal grants to the state and local agencies for Medicaid, other health related activities, and nutrition and family welfare; and Federal direct payments made to individuals under the CalFresh and supplemental social security income within counties in the Southern California Region are summarized in Table 21.35.

#### 21.3.7.4 Limited English Proficiency

The percent of the population that speaks English and other languages at home and the percent of the population that speak English "less than very well" based on the language they speak at home are presented in Tables 21.36 and 21.37.

**Table 21.31 Top Five Non-English Languages Spoken at Home as a Proportion of the Total Population Five Years and Older in the Central Coast Region, 2006–2010**

## 21.4 Impact Analysis

This section describes the potential mechanisms for change in conditions and analytical methods; results of impact analyses; potential mitigation measures; and cumulative effects.

### 21.4.1 Potential Mechanisms for Change and Analytical Methods

As described in Chapter 4, Approach to Environmental Analysis, the impact analysis considers changes in factors that affect environmental justice or minority and low-income populations specifically related to changes in CVP and SWP operations under the alternatives as compared to the No Action Alternative and Second Basis of Comparison.

The Council of Environmental Quality (CEQ) and U.S. Environmental Protection Agency (USEPA) established guidelines to assist federal agencies in the analysis of environmental justice defines minority and low-income areas summarized in Section 21.3, Affected Environment (CEQ, 1997). The following guidelines are used to determine if minority populations are present in a study area:

- The minority population of the affected area exceeds 50 percent, or
- The population percentage of the affected area is meaningfully greater than the minority population percentage in the general population or other appropriate unit of geographical analysis.

The CEQ guidelines do not specifically state the percentage considered meaningful in the case of low-income populations. For this analysis, the assumptions set forth in the CEQ guidelines for identifying and evaluating impacts on minority populations also are used to identify and evaluate impacts on low-income populations, including a determination that a low-income population is present if the project area if 50 percent or more of the population is living below the poverty level.

The alternatives considered in this EIS do not include project-specific construction activities. In most portions of the study area, the availability of CVP and SWP water supplies directly or indirectly affects most of the population within a county. Therefore, the entire population of each counties within the study area is considered to determine whether minority or low-income areas could be affected by implementation of the alternatives. In the study area, populations below the poverty level do not include 50 percent or more of the population. The highest proportion of populations below the poverty level occurs in Fresno and Tulare counties in which approximately 23 percent of the populations are below the poverty level. However, minority populations contribute more than 50 percent of the total county populations in 24 of the 35 counties. The following counties have 50 percent or more of the total population as minority populations.

- Central Valley Region: Colusa, Sacramento, Solano, Sutter, Yolo, Fresno, Kern, Kings, Madera, Merced, San Joaquin, Stanislaus, and Tulare counties

- Central Coast Region; Santa Barbara.
- Southern California Region: Los Angeles, Orange, Riverside, San Bernardino, San Diego, and Ventura.

Although, the majority of the populations in the Trinity River Region counties are not minority populations, these counties do include the Hoopa Valley Indian Reservation, Yurok Indian Reservation, and Resighini Rancheria. Therefore, the Trinity River Region counties are also included in the environmental justice analysis.

The CEQ guidance provides the following three factors to be considered for determination if disproportionately high and adverse impacts may accrue to minority or low-income populations.

The following criteria were used to evaluate the impacts to minority and low-income populations resulting from the operational changes following the implementation of each of the alternatives as compared to the No Action Alternative and the Second Basis of Comparison:

- Whether there is or would be an impact that results in a disproportionately high and adverse human health and environmental impact, including social and economic effects on environmental justice populations.
- Whether the environmental effects are significant and are, or may be, having an adverse impact on environmental justice populations that appreciably exceeds or is likely to appreciably exceed those on the general population or other appropriate comparison group.
- Whether the environmental effects occur or would occur in an environmental justice population affected by cumulative or multiple adverse exposures from environmental hazards.

To determine whether the operational changes resulting from implementation of each of the alternatives as compared to the No Action Alternative and the Second Basis of Comparison will have a "disproportionately high and adverse impact" on minority and low-income populations, various factors were considered, including potential adverse impacts, mitigation, and enhancement measures that will be incorporated into the alternatives; and offsetting benefits.

The environmental justice guidance documents do not specifically define conditions that would result in "high and adverse human health and environmental impact." For this analysis, the potential changes in air quality, cultural resources, public health, and socioeconomics were considered within the counties that had a minority population of 50 percent or greater of the total population.

The changes were then determined if the impacts would be disproportionally high on the minority populations. Potential adverse impacts were evaluated with regard to air quality, public health, and socioeconomics.

Changes in CVP and SWP operations under the alternatives as compared to the No Action Alternative and Second Basis of Comparison could result in disproportionally high effects on minority or tribal populations related to changes in air quality, public health, and socioeconomics.

##### *21.4.1.1 Changes in Emissions of Criteria Air Pollutants and Precursors, and/or Exposure of Sensitive Receptors to Substantial Concentrations of Air Contaminants Related to Changes in Groundwater Pumping*

Changes in CVP and SWP operations under the alternatives could change the use of individual engines to operate groundwater wells. To evaluate the potential for changes in emissions of criteria air pollutants and precursors, and/or exposure of sensitive receptors to substantial concentrations of air contaminants, results from the CVHM model that indicate changes in groundwater withdrawals due to changes in CVP and SWP operations were analyzed. However, it is not known how many of the groundwater pumps use electricity and how many use diesel engines. The diesel engines have the potential to emit criteria air pollutants and precursors, and toxic air contaminants, as described in Chapter 16, Air Quality and Greenhouse Gas Emissions.

Most of the groundwater wells in the Central Valley use electrical pumps. As reported in a recent environmental assessment, approximately 14 to 15 percent of the pumps used diesel fuel in 2003 (Reclamation 2013a). It is assumed for this EIS, that the portion of groundwater pumps that use electricity would remain approximately at 85 percent. Therefore, it is assumed that increases or decreases in groundwater pumping would be indicative of an increase or decrease in the use of diesel engines in the Central Valley as well as in the San Francisco Bay Area, Central Coast, and Southern California regions. Changes in CVP and SWP operations would not result in changes in groundwater pumping in the Trinity River Region; therefore, this analysis does not address Trinity River Region.

##### *21.4.1.2 Changes in Public Health Related to Changes in Potential Exposure to Mercury in Fish Used in Human Consumption*

Changes in CVP and SWP operations under the alternatives could change public health factors related to mercury concentrations in fish used for human consumption as compared to the No Action Alternative and Second Basis of Comparison, as described in Chapter 18, Public Health.

##### *21.4.1.3 Changes in Socioeconomics*

Changes in CVP and SWP operations under the alternatives could change socioeconomic factors related to employment related to irrigated agriculture and municipal and industrial (M&I) water supplies and tribal salmon harvest in the Trinity River Region as compared to the No Action Alternative and Second Basis of Comparison, as described in Chapter 19, Socioeconomics. However, changes in employment related to irrigated agriculture and M&I water supplies would be similar. Therefore, these changes are not analyzed in this EIS.

#### *21.4.1.4 Effects due to Cross Delta Water Transfers*

Historically water transfer programs have been developed on an annual basis. The demand for water transfers is dependent upon the availability of water supplies to meet water demands. Water transfer transactions have increased over time as CVP and SWP water supply availability has decreased, especially during drier water years.

Parties seeking water transfers generally acquire water from sellers who have available surface water who can make the water available through releasing previously stored water, pump groundwater instead of using surface water (groundwater substitution); idle crops; or substitute crops that uses less water in order to reduce normal consumptive use of surface water.

Water transfers using CVP and SWP Delta pumping plants and south of Delta canals generally occur when there is unused capacity in these facilities. These conditions generally occur during drier water year types when the flows from upstream reservoirs plus unregulated flows are adequate to meet the Sacramento Valley water demands and the CVP and SWP export allocations. In non-wet years, the CVP and SWP water allocations would be less than full contract amounts; therefore, capacity may be available in the CVP and SWP conveyance facilities to move water from other sources.

Projecting future environmental justice conditions related to water transfer activities is difficult because specific water transfer actions required to make the water available, convey the water, and/or use the water would change each year due to changing hydrological conditions, CVP and SWP water availability, specific local agency operations, and local cropping patterns. Reclamation recently prepared a long-term regional water transfer environmental document which evaluated potential changes in conditions related to water transfer actions (Reclamation 2014c). Results from this analysis were used to inform the impact assessment of potential effects of water transfers under the alternatives as compared to the No Action Alternative and the Second Basis of Comparison.

### 21.4.2 Conditions in Year 2030 without Implementation of Alternatives 1 through 5

This EIS includes two bases of comparison, as described in Chapter 3, Description of Alternatives: the No Action Alternative and the Second Basis of Comparison. Both of these bases are evaluated at 2030 conditions.

Changes that would occur over the next 15 years without implementation of the alternatives are not analyzed in this EIS. However, the changes to environmental justice factors that are assumed to occur by 2030 under the No Action Alternative and the Second Basis of Comparison are summarized in this section. Many of the changed conditions would occur in the same manner under both the No Action Alternative and the Second Basis of Comparison.

#### *21.4.2.1 Common Changes in Conditions under the No Action Alternative and Second Basis of Comparison*

Conditions in 2030 would be different than existing conditions due to:

- Climate change and sea level rise
- General plan development throughout California, including increased water demands in portions of Sacramento Valley
- Implementation of reasonable and foreseeable water resources management projects to provide water supplies

It is anticipated that climate change would result in more short-duration high-rainfall events and less snowpack in the winter and early spring months. The reservoirs would be full more frequently by the end of April or May by 2030 than in recent historical conditions. However, as the water is released in the spring, there would be less snowpack to refill the reservoirs. This condition would reduce reservoir storage and available water supplies to downstream uses in the summer. The reduced end of September storage also would reduce the ability to release stored water to downstream regional reservoirs. These conditions would occur for all reservoirs in the California foothills and mountains, including non-CVP and SWP reservoirs.

These changes would result in a decline of the long-term average CVP and SWP water supply deliveries by 2030 as compared to recent historical long-term average deliveries under the No Action Alternative and the Second Basis of Comparison. However, the CVP and SWP water deliveries would be less under the No Action Alternative as compared to the Second Basis of Comparison, as described in Chapter 5, Surface Water Resources and Water Supplies. Due to climate change and related lower snowfall, end of September low reservoir storage would be lower in critical dry years by 2030 as compared to recent historical conditions in Shasta Lake, Lake Oroville, Folsom Lake, New Melones Reservoir, and San Luis Reservoir. Therefore, the potential for reduced reservoir water supplies for wildland firefighting would be greater under the No Action Alternative and Second Basis of Comparison as compared to recent historical conditions.

Under the No Action Alternative and the Second Basis of Comparison, land uses in 2030 would occur in accordance with adopted general plans.

The No Action Alternative and the Second Basis of Comparison assumes completion of water resources management and environmental restoration projects that would have occurred without implementation of Alternatives 1 through 5, including regional and local recycling projects, surface water and groundwater storage projects, conveyance improvement projects, and desalination projects, as described in Chapter 3, Description of Alternatives. The No Action Alternative and the Second Basis of Comparison also assumes implementation of actions included in the 2008 U.S. Fish and Wildlife Service (USFWS) Biological Opinion (BO) and 2009 National Marine Fisheries Service (NMFS) BO that would have been implemented without the BOs by 2030, as described in Chapter 3, Description of Alternatives.

Under the No Action Alternative and Second Basis of Comparison, it is anticipated that mercury concentrations in fish tissue within the Delta will be either similar or greater than recent historical conditions. Phase 1 of the Delta Mercury Program mandated by the Central Valley Regional Water Quality Control Board (RWQCB) is currently being completed to protect people eating one meal per week of larger fish from the Delta, including Largemouth Bass. Phase 1 is focused on studies and pilot projects to develop and evaluate management practices to control methylmercury from mercury sources in the Delta and Yolo Bypass; and to reduce total mercury loading to the San Francisco Bay. Following completion of Phase 1 in 2019, Phase 2 will be implemented through 2030. Phase 2 will focus on methylmercury control programs and reduction programs for total inorganic mercury. Due to the extent of these studies, it is not anticipated that changes in methylmercury or total mercury concentrations in fish tissue will be reduced by 2030. Future mercury reduction and control programs will reduce mercury sources and related fish tissue concentrations; however, that will occur after 2030.

### 21.4.3 Evaluation of Alternatives

Alternatives 1 through 5 have been compared to the No Action Alternative; and the No Action Alternative and Alternatives 1 through 5 have been compared to the Second Basis of Comparison.

During review of the numerical modeling analyses used in this EIS, an error was determined in the CalSim II model assumptions related to the Stanislaus River operations for the Second Basis of Comparison, Alternative 1, and Alternative 4 model runs. Appendix 5C includes a comparison of the CalSim II model run results presented in this chapter and CalSim II model run results with the error corrected. Appendix 5C also includes a discussion of changes in the comparison of groundwater conditions for the following alternative analyses.

- No Action Alternative compared to the Second Basis of Comparison
- Alternative 1 compared to the No Action Alternative
- Alternative 3 compared to the Second Basis of Comparison
- Alternative 5 compared to the Second Basis of Comparison.

#### *21.4.3.1 No Action Alternative*

The No Action Alternative is compared to the Second Basis of Comparison.

##### 21.4.3.1.1 Central Valley Region

*Changes in Emissions of Criteria Air Pollutants and Precursors, and/or Exposure of Sensitive Receptors to Substantial Concentrations of Air Contaminants Related to Changes in Groundwater Pumping*

Groundwater pumping in the San Joaquin Valley portion of the Central Valley Region would increase by 8 percent under the No Action Alternative as compared to the Second Basis of Comparison. It is not known if the additional groundwater pumping would rely upon electricity or diesel to drive the pump engines. Under the worst case analysis, it is assumed that the increased use of diesel engines would be proportional to the increased use of groundwater. Therefore, under the No Action Alternative, there would be a potential increase in emissions of criteria air pollutants and precursors, and/or exposure of sensitive receptors to substantial concentrations of air contaminants as compared to the Second Basis of Comparison.

*Changes in Public Health Factors Related to Mercury in Fish used for Human Consumption*

Mercury concentrations in Largemouth Bass would be similar (within 5 percent change) in most locations in the Delta, except for Rock Slough, San Joaquin River near Antioch, and Montezuma Slough in Suisun Marsh. In these areas, the mercury concentrations would increase by 7 percent over long-term conditions under the No Action Alternative as compared to the Second Basis of Comparison. Under dry and critical dry years, mercury concentrations would increase by 7 to 8 percent at Rock Slough, intakes of the Banks and Jones pumping plants, and Victoria Canal. All values exceed the threshold of 0.24 mg/kg ww for mercury.

*Effects Related to Cross Delta Water Transfers*

Potential effects to environmental justice factors could be similar to those identified in a recent environmental analysis conducted by Reclamation for long-term water transfers from the Sacramento to San Joaquin valleys (Reclamation 2014c). Potential effects to environmental justice were identified as loss of employment in the seller's service area if crop idling was used to provide transfer water. The analysis indicated that the proportion of crop idled acreage would be small as compared to the overall regional irrigated acreage, and that this change would not result in in disproportionately high or adverse effects. In addition, beneficial effects could occur in the purchaser's service area if more acreage was cultivated with the water transfer program than without the water transfer program.

Under the No Action Alternative, the timing of cross Delta water transfers would be limited to July through September and include annual volumetric limits, in accordance with the 2008 USFWS BO and 2009 NMFS BO. Under the Second Basis of Comparison, water could be transferred throughout the year without an annual volumetric limit. Overall, the potential for cross Delta water transfers would be less under the No Action Alternative than under the Second Basis of Comparison.

#### 21.4.3.1.2 San Francisco Bay Area, Central Coast, and Southern California Regions

*Changes in Emissions of Criteria Air Pollutants and Precursors, and/or Exposure of Sensitive Receptors to Substantial Concentrations of Air Contaminants Related to Changes in Groundwater Pumping*

It is anticipated that CVP and SWP water supplies would be decreased by 10 percent and 18 percent, respectively, in the San Francisco Bay Area, Central

Coast, and Southern California regions under No Action Alternative as compared to the Second Basis of Comparison. The decrease in surface water supplies could result in additional use of groundwater pumps and emissions of air pollutants and contaminants if the use of diesel engines is also increased.

### *21.4.3.2 Alternative 1*

As described in Chapter 3, Description of Alternatives, Alternative 1 is identical to the Second Basis of Comparison. As described in Chapter 4, Approach to Environmental Analysis, Alternative 1 is compared to the No Action Alternative and the Second Basis of Comparison. However, because CVP and SWP operations under Alternative 1 are identical to conditions under the Second Basis of Comparison; Alternative 1 is only compared to the No Action Alternative.

#### 21.4.3.2.1 Alternative 1 Compared to the No Action Alternative

*Central Valley Region*

*Changes in Emissions of Criteria Air Pollutants and Precursors, and/or Exposure of Sensitive Receptors to Substantial Concentrations of Air Contaminants Related to Changes in Groundwater Pumping*

Groundwater pumping in the San Joaquin Valley portion of the Central Valley Region would decrease by 8 percent under Alternative 1 as compared to the No Action Alternative. It is not known if the reduction in groundwater pumping would result in a reduction of the use of electricity or diesel to drive the pump engines. For this analysis, it is assumed that the decreased use of diesel engines would be proportional to the decreased use of groundwater. Therefore, under Alternative 1, there would be a potential decrease in emissions of criteria air pollutants and precursors, and/or exposure of sensitive receptors to substantial concentrations of air contaminants as compared to the No Action Alternative.

*Changes in Public Health Factors Related to Mercury in Fish used for Human Consumption*

Mercury concentrations in Largemouth Bass would be similar in most locations in the Delta, except for Rock Slough, San Joaquin River near Antioch, and Montezuma Slough in Suisun Marsh. In these areas, the mercury concentrations would decrease by 6 percent over the long-term conditions under Alternative 1 as compared to the No Action Alternative. Under dry and critical dry years, mercury concentrations would decrease by 6 to 8 percent at Rock Slough, intakes of the Banks and Jones pumping plants, and Victoria Canal. All values exceed the threshold of 0.24 mg/kg ww for mercury.

*Effects Related to Cross Delta Water Transfers*

Potential effects to environmental justice conditions could be similar to those identified in a recent environmental analysis conducted by Reclamation for long-term water transfers from the Sacramento to San Joaquin valleys (Reclamation 2014c) as described above under the No Action Alternative compared to the Second Basis of Comparison. For the purposes of this EIS, it is anticipated that similar conditions would occur during implementation of cross Delta water transfers under Alternative 1 and the No Action Alternative, and that impacts on environmental justice factors would not be substantial due to implementation requirements of the transfer programs.

Under Alternative 1, water could be transferred throughout the year without an annual volumetric limit. Under the No Action Alternative, the timing of cross Delta water transfers would be limited to July through September and include annual volumetric limits, in accordance with the 2008 USFWS BO and 2009 NMFS BO. Overall, the potential for cross Delta water transfers would be increased under Alternative 1 as compared to the No Action Alternative.

*San Francisco Bay Area, Central Coast, and Southern California Regions*

*Changes in Emissions of Criteria Air Pollutants and Precursors, and/or Exposure of Sensitive Receptors to Substantial Concentrations of Air Contaminants Related to Changes in Groundwater Pumping*

It is anticipated that CVP and SWP water supplies would be increased by 11 percent and 21 percent, respectively, in the San Francisco Bay Area, Central Coast, and Southern California regions under Alternative 1 as compared to the No Action Alternative. The increase in surface water supplies could result in the reduction in use of groundwater pumps and emissions of air pollutants and contaminants if the use of diesel engines is also decreased.

##### 21.4.3.2.2 Alternative 1 Compared to the Second Basis of Comparison

Alternative 1 is identical to the Second Basis of Comparison.

#### *21.4.3.3 Alternative 2*

The CVP and SWP operations under Alternative 2 are identical to the CVP and SWP operations under the No Action Alternative, as described in Chapter 3, Description of Alternatives; therefore Alternative 2 is only compared to the Second Basis of Comparison.

##### 21.4.3.3.1 Alternative 2 Compared to the Second Basis of Comparison

The CVP and SWP operations under Alternative 2 are identical to the CVP and SWP operations under the No Action Alternative. Therefore, changes to environmental justice factors under Alternatives 2 as compared to the Second Basis of Comparison would be the same as the impacts described in Section 18.4.3.1, No Action Alternative.

#### *21.4.3.4 Alternative 3*

As described in Chapter 3, Description of Alternatives, CVP and SWP operations under Alternative 3 are similar to the Second Basis of Comparison with modified Old and Middle River flow criteria and New Melones Reservoir operations. As described in Chapter 4, Approach to Environmental Analysis, Alternative 3 is compared to the No Action Alternative and the Second Basis of Comparison.

#### 21.4.3.4.1 Alternative 3 Compared to the No Action Alternative

*Central Valley Region*

*Changes in Emissions of Criteria Air Pollutants and Precursors, and/or Exposure of Sensitive Receptors to Substantial Concentrations of Air Contaminants Related to Changes in Groundwater Pumping*

Groundwater pumping in the San Joaquin Valley portion of the Central Valley Region would decrease by 6 percent under Alternative 3 as compared to the No Action Alternative. It is not known if the reduction in groundwater pumping would result in a reduction of the use of electricity or diesel to drive the pump engines. For this analysis, it is assumed that the decreased use of diesel engines would be proportional to the decreased use of groundwater. Therefore, under Alternative 3, there would be a potential decrease in emissions of criteria air pollutants and precursors, and/or exposure of sensitive receptors to substantial concentrations of air contaminants as compared to the No Action Alternative.

*Changes in Public Health Factors Related to Mercury in Fish used for Human Consumption*

Mercury concentrations in Largemouth Bass would be similar (within 5 percent change) in most locations in the Delta, except for San Joaquin River near Antioch and Montezuma Slough in Suisun Marsh. In these areas, the mercury concentrations would decrease by 6 percent over the long-term conditions under Alternative 3 as compared to the No Action Alternative. Mercury concentrations under the dry and critical dry years would be similar throughout the Delta. All values exceed the threshold of 0.24 mg/kg ww for mercury.

*Effects Related to Cross Delta Water Transfers*

Potential effects to environmental justice factors could be similar to those identified in a recent environmental analysis conducted by Reclamation for long-term water transfers from the Sacramento to San Joaquin valleys (Reclamation 2014c) as described above under the No Action Alternative compared to the Second Basis of Comparison. For the purposes of this EIS, it is anticipated that similar conditions would occur during implementation of cross Delta water transfers under Alternative 3 and the No Action Alternative, and that impacts on environmental justice factors would not be substantial due to implementation requirements of the transfer programs.

Under Alternative 3, water could be transferred throughout the year without an annual volumetric limit. Under the No Action Alternative, the timing of cross Delta water transfers would be limited to July through September and include annual volumetric limits, in accordance with the 2008 USFWS BO and 2009 NMFS BO. Overall, the potential for cross Delta water transfers would be increased under Alternative 3 as compared to the No Action Alternative.

*San Francisco Bay Area, Central Coast, and Southern California Regions*

*Changes in Emissions of Criteria Air Pollutants and Precursors, and/or Exposure of Sensitive Receptors to Substantial Concentrations of Air Contaminants Related to Changes in Groundwater Pumping*

It is anticipated that CVP and SWP water supplies would be increased by 9 percent and 17 percent, respectively, in the San Francisco Bay Area, Central Coast, and Southern California regions under Alternative 3 as compared to the No Action Alternative. The increase in surface water supplies could result in the reduction in use of groundwater pumps and emissions of air pollutants and contaminants if the use of diesel engines is also decreased.

#### 21.4.3.4.2 Alternative 3 Compared to the Second Basis of Comparison

*Central Valley Region*

*Changes in Emissions of Criteria Air Pollutants and Precursors, and/or Exposure of Sensitive Receptors to Substantial Concentrations of Air Contaminants Related to Changes in Groundwater Pumping*

Groundwater pumping in the San Joaquin Valley portion of the Central Valley Region would be similar (within a 5 percent change) under Alternative 3 as compared to the Second Basis of Comparison. Therefore, the emissions of criteria air pollutants and precursors, and/or exposure of sensitive receptors to substantial concentrations of air contaminants would be similar under Alternative 3 as compared to the Second Basis of Comparison.

*Changes in Public Health Factors Related to Mercury in Fish Used for Human Consumption*

Mercury concentrations in Largemouth Bass would be similar throughout the Delta under Alternative 3 as compared to the Second Basis of Comparison, as summarized in Chapter 6, Surface Water Quality. All values exceed the threshold of 0.24 mg/kg ww for mercury.

*Effects Related to Cross Delta Water Transfers*

Potential effects to environmental justice factors could be similar to those identified in a recent environmental analysis conducted by Reclamation for long-term water transfers from the Sacramento to San Joaquin valleys (Reclamation 2014c) as described above under the No Action Alternative compared to the Second Basis of Comparison. For the purposes of this EIS, it is anticipated that similar conditions would occur during implementation of cross Delta water transfers under Alternative 3 and the Second Basis of Comparison, and that impacts on environmental justice factors would not be substantial in the seller's service area due to implementation requirements of the transfer programs.

Under Alternative 3 and the Second Basis of Comparison, water could be transferred throughout the year without an annual volumetric limit. Overall, the potential for cross Delta water transfers would be similar under Alternative 3 and the Second Basis of Comparison.

*San Francisco Bay Area, Central Coast, and Southern California Regions*

*Changes in Emissions of Criteria Air Pollutants and Precursors, and/or Exposure of Sensitive Receptors to Substantial Concentrations of Air Contaminants Related to Changes in Groundwater Pumping*

It is anticipated that CVP and SWP water supplies and emissions from diesel engines used for groundwater pumping would be similar in the San Francisco Bay Area, Central Coast, and Southern California regions under Alternative 3 as compared to the Second Basis of Comparison.

#### *21.4.3.5 Alternative 4*

The environmental justice conditions under Alternative 4 would be identical to the conditions under the Second Basis of Comparison; therefore, Alternative 4 is only compared to the No Action Alternative.

##### 21.4.3.5.1 Alternative 4 Compared to the No Action Alternative

The CVP and SWP operations under Alternative 4 are identical to the CVP and SWP operations under the Second Basis of Comparison and Alternative 1. Therefore, changes in environmental justice conditions under Alternative 4 as compared to the No Action Alternative would be the same as the impacts described in Section 12.4.3.2.1, Alternative 1 Compared to the No Action Alternative.

#### *21.4.3.6 Alternative 5*

As described in Chapter 3, Description of Alternatives, CVP and SWP operations under Alternative 5 are similar to the No Action Alternative with modified Old and Middle River flow criteria and New Melones Reservoir operations. As described in Chapter 4, Approach to Environmental Analysis, Alternative 5 is compared to the No Action Alternative and the Second Basis of Comparison.

##### 21.4.3.6.1 Alternative 5 Compared to the No Action Alternative

*Central Valley Region*

*Changes in Emissions of Criteria Air Pollutants and Precursors, and/or Exposure of Sensitive Receptors to Substantial Concentrations of Air Contaminants Related to Changes in Groundwater Pumping*

Groundwater pumping in the San Joaquin Valley portion of the Central Valley Region would be similar under Alternative 5 as compared to the No Action Alternative. Therefore, the emissions of criteria air pollutants and precursors, and/or exposure of sensitive receptors to substantial concentrations of air contaminants would be similar under Alternative 5 as compared to the No Action Alternative.

*Changes in Public Health Factors Related to Mercury in Fish used for Human Consumption*

Mercury concentrations in Largemouth Bass would be similar throughout the Delta under Alternative 5 as compared to the No Action Alternative, as summarized in Chapter 6, Surface Water Quality. All values exceed the threshold of 0.24 mg/kg ww for mercury.

*Effects Related to Cross Delta Water Transfers*

Potential effects to environmental justice factors could be similar to those identified in a recent environmental analysis conducted by Reclamation for long-term water transfers from the Sacramento to San Joaquin valleys (Reclamation 2014c) as described above under the No Action Alternative compared to the Second Basis of Comparison. For the purposes of this EIS, it is anticipated that similar conditions would occur during implementation of cross Delta water transfers under Alternative 5 and the No Action Alternative, and that impacts on environmental justice factors would not be substantial in the seller's service area due to implementation requirements of the transfer programs.

Under Alternative 5 and the No Action Alternative, the timing of cross Delta water transfers would be limited to July through September and include annual volumetric limits, in accordance with the 2008 USFWS BO and 2009 NMFS BO. Overall, the potential for cross Delta water transfers would be similar under Alternative 5 and the No Action Alternative.

*San Francisco Bay Area, Central Coast, and Southern California Regions*

*Changes in Emissions of Criteria Air Pollutants and Precursors, and/or Exposure of Sensitive Receptors to Substantial Concentrations of Air Contaminants Related to Changes in Groundwater Pumping*

It is anticipated that CVP and SWP water supplies and emissions from diesel engines used for groundwater pumping would be similar in the San Francisco Bay Area, Central Coast, and Southern California regions under Alternative 5 as compared to the No Action Alternative.

#### 21.4.3.6.2 Alternative 5 Compared to the Second Basis of Comparison

*Central Valley Region*

*Changes in Emissions of Criteria Air Pollutants and Precursors, and/or Exposure of Sensitive Receptors to Substantial Concentrations of Air Contaminants Related to Changes in Groundwater Pumping*

Groundwater pumping in the San Joaquin Valley portion of the Central Valley Region would increase by 8 percent under Alternative 5 as compared to the Second Basis of Comparison. It is not known if the additional groundwater pumping would rely upon electricity or diesel to drive the pump engines. Under the worst case analysis, it is assumed that the increased use of diesel engines would be proportional to the increased use of groundwater. Therefore, under Alternative 5, there would be a potential increase in emissions of criteria air pollutants and precursors, and/or exposure of sensitive receptors to substantial concentrations of air contaminants as compared to the Second Basis of Comparison.

*Changes in Public Health Factors Related to Mercury in Fish used for Human Consumption*

Mercury concentrations in Largemouth Bass would be similar in most locations in the Delta, except for Rock Slough, San Joaquin River near Antioch, and Montezuma Slough in Suisun Marsh. In these areas, the mercury concentrations would increase by 7 to 8 percent over long-term conditions under Alternative 5 as compared to the Second Basis of Comparison. During dry and critical dry years, mercury concentrations also would increase by 7 percent at intakes to Banks Pumping Plant and Jones Pumping Plant; and 13 percent at Rock Slough. All values exceed the threshold of 0.24 mg/kg ww for mercury.

*Effects Related to Cross Delta Water Transfers*

Potential effects to environmental justice factors could be similar to those identified in a recent environmental analysis conducted by Reclamation for long-term water transfers from the Sacramento to San Joaquin valleys (Reclamation 2014c) as described above under the No Action Alternative compared to the Second Basis of Comparison. For the purposes of this EIS, it is anticipated that similar conditions would occur during implementation of cross Delta water transfers under Alternative 5 and the Second Basis of Comparison, and that impacts on environmental justice factors would not be substantial in the seller's service area due to implementation requirements of the transfer programs.

Under Alternative 5, the timing of cross Delta water transfers would be limited to July through September and include annual volumetric limits, in accordance with the 2008 USFWS BO and 2009 NMFS BO. Under the Second Basis of Comparison, water could be transferred throughout the year without an annual volumetric limit. Overall, the potential for cross Delta water transfers would be reduced under Alternative 5 as compared to the Second Basis of Comparison.

*San Francisco Bay Area, Central Coast, and Southern California Regions*

*Changes in Emissions of Criteria Air Pollutants and Precursors, and/or Exposure of Sensitive Receptors to Substantial Concentrations of Air Contaminants Related to Changes in Groundwater Pumping*

It is anticipated that CVP and SWP water supplies would be decreased by 10 percent and 18 percent, respectively, in the San Francisco Bay Area, Central Coast, and Southern California regions under Alternative 5 as compared to the Second Basis of Comparison. The decrease in surface water supplies could result in increased use of groundwater pumps and emissions of air pollutants and contaminants if the use of diesel engines is also increased.

#### ***21.4.3.7 Summary of Environmental Consequences***

The results of the environmental consequences of implementation of Alternatives 1 through 5 as compared to the No Action Alternative and the Second Basis of Comparison are presented in Tables 21.38 and 21.39.

**Table 21.38 Comparison of Alternatives 1 through 5 to No Action Alternative**

| Alternative | Potential Change | Consideration for Mitigation Measures |
|---|---|---|
| Alternative 1 | Decrease potential for emissions of criteria air pollutants and precursors, and/or exposure of sensitive receptors to substantial concentrations of air contaminants by 8 percent in the Central Valley, 11 to 21 percent in the San Francisco Bay Area Region, and by 21 percent in the Central Coast and Southern California regions.<br>Similar mercury concentrations in Largemouth Bass in the most of the Delta; and a 6 percent decrease near Rock Slough, San Joaquin River at Antioch, and Montezuma Slough over the long-term conditions. | None needed |
| Alternative 2 | No effects on environmental justice factors. | None needed |
| Alternative 3 | Decrease potential for emissions of criteria air pollutants and precursors, and/or exposure of sensitive receptors to substantial concentrations of air contaminants by 6 percent in the Central Valley, 9 to 17 percent in the San Francisco Bay Area Region, and by 17 percent in the Central Coast and Southern California regions.<br>Similar mercury concentrations in Largemouth Bass in the most of the Delta; and a 6 percent decrease near San Joaquin River at Antioch and Montezuma Slough over the long-term conditions. | None needed |
| Alternative 4 | Same effects as described for Alternative 1 compared to the No Action Alternative. | None needed |
| Alternative 5 | Similar potential for emissions of criteria air pollutants and precursors, and/or exposure of sensitive receptors to substantial concentrations of air contaminants in the Central Valley, San Francisco Bay Area, Central Coast, and Southern California regions.<br>Similar mercury concentrations in Largemouth Bass throughout the Delta. | None needed |

Note: Due to the limitations and uncertainty in the CalSim II monthly model and other analytical tools, incremental differences of 5 percent or less between alternatives and the Second Basis of Comparison are considered to be "similar."

**Table 21.39 Comparison of Alternatives 1 through 5 to Second Basis of Comparison**

| Alternative | Potential Change | Consideration for Mitigation Measures |
|---|---|---|
| No Action Alternative | Increase potential for emissions of criteria air pollutants and precursors, and/or exposure of sensitive receptors to substantial concentrations of air contaminants by 8 percent in the Central Valley, 10 to 18 percent in the San Francisco Bay Area Region, and by 18 percent in the Central Coast and Southern California regions.<br>Similar mercury concentrations in Largemouth Bass in the most of the Delta; and a 7 percent increase near Rock Slough, San Joaquin River at Antioch, and Montezuma Slough over the long-term conditions. | Not considered for this comparison. |
| Alternative 1 | No effects on environmental justice factors. | Not considered for this comparison. |

| Alternative | Potential Change | Consideration for Mitigation Measures |
|---|---|---|
| Alternative 2 | Same effects as described for No Action Alternative as compared to the Second Basis of Comparison. | Not considered for this comparison. |
| Alternative 3 | Similar potential for emissions of criteria air pollutants and precursors, and/or exposure of sensitive receptors to substantial concentrations of air contaminants in the Central Valley, San Francisco Bay Area, Central Coast, and Southern California regions.<br>Similar mercury concentrations in Largemouth Bass throughout the Delta. | Not considered for this comparison. |
| Alternative 4 | No effects on environmental justice factors. | Not considered for this comparison. |
| Alternative 5 | Increase potential for emissions of criteria air pollutants and precursors, and/or exposure of sensitive receptors to substantial concentrations of air contaminants by 8 percent in the Central Valley, 10 to 18 percent in the San Francisco Bay Area Region, and by 18 percent in the Central Coast and Southern California regions.<br>Similar mercury concentrations in Largemouth Bass in the most of the Delta; and a 7 percent increase near Rock Slough, San Joaquin River at Antioch, and Montezuma Slough over the long-term conditions. | Not considered for this comparison. |

Note: Due to the limitations and uncertainty in the CalSim II monthly model and other analytical tools, incremental differences of 5 percent or less between alternatives and the Second Basis of Comparison are considered to be “similar.”

#### *21.4.3.8 Potential Mitigation Measures*

Mitigation measures are presented in this section to avoid, minimize, rectify, reduce, eliminate, or compensate for adverse environmental effects of Alternatives 1 through 5 as compared to the No Action Alternative. Mitigation measures were not included to address adverse impacts under the alternatives as compared to the Second Basis of Comparison because this analysis was included in this EIS for information purposes only.

Changes in CVP and SWP operations under Alternatives 1 through 5 as compared to the No Action Alternative would not result in changes in air quality or public health that are related to environmental justice factors. Therefore, there would be no disproportionately high or adverse environmental justice effects; and no mitigation measures are required.

#### *21.4.3.9 Cumulative Effects Analysis*

As described in Chapter 3, the cumulative effects analysis considers projects, programs, and policies that are not speculative; and are based upon known or reasonably foreseeable long-range plans, regulations, operating agreements, or other information that establishes them as reasonably foreseeable.

The cumulative effects analysis Alternatives 1 through 5 for Environmental Justice are summarized in Table 21.40.

**Table 21.4 Summary of Cumulative Effects on Environmental Justice of Alternatives 1 through 5 as Compared to the No Action Alternative**

| Scenarios | Actions | Cumulative Effects of Actions |
|---|---|---|
| Past & Present, and Future Actions included in the No Action Alternative and in all Alternatives in Year 2030 | Consistent with Affected Environment conditions plus:<br>Actions in the 2008 USFWS BO and 2009 NMFS BO that Would Have Occurred without Implementation of the Biological Opinions, as described in Section 3.3.1.2 (of Chapter 3, Descriptions of Alternatives), including climate change and sea level rise<br>Actions not included in the 2008 USFWS BO and 2009 NMFS BO that Would Have Occurred without Implementation of the Biological Opinions, as described in Section 3.3.1.3 (of Chapter 3, Descriptions of Alternatives):<br>• Implementation of Federal and state policies and programs, including Clean Water Act (e.g., Total Maximum Daily Loads); Safe Drinking Water Act; Clean Air Act; and flood management programs<br>• General plans for 2030.<br>• Trinity River Restoration Program.<br>• Central Valley Project Improvement Act programs<br>• Folsom Dam Water Control Manual Update<br>• FERC Relicensing for the Middle Fork of the American River Project<br>• Lower Mokelumne River Spawning Habitat Improvement Project<br>• Dutch Slough Tidal Marsh Restoration<br>• Suisun Marsh Habitat Management, Preservation, and Restoration Plan Implementation<br>• Tidal Wetland Restoration: Yolo Ranch, Northern Liberty Island Fish Restoration Project, Prospect Island Restoration Project, and Calhoun Cut/Lindsey Slough Tidal Habitat Restoration Project<br>• San Joaquin River Restoration Program<br>• Future water supply projects, including water recycling, desalination, groundwater banks and wellfields, and conveyance facilities (projects with completed environmental documents) | <u>These effects would be the same in all alternatives.</u><br>Climate change and sea level rise, development under the general plans, FERC relicensing projects, and some future projects to improve water quality and/or habitat are anticipated to reduce the availability of surface water, including CVP and SWP water supplies. This could result in increased groundwater withdrawals; and a portion of those groundwater pumps would rely upon diesel engines. Therefore, there would be an increased potential for emissions of criteria air pollutants and precursors, and/or exposure of sensitive receptors that could cause a disproportionately high and adverse impact on minority and low-income populations.<br>Mercury concentrations in fish tissue within the Delta will be either similar or greater than recent historical conditions because Phases 1 and 2 of the Delta Mercury Program would be completed by 2030, as mandated by the Central Valley RWQCB, including methylmercury control programs and reduction programs for total inorganic mercury. Due to the extent of these programs, it is anticipated that the programs would be initiated; however, future reductions in mercury sources and related reductions of mercury and methylmercury concentrations in fish tissue would actually occur after 2030. |

| Scenarios | Actions | Cumulative Effects of Actions |
|---|---|---|
| Future Actions considered as Cumulative Effects Actions in with all Alternatives in Year 2030 | Actions as described in Section 3.5 (of Chapter 3, Descriptions of Alternatives):<br>• Bay-Delta Water Quality Control Plan Update<br>• FERC Relicensing Projects<br>• Bay Delta Conservation Plan (including the California WaterFix alternative)<br>• Shasta Lake Water Resources, North-of-the-Delta Offstream Storage, Los Vaqueros Reservoir Expansion Phase 2, and Upper San Joaquin River Basin Storage Investigations<br>• El Dorado Water and Power Authority Supplemental Water Rights Project<br>• Sacramento River Water Reliability Project<br>• Semitropic Water Storage District Delta Wetlands<br>• North Bay Aqueduct Alternative Intake<br>• San Luis Reservoir Low Point Improvement Project<br>• Future water supply projects, including water recycling, desalination, groundwater banks and wellfields, and conveyance facilities (projects that did not have completed environmental documents during preparation of the EIS) | <u>These effects would be the same in all alternatives.</u><br>Future reasonably foreseeable storage and water supply projects would improve surface water reliability. These actions would reduce the potential for increased groundwater withdrawals; and reduce the potential for emissions of criteria air pollutants and precursors, and/or exposure of sensitive receptors that could cause a disproportionately high and adverse impact on minority and low-income populations. |
| No Action Alternative with Associated Cumulative Effects Actions in Year 2030 | Full implementation of the 2008 USFWS BO and 2009 NMFS BO | Climate change and sea level rise, FERC relicensing projects, and some future projects to improve water quality and/or habitat are anticipated to reduce the availability of surface water, including CVP and SWP water supplies. This could result in increased groundwater withdrawals; and a portion of those groundwater pumps would rely upon diesel engines. Therefore, there would be an increased potential for emissions of criteria air pollutants and precursors, and/or exposure of sensitive receptors that could cause a disproportionately high and adverse impact on minority and low-income populations.<br>Mercury concentrations in fish tissue within the Delta will be |

| Scenarios | Actions | Cumulative Effects of Actions |
|---|---|---|
| | | either similar or greater than recent historical conditions because Phases 1 and 2 of the Delta Mercury Program would be completed by 2030, as mandated by the Central Valley RWQCB, including methylmercury control programs and reduction programs for total inorganic mercury. Due to the extent of these programs, it is anticipated that the programs would be initiated; however, future reductions in mercury sources and related reductions of mercury and methylmercury concentrations in fish tissue would actually occur after 2030. |
| Alternative 1 with Associated Cumulative Effects Actions in Year 2030 | No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant) | Implementation of Alternative 1 with reasonably foreseeable actions would result in similar changes as under the No Action Alternative with these added actions. |
| Alternative 2 with Associated Cumulative Effects Actions in Year 2030 | Full implementation of the 2008 USFWS BO and 2009 NMFS BO CVP and SWP operational actions<br>No implementation of structural improvements or other actions that require further study to develop a more detailed action description. | Implementation of Alternative 2 with reasonably foreseeable actions would result in similar changes as under the No Action Alternative with these added actions. |
| Alternative 3 with Associated Cumulative Effects Actions in Year 2030 | No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant)<br>Slight increase in positive Old and Middle River flows in the winter and spring months | Implementation of Alternative 3 with reasonably foreseeable actions would result in similar changes as under the No Action Alternative with these added actions. |
| Alternative 4 with Associated Cumulative Effects Actions in Year 2030 | No implementation of the 2008 USFWS BO and 2009 NMFS BO actions unless the actions would have been implemented without the BO (e.g., Red Bluff Pumping Plant) | Implementation of Alternative 4 with reasonably foreseeable actions would result in similar changes as under the No Action Alternative with these added actions. |
| Alternative 5 with Associated Cumulative Effects Actions in Year 2030 | Full implementation of the 2008 USFWS BO and 2009 NMFS BO<br>Positive Old and Middle River flows and increased Delta outflow in spring months | Implementation of Alternative 5 with reasonably foreseeable actions would result in similar changes as under the No Action Alternative with these added actions. |

**Chapter 22**

# Other NEPA Requirements

## 22.1 Introduction

In addition to the factors described in Chapters 5 through 21, the National Environmental Policy Act (NEPA) requires consideration of the relationship of short-term uses and long-term productivity, consideration of irreversible and irretrievable commitments of resources, and growth-inducing impacts as compared to the No Action Alternative (40 Code of Federal Regulations [CFR] 1508.8). These considerations are described in the following sections of this chapter.

## 22.2 Relationship between Short-term Uses and Long-term Productivity

NEPA requires that an Environmental Impact Statement (EIS) prepared by Federal agencies disclose "…the relationship between short-term uses of man's environment and the maintenance and enhancement of long-term productivity…" (40 CFR 1502.16). As discussed in Chapter 1, Introduction, this EIS evaluates long-term potential direct, indirect, and cumulative impacts on the environment that could result from implementation of alternatives for the continued long-term operation of the Central Valley Project (CVP) and State Water Project (SWP) and implementation of ecosystem restoration. This EIS does not evaluate short-term impacts related to implementing project-specific actions, such as impacts during construction and/or start-up periods for actions that are not fully defined at this time and that may be implemented by Reclamation or other agencies as part of the alternatives. It is recognized that numerous projects would be planned, designed, and constructed under the No Action Alternative and the Second Basis of Comparison, including tidal wetlands and floodplain restoration, as described in Chapter 3, Description of Alternatives. It also recognized that facilities to implement fish passage at CVP reservoirs would be implemented under the No Action Alternative and Alternative 5; and facilities to implement a trap and haul program for steelhead from the San Joaquin River under Alternative 4. Project-specific construction impacts would be addressed in project-specific environmental documents prepared at the time the projects are proposed for approval. At this time, however, the need for, and the nature, magnitude, and extent of specific impacts are not known.

Potential long-term effects (beneficial and adverse) of implementation of Alternatives 1 through 5 as compared to the No Action Alternative with respect to each environmental resource are summarized in Table 22.1.

There would be no long-term effects related to geology and soils resources, agricultural resources, land use, cultural resources, and Indian Trust Assets because the conditions under Alternatives 1 through 5 would be similar to conditions under the No Action Alternative and to the Second Basis of Comparison.

A complete listing of the effects of implementation of Alternatives 1 through 5 as compared to the No Action Alternative and to the Second Basis of Comparison are included Chapter 3, Description of Alternatives.

**Table 22.1 Long-term Effects of Implementation of the No Action Alternative and Alternatives 1 through 5**

| Environmental Resources | Comparison of Alternatives 1 through 5 and the No Action Alternative |
|---|---|
| **Surface Water** | |
| Trinity Lake | Water surface elevations similar in Alternatives 1 through 5 and the No Action Alternative.<br>Storage under Alternatives 1, 3, and 4 is higher than under Alternatives 2 and 5 and the No Action Alternative. |
| Trinity River at Lewiston Dam | Flows similar or higher in November-December under Alternatives 1, 3, and 4 than under Alternatives 2 and 5 and the No Action Alternative.<br>Similar flows in other months. |
| Shasta Lake | Water surface elevations similar in Alternatives 1 through 5 and the No Action Alternative.<br>Storage under Alternatives 1, 3, and 4 is higher than under Alternatives 2 and 5 and the No Action Alternative. |
| Sacramento River at Keswick Dam | Flows similar or higher in December-August under Alternatives 1, 3, and 4 than under Alternatives 2 and 5 and the No Action Alternative.<br>Flows higher in September-November under Alternatives 2 and 5 and the No Action Alternative than under Alternatives 1, 3, and 4. |
| Sacramento River at Freeport | Flows similar or higher under Alternatives 1 and 4 than under Alternative 3; and flows higher under Alternative 3 than under Alternatives 2 and 5 and the No Action Alternative in May-June.<br>Flows higher in July-December under Alternatives 2 and 5 and the No Action Alternative than under Alternative 3; and flows higher under Alternative 3 than under Alternatives 1 and 4. |
| Clear Creek near Igo | Flows are similar under Alternatives 1 through 5 and the No Action Alternative in June-April.<br>Flows under Alternatives 2 and 5 and the No Action Alternative are higher in May than under Alternatives 1, 3, and 4. |
| Lake Oroville | Water surface elevations similar in Alternatives 1 through 5 and the No Action Alternative.<br>Storage under Alternatives 1, 3, and 4 is higher than under Alternatives 2 and 5 and the No Action Alternative. |
| Feather River downstream of Thermalito Complex | Flows under Alternatives 1, 3, and 4 similar or higher than under Alternatives 2 and 5 and the No Action Alternative. |

| Environmental Resources | Comparison of Alternatives 1 through 5 and the No Action Alternative |
|---|---|
| Folsom Lake | Water surface elevations similar in Alternatives 1 through 5 and the No Action Alternative.<br>Storage under Alternatives 1, 3, and 4 is higher in October-January than under Alternatives 2 and 5 and the No Action Alternative.<br>Storage under Alternatives 2 and 5 and the No Action Alternative are higher in August-September than under Alternatives 1, 3, and 4.<br>Storage similar under February-July in Alternatives 1 through 5 and the No Action Alternative. |
| American River at Nimbus Dam | Flows under Alternatives 1, 3, and 4 similar or higher than under Alternatives 2 and 5 and the No Action Alternative. |
| New Melones Reservoir | Water surface elevations similar in Alternatives 1 through 5 and the No Action Alternative.<br>Storage under Alternative 3 is higher than under Alternatives 1 and 4; and storage under Alternatives 1 and 4 are higher than under Alternatives 2 and 5 and the No Action Alternative. |
| Stanislaus River at Goodwin Dam | Flows higher under Alternatives 1 and 4 than under Alternative 3; and flows under Alternative 3 are higher than under Alternative 5 and the No Action Alternative.<br>Flows under Alternative 5 higher than under the No Action Alternative in April-May. |
| San Joaquin River at Vernalis | Flows higher in October under the Alternatives 2 and 5 and the No Action Alternative than under Alternatives 1, 3, and 4.<br>Flows higher in April under Alternative 5 than under all other alternatives.<br>Flows higher in May under Alternatives 1 and 4 than under Alternatives 3 and 5 and the No Action Alternative.<br>Flows similar during other months. |
| San Luis Reservoir | Water surface elevations similar in Alternatives 1 through 5 and the No Action Alternative.<br>Storage under Alternatives 1 and 4 higher than under Alternative 3; and storage under Alternatives 2 and 5 and the No Action Alternative.<br>Storage under Alternatives 2 and the No Action Alternative higher than under Alternative 5 in dry and critical dry years. |
| Flows into Yolo Bypass | Flows entering the Yolo Bypass at Fremont Weir higher under Alternatives 1, 3, and 4 than under Alternatives 2 and 5 and the No Action Alternative. |
| Delta Outflow | Delta outflow higher under Alternatives 2 and 5 and the No Action Alternative than under Alternatives 1, 3, and 4. |
| Reverse Flows in Old and Middle Rivers | Old and Middle River flows in April-May more positive under Alternative 5 than under Alternative 2 and the No Action Alternative.<br>Old and Middle River flows in July more positive under Alternatives 1 and 4 than under Alternative 3; and under Alternative 3 than under Alternatives 2 and 5 and the No Action Alternative.<br>Old and Middle River flows in other months higher under Alternatives 2 and 5 and the No Action Alternative than Alternative 3; and higher under Alternative 3 than under Alternatives 1 and 4. |
| **Water Supplies** | |
| Non-CVP and Non-SWP Deliveries | Water deliveries under Alternatives 1 through 5 and the No Action Alternative. |
| CVP Water Deliveries | Water deliveries higher under Alternatives 1 and 4 than under Alternative 3; and higher under Alternative 3 than under Alternatives 2 and 5 and the No Action Alternative. |

| Environmental Resources | Comparison of Alternatives 1 through 5 and the No Action Alternative |
|---|---|
| SWP Water Deliveries | Water deliveries higher under Alternatives 1 and 4 than under Alternative 3; and higher under Alternative 3 than under Alternatives 2 and 5 and the No Action Alternative. |
| **Surface Water Quality** | |
| Salinity in Northern Delta (near Emmaton) | Salinity in September-January under Alternatives 1, 3, and 4 than under Alternatives 2 and 5 and the No Action Alternative.<br>Salinity in February-August under Alternatives 2 and 5 and the No Action Alternative higher than under Alternatives 1, 3, and 4. |
| Salinity in Western Delta (near Port Chicago) | Salinity in September-January under Alternatives 1, 3, and 4 than under Alternatives 2 and 5 and the No Action Alternative.<br>Salinity in February-August under Alternatives 2 and 5 and the No Action Alternative higher than under Alternatives 1, 3, and 4. |
| Salinity in Western Central Delta (near Antioch) | Salinity in September-January under Alternatives 1, 3, and 4 than under Alternatives 2 and 5 and the No Action Alternative.<br>Salinity in February-August under Alternatives 2 and 5 and the No Action Alternative higher than under Alternatives 1, 3, and 4. |
| Salinity in Western Central Delta (near Contra Costa Water District Intakes) | Salinity in September-January under Alternatives 1, 3, and 4 than under Alternatives 2 and 5 and the No Action Alternative.<br>Salinity in February-August under Alternatives 2 and 5 and the No Action Alternative higher than under Alternatives 1, 3, and 4. |
| Salinity in Southern Delta (near CVP and SWP intakes) | Salinity under Alternatives 1 and 4 higher than under Alternative 3; and salinity under Alternative 3 higher than under Alternatives 2 and 5 and the No Action Alternative. |
| Mercury in Delta Fish | Mercury concentrations in fish tissue of large fish in the Delta used for human consumption would exceed guidelines established by the State of California under Alternatives 1 through 5 and the No Action Alternative.<br>In the interior Delta along the San Joaquin River and at the CVP Contra Costa Canal Pumping Plant, mercury concentrations in the tissue of large fish used for human consumption would be the higher under Alternative 5 than under Alternative 3. Mercury under Alternative 3 would be higher than under Alternative 2 and the No Action Alternative. Mercury under Alternative 2 and the No Action Alternative would be higher than under Alternatives 1 and 4.<br>Near Suisun Marsh and Cache Slough, mercury concentrations would be higher under Alternative 2 and the No Action Alternative than under Alternatives 1 and 4. Mercury under Alternatives 1 and 4 would be higher than under Alternative 5; and concentrations under Alternative 5 would be higher than under Alternative 3.<br>Along Old River near Clifton Court, mercury concentrations in the tissue of large fish used for human consumption would be higher under Alternative 2 and the No Action Alternative than under Alternative 5. Mercury under Alternative 5 would be higher than under Alternative 3. Mercury under Alternative 3 would be higher than under Alternatives 1 and 4.<br>Near the CVP Jones Pumping Plant intake, mercury concentrations in the tissue of large fish used for human consumption would be higher under Alternative 2 and the No Action Alternative than under Alternative 3. Mercury under Alternative 3 would be higher than under Alternatives 1 and 4. Mercury under Alternatives 1 and 4 would be higher than under Alternative 5. |
| Selenium in Delta and Delta Fish | Selenium concentrations similar under Alternatives 1 through 5 and the No Action Alternative. |

| Environmental Resources | Comparison of Alternatives 1 through 5 and the No Action Alternative |
|---|---|
| **Groundwater Resources** | |
| Trinity River Region | Similar groundwater conditions under Alternatives 1 through 5 and the No Action Alternative. |
| Central Valley Region: Sacramento Valley | Similar groundwater conditions under Alternatives 1 through 5 and the No Action Alternative. |
| Central Valley Region: San Joaquin Valley | Groundwater pumping would be higher under Alternative 5 than under Alternative 2 and the No Action Alternative. Pumping would be higher under Alternative 2 and the No Action Alternative than under Alternative 3. Pumping would be higher under Alternative 3 than under Alternatives 1 and 4. Increased groundwater pumping would result in lower groundwater elevations and increased subsidence potential. |
| San Francisco Bay Area, Central Coast, and Southern California Region | Groundwater pumping would be higher under Alternative 5 than under Alternative 2 and the No Action Alternative. Pumping would be higher under Alternative 2 and the No Action Alternative than under Alternative 3. Pumping would be higher under Alternative 3 than under Alternatives 1 and 4. Increased groundwater pumping would result in lower groundwater elevations and increased subsidence potential. |
| **CVP and SWP Energy Resources** | |
| Energy Generated and Used by CVP and SWP Water Users | CVP net energy generation would be higher under Alternative 2 and the No Action Alternative than under Alternatives 1 and 4. Net energy generation would be higher under Alternatives 1 and 4 than under Alternative 3. Net energy generation would be higher under Alternative 3 than under Alternative 5.<br>SWP net energy generation would be higher under Alternative 2 and the No Action Alternative than under Alternative 5. Net energy generation would be higher under Alternative 5 than under Alternative 3. Net energy generation would be higher under Alternative 3 than under Alternatives 1 and 4.<br>Energy use by CVP and SWP water users for alternative water supplies would be higher under Alternative 5 than under Alternative 2 and the No Action Alternative. Energy use would be higher under Alternative 2 and the No Action Alternative than under Alternative 3. Energy use would be higher under Alternative 3 than under Alternatives 1 and 4. |
| **Aquatic Resources** | |
| Trinity River: Coho Salmon | Habitat conditions would be similar under Alternatives 1 through 5 and the No Action Alternative. |
| Trinity River: Spring-run Chinook Salmon | Habitat conditions would be similar under Alternatives 1 through 5 and the No Action Alternative. |
| Trinity River: Fall-run Chinook Salmon | Habitat conditions would be similar under Alternatives 1 through 5 and the No Action Alternative. |
| Trinity River: Steelhead | Habitat conditions would be similar under Alternatives 1 through 5 and the No Action Alternative. |
| Trinity River: Green Sturgeon | Habitat conditions would be similar under Alternatives 1 through 5 and the No Action Alternative. |
| Trinity Lake and Lewiston Reservoir: Reservoir Fish | Habitat conditions would be similar under Alternatives 1 through 5 and the No Action Alternative. |
| Trinity River: Pacific Lamprey | Habitat conditions would be similar under Alternatives 1 through 5 and the No Action Alternative. |
| Trinity River: Eulachon | Habitat conditions would be similar under Alternatives 1 through 5 and the No Action Alternative. |

| Environmental Resources | Comparison of Alternatives 1 through 5 and the No Action Alternative |
|---|---|
| Sacramento River System: Winter-run Chinook Salmon | Habitat conditions would be better under Alternative 5 and the No Action Alternative than under Alternative 2. Conditions under Alternative 2 would be better than under Alternatives 3 and 4. Conditions under Alternative 3 and 4 would be better than under Alternative 1. |
| Sacramento River System: Spring-run Chinook Salmon | Habitat conditions would be better under Alternative 5 and the No Action Alternative than under Alternative 2. Conditions under Alternative 2 would be better than under Alternatives 3 and 4. Conditions under Alternative 3 and 4 would be better than under Alternative 1. |
| Sacramento River System: Fall-run Chinook Salmon | Habitat conditions under Alternatives 1, 3, 4, and 5 and the No Action Alternative would be better than under Alternative 2. |
| Sacramento River System: Late Fall-run Chinook Salmon | Habitat conditions under Alternatives 1, 3, 4, and 5 and the No Action Alternative would be better than under Alternative 2. |
| Sacramento River System: Steelhead | Habitat conditions would be better under Alternative 5 and the No Action Alternative than under Alternative 2. Conditions under Alternative 2 would be better than under Alternatives 3 and 4. Conditions under Alternative 3 and 4 would be better than under Alternative 1. |
| Sacramento River System: Green Sturgeon and White Sturgeon | Habitat conditions would be better under Alternative 3 than under Alternatives 1 and 4. Conditions under Alternative 4 would be better than under Alternatives 2 and 5 and the No Action Alternative. |
| Delta: Delta Smelt | Habitat conditions would better under Alternatives 2 and 5 and the No Action Alternative than under Alternatives 1, 3, and 4. |
| Delta: Longfin Smelt | Habitat conditions would better under Alternatives 2 and 5 and the No Action Alternative than under Alternatives 1, 3, and 4. |
| Delta: Sacramento Splittail | Habitat conditions would better under Alternatives 2 and 5 and the No Action Alternative than under Alternatives 1, 3, and 4. |
| Sacramento River System: Reservoir Fish | Habitat conditions would be similar under Alternatives 1 through 5 and the No Action Alternative. |
| Sacramento River System: Pacific Lamprey | Habitat conditions would be similar under Alternatives 1 through 5 and the No Action Alternative. |
| Sacramento River System: Striped Bass, American Shad, and Hardhead | Habitat conditions for Hardhead and American Shad would be similar under Alternatives 1 through 5 and the No Action Alternative.<br>Habitat conditions for Striped Bass would better under Alternatives 1, 2, and 5 and the No Action Alternative than under Alternatives 3 and 4 due to increased harvest limits. |
| Stanislaus River: Fall-run Chinook Salmon | Habitat conditions better under Alternatives 3 and 4 than under Alternatives 1, 2, and 5 and the No Action Alternative. |
| Stanislaus River: Steelhead | Habitat conditions better under Alternative 5 and the No Action Alternative than under Alternatives 3 and 4. Conditions under Alternatives 3 and 4 are better than under Alternatives 1 and 2. |
| Stanislaus River: White Sturgeon | Habitat conditions better under Alternatives 2 and 5 and the No Action Alternative than under Alternatives 1, 3, and 4. |
| New Melones Reservoir; Reservoir Fish | Habitat conditions would be similar under Alternatives 1 through 5 and the No Action Alternative. |
| Stanislaus River: Other Fish | Habitat conditions for Hardhead and American Shad would be similar under Alternatives 1 through 5 and the No Action Alternative.<br>Habitat conditions for Striped Bass would better under Alternatives 1, 2, and 5 and the No Action Alternative than under Alternatives 3 and 4 due to increased harvest limits. |

| Environmental Resources | Comparison of Alternatives 1 through 5 and the No Action Alternative |
|---|---|
| Pacific Ocean: Killer Whale | Habitat conditions would be similar under Alternatives 1 through 5 and the No Action Alternative. |
| **Terrestrial Resources** | |
| Terrestrial Resources along Shoreline of CVP and SWP Reservoirs | Habitat conditions would be similar under Alternatives 1 through 5 and the No Action Alternative. |
| Terrestrial Resources along Rivers Downstream of CVP and SWP Reservoirs | Habitat conditions along Trinity, Sacramento, American, and Feather rivers would be similar under Alternatives 1 through 5 and the No Action Alternative.<br>Habitat conditions along the Stanislaus River would be better under Alternatives 2 and 5 and the No Action Alternative than under Alternatives 1, 3, and 4. |
| Terrestrial Resources in Yolo Bypass | Habitat conditions would be similar under Alternatives 1 through 5 and the No Action Alternative. |
| Terrestrial Resources in Western Delta | Freshwater habitat in the western Delta would be better under Alternatives 2 and 5 and the No Action Alternative than under Alternatives 1, 3, and 4. |
| **Geology and Soils Resources** | |
| Geology and Soils Resources | Geology and soils conditions would be similar under Alternatives 1 through 5 and the No Action Alternative. |
| **Agricultural Resources** | |
| Agricultural Production and Employment | Agricultural production and employment conditions would be similar under Alternatives 1 through 5 and the No Action Alternative. |
| **Land Use** | |
| Municipal and Industrial Land Use | Municipal and industrial land use conditions would be similar under Alternatives 1 through 5 and the No Action Alternative. |
| **Visual Resources** | |
| Visual Resources of Land Irrigated with CVP and SWP Water | Visual resource conditions would be similar under Alternatives 1 through 5 and the No Action Alternative. |
| Visual Resources at Reservoirs that Store CVP and SWP Water | Visual resource conditions would be similar under Alternatives 1 through 5 and the No Action Alternative. |
| **Recreation Resources** | |
| Recreation Resources at Reservoirs that Store CVP and SWP Water | Recreational resource conditions at the reservoirs would be similar under Alternatives 1 through 5 and the No Action Alternative. |
| Recreation Resources in Rivers downstream of CVP and SWP Reservoirs | Recreational resource conditions at the along the rivers would be similar under Alternatives 1 through 5 and the No Action Alternative.<br>Recreational resource conditions related to Striped Bass fishing and sport ocean salmon fishing would be better under Alternatives 1, 2, and 5 and the No Action Alternative than under Alternatives 3 and 4 due to increased harvest limitations. |

| Environmental Resources | Comparison of Alternatives 1 through 5 and the No Action Alternative |
|---|---|
| **Air Quality and Greenhouse Gas Emissions** | |
| Emissions of Criteria Air Pollutants and Precursors and/or Exposure of Sensitive Receptors to Substantial Concentrations of Air Contaminants from Diesel Engines at Groundwater Wells | In the San Joaquin Valley and the San Francisco Bay Area, Central Coast, and Southern California regions, potential emissions from diesel engines used for groundwater pumping would be higher under Alternative 5 than under Alternative 2 and the No Action Alternative. Emissions would be higher under Alternative 2 and the No Action Alternative than under Alternative 3. Emissions would be higher under Alternative 3 than under Alternatives 1 and 4. |
| Increased Greenhouse Gas Emissions (GHG) due to Changes in Energy Resources Related to CVP and SWP Water Use | Overall changes are not known at this time due to complexity of energy demands associated with alternative water supplies. However, GHG emissions could increase due to energy use related to alternative water supplies. Energy use by CVP and SWP water users for alternative water supplies would be higher under Alternative 5 than under Alternative 2 and the No Action Alternative. Energy use would be higher under Alternative 2 and the No Action Alternative than under Alternative 3. Energy use would be higher under Alternative 3 than under Alternatives 1 and 4. |
| **Cultural Resources** | |
| Potential for Disturbance of Cultural Resources | Cultural resource conditions would be similar under Alternatives 1 through 5 and the No Action Alternative. |
| **Public Health** | |
| Water Supply Availability for Wildland Firefighting | Water supply conditions for fighting wildland firefighting would be similar under Alternatives 1 through 5 and the No Action Alternative. |
| Potential Exposure to Mercury in Fish in Delta | Mercury concentrations in fish tissue of large fish in the Delta used for human consumption would exceed guidelines established by the State of California under Alternatives 1 through 5 and the No Action Alternative.<br>In the interior Delta along the San Joaquin River and at the CVP Contra Costa Canal Pumping Plant, mercury concentrations in the tissue of large fish used for human consumption would be the higher under Alternative 5 than under Alternative 3. Mercury under Alternative 3 would be higher than under Alternative 2 and the No Action Alternative. Mercury under Alternative 2 and the No Action Alternative would be higher than under Alternatives 1 and 4.<br>Near Suisun Marsh and Cache Slough, mercury concentrations would be higher under Alternative 2 and the No Action Alternative than under Alternatives 1 and 4. Mercury under Alternatives 1 and 4 would be higher than under Alternative 5; and concentrations under Alternative 5 would be higher than under Alternative 3.<br>Along Old River near Clifton Court, mercury concentrations in the tissue of large fish used for human consumption would be higher under Alternative 2 and the No Action Alternative than under Alternative 5. Mercury under Alternative 5 would be higher than under Alternative 3. Mercury under Alternative 3 would be higher than under Alternatives 1 and 4.<br>Near the CVP Jones Pumping Plant intake, mercury concentrations in the tissue of large fish used for human consumption would be higher under Alternative 2 and the No Action Alternative than under Alternative 3. Mercury under Alternative 3 would be higher than under Alternatives 1 and 4. Mercury under Alternatives 1 and 4 would be higher than under Alternative 5. |
| **Socioeconomics** | |
| Agricultural and Municipal and Industrial Employment | Agricultural, municipal, and industrial employment would be similar under Alternatives 1 through 5 and the No Action Alternative. |

| Environmental Resources | Comparison of Alternatives 1 through 5 and the No Action Alternative |
|---|---|
| Municipal and Industrial Water Supply Operating Expenses | Municipal and industrial water supply operating expenses would be similar under Alternatives 1 through 5 and the No Action Alternative. |
| Recreational Economics CVP and SWP Reservoirs | Recreational economic conditions would be similar under Alternatives 1 through 5 and the No Action Alternative. |
| Recreational Economics Related to Striped Bass Fishing in Delta | Recreational economic conditions related to Striped Bass fishing would be better under Alternatives 1, 2, and 5 and the No Action Alternative than under Alternatives 3 and 4 due to changes in harvest limitations. |
| Commercial and Sport Ocean Salmon Fishing | Recreational economic conditions related to commercial and sport ocean salmon fishing would be better under Alternatives 1, 2, and 5 and the No Action Alternative than under Alternatives 3 and 4 due to changes in harvest limitations. |
| **Indian Trust Assets** | |
| Potential for Disturbance of Indian Trust Assets | Indian Trust Asset conditions would be similar under Alternatives 1 through 5 and the No Action Alternative. |
| **Environmental Justice** | |
| Emissions of Criteria Air Pollutants and Precursors and/or Exposure of Sensitive Receptors to Substantial Concentrations of Air Contaminants from Diesel Engines at Groundwater Wells | In the San Joaquin Valley, potential emissions from diesel engines used for groundwater pumping would be higher under Alternative 5 than under Alternative 2 and the No Action Alternative. Emissions would be higher under Alternative 2 and the No Action Alternative than under Alternative 3. Emissions would be higher under Alternative 3 than under Alternatives 1 and 4. |
| Potential Exposure to Mercury in Fish in Delta | Mercury concentrations in fish tissue of large fish in the Delta used for human consumption would exceed guidelines established by the State of California under Alternatives 1 through 5 and the No Action Alternative.<br>In the interior Delta along the San Joaquin River and at the CVP Contra Costa Canal Pumping Plant, mercury concentrations in the tissue of large fish used for human consumption would be the higher under Alternative 5 than under Alternative 3. Mercury under Alternative 3 would be higher than under Alternative 2 and the No Action Alternative. Mercury under Alternative 2 and the No Action Alternative would be higher than under Alternatives 1 and 4.<br>Near Suisun Marsh and Cache Slough, mercury concentrations would be higher under Alternative 2 and the No Action Alternative than under Alternatives 1 and 4. Mercury under Alternatives 1 and 4 would be higher than under Alternative 5; and concentrations under Alternative 5 would be higher than under Alternative 3.<br>Along Old River near Clifton Court, mercury concentrations in the tissue of large fish used for human consumption would be higher under Alternative 2 and the No Action Alternative than under Alternative 5. Mercury under Alternative 5 would be higher than under Alternative 3. Mercury under Alternative 3 would be higher than under Alternatives 1 and 4.<br>Near the CVP Jones Pumping Plant intake, mercury concentrations in the tissue of large fish used for human consumption would be higher under Alternative 2 and the No Action Alternative than under Alternative 3. Mercury under Alternative 3 would be higher than under Alternatives 1 and 4. Mercury under Alternatives 1 and 4 would be higher than under Alternative 5. |

## 22.3 Irreversible and Irretrievable Commitments of Resources

NEPA requires that an EIS prepared by Federal agencies disclose "…any irreversible and irretrievable commitments of resources which would be involved in the proposed action should it be implemented…" (40 CFR 1502.16). An irreversible and irretrievable commitment of resources includes use of natural or depletable resources, including consumption of construction materials and nonrenewable energy sources, and permanent conversion of land uses or habitat.

As described in Chapter 3, Description of Alternatives, there are several ongoing projects that are assumed to be implemented by 2030, such as Grasslands Bypass Project which is currently under construction. It is assumed that these projects would be included in the No Action Alternative, all other alternatives, and Second Basis of Comparison. The 2030 conditions assume the projected long-term conditions for each ongoing project as described in their respective environmental documents. This analysis does not address the construction activities of each ongoing project because those impacts were addressed in separate environmental documents for each project.

The alternatives include several future actions that would require construction, such as implementation of tidal wetlands and floodplains, fish passage facilities, or temperature control devices at CVP dams. Specific details for location and construction of these future projects are not identified at this time and are not addressed in this EIS. Future environmental documents would be prepared to analyze potential environmental consequences related to specific construction and operations. This EIS analyzes implementation of the alternatives with the assumption that these projects would be implemented by 2030; however, this EIS does not address irreversible and irretrievable commitment of resources associated with consumption of construction materials and permanent conversion of land uses or habitat.

Changes in nonrenewable energy resources would occur through implementation of the No Action Alternative and Alternatives 1 through 5. Under the alternatives, energy would be generated by CVP and SWP operations and used to convey water in CVP and SWP facilities. As discussed in Chapter 8, Energy, changes in CVP and SWP energy generation and use would result in the ability to provide additional energy for use by others or the need to purchase additional energy from others to operate the CVP and SWP facilities. Under both long-term average conditions and dry/critical dry water years, Alternative 5 would result in the least demand for electrical generation by others which would generally be produced using fossil fuels. The No Action Alternative and Alternative 2 would require more electrical generation by non-CVP and SWP facilities than Alternative 5; and less electrical generation than under Alternatives 1, 3, and 4. Alternative 1 would require the most electrical generation as compared to other alternatives.

## 22.4 Growth-Inducing Impacts

NEPA requires that an EIS prepared by Federal agencies evaluate indirect growth-inducing effects (40 CFR 1508.8). A project could result in growth-inducing impacts through several measures, including the removal of obstacles to population growth, or actions that encourage and facilitate other activities beyond those proposed by the project. The availability of adequate water supplies, employment opportunities, and improved cultural amenities are examples of actions that could be growth-inducing impacts. Growth inducement may or may not be detrimental, beneficial, or significant. However, if the induced growth impacted the environment, or the ability of agencies to provide public services to an extent not envisioned due to the project actions, the impacts would be considered to be adverse.

As described in Chapter 13, Land Use, and Chapter 19, Socioeconomics, land use and growth projections are not anticipated to change under Alternatives 1 through 5 as compared to the No Action Alternative and the Second Basis of Comparison. Municipal and industrial water users that use CVP and SWP water have prepared Urban Water Management Plans (UWMPs) that project water demand and future water supplies to meet the demands by 2030, including water conservation measures. Projects that had undergone environmental review, were under design, or under construction were considered to exist in 2030 water supply assumptions in the No Action Alternative, Alternatives 1 through 5, and the Second Basis of Comparison. Future projects described in the UWMPs that are under evaluation are considered as options to increase fixed-yield supplies, including additional groundwater pumping, water transfers, recycling water treatment, and desalination water treatment. Existing and future water supplies considered for municipalities by 2030 are presented in Appendix 5B, Future Municipal Water Supplies for CVP and SWP Water Users. For smaller water users that are not addressed in a UWMP, information was obtained from water master plans and integrated regional water management plans. The analysis presented in Chapter 19, indicated that use of the existing and planned future projects would be adequate to meet the water demands in 2030 with or without the CVP and SWP water supply availability under the alternatives considered in this EIS.

Alternatives 1, 3, and 4 would result in higher CVP and SWP water deliveries than the No Action Alternative and Alternatives 2 and 5. However, the additional water supplies under Alternatives 1, 3, and 4 would result in less groundwater pumping and less water transfers which could result in less potential for groundwater overdraft and soil subsidence, and less potential impacts in the service area of the seller for the transfer water. None of the alternatives considered in this EIS would increase the total water supplies to meet 2030 water demands; and therefore, none of the alternatives considered in this EIS are considered to be growth inducing.

This page left blank intentionally.

Chapter 23

# Consultation and Coordination

## 23.1 Introduction

This chapter summarizes completed, ongoing, and anticipated public outreach and agency involvement efforts related to preparation of the Environmental Impact Statement (EIS) for the coordinated long-term operation of the Central Valley Project (CVP) and State Water Project (SWP).

## 23.2 Consultation with the Public and Interested Parties

Consultation activities were initiated in 2012 with the scoping process and continued through the preparation of the Final EIS. In this section, the term "interested parties" includes representatives from agencies, utilities, agencies, organizations, and other entities.

### 23.2.1 Scoping Process

As described in Chapters 1 and 3, the scoping process was initiated on March 28, 2012, with the publication of the Notice of Intent (NOI) in the Federal Register and continued through June 28, 2012. Initially the public scoping process was to be completed on May 29, 2012. During the public scoping process, other agencies and interested persons requested an extension of the public scoping process to allow additional opportunities to provide scoping comments. In response to these requests, U.S. Department of the Interior, Bureau of Reclamation (Reclamation) published a notice on May 25, 2012, to extend the public scoping period through June 28, 2012.

Scoping meetings were held to inform the public and interested stakeholders about the project, and to solicit comments and input on the EIS. The scoping meetings were held in the following locations and resulted in the following level of public participation:

- Madera, California on April 25, 2012 (6 participants)
- Diamond Bar, California on April 26, 2012 (3 participants)
- Sacramento, California on May 2, 2012 (15 participants)
- Marysville, California on May 3, 2012 (2 participants)
- Los Banos, California on May 22, 2012 (230 participants)

Reclamation posted the scoping notices in the Federal Register, on its website, and in newspapers that served areas where the scoping meetings were held. Reclamation also published press releases to news organizations and others that have requested notifications for all press releases.

Each participant in the scoping meetings was invited to sign an attendance sheet and provided with an agenda, fact sheet, comment card, and speaker card. The agenda, fact sheet, and comment card were available in both English and Spanish.

Each scoping meeting began with a presentation by Reclamation. The presentation described the purpose of the meeting and the public scoping process, an overview of the reasons that Reclamation was preparing the EIS, description of the process and schedule that Reclamation will use to complete the EIS, and methods to provide comments at the scoping meeting and subsequently until the end of the public scoping period. The participants were encouraged to submit written comments by mail, email, or fax until the close of the public scoping comment period. During the presentation, Reclamation responded to questions as they arose from the meeting participants. Following the presentation, Reclamation heard testimony from those who presented oral comments. Oral comments were recorded by a transcriber. Reclamation offered to provide Spanish translation of the presentation and oral comments at each scoping meeting; however, the translation service was only requested and provided at the scoping meeting in Los Banos, California.

The scoping comments included suggestions related to:

- Purpose and need for the action.
- Geographical extent of the Project Area.
- Definition and assumptions of the No Action Alternative.
- Definition and assumptions of the action alternatives.
- Important considerations either for description of the affected environment or for the methods of analyses for the following resources:
  - Water resources.
  - Biological resources.
  - Land use and socioeconomics.
  - Air quality.
  - Recreation and visual resources.

Scoping comments were used in the development of a reasonable range of alternatives and identification of key issues that would require analysis in the Environmental Consequences sections of this EIS, as described in Chapters 3.

Scoping comments also were used in development of the level of detail and methods of analyses for water resources, biological resources, land use, socioeconomics, recreation, air quality, and visual resources. These resources are discussed in Chapters 5 through 10, 12 through 17, and 19 through 21.

Reclamation also posted on its website an initial range of alternatives discussed at the meeting on October 19, 2012 of invited stakeholders. As described in Chapter 3, Description of Alternatives, comments received during that process were used to refine the description of the alternatives.

Project status meetings were held with cooperating agencies and other stakeholders during preparation of the Draft EIS, including meetings in Sacramento, California on January 16, May 29, and November 5, 2014; February 20, 2015; and June 24, 2015.

The scoping report is included in Appendix 23A, Scoping Report.

### 23.2.2 Other Activities

Reclamation established a website which includes the background material related to the purpose and need for the action, materials used in the scoping process, scoping comments, and information related to meetings with invited stakeholders and interest groups to discuss assumptions to be considered in the development of the No Action Alternative and action alternatives. As described in Chapter 3, comments received on the information posted on Reclamation's website during that process were used to refine the description of the alternatives.

### 23.2.3 Stakeholder and Public Involvement during Preparation of the Final EIS

The Draft EIS was published for public review in July 2015. The Notice of Availability was published by Reclamation in the Federal Register on July 31, 2015 (Federal Register, Vol 80, No. 147, 45681). A copy of the Notice of Availability is included in Appendix 23B, Public Review of Draft Environmental Impact Statement.

Newspaper advertisements providing the dates and locations of the public meetings for the Draft EIS were published in the following newspapers on the specified dates.

- Sacramento Bee, Sacramento, California – August 26, 2015
- Oakland Tribune, Oakland, California – August 26, 2015
- San Jose Mercury, San Jose, California – August 26, 2015
- Contra Costa Times, Walnut Creek, California – August 26, 2015
- Record Searchlight, Redding, California – August 27, 2015
- Los Banos Enterprise, Los Banos, California – August 28, 2015
- Fresno Bee, Fresno, California – September 1, 2015
- Los Angeles Times, California – September 3, 2015

The distribution list for the Draft EIS is included in Chapter 24, Environmental Impact Statement Distribution List. Reclamation posted notification of the availability of the Draft EIS and the location and timing of public meetings on its website and through press releases.

Four public meetings were held during the public review period for the Draft EIS in the following locations, with the following level of public participation:

- Sacramento, California on September 9, 2015 (9 participants)
- Red Bluff, California on September 10, 2015 (9 participants)
- Los Banos, California on Tuesday, September 15, 2015 (9 participants)
- Irvine, California on September 17, 2015 (2 participants)

The public meetings included an open house preceding a presentation by Reclamation. The open house portion of the meetings included several project information stations staffed by project team members available to respond to attendee's questions. The open house stations included:

- Welcome Station with display boards that described the public meeting format
- Purpose and Need of the Project
- Surface Water and Groundwater Resources
- Aquatic, Wildlife, and Botanical Resources
- Socioeconomics
- Comments with a court reporter to record verbal comments

Fact sheets were provided at each of the open house stations.

Following the open house portion of the public meeting, Reclamation staff led a brief presentation. The open house portion of the public meeting was resumed after the presentation.

Copies of the display boards, fact sheets, and the presentation are included in Appendix 23B, Public Review of Draft Environmental Impact Statement.

Only attendees at the meeting in Red Bluff chose to provide verbal comments to the court reporter. The transcript of those comments also is included in Appendix 23B. Responses to those comments are included in Appendix 1E.

Approximately 860 written and verbal comments were received on the Draft EIS. All of the comments received on the Draft EIS were considered in preparation of the Final EIS. Written responses to all substantial comments received are included in Appendices 1A through 1E of the Final EIS.

## 23.3 Consultation with U.S. Fish and Wildlife Service and National Marine Fisheries Service

As described in Chapter 1, federal agencies also have an obligation pursuant to the Endangered Species Act (ESA) to "…ensure that any discretionary action authorized, funded, or carried out by such an agency is not likely to jeopardize the continued existence of any endangered or threatened species or result in the destruction or adverse modification…" of such species' designated "critical habitat," "…unless such agency has been granted an exemption for such action…" by the Endangered Species Committee which the ESA creates (16 United States Code (U.S.C.) section 1536 (a)(2). A discretionary agency action jeopardizes the continued existence of a listed species if it "reasonably would be expected, directly or indirectly, to reduce appreciably the likelihood of both the survival and recovery of a listed species in the wild by reducing the reproduction, numbers, or distribution of that species" (50 Code of Federal Regulations [CFR] section 402.02). Such action results in the destruction or adverse modification of designated critical habitat if there is "… a direct or indirect alteration that appreciably diminishes the value of critical habitat for both the survival and recovery of a listed species" (50 CFR section 402.02).

In carrying out its obligations, Reclamation must consult with the appropriate regulatory agency or agencies (e.g., U.S. Fish and Wildlife Service [USFWS] and National Marine Fisheries Service [NMFS]). At the conclusion of this consultation process, those agencies render written statements (known as biological opinions) setting forth their opinion as to how an action being proposed by Reclamation would affect a listed species and its designated critical habitat. If these agencies conclude that an action will jeopardize the continued existence of a listed species or result in the destruction or adverse modification of their designated critical habitat, then they must suggest a reasonable and prudent alternative to the action being proposed by Reclamation.

Pursuant to ESA Section 7(a)(1), Reclamation also considers which it could take under its existing authorities to benefit listed species. However, Section 7(a)(1) does not give Reclamation additional authority to undertake any particular action, regardless of its potential benefit for threatened and endangered species.

The Fish and Wildlife Coordination Act requires that Reclamation consult with fish and wildlife agencies (federal and state) on all water development projects that could affect biological resources. As part of this project, Reclamation has been in continuous consultation with USFWS and NMFS. This continuous consultation also satisfies any applicable requirements of the Fish and Wildlife Coordination Act.

## 23.4 Consultation with Cooperating Agencies and Other Entities

In accordance with requirements of the National Environmental Policy Act (NEPA), Reclamation invited eligible governmental agencies to participate as a cooperating agency. The federal cooperating agencies include the USFWS, NMFS, U.S. Environmental Protection Agency (USEPA), U.S. Army Corps of Engineers (USACE), and Bureau of Indian Affairs (BIA).

Reclamation also provided non-federal agencies with the opportunity to participate in the NEPA process if they qualified under NEPA (as described above) as a cooperating agency. In August of 2012, Reclamation mailed invitations to 747 non-federal entities to be cooperating agencies for this EIS, including:

- California Department of Water Resources

- State Water Resources Control Board
- California Department of Fish and Wildlife
- Agencies that have contracts with the CVP or SWP for water delivery, water service repayment, exchange or settlement, or use of CVP or SWP facilities for conveyance
- State and Federal Contractors Water Agency
- Cities and counties within the CVP and SWP service areas
- Federally-recognized tribes within the CVP and SWP service area or areas affected by CVP or SWP operations

Non-federal entities that meet the specified criteria for cooperating agencies are required to enter into a Memorandum of Understanding (MOU) with Reclamation to memorialize their participation as a cooperating agency.

Reclamation has signed cooperating agency MOUs with the following entities:

- Anderson-Cottonwood Irrigation District
- California Department of Water Resources
- California Valley Miwok Tribe
- City of Hesperia
- Contra Costa Water District
- Friant Water Authority
- Glenn-Colusa Irrigation District
- Metropolitan Water District of Southern California
- Oakdale Irrigation District
- Reclamation District 108
- San Diego County Water Authority
- San Juan Water District
- San Luis & Delta-Mendota Water Authority
- Stockton East Water District
- Sutter Mutual Water District
- Tehama Colusa Canal Authority
- Zone 7 Water Agency

These agencies have participated in preliminary review of written materials that were used to prepare this Draft EIS.

Reclamation also received a request from an interested party to include the Federal Emergency Management Agency (FEMA) as a cooperating agency. However, Reclamation concluded that FEMA does not have special expertise related to environmental issue that would not be addressed by other cooperating federal agencies.

Reclamation also received a request from the State Water Contractors, a non-profit association of 27 public agencies from northern, central, and southern California that purchase water under contract from the SWP (SWC 2015).

However, Reclamation concluded that the State Water Contractors was not a public agency; and therefore, could not be cooperating agency. However, this group and several other non-profit groups (including the Natural Resources Defense Council and The Bay Institute) have participated in preliminary review of written materials that were used to prepare this Draft EIS.

## 23.5 Consultation with Other Federal, State, and Local Agencies

This EIS was prepared in accordance with policies and regulations adopted by federal and state agencies. Brief discussions of relevant policies and regulations for each resource are included in Appendix 4A, Federal and State Policies and Regulations. Reclamation considered the requirements of these policies and regulations during preparation of the EIS and consultation with the related agencies, including the major regulations summarized below.

### 23.5.1 Federal Water Pollution Control Act Amendments of 1972 (Clean Water Act)

The Federal Water Pollution Control Act Amendments of 1972, also known as the Clean Water Act (CWA), established the institutional structure for the U.S. Environmental Protection Agency (USEPA) to regulate discharges of pollutants into the waters of the United States, establish water quality standards, conduct planning studies, and provide funding for specific grant projects. The Clean Water Act was further amended through the Clean Water Act of 1977 and the Water Quality Act of 1987. The California State Water Resources Control Board (SWRCB) has been designated by the USEPA along with the nine Regional Water Quality Control Boards (RWQCBs) to develop and enforce water quality objectives and implementation plans in California. The provisions of the Clean Water Act which affect water resources in the project area are described below.

- Section 401 of the Clean Water Act requires water discharges into navigable waters of the United States to apply for a Federal license or permit and to certify that the discharge will be in compliance with specified provisions of the Clean Water Act. Federal permits that are issued related to disturbance of waters of the United States (such as streams and wetlands) also require a Water Quality Certification in accordance with Clean Water Act section 401.

- Section 402 established the National Pollutant Discharge Elimination System (NPDES) permit program to regulate point source and non-point source discharges of pollutants into waters of the United States. An NPDES permit sets specific discharge limits for point and non-point sources discharging pollutants into waters of the United States and establishes monitoring and reporting requirements. The NPDES permits are issued for long-term discharges, including discharges from treatment plants, and temporary discharges, such as discharges during construction activities (e.g., General Permit for Storm Water Discharges Associated with Construction Activities).

- Section 404 requires the U.S. Army Corps of Engineers (USACE) to issue permits for discharge of dredge or fill material into navigable waters, their tributaries, and associated wetlands. Activities regulated by 404 permits include, but are not limited to, dredging, bridge construction, flood control actions, and some fishing operations.
- Section 303 requires preparation of basins plans. The SWRCB has approved water quality control plans (basin plans) for each watershed basin in the State. The basin plans designate the beneficial uses of waters within each watershed basin, and water quality objectives designed to protect those uses pursuant to Section 303 of the Clean Water Act. The beneficial uses together with the water quality objectives that are contained in the basin plans constitute State water quality standards.
- Under the CWA section 303(d), the SWRCB and USEPA identifies and ranks water bodies for which existing pollution controls are insufficient to attain or maintain water quality standards based upon information prepared by all states, territories, and authorized Indian tribes. Each state must establish priority rankings and develop Total Maximum Daily Loads (TMDLs) for all impaired waters. TMDLs calculate the greatest pollutant load that a waterbody can receive and still meet water quality standards and designated beneficial uses.

### 23.5.2 Rivers and Harbors Act

The navigable waters of the United States in the Study Area, including the major rivers in Sacramento and San Joaquin rivers watersheds and waterways in these watersheds affected by tidal action, are subject to the requirements of the Rivers and Harbors Act. “Navigable waters of the United States” are defined as those waters subject to the ebb and flow of the tide shoreward to the mean high-water mark or those that are used, have been used in the past, or may be susceptible to use in interstate or foreign commerce. Sections 9 and 10 of the River and Harbors Act are applicable to the coordinated long-term operation of the CVP and SWP.

Under the reauthorization of the Rivers and Harbor Act of 1937, Reclamation took responsibility for the operation of the CVP.

#### *23.5.2.1 Section 9 of the Rivers and Harbors Act*

Section 9 of the Rivers and Harbors Act prohibits construction of any dike or dam across any navigable waters without approvals from the Chief of Engineers and the Secretary of the Army.

#### *23.5.2.2 Section 10 of the Rivers and Harbors Act*

Section 10 of the Rivers and Harbors Act of 1899 prohibits alterations of any navigable waters, including construction of structures in, over, or under; excavation of material from; and deposition of material into navigable waters of the United States without permission from the USACE. The approval process generally is completed simultaneously with the approval process under the Clean Water Act Section 404.

### 23.5.3 Federal Safe Drinking Water Act

The Safe Drinking Water Act (SDWA) protects public health by regulating the nation's public drinking water supply. The SDWA authorizes USEPA to set national health-based standards for drinking water to protect against both naturally occurring and human-made contaminants that may be found in drinking water and its sources, including rivers, lakes, reservoirs, springs, and groundwater wells.

### 23.5.4 Wild and Scenic Rivers Act

Congress created the National Wild and Scenic Rivers Act in 1968 (Public Law 90-542; USC 1271 et seq.) to preserve rivers and outstanding natural, cultural, or recreational features in a free-flowing condition. High priority is place on visual resource management of these rivers to preserve or restore their scenic characteristics. Under this act, a Federal agency may not assist the construction of a water resources project that would have a direct and adverse effect on the free-flowing, scenic, and natural values of a wild or scenic river. If the project would affect the free-flowing characteristics of a designated river or unreasonably diminish the scenic, recreational, and fish and wildlife values present in the area, such activities should be undertaken in a manner that would minimize adverse impacts and should be developed in consultation with the National Park Service.

Within the study area, the following portions of the rivers have been designated as Wild and Scenic Rivers.

- The Klamath River from the confluence with the Trinity River to the Pacific Ocean was designated to be part of the National Wild and Scenic Rivers System on January 19, 1981.
- The Middle Fork Feather River (from Beckwourth downstream of Lake Davis to Lake Oroville) was designated to be part of the National Wild and Scenic Rivers System on October 2, 1968.
- The American River between Nimbus Dam and the confluence with the Sacramento River was designated to be part of the National Wild and Scenic Rivers System on January 19, 1981.

### 23.5.5 Fish and Wildlife Coordination Act (16 USC Section 651 et seq.)

The Fish and Wildlife Coordination Act, as amended in 1964, was enacted to protect fish and wildlife when federal actions result in the control or modification of a natural stream or body of water. The statute requires federal agencies to take into consideration the effect that water-related projects would have on fish and wildlife resources. Consultation and coordination with USFWS and State fish and game agencies are required to address ways to prevent loss of and damage to fish and wildlife resources and to further develop and improve these resources.

### 23.5.6 Marine Mammal Protection Act (16 USC 1361-1421h)

The Marine Mammal Protection Act (MMPA) was enacted in 1972. All marine mammals are protected under the MMPA. The MMPA prohibits, with certain exceptions, the "take" of marine mammals in U.S. waters and by U.S. citizens on the high seas, and the importation of marine mammals and marine mammal products into the United States. It defines "take" to mean "to hunt harass, capture, or kill" any marine mammal or attempt to do so. Exceptions to the moratorium can be made through permitting actions for take incidental to commercial fishing and other nonfishing activities; for scientific research; and for public display at licensed institutions such as aquaria and science centers.

### 23.5.7 Migratory Bird Treaty Act

The Migratory Bird Treaty Act (MBTA) implements a series of international treaties that provide migratory bird protection. The MBTA authorizes the Secretary of the Interior to regulate the taking of migratory birds, and the act provides that it shall be unlawful, except as permitted by regulations, "to pursue, take, or kill any migratory bird, or any part, nest or egg of any such bird" (16 USC section 703). This prohibition includes both direct and indirect acts, although harassment and habitat modification are not included unless they result in direct loss of birds, nests, or eggs. The current list of species protected by the MBTA was published in the March 10, 2010 *Federal Register* (*Federal Register*, Volume 75, page 9282 [75 FR 9282]).

### 23.5.8 Executive Order 13186: Responsibilities of Federal Agencies to Protect Migratory Birds

Executive Order 13186 (January 10, 2001) directs federal agencies that have, or are likely to have, a measurable negative effect on migratory bird populations to develop and implement a Memorandum of Understanding with USFWS to promote the conservation of migratory bird populations. The Memorandum of Understanding should include implementation actions and reporting procedures that would be followed through each agency's formal planning process, such as resource management plans and fisheries management plans.

### 23.5.9 Executive Order 11990: Protection of Wetlands

Executive Order 11990 (May 24, 1977) established the protection of wetlands and riparian systems as the official policy of the federal government. It requires all federal agencies to consider wetland protection as an important part of their policies and take action to minimize the destruction, loss, or degradation of wetlands and to preserve and enhance the natural and beneficial values of wetlands.

### 23.5.10 Federal Clean Air Act

National air quality policies are regulated through the Federal Clean Air Act (FCAA) of 1970 and its 1977 and 1990 amendments. Basic elements of the FCAA include national ambient air quality standards for criteria air pollutants, hazardous air pollutants standards, state attainment plans, motor vehicle emissions standards, stationary source emissions standards and permits, acid rain control measures, stratospheric ozone protection, and enforcement provisions.

### 23.5.11 National Historic Preservation Act of 1966

Section 106 of the NHPA and its implementing regulations (36 Code of Federal Regulations (CFR) Part 800) require Federal agencies to consider the effects of their undertakings on cultural resources that are, or that may be, eligible for listing in the National Register of Historic Places (NRHP) and to afford the Advisory Council on Historic Preservation an opportunity to comment. NRHP-eligible resources are considered to be "significant." The criteria used to evaluate eligibility for listing on the NRHP are further discussed in the next subsection.

The Section 106 process that is typically associated with NEPA compliance requires consultation of the federal lead agency with other federal, state, and local agencies, the Advisory Council on Historic Preservation, the State Historic Preservation Officer (SHPO), Indian tribes, and interested members of the public, such as historical societies. Throughout the Section 106 process, the federal lead agency and consulting parties work together to identify adverse impacts on sites of cultural significance or historic properties, and seek ways to avoid, minimize, or mitigate the adverse effects. A Memorandum of Agreement or Programmatic Agreement is issued by the participating parties that includes the measures agreed upon to avoid or reduce (i.e., mitigate) adverse effects. For large or complex undertakings, a Programmatic Agreement may also be negotiated to develop a phased approach to historic properties management or alternative Section 106 processes through consultations. Thus, impacts to cultural resources that are identified in a NEPA document are addressed through Section 106.

Section 110 of the NHPA sets out the broad responsibilities of Federal agencies for identifying and protecting historic properties under their jurisdiction, and for avoiding unnecessary damage to them. It is intended to ensure that an historic preservation program is fully integrated into the ongoing program of each Federal agency. Section 110 allows the costs of preservation activities as eligible project costs in all undertakings conducted or assisted by a Federal agency. Federal agencies are directed to withhold grants, licenses, approvals, or other assistance to applicants who intentionally damage or adversely affect historic properties in an effort to avoid the Section 106 process.

### 23.5.12 American Indian Religious Freedom Act

The American Indian Religious Freedom Act of 1978 protects the rights of Native Americans to freedom of expression of traditional religions (24 U.S. Code section 1996). This act established "the policy of the United States to protect and preserve for American Indians their inherent right of freedom to believe, express, and exercise the traditional religions…including but not limited to access to sites, use and possession of sacred objects, and the freedom to worship through ceremonials and traditional rites."

### 23.5.13 Indian Sacred Sites on Federal Land

Executive Order 13007 provides that in managing Federal lands, each Federal agency with statutory or administrative responsibility for management of Federal lands shall, to the extent practicable and as permitted by law, accommodate access to and ceremonial use of Indian sacred sites by Indian religious practitioners, and avoid adversely affecting the physical integrity of such sacred sites.

## 23.6 Consultation with Tribal Governments

Consistent with President Clinton's April 29, 1994 Memorandum and President Obama's November 5, 2009 Memorandum, Reclamation contacted federally-recognized tribal governments to participate in preparation of this EIS. Reclamation met with the California Valley Miwok Tribe in 2012 and the Miwok Maidu United Auburn Indian Community of the Auburn Rancheria in 2013.

Reclamation will continue to consult with each tribe on a government-to-government basis before taking any action that could affect a tribal government. Under the Federal Trust responsibility, Reclamation will provide full disclosure of the beneficial and adverse impacts of a project to the tribal government in a manner that provides adequate time for review and response. Reclamation will review comments received and consult with the tribal government prior to decisions related to a project.

Tribes and Indian Trust Assets were considered during preparation of this EIS, in accordance with environmental justice considerations identified in Executive Order 12898 (February 11, 1994), as summarized in Chapter 20, Indian Trust Assets, and Chapter 21, Environmental Justice.

# Environmental Impact Statement Distribution List

This chapter provides locations where the Draft and Final Environmental Impact Statement (EIS) are available for review and a list of governmental entities, organizations, and interested parties that received copies of this EIS.

## 24.1 Document Availability

The public distribution of this Draft and Final EIS emphasizes the use of electronic media to ensure cost-effective, broad availability to the public and interested parties. The Draft and Final EIS are available on the Internet at Reclamation's website.

Printed copies of the Draft and Final EIS are available for review at the following locations.

U.S. Department of the Interior, Bureau of Reclamation Library
2800 Cottage Way
Sacramento, CA 95825

U.S. Department of the Interior, Bureau of Reclamation, Bay-Delta Office
801 I Street, Suite 140
Sacramento, CA 95814

Electronic copies of the Draft and Final EIS are available on compact disc for viewing at the following libraries.

Alameda County Library
1247 Marin Avenue
Albany CA 94706

Alameda County Library
200 Civic Plaza
Dublin CA 94568

Alameda County Library
6300 Civic Terrace Avenue
Newark CA 94560

Butte County Library
1108 Sherman Avenue
Chico CA 95926

Colusa County Free Library
738 Market Street
Colusa CA 95932

Contra Costa County Library
501 W. 18th Street
Antioch  CA 94509

Contra Costa County Library
104 Oak Street
Brentwood  CA 94513

Contra Costa County Library
1050 Neroly Road
Oakley  CA 94561

Contra Costa County Library
80 Power Avenue

## 24.2 Agencies and Organizations Receiving Copies of the Draft Environmental Impact Statement

All persons, agencies, and organizations listed in this chapter have been informed of the availability of and locations to obtain the Draft and Final EIS. Parties listed below have received an electronic copy on a compact disc of the Draft and Final EIS.

### 24.2.1 Federal Agencies

- Bureau of Indian Affairs
- National Marine Fisheries Service
- U.S. Army Corps of Engineers
- U.S. Environmental Protection Agency
- U.S. Fish and Wildlife Service
- Western Area Power Administration

### 24.2.2 Tribal Interests

- California Valley Miwok Tribe
- United Auburn Indian Community

### 24.2.3 State Agencies

- California Department of Fish & Wildlife
- California Department of Water Resources
- Delta Stewardship Council

### 24.2.4 Regional and Local Entities

- Alameda County Zone 7

- Anderson-Cottonwood Irrigation District
- Central Delta Water Agency
- Contra Costa Water District
- East Bay Municipal Utility District
- El Dorado County Water Agency
- El Dorado Irrigation District
- El Dorado Water and Power Authority
- Folsom, City of
- Friant Water Authority
- Glenn-Colusa Irrigation District
- Hesperia, City of
- Lower Tule River Irrigation District
- Oakdale Irrigation District
- Placer County Water Agency
- Reclamation District 108
- Roseville, City of
- Sacramento, City of
- San Diego County Water Authority
- San Juan Water District
- San Luis & Delta Mendota Water Authority
- Santa Clara Valley Water District
- South Delta Water Agency
- South San Joaquin Irrigation District
- Stanislaus, County of
- Stockton East Water District
- Sutter Mutual Water Company
- Tehama-Colusa Canal Authority
- Westlands Water District

### 24.2.5 Other Interested Parties

- AquAlliance
- The Bay Institute
- California Farm Bureau Federation
- Coalition for a Sustainable Delta
- California Water Impact Network
- California Sportfishing Protection Alliance
- The Center for Environmental Science Accuracy and Reliability
- Environmental Water Caucus
- Friends of the River
- Golden Gate Salmon Association
- Kern County Water Agency
- Northern California Water Agency
- Natural Resources Defense Council
- North Coast Rivers Alliance

- Pacific Coast Federation of Fisherman's Associations
- Restore the Delta
- South Valley Water Association
- State and Federal Contractors Water Authority
- State Water Contractors
- Water 4 Fish

**Chapter 25**

# List of Preparers

The following individuals contributed to the preparation of this Environmental Impact Statement.

**Bureau of Reclamation**

| Name | Title | Years of Experience |
|---|---|---|
| Theresa Olson | Chief, Conservation and Conveyance Division | 23 |
| Amy Aufdemberge | Assistant Regional Solicitor | More than 20 |
| Andrew Shultz | Fish Biologist | 20 |
| Ann Stine | Natural Resources Specialist | 32 |
| Ben Nelson | Natural Resources Specialist | 5 |
| Bonnie Van Pelt | Natural Resources Specialist | 9 |
| Carolyn Bragg | Natural Resources Specialist | 8 |
| David O'Connor | Water Resource Modeler | 9 |
| David van Rijn | Chief, Science Division | 22 |
| Donna Garcia | Project Manager | – |
| Erwin Van Nieuwenhuyse | Supervisory Fish Biologist | 15 |
| Greg Krzys | Natural Resources Specialist | 20 |
| Janice Piñero | Endangered Species Act Compliance Specialist | 15 |
| Jason Hassrick | Fish Biologist | 17 |
| Joel Sturm | Geologist | 40 |
| John Dealy | Project Manager | More than 30 |
| John Hannon | Fisheries Biologist | 25 |
| Josh Israel | Fish Biologist | 11 |
| Kaylee Allen | Assistant Regional Solicitor | 16 |
| Kirk Nelson | Civil Engineer (Hydraulic) | 11 |
| Kristin White | Hydraulic Engineer | 11 |
| Laureen Perry | Regional Archaeologist | 25 |
| Michael Mosley | Physical Scientist | 7 |
| Michael Tansey | Climate Change Coordinator | 40 |
| Michele Palmer | Fisheries Biologist | 20 |
| Michelle Banonis | BDCP Program Manager | 16 |

| Name | Title | Years of Experience |
|---|---|---|
| Nancy Parker | Hydraulic Engineer (Water Resources Engineer) | 25 |
| Patti Idlof | Supervisory Natural Resources Specialist | 30 |
| Paul Zedonis | Supervisory Natural Resource Specialist | 25 |
| Rain Emerson | Supervisory Natural Resource Specialist | 6 |
| Rebecca Victorine | Natural Resource Specialist | 18 |
| Ronald Silva | Chief, Engineering and O&M Division | 30 |
| Russell Grimes | Chief, Environmental Compliance and Habitat Conservation Branch | 24 |
| Scott Springer | Outdoor Recreation Planner | 21 |
| Stanley Parrott | Geologist | 29 |
| Steve Pavich | Agricultural Economist | 18 |
| Traci Michel | Water Management Goal Supervisor | 22 |

**CH2M HILL**

| Name | Project Role | Education |
|---|---|---|
| Gwendolyn Buchholz, Professional Engineer (P.E.) | Project Manager | M.S., Civil Engineering, 1976<br>B.A., Physics, 1974 |
